INTRODUCTION

J'ai « découvert » l'écologie au début des années 70, croisant dans le même temps la pollution, les luttes paysannes et la malbouffe, la médecine qui avait (déjà) perdu son âme, les mouvements sociaux et bien sûr le nucléaire qui a occupé une grande partie de ma vie.

Après la catastrophe de mars 2011 au Japon, j'ai suivi chaque jour une partie des grands journaux japonais anglophones pour essayer de sauvegarder un maximum d'articles ayant trait à Fukushima. L'idée était de conserver une sorte d'archive accessible à tous, qu'ils soient écrivains, journalistes ou tout simplement intéressés.

Le blog « [Fukushima-is-still-news](http://fukushima-is-still-news.com) » a été poursuivi jusqu'en 2019. Ci-dessous, la conclusion parue le jour où j'ai décidé d'arrêter mon blog.

End of March 2019: Time to stop this blog

29 Mars 2019

Rédigé par fukushima-is-still-news et publié depuis Overblog

I have been collecting and spreading information on the Fukushima disaster for more than 8 years.

More than ever I am convinced that the name of my blog « Fukushima-is-still-news » was aptly chosen. Or perhaps I should have called it « Fukushima should still be news ». What I'm getting at is that I know the disaster is going on and we cannot simply forget Fukushima and turn the page. But the mode of action I chose 8 years ago has its limits and it is time for me to stop this blog.

I don't want the contents to be lost, so I will try and publish the lot with the Éditions de Fukushima so that the information remains available online.

Good bye for now. I am not doing a disappearing act. I'm still there tracking what's going on in the world of nukes.

C'est maintenant chose faite. Le blog *fukushima-is-still-news* est désormais disponible aux Éditions de Fukushima. Une fois de plus merci à mon ami Pierre, qui m'a convaincue à l'époque de tenir ce blog et m'a aidée à le lancer.

Odile Girard

Avertissement

La mise en page de dizaines de milliers de pages étant trop fastidieuse, nous avons préféré dans un premier temps éditer les volumes 7 à 16 sans mise en page particulière plutôt que de risquer de ne jamais les éditer. Chacun de ces livres est donc, dans la version présente, constitué des articles du blog copiés de manière brute. Les articles sont disposés a priori chronologiquement. Nous nous excusons donc pour l'absence de table des matières. La recherche peut toutefois facilement être effectuée par mot clé avec la fonction CTRL + F

Le présent volume est le douzième d'une collection de 16 ouvrages :

Vol. 1 : Daiichi Nuclear Plant (2012-2014)

Vol. 2 : Daiichi Nuclear Plant (2015-2019)

**Vol. 3 : Radioactive Fallout And Waste,
No.4 Fuel Removal,
Nuclear Workers,
and UN Conference**

Vol. 4 : Nuke Safety (2012-2015)

Vol. 5 : Nuke Safety (2016-2019)

**Vol. 6 : Reprocessing,
Storage Nuclear Waste,
and Decommissioning**

**Vol. 7 : Practical Problems For The Japanese Population
2012-2014**

**Vol. 8 : Practical Problems For The Japanese Population
2015-2017**

**Vol. 9 : Practical Problems For The Japanese Population
2018-2019**

**Vol. 10 : Health Effects Of Radiation
and Collateral Effects**

Vol. 11 : Anti-Nuclear Activity-Opinion

Vol. 12 : Vested Interests - Transparency - Corruption (1)

**Vol. 13 : Vested Interests - Transparency - Corruption (2)
and Olympics**

Vol. 14 : Nuclear Weapons

**Vol. 15 : Nuclear Future,

Lack of transparency update Feb 12, 2012

February 12, 2012

TEPCO provided radiation map to U.S. before Japanese public

<http://mdn.mainichi.jp/mdnnews/news/20120212p2g00m0dm019000c.html>

TOKYO (Kyodo) -- Tokyo Electric Power Co. provided a contamination survey map of its crippled Fukushima No. 1 nuclear plant to the U.S. nuclear regulator nearly a month before its official disclosure to the public in Japan in late April last year, company officials said.

The revelation follows a series of revelations that the government data from the System for Prediction of Environmental Emergency Dose Information and the Japan Meteorological Agency's data on the projected radiation spread were provided to the United States and other international institutes before disclosure of the information in Japan.

TEPCO started making the map which described the amount of radiation at up to 150 spots around the buildings in the power plant site on March 22 and provided it the same day to the U.S. Nuclear Regulatory Commission at the request of its staff members dispatched to Japan after the March 11 earthquake and tsunami triggered the nuclear crisis, the officials said.

TEPCO officials and NRC staffers continued to share updated versions of the map almost every day via e-mail, they said.

TEPCO only started providing the data to Japan's Nuclear and Industrial Safety Agency on March 23. It waited until April 24 to make the map public, only after the media reported details of the map a day before.

An official at TEPCO's public relations department said the company had provided data on the radiation amount at the Fukushima No. 1 complex at press conferences even before the official disclosure of the map, adding the utility "received advice" from the NRC.

Govt to make TEPCO more transparent / 3 committees to oversee management

The Yomiuri Shimbun

The government plans to require Tokyo Electric Power Co., operator of the crippled Fukushima No. 1 nuclear power plant, to introduce a committee governance structure to increase management transparency.

The policy is included in the draft comprehensive special business plan, which will be compiled by the government's Nuclear Damage Liability Facilitation Fund and TEPCO in March.

TEPCO Chairman Tsunehisa Katsumata is set to resign to take responsibility for the nuclear crisis. His successor will be recruited from outside the company to increase the transparency of TEPCO's management.

TEPCO tentatively decided Thursday to accept the fund's demand that it hold a one-third stake in the utility through a capital injection using taxpayers' money.

With the veto power that comes with a one-third stake, the fund will be able to overturn decisions in shareholders meetings concerning TEPCO's management policy.

The government decided TEPCO's opaque management practices--including high labor costs and donations as part of its expenses that are used to determine electricity charges--need to be changed if the utility is to regain public trust.

By making it possible for outside entities to oversee TEPCO's management system, the government aims to make it easier to gain the public's understanding over using public funds to assist TEPCO.

In addition to introducing a committee system, the draft plan for new management will introduce an internal company system to encourage TEPCO's internal divisions to compete with one another to reduce costs.

Concerning a financial assistance scheme for TEPCO, the fund will inject 1 trillion yen as additional capital while banks will loan a total of 1 trillion yen.

Alternatively, the banks could buy TEPCO's bonds, instead of extending loans.

To minimize the burden on the banks, hundreds of billions of yen out of the 1 trillion yen will be set aside as a line of credit from which TEPCO would be able to borrow money when necessary.

The fund plans to present the scheme to banks in the near future.

On Thursday night, a TEPCO executive said, "We assume the government wants to hold at least one-third [of a stake in TEPCO] through the injection of capital, as that percentage comes with veto power."

However, the government demands at least a majority of voting rights in TEPCO, which still leaves some gaps between the two parties' positions.

Under the committee-company system, TEPCO will have three committees within the board of directors--the nominating committee, which selects and dismisses members of the board; the audit committee overseeing the work of board members; and the compensation committee, which determines board members' salaries.

For all three committees, more than half of the members will be outside directors.

Under the system, executive officers will be appointed to carry out separate functions of business operations from the board of directors, which oversees management.

Pro-nuclear energy town councillor's firm had 700 million yen in nuke plant contracts

<http://mdn.mainichi.jp/mdnnews/news/20120207p2a00m0na023000c.html>

TAKAHAMA, Fukui -- A town assembly member here calling for the continuation of nuclear power is also president of a company that has received at least 700 million yen in nuclear-related construction contracts, it has been learned.

Akio Awano, 62, is vice-speaker of the municipal assembly of Takahama, which hosts a Kansai Electric Power Co. nuclear plant. He is also part of a local organization promoting nuclear power plants.

According to the Fukui Prefectural Government and other sources, Awano's firm, a metal processing company, has around 15 employees and earned about 200 million yen in fiscal 2010. It has an office in the Takahama nuclear plant and has expanded its business on a diet of nuclear plant-related construction.

Construction records show that Kansai Electric began contracting Awano's firm directly in the 1990s, and has forked out some 536 million yen to the company for 67 jobs in the past five years. Furthermore, Awano's company took 66 subcontracted jobs at the utility over the same period. Most local construction businesses get at most about 15 power company jobs per year.

In September of last year, Awano submitted a written statement seeking continuation of nuclear power generation, including the restart of Takahama plant reactors off-line for regular inspections. The statement was approved by an overwhelming majority of the town assembly.

However, Fukui Gov. Issei Nishikawa has said, "Unless the national government submits new safety standards reflecting the knowledge gained from the Fukushima nuclear disaster, I cannot agree" to a restart of the reactors. Oi and Mihama, two other towns in Fukui Prefecture also hosting nuclear facilities, have not passed resolutions in favor of restarting reactors.

Awano has defended himself by saying, "I submitted the statement after looking at the country's energy situation and judging that nuclear power is necessary. My actions as an assembly member and my management of the company are completely separate, and I was not influenced by the construction contracts."

The No. 1, 2, and 4 reactors at the Takahama plant are off-line for inspections. In January Kansai Electric submitted a safety evaluation of the No. 1 reactor to the Nuclear and Industrial Safety Agency, a prerequisite for it to be restarted. The agency and the Nuclear Safety Commission of Japan will look at the evaluation and Prime Minister Yoshihiko Noda will make a decision on the restart based on local opinions. Kansai Electric has declined to comment on individual contracts, saying only that its business partners are "evaluated and registered in a fair manner, with the most appropriate company for a construction job chosen and contracted."

Nuke plant operators paid \$2 bil. to localities

http://www3.nhk.or.jp/daily/english/20120206_27.html

Newly disclosed documents show that nuclear power plant operators in Japan have paid more than 2 billion dollars to local authorities hosting their facilities over the past 4 decades.

NHK obtained information about the payments from 44 prefectures and municipalities based on the information disclosure system.

The information shows that the payments have reached 2.1 billion dollars since construction of nuclear plants began in the late 1960s.

Of the amount, Tokyo Electric Power Company which operates the disabled Fukushima Daiichi nuclear plant paid nearly 460 million dollars. Other utilities have continued making payments ever since the accident at the plant.

Power companies pay the money to promote the construction of nuclear plants. Some local governments ask for donations to invest the money in the regional economies.

The utilities view the payments as part of the cost of generating power and pass the expense on in utility fees.

But an economy ministry panel said last week that the payments should not be counted as a cost.

Host communities have spent the money in various ways. They include public works projects, events and scholarships as well as statues of animation characters and promotional videos.

The host communities also receive subsidies from the central government, but the payments decrease in stages. Until 2003, they were only allowed to use the money to construct public facilities.

The payments are apparently convenient for some communities that are struggling to find ways to maintain the facilities.

Kyushu men sent to Fukushima nuke plant under falsified labor deals

<http://mdn.mainichi.jp/mdnnews/news/20120206p2a00m0na013000c.html>

As efforts to tame the crisis at the Fukushima No. 1 nuclear plant continue, laborers from as far as Kyushu have been dispatched there under illegal labor deals and forced to work inside at least one of the crippled plant's highly contaminated reactor buildings.

A man in his 40s from Nagasaki Prefecture recently related how he carried lead sheets weighing some 20 kilograms each up as high as the sixth floor of one building. A Geiger counter dangling from his neck sounded noisily and his mask misted over as temperatures climbed above 30 degrees Celsius.

"I was really angry because I was treated like a slave," Yosuke Nakayama, a pseudonym, said of his some 40 days at the Fukushima plant, starting in July last year.

The lead sheets were installed inside the plant's No. 1 reactor building to block radiation. Nakayama, however, was not angry about the hard work, but about the treatment he received upon returning home to Nagasaki.

He said he was paid 11,000 yen per day he worked for a company six layers down in a seven-layer outsourcing pyramid, with only the top-tier firm receiving orders directly from plant operator Tokyo Electric Power Co. He had been promised 14,000 yen per day, and had also been assured he would not have to enter the reactor buildings.

When Nakayama demanded an explanation for the 3,000 yen difference, his subcontractor mentioned the name of a Fukuoka-based crime syndicate.

"We don't care if yakuza show up," the contractor said, apparently threatening him.

A third-tier company to which Nakayama's employer dispatched laborers via two other firms has been slapped with administrative punishments twice for its ties to crime syndicates.

Contacted by the Mainichi, Nakayama's employer acknowledged the dispatch of workers without a license. "We received about 13,000 yen from a fifth-tier firm and we'd lose money unless we deduct expenses," the company said.

Businesspeople familiar with the Kyushu Electric Power Co.'s Genkai Nuclear Power Plant in Saga Prefecture say a significant number of laborers have been sent to Fukushima.

A utility work firm in Saga has been recruiting laborers from across Kyushu since last December, ostensibly for work at nuclear plants in Kyushu and Shikoku. The names of about 20 laborers are written on the firm's white board, along with their destination: "Fukushima No. 1."

An executive of the firm says it started sending laborers to Fukushima in response to requests from its business partners. "People from Kyushu are in demand because they're serious. We will send them again if requested."

A Saga man in his 30s did a job similar to Nakayama's at the Fukushima plant after being dispatched from a seventh-tier firm. He contacted the company after seeing a posting at a job-placement office and got the Fukushima job.

He received about 300,000 yen for some 40 days of work, and absorbed a radiation dose of some 10 millisieverts. "There are no jobs in my hometown, so it can't be helped," he says, adding he is waiting for another Fukushima assignment.

February 04, 2012

Falsified labor deals rampant at Japan's nuke plants, says suspect

<http://mdn.mainichi.jp/mdnnews/news/20120204p2a00m0na016000c.html>

A power plant construction and maintenance firm has falsified worker contracts for temporary labor at nuclear plants across Japan for years, according to statements by one of the company's employees charged with involvement in the fraudulent agreements.

Hideo Ichise, 58, and two other people were indicted on Feb. 2 for the dispatch of a worker to the Oi nuclear plant in Fukui Prefecture under a false contract, a violation of the Employment Security Law.

Ichise's employer Taihei Dengyo Kaisha Ltd. -- where he now serves as business manager after a stint as the firm's Oi operations chief -- along with Fukui Prefecture-based plumbing company Takada Kiko were also charged.

Investigators have discovered a dossier on falsified worker contracts at more than 30 Taihei Dengyo branches, further suggesting the firm has been involved in illicit labor deals involving nuclear power plants across the country.

Police have furthermore discovered cases of various personnel agencies siphoning off the wages of temporary workers at nuclear plants, while involvement of the Kitakyushu-based crime syndicate Kudo-kai has also been uncovered.

According to investigative sources, Ichise said, "We have participated in (illicit nuclear labor practices at the Oi plant) for many years. We have been doing the same thing at other nuclear power plants."

Taihei Dengyo's operating officer was also quoted as telling police, "Our company alone cannot hire many workers, so we (falsified labor contracts) knowing it was illegal."

Other sources involved in work at nuclear power plants have provided similar information, including one Saga Prefecture man in his 50s who worked at the Genkai Nuclear Power Plant there during regular inspections about three years ago. He was dispatched to a construction company by a temp agent called simply "boss." Although there was ostensibly a contract with the construction company and the man worked directly under a construction company employee, "boss" apparently took 5,000 yen out of his 13,000-yen daily wage.

A year earlier, the Saga man had also worked at the Genkai plant during a regular check as an employee of an electrical firm for about two months. A fellow worker in his 50s had to take more than two weeks off after injuring his ankle at the plant but had to pay his own medical bills.

In this case, the Saga man worked under the guise of the electrical firm. "There were gangsters among those bosses, and sometimes two bosses raked off my wages," the Saga man recalls.

A temporary personnel agency operator says, "Parent companies send us requests for a certain number of workers, and we submit a list of people who then go and work under those parent companies at nuclear power plants. We give the workers their wages after deducting our share." Another agent told the Mainichi, "There are times when gangsters are involved in recruiting workers. It is easy for us to hire them because they save us the trouble."

It is not clear why such unlawful labor practices have been overlooked. An inspector at a labor standards office stated, "It is very difficult to get a full picture of the labor practices at nuclear power plants because corporate parent-subsidiary relations change depending on their line of work. It is also difficult to conduct surprise on-site inspections of nuclear power plants because advance notification is necessary as part of antiterrorism measures."

Economy, Trade and Industry Minister Yukio Edano instructed electric power companies to abide by the law and bar crime syndicates from involvement in work at nuclear power plants. However Takayoshi Yoro, a professor emeritus of labor law at Ryukoku University, says, "Falsified labor contracts have been rampant for so long. If the government is dead serious about stamping them out, nuclear power plants will stop running. Power companies and general contractors simply have to directly hire workers, but I wonder if they have the determination to do so."

February 03, 2012

Indictment of contractors exposes illicit work at nuke plants

<http://mdn.mainichi.jp/mdnnews/news/20120203p2a00m0na018000c.html>

FUKUOKA -- Three people and two firms were indicted Feb. 2 on charges of dispatching a worker to the Oi Nuclear Power Plant in Fukui Prefecture under a falsified contract in violation of the Employment Security Law.

Those indicted by the Kokura Local Public Prosecutors Office are Hideo Ichise, 58, of Tsuruga, Fukui Prefecture, Yoshimi Tomita, 59, of Maizuru, Kyoto Prefecture, and Kanae Ikegami, 36, of Kitakyushu's Wakamatsu Ward. Prosecutors also indicted Taihei Dengyo Kaisha Ltd., a Tokyo-based power plant construction and maintenance firm, and Takada Kiko, a plumbing firm in Takahama, Fukui Prefecture. The Kokura Summary Court on Feb. 2 fined Ichise and Tomita and the two firms 500,000 yen each and Ikegami 250,000 yen. Ichise is the Fukui business manager of Taihei Dengyo, and he previously served as the firm's Oi operation chief. Tomita is president of Takada Kiko while Ikegami is an executive of Dream, previously known as Soshin Kogyo, a plumbing and housing equipment firm. She is also the wife of a gang leader with ties to the Kitakyushu-based crime syndicate Kudo-kai.

"Many documents showing illegal labor were found, one after another, during our search. They proved many years of shady deals," says a senior officer with the Fukuoka Prefectural Police. The case sheds light on not just one firm or one nuclear power plant but the nuclear power industry as a whole.

Sixty-one-year-old Masaki Yoshimura (pseudonym) in Kitakyushu was dispatched to many nuclear power plants in Japan while working for a construction company for a period of 14 years that ended seven years ago. There were many companies involved in his work between his employer and general contractors such as nuclear power plant manufacturers. One of those companies was Taihei Dengyo.

Repairing plumbing was the main part of his job, but instructions came from different companies depending on which nuclear power plants he was working at. Electric power companies, operators of nuclear power plants, paid general contractors a daily pay of 100,000 yen, but Yoshimura got only 18,000 yen. More than 80 percent of his daily wage was siphoned off.

"It's the world of siphoning off. It's a system in which big companies make money handsomely," he says. The nuclear job scandal involving Taihei Dengyo uncovered the fact that **illegal labor supports nuclear power businesses**. Fake contracts and unlicensed dispatches of workers are peppered with acts of siphoning off pay. These practices have put laborers in an unstable position and invited crime syndicates' involvement.

"The Geiger counters quickly sound, so you can't work for so long. Fifty to 100 people have to work together. People at the bottom of society are there," Yoshimura says.

Radiation zones are divided into a scale from A to D, and workers assigned to D, the highest radiation zone, have to wear protective gear and layers of gloves. "Competent workers brought with them other workers' Geiger counters so they would not to exceed the dosage limits and to improve their work efficiency," Yoshimura said.

Stopping a nuclear reactor for just one day reportedly results in a loss to the owner of 100 million yen. A retired electric power company official says, "Electric power companies have repeatedly requested shorter inspections. But to shorten checks without changing the number of items to inspect, you have to either cut corners or force workers to work throughout the night," he says.

According to the Japan Nuclear Energy Safety Organization, about 90 percent of some 83,000 nuclear power plant workers who were exposed to radiation in fiscal 2009 were not employed directly by nuclear power plant operators. **Their average radiation dosage was 3.6 times the level suffered by employees of those operators.**

The Committee on Poverty of the Japan Federation of Bar Associations last year conducted a survey of nuclear power plant workers. Lawyer Tatsuo Watanabe, a member of the committee, says, "From an ethical point of view, we should check unlawful labor at nuclear power plants that is being done for economical reasons."

More than 1,000 workers are necessary for a regular inspection of a nuclear reactor, but postings for these jobs do not show up at job-placement offices. Most part-time nuclear workers find employment through personal connections and introductions. A labor bureau official says: "(The connections) are extra careful to not hurt the electric power companies. Those with strong personal connections have strong solidarity and are tightlipped. They are in a world of their own."

February 01, 2012

Editorial: Nuclear regulatory reform must weed out entrenched interests

<http://mdn.mainichi.jp/perspectives/news/20120201p2a00m0na004000c.html>

Bills relating to a shift in the nation's nuclear power policy were approved by the Cabinet on Jan. 31. In addition to the establishment of a new nuclear regulatory agency under the Environment Ministry, the government is aiming to legislate the lifespan of nuclear reactors, and require plant operators to outline specific measures against severe nuclear accidents.

Significant harm has been done by allowing the Nuclear and Industrial Safety Agency (NISA), an administrative body tasked to regulate nuclear power safety, to exist under the umbrella of the Ministry of Economy, Trade and Industry (METI), a major promoter of nuclear power. Divorcing nuclear regulation from nuclear promotion and centralizing regulatory duties into one agency stands to reason. Changing the agency's name from the originally proposed "nuclear power safety agency" to "nuclear power regulatory agency" is likewise pertinent, considering the new agency's nature.

However, the mere alteration of a name and rearrangement of an organization will not result overnight in a highly independent agency specializing in regulation. Because many of the new agency staff members are likely to come from NISA, specific measures are necessary to secure the independence of the new body.

It remains unclear how a nuclear safety investigation committee, envisaged in one of the bills approved by the Cabinet, will contribute toward ensuring the safety of nuclear power. Since the Cabinet Office's Nuclear Safety Commission (NSC) lost the confidence of the Japanese public over its response to the

ongoing nuclear disaster, the new committee cannot expect to gain it back without demonstrating its independence and competence.

The handling of the continuing nuclear crisis has been problematic particularly due to the government's lack of readiness, which has generated suspicions that the disaster could have been mitigated had the government been more capable of crisis management. Crisis management will be an important duty of the new regulatory agency, and must be attended to adequately.

Meanwhile, some things have slipped through the centralization of regulatory responsibilities. Safety research conducted by the Japan Atomic Energy Agency (JAEA) and the inspections and other safeguards implemented by the Ministry of Education, Culture, Sports, Science and Technology to prevent the diversion of nuclear material toward the production of nuclear weapons will not fall under the jurisdiction of the new regulatory agency. It remains to be seen how these tasks will be integrated into the new scheme.

Included in the latest bills are the designation of a 40-year lifespan for nuclear reactors and the implementation of "back-fit" measures that would hold existing reactors to the latest technological standards. The government claims that the combination of these two mandates would make it extremely difficult for reactors to continue running more than 40 years. The bills, however, include special exemptions allowing reactors to operate for up to 60 years. Stringent criteria must be set to prevent "exceptions" from undermining the rule.

We hope also that the proposed legal reforms lead to a stronger nuclear disaster prevention scheme. In the case of the Fukushima disaster, the off-site emergency response center failed to function. A fundamental review of Japan's nuclear crisis preparedness is imperative. Along with an expansion of disaster protection zones emphasizing nuclear disaster countermeasures, there is a pressing need to reassess national and regional disaster prevention plans.

Numerous corporations and organizations make up the national framework that had heretofore promoted nuclear power, and their role in "amakudari" -- literally "descent from heaven," referring to the practice of former bureaucrats taking advisory posts in industries they previously regulated -- has been pointed out. For effective regulations to gain ground, it is important to extend reform to such organizations with entrenched interests.

Money and nukes Feb 13, 2012

February 13, 2012

Professor who promoted lenient standards for nuclear containers received donations

<http://mdn.mainichi.jp/mdnnews/news/20120213p2a00m0na018000c.html>

A Tokyo Institute of Technology professor received a large amount of donations from engineering firm OCL Corp. before he promoted lenient inspection standards for spent nuclear fuel casks that the company produced, the Mainichi has learned.

Professor Masanori Aritomi was the driving force behind the standards, which favored OCL Corp. The Atomic Energy Society of Japan (AESJ) adopted the standards for inspections of transportation casks.

The finding highlights campaigns by proponents of the so-called "nuclear village" establishment to adopt such lax standards -- rather than the national standards -- to their advantage.

According to minutes of the AESJ's deliberations and people familiar with the issue, the AESJ decided on the inspection standards, also known as "AESJ standards," to apply to the safe design and inspections of transportation casks for spent fuel, new mixed oxide fuel and high-level radioactive waste. After soliciting opinions from the public, the government will formally set new standards this year.

The AESJ normally comes up with its own atomic energy-related standards after a sectional committee writes a draft that is then checked by experts and standards committees. The society's panel on nuclear fuel transportation casks began deliberations in 2010. The deliberations were held at OCL's conference room and the draft was drawn up by a member of the panel from OCL.

Aritomi served as head of the panel on transportation casks and its umbrella organization, the nuclear fuel cycle department. He also took on the position of deputy chairman of the decision-making standards committee.

Tokyo Institute of Technology records show that Aritomi received a total of 14.85 million yen in scholarship donations from OCL between fiscal 2006 and 2010. Another researcher, a Tokyo Institute of Technology associate professor and a member of the sectional committee, received a 1 million yen scholarship donation in fiscal 2010.

The deliberations focused on whether heat transfer inspections to check how heat stemming from spent nuclear fuel would be transmitted to casks should be conducted on all new casks. The AESJ draft says sample inspections are acceptable so long as cask manufacturers have a good track record, but the Nuclear and Industrial Safety Agency (NISA) is demanding inspections of all transportation casks. During a meeting of experts in June last year, a safety examiner from NISA expressed the agency's opposition to sample inspections.

In spite of the opposition, however, the lenient inspection standards were approved by an overwhelming majority through balloting by members of the standards committee between Dec. 23 last year and Jan. 19 this year, with only a member from NISA dissenting. A member from the Japan Nuclear Energy Safety Organization abstained.

According to experts familiar with transportation casks, a large transportation cask can store as many as 38 spent nuclear fuel rods. Heat transfer inspections impose a heavy financial burden on the manufacturers because the number of electric heaters they have to install has to match the number of spent nuclear fuel rods.

Aritomi told the Mainichi he has no intention of deliberately siding with OCL.

"If all transportation casks are checked, shipments will slow down and the processing of spent fuel will not progress," he said. "We, the AESJ, determined that sample inspections were OK."

However, when asked about his involvement in the entire decision-making process, he said, "It cannot be helped if suspicion is raised over my neutrality. I think I should resign at least as the head of the sectional committee or deputy chairman of the standards committee."

Nevertheless, Aritomi also argued: "Unlike nuclear reactors, the transportation cask is not something which you can write a thesis about, and there are not many researchers. I realized there were many problems with the deliberation structure, but there were few people who could get involved."

OCL Managing Director Kazuo Kawakami dismissed any suspicions arising over the issue, saying, "The committee is operating in accordance with the principles of fairness, justice and openness, and does not cause any suspicion."

A NISA official commented, "Transportation casks should be subject to tough standards because they are transported near citizens. We cannot adopt the (AESJ) standards as government standards."

Aritomi was appointed as an adviser to the Cabinet Secretariat by then Prime Minister Naoto Kan shortly after the outbreak of the crisis at the Fukushima No. 1 Nuclear Power Plant.

Government approves additional funds for TEPCO

http://www3.nhk.or.jp/daily/english/20120213_29.html

Japan's industry minister has warned Tokyo Electric Power Company, operator of the troubled Fukushima Daiichi nuclear power plant, that it must accept state control in order to get a capital injection.

Yukio Edano told TEPCO President Toshio Nishizawa on Monday that the company will not receive public money unless the government gets adequate voting rights in return.

He said the government will not otherwise accept the business revival plan the utility is to submit by the end of March. TEPCO needs a large amount of financial aid to cover compensation payments to victims of the nuclear disaster at the plant and for alternative thermal power generation in place of nuclear energy.

Nishizawa said TEPCO will bear the government's requirement in mind in working out its revival plan.

The president told reporters after the meeting that his company will discuss details of a capital injection request with a government-backed organization for the victims.

Providing that it acquires the voting rights, the government has decided to give the utility **nearly 9-billion dollars in additional financial aid to be used for compensation payments**. The money is separate from the proposed capital injection fund for TEPCO.

Government's responsibility - but to what extent ?

February 14, 2012

Editorial: Govt' must be aware of responsibilities if it takes over TEPCO

<http://mdn.mainichi.jp/perspectives/news/20120214p2a00m0na005000c.html>

Economy, Trade and Industry Minister Yukio Edano has approved additional financial assistance of some 690 billion yen for the troubled Tokyo Electric Power Co. (TEPCO), the operator of the Fukushima No. 1 Nuclear Power Plant, to provide funds for the massive compensations for nuclear disaster-induced damage. Apart from this, the government is poised to inject public funds into the utility to place it under virtual state control and prevent the firm from becoming insolvent. The minister's approval had been delayed due to rows between the utility and the government over the latter's demand to share TEPCO's management rights.

If the unproductive conflict between the government and the utility lingers on and results in a delay in compensating the victims of the nuclear catastrophe, however, the situation will turn into a case of the tail wagging the dog. If the government is to share TEPCO's management rights by injecting public funds, the government needs to be aware of its responsibility to take on the task of bringing the nuclear crisis under control at an early date, rescuing nuclear disaster victims and maintaining a stable energy supply.

Following the government's approval of the additional financial assistance, TEPCO released its settlement for April-December 2011, in which the utility incurred some 620 billion yen in net losses -- due mainly to increased fuel costs following the suspension of nuclear power plants. If it were not for the injection of public funds, the utility would likely turn insolvent in the business year ending March 2013. That is why a capital injection at the 1-trillion-yen level has been under consideration.

Because TEPCO's total market value currently stands at some 320 billion yen, the government would be able to acquire up to three-fourths of its management rights by investing 1 trillion yen into the flagging company. If the government acquires more than two-thirds of TEPCO's management rights, the government would be entitled to making such key managerial decisions as restructuring. Industry Minister Edano demanded of TEPCO President Toshio Nishizawa that the utility hand over "sufficient voting rights" to the government as a precondition for the additional financial support. It appears that the government is aiming to take over a certain managerial control of the utility by acquiring a majority of its voting rights, after which it would push through a reform of the entire energy system, including separating electricity generation and transmission.

TEPCO, meanwhile, has been opposing the handing over of its management rights to the government. President Nishizawa stated as he released the utility's settlement, "We will discuss the issue by taking the industry minister's ideas into full consideration."

What significance, however, does this tug-of-war between the government and the utility have? They need to be reminded that **the aim of providing financial support for TEPCO is to bring the nuclear crisis under control at an early date, compensating the nuclear disaster victims swiftly and maintaining a stable energy supply.**

TEPCO is poised to draw up a comprehensive special business plan incorporating the injection of public funds by the end of March, in conjunction with the Nuclear Damage Liability Facilitation Fund. While it goes without saying that TEPCO is required to do its utmost to streamline its management, the government also needs to bear due responsibility as an investor in the utility.

However, there are also discrepancies within the government over its attempt to acquire a majority of TEPCO's voting rights, with the Finance Ministry opposed to the move on the grounds that it could increase the government's financial burden for decommissioning nuclear reactors and compensating nuclear disaster victims. As long as there is a conflict of opinions within the government over taking over the responsibility for the nuclear disaster and its aftermath, we can't be sure if the government can be tasked with TEPCO's management.

Unless TEPCO reactivates idled nuclear reactors and raises utility bills, the company is estimated to take only a year to use up the one trillion yen to be injected by the government, because of increased fuel costs. There is also a limit to the effectiveness of the government entirely taking over the utility and downsizing it. The government is urged to exercise its responsibility in settling the structural problems if taxpayers' money is to be injected to bring the utility under state control.

Govt and TEPCO play tug-of-war over voting rights

http://www3.nhk.or.jp/daily/english/20120214_17.html

Difficult negotiations between the Japanese government and the operator of the tsunami-hit nuclear plant over voting rights of the company will soon begin in earnest.

Tokyo Electric Power Company wants the government to have less say over the funds it provides the firm.

Industry minister Yukio Edano told TEPCO President Toshio Nishizawa on Monday the government would not accept the company's business revival plan unless it gets adequate voting rights. The plan includes an injection of public funds to boost the firm's finances.

Some government officials think it should have majority voting rights over the company if it is to receive public funds.

Others say over two-thirds voting rights is necessary, to allow the government to veto all proposals at a general shareholders meeting.

TEPCO seeks to minimize state control, saying it wants to maintain autonomy as a private firm.

Some inside the government support TEPCO's stance. They worry about the huge responsibility the government may bear in compensating victims and decommissioning the plant.

Agreement on funding and voting rights is urgent for TEPCO as it forecasts a net loss of nearly 9 billion dollars for the business year through March. It could also affect financing from banks.

Transparency (lack of) again

Japan official faults nuke design, defends secrecy

<http://mdn.mainichi.jp/mdnnews/news/20120215p2g00m0dm015000c.html>

TOKYO (AP) -- The government official who outlined Japan's worst-case scenario for the unfolding nuclear disaster last March defended how his study, warning that millions of people might have to flee, was kept secret.

Authorities would have had as much as a week or two to expand the evacuation zone if the worst-case scenario had started to unfold, said Shunsuke Kondo, who heads the Japan Atomic Energy Commission that helps set government nuclear policy.

But he also acknowledged Tuesday that the design for the Fukushima Dai-ichi nuclear power plant had been faulty and he had not expected the "Chernobyl-style disaster" that occurred.

Kondo was commissioned by then-Prime Minister Naoto Kan to write the worst-case scenario on what might happen after the March 11 tsunami crippled the plant and caused three reactors to melt down.

But fearing widespread panic, officials kept secret the 15-page document he delivered March 25. It was obtained by The Associated Press last month.

The document said evacuation zones possibly would have to be expanded, including the Tokyo area with a population of 35 million people, if massive radiation began to leak from the plant, 230 kilometers (140 miles) from the capital.

Workers ultimately were able to bring the reactors under control.

But at the time, just two weeks after the disaster, it was unclear whether emergency measures would succeed, and an aftershock or another tsunami could have set off explosions and leaks at the crippled plant.

Kondo, 69, a former engineering professor at the prestigious University of Tokyo, said the government responded properly to his scenario, which he prefers be called "contingency," instead of "worst-case." "Thinking of contingencies is Common Sense Crisis Management 101," said Kondo, while noting the secrecy decision was not his but politicians'.

"Implementing cost-effective measures was the proper response," he told The Associated Press at his office in a rare interview.

Nearly a year after the disaster, the probability of the nuclear crisis spiraling out of control was tiny, according to Kondo, a stately looking man with white hair and sharp eyes.

The only task left undone from his scenario is relatively minor [??]-- covering the pools of spent nuclear fuel rods sitting next to each reactor at Fukushima Dai-ichi, he said.

Spent fuel rods are still highly radioactive. Hydrogen explosions blew apart two of six containment buildings at Fukushima.

Kondo's scenario had warned the radiation equivalent of two reactor cores might leak if the spent fuel started to burn.

Now, the rods are immersed in water and are stable.

Kondo, a longtime advocate of atomic technology as clean energy, acknowledged the design of Fukushima Dai-ichi had been faulty.

It failed in crucial "venting," to release pressure and prevent explosions, spreading radiation into the environment in what Kondo likened to the 1986 Chernobyl disaster.

Kondo had erroneously expected problems at a Japan plant to be like the Three Mile Island accident, where radiation leakage was limited.

"That was our biggest mistake," he said.

Decades will now be needed before Fukushima Dai-ichi can be fully decommissioned.

Authorities evacuated 59,000 residents within 20 kilometers (12 miles) of the Fukushima plant. Thousands more left other towns later.

Kondo still has sleepless nights.

"I can't sleep when I think of all those people who had to evacuate, all those mothers worried for their children," he said.

update on government-TEPCO battle, Feb 15

Govt, TEPCO battle over management rights

<http://www.yomiuri.co.jp/dy/national/T120214005775.htm>

Takeo Miyazaki and Kunihiko Yasue / Yomiuri Shimbun Staff Writers

A fierce tug-of-war between the government and Tokyo Electric Power Co. over the utility's management is becoming more apparent as the government seeks a level of control over the company.

On Monday, Economy, Trade and Industry Minister Yukio Edano urged TEPCO President Toshio Nishizawa to concede the company's management rights to the government.

However, TEPCO has not changed its unyielding stance that the company should remain private, not government-run.

The fight between the government and TEPCO is making the prospects of solving important issues, such as rate hikes and management reform, unclear.

"I have no intention to approve injecting public funds [to TEPCO] while it does not give the government voting rights proportionate to the amount of money it provides," Edano said at Monday's talks with Nishizawa.

"The [finance] minister's stance is not something we can take lightly. However, to utilize the power of private enterprise is essential in the business world, and the electricity industry is no exception. We want to carefully discuss [management rights] before drawing a conclusion," Nishizawa said after the meeting. The government plans to obtain a certain amount of TEPCO shares after injecting about 1 trillion yen in public funds to the power company. The point of contention is the proportion of voting rights the government would acquire. Edano plans to obtain at least a majority of voting rights, and, if possible, intends to acquire two-thirds of voting rights. The minister is believed to have the aim of taking over TEPCO's management and taking the initiative in reforming it. In the end, this could pave the way for separating power generation from power transmission and distribution--all of which are presently handled by utilities.

However, TEPCO has resisted conceding unconditionally to Edano's requests.

TEPCO's bottom line is to maintain its status as a private enterprise with management independence. TEPCO is able to maintain a hard-line stance because the government does not have a unified opinion on the amount of voting rights it should have.

On Monday, Chief Cabinet Secretary Osamu Fujimura distanced himself from Edano's remarks on voting rights. "His remarks have not achieved consensus in the government," Fujimura said at a press conference Monday.

Observers say Edano's remarks reflect his irritation with TEPCO's unyielding stance. The economy minister tried to break the impasse by also taking a tough stand with the utility, the observers said.

===

TEPCO's electricity rate hike plan

One of the major reasons Edano hardened his attitude toward TEPCO is the company's plan to raise electricity rates without consulting the government.

In January, TEPCO announced it would seek an average 17 percent increase in electricity charges for corporate users without sufficiently explaining the plan to Edano.

Earlier, the power company had announced its intention to raise electricity charges for households, although the government had not yet decided its stance on the issue. The announcement created a stir in the government.

Earlier this month, the economy ministry asked power companies to revise their methods of calculating household electricity charges. The ministry asked the companies to lower the wage levels they used in calculating labor costs, which are significantly higher than wage levels of ordinary companies.

The current method for calculating the electricity rate for households is to first add up all costs--including labor and fuel costs--and then decide on an amount of profit to be added.

The ministry also asked power companies to exclude donations to industry organizations in calculating electricity rates.

The power companies' review on calculating rates for households is expected to end by summer. Nishizawa has suggested the power company would reduce the average 17 percent rise in electricity rates for large-lot users--factories and offices--after the summer. Observers said Nishizawa intends to secure a profit through the 17 percent increase, and then reduce rates.

However, TEPCO's plan provoked an angry backlash from the Tokyo metropolitan government, other local governments and private companies. Edano is demanding the utility reflect the company's revised cost calculations as soon as possible in deciding rates for corporate users.

"I would like to ask [TEPCO] to promise the review on calculating the cost will be reflected in charges for corporate users," Edano said Monday.

However, Nishizawa refrained from making a firm commitment to Edano. "There has been a lack of explanation to corporate users [on electricity rate hikes]. We'll improve the situation and explain the matter thoroughly," he said.

===

Reconstruction plan still vague

The utility plans to draw up its business reconstruction plan in March.

Edano has urged TEPCO to show the details of the "new" TEPCO in the reconstruction plan. However, details of the plan are still unclear.

According to sources, a proposal to introduce a committee governance structure to increase management transparency will be included in the plan. However, it is not clear how much Edano, who is demanding bolder steps from TEPCO, will see his intentions reflected in the reconstruction plan.

"I would like to ask [TEPCO] to recognize that the company is starting afresh, and to clearly show [in the reconstruction plan] that it will take bold steps in restructuring its business and changing company mentality," Edano said.

"We are now discussing a new style for our company, but there are ideas that need to be developed--we want to reveal the details in the reconstruction plan," Nishizawa said.

Takashi Shimada, director general of the Nuclear Damage Liability Fund, was not optimistic. "It is uncertain how much the government can do [to reform TEPCO] as a creditor and within the framework of the current electricity system," Shimada said.

Why the rush ?

February 21, 2012

Experts criticize Nuclear Safety Agency

http://www3.nhk.or.jp/daily/english/20120221_11.html

Japan's nuclear safety agency has been criticized by its own panel of experts for rushing to approve stress tests for halted nuclear reactors.

The Nuclear and Industrial Safety Agency last week gave its first nod of approval for the test results on 2 reactors at the Ohi nuclear plant in western Japan.

The agency reached the conclusion after cutting off debate by the panel of experts days earlier.

At the panel's meeting on Monday, Professor Emeritus Hiromitsu Ino of the University of Tokyo said

discussions hadn't been exhausted, and he feels deceived.

Masashi Goto, a lecturer at the Shibaura Institute of Technology, said the panel's job is to fully review plant safety to prevent another nuclear accident.

Goto said he cannot understand why the agency was rushing to reach a conclusion.

An agency official pointed out that the experts' panel had met 8 times since last November. He said the agency thought conditions were met to endorse the results at the Ohi nuclear plant.

Having a stress test approved is a key step for restarting the country's nuclear reactors. Most of them were halted for regular inspections after the March 11th disaster.

More "nuclear money"

February 23, 2012

Assembly member realtor's high rent for factory linked to promotion of nuclear power

<http://mdn.mainichi.jp/mdnnews/news/20120223p2a00m0na008000c.html>

TAKAHAMA, Fukui -- A town assembly member who runs a real estate company has received unusually high rent from a subsidiary of Kansai Electric Power Co. (KEPCO), apparently in return for promoting the utility's nuclear power plant in the town, it has been learned.

Tomio Yamamoto, 53, a member of the Takahama Town Assembly in Fukui Prefecture and president of OHC Fukui, a real estate company in the town, received over 100 million yen from a subsidiary of KEPCO for renting an unused factory over four years until fiscal 2010. The subsidiary firm used the factory as storage.

The town of Takahama is home to KEPCO's Takahama Nuclear Power Plant, which has four nuclear reactors.

According to the revelations, senior officials of the Takahama Municipal Government solicited KEPCO to make the property contract with OHC Fukui, in which the rent was set at almost twice the standard in the area, according to realtor sources.

In September last year, Yamamoto cooperated with the town assembly's proposal for an opinion statement seeking the reactivation of the nuclear power plant -- setting another example of local assembly members receiving "nuclear money" for promoting nuclear energy projects.

The opinion statement was proposed by Akio Awano, 62, vice speaker of the town assembly, and was endorsed by Yamamoto and two other town assembly members before it was submitted to the assembly. The proposal eventually passed the assembly in the wake of the Fukushima nuclear disaster in March last year.

According to the town hall and other insider sources, Yamamoto established a company to produce new material from used tires in 2004, for which he built a factory on the approximately 5,910-square-meter

land lot he purchased from the town for 88.65 million yen. However, the project failed and the factory became out of use.

Although it has not been clear how much money was paid in rent to the real estate company in fiscal 2007, 50 million yen was paid to the firm annually by the KEPCO subsidiary from fiscal 2008 to 2010, according to the sources.

Tokyo conference on Fukushima

February 24, 2012

Foreign nuclear experts discuss Fukushima

http://www3.nhk.or.jp/daily/english/20120224_36.html

Foreign nuclear experts are discussing the Fukushima nuclear accident at a conference in Tokyo.

The Japanese government panel investigating the disaster is sponsoring the 2-day conference as part of efforts to verify what happened.

The panel invited 5 experts from abroad, including the head of the French Safety Authority, Andre-Claude Lacoste, and Richard Meserve, a former chairman of the US Nuclear Regulatory Commission.

Most speakers said the operators are primarily responsible for dealing with nuclear plant accidents. But they added that in the case of Fukushima, it was unclear which roles the Japanese government and Tokyo Electricity Power Company were playing.

The experts noted the importance of truthful disclosure of information. They said the Japanese government should have frankly admitted to lacking certain knowledge. They also said that if the public trusts the government, no confusion will arise over information it supplies.

On Saturday, the 5 experts are due to discuss how the investigation into the Fukushima disaster should proceed.

The Japanese government panel in December issued an interim briefing on the Fukushima disaster. It will use the experts' opinions in drawing up a final report, which is expected to be issued by late July.

Call for greater transparency

U.S. frustrated at lack of information from Japan after disaster

<http://mdn.mainichi.jp/mdnnews/news/20120224p2g00m0dm024000c.html>

TOKYO (Kyodo) -- A U.S. official, who was sent to Japan shortly after last March's earthquake and tsunami as head of a Nuclear Regulatory Commission team to see what was happening with the nuclear disaster, recently recalled the frustration the U.S. side felt over the lack of information from Japan in the early days of the crisis.

Nuclear regulator Charles Casto told Kyodo News in a telephone interview from Atlanta this week that the Japanese government did not accept the United States' offer to permanently station nuclear experts at the prime minister's office and indicated that it was 10 days after the March 11 disaster that communication between the two countries became smooth.

Casto also said the NRC had predicted that a radioactive plume from the crippled Fukushima Daiichi nuclear power plant could reach as far as 38 kilometers northwest of the plant in Fukushima Prefecture. Based on the estimate as well as opinions in the U.S. military, which had been concerned over the slight rise in radiation levels at the U.S. Navy's Yokosuka base in Kanagawa Prefecture, he said the U.S. government issued an advisory for nationals to evacuate from areas within 80 km of the plant -- roughly double the projected figure.

Casto, who arrived in Japan days after the disaster, said one of the first issues his team had to handle was evacuating U.S. citizens and "ensuring immediate action to get water on the spent fuel pools and the reactors."

But the team's efforts hit a snag as Japan rejected a proposal made on March 14 by U.S. Ambassador to Japan John Roos to then Chief Cabinet Secretary Yukio Edano to place a member of the U.S. team at the prime minister's office.

Casto said the purpose of the U.S. request was to be able to "get information...to protect American citizens" without "overly burdening" Japanese officials, as the U.S. team member would be able to see the information directly and report back to the ambassador.

Following Japan's rejection, Casto said he dispatched his team's members to such entities as the Nuclear and Industrial Safety Agency -- Japan's nuclear regulator under the Economy, Trade and Industry Ministry -- the Defense Ministry and Tokyo Electric Power Co., operator of the Fukushima plant, to gather information.

The first meeting between Japanese and U.S. officials took place on March 16 under the lead of the Defense Ministry, but confusion continued because the ministry did not have enough of the information the United States was seeking, he said.

Finally, a meeting involving experts and officials in charge from the two countries was held on the night of March 21 at the proposal of Goshi Hosono, who was a special adviser to then Prime Minister Naoto Kan, and it was followed by regular communication between the two sides.

"Frustration was built from the 16th to the 20th, of lack of information, confusing stories," recalled Casto, who was the U.S. team's head until he left Japan on Feb. 2 and visited the Fukushima Daiichi plant six times during the 10-and-a-half-month period.

"It's an honor," Casto said of his mission in Japan, emphasizing that it is important that the United States and Japan work together to overcome the unprecedented nuclear disaster. "I love Japan. I love the people. It feels like it's my second home now," he added.

Casto's current formal title is deputy regional administrator for construction in Region 2, based in Atlanta. He will move to the NRC's Chicago office soon.

Get rid of them all

February 25, 2012

Gov't to demand resignation of entire TEPCO board

<http://mdn.mainichi.jp/mdnnews/news/20120225p2a00m0na011000c.html>

The government is set to demand that all 17 board members of Tokyo Electric Power Co. (TEPCO), operator of the crippled Fukushima nuclear plant, resign at the utility's next shareholder meeting in June, government sources said.

In return for the planned infusion of about 1 trillion yen in public funds, officials have deemed it necessary to replace all TEPCO's board members to clarify their responsibility for the nuclear crisis.

The plan will be incorporated into a comprehensive business plan that the government-backed Nuclear Damage Liability Facilitation Fund (NDF) and TEPCO will work out in March.

The government will force TEPCO Chairman Tsunehisa Katsumata, who has announced his intention to step down, to give up his retirement allowance, and halve the number of the utility's board members.

The government intends to appoint an outsider such as a private company president to replace Katsumata.

Many government and NDF officials are calling for the appointment of younger TEPCO employees to the board, citing the need for a smooth handover of the handling of nuclear crisis compensation. NDF and other relevant bodies are selecting deputy general managers and department managers at the TEPCO headquarters as well as branch managers to fill positions on the board excluding chairman.

Economy, Trade and Industry Minister Yukio Edano has apparently deemed it necessary for not only the TEPCO president and chairman but the entire board to step down to avoid giving the public the impression that the infusion of public funds is aimed solely at bailing out the utility, according to government sources.

Restore public confidence ?

February 26, 2012

Foreign nuclear experts advise on Fukushima

http://www3.nhk.or.jp/daily/english/20120226_02.html

Foreign experts have told a Japanese government panel that its final report on the Fukushima nuclear accident should include lessons learned and proposals for ensuring safety.

Five foreign nuclear experts gave their opinions at the conclusion of the 2-day conference in Tokyo on Saturday. The meeting was sponsored by a Japanese panel of experts in various fields, charged with investigating the accident at the Fukushima Daiichi plant last March.

The head of the French nuclear safety authority, Andre-Claude Lacoste, said the final report should be more than a list of facts and include lessons and proposals.

Former chairman of the US Nuclear Regulatory Commission Richard Meserve said the accident led to a loss of public trust in the government and power companies. He said they must ensure openness in their activities in order to restore confidence.

The foreign experts also proposed that the Japanese government panel should try to identify the current status of the crippled reactors through computer simulations, in order to ease public fears.

After the conference, the head of the panel, Yotaro Hatamura, said the experts noted **it is most important to prepare for accidents based on the idea that what is improbable is possible**. He said Japan had lacked this idea.

Hatamura said the panel will compile their final report by late July, taking the foreign experts' opinions into account.

Report on the handling of the disaster

February 28, 2012

Report takes former PM Kan to task over Fukushima nuke disaster handling

<http://mdn.mainichi.jp/mdnnews/news/20120228p2a00m0na016000c.html>

The office of former Prime Minister Naoto Kan came in for scathing criticism in a Feb. 27 report on the handling of the Fukushima nuclear crisis' opening days, with the document accusing the PM's office of "grandstanding" and causing "useless confusion."

The report, put together by the private Fukushima nuclear disaster independent investigative committee, concludes that the Prime Minister's Office's first response to the meltdowns at the Fukushima No. 1 nuclear plant "increased the risk of worsening the situation through stress and useless confusion." Furthermore, "grandstanding led to badly muddled crisis management measures" which did little or nothing to help prevent a worsening of the disaster. The report also rebuked the highest levels of government for meddling in emergency response measures.

The investigative committee, which began its work in September last year, is made up of six scientists and legal experts. Fukushima No. 1 plant operator Tokyo Electric Power Co. (TEPCO) refused to cooperate with the committee's inquiries.

One focus of the report is the Prime Minister's Office's dispatch of electricity trucks to the No. 1 plant when it lost all power in the March 11, 2011 tsunami, knocking out the reactors' cooling systems. When the trucks arrived, there were no electrical cords to hook them up to the plant.

"That's the point at which we (the government) began to distrust TEPCO," then Cabinet Secretary Yukio Edano (now economy, trade and industry minister) is quoted as saying in the report. However, the

investigators concluded that government distrust of TEPCO was a factor behind the direct intervention of the PM's Office.

The report also stated that "Orders by the Prime Minister's Office and industry ministry that gas building up in the reactor vessels be vented right away (to reduce pressure) were not at all helpful," citing the loss of power at the plant and the fact that TEPCO was waiting for local residents to be evacuated.

The report also takes Kan to task over the injection of sea water into the No. 1 reactor, stating that he confused the situation and risked making it far worse when, at a meeting at around 6 p.m. on March 12, he "vehemently" expressed worries that the injection would cause the reactor to go critical again and ordered a reappraisal of the planned operation. Fukushima No. 1 plant chief Masao Yoshida, however, began injecting sea water at 7:04 p.m., and ignored orders from both the Prime Minister's Office and TEPCO's Tokyo headquarters to stop.

"Had Yoshida obeyed the order from the Prime Minister's Office, there was a real danger that the operation would have been started too late," the report states. However, it furthermore concludes that the fact Yoshida took action in direct opposition to government and TEPCO orders was "a very serious risk in terms of crisis management."

The report is not entirely damning of Kan's actions, however, stating that his refusal on March 15 to allow TEPCO to abandon the nuclear plant "in the end compelled TEPCO to remain steadfast" as the crisis unfolded.

On the other hand, the report also states that Kan was aware he was making Nuclear Safety Commission of Japan Chairman Haruki Madarame and his Cabinet ministers uncertain about any objections they had to his decisions with his strong, top-down command style and insistence on his own opinions.

Furthermore, as leader, Kan's "self-assertion was a positive in that he could judge the situation and implement countermeasures, but was a negative in that it became a form of psychological control of others involved and caused a withering of their roles in the crisis.

Panel denounces govt. handling of disaster

http://www3.nhk.or.jp/daily/english/20120228_32.html

An independent panel investigating the accident at the Fukushima Daiichi nuclear plant has criticized the government's responses as ad-hoc, stopgap measures.

A report issued by the panel on Tuesday says then prime minister Naoto Kan and several other lawmakers told the panel that they had no understanding of the nuclear disaster manuals. They said they had received no explanations of the manuals from ministry officials at an early stage of the accident.

The report says Kan first received explanations of the manuals from officials 4 days after the accident, when a joint task force of the government and Tokyo Electric Power Company was set up.

The panel says that just after the accident occurred, staff members at the prime minister's office were busy looking up in books the basics of legislation on nuclear disasters.

Tetsuro Fukuyama was the deputy chief Cabinet secretary at that time. He reportedly said he received no explanations of disaster-related matters from officials during the six months from assuming the post.

Fukuyama told the panel that he was hardly even aware of the functions of the Nuclear and Industrial Safety Agency. He said that it was a grave mistake on his part to believe that officials would pass on information soon after they confirmed the situation.

Although receiving little information from the plant operator and the nuclear agency, Kan and other ministers started to be involved in decision-making on the accident. The issues included whether to vent gas from the reactor containment vessels, and to pump sea water to cool the reactors. Manuals say plant operators are responsible for making such decisions.

One of the lawmakers working at the prime minister's office at that time said politicians were only focusing on short-term measures and problems immediately facing them.

The report says Cabinet ministers were busy making off-the-cuff measures without basic awareness of the disaster while receiving poor support from officials.

It recommends that the government review its disaster manuals and the system to seek advice from officials.

well...

February 28, 2012

Edano advised Kan not to visit Fukushima

http://www3.nhk.or.jp/daily/english/20120228_31.html

The morning after last year's March 11th Fukushima nuclear disaster, then Prime Minister Naoto Kan flew to the disaster site by helicopter, although his spokesman advised him not to do so, warning of criticism from the opposition.

A report issued on Tuesday by an investigating panel cites vivid accounts of Kan and others at the prime minister's official residence in the first days of the disaster.

Early on March 12th, Prime Minister Kan took a helicopter ride to personally visit the Fukushima Daiichi nuclear plant. He was frustrated that the plant operator, Tokyo Electric Power Company, had not started a venting operation to ease pressure inside the pressure vessel of Reactor Number One.

Chief Cabinet Secretary Edano tried to talk Kan out of the visit. He said that with such a visit the prime minister would be definitely criticized politically. Then, Kan said to Edano, "Which is more important, facing political criticism, or being able to put a reactor under control?" Edano replied, "If you understand, then please go ahead."

The report also cites a conversation between Prime Minister Kan and Nuclear Safety Commission Chairman Haruki Madarame over a hydrogen explosion that occurred at Reactor Number One shortly after 3:30 PM on March 11th.

Kan asked Chairman Madarame to explain why this happened even though he had told Kan that an explosion would never occur. Madarame simply moaned, burying his head in his hands.

The panel's report quotes Madarame as saying that when he saw the image of the explosion on TV, he immediately knew it was a hydrogen explosion. He said he was stunned and speechless because he had told Kan that morning that there would be no hydrogen explosion.

Later at a quarter to 6 that evening, Chief Cabinet Secretary Edano held a news conference and with no sufficient information available about what had happened, only acknowledged that some sort of explosion had occurred. Edano recalled that it was the most difficult news conference he had ever held.

Before dawn on March 15th, nuclear fuel became exposed and the danger of an explosion was pointed out. TEPCO made an inquiry to the prime minister's official residence, which sounded like a wish to withdraw its personnel from the disaster site.

At around 3:30 AM, Prime Minister Kan and key cabinet ministers met to assess the situation. Kan said that if TEPCO abandoned its job of pumping water into the reactor and if radioactive substances kept spreading into the atmosphere, then the whole of eastern Japan could be in serious trouble.

With that remark by the Prime Minister, the cabinet meeting decided to put his advisor, Goshi Hosono, on standby at TEPCO headquarters.

In defense of TEPCO

February 29, 2012

Business Federation chief criticizes gov't over response to nuclear crisis

<http://mdn.mainichi.jp/mdnnews/news/20120229p2a00m0na009000c.html>

Hiromasa Yonekura, head of the Japan Business Federation (Nippon Keidanren), has criticized the government for its response to the crisis at the tsunami-hit Fukushima No. 1 Nuclear Power Plant. "The accident was caused not by problems involving the management of Tokyo Electric Power Co. (TEPCO) but by the massive natural disasters. In particular, I think the government's response was very wrong," Yonekura told a news conference on Feb. 27.

"Nuclear and Industrial Safety Agency (NISA) workers stationed near the plant escaped shortly after the accident. However, TEPCO workers did their best to bring the crisis under control without fleeing," he said. "The government should apologize saying, 'We're sorry about NISA workers fleeing the scene.'" Yonekura referred to the fact that NISA inspectors stationed near the power plant evacuated to an off-site center on March 12, immediately after the crisis broke out.

The government's fact-finding panel on the nuclear crisis stated in its interim report in December that questions remain as to whether the inspectors' decision to evacuate at the time was appropriate.

Yonekura also expressed his understanding of TEPCO's plan to raise electricity rates for corporate customers. "TEPCO is required to import extra crude oil because it can't operate its nuclear plants, costing itself trillions of yen. Electric power companies would go bankrupt if they were told not to raise their rates under these circumstances."

His remarks, which can be interpreted as defending TEPCO from criticism, could stir controversy.

No comment

Mayor of nuclear reactor city used taxpayers' money on gifts for nuclear disaster minister

<http://mdn.mainichi.jp/mdnnews/news/20120229p2a00m0na011000c.html>

TSURUGA, Fukui -- The mayor of this city, home to three nuclear reactors, gave year-end gifts to nuclear disaster minister Goshi Hosono and other legislators using taxpayers' money, it has been learned.

Tsuruga Mayor Kazuharu Kawase, 60, used his mayor's entertainment expenses to purchase and give assortments of Echizen snow crab worth 10,000 yen each to 11 Diet members of both the ruling and opposition parties as year-end gifts between November and December last year. Echizen crabs are a local specialty of Fukui Prefecture.

Kawase is known to have repeatedly advocated the necessity of the prototype fast-breeder reactor Monju in the city and of building additional nuclear power plants. He also chairs the All Japan Council of Local Governments with Atomic Power Stations.

According to the bill of the mayor's entertainment expenses, Mayor Kawase purchased a total of 180,000 yen worth of Echizen crab assortments as gift items for 18 people, including 11 Diet members.

Aside from Hosono, the recipients of the gifts included then Science Minister Masaharu Nakagawa, who was in charge of the Monju reactor at the time; Seiji Maehara, policy chief of the ruling Democratic Party of Japan; and Sadakazu Tanigaki, president of the largest opposition Liberal Democratic Party.

Mayor Kawase reportedly handed the crab assortments to the lawmakers when he visited them at the Diet Members' Office Building and other facilities while he was on an official trip to Tokyo for meetings and to lodge petitions.

According to the bills of the mayor's entertainment expenses over the past five years, Kawase has sent Echizen crabs to several Diet members and the mayor of Mito -- a sister city of Tsuruga -- almost every year since fiscal 2007.

Can lessons be learned from Fukushima ?

March 1, 2012

Editorial: Independent nuke disaster panel must scrutinize gov't crisis management

<http://mdn.mainichi.jp/perspectives/news/20120301p2a00m0na002000c.html>

An independent fact-finding panel on the ongoing Fukushima nuclear crisis, which has published a report on its investigation into the accident, is urged to thoroughly scrutinize the government's crisis-management system.

The independent panel has interviewed those involved from a standpoint different from those of the government's fact-finding panel and the Diet's investigative committee that is also investigating the crisis. What is notable is that the independent panel incorporated its interviews with Cabinet ministers concerned in its report and has concluded that there were serious problems with the crisis-management system of the Prime Minister's Office.

The crisis-management system to respond to not only nuclear accidents but also all kinds of serious disasters is a key issue in Japan's national policy. Nevertheless, an interim report worked out by the government's investigative panel at the end of last year postponed specific scrutiny of the crisis-management system of the Prime Minister's Office even though it briefly touched on the matter.

The government's panel is urged to interview Cabinet ministers concerned and take other steps to thoroughly scrutinize the crisis-management system before it compiles a final report. The Diet's panel on the nuclear accident, which is to be legally given broad power including authority to summon witnesses to testify under oath, should also clarify problems involving the government's crisis management from an independent standpoint.

The independent panel touched on the qualities of Naoto Kan, who was prime minister when the nuclear crisis broke out in March 2011. However, it would be wrong if problems involving the government's response to the crisis were attributed to an individual's character. The government would unlikely have managed the nuclear crisis in an appropriate manner if anybody else had been prime minister. Rather, the government's response to the nuclear crisis should be **thoroughly scrutinized from the aspects of both its system and how it was implemented so that lessons learned from the response can be put to good use for the future.**

For example, the finding that then Prime Minister Kan gave an instruction to procure batteries on his mobile phone came as a surprise, but he was forced to do so because the government's Nuclear and Industrial Safety Agency and Nuclear Safety Commission of Japan lacked the ability to deal with the situation and were useless. Lessons learned from the finding should be put to good use for a new nuclear energy regulatory body. The new regulatory body will be set up based on reflections on the fact that mutual distrust between the Prime Minister's Office and other administrative bodies adversely affected the government's response to the nuclear crisis.

Mobile phones cannot be used at the crisis-management center on the basement of the Prime Minister's Office for security reasons. However, considering the urgent need to gather information at the time of serious disasters, such technical challenges need to be addressed.

The Prime Minister's Office is not solely responsible for the management of the nuclear crisis. It is necessary to scrutinize whether Tokyo Electric Power Co. (TEPCO), the operator of the tsunami-hit Fukushima No. 1 Nuclear Power Plant, responded to the crisis in an appropriate manner. Additionally, the

chain of command between the central government's nerve center and officials at disaster scenes needs to be reviewed.

TEPCO headquarters instructed the Fukushima power station to discontinue injecting sea water into the No. 1 reactor in an effort to cool down its core, but the manager of the plant continued to do so in defiance of the order. The independent fact-finding panel underscores the importance of lower-ranking organizations following instructions from higher-ranking bodies. However, it is better to clarify what lower-ranking bodies can do at their own discretion and leave that to them.

What is of urgent necessity now is to speedily create a new crisis-management system based on lessons learned from thoroughly scrutinizing the response to the Fukushima nuclear crisis. It is also indispensable to secure and develop human resources.

Light was shed on problems involving the government's crisis management system when the Great Hanshin Earthquake devastated Kobe and surrounding areas in January 1995. If the government's crisis-management system is left as it is now, we fear we may have to point out the same problems again in five or 10 years' time.

TEPCO's forecast

March 3, 2012

TEPCO eyes 3-year hike limit / Believes charges could be lowered upon restarting of reactors

<http://www.yomiuri.co.jp/dy/national/T120302004881.htm>

The Yomiuri Shimbun

Tokyo Electric Power Co., which has announced it will raise its electricity prices later this year, plans to bring them back to current levels in 2015 and reduce them further in 2018, it has been learned.

The three-year limit on the envisaged price hikes is based on the assumption that TEPCO can improve its earnings by restarting its reactors at the Kashiwazaki-Kariwa nuclear power plant in Niigata Prefecture in 2013.

TEPCO, the operator of the crippled Fukushima No. 1 nuclear power plant, is set to include this scenario in a comprehensive special business plan it will compile this month with the government's Nuclear Damage Liability Facilitation Fund, according to sources.

The utility has said it will raise electricity charges for large-lot users by an average of 17 percent starting in April, and by about 10 percent for households starting in July.

The hikes are meant to cover growing fuel costs resulting from increased thermal power generation because operations at TEPCO nuclear power plants have been suspended.

Prior to drafting the special business plan, TEPCO has compiled its projected cash flow over the next decade, which shows the utility's fuel costs will increase to 2.8 trillion yen in the business year ending in March 2013.

However, the costs would fall to 1.9 trillion yen in the business year ending in March 2017 if the company could steadily resume operations of its nuclear reactors at the Kashiwazaki-Kariwa plant.

Therefore, TEPCO believes it will be possible to gradually lower its fees from three years after the hikes, the sources said.

Meanwhile, the utility will reduce its personnel expenses by about 15 percent to 320 billion yen in the business year ending in March 2022 from the current 380 billion yen in an attempt to gain public understanding for the hikes, according to the sources.

TEPCO is expected to incur an after-tax loss of about 710 billion yen on an unconsolidated basis for the current business year ending March 31.

However, the utility hopes to start repaying public funds it will receive to cover compensation for those affected by the nuclear crisis from the business year up to March 2014, according to the sources. TEPCO expects its balance of payments to improve at that time, mainly due to lower fuel costs after it resumes operations at the Kashiwazaki-Kariwa plant, they said.

The utility hopes to repay 75 billion yen to 270 billion yen annually over a nine-year period, the sources added.

Public funds will be injected via the Nuclear Damage Liability Facilitation Fund in the form of government compensation bonds, which can be cashed like checks when necessary.

The bonds provided to the organization will be worth 5 trillion yen, of which about 1.6 trillion yen in cash will be initially paid to TEPCO, according to the sources.

The utility will squeeze out funds to repay the public money from its profits every year under the name of "special contributions," the sources said.

Defiant Nuclear Safety Commission chief says he will quit post

<http://mdn.mainichi.jp/mdnnews/news/20120302p2a00m0na002000c.html>

Nuclear Safety Commission (NSC) Chairman Haruki Madarame has said he will definitely step down as NSC chief once a new nuclear regulatory agency is established in April.

Madarame made the comment during testimony before the House of Representatives Budget Committee on March 1 after lower house member Hiroshi Kajiyama of the largest opposition Liberal Democratic Party (LDP) demanded his resignation. Kajiyama had assailed Madarame for suggesting that it is inappropriate for Japan to issue evacuation orders based on System for Prediction of Environmental Emergency Dose Information (SPEEDI) data. SPEEDI predicts how radioactive substances will spread.

Kajiyama called Madarame "irresponsible" and asked him, "Why don't you resign?"

Madarame responded by saying, "When April comes, there will be a new organization (Nuclear Regulatory Agency) and the NSC itself will be disbanded. I will naturally step down." He went on to say that there is no country in the world that plans evacuations based on systems like SPEEDI.

The NSC gives advice to the government and nuclear power plant operators in case of nuclear accidents, and confirms the adequacy of stress tests before restarts of idled nuclear reactors.

Prime Minister Yoshihiko Noda told the parliamentary committee, "We don't know what's going to happen before the formation of the new organization. We want the NSC to remain vigilant and prepare (for any contingency)."

An investigation initiated by the Diet concluded in February that Madarame's actions in the early days of the nuclear crisis at the Fukushima No. 1 nuclear plant were inadequate, along with the actions of Nobuaki Terasaka, the then director of the government's Nuclear and Industrial Safety Agency.

Ministry leaders decided to hold nuclear data after Fukushima crisis

<http://mdn.mainichi.jp/mdnnews/news/20120303p2g00m0dm020000c.html>

TOKYO (Kyodo) -- The science minister and other top ministry officials decided to withhold radiation forecast data from the public four days after the March 11 earthquake and tsunami triggered a nuclear crisis at the Fukushima Daiichi power plant, an internal document made available Friday showed.

Then Education, Culture, Sports, Science and Technology Minister Yoshiaki Takaki, lawmakers serving as top ministry officials and top bureaucrats made the decision on March 15 to withhold data about the predicted spread of radioactivity, which included an assumption that all radioactive material would be discharged from the crippled plant.

Prediction of the spread of radioactive substances, compiled from the System for Prediction of Environmental Emergency Dose Information, "could be by no means released to the public," the document dated March 19 showed.

On Friday, a ministry official said top ministry officials had made no decision on releasing the data, noting that contents in the document, a memorandum prepared by ministry officials, were inaccurate.

The document stated that radioactive clouds could spread from the crippled nuclear power plant to the Kanto and Tohoku regions, indicating that the ministry had made various estimates about the spread of released radioactive substances, including the worst-case scenario.

The minister and the other top officials concluded that estimated data from SPEEDI should not be released and more general data should be prepared for release.

Kan Suzuki, then vice science minister, told Kyodo News that there had been no assuming the discharge of all radioactive substances, adding release of such an estimate could have panicked the public.

When shareholders sue TEPCO

March 5, 2012

TEPCO managers sued for 5.5 tril. yen

http://www3.nhk.or.jp/daily/english/20120305_27.html

A group of shareholders in Tokyo Electric Power Company has sued former and current executives of the utility, seeking 5.5 trillion yen, or nearly 68 billion dollars, in damages over the Fukushima nuclear crisis.

The group of 42 individual shareholders filed the lawsuit at the Tokyo District Court on Monday against 27 people who have held senior executive posts at TEPCO since 2002.

That was the year a government panel warned that a major earthquake could strike the area in which the Fukushima Daiichi nuclear power plant is located.

The shareholders argue that the utility failed to heed the warning and took no measures to protect the plant from tsunami and earthquakes.

The shareholders say they calculated the amount of the damages based on a report by a third-party panel that looked into the utility's management since the accident.

They are asking the firm to use the winnings to compensate those affected by the accident.

A lawyer for the group says Japan's corporate culture will not change unless individual senior executives are held accountable for problems.

He also says the shareholders want to correct what they call a system of collective irresponsibility in the nuclear-power industry.

Tokyo Electric has declined to comment. The utility is projected to post a net loss of 8.6 billion dollars for the business year through March.

Over 300 financial firms provide credit to nuclear arms firms: NGO

<http://mdn.mainichi.jp/mdnnews/news/20120305p2g00m0dm027000c.html>

SYDNEY (Kyodo) -- A total of 322 financial institutions in 30 countries, including Japan, have provided credit to Boeing Co. and 19 other companies in six countries that are involved in the development and manufacturing of nuclear weapons, a nongovernmental organization report showed Monday.

The Australia-based International Campaign to Abolish Nuclear Weapons said in the report that those financial institutions provided credit totaling about \$48.7 billion, or about 4 trillion yen, since 2008.

The NGO urged the financial institutions named in the report to stop doing such business because they are aiding the continued existence of nuclear weapons.

"By lending money to nuclear weapons companies and purchasing their shares and bonds, banks and other financial institutions are indirectly facilitating the build-up and modernization of nuclear forces," the report said.

Japanese financial institutions named in the report -- Mitsubishi UFJ Financial Group Inc., Mizuho Financial Group Inc. and Sumitomo Mitsui Financial Group Inc. -- have provided a total of about \$3.53 billion, or about 289 billion yen, in credit to the so-called nuclear weapons companies, according to the NGO.

Nomura Holdings Inc. and Daiwa Securities Group Inc. have also been involved in bond sales for some of the 20 companies listed in the report as involved in developing and manufacturing nuclear weapons.

"We can't comment on our businesses with specific companies," said an official of Mitsubishi UFJ, which the report accuses of being "among the banks and other financial institutions most heavily involved."

Two Dutch financial institutions, PGGM and Rabobank Group, have an internal policy of not providing finance to armament-related companies, the report says, adding that neither has been involved in financing any of the 20 companies since July 2008.

Mizuho Corporate Bank Ltd., one of Mizuho's main banks, apparently has an internal policy of not providing loans aimed at the manufacturing of nuclear weapons.

An official of Daiwa Securities Group said the company wants to consider how it can incorporate into its business "the viewpoint of eradicating nuclear weapons."

The 20 companies that are named in the report as those involved in the development and manufacturing of nuclear weapons include BAE Systems plc, Rolls-Royce Holdings plc and European Aeronautic Defence and Space Co.

More dubious practices?

March 6, 2012

Shenanigans at TEPCO subsidiary led to higher electricity rates: investigation

<http://mdn.mainichi.jp/mdnnews/news/20120306p2a00m0na006000c.html>

Tokyo Electric Power Co. (TEPCO) raised electricity rates after one of its subsidiaries offloaded an assignment from the utility -- and its projected profits -- onto a third-party firm, a Tokyo Metropolitan Government investigation has revealed.

The subsidiary was tasked with operating a high-class restaurant for TEPCO employees, and apparently forked the whole business over to an unrelated company, according to the results of the investigation released on March 5.

"TEPCO has been conducting similar transactions with other subsidiaries systematically and added the extra costs to electricity rates," Tokyo Vice Gov. Naoki Inose stated as the results were unveiled. The

Tokyo government furthermore plans to ask Economy, Trade and Industry Minister Yukio Edano to investigate dubious business practices at TEPCO subsidiaries.

According to the Tokyo Metropolitan Government, the TEPCO subsidiary in question is Tokyo Living Service Co., which has been running welfare-related business for TEPCO staff such as dormitories for single employees, travel firms, nursing-care facilities and nursery schools. The company, which has 1,000 employees, posted about 14 billion yen in sales for the 2010 business year.

"It is a source of employment for retired TEPCO employees, and 70 percent of its business comes from TEPCO," said a source close to the utility.

The restaurant TEPCO commissioned Tokyo Living to operate is the "Shibuya Toyu Club" -- a high-class restaurant open exclusively to TEPCO employees. But Tokyo Living is, in fact, believed to have left a third company run the restaurant, only taking a cut of the profits.

The Tokyo Metropolitan Government suspects that, as a result of the utility allowing Tokyo Living to make such deals, revenue TEPCO was supposed to get from the restaurant dropped substantially.

TEPCO scrapped the restaurant contract with Tokyo Living in May 2011, and the Shibuya Toyu Club is now operated by a different firm. TEPCO's public relations department has acknowledged such business practices at TEPCO and its subsidiary, adding, "We are planning to sell Tokyo Living. We will continue to review the ways in which transactions are made."

In related news, a government panel investigating management practices at the troubled utility has said in its own report that companies affiliated with TEPCO (including its subsidiaries) are profiting from deals with the firm.

[Click here for the original Japanese story](#)

TEPCO told to streamline March 7, 2012

Industry minister to tell TEPCO to cut 'free' contracts with affiliated firms by 30 percent

<http://mdn.mainichi.jp/mdnnews/news/20120307p2a00m0na012000c.html>

Economy, Trade and Industry Minister Yukio Edano said on March 6 that he would urge Tokyo Electric Power Co. (TEPCO) to cut the amount of its "free" contracts with its affiliated firms and subsidiaries by 30 percent within three years.

The same instruction will be given to the government's Nuclear Damage Liability Facilitation Fund. Edano made the decision at a time when critics say "free" contracts with its group firms have pushed up TEPCO's costs, resulting in higher electricity rates.

At the meeting on March 6 of the government's "Task Force on the Reform of Electric Power Systems," Tokyo Vice Gov. Naoki Inose said that if TEPCO were to increase public tenders and reduce the unit amount of each contract, "of its annual free contracts totaling 172 billion yen, it will be able to cut 50 billion yen a year and 150 billion yen for three years." He then said, "It should use the reduced amount to curb an attempt to raise electricity rates." In his response, Edano said, "I want to instruct them to further streamline their operations with the target of reducing 30 percent within three years."

A Tokyo Metropolitan Government investigation has revealed that one of TEPCO's subsidiaries, tasked with operating a high-class restaurant for TEPCO employees, forked the whole business over to an unrelated company, resulting in the TEPCO unit making more profits than it should. TEPCO has paid costs higher than necessary to its subsidiaries, and the extra costs have been added to electricity rates.

After the task force meeting, Inose told reporters that a total of 155 retired TEPCO employees are working at 118 TEPCO group firms as board members. If TEPCO employees on loan to those subsidiaries and TEPCO directors-cum non-executive directors at those subsidiaries are included, the number increases to 486. The average annual salary for executive directors, excluding those on loan, is 10.85 million yen each, and there are even TEPCO group firms with most of their board members being retired TEPCO employees.

Inose said, "The structure in which the bills (for overvalued costs) are sent to users is not a problem with TEPCO alone. It is a problem with all utility companies."

So they knew...

March 10, 2012

Govt knew N-meltdown was probable / Summaries show concerns arose

Mar. 11

The Yomiuri Shimbun

<http://www.yomiuri.co.jp/dy/national/T120309007035.htm>

The government's Nuclear Emergency Response Headquarters was aware that the Fukushima No. 1 nuclear power plant would likely suffer a meltdown just hours after the nuclear crisis began, according to internal meeting summaries released Friday.

It is the first time that the summaries of the meetings, chaired by then Prime Minister Naoto Kan and attended by other ministers concerned as members, have been made available.

The summaries suggest how confused the government became due to a lack of information--for example, some members objected to the government's gradual expansion of the evacuation area.

Now that the records have been released, how top government officials reacted to the meltdown may be brought into question, observers said.

The 76 pages of summaries were compiled based on notes left by the Economy, Trade and Industry Ministry's Nuclear and Industrial Safety Agency and other involved parties. They cover the headquarter's 23 meetings held from the night of the disaster to Dec. 26.

At the first meeting, which started after 7 p.m. on March 11, members of the headquarters were briefed that the plant had activated emergency cooling systems--which run mainly on batteries--after losing all of its power, the summaries said.

"After [the batteries run out in] eight hours, temperatures at the reactor cores will increase and the reactors will likely suffer a meltdown," an unknown speaker was quoted as saying in the summaries.

At the headquarters' third meeting starting on the afternoon of March 12, Koichiro Gemba, who served as state minister in charge of national policy at that time, once again referred to the possibility of a meltdown.

"Is it enough to designate a 10-kilometer radius [around the crippled nuclear plant] as the evacuation area? Shouldn't we reconsider?" Gemba was quoted as saying.

At that time, the government had not officially referred to the possibility of a meltdown at the nuclear power plant. The evacuation area was expanded to 10 kilometers that morning from an initial three kilometers.

The area was further widened to 20 kilometers after the plant's No. 1 reactor was hit by a hydrogen explosion that occurred three hours after the third meeting.

At a meeting held after 10 p.m. the same day, Kan referred to the 1986 Chernobyl disaster and the 1979 Three Mile Island crisis in the United States.

"Could a Chernobyl-type [meltdown] occur? Or a meltdown similar to the one at Three Mile Island?" the summaries quote him as saying.

However, no responses were recorded in the summaries.

At a meeting on March 14, Kan described a 20-kilometer radius as being "sufficient" for the evacuation zone, but Gemba questioned this, saying, "Some experts have different opinions," according to the summaries.

The records also show heated discussions were held over releasing steam containing radioactive substances from the plant's reactors into the atmosphere.

They also show there was extreme confusion when the plant's Nos. 3 and 4 reactors were hit by hydrogen explosions.

(Mar. 10, 2012)

Records show Japan gov't knew meltdown risk early

<http://mdn.mainichi.jp/mdnnews/news/20120310p2g00m0dm103000c.html>

TOKYO (AP) -- Just four hours after a tsunami swept into the Fukushima nuclear power plant, Japan's leaders knew the damage was so severe that the reactors could melt down, but they kept their knowledge secret for months. Five days into the crisis, then-Prime Minister Naoto Kan voiced his fears that it could turn worse than Chernobyl.

The revelations were in documents released Friday, almost a year after the disaster. The minutes of the government's crisis management meetings from March 11 -- the day the earthquake and tsunami struck -- until late December were not recorded and had to be reconstructed retroactively.

They illustrate the confusion, lack of information, delayed response and miscommunication among government, affected towns and plant officials, as some ministers expressed the sense that nobody was in charge when the plant conditions quickly deteriorated.

The minutes quoted an unidentified official explaining that cooling functions of the reactors were kept running only by batteries that would last just eight hours.

"If temperatures in the reactor cores keep rising beyond eight hours, there is a possibility of meltdown," the official said during the first meeting, which started about four hours after the magnitude-9.0 earthquake and ensuing tsunami hit the Fukushima Dai-ichi (No. 1) plant, setting off the crisis.

Apparently the government tried to play down the severity of the damage. A spokesman for the Nuclear and Industrial Safety Agency was replaced after he slipped out a possibility of meltdown during a news conference March 12.

The plant operator, Tokyo Electric Power Co., acknowledged a partial meltdown much later, in May.

Top government spokesman Yukio Edano, who is now trade minister, urged other ministers to watch what they said to the public.

"We must provide information fast, but it must be accurate," Edano said on March 14. "We must be clear about all our evaluations and judgment, and announce them only after we reach a decision."

While then-trade minister Banri Kaieda suggested on March 11 that residents within a 10-kilometer radius might have to be evacuated, the government ordered 1,800-plus residents within a 2-kilometer zone to leave. Then that expanded to 3 kilometers, then to 10 kilometers within two hours, and finally to 20 kilometers the next day.

Kan said a 20-kilometer zone would suffice. After seeing a series of explosions and fires at reactor buildings, Kan on March 16 cautioned his Cabinet about the possibility that the Fukushima crisis could be worse than the Chernobyl accident in 1986.

Kan was particularly concerned about a spent fuel pool inside the No. 4 reactor building, which had the largest number of fuel rods and rising water temperatures.

"We should worry about the Unit 4 pool, whose temperature has been on the rise," he said, adding that other spent fuel pools at Fukushima Dai-ichi, as well as four others at the neighboring Dai-ni (No. 2) plant, could also deteriorate.

"The amount of radiation that could be released from those reactors could be larger than Chernobyl. We must keep cooling the reactors, whatever it takes. It's going to be a long battle," he said, according to the minutes dated March 16.

It was nearly 10 days before one of his top nuclear advisers produced a worst-case scenario at his request. The March 25 paper, produced by the head of the Japan Atomic Energy Commission, warned that a disaster of that scale would require evacuating 30 million people from the greater Tokyo area. Fearing panic, the government kept the report a secret, but The Associated Press obtained it in January.

The failure to properly record the minutes of the government's crisis management meetings has added to sharp public criticism about how the nuclear crisis was handled, deepening distrust of politicians and bureaucrats.

"Who is the leader of the actual operation? I get too many requests and appeals that are incoherent," Yoshihiro Katayama, internal affairs minister at the time, said at a March 15 meeting. "Nobody seems to be in charge."

The minutes also showed top crisis managers were confused, causing miscommunication that left local officials and residents without crucial information needed for evacuation. The ministers used a list of people who needed assistance for evacuation and their details by quoting Japanese media, not firsthand information from local authorities.

Yukiya Amano, director general of the International Atomic Energy Agency, said it was not just natural disasters that caused the Fukushima crisis. He said accident command lines were unclear and response plans were not sufficiently integrated. Amano also cited the nuclear regulator's weak oversight, insufficient guard against possible risks such as total power loss and inadequate training to respond to serious accidents.

But Fukushima provided a lesson for the rest of the world and nuclear safety is stronger than a year ago, he said in a statement Friday from Vienna.

"Human failings such as these are not unique to Japan," Amano said. "We humans learn from our mistakes."

Not very satisfactory

March 12, 2012

ONE YEAR AFTER THE DISASTER / Summaries prove government's ineptitude / Chaos reigned at nuclear emergency response HQ over decision-making process, evacuation zones

Toshiaki Sato and Koichi Yasuda / Yomiuri Shimbun Staff Writers

<http://www.yomiuri.co.jp/dy/national/T120311003852.htm>

The summaries of meetings held after the outbreak of the crisis at the Fukushima No. 1 nuclear power plant expose the ineptitude of the government in dealing with the disaster.

The 76 pages of summaries were compiled from notes and other materials following revelations that the government had failed to keep minutes of the meetings. They were released Friday.

Although they cover 23 meetings of the Nuclear Emergency Response Headquarters, they barely scratch the surface of what was discussed.

The decision-making process on such key policies as responses to a nuclear meltdown is still a matter of conjecture.

The release of such inadequate summaries has once again put the government on the spot for its lackadaisical attitude toward keeping records on important meetings.

"We should've been prepared for an emergency by [setting up a system] to tape-record meetings that take place in confusing situations, so the recordings could be used to produce ex post facto minutes," Economy, Trade and Industry Minister Yukio Edano told reporters Friday following release of the summaries. Edano was chief cabinet secretary when the nuclear crisis erupted.

The first meeting of the Nuclear Emergency Response Headquarters, which is headed by the prime minister, began after 7 p.m. on March 11, the day when the government declared a state of emergency at the Fukushima plant.

Although the government was supposed to take the lead in swiftly resolving the crisis, the summaries suggest it was completely confused and decided on a mishmash of policies with little transparency. Symbolic of this confusion was the government's assessment of the meltdown.

Members of the headquarters were briefed that the plant had activated emergency cooling systems, run mainly on batteries, after losing its power, the summaries said.

"After [the batteries go dead in about] eight hours, the reactors probably will undergo a meltdown," an unknown speaker was quoted as saying in the summaries.

According to an analysis by Tokyo Electric Power Co. in May, a meltdown is believed to have started at the No. 1 reactor on the night of March 11.

However, members of the headquarters apparently were not aware of the imminent danger.

"No radioactive materials have been detected to have leaked from the plant. There is no need to take special action," another unknown speaker was quoted as saying in the summaries.

In line with this statement, the government issued an evacuation order only to people within a three-kilometer radius of the plant.

However, the government received a report from TEPCO saying it would release steam from the plant's reactor into the atmosphere to reduce pressure inside. As a result, the government expanded the evacuation area to 10 kilometers early in the morning of March 12.

But opinion was divided in the Cabinet on the size of the evacuation zone.

In the third meeting of the headquarters, which started early in the afternoon of March 12, Koichiro Gemba, then state minister in charge of national policy, called on the headquarters to reconsider the evacuation zone.

"There is the possibility of a meltdown. Shouldn't we review the 10-kilometer-radius zone [and expand it further]?" Gemba was quoted as saying.

However, the summaries indicated that discussions on this subject were far from adequate.

Three hours after this meeting, a hydrogen explosion ripped the No. 1 reactor building apart, an incident no one in the government had anticipated. As a result, the evacuation area was expanded to 20 kilometers in the evening, a decision made far too late.

The summaries also show confusion in the government's chain of command was compounded when hydrogen explosions occurred at the plant's Nos. 3 and 4 reactor buildings.

At the eighth meeting held in the early afternoon of March 15, then Internal Affairs and Communications Minister Yoshihiro Katayama made a complaint.

"Who is leading this operation? We've received numerous requests, but many of them seem pointless," he was quoted as saying. "They are piecemeal and childish. There is a lack of command [in the government]."

Katayama apparently was critical that the integrated command had been split up, so operations were being carried out on the basement floor of the Prime Minister Office's crisis management center and on the fifth floor, where Prime Minister Naoto Kan was working.

However, Kan put all the blame on TEPCO, according to the summaries.

"Ninety percent of the raw data comes from TEPCO," Kan said. "Economy, Trade and Industry Minister Banri Kaieda and Goshi Hosono, special adviser to the prime minister, are assigned to deal with TEPCO, but communication is insufficient."

At a meeting on the evening of March 16, at which the overheating of the spent nuclear fuel storage pool of the No. 4 reactor was on the agenda, Kan was quoted as saying testily: "It's out of question [for TEPCO] to withdraw [from the Fukushima plant]. We may end up being exposed to higher levels of [radioactive] materials than those released in the Chernobyl disaster."

At the 10th meeting on March 17, Cabinet members expressed frustration over the situation as comprehensive policies still had not been worked out, even though six days had passed since the disaster.

"We should order local residents [around the nuclear power plant] to evacuate based on the worst-case scenario," Gemba was quoted as saying. "I've already devised an evacuation plan."

It is not known if that plan was approved.

The government was later criticized for failing to come up with an evacuation plan by utilizing data from the System for Prediction of Environmental Emergency Dose Information (SPEEDI), a system for predicting the spread of radioactive materials.

The summaries show the issue had not been discussed, either at the Nuclear Emergency Response Headquarters or the government-TEPCO joint headquarters.

The April 4 release into the sea of water contaminated with low-level radiation from the Fukushima plant drew international criticism. The summaries show the headquarters discussed the issue only once at the 13th meeting on April 11, when Kaieda reported that the measure was an "emergency step and unavoidable."

After the summaries were released, one Cabinet member called for further investigation.

"The decision-making process has not yet been fully clarified," he said.

Should this be M.Noda's role?

March 12, 2012

Noda to take lead in gaining local approval to restart nuclear plants

<http://mdn.mainichi.jp/mdnnews/national/archive/news/2012/03/12/20120312p2g00m0dm066000c.html>

TOKYO (Kyodo) -- Prime Minister Yoshihiko Noda pledged Sunday to take a leadership role in gaining local approval to restart nuclear power reactors once the central government decides to do so, to avert potential power shortages around Japan caused by the lost output of atomic plants previously producing a third of the nation's electricity.

At a press conference held on the first anniversary of the devastating March 2011 earthquake and tsunami, Noda also said he will make a formal request for prefectural governments to accept debris generated by the natural disaster that hit northeastern Japan.

The central government "should make every effort" to obtain the support of areas where nuclear plants are located, Noda said.

"I'm aware that I have to take a lead" in asking for cooperation of local governments and residents, he said, while reiterating that "politics will decide" ultimately whether to give the green light to resume the operations of idled reactors nationwide. Of Japan's 54 commercial nuclear reactors, only two are currently online.

The nuclear crisis at the Fukushima Daiichi power plant, triggered by the magnitude 9.0 earthquake and ensuing tsunami on March 11 last year, has made the public wary about the safety of nuclear plants.

But since he took office in September, Noda has expressed his willingness to restart the reactors, warning power shortages otherwise could drag down the country's economy.

Noda also said he will formally urge municipalities to accept debris from areas devastated by the natural disasters, vowing to speed up the disposal, whose progress has been slow due to fears the debris may contain radioactive substances from the related disaster at the Fukushima Daiichi nuclear power plant.

The national government "will move one and two steps forward" to dispose of the debris, Noda said, adding that he will also call for the cooperation of private businesses such as cement companies on the issue.

Some local governments have announced their intention to cooperate, but outside the northeastern region, only the Tokyo metropolitan government has actually begun accepting waste.

Now they tell us (transparency abroad)

March 13, 2012

S.Korean nuclear plant lost power for 12 minutes

http://www3.nhk.or.jp/daily/english/20120313_29.html

A South Korean nuclear regulator says a reactor at a nuclear power plant in the country had no electricity for 12 minutes last month.

The Nuclear Safety and Security Commission said on Tuesday that the accident took place at the number one reactor at the Kori plant in Busan.

The institute said electricity was lost for 12 minutes from shortly after eight thirty PM on February 9th when the plant was undergoing a regular inspection.

Inspections and repairs were underway at the reactor for exchanging nuclear fuel when the power went out. An emergency diesel generator also did not work.

The commission said the reactor was halted but that a storage pool for spent fuel and facilities to cool the reactors were operating.

The plant's operator did not file a report about the outage until Monday, more than one month after the incident.

The reactor began operating in 1978 with a time limit of 30 years set for its operation. But the government later extended the limit.

The accident last March at the Fukushima Daiichi nuclear power plant in Japan worsened because all power at the facility was lost. The commission is taking the latest occurrence seriously and has sent investigators to the plant to look into the cause.

March 13, 2012

US: Nebraska nuclear plant fire was serious threat

http://www3.nhk.or.jp/daily/english/20120313_12.html

US nuclear regulators say a fire that knocked out the cooling system for spent fuel at a nuclear plant in Nebraska last year represented a serious safety threat.

The Nuclear Regulatory Commission issued a preliminary report on Monday into the fire at the Fort

Calhoun plant last June.

The report says the plant operator could have prevented the fire if it had investigated an unusual smell coming from an electric breaker 3 days earlier.

The fire caused a loss of power that knocked out the system to cool spent nuclear fuel for about 90 minutes.

However, the report says temperatures never exceeded safe levels as the plant had been shut down for refueling maintenance from about 2 months earlier.

US nuclear regulators are keen to avoid any nuclear accident, drawing lessons from the Fukushima nuclear disaster in Japan.

A matter of trust

Asahi poll: 80% distrust government's nuke safety measures

March 13, 2012 - http://ajw.asahi.com/article/behind_news/social_affairs/AJ201203130031

A whopping 80 percent of people in Japan do not trust the government's safety measures for nuclear power plants.

The results are from a nationwide random telephone survey of 3,360 people conducted by The Asahi Shimbun on March 10-11. It received 1,892 valid responses.

Fifty-seven percent of the respondents said they are opposed to restarting nuclear reactors currently off line for regular maintenance, compared to the 27 percent in favor.

A gap between genders was conspicuous over whether to restart the reactors. Although men were almost evenly split, with 47 percent against and 41 percent in favor, 67 percent of women are opposed, compared with just 15 percent who support the restarts.

With only two reactors currently online among the 54 in the country, 75 percent of the respondents were "greatly concerned" or "somewhat concerned" about the possibility of economic impacts from the suspension of reactors. But just 31 percent of those respondents supported the restarts, while 54 percent were opposed.

Regarding the government's safety steps for nuclear plants, 52 percent said they "do not trust so much," and 28 percent said they "do not trust at all." Although the government has been proceeding with computer-simulated stress tests on reactors, which are necessary steps to reactivate them, people apparently have a deep distrust of the government's nuclear safety provisions.

Asked about Tokyo Electric Power Co.'s plans to increase electricity rates for households, an overwhelming 79 percent said that is "unacceptable," while 17 percent said it is "acceptable." In TEPCO's service area, an even higher 83 percent said it is "unacceptable."

Meanwhile, the support rate for the Cabinet of Prime Minister Yoshihiko Noda was 27 percent, unchanged from the previous poll in February, while 48 percent disapproved.

Should he ?

March 14, 2012

Noda seeks local support for reactor restart

http://www3.nhk.or.jp/daily/english/20120314_20.html

Prime Minister Yoshihiko Noda has pledged to seek public support for restarting nuclear reactors in the country after the Fukushima nuclear plant accident last March.

Japan's Nuclear Safety Commission will soon announce results of its review of stress tests on the 2 halted reactors at the Ohi nuclear plant in central Japan.

Speaking in the Diet on Wednesday Noda said restarting the Ohi reactors depends on whether the government can convince local residents that it is safe to do so.

All of Japan's 54 nuclear reactors will be in shutdown mode by late April when the last two go offline for regular inspection.

The need for independence

Editorial: Creation of new nuclear regulatory agency no stage for political grandstanding

<http://mdn.mainichi.jp/perspectives/news/20120314p2a00m0na001000c.html>

It is now looking much more likely that the establishment of a new nuclear regulatory agency will be delayed. The Democratic Party of Japan-led administration had planned to get the new body off the ground on April 1, but opposition parties have indicated they will fight the passage of bills underpinning the agency when they come up for debate in the Diet.

The new agency's predecessor is the Nuclear and Industrial Safety Agency (NISA), a part of the Ministry of Economy, Trade and Industry -- a ministry directly involved in the promotion of nuclear power. After the Fukushima No. 1 nuclear plant meltdowns in March last year, the government decided that NISA's position under the industry ministry was a serious flaw in Japan's nuclear safety regime and moved to abolish it in favor of the new regulatory agency.

Surely anyone would admit that splitting NISA from the industry ministry and combining its brief with other regulatory duties is an important step. Not only is the conflict of interest inherent in the current

state of affairs obvious, it also goes without saying that a new regulatory body must be put in place as soon as possible.

The real issue is how that body will be set up. The Cabinet has decided on a bill to establish it as an external bureau of the Ministry of the Environment. Some members of the opposition, however, have argued strongly for the agency to be a separate committee, which would have a great deal of independence under Article 3 of the National Government Organization Law.

The government has made much of the merits of putting the new agency under the environment ministry, saying that crisis management would be much easier than if the body was set up as an independent committee. On the other hand, there are valid worries over whether an agency under the ministry could, when needed, make truly independent, objective judgments contrary to government expectations. The government needs to address this concern in a concrete manner.

There is also a pressing need to focus on how a revamped Nuclear Safety Commission of Japan (NSC) will help guarantee the incipient regulatory agency's independence. It must furthermore be noted that the environment ministry has no crisis management experience, which is a source of some worry.

On the other hand, we must not jump to the conclusion that setting up the new agency, as the opposition suggests, as an Article 3 committee like the Fair Trade Commission would necessarily guarantee absolute independence. Whether an external bureau of the environment ministry or a separate commission, the points truly at issue are how it is built, how it is managed, and how it will retain important staff.

We also call on the opposition not just to try and slow debate on the bills underpinning the new agency, but to initiate substantive discussion on this important issue. Opposition parties must explain how the Article 3 committee they favor would be put together, and how that would safeguard the new body's independence of action. They must also tell us in definite terms what structure they see for the committee that would allow it to overrule government policy in a crisis.

It is also possible that the delay in creating the new regulatory agency will also affect decisions on restarting nuclear reactors idled for regular maintenance. On March 13, the NSC completed approval of the results of stress tests on the No. 3 and 4 reactors at the Oi nuclear plant -- conducted by NISA, which we have already seen has a direct conflict of interest.

Of course, under the stress test process, the decision on restarting reactors can be made at the political level. However, it's just impossible at this point to ask us to trust NISA and the incumbent version of the NSC.

At this moment, faced with the frankly nerve-wracking technology of nuclear power, deliberations and decisions on its future must not be delayed by political gamesmanship. We call on the governing and opposition parties together to move deliberations on this issue forward.

TEPCO under fire for hiring ex-Tokyo gov't bureaucrat to collect energy policy info

<http://mdn.mainichi.jp/mdnnews/news/20120315p2a00m0na010000c.html>

Tokyo Electric Power Co. (TEPCO) hired a former Tokyo Metropolitan Government official to collect the capital's energy policy information in the wake of the Fukushima nuclear disaster, the Mainichi has learned.

Hisao Ohashi, 65, former chief of the Bureau of Environment at the Tokyo Metropolitan Government, was employed by TEPCO as an advisor in September last year, half a year after the outbreak of the nuclear crisis at the utility's Fukushima No. 1 Nuclear Power Plant, sources close to the case told the Mainichi. Ohashi, who had left his metropolitan government post in June 2006, was assigned by TEPCO to collect internal information on the capital's energy policy from metropolitan officials and provide the information to the utility.

While some TEPCO officials were cautious about the idea of hiring the former metropolitan bureaucrat as the utility was to receive massive amounts of public funds from the central government on the heels of the nuclear disaster, the company's general affairs division pressed ahead with the personnel plan, which was ultimately approved by TEPCO President Toshio Nishizawa. The utility's move, which comes against its responsibility to streamline as a precondition for raising electricity bills, looks set to stir up criticism toward its management attitude.

At TEPCO, Ohashi served as an advisor to its Environment Department, which is in charge of taking measures to reduce carbon dioxide emissions at power stations and the disposal of polychlorinated biphenyl (PCB) contained in large electric transformers. However, he quit TEPCO on Feb. 20 this year after learning that the Mainichi Shimbun newspaper had started investigating his re-employment.

According to sources close to TEPCO, the utility's Environment Department had intended since before the March 11 disaster to hire a former metropolitan official because the department was having difficulties in responding to a metropolitan government system that obliges plants and other facilities to reduce carbon dioxide emissions by 6 to 8 percent, starting in April 2010.

TEPCO's general affairs division and former TEPCO officials singled out Ohashi, and the utility told him in the summer of 2010 that it wanted to hire him as an advisor the next summer. At the time, Ohashi was positive about the plan, but after the Great East Japan Earthquake and tsunami in March last year, he declined to take up the post, saying, "The situation has changed."

TEPCO nevertheless sounded out Ohashi once more in May last year, but he refused again. In August, TEPCO asked him one more time, saying, "We are in trouble making post-disaster responses, such as the

disposal of debris (in disaster-stricken regions). Please advise us on how local governments think about debris." Ohashi complied with TEPCO's request, thinking, "I can utilize my experience and will also be of help to others." While Ohashi had initially offered to work for free, the utility's personnel affairs department was reluctant to hire him that way and ended up paying him over 5 million yen a year in salary.

A special measures law enacted after the March 11 quake disaster and nuclear crisis obliges TEPCO to cooperate with the central and local governments over the treatment of debris contaminated with radioactive materials.

Some in the utility's Environment Department had voiced concerns over hiring the former metropolitan official, saying, "If this comes to surface, we would face criticism." However, the utility's general affairs division rammed through the personnel plan. "On top of the treatment of debris, the biggest reason for us to invite Mr. Ohashi was because we wanted to know the capital's policy directions," sources close to the case confided.

Ohashi collected information from metropolitan officials about the Tokyo government's plan to construct a liquefied natural gas (LNG) power plant as part of measures to deal with electricity shortages. He reported the information to TEPCO officials during its meetings. "We had expected that we would also be able to get information on environmental policies (that he was specialized in) thereafter," said concerned sources.

After retiring from the metropolitan government, Ohashi became a board member of a company capitalized by local governments and then served as president of a metropolitan government-affiliated organization for about a year until July last year.

"We hired him because we expected that he would exert a positive impact on our company," said TEPCO President Nishizawa. "If there's any criticism, we will face it."

TEPCO, TEPCO

March 16, 2012

TEPCO admits hiring another former gov't official after Fukushima meltdowns

<http://mdn.mainichi.jp/mdnnews/news/20120316p2a00m0na009000c.html>

Tokyo Electric Power Co. (TEPCO) announced on March 15 that it hired another former public servant following the outbreak of the nuclear disaster in March last year.

TEPCO revealed that it hired a retired Japan Coast Guard (JCG) official as a temporary worker in April last year, a month after the outbreak of the nuclear crisis at the Fukushima No. 1 nuclear plant, to capitalize on the former official's expertise.

The announcement came only hours after the Mainichi reported earlier the same day that TEPCO had hired a former Tokyo Metropolitan Government official as an advisor in September last year to collect information on the capital's energy policy. The ex-metropolitan official quit the post earlier this year.

The fact that the utility hired at least two former public servants after the nuclear crisis appears likely to draw further criticism of the utility, which has received massive financial assistance from the central government to deal with the nuclear catastrophe.

In defending the utility's employment of the former JCG official, a TEPCO spokesperson said during a press conference, "The former official has skills and techniques that our employees do not."

According to TEPCO, it hired the former JCG official on April 13 last year. The utility, however, withheld the worker's gender, title and duties, only saying that the person was "engaged in port-related work."

Overall, the utility had hired 49 former civil servants as of the end of February this year, including those recruited before the Fukushima nuclear disaster. Among the 49 former officials, seven were from the JCG, two from the Forestry Agency, two from the Meteorological Agency, one from the Land, Infrastructure, Transport and Tourism Ministry, one from the Fire and Disaster Management Agency, one from the National Police Agency, 30 from local police departments, and five from local governments.

Let's not upset our people

Nuclear safety agency opposed expansion of safety measures in 2006

<http://mdn.mainichi.jp/mdnnews/news/20120316p2g00m0dm012000c.html>

TOKYO (Kyodo) -- The Nuclear and Industrial Safety Agency proposed freezing studies started by the Nuclear Safety Commission in 2006 to expand the disaster mitigation zone around nuclear power plants in the event of a disaster, to bring Japanese regulations into compliance with international standards, according to emails released Thursday by the commission.

The agency, under the Ministry of Economy, Trade and Industry, argued that expansion of the zones "could cause social unrest and increase popular anxiety," the emails showed.

The commission, an independent body supervising nuclear safety regulation, did not enlarge the zones after considering the matter in 2006. It now appears the outcome was a result of the agency's repeated complaints.

But if the commission had gone through with the expansion, the chaotic developments surrounding the evacuation of people following the nuclear crisis at the Fukushima Daiichi power plant in March last year might have been mitigated, people familiar with the matter said.

In March 2006, an expert panel at the commission began studying whether to expand the range of the priority disaster mitigation zone from the current radius of between 8 and 10 kilometers from a nuclear power plant, according to the emails.

While the current zone was set based on Japanese standards, new guidelines announced by the International Atomic Energy Agency called for the area within a radius of 5 km as the top priority zone and 30 km as the priority zone.

But the Nuclear and Industrial Safety Agency began to complain about the move in late April that year. In an email on April 24, for example, the agency asked the commission not to use the expression "immediate evacuation" for the top priority zone, and two days later asked it to freeze the studies.

Although the commission initially turned down the agency's repeated complaints, it eventually decided in November not to expand the zone.

Yoshinori Moriyama, a senior agency official in charge of measures concerning nuclear emergencies, told reporters Thursday the agency asked for the freeze so as to avoid a "hasty decision" which could have thrown local governments into confusion.

Following the Fukushima nuclear crisis, triggered by the March 11 earthquake and tsunami last year, the commission decided to expand the priority disaster mitigation zone to a radius of 30 km from plants and set the area within a radius of 5 km as subject to immediate evacuation, as initially envisioned by the commission in 2006.

TEPCO - it didn't work

March 22, 2012

TEPCO changes rate hike plan / Rates for industrial customers can't be raised before contracts expire

The Yomiuri Shimbun

<http://www.yomiuri.co.jp/dy/national/T120321005009.htm>

Tokyo Electric Power Co. said Wednesday that it will postpone utility rate hikes for some of its industrial customers until after it can obtain their approval on its rate increase plans.

Those subject to the postponement are industrial consumers whose current service contracts are effective until after the planned April 1 implementation date for the new rates.

TEPCO's change of stance came after it judged that it failed to sufficiently explain to industrial customers that rate hikes before the expiration of contracts require approval of the customers.

Earlier in the day, Economy, Trade and Industry Minister Yukio Edano said he had directed the utility to take corrective measures to sufficiently explain its utility rate hike plans.

In a news conference held after a Cabinet meeting, Edano said, "Although utility increases before the expiration of contracts require approval of customers, TEPCO failed to thoroughly explain that point."

TEPCO plans to raise the rates for industrial consumers, such as factories and office buildings, by an average of 17 percent from April 1. The rates for these customers have already been deregulated, so the utility is allowed to charge increased rates through negotiations with individual customers without obtaining the approval of the METI minister.

The utility had sent to its industrial customers a document saying that "new utility rates will be applied from April 1 regardless of the expiration dates for the current contracts."

But as for industrial consumers whose contracts will come up for renewal on or after April 1, rates should be maintained at the current levels until the present contracts expire.

TEPCO stopped short of explaining this point and dealt with individual customers separately when it was asked about it.

"It's jaw-dropping," Edano said. "I want TEPCO to rectify its management culture drastically."

About 240,000 industrial customers are subject to the planned hikes, the utility said.

In connection with the rate hike plan, TEPCO President Toshio Nishizawa once said, "Rate increases are a power company's right." This sparked backlash from local governments and industrial sectors.

Regarding the rate hike for households that requires ministry approval, the utility plans to apply for an increase of about 10 percent effective from July. But it will face severe screening by the ministry.

More information disappears

Fukushima Pref. deleted 5 days of radiation dispersion data just after meltdowns

<http://mdn.mainichi.jp/mdnnews/news/20120322p2a00m0na012000c.html>

The Fukushima Prefectural Government revealed on March 21 that it deleted five days of early radiation dispersion data almost entirely unread in the wake of the meltdowns at the Fukushima No. 1 nuclear plant.

The data from the System for Prediction of Environmental Emergency Dose Information (SPEEDI) -- intended to predict the spread of radioactive contamination, information vital for issuing evacuation advisories -- was emailed to the prefectural government by the Ministry of Education, Culture, Sports, Science and Technology.

According to the prefecture's disaster countermeasure office, just after the March 2011 quake and tsunami, its dedicated SPEEDI terminal was unable to receive data due to effects of the disasters. Therefore, prefectural officials asked the Nuclear Safety Technology Center, which operates SPEEDI, to send data via email on March 12, 2011 -- one day into the nuclear crisis. The Nuclear Safety Technology Center then sent the data hourly starting at 11:54 p.m. that day. The Fukushima Prefectural Government, however, deleted all the data it received from March 12 to about 9 a.m. March 16.

The prefectural government's nuclear center in Okuma, one of the towns hosting the Fukushima No. 1 plant, received emailed data once at midnight on March 11, but the disaster countermeasure office in the prefectural capital was not aware of it.

"We failed to share the information amid all the confusion, and the fact that we had asked for the information to be sent by email hadn't been shared within the countermeasure office," said Yoshihiro Koyama, head of the prefecture's nuclear safety measures section. "We have not been able to confirm when the data was deleted and by who."

At around 10:30 a.m. on March 13, 2011, the disaster countermeasure office confirmed for the first time that it had received data from the central government's Nuclear and Industrial Safety Agency by fax. But the disaster countermeasure office judged that "the data is useless because the predicted amount of released radiation is unrealistic."

The Fukushima Prefectural Government also failed to give the data to the people of the prefecture and local municipalities partly because the central government was supposed to release such data in the first place.

Use of public funds

March 22, 2012

Mayor of town hosting nuke plant under fire for gifts to prefectural governor, exec

<http://mdn.mainichi.jp/mdnnews/news/20120322p2a00m0na004000c.html>

GENKAI, Saga -- The mayor of this town which is home to Kyushu Electric Power Co.'s Genkai nuclear power plant sent beef and other local delicacies to the Saga governor and the utility's executive last year, when the reactivation of the plant's reactors had been debated, it has emerged.

Genkai Mayor Hideo Kishimoto gave the food gifts to Saga Gov. Yasushi Furukawa and a senior official at Kyushu Electric Power Co. between April and May 2011, at a time when the recipients' decisions were at stake over the resumption of the Genkai nuclear plant's No. 2 and No. 3 reactors.

According to the Genkai Municipal Government, the mayor brought to Gov. Furukawa six packs of strawberries under the local brand "Saga Honoka" (4,725 yen in total) as a souvenir on April 20, 2011, and sent to the governor a Saga beef set (8,320 yen) and four packages of raw hamburger (1,680 yen in total) at a postal cost of 950 yen on May 26. The gifts and the mail cost were covered by the mayor's entertainment expenses.

Furthermore, Mayor Kishimoto gave an assortment of Saga beef (25,600 yen) to a senior Kyushu Electric official when he visited the utility on May 30 last year. All the gift items were given on the grounds of "promoting local specialties of Genkai and other areas," according to the city.

When asked about the use of public funds for the gifts to the governor, Mayor Kishimoto said, "I don't remember well, but I probably thought that I needed to have the governor know about local specialties as he was eager to export prefecture-made products overseas. ... I never talked about the reactivation of nuclear reactors."

Gov. Furukawa said, "I don't remember if I received the gifts or not. I believe the mayor brings such items as promotional tools rather than as presents."

Kyushu Electric's press officials commented, "We are confirming the facts at the moment."

A reform task force for TEPCO ?

March 25, 2012

Task force eyed for TEPCO to oversee reform / Outside experts to work with new chairman

<http://www.yomiuri.co.jp/dy/national/T120324003250.htm>

The Yomiuri Shimbun

The government's Nuclear Damage Liability Facilitation Fund has begun considering the establishment of a reform task force comprised of outside members for Tokyo Electric Power Co., according to sources.

The fund plans to invite a new chairman of TEPCO's board of directors from outside the utility and set up the task force under the direct command of the new chairman.

The fund aims to proceed with management reforms after it contributes money to TEPCO.

Officials from the fund, including experts in corporate rehabilitation, will join the task force to bolster the authority of the new chairman.

The fund envisions the task force will have sufficient authority to advise the new chairman and supervise TEPCO's management.

TEPCO will include steps to restructure itself into a company with committees when it proposes a comprehensive special business plan at a shareholders meeting in June.

As a result, a majority in TEPCO's board of directors will be from outside the utility. Operating officers promoted from within will oversee practical operations.

However, as many outside board directors would be part-time, it could take a long time for them to understand details of the company's internal affairs.

Some government officials have voiced concern that operating officers promoted from within TEPCO may take over the reins of power and that the reforms would become toothless.

It also is possible that the outside board directors do not have advanced knowledge of electricity supply and other key aspects of the company's operations.

The reform task force operating under the direct command of TEPCO's new chairman is modeled after a system first introduced by the Industrial Revitalization Corporation of Japan (IRCJ), established in 2003 as a joint public-private sector fund, in which it dispatched its officials to companies that it funded. The IRCJ disbanded in 2007.

TEPCO's task force on reform will comprise experts in accounting, corporate rehabilitation and other fields. Task force members will not be transferred to the power company but rather work both for the fund and as TEPCO officials.

The task force will supervise operating officers promoted from within TEPCO, and relay the new chairman's management policy to other executives and working-level employees.

The fund also expects the new chairman will bring staff from his or her company to join the task force. However, TEPCO executives oppose the plan, arguing the establishment of such a task force under the direct command of the new chairman will lead to conflicts with other internal entities in the future.

What "neutrality" ?

March 26, 2012

<http://mdn.mainichi.jp/mdnnews/news/20120326p2a00m0na005000c.html>

Nuclear industry group paid 7.9 million yen to 4 scholars on Fukui panel

FUKUI -- An Osaka-based nuclear power industry group with strong ties to Kansai Electric Power Co. (KEPCO) paid four members of a 12-member Fukui prefectural nuclear safety advisory panel a total of 7.9 million yen in contributions between fiscal 2006 and 2010, the Mainichi has learned.

The Fukui prefectural panel is tasked with giving Fukui Prefecture, home to over a dozen nuclear reactors, technical advice, including guidance related to decisions on the restart of idled KEPCO nuclear power plants.

According to the Osaka-based Kansai nuclear power council (Kan Gen Kon), it gave the money to the four in the form of research grants. They are Fukui University professor Yoshinobu Izumi, who received 300,000 yen in fiscal 2010, Osaka University professor Kazutoshi Nishimoto, who received 3.6 million yen between fiscal 2006 and 2008, former Kyoto University professor Kaichiro Mishima who received 3 million yen between 2006 and 2007 and Nagoya University professor Akio Yamamoto, who received 1 million yen between fiscal 2009 and 2010.

A KEPCO board member normally chairs the Kan Gen Kon and KEPCO serves as a corporate member. The Kan Gen Kon says it is giving research grants to scholars who have made contributions to the promotion of nuclear power and the use of radiation and are conducting promising research. It added it is operating independently of KEPCO.

The Fukui prefectural panel stipulates only that the governor will request experts to be on the panel without requiring them to report on contributions from the nuclear power industry and other details.

The governmental Nuclear Safety Commission of Japan asks prospective members of the commission to voluntarily report their relations with the electric power industry and other details to ensure neutrality in their screenings of nuclear issues.

The FEPC against prevention

March 27, 2012

Industry body opposed boosting nuke disaster prevention steps before Fukushima crisis

<http://mdn.mainichi.jp/mdnnews/news/20120327p2a00m0na015000c.html>

The Federation of Electric Power Companies of Japan (FEPC) had told the government's Nuclear Safety Commission (NSC) in writing that it would oppose any plans to step up preventative measures against nuclear accidents shortly before the outbreak on March 11, 2011, of the crisis at the Fukushima No. 1 Nuclear Power Plant, according to documents obtained by the Mainichi through information disclosure laws.

The FEPC, which groups 10 power companies in the country, said in written documents addressed to the NSC that it would stand against the government body's move to strengthen the country's preventative measures against nuclear accidents because such plans would give the impression that nuclear power was dangerous and affect the regions hosting nuclear power plants accordingly, as well as push up costs for such measures. The revelation shows that the utility firms in the country downplayed preventative measures against nuclear accidents.

The NSC, tasked with drawing up the country's guidelines on nuclear disaster prevention, started its preparations to introduce new guidelines in March 2006 after the International Atomic Energy Agency (IAEA) defined international standards for preventative measures against major nuclear accidents in 2002. However, the NSC had shelved its plan for tougher preventative measures once because the government's Nuclear and Industrial Safety Agency (NISA) repeatedly opposed the move, saying, "It would amplify public fears about nuclear power."

But many foreign countries started to introduce preventative measures against nuclear accidents, and therefore the NSC expressed its intention to consider introducing tougher preventative measures again in its "basic plans for near-term measures" released in December 2010.

Responding to the NSC's move, the FEPC sent the written documents to the NSC on Jan. 13 and Feb. 3, 2011, saying that it had "estimated in its own right" the possible reaction from local governments in the event that the international standards were adopted.

On the impact of the introduction of a Precautionary Action Zone (PAZ) designated within a radius of about five kilometers from a troubled nuclear power plant, the FEPC said, "It could cause land prices to fall and reduce the number of tourists." It also opposed the idea of expanding Emergency Planning Zones (EPZ) within a radius of eight to 10 kilometers from a troubled nuclear power plant to designate an Urgent Protective Action Planning Zone (UPZ) within a radius of about 30 kilometers from the nuclear plant, saying, "Local governments that fall within the zone will demand subsidies."

Shortly after that, the crisis broke out at the Fukushima No. 1 Nuclear Power Plant. The NSC worked out new guidelines based on international standards on March 22 this year. The government set aside 8.97 billion yen for "subsidies for emergency safety measures" in the state budget for fiscal 2012, three times more than the outlay for the previous year. The NSC said, "Before the accident, the plant operators that were supposed to be regulated were allowed to intervene in policy decision-making."

The FEPC, on the other hand, said, "It was part of our cooperation in introducing standards." It had already been found out that NISA also opposed the introduction of tougher disaster prevention measures in 2006.

How much should be in textbooks?

March 28, 2012

School textbooks diverge on handling of tsunami photos, nuclear disaster

<http://mdn.mainichi.jp/mdnnews/news/20120328p2a00m0na010000c.html>

New high-school textbooks whose screening results were announced on March 27 made many references to the Great East Japan Earthquake and tsunami, but diverged on the handling of photos, and descriptions of the ensuing disaster at the Fukushima No. 1 Nuclear Power Plant.

Publisher Tokyo Shoseki Co. carried a section for students to learn about natural disasters in its textbook "Kagagu to Ningen Seikatsu" (Science and human life). A color photo showing a tsunami surging into a residential area on March 11, 2011 took up about half a page in the B5-sized textbook. The photo was taken by Mainichi photographer Koichiro Tezuka, and won a Japan Newspaper Publishers and Editors Association award.

According to the Ministry of Education, Culture, Sports, Science and Technology, a total of 53 textbooks in eight of the 10 main subjects mentioned the earthquake disaster, while three textbooks used photos of the March 2011 tsunami.

"Photographs firmly convey the unparalleled extent of the disaster. We took the schools hit by the disaster into consideration, and cut photos so that human suffering was not brought to the fore," a Tokyo Shoseki official said.

Many textbooks carried smaller photos of devastated city areas and rubble, and used chronological lists to describe the disaster.

"There are concerns about the psychological impact on people hit by the disaster. We carried photos of the Great Hanshin Earthquake but it's hard to tell if this was the right thing to do," one publishing official commented.

A total of 16 textbooks from six subjects made references to the nuclear disaster triggered by the quake. But only Yamakawa Shuppansha's "Gendai Shakai" (Modern society) published the name of the operator of the Fukushima No. 1 nuclear plant (Tokyo Electric Power Co.). The Education Ministry's screening guidelines request that publishers refrain from advertising or criticizing specific companies, and many publishers were careful about their descriptions, using only such terms as "the Fukushima No. 1 Nuclear Power Plant." Some publishers added that the nuclear crisis had yet to be conclusively evaluated, so handling the disaster was difficult.

Only one publisher, Kairyudo Publishing Co., touched on the issue of radioactive contamination and food safety in its textbook "Katei Kiso" (Home basics). The deadline for textbook submissions was in late April last year. At the time of the quake, the textbook contained no mention of radiation. However, editorial staff judged that the subject concerned life and people's lifestyles, and before the deadline, which was extended by about one month due to the quake and tsunami, it added a column whose theme was "radiation's pollution of the environment and interim regulatory limits."

An official of another textbook publisher commented, "We were busy responding to the disaster, and unable to include all the references we wanted to."

Publishers are now expected to apply to replace content in their textbooks.

Yes, what about the promised regulatory body?

April 9, 2012

Govt. urged to set up new nuclear regulator

http://www3.nhk.or.jp/daily/english/20120409_24.html

Japanese municipalities hosting nuclear power stations have urged Nuclear Crisis Minister Goshi Hosono to expedite the planned launch of a new regulating body.

Kazuharu Kawase, the head of an association of such municipalities and the mayor of Tsuruga City, visited Hosono on Monday to make the request.

Kawase told the minister that the government's stress tests, its call for establishing a reactor service life of 40 years, and its new safety standards all lack scientific basis.

He said people living near nuclear power plants are becoming increasingly confused and are losing faith in the government.

He asked Hosono to establish a new and reliable nuclear regulatory body as soon as possible. He also asked the minister to ensure that the new body functions effectively and that it clearly explains how it is going to improve safety.

Hosono replied that the establishment of a new body will help assure residents of nuclear safety. He said he hopes to launch such an agency in the not-too-distant future after getting opposition parties on board.

Kawase also said many people who were evacuated after last year's nuclear accident at the Fukushima Daiichi power plant do not know when they can return to their home towns. He called for the speedy decontamination of affected areas, saying residents' uncertainties about their futures are fueling their distrust of the government.

Livelihoods vs safety

Incumbent in nuclear host city re-elected as voters give priority to livelihoods

<http://mainichi.jp/english/english/newsselect/news/20120416p2a00m0na012000c.html>

OMAEZAKI, Shizuoka -- Voters in this city, home to the controversial Hamaoka Nuclear Power Plant, reluctantly helped incumbent Mayor Shigeo Ishihara win re-election in the April 15 mayoral election, **saying their livelihoods will be in trouble without a nuclear power plant.**

Ishihara, 64, the only candidate who did not voiced opposition to the reactivation of the plant, was re-elected to a third four-year term by collecting 12,018 votes, compared with 6,840 for former city assemblyman Katsuhisa Mizuno, 58, and 1,891 for travel agent Haruhisa Muramatsu, 60.

The election came after an expert panel under the Cabinet Office in late March predicted that a tsunami of up to 21 meters -- or far higher than an 18-meter levee under construction -- may strike this Pacific coastal city.

Chubu Electric Power Co.'s Hamaoka plant, southwest of Tokyo, has been suspended since May last year on the orders of then Prime Minister Naoto Kan in the aftermath of the Fukushima nuclear disaster triggered by the March 11 Great East Japan Earthquake and tsunami.

But a number of residents in the city with a population of about 35,000 told the Mainichi that they voted for the incumbent mayor because the regional economy will run into trouble without the Hamaoka plant.

A company employee in his 50s who cast his ballot in the city's Ikeshinden district questioned the credibility of the huge tsunami prediction and said, "I want opponents of nuclear power to know how the lives of nuclear power plant workers will be affected."

Another company employee in his 40s said that the nuclear power plant is necessary for the city, adding that Omaezaki will be in serious trouble economically without it.

But a housewife in her 30s who has two elementary school-age children, said she did not vote for Ishihara. "The local economy is important, but it will be worse if an earthquake hits, making here uninhabitable and causing health hazards."

Ishihara said after his re-election that he takes the opinions of those who voted for his rivals seriously. He pledged to do his best to bring the whole city together.

Asked about the 21-meter-tall tsunami prediction, the mayor said he will ask the central government to back up its claim with evidence. He said it is not fair for the central government to come up with such projections while construction of the levee 18 meters above sea level is under way.

He added that he has no choice but to ask plant operator Chubu Electric Power to take additional safety measures in the course of future negotiations.

The Omaezaki election was the latest in a series of local elections in which incumbent leaders in municipalities hosting nuclear power plants have prevailed over rivals without coming out against nuclear power.

Record low for nukes

Nuclear operating rate hits record low in FY2011

http://www3.nhk.or.jp/daily/english/20120416_24.html

Japan's nuclear power plants were operating at a record-low rate during the just-ended fiscal year, due to the effects of the Fukushima nuclear disaster.

The Federation of Electric Power Companies says that the average operating rate for Japan's 54 nuclear reactors stood at 23.7% for the year that ended in March.

The figure is down 43.6 points from the year before and the lowest since 1966, when commercial nuclear power generation began in Japan.

Before the Fukushima disaster in March of last year, about 37 reactors were in operation. But many have since gone offline for regular inspections, with no clear prospects for reactivation. Only one reactor, in Hokkaido, northern Japan, remains online.

During the past fiscal year, Japan's 10 regional power companies generated or purchased about 937 billion kilowatt-hours of electricity.

The figure was down year-on-year by a record margin of 5%, due partly to nationwide efforts to save power in the wake of the nuclear disaster.

Better the devil you know

April 16, 2012

Hamaoka nuclear host city reacts angrily to anti-nuclear forces

<http://mainichi.jp/english/english/perspectives/news/20120416p2a00m0na001000c.html>

OMAEZAKI, Shizuoka -- Voters in this city, home to the Hamaoka Nuclear Power Plant, favored incumbent Mayor Shigeo Ishihara over two other candidates in the April 15 mayoral election after heeding his election campaign promise that he will listen to local residents and carefully guide the city when it comes to restarting the idled nuclear station.

The city, southwest of Tokyo, has co-existed with the power plant of Chubu Electric Power Co. for more than 35 years, and the latest election focused on the fate of the idled nuclear power plant.

Two rookies -- former city assemblyman Katsuhisa Mizuno and travel agent Haruhisa Muramatsu -- took on the incumbent mayor by vowing not to approve the plant's reactivation and by calling for the decommissioning of the plant, respectively.

But voters opted for Ishihara over the two rookies apparently out of consideration for the city's long association with nuclear power.

Mayor Ishihara has pursued a conciliatory approach toward Chubu Electric Power while cooperating with the central government in going along with a plutothermal or plutonium-thermal program.

But Ishihara said after the March 11, 2011 Great East Japan Earthquake and tsunami triggered the crisis at the Fukushima No. 1 Nuclear Power Plant that the nuclear safety myth was over. But at the same time, he asked Chubu Electric Power to beef up measures against tsunami in an effort to keep the option open for restarting the idled Hamaoka plant.

But the city's fiscal 2011 budget totaling 16.8 billion yen, crafted before the nuclear plant was suspended last May, shows that nuclear-related subsidies and fixed property tax accounted for about 40 percent. **If the power plant goes offline permanently, it will be difficult for the city to maintain public facilities that have been built or are under construction thanks to such subsidies.** City residents know that and made the "realistic choice" to re-elect Ishihara.

But there is no clear-cut indication of how the city is going to implement measures against projections by an expert panel under the Cabinet Office that a tsunami of up to 21 meters may hit the city along the Pacific coast.

Omaezaki and surrounding municipalities will face heated debate, as in the case of the Oi Nuclear Power Plant operated by Kansai Electric Power Co. (By Susumu Funatsu, Kakegawa Bureau)
April 16, 2012(Mainichi Japan)

Reorganisation of TEPCO

April 19, 2012

TEPCO to draw up renewal plan under new chairman

http://www3.nhk.or.jp/daily/english/20120419_11.html

The government's search for a new head of an ailing utility has finally come to an end. It is set to name a lawyer as the chairman of the Tokyo Electric Power Company, to which it plans to inject more than 10 billion dollars in public funds.

The government has decided to appoint to the post **Kazuhiko Shimokobe, a former vice president of the Japan Federation of Bar Associations.**

After the Fukushima Daiichi accident, Shimokobe was posted as the chair of the government-backed nuclear compensation fund. He has also headed a third-party panel investigating the utility's management and finances.

Shimokobe will replace Tsunehisa Katsumata, the current chairman of the firm at the company's next shareholders meeting.

Tokyo Electric and the compensation fund is now set to draw up under its new chairman a business turnaround plan, which was to have been submitted by the end of March.

Creation of the plan has been delayed by difficulties in finding a new person to lead the company, given its hard situation.

The turnaround plan calls for the injection of about 12 billion dollars in public funds to boost the firm's capital base. The government will hold a maximum two-thirds of voting rights.

The plan is also expected to call for an electricity rate hike of about 10 percent for households.

What's with the promised nuclear safety agency ?

April 20, 2012

Political tension should not hamper talks on nuclear agency: Hosono

<http://mainichi.jp/english/english/newsselect/news/20120420p2g00m0dm063000c.html>

TOKYO (Kyodo) -- Nuclear disaster minister Goshi Hosono on Friday expressed hope that parliamentary deliberations on a government bill to launch Japan's new nuclear safety agency would not be further delayed amid rising political tension over blunders by two other ministers.

"We have been waiting for the discussions with the (main opposition) Liberal Democratic Party since January over the new regulatory body, but deliberations have not yet started," Hosono, who doubles as environment minister, told a press conference.

"I think talks on nuclear regulations and safety should be discussed properly without being influenced by the political situation," he added.

On Friday, the opposition-controlled House of Councillors approved censure motions against Defense Minister Naoki Tanaka, who has been criticized for his handling of a string of security issues, and transport minister Takeshi Maeda, accused of trying to meddle in a recent local election.

The LDP, which submitted the motions on Wednesday along with other opposition parties, says it will continue to boycott all parliamentary deliberations unless the two ministers are replaced immediately. The motions are non-binding.

Amid growing political confrontation, the LDP and its ally, the New Komeito party, submitted a bill on Friday that aims to create an independent nuclear regulatory commission as a counterproposal to the government's bill.

Both entities are the same in that they would be placed under the Environment Ministry, but the opposition parties seek to make the commission sufficiently free from political influence by legally guaranteeing its independence in line with Article 3 of the National Government Organization Act.

Under the counterproposal, the commission will be an umbrella organization of a new nuclear regulatory agency, and would take control of the agency's personnel and budget matters.

The government has decided to review its nuclear regulations after the current setup of the nuclear safety agency under the Economy, Trade and Industry Ministry, which has promoted atomic power, came under fire following the accident at the Fukushima Daiichi nuclear power plant, triggered by the earthquake and tsunami on March 11 last year.

The government hoped to separate the current agency from the industry ministry and create a new nuclear regulatory agency on April 1, but failed to do so amid objections from opposition parties.

"Reform" for TEPCO

April 26, 2012

Reform headquarters under direct control of new chairman to be set up at TEPCO

<http://mainichi.jp/english/english/newsselect/news/20120426p2a00m0na016000c.html>

The Nuclear Damage Liability Facilitation Fund and Tokyo Electric Power Co. (TEPCO) have decided to set up a "reform headquarters" at Japan's biggest utility in June that will directly report to Kazuhiko Shimokobe, the utility's next chairman.

The secretariat of the reform headquarters is expected to consist mainly of senior staff from the Nuclear Damage Liability Facilitation Fund and TEPCO's middle-ranking reform-minded employees. The reform headquarters, tasked with carrying out internal supervision and coordination as Shimokobe's task force, will take the lead in reforming the giant organization that boasts about 50,000 group employees.

The scheme will be included in the "comprehensive special business plan" that the Nuclear Damage Liability Facilitation Fund and TEPCO plan to jointly submit to Economy, Trade and Industry Minister Yukio Edano on April 27. The business plan outlines measures to restructure the utility and review the composition and nature of the business organization.

The reform headquarters is expected to be staffed by 20 to 30 people. The successor to current TEPCO President Toshio Nishizawa will be named deputy chief of the reform headquarters. Those middle-ranking TEPCO employees whom the Nuclear Damage Liability Facilitation Fund judged through interviews and other means as having "strong crisis awareness" of the utility's current status will be selected and recruited from all sections across the company including the fuel division. The reform headquarters will also be tasked with conquering the drawbacks from the persistent sectionalism rampant within the company.

Former industry ministry official Takashi Shimada, who had played a key role in compiling the "comprehensive special business plan" as head of the steering committee of the Nuclear Damage Liability Facilitation Fund will be named a leader of the secretariat of the reform headquarters. Shimada was a key figure within the industry ministry who advocated a reform of the electric power industry. While being respected by industry minister Edano, Shimada had long served as secretary for former state minister for economic and fiscal policy Kaoru Yosano who has appealed for the need of nuclear power. Therefore, TEPCO Chairman Tsunehisa Katsumata has faith in Shimada. While playing a role in bridging between the government and TEPCO, which tend to conflict with each other, Shimada will keep a close eye out for what is going on within and outside the company. Consultants and accountants from outside will also be recruited into the reform headquarters.

The government will inject one trillion yen in public funds into TEPCO after receiving endorsement for the comprehensive business plan in early May following the Golden Week holiday period. The government is expected to secure a majority stake in the utility that carries with it voting rights in such a way to effectively nationalize the company. TEPCO, under Shimokobe as chairman, will move ahead to reform itself as stipulated in the comprehensive business plan, reducing costs by 3.3 trillion yen over 10 years and splitting the company into power transmission and distribution entities.

TEPCO will have a majority of its board members from outside and become a company with committees in June. The utility will facilitate smooth payments of damages for the Fukushima nuclear disaster and ensure stable power supply simultaneously by setting up the task force under the direct control of the chairman to accelerate its reform efforts. The reform headquarters are poised to play a leading role in addressing difficult issues including that of electricity rate hikes.

TEPCO's business plan

April 28, 2012

TEPCO submits 10-year restructuring plan to gov't

<http://mainichi.jp/english/english/newsselect/news/20120428p2g00m0dm030000c.html>

TOKYO (Kyodo) -- Tokyo Electric Power Co. and a state-backed bailout fund submitted to the government Friday a restructuring plan to help the company overcome its financial plight following the Fukushima Daiichi nuclear power plant disaster, such as through the injection of 1 trillion yen in public funds and electricity rate hikes.

The so-called comprehensive special business plan will become official once Economy, Trade and Industry Minister Yukio Edano gives his approval, possibly in early May, paving the way for the **de facto nationalization of Japan's largest utility known as TEPCO.**

The content of the document will be announced after gaining approval, TEPCO and the Nuclear Damage Liability Facilitation Fund said.

In addition to promising to cut more than 3 trillion yen in costs through fiscal 2020 to finance compensation payments related to the nuclear accident, TEPCO will seek to increase profits by raising household electricity rates by about 10 percent for three years from July and restarting its idled nuclear reactors in Niigata Prefecture from fiscal 2013.

The utility is seeking to swing into the black in the business year through March 2014, but it is uncertain whether controversial measures such as rate hikes and restarting reactors can be carried out as planned.

TEPCO President Toshio Nishizawa, speaking to reporters after holding talks with the fund to finalize the plan, said, "I'm aware that the hurdle (we have to overcome) is extremely high...and the company will work as one toward that end."

In a symbolic move to mark a fresh start for the company, TEPCO Chairman Tsunehisa Katsumata and Nishizawa are likely to step down at the company's annual shareholders' meeting in late June. More than half of the board of directors will be invited from outside the company to enhance management oversight.

The government has already decided to appoint Kazuhiko Shimokobe, a lawyer and head of the bailout fund's decision-making board, as the next TEPCO chairman, and the focus of attention is now shifting to who will be promoted from inside the company to succeed Nishizawa.

The new management lineup will be unveiled when the company announces its financial results for fiscal 2011 likely in May, according to Nishizawa.

Shimokobe separately told reporters he plans to set up a management reform task force that he and the new president will directly take control of. He wants it to be joined by reform-minded mid-level and younger employees and, if necessary, seek cooperation from experts outside.

"This is effectively the last chance to renew TEPCO. We're going to do this work with speed," Shimokobe said.

TEPCO and the fund had initially expected to finalize the restructuring plan by the end of March, but the move was delayed because the government had difficulty in choosing the next chairman to lead the company's reform process.

In addition to trillions of yen in compensation payments, the once blue-chip company faces a heavy financial burden amid increasing fuel costs for thermal power generation to make up for halted nuclear power generation following the Fukushima accident.

It is also looking at massive costs for the decades-long process of scrapping the Fukushima Daiichi plant's four reactors, three of which suffered meltdowns following the huge earthquake and tsunami on March 11, 2011.

In late March, TEPCO made a request for the capital injection to the fund, saying the company might fall into negative net worth without the 1 trillion yen of taxpayers' money.

In return for the aid, the government is expected to acquire a majority stake in the company, which would enable the state to choose board members, and make sure it can boost the stake to more than two-thirds for stronger control if necessary, according to sources close to the matter.

TEPCO has so far won approval to get 1.58 trillion yen of financial assistance from the fund, but the aid is limited to the use of paying ballooning compensation, and TEPCO remains in a tough business situation due to such challenges as growing fuel costs.

Bribes

May 3, 2012

Consumers ultimately paid up for nuclear bribery in japan

<http://nuclear-news.net/2012/05/03/consumers-ultimately-paid-up-for-nuclear-bribery-in-japan/>

Consumers ultimately footed bill, Utilities gave nuclear plant hosts

billions <http://www.japantimes.co.jp/text/nn20120502x1.html>

Kyodo Electric utilities, their subsidiaries and related organizations provided at least ¥28.7 billion to local governments, mostly as donations, during the five years through to March 31, local government sources and data obtained by Kyodo News revealed.

The electric power companies incorporated most of the expenses into their electricity charges for consumers and business clients as necessary costs for power generation. Such donations are not required to be made public and may amount to more than the latest finding revealed Tuesday, experts said.

The central government has recently hammered out a plan to ban power utilities from incorporating their donations in electricity charges.

The donations were given to prefectural governments, prefectural capitals and 60 governments of municipalities that host nuclear power plants or are located near such plants.

Among the around 650 cases of donations uncovered, more than ¥100 million was provided to local governments in 35 cases, 30 of which involved municipalities that host nuclear plants or are located near them. Besides locations with power plants, Kansai Electric Power Co. donated ¥250 million to the Osaka Municipal Government to help finance a face-lift for a municipal science museum.

The biggest single amount given was about **¥5 billion** that Tokyo Electric Power Co., which operates the troubled Fukushima No. 1 nuclear plant, provided in 2007 to the city of **Kashiwazaki** in Niigata Prefecture to help build and maintain Yume no Mori Park, facing the Sea of Japan.

Kashiwazaki and the neighboring village of Kariwa in the same prefecture are home to Tepco's seven-reactor Kashiwazaki-Kariwa nuclear plant, the world's largest atomic plant, with a combined output capacity of 8.2 million kw.

Tepco also gave about ¥4 billion worth of cash and land lots to Kariwa.

The Fukui Prefectural Government accepted ¥1.33 billion in funds to build a railway directly linking Tsuruga Station in the prefecture with the cities of Osaka, Kyoto and Kobe.

Fukui Prefecture hosts the largest number of nuclear reactors in Japan. The donations are believed to have been provided by Kansai Electric and Japan Atomic Power Co. The Fukui Prefectural Government has refused to identify the donors, noting they do not wish to be identified.

Kepeco operates three nuclear power plants and Japan Atomic Power one in Fukui Prefecture.

The Gifu Prefectural Government accepted about ¥1.89 billion in 2008 from Chubu Electric Power Co. under an agreement with the Nagoya-based utility to finance a road construction project near a hydroelectric power plant.

The agreement was made after the utility withdrew from the power plant's construction.

The Shizuoka Prefectural Government accepted around ¥1.63 billion from Chubu Electric in the three years through March after the local government could not receive state subsidies for two of five reactors at the Hamaoka nuclear plant in the city of Omaezaki, Shizuoka Prefecture. The two reactors ceased operation in 2009.

All about transparency and independence

New nuclear regulatory agency still up in air

<http://mainichi.jp/english/english/newsselect/news/20120506p2g00m0dm062000c.html>

TOKYO (Kyodo) -- Japan entered a rare period on Sunday of having no nuclear power supply following last year's Fukushima No. 1 Nuclear Power Plant disaster, without seeing much progress on shaping a new nuclear regulatory agency that could play a key role in addressing public concerns over the safety of atomic power.

The government plans to establish a new agency under the Environment Ministry amid criticism that the existing Nuclear and Industrial Safety Agency lacks teeth because it is under the umbrella of the Economy, Trade and Industry Ministry, a promoter of nuclear power.

But parliamentary deliberations on a bill submitted by the government to launch the new agency on April 1 have not yet started and the main opposition Liberal Democratic Party has complained that the organization's independence would not be sufficiently secure under the government plan.

"What the government is trying to do is just create a second NISA under the Environment Ministry," LDP lawmaker and former Chief Cabinet Secretary Yasuhisa Shiozaki said after the submission of the government bill in January.

To challenge the government, the LDP, along with its ally, the New Komeito party, submitted a bill in April that proposes putting a new agency under the control of what they call a "nuclear regulatory commission" with a legally guaranteed independence.

The appointment of the five commission members would require Diet approval and the commission would have the right to decide on the agency's personnel and budget matters.

The organizational structure reflects Shiozaki's view that one of the important lessons Japan must learn from the Fukushima crisis is to reduce the risks created by political interference.

Former Prime Minister Naoto Kan, who had to deal with the crisis when it first erupted, has come in for criticism from some quarters, with a private-sector nuclear accident investigation panel saying in a report it issued in late February that "unnecessary confusion" may have occurred because people at the prime minister's office who lacked sufficient expertise got involved in detailed technical issues in trying to contain the crisis.

In the United States, with regard to events that would be occurring inside the plant, responsibility would lie with the plant operator and the regulator, Richard Meserve, former chairman of U.S. Nuclear Regulatory Commission, said during a hearing in Tokyo by a Diet-appointed accident investigation panel in February.

In the counterproposal, the opposition parties made clear that the envisioned commission would wield authority over technical matters inside nuclear power plants even in the event of an accident.

But the government believes that political decisions could increase in importance during emergencies, such as when mobilizing the Self-Defense Forces, and doubts whether the opposition-proposed collegiate panel would be capable of swift decision-making.

The delay in the launch of the new agency has also complicated the issue of whether to restart two reactors in Fukui Prefecture to address power shortages in the summer, with some ruling Democratic Party of Japan lawmakers calling for the government to wait until the agency is created before making a final decision.

Satoshi Arai, chair of a DPJ taskforce on nuclear accident-related issues, has warned that it would lead to problems in the future if the government rushes to restart them without changing the current framework, in which the nuclear regulator is under the auspices of its promoter, the industry ministry.

"Industry minister Yukio Edano is in charge of NISA and at the same time of energy policy ... These two functions were what the International Atomic Energy Agency advised Japan in 2007 to separate, but what was not implemented," he told a meeting of party members in mid-April.

Now that the opposition parties have compiled a counterproposal on a new regulatory body, a government official involved in preparing for the launch of a new agency expects that things will start to progress.

"In the not-so-distant future, I believe arrangements will be made to reach a conclusion on the issue because we all understand that we cannot take so much time," he said.

Muneo Morokuzu, a professor at the University of Tokyo, expressed hope that the ruling and opposition parties would engage in talks not only on the form of the organization, but also on more substantial issues related to the new agency.

"Regardless of the legal status of the regulatory body, what is important is to create a new agency with greater independence and a high degree of professionalism," said the professor specializing in nuclear regulations.

TEPCO new president vows to promote reform

http://www3.nhk.or.jp/daily/english/20120508_35.html

The incoming president of Tokyo Electric Power Company says he will do his best to quickly pay damages to those affected by the Fukushima nuclear accident, while promoting the reform of the company.

Managing Director Naomi Hirose was speaking to reporters on Tuesday after he was named the new president at a board meeting earlier in the day.

Hirose said one of his main tasks will be to ensure that people affected by the nuclear accident at the Fukushima Daiichi nuclear power plant will be compensated.

He said he will work toward the decommissioning of the crippled plant while stabilizing it. He said that providing electricity in a stable way while streamlining the company will also be an important task.

Hirose said the firm, together with a government-backed nuclear disaster fund, has already drawn up a plan listing what the company has to do. He said what matters is to implement those measures.

He said he will take the lead in reforming the company to show people a new TEPCO as soon as possible.

Restructuring TEPCO

May 9, 2012

Government approves TEPCO's restructuring plan

http://www3.nhk.or.jp/daily/english/20120509_36.html

The Japanese government has approved a restructuring plan for the Tokyo Electric Power Company, or TEPCO, to cover the huge expenses from the Fukushima nuclear plant accident.

Industry minister Yukio Edano conveyed the decision on Wednesday to TEPCO's outgoing President Toshio Nishizawa and Kazuhiko Shimokobe, who was recently chosen to be the next Chairman of the utility. Shimokobe currently chairs the steering committee of a state-backed nuclear compensation fund.

The plan, submitted by TEPCO and the state-backed fund on April 27th, is to put the company effectively under state control after its general shareholders' meeting in June.

The plan calls for the government to inject about 12.5 billion dollars in taxpayer's money for it to hold a majority stake.

The government will also extend about 10.7 billion dollars more to help TEPCO pay compensation to those affected by the accident.

To rebuild its finances, TEPCO says it will ask the government to approve a 10.28-percent increase in household electricity fees.

The utility has also proposed a new rate plan geared to encourage energy-saving by raising part of summer daytime rates while lowering them for night use.

The plan is expected to help TEPCO avoid liabilities exceeding assets from the costs of compensation and the decommissioning of the Fukushima reactors.

Government to reform TEPCO?

May 10, 2012

Editorial: Gov't should fulfill responsibility for rehabilitation of TEPCO

<http://mainichi.jp/english/english/perspectives/news/20120510p2a00m0na017000c.html>

The Japanese government is urged to fulfill its responsibility for the rehabilitation of the troubled Tokyo Electric Power Co. (TEPCO), which it has placed under its control.

Economy, Trade and Industry Minister Yukio Edano on May 9 approved a rehabilitation plan worked out by TEPCO, the operator of the tsunami-hit Fukushima No. 1 Nuclear Power Plant. Under the proposal, the government will provide TEPCO with an infusion of approximately 1 trillion yen in public funds through its purchase of TEPCO shares.

The infusion will bring the total amount of public funds provided to TEPCO to some 3.5 trillion yen, which includes those for the payment of compensation to victims of the nuclear disaster.

Such a huge amount of financial assistance from the government is aimed at helping TEPCO fulfill its responsibility for paying compensation to victims, ending the nuclear disaster and ensuring a stable supply of electric power. If the assistance fails to achieve a turnaround, the government will be forced to extend additional financial assistance to the firm. TEPCO is now under pressure to quickly rehabilitate itself.

The rehabilitation plan aims to turn TEPCO into the black in the business year ending March 31, 2014. **However, the implementation of the plan will likely face setbacks because it is based on the principle that TEPCO will raise electricity fares for households and reactivate its Kashiwazaki-Kariwa Nuclear Power Plant.**

TEPCO needs to thoroughly streamline its management by drastically reorganizing its affiliated firms and slashing retirees' corporate pension benefits. Reforming its dogmatic corporate culture is also an urgent task for TEPCO, which has clung to its regional monopoly and insists that it has the right to raise electricity charges.

Under the plan, TEPCO will appoint a majority of its board members from outside the firm and set up a management reform task force comprised of younger and mid-ranking employees as well as those of the Nuclear Damage Liability Facilitation Fund.

Managing director Naomi Hirose, who is set to assume the presidency of TEPCO, said he will play a leading role in reforming the utility. "I'll take the lead in our efforts to convince the public as soon as possible that TEPCO has changed."

TEPCO also faces hurdles in reactivating its nuclear power plants that have been suspended for regular inspections.

The general public is filled with a sense of distrust in not only TEPCO that has caused the nuclear disaster but also the government's nuclear power policy and standards for the safety of nuclear plants. While the government is authorized to decide whether to permit power suppliers to resume operations at their nuclear power stations, it also will be in a position to apply for such permission as the largest shareholder in TEPCO. Therefore, the government is required to provide a more convincing explanation if it grants TEPCO permission to reactivate its nuclear power stations.

First of all, the government should set up a planned new nuclear power regulatory agency as soon as possible and work out new safety standards for nuclear power stations based on the results of its investigation into the Fukushima disaster. Unless it explains the need for the resumption of operations at nuclear plants and the safety of such power stations based on such efforts, the government is highly unlikely to win the public's understanding.

Furthermore, the government needs to clarify its policy goal of getting rid of all nuclear plants in the future and show specific measures to achieve this in efforts to convince the general public.

The costs of decommissioning the crippled nuclear plant and decontaminating areas tainted with radioactive substances from the power station still cannot be estimated. In this sense, the latest TEPCO rehabilitation plan is merely a provisional one. The plan points to the possibility of the government extending additional assistance to the utility, showing that no optimism is warranted about the prospects of TEPCO's rehabilitation.

Unless the rehabilitation of the utility progresses steadily, it will only increase the financial burden on taxpayers. Both TEPCO and the government, which has injected a massive amount of taxpayers' money into TEPCO to place the utility under its control, must be aware of the weight of their responsibility for the rehabilitation of the power supplier.

Toward a "new" TEPCO?

May 10, 2012

'New' TEPCO faces rocky road / Restoring public image, reducing power costs among top priorities

<http://www.yomiuri.co.jp/dy/business/T120509005171.htm>

Chiaki Toyoda and Tadaaki Inoue / Yomiuri Shimbun Staff Writers

With the new management lineup set for Tokyo Electric Power Co., incoming **President Naomi Hirose will face the challenge of reforming the company's tarnished reputation while maintaining a stable electricity supply to consumers.**

The new president already has a bulging in-box, including the difficult tasks of resuming operations at plants idled for routine maintenance and decommissioning damaged reactors.

The latest appointments were carried out at the initiative of the government's Nuclear Damage Liability Facilitation Fund, which backs TEPCO's compensation payments over damages due to the crisis at the utility's Fukushima No. 1 nuclear power plant.

The selection of Hirose, who was in charge of TEPCO's compensation negotiation headquarters for people affected by the crisis, was apparently aimed at creating the image of a "new TEPCO."

Kazuhiko Shimokobe, a lawyer who heads the nuclear damage fund's management committee, will replace Tsunehisa Katsumata as chairman.

===

TEPCO to reflect govt's will

Asked how he will steer the virtually nationalized company, Hirose, who is currently managing director, said at a press conference Tuesday, "This will be my first experience [as president], so I don't have any outlook."

The comment reflects the fact that the firm will follow the government's will and instructions in shaping its business operations.

Katsumata initially demanded that President Toshio Nishizawa keeps his post. However, past comments made by Nishizawa, such as "Rate increases are a power company's right," sparked a backlash, which led the government to flatly refuse Katsumata's request.

With the injection of public funds, the government will gain a majority equity stake in the power company on a voting rights basis. On the government's side, incoming Chairman Shimokobe led the selection process for the latest appointments of the new management executives.

Meetings between the government and all of TEPCO's corporate officers, including Hirose, continued into Golden Week in late April and early May. At the meetings, Katsumata and others voiced their ideas on appointing new corporate officers, but their suggestions were reportedly rejected by the government.

Shimokobe picked Hirose as the new president, saying Hirose, 59, has the zeal to reform the power company.

Many of TEPCO's former presidents have backgrounds in planning or general affairs.

The appointment of Hirose, whose experience is mainly in sales, is a rare case. Initially there was a proposal to select a new president from outside the board of directors. However, a decision was made to appoint someone from within the board out of consideration for the company's internal harmony.

===

Hikes envisioned

Under the new leadership, TEPCO will set up a management reform headquarters, which will be directly under the command of Hirose and Shimokobe.

The new office, which will tackle various business challenges, will have 20 to 30 staffers, including those from the fund as well as the power utility's young and midcareer employees.

TEPCO aims to raise household electricity rates by about 10.3 percent from July.

The company raised prices for large-lot consumers in April, but did not provide sufficient explanation, creating resentment among consumers, and leading some firms to refuse the hikes.

At the Tuesday press conference, Hirose said, "Taking the lesson from last time into consideration, we will thoroughly streamline the company, and then carefully explain the necessity of the hikes to consumers."

At the same press conference, the incoming president emphasized he would work on restarting reactors at the Kashiwazaki-Kariwa nuclear power plant in Niigata Prefecture. Without resuming operations at nuclear plants, which produce power more cheaply than other facilities, TEPCO's financial situation will not improve, forcing it to raise fees drastically.

However, in Niigata Prefecture strong distrust remains toward the company. Niigata Gov. Hirohiko Izumida maintains a cautious approach on the issue, casting a shadow over the prospect of restarting the reactors.

Government control or independence ?

May 11, 2012

Gov't eyes compromise with opposition over new nuclear safety agency

<http://mainichi.jp/english/english/newsselect/news/20120511p2g00m0dm125000c.html>

TOKYO (Kyodo) -- The government is considering striking a compromise with the opposition camp to expedite the creation of Japan's new nuclear safety agency, which has been delayed amid objections from the opposition, government sources said Friday.

The administration of Prime Minister Yoshihiko Noda, which attempted unsuccessfully to establish the new body on April 1, now hopes to speed up the process, as it is trying to deal with an expected rise in electricity use this summer with all of the nation's reactors having been suspended for checkups and unable to restart.

Both the government and two major opposition parties envision placing a nuclear power regulatory agency under the Environment Ministry, and separating the Nuclear and Industrial Safety Agency from the Ministry of Economy, Trade and Industry, which has promoted nuclear power.

But a bill the government has submitted to parliament seeks to have the environment minister decide personnel and budgetary affairs of the envisaged agency, citing the need for the government to be involved in crisis management.

In contrast, a bill presented last month by the main opposition Liberal Democratic Party and its ally the New Komeito party calls for creating a highly independent nuclear regulatory commission as an umbrella organization taking control of the new agency's personnel and budget matters.

The proposed commission would have its independence guaranteed under Article 3 of the National Government Organization Act, as is the case for the Japan Fair Trade Commission, the country's antimonopoly watchdog, and other entities.

The LDP and New Komeito want the commission to be sufficiently free from political influence, saying political intervention will only bring confusion in dealing with a nuclear accident.

The government has decided to review its nuclear regulations after the current setup of the nuclear safety agency under the industry ministry came under fire in the wake of the Fukushima nuclear crisis following the March 11, 2011 earthquake and tsunami.

But it is uncertain whether the ruling and opposition camps would come to full agreement given major pending issues such as the extent of the authority to be given to the new commission.

An average increase of over 10 percent for 3 years

TEPCO's business plan approved; utility effectively state controlled

The Yomiuri Shimbun

<http://www.yomiuri.co.jp/dy/national/T120510006596.htm>

The government has approved a special business plan for Tokyo Electric Power Co. that includes an injection of 1 trillion yen in public funds, effectively putting the utility under state control.

With the approval Wednesday, the utility, which runs the crisis-hit Fukushima No. 1 nuclear power plant, **will apply to raise electricity rates for households and small-lot users, such as convenience stores, later this week.**

Under the current rate, a household that uses 290 kilowatt-hours a month would be charged 6,973 yen. After the hike, that household would see its bill increase by 480 yen, or 6.9 percent.

The utility included the rate hike, together with cost-cutting measures, in its new comprehensive special business plan.

The average rate increase for households is 10.28 percent. Although the basic charge will remain the same, rates will rise incrementally in line with the amount of electricity used. Electricity use up to 120 kwh a month will see a hike of 0.74 yen per kwh. Use between 120 kwh and 300 kwh will see an increase of 2.3 yen per kwh, while that over 300 kwh will increase by 4.89 yen per kwh.

For large-lot users such as factories and offices, whose electricity charges have already increased by an average of 16.7 percent since April, the new plan will see their rate trimmed by 0.31 percentage point to 16.39 percent.

The new business plan, which features a corporate restructuring program, is based on the assumption that TEPCO's Kashiwazaki-Kariwa nuclear power plant in Niigata Prefecture will resume operations from fiscal 2013.

The rate hike is supposed to be for three years. With the restart of the plant, the rates would be returned to current levels from fiscal 2015.

However, as the Niigata prefectural government remains wary about giving the restart the go-ahead, there is no clear timeline for the plant to resume operations.

At a press conference after his ministry approved the plan, Economy, Trade and Industry Minister Yukio Edano said: "We can't say anything definite now about whether we can restart the plant. As a matter of course, we may review [TEPCO's plan] later." With regards to the rate hike, Edano said the government will make efforts to trim the increase.

Under the plan, the government will provide public funds of 1 trillion yen through the Nuclear Damage Liability Facilitation Fund to keep TEPCO's finances from deteriorating further. The utility is facing massive compensation payments due to the crisis.

With the latest funds, the total amount of public money provided to TEPCO will total about 3.5 trillion yen.

By providing the funds, the government will gain a majority equity stake and voting rights in TEPCO. Should corporate restructuring efforts not go as well as expected, the government will raise its voting rights to more than two-thirds, gaining the right to decide key corporate policies.

Most of the current board, including Chairman Tsunehisa Katsumata and President Toshio Nishizawa, will step down to take responsibility for the crisis at a shareholders meeting slated for late June.

Kazuhiko Shimokobe, head of the fund's steering committee, will become the new chairman, while Managing Director Naomi Hirose will take over as president.

Also included in the latest business plan are measures to slash costs--through such steps as staff reduction--by more than 3.3 trillion yen over a 10-year-period, and adopting a company-with-committees system to increase transparency.

With the adoption of the system, TEPCO will establish a nominating committee to select directors, an audit committee to monitor directors, and a compensation committee to decide directors' remuneration. These committees will be composed mostly of outside directors.

For an independent nuke commission

May 12, 2012

Editorial: Gov't should ensure independent nuclear power panel will function properly

<http://mainichi.jp/english/english/perspectives/news/20120512p2a00m0na007000c.html>

The government is required to ensure **an independent nuclear regulatory commission**, which it is set to launch under Article 3 of the National Government Organization Act, will effectively function and fulfill its responsibilities.

It is important to secure human resources and build a framework that can ensure the safety of nuclear power stations and promptly respond to any accidents in an appropriate manner. Both the ruling and opposition blocs are urged to hold consultations to add the finishing touches to the plan.

The crisis at the tsunami-hit Fukushima No. 1 Nuclear Power Plant has highlighted structural problems involving government organizations that regulate nuclear power stations. Specifically, it is inappropriate that the Nuclear and Industrial Safety Agency (NISA), which supervises the safety of nuclear plants, is under the umbrella of the Ministry of Economy, Trade and Industry (METI), which promotes nuclear power.

Nevertheless, new nuclear regulatory organizations have not yet been launched even though one year has passed since the outbreak of the crisis. Both ruling and opposition parties should be blamed for their negligence.

The government has submitted a bill to the Diet aimed at setting up a nuclear regulatory agency as an extra-ministerial organization of the Environment Ministry. At the same time, the largest opposition Liberal Democratic Party (LDP) and its ally, the New Komeito party, have made their proposal on the framework of regulatory bodies.

Both the government's plan and one proposed by the LDP-Komeito alliance are the same in that both call for separation of NISA from METI, but are different in how far new nuclear power regulatory bodies should be independent of the administrative body.

The government's plan would require the Environment Ministry to control the personnel management and budget of the regulatory agency. Under the LDP-Komeito plan, however, the regulatory commission would place the regulatory agency under its supervision and control the agency's personnel management and budget. Moreover, the appointment of members of the commission would have to be approved by the Diet.

The government is willing to basically accept the LDP-Komeito proposal, but it is still naive to believe that the regulatory commission will secure enough independence from the administrative body even if it is set up under Article 3 of the National Government Organization Act as proposed by the LDP and Komeito.

The question is who will be appointed as members of the commission. The panel will not win the public's understanding unless its members are selected from among those critical of government officials, researchers and industry insiders, who have promoted nuclear power and created the myth of nuclear plants' infallible safety, and are dedicated to the safety of the public.

The regulatory agency would handle practical regulatory work and support the commission. However, most of the agency's officials will likely be transferred from NISA and the Cabinet Office's Nuclear Safety Commission of Japan. The officials should not allow bureaucratic red tape to linger. Rules should be established to ban officials of the new regulatory agency from returning to the ministries and agencies where they once belonged.

A private fact-finding panel on the Fukushima nuclear crisis uncovered in February this year that the Japan Nuclear Energy Safety Organization, which is under the umbrella of NISA, had inspected nuclear power stations based on instruction manuals that were exact copies of documents produced by the plants' operators. The restructuring of the government's nuclear power regulatory organizations will be meaningless unless the implementation of safety regulations is improved.

The government had insisted that it would be easier for the new regulatory agency to respond to the emergency situation if it was placed under the Environment Ministry. Ruling and opposition parties are urged to thoroughly deliberate on how the regulatory commission would manage a crisis as an independent body to be established under Article 3 of the National Government Organization Act.

Since May 5, none of Japan's nuclear plants has been in operation. The government has released its estimate that if the No. 3 and 4 reactors at the Oi Nuclear Power Plant in Fukui Prefecture are reactivated, its operator Kansai Electric Power Co. will manage to secure enough electric power for consumption in the Kansai region this coming summer. However, reactivation of these reactors will hardly convince the public unless the new nuclear power regulatory bodies are launched or new safety standards are established based on the results of the investigation into the Fukushima nuclear disaster.

May 13, 2012

Opposition's N-safety plan to be OK'd by govt, DPJ

<http://www.yomiuri.co.jp/dy/national/T120512002930.htm>

The Yomiuri Shimbun

Resolution is on the horizon for the Diet impasse over a bill to create a nuclear regulatory agency, as the government and the ruling Democratic Party of Japan have decided to accept a counterproposal from the Liberal Democratic Party and New Komeito that calls for drastic revisions to the government-sponsored bill, government sources have revealed.

The ruling bloc is determined to make the concessions necessary to enact legislation to launch the government-envisioned nuclear regulatory body during the current legislative session, several government and DPJ sources said Friday.

The proposal put forth by the two major opposition parties says the government-envisioned nuclear regulatory agency, under the Environment Ministry, should be subordinate to what the LDP and Komeito have tentatively called a "nuclear regulatory commission."

This regulatory commission would have a highly independent status, much like the Fair Trade Commission under Article 3 of the National Government Organization Law.

Under the LDP-Komeito proposal, the government-planned agency would have about 500 employees and act as the secretariat of a five-member regulatory commission. Appointments to the independent commission would require Diet approval, sources said.

The capitulation of the ruling camp to opposition parties is expected to lead to an early start of Diet deliberations on the government-sponsored bill, according to the sources.

In exchange for the concession to incorporate the opposition-proposed commission into the government bill, the ruling bloc has called for the opposition to start Diet debates on the bill from Friday, they said.

The government hopes to establish the nuclear regulatory agency as early as June 1, the sources noted.

The opposition-envisioned nuclear regulatory commission would have the right to decide on a wide range of personnel and budgetary matters, as is the case with the FTC.

The government's bill would have empowered the environment minister to appoint the chief of the agency to ensure a swift political decision could be made in the event of a nuclear emergency.

The LDP-Komeito plans are designed to grant major decision-making authority to the nuclear commission, leading Environment Minister Goshi Hosono to express his concern that the commission, a collegial panel, could have difficulty handling a potential nuclear crisis.

The warning was ignored

May 15, 2012

TEPCO was warned of possible power loss from tsunami at nuclear plants in 2006

<http://mainichi.jp/english/english/newsselect/news/20120515p2a00m0na007000c.html>

The Nuclear and Industrial Safety Agency (NISA) warned the Tokyo Electric Power Co. (TEPCO) in 2006 of the possibility of losing all power at nuclear power plants in the event of a tsunami, **but this warning was ignored**, it has been learned.

The warning came after the 2004 earthquake off of Sumatra and ensuing tsunami, but NISA did not press power companies to put in place tsunami countermeasures. A NISA official says, **"If measures had been taken then, the Fukushima No. 1 Nuclear Power Plant disaster might have been prevented."**

The issuance of the warning was revealed by Economy, Trade and Industry Minister Yukio Edano at a press conference on May 15 after a Cabinet meeting.

NISA had been holding information sessions since January 2006 along with the Japan Nuclear Energy Safety Organization, TEPCO and other utilities. Because the tsunami from the Sumatra quake had forced a reactor-cooling seawater pump at a nuclear plant in India to go offline, effects and countermeasures for Japan's nuclear plants were discussed at the sessions. In August 2006, it was pointed out that a tsunami larger than expected could cause the seawater pump at the Fukushima No. 1 Nuclear Power Plant to go offline.

However, on May 14 at a meeting of a Diet committee investigating the Fukushima disaster, TEPCO Chairman Tsunehisa Katsumata said, "The warning was not transmitted to me, and the executives did not consider countermeasures."

Tsugara should be decommissioned straight away

May 15, 2012

Warnings over fault below nuke reactors in Fukui were ignored

<http://mainichi.jp/english/english/newsselect/news/20120515p2a00m0na010000c.html>

The possibility that a fault right below the nuclear reactor buildings at the Tsuruga Power Station in Fukui Prefecture may move in conjunction with nearby active faults has been repeatedly pointed out since 2008, but the government regulator and the plant's operator failed until recently to take any measures.

The Japan Atomic Power Co. (JAPC), the operator of the Tsuruga nuclear power plant, only released its plan on May 14 this year to survey the area to examine the possibility that the fracture zones -- a type of fault -- right below the plant's nuclear reactor buildings could in fact be active faults. The planned survey - - scheduled to be completed by November -- was approved by the government's Nuclear and Industrial Safety Agency (NISA) later the same day.

If the fracture zones are recognized as active faults that had moved sometime after around 120,000 to 130,000 years ago, the Tsuruga nuclear plant is likely to be decommissioned. It has been confirmed that there are 150 to 160 fracture zones on the premises of the plant in Tsuruga. On April 24, NISA surveyed three fracture zones, including two running below the building housing the plant's No. 2 reactor, raising the possibility that they could move in tandem with an active fault called the Urasoko Fault, located some 150 meters northeast of the No. 2 reactor.

On May 14, NISA held a meeting of experts to discuss the issue and approved JAPC's plan to report the survey results by November. While JAPC is poised to underscore its claim that the fracture zones are "not active faults" by conducting boring surveys at five locations at the nuclear plant, the plant cannot be reactivated unless the operator can provide evidence supporting these assertions.

Yuichi Sugiyama, the head of a research team at the National Institute of Advanced Industrial Science and Technology (AIST), which surveyed fault lines at the Tsuruga nuclear plant, said at the NISA meeting on May 14, "The possibility that the fracture zones are active faults cannot be ruled out at the moment. We should obtain reliable survey results, even if it takes time."

The presence of the fracture zones below the Tsuruga nuclear plant was mentioned in the application for permission to construct the No. 1 reactor, which was approved in 1966. However, it was determined at the time that the fracture zones were small-scale "dormant faults" from extremely old times, and they were not taken into consideration for the plant's seismic-resistant design. The presence of the Urasoko active fault -- located some 250 meters away from the No. 1 reactor -- had not been known by that time.

It was in 1991 that the presence of the Urasoko Fault came to surface. While it had initially been thought that the fault was about 3 kilometers long, several faults were later discovered to exist along its extension. Experts pointed out the risk of the faults moving together, but JAPC only acknowledged in March 2008 that they were active faults about 25 kilometers long.

Several experts had also earlier pointed out the possibility that the fracture zones at the Tsuruga nuclear complex could move in conjunction with the Urasoko Fault and could have a critical impact on the nuclear reactors. However, JAPC submitted a report to NISA in 2008, insisting that the fracture zones' activity period dates back to earlier times and that they would not move in tandem with the Urasoko Fault.

Mitsuhsa Watanabe, professor at Toyo University and a specialist in active faults, was skeptical about the JAPC report at the time. "Old fracture zones are consolidated and become stiff, but the report does not use such expressions as 'stiff' at all." The distribution of the fracture zones at the Tsuruga plant also convinced him that they were apparently linked to the Urasoko Fault. **Watanabe has thus repeatedly pointed out the possibility of the faults moving together** during academic meetings and other occasions since 2008.

However, JAPC and NISA failed to take immediate action. Even after an opinion was voiced demanding an in-depth examination of the issue during a council meeting at NISA in September 2010, the agency did not conduct an on-the-spot survey at the Tsuruga power station. **It was only after the nuclear disaster at the Fukushima No. 1 Nuclear Power Plant in March last year that NISA finally moved ahead to conduct a field survey at the Tsuruga plant, in April this year.**

During the survey, the fracture zones at the Tsuruga plant were found to be soft when scraped with sickles and extend linearly on the land surface. All four experts who took part in the survey agreed that the fracture zones "cannot be determined to be old faults." Masaru Kobayashi, director at NISA's seismic safety office, said remorsefully, "I should've ordered a survey much earlier."

Says professor Watanabe, **"Why did they fail to conduct the survey for such a long time on something that can be so easily understood by visiting the spot? It's not academic research but an argument for safety. The plant should be decommissioned right away."**

What happened at the top on 3-11

May 19, 2012

Convincing Kan to declare N-crisis 'took time'

The Yomiuri Shimbun

<http://www.yomiuri.co.jp/dy/national/T120518005327.htm>

The government's initial response to the Fukushima nuclear crisis was held up because it took more than one hour to persuade then Prime Minister Naoto Kan to declare a nuclear emergency, the industry minister at the time has revealed.

Banri Kaieda made the disclosure when he attended a session of the Fukushima Nuclear Accident Independent Investigation Committee as an unsworn witness Thursday.

It was the first time the committee conducted an open hearing investigation of a Diet member. Kaieda is a House of Representatives member from the ruling Democratic Party of Japan.

On the evening of March 11, 2011, Tokyo Electric Power Co., the operator of the Fukushima No. 1 nuclear power plant, informed Kaieda of a critical situation at the plant. Kaieda, who was the economy, trade and industry minister at the time, hurried to the Prime Minister's Office and asked Kan to declare a nuclear emergency, he told the panel.

However, it took more than one hour until Kan issued the declaration because "it took time to get the understanding of the prime minister," Kaieda said.

Kaieda asked Kan to issue the declaration and establish the Nuclear Emergency Response Headquarters to be headed by the prime minister.

However, Kan responded, "On what grounds?"

Yukio Edano, who was chief cabinet secretary at the time, special advisers to the prime minister and other staffers then scrambled to confirm relevant laws--such as the Law on Special Measures Concerning Nuclear Emergency Preparedness--that would justify the issuance of the declaration and establishment of the headquarters, Kaieda told the panel.

While they were desperately trying to confirm the legal basis for these actions, Kan attended a meeting of ruling and opposition party leaders and engaged in other business.

Holding back the issuance of the emergency declaration resulted in delays in the efforts by authorities to inform residents near the nuclear station about the accident.

Some members of the Liberal Democratic Party and other opposition parties have ripped into the initial response of the DPJ-led administration. "The delay reduced the time residents had to decide whether they should evacuate," an opposition lawmaker said.

Kaieda admitted that communications between the Prime Minister's Office, TEPCO's head office and the Fukushima No. 1 nuclear plant were poor and chaotic.

"It was like we were playing Chinese whispers. I thought, 'This situation has to change,'" Kaieda told the independent panel during the hearing, which lasted about 2-1/2 hours.

There have been conflicting reports over whether then TEPCO President Masataka Shimizu told the government he intended to withdraw all workers from the crippled plant on March 15, 2011. Kaieda said he remembered Shimizu telling him about "an evacuation from the No. 1 plant to the Fukushima No. 2 power plant."

"I clearly recall three words President Shimizu said when he telephoned me. 'No. 1 power plant,' 'No. 2 power plant' and 'evacuation,'" Kaieda said. "There was never any mention of leaving some workers at the plant" to try to stop the crisis from spiraling out of control.

TEPCO insists it never intended to evacuate its workers from the complex after it was battered by the March 11 earthquake and ensuing tsunami.

Current TEPCO President Tsunehisa Katsumata told a hearing investigation by the committee Monday that "there is no truth" in the claim that the utility asked the government for permission to pull all its workers from the nuclear plant.

1 trillion yen for TEPCO on July 25

May 22,2012

TEPCO to be nationalized July 25, gov't to acquire up to 75% stake

<http://mainichi.jp/english/english/newsselect/news/20120522p2g00m0dm011000c.html>

TOKYO (Kyodo) -- The government will effectively nationalize Tokyo Electric Power Co. on July 25 by injecting 1 trillion yen in public money into the nation's biggest utility facing huge costs stemming from the Fukushima Daiichi nuclear power plant disaster, Tokyo Electric said Monday.

The government will initially acquire 50.11 percent of the company's voting rights, enabling the state to choose the board members, and will be able boost the government ownership stake to up to 75.84 percent for even stronger control in pushing for reforms.

To effect the changes, TEPCO plans to change its articles of incorporation at its annual shareholders' meeting on June 27 to allow it to increase its authorized shares from 1.8 billion now.

TEPCO will then issue two new types of preferred shares -- one carrying voting rights, and another with no such rights but convertible to common shares with voting rights.

The state-backed Nuclear Damage Liability Facilitation Fund will pay the 1 trillion yen to TEPCO on July 25, and in return acquire 1.6 billion preferred shares with voting rights for 200 yen each and 340 million convertible shares for 2,000 yen each.

TEPCO also intends to cut more than 3.37 trillion yen in costs over 10 years to March 2022, and carry out various reforms in line with a restructuring plan approved by the government earlier this month.

The government will start recouping the 1 trillion yen in taxpayer money once the fund sees progress in reforming the company, or judges the company capable of raising funds through the corporate bond market.

Because of the changes, the Tokyo metropolitan government, the current largest shareholder, will see its stake halved to 1.34 percent, from 2.68 percent at the end of March. The stake could fall to 0.65 percent in the future.

JAEC pro-nuke secret meeting

May 24, 2012

JAEC had secret 'study meeting' of nuclear advocates to draft reprocessing policy report

<http://mainichi.jp/english/english/newsselect/news/20120524p2a00m0na014000c.html>

The Japan Atomic Energy Commission (JAEC) invited only pro-nuclear people from government and power industry bodies to have a secret "study meeting" on April 24 to draft a report on the country's policy of reprocessing spent nuclear fuel, it has been learned.

At the study meeting, a draft report with a cover sheet which read "Handle with care" was handed out to about 30 participants. The "Overall Evaluation" in the draft report -- the conclusion of the report -- was then rewritten in such a way as to make it in favor of reprocessing spent nuclear fuel in accordance with the wishes of power companies before it was submitted to a JAEC subcommittee. While the government has been emphasizing its plan to review the country's nuclear policy from scratch, the revelation highlights the fact that the policy-making process has been distorted.

The JAEC subcommittee incorporated the amended version of the overall evaluation into its report and presented it to the "council of new national energy policy" chaired by JAEC Chairman Shunsuke Kondo on May 23. The report is to be presented to the government's Energy and Environment Council soon.

The Mainichi obtained 79 pages of A-4 size documents. "For use for 4/24 Study Meeting" is written on the upper right of the cover of the documents, with the title: "The Technical Subcommittee on Nuclear Power, Nuclear Fuel Cycle, etc. (the 13th round)." The documents were the draft version of the report that was scheduled to be discussed on April 27.

The secret study meeting was held for about two hours from shortly after 5 p.m. on April 24 at the Central Government Building No.4 in Tokyo's Kasumigaseki district where JAEC is located. The participants in the meeting included JAEC Vice Chairman Tatsujiro Suzuki; Cabinet Office officials in charge of nuclear policy; Hideo Morimoto, director of the Nuclear Facilities Development and Nuclear Fuel Cycle Industry Division at the Agency for Natural Resources and Energy; Hideki Oda, director of the nuclear energy division at the Federation of Electric Power Companies of Japan; Harukuni Tanaka, managing director at Japan Nuclear Fuel Ltd.; a top official of the Japan Atomic Energy Agency, which operates the Monju prototype fast-breeder reactor; and employees of power firms including Tokyo Electric Power Co. and Japan Atomic Power Co. Tatsujiro Suzuki was the only official representing JAEC.

The subcommittee discussed policies of reprocessing all spent nuclear fuel, direct disposal of spent nuclear fuel and a "concurrent" approach of reprocessing some spent fuel and directly disposing of other spent fuel. According to sources concerned, a top official of the Japan Nuclear Fuel Ltd. asked at the secret meeting for maintaining the reprocessing plant in Rokkasho, Aomori Prefecture. JAEC's Suzuki, who chaired the meeting, was quoted as saying in his reply, "The concurrent approach is the best because it does not affect the project (at the reprocessing plant)." While it is difficult to secure consent on the idea of reprocessing all spent nuclear fuel because of the reprocessing plant being hit by a string of trouble in the past, they apparently feared that the direct disposal of all spent nuclear fuel could lead to the shutdown of the reprocessing plant.

Because the direct disposal of all spent nuclear fuel is more economically feasible even if the prices of uranium rise 30 fold, the overall evaluation in the original draft report said, "The direct disposal is

superior to reprocessing or the concurrent approach in terms of total costs." But while the amended draft report said "it was highly possible that direct disposal would be superior to reprocessing or the concurrent approach if the price of uranium remains at the current level," it emphasized the merits of the concurrent approach in many parts of the report saying in part, "the concurrent approach is slightly superior economically to reprocessing all spent nuclear fuel." The draft report was not discussed on April 27 due to a lack of time but it was discussed on May 8.

JAEC Chairman Kondo said, "It's too much (if the draft report was distributed). That is an issue that involves my supervisory responsibility." JAEC Vice Chairman Suzuki said, "I may have attended (the study meeting), but in the final analysis it did not affect the discussion at the subcommittee."

'Secret meeting' on fuel cycle was like gathering of 'nuclear villagers'

<http://mainichi.jp/english/english/newsselect/news/20120524p2a00m0na015000c.html>

A preposterous scene was recently played out behind closed doors in central Tokyo. A secret meeting on Japan's policy for its nuclear fuel cycle, dubbed a "study meeting," was held in the Kasumigaseki district on April 24. Government officials and businessmen from the power industry, who are supposed to draw a sharp line between the two sides, enjoyed chatting and laughing with one another. It was something like a gathering of "nuclear villagers."

A mysterious document was distributed to each participant. The Mainichi's reporting team later found out that the document was in fact the original draft report that was to later be presented to the subcommittee of the Japan Atomic Energy Commission (JAEC).

Shortly after 5 p.m. on April 24 -- at conference room 743 on the seventh floor of the Central Government Building No. 4 -- a reporter witnessed men in business suits filing into the conference room one after another through doors that were kept open. **They were all pro-nuclear people** from JAEC, the Cabinet Office, the Agency for Natural Resources and Energy in the Ministry of Economy, Trade and Industry, the Federation of Electric Power Companies of Japan, Japan Nuclear Fuel Ltd., Tokyo Electric Power Co., etc. There was no one there who was opposed to or cautious about the use of nuclear power.

Holding a pile of documents under his arm, a man in a blue shirt entered the room and put the documents on a desk somewhat roughly. He divided the documents into two piles because if he put them in one stack, it could crumble. One of the piles was about 20 centimeters high and the other about 10 centimeters. It was later found out that the documents were the original draft report for the "Technical Subcommittee on Nuclear Power, Nuclear Fuel Cycle, etc." The draft report was actually discussed at a subcommittee meeting 14 days later.

Two officials from the Cabinet Office distributed one set of the documents to each participant sitting at desks arranged in a square shape. Sitting near the doors, a top official of the Japan Atomic Energy Agency (JAEA), which operates the prototype fast-breeder reactor Monju, was poring over the documents. Soon afterwards, the participants started chatting with one another. When one of the members criticized Tetsunari Iida, a staunch opponent of nuclear power and head of the Institute for Sustainable Energy Policies (ISEP), by name, the participants burst into laughter.

At 5:10 p.m., the doors to the conference room were closed quietly and the secret meeting kicked off. According to sources concerned, a top official of Japan Nuclear Fuel Ltd., which operates the reprocessing plant in Rokkasho, Aomori Prefecture, asked other participants to accept the concurrent approach of "reprocessing and directly disposing of spent nuclear fuel," which could help the firm survive. According to the sources, he stressed that "if the Rokkasho facility were to be abandoned and spent nuclear fuel were to be disposed of directly, problems would occur here and there." If the reprocessing business at Rokkasho fell apart, it is said that about **2.9 metric tons of spent nuclear fuel** will have to be hauled out of the storage facility in Rokkasho.

The subcommittee presented its report containing the "Overall Evaluation" full of expressions in favor of the concurrent approach to the "council of new national energy policy" on May 23. An industry ministry official condemned the report, saying, "Even if spent nuclear fuel is reprocessed, waste must eventually be disposed of. At a time when the government and bureaucrats need to come together and toil to create permanent disposal facilities, they are pushing for a policy that will only delay the inevitable."

When the Mainichi reported in its morning edition on May 8 that an agenda item for the "council of new national energy policy" headed by JAEC Chairman Shunsuke Kondo had been covered up because it stood in the way of reactivating idled nuclear reactors, Kondo said "there was no problem." But in light of what happened at the secret meeting, the same excuse will never be acceptable.

When a Cabinet Office official, acting as an official of the secretariat for the council, distributed the agenda item for the council entitled "(Nuclear power's) Coexistence with local communities" to the Agency for Natural Resources and Energy, the Federation of Electric Power Companies and others concerned, he was told that, "Should they include Shiga Prefecture (which is cautious about reactivation of idled nuclear reactors)? If so the council meeting will be bogged down." Then, the agenda item was withdrawn.

While insisting that it was inappropriate to hand it out to power suppliers, Kondo said, "That was not an agenda item but a memo. If it was an agenda item, it should have been arranged in a Power Point format ... The secretariat sent it out through e-mail by mistake."

But the original draft report distributed at the secret meeting came in a Power Point format. Furthermore, it was distributed not by e-mail but it was handed out directly to people from the power industry at the

meeting. When the cover-up issue was pointed out earlier this month, Goshi Hosono, the state minister in charge of nuclear accidents, stood behind Kondo. We will see how Hosono will respond to this latest scandal.

JAEC pro-nuke secret meeting

May 24, 2012

JAEC had secret 'study meeting' of nuclear advocates to draft reprocessing policy report

<http://mainichi.jp/english/english/newsselect/news/20120524p2a00m0na014000c.html>

The Japan Atomic Energy Commission (JAEC) invited only pro-nuclear people from government and power industry bodies to have a secret "study meeting" on April 24 to draft a report on the country's policy of reprocessing spent nuclear fuel, it has been learned.

At the study meeting, a draft report with a cover sheet which read "Handle with care" was handed out to about 30 participants. The "Overall Evaluation" in the draft report -- the conclusion of the report -- was then rewritten in such a way as to make it in favor of reprocessing spent nuclear fuel in accordance with the wishes of power companies before it was submitted to a JAEC subcommittee. While the government has been emphasizing its plan to review the country's nuclear policy from scratch, the revelation highlights the fact that the policy-making process has been distorted.

The JAEC subcommittee incorporated the amended version of the overall evaluation into its report and presented it to the "council of new national energy policy" chaired by JAEC Chairman Shunsuke Kondo on May 23. The report is to be presented to the government's Energy and Environment Council soon.

The Mainichi obtained 79 pages of A-4 size documents. "For use for 4/24 Study Meeting" is written on the upper right of the cover of the documents, with the title: "The Technical Subcommittee on Nuclear Power, Nuclear Fuel Cycle, etc. (the 13th round)." The documents were the draft version of the report that was scheduled to be discussed on April 27.

The secret study meeting was held for about two hours from shortly after 5 p.m. on April 24 at the Central Government Building No.4 in Tokyo's Kasumigaseki district where JAEC is located. The participants in the meeting included JAEC Vice Chairman Tatsujiro Suzuki; Cabinet Office officials in charge of nuclear policy; Hideo Morimoto, director of the Nuclear Facilities Development and Nuclear Fuel Cycle Industry Division at the Agency for Natural Resources and Energy; Hideki Oda, director of the nuclear energy division at the Federation of Electric Power Companies of Japan; Harukuni Tanaka, managing director at Japan Nuclear

Fuel Ltd.; a top official of the Japan Atomic Energy Agency, which operates the Monju prototype fast-breeder reactor; and employees of power firms including Tokyo Electric Power Co. and Japan Atomic Power Co. Tatsujiro Suzuki was the only official representing JAEC.

The subcommittee discussed policies of reprocessing all spent nuclear fuel, direct disposal of spent nuclear fuel and a "concurrent" approach of reprocessing some spent fuel and directly disposing of other spent fuel. According to sources concerned, a top official of the Japan Nuclear Fuel Ltd. asked at the secret meeting for maintaining the reprocessing plant in Rokkasho, Aomori Prefecture. JAEC's Suzuki, who chaired the meeting, was quoted as saying in his reply, "The concurrent approach is the best because it does not affect the project (at the reprocessing plant)." While it is difficult to secure consent on the idea of reprocessing all spent nuclear fuel because of the reprocessing plant being hit by a string of trouble in the past, they apparently feared that the direct disposal of all spent nuclear fuel could lead to the shutdown of the reprocessing plant.

Because the direct disposal of all spent nuclear fuel is more economically feasible even if the prices of uranium rise 30 fold, the overall evaluation in the original draft report said, "The direct disposal is superior to reprocessing or the concurrent approach in terms of total costs." But while the amended draft report said "it was highly possible that direct disposal would be superior to reprocessing or the concurrent approach if the price of uranium remains at the current level," it emphasized the merits of the concurrent approach in many parts of the report saying in part, "the concurrent approach is slightly superior economically to reprocessing all spent nuclear fuel." The draft report was not discussed on April 27 due to a lack of time but it was discussed on May 8.

JAEC Chairman Kondo said, "It's too much (if the draft report was distributed). That is an issue that involves my supervisory responsibility." JAEC Vice Chairman Suzuki said, "I may have attended (the study meeting), but in the final analysis it did not affect the discussion at the subcommittee."

'Secret meeting' on fuel cycle was like gathering of 'nuclear villagers'

<http://mainichi.jp/english/english/newsselect/news/20120524p2a00m0na015000c.html>

A preposterous scene was recently played out behind closed doors in central Tokyo. A secret meeting on Japan's policy for its nuclear fuel cycle, dubbed a "study meeting," was held in the Kasumigaseki district on April 24. Government officials and businessmen from the power industry, who are supposed to draw a sharp line between the two sides, enjoyed chatting and laughing with one another. When one of the members criticized Tetsunari Iida, a staunch opponent of nuclear power and head of the Institute for Sustainable Energy Policies (ISEP), by name, the participants burst into laughter.

At 5:10 p.m., the doors to the conference room were closed quietly and the secret meeting kicked off. According to sources concerned, a top official of Japan Nuclear Fuel Ltd., which operates the reprocessing plant in Rokkasho, Aomori Prefecture, asked other participants to accept the concurrent approach of "reprocessing and directly disposing of spent nuclear fuel," which could help the firm survive. According to the sources, he stressed that "if the Rokkasho facility were to be abandoned and spent nuclear fuel were to be disposed of directly, problems would occur here and there." If the reprocessing business at Rokkasho fell apart, it is said that about **2.9 metric tons of spent nuclear fuel** will have to be hauled out of the storage facility in Rokkasho.

The subcommittee presented its report containing the "Overall Evaluation" full of expressions in favor of the concurrent approach to the "council of new national energy policy" on May 23. An industry ministry official condemned the report, saying, "Even if spent nuclear fuel is reprocessed, waste must eventually be disposed of. At a time when the government and bureaucrats need to come together and toil to create permanent disposal facilities, they are pushing for a policy that will only delay the inevitable."

When the Mainichi reported in its morning edition on May 8 that an agenda item for the "council of new national energy policy" headed by JAEC Chairman Shunsuke Kondo had been covered up because it stood in the way of reactivating idled nuclear reactors, Kondo said "there was no problem." But in light of what happened at the secret meeting, the same excuse will never be acceptable.

When a Cabinet Office official, acting as an official of the secretariat for the council, distributed the agenda item for the council entitled "(Nuclear power's) Coexistence with local communities" to the Agency for Natural Resources and Energy, the Federation of Electric Power Companies and others concerned, he was told that, "Should they include Shiga Prefecture (which is cautious about reactivation of idled nuclear reactors)? If so the council meeting will be bogged down." Then, the agenda item was withdrawn.

While insisting that it was inappropriate to hand it out to power suppliers, Kondo said, "That was not an agenda item but a memo. If it was an agenda item, it should have been arranged in a Power Point format ... The secretariat sent it out through e-mail by mistake."

But the original draft report distributed at the secret meeting came in a Power Point format. Furthermore, it was distributed not by e-mail but it was handed out directly to people from the power industry at the meeting. When the cover-up issue was pointed out earlier this month, Goshi Hosono, the state minister in charge of nuclear accidents, stood behind Kondo. We will see how Hosono will respond to this latest scandal.

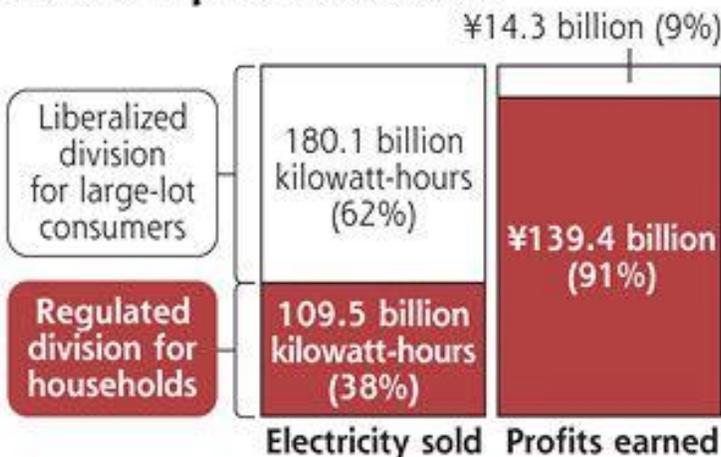

40% of power sold bring 90% profits to TEPCO

90% of TEPCO's annual average profits come from households

<http://www.yomiuri.co.jp/dy/national/T120523005516.htm>

The Yomiuri Shimbun

TEPCO's profit structure

Figures are the annual average between fiscal 2006 and 2010. Percentage figures are proportional to the total.

About 90 percent of Tokyo Electric Power Co.'s annual average profits came from sales to households from fiscal 2006 to 2010, even though the amount of power sold to such users accounts for only about 40 percent of the total for the period, according to a recent report.

Given this latest revelation, the power company will likely again face demands for a review of its rate calculation method.

TEPCO recently submitted a summary report outlining its earnings structure to the Economy, Trade and Industry Ministry.

According to the report, presented Wednesday at the second meeting of an expert panel to examine electricity rates, TEPCO sold an annual average of 289.6 billion kilowatt-hours to consumers from fiscal 2006 to 2010. Of this, electricity for households accounted for 38 percent, while that for large-lot consumers accounted for 62 percent.

In terms of sales during the same period, of 4.96 trillion yen generated, the proportions of power sales to households and large-lot consumers were almost the same, with 49 percent and 51 percent, respectively.

However, of the company's 153.7 billion yen profit, 91 percent was generated from electricity sales to households, while only 9 percent came from sales to large-lot users.

Within TEPCO's jurisdiction, gas companies and oil distributors among others are registered as power producers and suppliers (PPS) that can sell electricity to large-lot users.

As a result, a relatively competitive electricity market exists for large-lot consumers, forcing sellers to reduce rates for such users.

Therefore, it is believed TEPCO was trying to ensure its profits from the electricity it sold to households.

Household electricity rates are regulated, with the overall price including costs for power distribution and transmission.

The current system allows a business reward whereby TEPCO can add a fixed portion of its assets related to the electricity business, such as maintaining its power transmission grid, to the rates it charges.

Therefore, the more TEPCO spends on facility investment to increase its power output, the greater its business reward, which can be added on to the regulated household rates.

Experts have pointed out that such a structure makes reduction of household electricity prices difficult.

The expert panel aims to reduce the average 10.28 percent price hike for household electricity rates recently sought by TEPCO.

"Black box" scandal(s)

May 25, 2012

Yoroku: Dismantling the 'black boxes' of Japanese nuclear power

<http://mainichi.jp/english/english/perspectives/news/20120525p2a00m0na007000c.html>

A device that spat out chocolate if someone deposited 100 yen into a coin slot could fit the definition of what is known in science and engineering as a "black box" -- **a system whose inputs and outputs are visible, but not its inner workings**. Inside the facade may be your standard vending machine, a magical contraption that transforms metals into chocolate, or even a human being.

A couple of months ago, Tokyo Electric Power Co. (TEPCO), operator of the stricken Fukushima nuclear power station, announced that the water level in the No. 2 reactor containment vessel was only 60 centimeters deep. **What's going on inside the crippled reactors remains unknown for the most part**. In other words, **the nuclear disaster has created its own "black boxes" whose input is cooling water and whose output is highly radioactive water**.

Japan's nuclear safety administration, which downplayed the risks of a serious nuclear disaster and failed to take measures against a massive tsunami and loss of power, is responsible for bringing these troublesome black boxes into existence. It's only natural that the nuclear policymaking process dominated by the "nuclear village" -- the name given to the nation's pro-nuclear collection of politicians, bureaucrats, academics, and utilities -- has come to be looked upon with great suspicion.

Now, another black-box scandal in nuclear policymaking has emerged.

It was recently reported that the Japan Atomic Energy Commission (JAEC) held a secret meeting on April 24, before a JAEC subcommittee compiled and submitted a report on the country's policy of reprocessing spent nuclear fuel to the "council of new national energy policy" on May 23. The discussion, dubbed a "study meeting," took place behind closed doors, with only pro-nuclear parties from government and power industry bodies invited to attend. The chief of the JAEC subcommittee was also in attendance.

If the JAEC merely needed to hear the opinions of power companies, they could have held a public hearing. News of what could be seen as further collusive activity by the "nuclear village" -- and what could be interpreted as the "village" flaunting its indifference to the fact that it is already the target of widespread distrust -- is maddening the public.

It is said that the black boxes at the Fukushima plant will take decades to decommission. **But the black box that spawned the nation's nuclear policy can be dismantled today.** ("Yoroku," a front-page column in the Mainichi Shimbun)

Hosono criticises JAEC (but not too severely)

Hosono raps panel for seemingly acting in favor of nuclear industry

<http://mainichi.jp/english/english/newsselect/news/20120525p2g00m0dm102000c.html>

TOKYO (Kyodo) -- Nuclear disaster minister Goshi Hosono on Friday criticized a government panel on nuclear fuel cycle policy for acting in a way that could be construed as favoring the nuclear industry.

He was referring to a study meeting convened by the Japan Atomic Energy Commission, during which the panel showed a draft report on its assessment of nuclear fuel cycle policy options only to nuclear power promoters, such as utilities, before disclosing it to the public.

"It is a problem that documents were distributed to (electricity) companies in advance. Such a practice must be changed," Hosono told a press conference.

But he said that the commission needs to hear the opinions of companies and other entities involved in nuclear fuel cycle matters to compile the policy, adding that contact between the panel members and the utilities was not in itself a problem.

Noting that the draft report was scrutinized in a public setting, Hosono also denied that the panel's decision was influenced by the industry.

The study meeting was attended only by promoters of nuclear power, including the Economy, Trade and Industry Ministry, the Federation of Electric Power Companies of Japan and Japan Nuclear Fuel Ltd., which operates a spent fuel reprocessing plant in the village of Rokkasho in Aomori Prefecture.

Some of the wording of the draft report was revised in favor of nuclear power promoters after the meeting.

Hosono told the press conference that he also wants to review the organization of the commission's secretariat, which includes people dispatched from utilities.

"It is not desirable to arouse the public's suspicions. I am considering having them return to their companies when the timing is right," he said.

Secret meetings with pro-nukes produced no minutes

May 25, 2012

Atomic commission chief admits attendance at secret session on nuclear fuel cycle

<http://mainichi.jp/english/english/newsselect/news/20120525p2a00m0na020000c.html>

Shunshuke Kondo, chairman of the Japan Atomic Energy Commission (JAEC), attended a closed-door meeting on a review of the nation's nuclear fuel cycle policy on Dec. 8 last year, according to memos obtained by the Mainichi Shimbun.

The revelation comes after the JAEC was found to have held closed-door "study" sessions with only pro-nuclear members in attendance. **The JAEC held such secret sessions over more than 20 occasions**, and an official of the Education, Culture, Sports, Science and Technology Ministry, which is in charge of research and development of fast-breeder reactors, also participated.

The commission, which is overseen by the Cabinet Office, did not produce minutes of those secret meetings, and after each session, Cabinet Office officials in charge of nuclear policy were tasked with retrieving the many materials that had been distributed.

Following the finding by the Mainichi, Chief Cabinet Secretary Osamu Fujimura told a news conference on May 25 that the JAEC held 23 closed-door meetings from last November to April this year and that Chairman Kondo attended the first four sessions.

According to memos written by participants in the Dec. 8 meeting that Chairman Kondo attended, the gathering was held from 4 to 6 p.m. in a conference room of the Cabinet Office. The JAEC held the meeting ahead of full-scale discussions from January by its subpanel on Japan's nuclear fuel cycle policy regarding how to dispose of spent nuclear fuel.

Besides Kondo, participants included JAEC Vice Chairman Tatsujiro Suzuki; Commissioner Etsuko Akiba; an assistant division chief of the science ministry; Hirobumi Kayama, director of the Office for International Nuclear Energy Cooperation at the Agency for Natural Resources and Energy; Kimihide Namura, director of the Radioactive Waste Management Policy Office at the agency; Harukuni Tanaka, managing director at Japan Nuclear Fuel Ltd., which operates an atomic fuel cycle facility in Rokkasho, Aomori Prefecture; and senior officials of the Federation of Electric Power Companies of Japan -- made up of the Japan Atomic Energy Agency, which manages the prototype fast-breeder reactor Monju, and other electric power firms.

All participants were proponents of nuclear power and there were no opponents or skeptics present at the meeting.

Interviews with people familiar with the meeting and a subsequent probe found that the JAEC held more than 20 secret meetings, including one on April 24 this year in which copies of a draft report on the assessment for options on how to dispose of spent nuclear fuel were distributed ahead of the subpanel's meeting and representatives of the electric power industry sought revisions in their favor.

Under an unwritten rule, distributed documents were collected after each session and minutes of those meetings were not prepared. Some participants scribbled memos on the content of the secret meetings and the names of participants and e-mailed them to selected parties.

The JAEC organization has a chairman and four other members, and the JAEC law stipulates that the commission can convene meetings attended by the chairman and two other members and exercise voting rights.

Kondo has said his commission has refrained from holding debate on nuclear policy among three or more commission members to ensure transparency, but acknowledged that he attended the Dec. 8 secret meeting with two other commission members. However, he maintains he did not do anything wrong because it was a study meeting to provide data and seek explanations from participants.

Flawed arguments

Jun. 12, 2012

Editorial: PM's flawed arguments for Oi reactor restarts play on fear, hobble reform

<http://mainichi.jp/english/english/perspectives/news/20120612p2a00m0na008000c.html>

Prime Minister Yoshihiko Noda's June 8 news conference on the restart of reactors at the Oi nuclear power plant in Fukui Prefecture appealed neither to our reason nor our hearts. The message he was trying to convey -- that the Oi plant reactors are safe and need to be brought back online -- was plainly aimed not at the Japanese people, but at Fukui Gov. Issei Nishikawa, whose okay is needed to flip the switch.

This approach cannot possibly win the support of the public, and there are a number of serious flaws with it. First of all, Noda stated that "accidents can be prevented even if the Oi plant is hit with an earthquake or tsunami on the scale of the one that struck Fukushima," and "even if the plant lost power, this would not result in damage to the reactor cores."

To begin with, the greatest lesson we've learned from the Fukushima nuclear disaster is that no matter how thorough preparations may be, accidents can still happen. Nevertheless, Noda has gone back to the now broken premise that "accidents can't happen" as a way to push forward with the Oi reactor restarts. In other words, the government has returned to the "safety myth" that underpinned nuclear power in Japan before the Fukushima disaster.

We must also take issue with using "Fukushima-like" as a parameter for defining "guaranteed safety." Whatever shape the next accident takes, it certainly won't be exactly the same as the March 2011 meltdowns at the Fukushima No. 1 nuclear plant.

Internationally, the safety of nuclear power is generally based on five "layers" of protection. The first three layers are preventative, while the fourth and fifth assume the occurrence of a major disaster, and call for protecting people and the environment from emissions of radioactive materials.

Some portion of recommended anti-quake work, such as base-isolation to insulate buildings against seismic vibrations, has not been carried out at the Oi plant, operated by Kansai Electric Power Co. This begs the question of how the fourth and fifth layers of protection are to be implemented in case of an accident. The prime minister has a duty to explain this thoroughly to the Japanese people.

Furthermore, Noda's statement that "if all of Japan's nuclear reactors remain idle, Japanese society will not function" is also flawed. The government has already said it is planning to break the country's

dependence on nuclear power, and is putting a great deal of time and effort into deliberations on what sort of energy mix Japan should be aiming for.

Even though these discussions have yet to reach a conclusion, Noda went on to say that "the livelihoods and daily lives of the Japanese people cannot be sustained if reactors are only restarted for the summer," and "from the energy security point of view, nuclear power is very important." These statements, we believe, leave true national debate on this issue behind in the dust.

Of course lives could be at stake if Japan is hit with sudden blackouts from a lack of electricity. Industry will also be affected if planned blackouts continue this year. This is a weighty problem indeed.

However, we've all known for more than a year that the country needs measures to deal with summer power shortfalls, and both the government and Kansai Electric have been negligent in developing those measures. And though these parties ought to be reflecting on and apologizing for their negligence, all we see them doing is fanning the flames of anxiety.

There is a major push on now to save electricity, cut down on peak usage, and create flexibility in the power system. To force the restart of the Oi plant reactors even amid all these efforts would be to crush the fragile bud of energy reform now growing in society.

Prime Minister Noda derided anti-restart arguments as "emotional." Anti-nuclear accident measures, however, are hardly a sentimental project. Is it not those pressing for reactor restarts even as the Fukushima disaster rages on that are the "emotional" ones?

More secret and dissimulation

June 19, 2012

Experts at secret meeting decided to cover up scenario for dealing with spent nuclear fuel

<http://mainichi.jp/english/english/newsselect/news/20120619p2a00m0na015000c.html>

Pro-nuclear power experts who gathered at secret meetings in March organized by the Japan Atomic Energy Commission (JAEC) decided to **conceal a scenario for dealing with spent nuclear fuel which would be unfavorable to the promotion of fast-breeder reactors**, from a subcommittee, it has been learned.

JAEC, under the umbrella of the Cabinet Office, has submitted three other scenarios to the subcommittee after deleting the scenario in question, clarifying that the secret meetings influenced the core of Japan's so-called nuclear fuel cycle policy.

The subcommittee of JAEC reviewing the nuclear cycle policy discussed the three scenarios and is set to submit them to the government's Energy and Environment Council.

Four members of a JAEC experts' panel on new nuclear energy policy have urged JAEC not to submit the scenarios to the government. "The proposals are unjustifiable because they were adopted in ignorance of a democratic process," read an opinion submitted to JAEC Chairman Shunsuke Kondo.

The Cabinet Office's atomic power policy division, five of whose members attended the March 8 secret meeting, refused to comment on the revelations. "We can't answer any question that could actually be a bluff."

In the nuclear fuel cycle project, spent nuclear fuel would be reprocessed and reused as fuel for nuclear reactors. Reactors in which the fission of a chain reaction is sustained by fast neutrons in the process of reusing spent fuel are called fast reactors (FRs). Among these, reactors that produce more fuel than original fuel, such as the Monju prototype reactor in Fukui Prefecture, are called fast-breeder reactors (FBRs).

The Mainichi Shimbun has recently obtained a document detailing four scenarios on whether to go ahead with the nuclear fuel cycle project, including one that attendees of the secret meeting agreed to cover up.

Scenario 1 calls for the reprocessing of all spent nuclear fuel and its use in commercial FRs. Under scenario 2, part of spent nuclear fuel would be reprocessed and the remainder would be stored while research and development would be conducted to determine whether FRs can be put into commercial use.

Under scenario 3, part of the spent fuel would be reprocessed, the remainder would be disposed of and the project of putting FRs into commercial use would be discontinued. Scenario 4 calls for disposal of all spent nuclear fuel and the discontinuation of the project of putting FRs into practical use.

If scenarios 1 and 2 were adopted, the Monju-related research and development project would be continued, but scenarios 3 and 4 would mean that the project must be called off.

When the four scenarios were submitted to one of the secret meetings, held on March 8, for deliberations, attendees insisted that scenario 3 should be excluded.

"The subcommittee's discussions would certainly focus on the middle (scenarios 2 or 3) rather than scenario 1 that calls for reprocessing of all spent fuel or scenario 4 that envisages the disposal of all spent fuel. If scenario 3 were included, there would certainly be some subcommittee members who would choose it," one of them was quoted as telling the secret meeting.

"We've come to a crucial stage now. Scenario 2 is desirable and scenario 3 should be deleted," another reportedly said.

A document detailing the four scenarios was also distributed at another secret meeting on March 22. At the time, the moderator of the meeting said, "There was a plan to recommend four scenarios but we reduced them to three." However, attendees did not discuss the matter.

Scientists and public trust

June 20, 2012

Public trust in scientists, engineers dropped after Fukushima nuke disaster: gov't report

<http://mainichi.jp/english/english/newsselect/news/20120620p2g00m0dm088000c.html>

Public confidence in Japanese scientists and engineers declined after the outbreak in March 2011 of the crisis at the Fukushima No. 1 Nuclear Power Plant, the government said in its 2012 white paper on science and technology.

The white paper endorsed by the Cabinet on June 19 said, "Public confidence in scientists and engineers dropped" due to the accident at the crippled Fukushima nuclear power station.

Citing as an example the fact that robots made in Japan were almost useless to deal with the nuclear crisis, the annual government report pointed out that Japanese technological developments were not prepared for actual operations to respond to such disasters. On the fact that the government failed to provide sufficient information to the public, the report said, "It is important to prepare" a mechanism similar to those adopted by Britain and the United States to facilitate the provision of information from scientists to the government.

Asked whether it is good for experts to decide on the direction of research, only 19 percent of ordinary people polled in the questionnaire survey for the white paper said they thought so, down sharply from the pre-disaster level of 59 percent.

Meanwhile, in a survey on experts, 43 percent of the respondents said they were trusted, while 39 percent said they were not trusted. The white paper, therefore, lashed out at experts for their low sense of responsibility, saying that they did not take the declining public confidence in them seriously. The report, however, stopped short of making in-depth analysis and proposals as to why the gap in perception between the public and experts was created and what experts should correct or improve.

While stressing the need to recognize higher risks accompanied by developments of science and technology, the report said transmission of information in emergency situations should be discussed on a routine basis. It then said, "Japan must become a country capable of minimizing damage and recovering quickly."

Bad start for transparency

June 20, 2012

Delayed disclosure at Ohi plant

http://www3.nhk.or.jp/daily/english/20120620_15.html

The operator of the Ohi nuclear power plant says an alarm went off on Tuesday on a water level detector at its No.3 reactor.

The plant in Fukui Prefecture, central Japan will become the first to go back online in Japan since last year's disaster.

Kansai Electric Power Company said on Wednesday that the alarm suggested the water level had fallen in a tank used to cool an electric power generator at its No.3 reactor.

The firm says workers who examined the tank found no leaks but that the water level was about 5 centimeters lower than usual. The company says it's investigating the cause of the alarm.

The No.3 reactor is one of 2 being readied for a restart in line with a central government decision on Saturday.

The government has set up a special monitoring system with resident inspectors at the plant to deal promptly with possible accidents and problems.

But **the disclosure of Tuesday's incident came about 13 hours after the alarm went off.**

Kansai Electric says it did not make the information public on Tuesday because the incident did not match levels requiring disclosure by law and in-house rules.

Nuclear and Industrial Safety Agency official Yasushi Morishita apologized at a news conference, saying his lapse in judgment caused the delayed disclosure.

Water-level alarm goes off at Oi Nuclear Power Plant; no abnormalities detected

<http://mainichi.jp/english/english/newsselect/news/20120620p2a00m0na010000c.html>

A water-level alarm went off at the Oi Nuclear Power Plant in Fukui Prefecture on June 19, plant operator Kansai Electric Power Co. (KEPCO) said, as preparations for the controversial restart of two reactors at the plant continue.

KEPCO announced June 20 that an alarm indicating a decreased water level in a generator cooling tank of the plant's No. 3 reactor was activated at 9:51 p.m. on June 19. Work at the plant is being monitored on a 24-hour basis.

In a news conference starting at 11 a.m. on June 20, the Nuclear and Industrial Safety Agency apologized for the half-day delay between the incident and its announcement.

KEPCO said the alarm stopped after four minutes. Officials said there were no abnormalities with the water level in the tank, and it was thought that the water level had changed temporarily when a pump started operating.

It was the first alarm at the plant since work began on June 16 in preparation for the restart of the No. 3 and 4 reactors.

The new regulatory panel by September?

June 21, 2012

Bill to create new nuclear regulatory body passes Diet

<http://mainichi.jp/english/english/newsselect/news/20120621p2g00m0dm007000c.html>

TOKYO (Kyodo) -- The House of Councillors on Wednesday passed a bill to create a new nuclear regulatory body that will play a key role in enhancing Japan's nuclear regulations in the wake of last year's Fukushima Daiichi atomic power plant disaster.

Following the passage of the bill, resulting in its enactment, the government is expected to step up its efforts to launch a "nuclear regulatory commission" with a high degree of independence by September, consisting of five members with expertise on such issues as nuclear reactors and earthquakes.

The new regulatory framework is different from what the government had initially expected to create because the ruling and opposition parties engaged in negotiations and crafted a new bill largely based on a proposal from the opposition bloc.

While the commission will be placed under the Environment Ministry, its independence will be guaranteed legally by giving it status akin to the country's antimonopoly watchdog the Japan Fair Trade Commission.

Ensuring the independence of the new body has been an important point amid criticism that the existing nuclear safety agency may have lacked teeth as it is under the umbrella of the Ministry of Economy, Trade and Industry, a promoter of nuclear power.

The launch of the commission is likely to affect the issue of whether to restart other reactors in addition to the Nos. 3 and 4 units at Kansai Electric Power Co.'s Oi plant, which the government has decided to put back online to cope with power shortage concerns in the summer.

TEPCO justifies the way they dealt with the disaster

June 21, 2012

TEPCO justifies in nuclear accident report failure to predict huge tsunami

<http://mainichi.jp/english/english/newsselect/news/20120621p2g00m0dm016000c.html>

TOKYO (Kyodo) -- Tokyo Electric Power Co. on Wednesday, in its final report on the Fukushima Daiichi nuclear power plant disaster, admitted it was not sufficiently prepared to deal with tsunami-triggered nuclear accidents, but the utility justified its failure to predict the huge tsunami that hit the complex last year.

The over 10-meter-high tsunami that followed a huge earthquake on March 11, 2011, was "beyond expectations," the report said, reiterating the company's earlier view that the larger-than-expected

tsunami was the direct cause of the nuclear crisis, while criticizing the government for interfering in its efforts to bring the nuclear complex under control.

The report is a result of a year-long in-house investigation into the world's worst nuclear accident since the 1986 Chernobyl disaster. But it stopped short of digging deeper into the background of why Tokyo Electric could only make insufficient accident assumptions and left unanswered questions about the accident.

As in the interim report issued in December, the utility known as TEPCO maintained the view that key facilities at the plant withstood the impact of the magnitude 9.0 earthquake, but ensuing tsunami waves flooded electrical equipment and resulted in a loss of power, leading to the failure of reactor cooling systems.

Executive Vice President Masao Yamazaki told a press conference that TEPCO had taken measures to secure safety "to the extent possible," but the tsunami was on "a scale rare in all history." "Looking back, precautions were not sufficient," he said.

The report also said that not only the utility, but "people concerned in nuclear issues as a whole" were not able to predict that an event largely exceeding their expectations could occur, apparently referring to government bodies and experts involved in issuing assessments on the height of tsunami that could hit the plant.

Responding to criticism that staffers may have not had sufficient understanding of an emergency cooling system at the No. 1 unit called an isolation condenser, TEPCO insisted that they had been receiving training and had sufficient knowledge.

TEPCO, meanwhile, turned its fire on the government's response in the early stage of the nuclear crisis, saying that "unnecessary confusion" was caused for those on the front line by the interference of then Prime Minister Naoto Kan and other people at his office.

Such government behavior "only put the nuclear power plant chief in a dilemma and did not contribute to improve" the situation, it said.

The company's communications activities related to the crisis were also restricted because it had to seek approval from the prime minister's office and the Nuclear and Industrial Safety Agency before making announcements to the public, the report added.

TEPCO said it interviewed around 600 people who were involved in dealing with the crisis, which resulted in the meltdowns of the Nos.1 to 3 reactors at the plant.

The No. 2 reactor is believed to have leaked massive radioactive substances that seriously contaminated areas northwest of the Fukushima plant, although a hydrogen explosion did not take place inside the reactor building. But the report did not specify areas that were damaged.

Fukushima people don't agree with TEPCO' report

Fukushima residents call TEPCO nuke disaster report 'sloppy' and 'false'

<http://mainichi.jp/english/english/newsselect/news/20120621p2a00m0na017000c.html>

FUKUSHIMA -- Tokyo Electric Power Co. (TEPCO)'s final report on the Fukushima nuclear disaster has triggered a major backlash from prefectural residents and authorities who call it weak and even laced with falsehoods, it has been learned.

In the 352-page report, released on June 20 after a year-long internal investigation, TEPCO admits that the firm's tsunami policy had been insufficient. However, the utility justifies its unpreparedness by saying that the March 11, 2011 quake-triggered tsunami was "beyond expectations," and that the central government's "interference" obstructed its subsequent nuclear disaster management.

"TEPCO should have asked itself why it didn't have a sufficient tsunami policy and whether they had an opportunity to set one up," said Yoshihiro Koyama, head of Fukushima Prefecture's nuclear safety measures division. "We still don't know what happened in the cores of the No. 1, 2 and 3 reactors, among other unclear information. TEPCO should continue to try and explain all facts related to the crisis, and the government's disaster committee should do a deep investigation of the accident."

Meanwhile, Mayor Tamotsu Baba of the village of Namie points out a significant fabrication of data in TEPCO's report. While the document states that "TEPCO employees visited the village of Namie from March 13, 2011" to inform city authorities of details regarding the crisis, Baba says that they heard from TEPCO officials for the first time only in late March.

"This report is not just sloppy in content -- it includes falsified information," said Baba, who is expected to seek charges against the former TEPCO president and other officials for violating a liaison pact by not reporting to the Namie Municipal Government immediately after the outbreak of the disaster.

A 71-year-old resident who evacuated from Tomioka -- inside the evacuation zone around the plant -- and now lives at a temporary housing complex in the prefectural city of Koriyama, also criticized the report, saying that it is likely TEPCO may still be hiding information from residents.

"Despite being a final report, I feel somewhat that TEPCO is still hiding many things. It's crystal clear that the company tries to play innocent and escape responsibility," the man said.

All the government's fault

June 22, 2012

<http://www.yomiuri.co.jp/dy/national/T120621005349.htm>

TEPCO report blames govt / Points finger at PM, admits it was unprepared for large tsunami

The Yomiuri Shimbun

Tokyo Electric Power Co. has defended its actions following the March 11, 2011, earthquake and tsunami, claiming that interference by the Prime Minister's Office confused workers at the Fukushima No. 1 nuclear power plant during the initial period of the crisis there, according to a final report by TEPCO.

The report, released Wednesday, was compiled by an in-house panel convened in June last year. The report was based on about 600 hearings with employees and others, as well as computer analysis on why meltdowns occurred in the plant's reactors.

The 1,200-page report, however, left many issues unclear, such as why the No. 2 reactor released massive amounts of radiation into the air. Also, it made almost no references to the responsibilities of TEPCO Chairman Tsunehisa Katsumata and other executives.

The release of the report wraps up TEPCO's investigation of the crisis before a shareholder meeting next Wednesday.

"We've made the best possible efforts in conducting our investigation," said Executive Vice President Masao Yamazaki, head of the in-house panel, during a press conference Wednesday at the utility's headquarters in Chiyoda Ward, Tokyo.

The report emphasized that intervention by then Prime Minister Naoto Kan and other top government officials in the Prime Minister's Office "caused unnecessary confusion by making unrealistic demands."

Kan phoned Masao Yoshida, then head of the plant, the day after the Great East Japan Earthquake.

Kan and one of his aides spoke with Yoshida, proposing that the plant's reactors could be cooled down by referring to the 1979 nuclear crisis at Three Mile Island in the United States, the report said.

It described the instructions as "unrealistic given the actual state" of the reactors.

Regarding information released to residents near the crippled plant, which was criticized as being insufficient, the report again blamed the Prime Minister's Office.

TEPCO found it difficult to release information without approval from the office after it expressed dissatisfaction over TEPCO's release of a photo of the No. 1 reactor, which was hit by a hydrogen explosion the day after the disaster, the report said.

As a result, the utility could not promptly announce that pressure inside the No. 3 reactor's containment vessel was increasing March 14 until it obtained government approval, the report added.

Regarding safety measures against tsunamis, the report repeated that TEPCO had been "unprepared" for a tsunami of the size triggered by the Great East Japan Earthquake because it was beyond the scope of its estimates.

TEPCO estimated in the spring of 2008 that the plant could be hit by a tsunami as high as 15.7 meters. However, the report justified the utility's failure to take any countermeasures at that time because it was "just a provisional estimate."

"We're sorry we failed to prevent the reactor cores from being damaged," the report said.

However, the report repeated excuses regarding the tsunami by describing it as "one of the most powerful tsunamis ever seen" and "a giant tsunami beyond our imagination."

===

Denies withdrawal plan

Regarding whether TEPCO considered withdrawing all workers from the crippled Fukushima plant, the report insisted the utility did not have such a plan. It cited an internal document stipulating that all employees "except for emergency workers" should be evacuated quickly in the event of an accident.

The report said the utility "found it odd" when Kan shouted that withdrawing all workers from the plant would be unacceptable during his visit to TEPCO's headquarters.

When the Diet-appointed Fukushima Nuclear Accident Independent Investigation Commission conducted a hearing last month with then Economy, Trade and Industry Minister Banri Kaieda, he mentioned a telephone call he received from then TEPCO President Masataka Shimizu.

"They used the word 'withdrawal,' and never mentioned that some [of the plant's workers] would remain there," he told the panel.

However, the panel announced June 9 that it "cannot confirm that TEPCO made a decision to withdraw all workers" from the plant, based on Yoshida's testimony.

A similar investigation by the government also supported this when it released an interim report in December.

On the other hand, the Independent Investigation Commission on the Fukushima Nuclear Accident, set up as a private-sector panel by the Rebuild Japan Initiative Foundation, said, "There is not enough evidence to support TEPCO's claims" that all top government officials at the Prime Minister's Office believed the utility would withdraw all workers from the crippled plant.

June 21, 2012

TEPCO report on Fukushima nuke disaster dodges blame, points finger at gov't

<http://mainichi.jp/english/english/newsselect/news/20120621p2a00m0na013000c.html>

An internal Tokyo Electric Power Co. (TEPCO) report on the Fukushima nuclear meltdowns released on June 20 heaps blame on the government for worsening the situation, while absolving the firm of nearly all responsibility for the disaster.

Speaking at a news conference on the release of the report, TEPCO Vice President and internal investigative committee chair Masao Yamazaki admitted that there were "some problems" with how the utility responded to the March 2011 meltdowns. Furthermore, the report states that "all parties connected to the disaster, including this company, should reflect deeply on what happened."

However, Yamazaki maintained that TEPCO had "successfully carried out all prescribed procedures" and "employees did everything they could under difficult circumstances.

"There was trouble with several reactors simultaneously, and it was a very severe situation. Despite a total power failure, aftershocks and multiple tsunami warnings, (TEPCO staff) managed to cope," he added. The document itself traces the release of radioactive materials from the plant -- estimated at the equivalent of roughly 900,000 terabecquerels of radioiodine -- but does not address whether TEPCO could have done anything to lessen the severity of the disaster.

The report reserved particularly scathing criticism for former Prime Minister Naoto Kan, who visited the stricken plant just a day after the March 11, 2011 earthquake and tsunami triggered the nuclear disaster. Specifically, the report blamed Kan's visit and subsequent contacts with then Fukushima No. 1 plant manager Masao Yoshida for "promoting useless confusion" in the opening days of the crisis.

Yoshida was quoted in the report as saying an "oppressive" Kan was "in a fit of rage and screamed at me" during a March 15 video conference. "He demanded to know if anyone had run away, and if anyone had, who they were," Yoshida's statement read. Kan has repeatedly insisted that TEPCO had hinted it wanted to abandon the plant soon after the crisis began, but the report includes internal documents calling for evacuation of "all but essential emergency personnel," and concludes the staff was well aware of the need to deal with the meltdowns.

The committee also turned criticism of its "slow" public release of "meager" information on the developing crisis back on the government, concluding that Tokyo had "restricted both the content and the timing of information releases."

One example quoted was photos of the March 12 hydrogen explosion that blew apart the No. 1 reactor building. The photos were released before reaching the Prime Minister's Office, which allegedly viewed this as a problem. Then TEPCO President Masataka Shimizu subsequently told TEPCO staff, "From now on, all information goes to the PM's Office first, and nothing is to be released until we get permission from them."

The report states that as a result, information on rising pressure in the No. 3 reactor containment vessel on March 14 was released late as TEPCO tried to coordinate with the government.

The pattern of laying blame at the government's feet repeated itself throughout the TEPCO committee's findings. For instance, the committee claimed that responsibility for the No. 1 plant's failed tsunami

defenses lay not with the utility, but with the Ministry of Education, Culture, Sports, Science and Technology and the Nuclear and Industrial Safety Agency for "not instructing (TEPCO) to implement anti-tsunami measures immediately" -- despite a 2008 government report warning of massive waves.

TEPCO tries again to "duck responsibility"

June 22, 2012

Editorial: TEPCO internal report on Fukushima nuclear disaster nothing but self-justification

<http://mainichi.jp/english/english/perspectives/news/20120622p2a00m0na007000c.html>

The final report issued by Tokyo Electric Power Co. (TEPCO)'s in-house investigative panel on the Fukushima nuclear crisis looks like it was written up to counter the growing swarm of lawsuits that have been and could yet be filed against the utility and its board members.

The report attributes the meltdowns at the Fukushima No. 1 nuclear plant in March 2011 to "higher tsunami than predicted."

The panel reportedly interviewed a total of 600 people involved for the report, whose main body alone is 352 pages long. However, it failed to "clarify the cause of the nuclear crisis and propose measures needed to contribute to the safety of nuclear power stations," as it was required to. The panel was supposed to dig up the facts behind the disaster, get to the bottom of what happened and clarify where responsibility lies. This it fails to do. Rather, it makes excuses for what critics have called TEPCO's inappropriate response to the crisis. It's questionable whether such a company can continue to be allowed to operate nuclear plants.

For example, the government's investigative panel pointed out in its interim report in December last year that workers' skills were not up to operating cooling systems in the plant's No. 1 and 3 reactors. In response, the TEPCO final report argues that workers' lack of skill did not adversely affect the subsequent response to the accident. However, it fails to discuss how the situation would have developed if the workers had responded to the accident in a different way.

Moreover, the TEPCO report shifts the responsibility for predicting the tsunami risk to the nuclear plant to others, stating that "it is desirable for a specialized research organization, which is a government body, to show a coordinated view on the matter."

The report also concludes that then Prime Minister Naoto Kan and his staff's intervention in TEPCO's response to the crisis "promoted useless confusion." If a third-party body said so, it would have some power to persuade, but such an argument by the entity responsible for the disaster sounds like an attempt to duck responsibility.

Numerous questions remain regarding the crisis. The report concludes that the primary source of radioactive substances that spread to Iitate, Fukushima Prefecture and other areas northwest of the plant was its No. 2 reactor. However, no hydrogen explosion occurred in that particular unit, and which part of the reactor was damaged and the route of radioactive substances leaking into the air remain unclear. The report also states that primary devices in the reactor were not damaged by the earthquake, based on such data as the pressure and temperature in the reactor. TEPCO, however, has not yet confirmed the actual condition of the No. 2 reactor assembly, as persistently high radiation inside the reactor building have ruled out on-the-spot inspections.

The way that TEPCO discloses information has also been called into question. TEPCO headquarters and the Fukushima No. 1 plant are connected by a direct communications line, and video conferences between workers at these two locations have been filmed. The footage is crucial material for the effort to get to the bottom of TEPCO's response to the crisis, but the utility has refused to disclose it, citing concern for the privacy of those involved in the conferences. It would be a serious problem if the company were reluctant to disclose information because shareholders have filed damages suits personally against former and current board members. Accident victims have also sued the company.

International Atomic Energy Agency (IAEA) safety regulations stipulate that utilities are primarily responsible for the safety of nuclear plants they operate. Therefore, TEPCO has absolutely no way to evade its responsibility for the Fukushima nuclear crisis, and it is TEPCO's minimum responsibility to fully disclose information on the crisis.

The Fukushima nuclear disaster investigative panels of the executive and legislative branches of the government -- set to compile their own final reports shortly -- should release the results of their investigations in a way that can convince the public.

Utilities paid local governments ¥73 billion in dividends: sources

Kyodo

<http://www.japantimes.co.jp/text/nn20120624a2.html#.T-bXgpFIwpU>

Power companies paid out about ¥72.7 billion in dividends to municipalities nationwide in the last five years, sources said Saturday.

Local governments that received the funds, especially those that are leading shareholders in their regional utilities, will likely come under pressure to more actively convey residents' views on key issues, including nuclear safety and electricity charges, according to experts.

The city of Osaka, which is the top shareholder in Kansai Electric Power Co. with a stake of around 8.9 percent, received more than ¥5 billion in annual dividends since fiscal 2007, while Yamaguchi Prefecture, whose 13.3 percent stake in Chugoku Electric Power Co. makes it the utility's largest shareholder, netted about ¥2.4 billion in dividends each year.

The Tokyo Metropolitan Government, the leading shareholder in Tokyo Electric Power Co. with a roughly 2.6 percent stake, was paid around ¥10.8 billion in dividends annually.

The metropolitan government was using the funds to cover the cost of running the capital's public bus service, but that source of income has dried up since the nuclear crisis at Tepco's Fukushima No. 1 power plant started in March 2011.

Meanwhile, both Miyagi and Aomori prefectures own shares in Tohoku Electric Power Co.

Many local governments operated their own power generation facilities before the war but in 1941 were ordered by the government to hand them over to regional power companies. In exchange, they received shares in the utilities.

Gov't protecting nuke industry

June 23, 2012

Nuclear power plant collusion

<http://www.japantimes.co.jp/print/ed20120623a1.html>

As the March 2011 reactor meltdowns at Tokyo Electric Power Co.'s Fukushima No. 1 power plant demonstrated, loss of power sources for an extended period of time at a nuclear power plant — known as a "station blackout" (SBO) — can lead to catastrophic results. It was recently reported that the Nuclear Safety Commission colluded with Tepco over the nation's SBO-related safety standard about two decades ago.

This revelation and the recent government decision to restart the Nos. 3 and 4 reactors at Kansai Electric Power Co.'s Oi nuclear power plant in Fukui Prefecture only serve to reinforce the **widespread belief that the government is continuing to protect the interests of the nuclear power industry even in the wake of the Fukushima disaster.**

In 1990, the government issued a safety standard stating that there is no need to take into account SBOs lasting 30 minutes or longer in designing a nuclear power plant. Because preparations for long SBOs had become obligatory overseas, in 1991 the NSC established a working group to consider a revision of the safety standard. The group consisted of five experts and officials from Tepco, Kepco and the then Japan Atomic Energy Research Institute, which had a cooperative relationship with the power companies.

Because Tepco and Kepco opposed incorporating preparations for long SBOs into the design standard, the then Science and Technology Agency, which was serving as NSC's secretariat, asked the two power companies to "compose sentences" stating why there is no need to consider preparations for SBOs lasting more than 30 minutes and to submit them.

The working group subsequently adopted Tepco's explanation that nuclear power plant design in Japan has an adequate margin of safety, and that if a nuclear power plant is operated properly, the level of safety will be sufficient.

In June 1993, the working group issued a report saying that even if an SBO occurs, it would not lead to a severe accident. As a result, the government safety standard was not revised.

It is clear that what the NSC basically did was let a power company write the draft of its report.

Given that the meltdown at Fukushima No. 1 might have been prevented had the safety standard been revised, those involved in the process should be deeply ashamed of their actions.

In October 2011, the NSC purportedly made public "all" the documents it had related to the process. Only after the Diet committee investigating the Fukushima nuclear accident demanded further disclosure did the NSC release additional documents in early June revealing that the working group had asked Tepco and Kepco to "compose sentences."

The NSC must make public all its documents before it is abolished to make way for the establishment of a new nuclear regulatory authority around September

APEC draft

June 24, 2012

APEC ministers to agree on importance of nuclear energy use: draft

<http://mainichi.jp/english/english/newsselect/news/20120624p2g00m0dm009000c.html>

TOKYO (Kyodo) -- Energy ministers of the Asia-Pacific Economic Cooperation forum will agree at their two-day meeting from Sunday in St. Petersburg, Russia, on the importance of using nuclear energy to reduce carbon dioxide emission and to meet the growing demand for energy, a draft of the joint declaration obtained by Kyodo News showed Saturday.

"The APEC region recognizes the importance of the **safe and secure uses** of peaceful nuclear energy, and its potential in diversifying our energy mix, meeting the growing energy demand, and in reducing greenhouse gas emissions in the region despite the tragic accident at the Fukushima Daiichi nuclear power station" triggered by the March 2011 earthquake and tsunami, the draft of the "St. Petersburg Declaration" said.

The draft showed that the declaration, to be adopted Monday, will largely reflect the views of countries promoting nuclear power plants, led by Russia and the United States, while urging Japan to share the lessons it has learnt from the Fukushima crisis.

While the member countries and relevant international organizations coordinate efforts to ensure nuclear safety and dealing with possible problems, "We expect that Japan should contribute to the international approach by sharing its knowledge and experience, including information on the Fukushima Daiichi accident," the draft said, adding they "recognize the progress made by the Japanese government to bring the station to a stable condition."

Particular attention should be paid to strengthening cooperation by interested member economies of APEC and the relevant international organizations, notably the International Atomic Energy Agency, including "sharing knowledge and experience on nuclear technologies and safety at nuclear power stations and related facilities to improve nuclear safety standards, and coordinate emergency response and preparedness mechanisms," the draft said.

Noting that natural gas emits relatively small amounts of carbon dioxide, the APEC economies recognize it is important "to evaluate the production, trade potential and environmental impact of shale gas and other unconventional gas resources," according to the draft.

They will also promote steady investment in natural gas infrastructure, including liquefaction facilities, the draft said.

Economy, Trade and Industry Minister Yukio Edano will attend the meeting from Japan and is expected to hold bilateral talks with the representatives from Russia, the United States and Australia.

APEC meet to uphold nuke power

Jiji

<http://www.japantimes.co.jp/text/nb20120623a5.html#.T-bfApFIwpU>

Energy ministers of Asia-Pacific Economic Cooperation forum members are expected to issue a joint statement after their meeting next week that will confirm the importance of nuclear energy, Jiji Press learned Thursday.

The ministers are expected to highlight the role of nuclear power in securing energy security by reducing dependence on fossil fuels and combating climate change by reducing carbon dioxide emissions, sources said.

Russia, the chair of the Sunday-Monday meeting in St. Petersburg, maintains its policy to promote nuclear power despite the triple-meltdown crisis that started in March 2011 at Tokyo Electric Power Co.'s Fukushima No.1 nuclear plant.

As an important means of acquiring foreign currency, Russia intends to expand nuclear power plant exports. The joint statement will reflect Russia's stance, the sources said.

At the meeting, Japan, which plans to reduce its dependence on nuclear energy, will explain its responses to the nuclear accident and steps it has taken to restart idled reactors at a Kansai Electric Power Co. plant. It will urge other APEC members to share technical knowledge on nuclear safety measures.

The joint statement will underline the need for efforts to boost nuclear safety, in addition to underscoring the importance of atomic power, the sources said.

At the meeting, the ministers will discuss various issues, such as energy conservation, ways to promote smart communities utilizing renewable energy, emergency responses to geopolitical risks in the Middle East, and promotion of natural gas use.

Board of Audit to check on TEPCO

June 25, 2012

Government watchdog to audit TEPCO

http://www3.nhk.or.jp/daily/english/20120625_25.html

Japan's Board of Audit is to evaluate the activity of Tokyo Electric Power Company, operator of the disaster-hit Fukushima nuclear plant, as the company receives a massive injection of public funds.

This is a rare move for the watchdog, which normally only audits government and semi-public entities. However, TEPCO will be temporarily placed under state control following the capital injection, with the government taking more than 50 percent of the company's voting rights.

The government has set aside 30 billion dollars in financial assistance to help TEPCO pay compensation to victims of last year's nuclear accident.

The government will also provide some 12.5 billion dollars in public funds to aid the power company in balancing its books.

Last month, TEPCO announced it will cut more than 41 billion dollars in costs by the end of fiscal 2021, in line with government-approved measures.

The Board of Audit will evaluate as early as this summer whether TEPCO is fulfilling its obligations under the plan.

Revision of Atomic Energy Law (part 3)

June 26, 2012

Atomic energy law's sly alteration is abuse of legislative process

<http://mainichi.jp/english/english/perspectives/news/20120626p2a00m0na004000c.html>

In addition to "decisive" politics and "indecisive" politics, there is such a thing as "overlooked" politics.

The Atomic Energy Basic Law was amended in the shadows of the hoopla surrounding the three-party agreement on a tax hike. The new clause allows the possibility of nuclear armament open to interpretation. It was an underhanded deal, in which an amendment to the Atomic Basic Law was merely incorporated into the appendix of a law on the establishment of a nuclear regulatory panel.

It's not just anti-nuclear activists and those in support of abandoning nuclear power generation who have been shocked by the stunt. Those in the pro-nuclear power camp who are searching for a way to rebuild a united front have also expressed criticism.

This is no way to win back the public's confidence.

The law on the establishment of a nuclear regulatory commission was hastily passed. A revised bill that the ruling Democratic Party of Japan (DPJ), and opposition parties the Liberal Democratic Party (LDP) and the New Komeito modified and agreed to was submitted to the Diet on June 15, and passed on June 20. The process of establishing the commission had been sped up in light of the reactivation of Kansai Electric Power Company's Oi Nuclear Power Plant in Fukui Prefecture.

Only at a meeting of an upper house environmental committee on June 20, when a DPJ lawmaker questioned whether nuclear arms development was the purpose of passing the bill, did it become public that a clause in the Basic Law had been revised.

The legislator lamented that the bill had been submitted just a few days earlier, and that they had not been given resources to compare the old and new versions of the modified clause. Also, while the revision had been initiated by the LDP, the clause in question was not mentioned in a bill outline that had been distributed at an LDP meeting on the evening of June 14, immediately after the three-party tax agreement. One policy expert in the LDP was even unclear on how and why things unfolded the way they did.

So what exactly does the clause that has fueled suspicions about its intentions say? The Atomic Energy Basic Law stipulates in Article 2 that research into and use of atomic power are restricted to peaceful purposes, championing democratic, independent and public disclosure principles. The appendix in question adds a sentence stating Japan's atomic energy policy should contribute to national security.

What constitutes "national security?" Asked by the aforementioned DPJ member whether nuclear arms development was the new regulatory body bill's true aim, the House of Representatives member of the

LDP who submitted the bill denied that was the case, saying, "The purpose is to centralize the safety of nuclear power, safeguards by the International Atomic Energy Agency to prevent the military use of nuclear materials, and nuclear security to prevent terrorism into one commission."

Since June 20, various media have reported on the furtive move, with one paper carrying the front-page headline, "Nuclear power constitution changed surreptitiously, concerns toward military use." A deputy press secretary of South Korea's Ministry of Foreign Affairs and Trade has also said that the ministry is "watching the situation closely."

It's not surprising that the bill came from the LDP. In post-war Japan, countless politicians and bureaucrats have revealed their off-the-record hopes for the country's nuclear armament. Japan's latent nuclear capability was what lent moral support to the leaders of this economic giant, who ostensibly were against nuclear weapons.

What then, is the reason for Japanese politicians to reveal their once masked pride in latent nuclear capability now?

"It probably comes down to the Rokkasho Reprocessing Plant," said a bureaucrat with whom I've been acquainted for years. "If the country moves toward the abandonment of nuclear power, that facility will lose meaning. If it is legally granted legitimacy as a facility for the military use of nuclear materials, then it can continue to exist. I believe that there were LDP lawmakers who thought of that, and bureaucrats who supported them.

"The revision of relevant laws through their incorporation in appendices should only take place when a change in one law necessarily involves a change in another. The latest case has been an abuse of that process. It stands legally, but I think it's wholly inappropriate as legislation."

The Atomic Energy Basic Law went into effect in 1955, the same year that the LDP was founded. Fifty-seven years have since passed, and we are moving further and further away from democratic, independent and public disclosure principles. (By Takao Yamada, Expert Senior Writer)

TEPCO bitterly criticized by shareholders

June 27, 2012

TEPCO shareholders' meeting marked by calls to break away from nuclear power

<http://mainichi.jp/graph/2012/06/27/20120627p2a00m0na020000c/001.html>

Tokyo Electric Power Co. (TEPCO) came under bitter criticism over its corporate management and handling of the crisis at the Fukushima No. 1 Nuclear Power Plant at a general shareholders meeting in Tokyo on June 27, the utility's second since the outbreak of the crisis.

At 10 a.m., 3,112 shareholders filed into Yoyogi National Gymnasium in Tokyo's Shibuya Ward for the meeting -- highlighting the high interest in a horde of issues including huge compensation payments over the nuclear disaster triggered by the March 2011 Great East Japan Earthquake and tsunami. The shareholders' meeting kicked off in a highly tumultuous atmosphere, with civic groups and ordinary citizens also gathering outside the venue, calling for a nuclear-free energy policy.

Individual shareholders and other interested parties started turning up shortly after 8 a.m., about two hours before the start of the meeting. Among them was a 45-year-old company employee from Tokyo's Edogawa Ward, who held a fan reading "No nuclear power."

"The people of Fukushima had to leave their homes. The top executives who promoted nuclear power should do their utmost to fully compensate them," he said.

The 45-year-old said he had become a shareholder of TEPCO after the Fukushima nuclear disaster in a bid to convey his thoughts to TEPCO executives. He added that he planned to support a proposal to be made during the meeting by a civic group of 402 shareholders that TEPCO's Kashiwazaki-Kariwa Nuclear Power Plant in Niigata Prefecture be decommissioned and a thermal power plant be built there.

Among the other shareholders attending the meeting were two members of German environmental group Ethecon Foundation Ethics & Economics, including its chairman Axel Koehler-Schnura. They, as TEPCO shareholders, planned to present a "Black Planet Award" trophy, a black filthy globe, to TEPCO management. The award is given each year to the company that has produced the worst effects on the global environment.

"TEPCO caused unrecoverable damage to the global environment and the human rights of people throughout the world," the chairman said.

Meanwhile, several shareholders voiced support for the Tokyo Metropolitan Government's proposal to ensure transparency of TEPCO's management and introduce competition in the power industry.

Tomoyuki Tsukuda, a 37-year-old resident of Ichikawa, Chiba Prefecture, who attended TEPCO's shareholders' meeting for the first time this year, said, "TEPCO plans to give bonuses to its employees, but I wonder if money has been paid to those workers who have been dealing with the disaster (at the nuclear plant). Bonuses should be given to such people."

Fumiko Murakami, a 63-year-old housewife from Kisarazu, Chiba Prefecture, commented, "I have a feeling that the top management has released only self-serving information. I want them to promise to disclose information honestly."

Masanori Tagawa, 63, from Nara, called for the company to gradually break away from nuclear power. He said he would support the proposal to abandon nuclear power.

"It is unavoidable to operate nuclear reactors during the transition to clean energy, but I don't think the current measures can ensure safety," he explained.

Also among the shareholders were former TEPCO workers. Mikio Nakayama, 72, who served as a member of the Nerima Ward Assembly and the Tokyo Metropolitan Assembly, said, "Ideally, we should reduce nuclear power in stages, but when I think of people's livelihood in the immediate future, I would support the reactivation of nuclear reactors." He added: "TEPCO's responsibility is heavy, but nuclear power has been promoted as national policy. More national debate is needed."

Journalists were allowed to observe the shareholders' meeting live on a monitor. Last year the screen image was so blurred that the faces of the board members on the stage could barely be identified. There was some improvement this year, with close-ups of the board members who were speaking, but filming and broadcasting of the question-and-answer session were forbidden.

"We have not obtained approval from shareholders," a TEPCO spokesperson said.

TEPCO shareholders' meeting starts off tumultuously

<http://mainichi.jp/english/english/newsselect/news/20120627p2g00m0dm061000c.html>

TOKYO (Kyodo) -- Tokyo Electric Power Co.'s meeting of shareholders started off tumultuously Wednesday morning, with individual shareholders interrupting proceedings and its largest stockholder coming to the fore to press the utility to reform itself following the Fukushima Daiichi nuclear power plant disaster.

The company known as TEPCO is seeking approval for changes in its articles of incorporation necessary to receive a planned 1 trillion yen injection of public funds, which would effectively put the country's largest utility under state control.

At the outset of the annual meeting, outgoing Tokyo Electric Chairman Tsunehisa Katsumata apologized over the nuclear crisis and vowed to "start afresh from zero" to restore public confidence.

The proceedings were interrupted a few times as shareholders proposed motions such as to seek the dismissal of the moderator, served by Katsumata.

Also on the agenda are votes on shareholder proposals, including those from the Tokyo metropolitan government, the largest shareholder with about a 2.7 percent stake.

It is the first time that TEPCO has faced a proposal from a municipal shareholder, suggesting a change in the behavior of local governments, often seen as "silent shareholders," amid growing public criticism of the utility's move to raise electricity rates for households.

The Tokyo metropolitan government proposed that TEPCO stipulate in its corporate rules that it will "put customer service first" as its management philosophy and ensure transparency in management by disclosing information over electricity retail prices.

Tokyo Vice Gov. Naoki Inose appeared at the meeting to explain the proposals, saying, "What is needed for TEPCO, which has to restart from zero, is this kind of change in its way of thinking."

A group of individual shareholders, meanwhile, proposed the utility's withdrawal from nuclear power generation, an attempt it has been making repeatedly.

The company's board of directors has made clear its oppositions to such shareholder proposals, and they are likely to be voted down as it appears difficult to muster enough support from other shareholders.

The company also sought for approval to select 11 board members including Kazuhiko Shimokobe, a lawyer who is set to become next chairman.

TEPCO has decided to revamp its management as it will receive taxpayers' money as part of a 10-year business plan aimed at helping the company overcome its financial plight following the world's worst nuclear accident since the 1986 Chernobyl disaster.

Based on the restructuring plan, TEPCO will avoid insolvency and continue to deal with three key tasks -- paying trillions of yen in compensation related to the disaster, scrapping the Fukushima plant's crippled reactors and providing stable electricity supply to areas including Tokyo.

Shareholders' antinuke position no much use

June 27, 2012

Utilities defy shareholders' antinuke calls

Investors OK nationalization of Tepco; Kepco foils Hashimoto

<http://www.japantimes.co.jp/text/nn20120627x1.html#.T-spm5FlwpU>

By KAZUAKI NAGATA and ERIC JOHNSTON
Staff writers

Nine electric utilities held annual shareholders' meetings Wednesday, with antinuclear investors causing a ruckus by pushing them to shut down their atomic plants and increase the use of renewable energy.

Tokyo Electric Power Co. and Kansai Electric Power Co. also faced rare criticism from local governments, which own a considerable stake in the regional power companies and have started scrutinizing their financial structures after the catastrophe at the Fukushima No. 1 nuclear power plant.

"Public confidence in Tepco has been damaged," and the company has to seriously try to change itself, Tokyo Vice Gov. Naoki Inose told the meeting. The Tokyo Metropolitan Government is Tepco's largest stakeholder.

Shareholders voted in favor of the plan to nationalize the utility.

Not a single proposal by shareholders was approved.

Kepeco shareholders said no to all 28 motions made Wednesday to shift from nuclear power and fossil fuels to renewable energy, including one backed by the mayors of Osaka, Kobe and Kyoto that would have obliged the utility to eventually abolish its 11 reactors.

The rejections were not unexpected after Kepeco's management announced earlier this month it opposed all attempts to reduce reliance on nuclear power and it was clear the majority of shareholders would vote against the motions.

But the defeat is likely to deal a blow to Osaka Mayor Toru Hashimoto's reputation as an effective antinuclear mayor, as he turned down a plebiscite drive by Osaka residents back in February to get the city out of nuclear power by saying it was better to oppose Kepeco at the shareholders' meeting.

The city of Osaka, which owns about 9 percent of Kepeco's stock, was represented by Hashimoto, who warned that the world is changing and Kepeco needs to embrace renewable energy or risk going out of business.

"At this rate, Kepeco is going to end up bankrupt. Explanations about the future risk (of continuing with nuclear power) are insufficient," Hashimoto said during the meeting.

He then posed detailed questions about the problem of spent nuclear fuel, including how Kepeco is going to store its fuel in the mid- and long term. He also asked what would happen to Kepeco's costs if its 11 reactors were halted permanently.

Kepeco officials sidestepped most of his questions about spent fuel storage plans, but they said abolishing the reactors would mean spending ¥900 billion on replacement fuel sources.

Meanwhile, Tokyo Vice Gov. Inose slammed Tepco for planning to pay employee bonuses this winter. He pointed out that Resona Bank and Japan Airlines Corp., which both received public funds for rehabilitation, did not pay bonuses for several seasons during their rehabilitation.

Tepco will be selling ¥1 trillion worth of shares to the government-backed Nuclear Damage Liability Facilitation Fund, which will have a stake exceeding 50 percent.

A shareholder proposed unsuccessfully that Tepco move its headquarters to Fukushima Prefecture. "That way you can give more sincere support" to the disaster victims, he said.

Some shareholders defended the utility, urging it to insist more loudly that the crisis is not just Tepco's fault, because the government failed to regulate it to prepare for the huge tsunami.

TEPCO after public trust

June 28, 2012

TEPCO's new chairman promises reform

http://www3.nhk.or.jp/daily/english/20120628_26.html

The new Chairman of Tokyo Electric Power Company says he will push to reform management to regain public trust following last year's Fukushima nuclear accident.

Kazuhiko Shimokobe spoke at a news conference on Thursday, one day after his appointment as TEPCO chairman at a shareholders meeting.

Shimokobe said TEPCO is a huge monopoly and has failed to pay much attention to customers' needs.

He said he will make sure TEPCO listens carefully to outside criticism of its corporate culture and that every TEPCO employee takes customers' needs into account.

TEPCO has been criticized not just for its handling of last year's accident but also for unilaterally imposing price increases.

Shimokobe is a 64-year-old lawyer. He served as chairman of the government-backed Nuclear Damage Liability Facilitation Fund that helped TEPCO compensate victims of the disaster.

Shimokobe said it would be very hard for TEPCO to restart idled reactors at its nuclear plant in Kashiwazaki-Kariwa in Niigata without consent from the local community.

But he said he is keenly aware of the harsh reality that a significant delay in the planned resumption early next year would adversely affect electricity supply. He added that at the moment, he is not considering asking for higher electricity rates if the reactors are not restarted as planned.

Utilities should put customers first

June 28, 2012

Editorials: Major power companies must put the customer first

<http://mainichi.jp/english/english/perspectives/news/20120628p2a00m0na002000c.html>

Nine electric power companies came under mounting pressure at their respective shareholders meetings on June 27 to initiate reforms to better serve their customers.

Tokyo Vice Gov. Naoki Inose attended the shareholders meeting of Tokyo Electric Power Co. (TEPCO) as the representative of the Tokyo Metropolitan Government, the top shareholder in the utility. He criticized a plan by the company, which owns the crippled Fukushima No. 1 Nuclear Power Plant, to raise electricity charges, and demanded that the firm further streamline its operations. The metropolitan government submitted proposals on measures to ensure transparency of TEPCO's management and on the introduction of market mechanisms pertaining to investment in plants and equipment.

TEPCO has come under fire for being **bureaucratic and dogmatic in its response to demands for compensation** over the nuclear crisis and its plan to increase its electric power charges. The metropolitan government's proposals reflect the public's opinion of the company. The proposals were not approved, however, because financial institutions and many other major shareholders sided with TEPCO management.

Nevertheless, the company's plans to accept an infusion of 1 trillion yen in public funds and replace most of its board members were endorsed. Since the company is set to rehabilitate itself by using such a massive amount of taxpayers' money, it must not take advantage of its regional monopoly to continue its arrogant management practices.

It is TEPCO's responsibility to speedily release accurate information to boost managerial transparency and promote competition as part of an effort to reduce customers' electricity bills. **The utility should respect the spirit of the metropolitan government's proposals and aid consumers to the maximum possible extent, even though the metropolitan government's proposals were voted down.**

In Osaka, Mayor Toru Hashimoto attended the shareholders meeting of Kansai Electric Power Co. (KEPCO) as a representative of the Osaka Municipal Government, the utility's top stockholder. The municipal government submitted a proposal to quickly decommission all of KEPCO's nuclear power plants, but the measure was voted down. Still, as shareholders asked questions about the company's plan to resume operations at the idled No. 3 and 4 reactors of the Oi Nuclear Power Plant in Fukui Prefecture, the meeting lasted for a record 5 1/2 hours.

Proposals that nuclear power stations be decreased or completely shut down were submitted at the shareholders meetings of other utilities, reflecting the **public's growing concern about the safety of**

nuclear plants since the outbreak of the Fukushima nuclear crisis and increasing distrust in utilities that operate such power stations.

The national government's failure to work out a clear-cut atomic power policy appears to be fueling such concern and distrust. All power suppliers that operate nuclear plants must remember it is impermissible for them to reactivate these plants without ensuring safety.

The central government is considering reforming the electric power supply system in a bid to put an end to major electric power companies' regional monopolies. We urge all of these companies to take advantage of proposals made by shareholders at their June 27 meetings to transform their management in a way that will benefit consumers.

Leakage of secret documents

June 30, 2012

Govt: 6 classified documents leaked

The Yomiuri Shimbun

<http://www.yomiuri.co.jp/dy/national/T120629006730.htm>

A farm ministry internal investigation team on Friday confirmed six classified government documents have been leaked and indicated a former senior vice minister was "highly likely" to have been involved in the leakage.

Li Chunguang, a 45-year-old first secretary at the Chinese Embassy in Tokyo, is suspected of having obtained the classified documents about a program to export agricultural products to China.

Regarding how the documents were leaked, the Agriculture, Forestry and Fisheries Ministry's investigation team said former Senior Vice Minister Nobutaka Tsutsui is suspected of being involved.

However, the team said it has not been able to confirm his involvement.

Tsukasa Iwamoto, a senior vice minister who heads the investigation team, said leakage of four documents classified as "Level 3," the highest confidentiality level, and two official telegrams were confirmed.

After the media reported the leaks, the investigation team questioned the head of the Promotion Association of Agriculture, Forestry, Fisheries & Foods Exporting to China, who used to be a state-funded secretary to a House of Representatives member. He admitted to having obtained the documents in question.

The association runs a program to export agricultural products to China.

Of the documents, one Level 3 document described the future prospects of domestic rice supply and demand that was deeply affected by the crisis at the Fukushima No. 1 nuclear power plant.

Copies of the document, which was drawn up for Tsutsui, were distributed to just seven people, including Tsutsui and senior officials of the ministry's Management Improvement Bureau, Iwamoto said.

However, five of the officials, excluding Tsutsui and his then private secretary, had no contact with the head of the association.

According to Iwamoto, Tsutsui is the only person who has received all four Level 3 documents, but he was quoted as saying that he never showed the documents to any outsider.

Meanwhile, right after the farm ministry received two official telegrams from the Foreign Ministry on March 15, Tsutsui's secretary sent them by fax from Tsutsui's office at the ministry to his office in the Diet members' office building under instructions from Tsutsui, Iwamoto said.

However, Tsutsui was quoted as saying he did not remember giving them to the association's head.

The head also said he did not remember from whom he received the documents, Iwamoto said.

As the head shredded the ministry's documents including the six classified ones before questioning, the investigation team was not able to say Tsutsui was involved in the leakage, he said.

Iwamoto also said the team also failed to confirm whether Li gained knowledge of the contents of the documents.

Police have sent papers on Li to the Tokyo District Public Prosecutors Office on suspicion of violating the Alien Registration Law.

Atomic Energy Basic Law (Part 4)

July 2, 2012

Business-as-usual alteration of nuclear law unsettling

<http://mainichi.jp/english/english/perspectives/news/20120702p2a00m0na005000c.html>

The long dominant and now largest opposition Liberal Democratic Party (LDP) insists that an amendment to the Atomic Energy Basic Act is not a ploy to pave the way toward Japan's acquisition of nuclear arms. Moreover, the House of Representatives Legislation Bureau says the steps taken to institute the legal amendment have not violated any bylaws or regulations.

But there's something unsettling about the whole thing. First, there's the question of what a "basic act" is supposed to be. One can't help but feel that a foundational legal framework for atomic energy policy is being altered as if it were a routine process.

As mentioned in last week's installment of this column, Article 2 of the Atomic Energy Basic Law stipulates that research into and use of atomic power are restricted to peaceful purposes, championing democratic, independent and public disclosure principles. In the latest amendment, the clause that Japan's atomic energy policy should contribute to national security -- with the wording as it was originally suggested by the LDP -- was added. Suspicions have subsequently emerged that the revision is either an attempt to tie the conservative ideology of self sufficiency and self defense to nuclear arms development, or to allow for the continued operation and possible military use of the Rokkasho Nuclear Reprocessing Plant.

The national security clause was included as an appendix to a bill for the establishment of a new nuclear regulatory body in late June, and initially went unnoticed even by newspaper reporters.

Soon after the bill's passage, newspapers carried headlines decrying the "surreptitious alterations," and voicing worries concerning the military use of nuclear power. Former Chief Cabinet Secretary Yasuhisa Shiozaki, who heads an LDP project team on the establishment of the new panel, objected. He said that there were absolutely no military implications or alterations to the three non-nuclear principles in the use of the expression "national security" in the bill's appendix, and that the use of an appendix itself is standard procedure, and hardly counts as act of stealth.

Meanwhile, Masayoshi Yoshino, who, along with Shiozaki, was instrumental in bringing together the LDP proposal, also denied any ulterior motives for the amendment.

"The issue always came up during intra-party discussions, but there is no truth to the allegations" that the basic law was revised based on policy interests, he said. "In the bill establishing the new nuclear regulatory body, we included a clause saying that 'Japan's atomic energy policy should contribute to national security.' But that means we will work toward nuclear non-proliferation and take anti-terrorism measures. It was merely the result of our consultation with the legislation bureau to insure consistency with other laws."

Yoshino, whose constituency is based in central southern Fukushima Prefecture, hit hardest by the ongoing nuclear crisis, is distressed by how some have responded to the latest move.

"Under the law as it was, if a nuclear armament advocate were to become prime minister, the government could have refused international agencies from inspecting our nuclear facilities. The intention of the new law was to prevent such a thing from happening," he said. "I didn't think we'd be accused of moving toward nuclear arms development."

Bureau officials say there were no procedural violations, a statement backed up by "Workbook Hosei Shitsumu," a legislative manual that bureau staff have with them at all times. "For the purpose of establishing a new law, existing laws shall be amended through appendices," it reads on page 343.

The Atomic Energy Basic Act went into effect in 1955, 10 years after the atomic bombings of Hiroshima and Nagasaki, and a year after the Japanese fishing boat Daigo Fukuryu Maru was hit by fallout from a U.S. nuclear test in the Pacific. It gave rise to heated debate on the interchangeability of nuclear technology used for peaceful and military purposes, as well as on mutual dependence.

The three principles of democracy, independence and openness in nuclear science emerged on the initiative of renowned physicists such as Hideki Yukawa, Shinichiro Tomonaga, Mitsuo Taketani and Shoichi Sakata, and were incorporated into the Science Council of Japan's statement on nuclear power. Article 2 of the Atomic Energy Basic Law is a reflection of that.

Fundamental questions about nuclear power have emerged once again, and yet among the politicians, bureaucrats and academics of today, the passion and sense of crisis that existed 57 years ago is gravely lacking. The standard procedures for handling the minute details of establishing a new regulatory body is one thing. But the utterly business-like manner in which the basic principles behind a basic law have been altered is unnerving. (By Takao Yamada, Senior Expert Writer)

A thousand times more expensive than regular nuclear power

July 4, 2012

Monju costs far surpass usual nukes

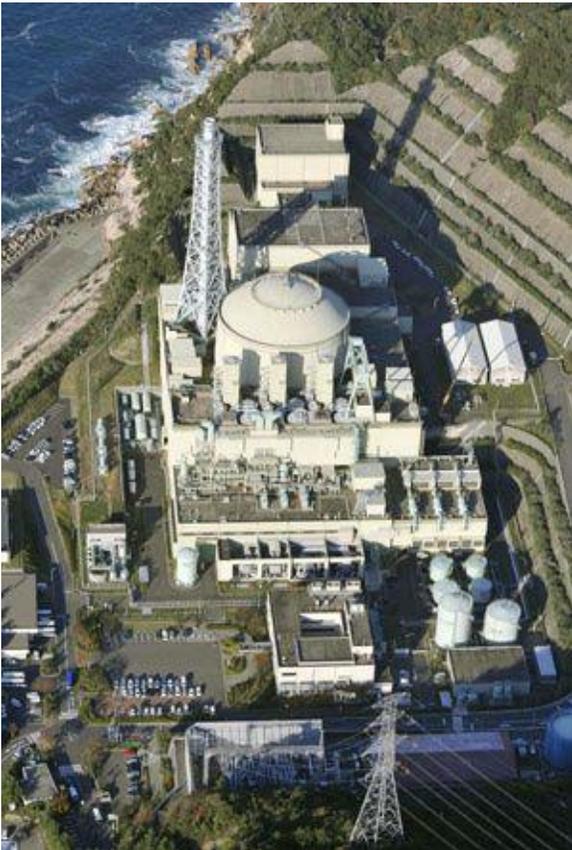

Trouble-prone reactor has rung up far higher tab than initially planned

http://www.japantimes.co.jp/text/nn20120704f1.html#.T_RyCpFIwpU

Kyodo

If the troubled Monju prototype fast breeder reactor project continues, its costs will swell to more than ¥1.4 trillion and its power generation costs will be ¥10,000 per kwh, roughly 1,000 times greater than a regular reactor, according to data compiled by Kyodo News.

Does it have the future?: The prototype fast breeder reactor Monju sits idle in Tsuruga, Fukui Prefecture, last November. KYODO

Construction of the reactor in Tsuruga, Fukui Prefecture, started in 1985 as part of the government's goal to establish a nuclear fuel cycle to make use of spent nuclear fuel at conventional atomic plants that run on uranium. Monju uses a uranium and plutonium mix known as **MOX** as fuel.

The facility operated by the government-affiliated Power Reactor and Nuclear Fuel Development Corp. first reached criticality — where a chain reaction of nuclear fission is sustained — in 1994.

But sodium, used as a coolant, leaked during its test run in December 1995. Around 640 kg of leaked sodium reacted with air and sparked a fire, forcing a prolonged suspension.

The operator was also caught trying to cover the incident up. Workers made a false report about and truncated video footage of the accident.

The operator was revamped into the Japan Nuclear Cycle Development Institute, which was subsequently merged with the Japan Atomic Energy Research Institute in 2005 to create the Japan Atomic Energy Agency.

The prototype reactor, designed to produce more fuel than it consumes, also faced other problems, prompting further delays in its restart initially set for March 2008.

In an application for a permit to build the reactor filed in 1980, the government estimated ¥322 billion in construction costs.

A probe by the Board of Audit found that total costs spent through fiscal 2010 came to around ¥1.08 trillion.

On June 12, the science and technology ministry announced Monju would require an additional ¥160 billion to ¥170 billion over 10 years if it is reactivated.

The Japan Nuclear Cycle Development Institute calculated in 2002 that decommissioning Monju and disposing of the radioactive materials would cost ¥174 billion.

Adding these figures up, the sum will top ¥1.4 trillion.

The reactor, meanwhile, generated a total of 102.3 million kwh between August 1995 and the sodium leak. The unit cost will thus be ¥10,000 per kwh, around 1,000 times greater than the current power generation cost of nuclear power stations, estimated at ¥9 per kwh, and around 300 times greater than solar power's roughly ¥30.

The colossal development cost of the Monju project was a hot topic at a meeting of the Lower House Committee on Audit and Oversight of Administration as well as the government's council on administrative reforms last year.

The science and technology ministry has appropriated ¥17.5 billion in what it said was the minimum needed for maintenance, saying it will not seek to restart the reactor this fiscal year.

The government has repeatedly been putting off the target date to commercialize a fast breeder reactor. Under a long-term plan formulated in 1967, the target was around 1985. Under the current nuclear framework worked out in 2005, it is set at around 2050.

The Japan Atomic Energy Commission is apologetic and suggests no checks were imposed on Monju's costs.

"Over the years, a substantial amount of funds has been poured (into the project), but it has not yet been put to practical use," says a nuclear fuel cycle report adopted June 21 by the commission.

The government has said it will seek to rely less on nuclear power in light of the Fukushima crisis. The costly Monju will likely be a test case to see if it is serious about such a position.

Promise of neutrality

July 4, 2012

Nuclear watchdog to bar industry insiders

Kyodo

http://www.japantimes.co.jp/text/nn20120704a4.html#.T_RxyZF1wpU

The government said Tuesday **it will not allow people who have worked for nuclear power plant operators or related organizations over the past three years to join the new atomic regulatory commission.**

People who have received around ¥500,000 annually in remuneration from the same nuclear plant operator over the past three years will also not be selected, nuclear disaster minister Goshi Hosono said in announcing the qualifications for commission members to ensure the entity's neutrality.

The two requirements are not stipulated in the recently enacted law that authorizes the creation of the new nuclear regulatory body, but the government added the "strict criteria" because its handling of regulations has come under scrutiny since the Fukushima nuclear crisis, Hosono said.

"Based on the qualifications, we will narrow the number of appropriate people," he added.

Related organizations could include nuclear reactor makers, the Federation of Electric Power Companies of Japan and the Central Research Institute of the Electric Power Industry. Lecture fees and payments for writing are considered remuneration.

To ensure transparency, people chosen as commissioners will be asked to disclose the amount of donations they have received in the past three years and the source of the money.

They will also be required to report the number of their students who have found jobs with nuclear plant operators.

The government plans to launch the regulatory authority by September, replacing the Nuclear and Industrial Safety Agency, which is part of the Ministry of Economy, Trade and Industry, a promoter of nuclear power.

The appointments of chairman and four commissioners of the new regulatory body will need Diet approval.

Looking for more money

Government spending on reconstruction work related to the March 2011 earthquake and tsunami over the next five years will likely exceed the ¥19 trillion originally planned, Finance Minister Jun Azumi said Tuesday, indicating the need for a supplementary budget.

The spending plan, officials said, can be raised to more than ¥20 trillion to offer more grants to affected local governments and help handle the Fukushima nuclear crisis.

"In a period between the second half of this year and next year, we are likely to face a situation in which we cannot avoid spending beyond the ¥19 trillion framework," Azumi said. "We must consider measures to deal with this development."

He said the government can use ¥1.98 trillion in surplus funds carried over from fiscal 2011 budgets. "We will discuss (whether to formulate) a supplementary budget," he added.

A year ago, the government said it would spend around ¥19 trillion on the five-year reconstruction program and an additional ¥4 trillion over the following five years, with the framework subject to revision.

"Network problems"?

July 5, 2012

Website of panel investigating Fukushima accident becomes inaccessible

<http://mainichi.jp/english/english/newsselect/news/20120705p2g00m0dm037000c.html>

TOKYO (Kyodo) -- The website of a parliament-appointed panel investigating the nuclear accident at the Fukushima Daiichi power plant became inaccessible on Wednesday night, panel officials said, blaming **network problems experienced by a company that maintains computer servers for it.**

Multiple websites hosted by the company are experiencing similar trouble, they said, with the company saying it has come under cyberattacks from overseas.

The investigation commission, led by Kiyoshi Kurokawa, a professor emeritus at the University of Tokyo, has been **proactively disclosing information by streaming panel deliberations live on the Internet,** for instance.

The commission is set to issue on Thursday a report on the causes and developments of the nuclear accident, while streaming live a news conference held by Kurokawa and other panel members.

TEPCO's reaction

July 5, 2012

TEPCO, government, react to panel report

http://www3.nhk.or.jp/daily/english/20120705_35.html

The operator of the Fukushima Daiichi nuclear plant has come out against a Diet-appointed panel's view that last year's earthquake, and not just the tsunami, may have damaged the plant.

Tokyo Electric Power Company spokesman Junichi Matsumoto told reporters on Thursday that operation records and other data do not suggest any damage came from the jolt.

Matsumoto was commenting on the expert panel's report released earlier in the day, which said it cannot be ruled out that damage to key safety systems came from the jolt.

But he added that the company will carefully study the report before deciding what to do.

Meanwhile, the government's top spokesman said he wants to express respect for the panel's efforts in issuing the report based on intensive hearings.

Chief Cabinet Secretary Osamu Fujimura told reporters that the government will take necessary steps by taking the panel's views seriously, along with a government panel's report expected later in July.

Industry minister Yukio Edano, who was chief Cabinet secretary at the time of the accident, also said he will take Thursday's report seriously.

Edano said the government will act with a serious awareness that the accident still leaves Fukushima prefectural residents and others facing a lot of difficulties.

Manipulation, manipulation

July 9, 2012

Atomic Energy Commission held undocumented, closed-door meetings for more than a decade

http://www.japantimes.co.jp/text/nn20120709a3.html#.T_rLpZFIwpU

Kyodo

The Japan Atomic Energy Commission has held closed preparatory sessions for more than 10 years prior to its open meetings every week, sometimes deliberating important matters of nuclear energy policy without keeping minutes, former commissioners and government sources said Saturday.

Prior to the regular meetings every Tuesday, the five-member commission tasked with deciding basic nuclear energy policies has held unofficial meetings every Thursday attended by officials of relevant ministries and sometimes private business operators.

The revelation, which critics say signifies that the regular meetings were meaningless, comes after the commission was found to have held so-called study meetings with promoters of nuclear power and presented them with its conference materials in advance.

It also comes after the government pledged to keep proper minutes of meetings after it faced criticism in January for not keeping minutes of 10 government meetings regarding the 2011 earthquake and tsunami and nuclear crisis at the Fukushima Daiichi power plant.

According to the former commissioners, the closed-door meetings were held even before the 2001 government reorganization when Japan Atomic Energy Commission was placed under the Cabinet Office, and discussed the agenda for coming regular meetings.

Current commission chairman Shunsuke Kondo said, "Preliminary meetings are where members share their understanding and do not fall into the category of decision-making." He said no minutes are kept of what is discussed, but said the commission started keeping records of participants and meeting agendas from this spring.

However, several former commissioners said the framework of nuclear policy and nuclear fuel cycle policy were deliberated at the Thursday meetings. And an official at the Ministry of Economy, Trade and Industry said the meetings "played a role in framing ideas within the nuclear power village (the nuclear power industry) and to fill voids that opponents (of nuclear power) could take advantage of."

Yukiko Miki, administrative director of nonprofit organization Information Clearinghouse Japan, called the preparatory meetings disturbing, saying if things are prepared beforehand, "regular meetings will not be substantial."

Meanwhile, a parliamentary investigation panel into the Fukushima Daiichi plant disaster has found that Tokyo Electric Power Co. had urged its employees and those of subcontractors to attend a 2003 meeting in Fukushima Prefecture to explain nuclear safety to local residents, and how to fill in questionnaires afterward about the meeting.

"It has been common to conceal and manipulate information on risks that could be obstacles to promoting nuclear power," the panel said. TEPCO, the operator of the Fukushima plant, has so far denied any manipulation but said it will look into the matter.

Bloomberg on the panel's nuclear report

July 9, 2012

Japan's Unsatisfying Nuclear Report

By the Editors *Jul 9, 2012 12:30 AM GMT+0200*

http://www.bloomberg.com/news/2012-07-08/japan-s-nuke-report-undercuts-itself-with-cultural-copout.html#disqus_thread

By Japanese standards, the report released Thursday by the Fukushima Nuclear Accident Independent Investigation Commission could be considered remarkable.

Its 641 pages, drawing on town-hall meetings, household surveys, more than 900 hours of hearings and interviews with 1,167 people are the product of an unprecedented six-month inquiry -- the first independent investigation in Japan to have subpoena power.

Its account of the March 11, 2011, earthquake, tsunami and ensuing nuclear meltdown, which displaced about 160,000 people and left parts of Japan unlivable, differs in crucial ways from those of Japan's nuclear regulatory agencies, the Tokyo Electric Power Co. (9501) that operated the plants and then-Prime Minister Naoto Kan. Most important, the report squarely blames the catastrophe on a pattern of human failure, not a freakish act of nature.

Yet for all its detail and willingness to label the Fukushima disaster as "profoundly manmade," the report does not identify which men (and this being Japan, there probably weren't many women) failed. Instead, it sweepingly indicts "the ingrained conventions of Japanese culture," effectively letting individual culprits off the hook. Its conclusions and recommendations avoid any discussion of prosecution or punishment.

Still, the report helps guide the way forward. A crucial finding is that the earthquake prior to the tsunami may have incapacitated one of the reactors and its safety equipment -- a possibility that Tepco had resolutely denied. Moreover, the commission found that Tepco had not upgraded that reactor's seismic defenses as required by Japan's Nuclear and Industrial Safety Agency, that the agency failed to enforce that upgrade and that the recorded seismic motion at Fukushima actually exceeded even the level that the standards were meant to protect against.

These findings suggest that Japan's decision to restart some of its reactors -- the first, in Ohi on Japan's west coast, resumed operation a week ago -- is premature. The Ohi reactor passed the stress test required in the aftermath of Fukushima, but that is no guarantee it could withstand an earthquake of the same 9.0 magnitude. One of the country's most vocal seismic whistle-blowers, Katsuhiko Ishibashi, who foretold the potential for the disastrous 1995 Kobe earthquake as well as a Fukushima-like event, has warned that the government is underestimating the restarted plant's vulnerability.

Given the risks involved, the prevalence of seismic activity in Japan and the diminishing enthusiasm of the Japanese public for nuclear energy, it would be sensible for Prime Minister Yoshihiko Noda to err on the side of caution and set as a temporary benchmark the ability to withstand a 9.0 earthquake before a reactor can go back online.

Temporary is the key here, because rigorous new standards will take time to refine and should be the purview of the new independent regulatory body that the commission calls for, and that the government is moving too slowly to establish. The long history of collusion between companies such as Tepco and the Nuclear and Industrial Safety Agency -- housed in the Ministry of Economy, Trade and Industry, which also promotes Japan's nuclear industry -- has contributed to numerous deadly incidents and near-misses. The commission also rightly calls for Japan's Diet to more closely supervise this new regulatory body. NISA resisted the commission's inquiry, and Tepco still refuses to turn over video footage of conference calls held during the crisis that might shed still more light on it. More political heat might make it easier to overcome such recalcitrance in the future.

Where the report falls seriously short, however, is the aspect that has drawn the most approving attention: its conclusion that the near-cataclysm at Fukushima was, at bottom, a cultural mishap. It is both a copout and a cliché to fall back on Japan's "groupism" and say that "had other Japanese been in the shoes of those who bear responsibility for this accident, the result may well have been the same." Japan is hardly the only country where safety regulations are poorly enforced and old-boy networks protect industry interests. Witness the 2006 Sago mine explosion in the U.S., where hundreds of earlier safety violations brought only low fines, and the revolving door between the coal mining industry and the U.S. Department of Interior was in full swing.

Moreover, notwithstanding the commission's lament about the Japanese "reluctance to question authority," many citizens did repeatedly express their concerns about the safety of Tepco's Fukushima reactors, including legislators from Japan's Communist Party. Their warnings were brushed aside by those in power. Let's hope that the otherwise instructive findings and recommendations of this commission are not.

Gov't radiation cover-up

July 11, 2012

Futaba mayor lashes gov't over radiation cover-up after nuke disaster

<http://mainichi.jp/english/english/newsselect/news/20120711p2a00m0na007000c.html>

Katsutaka Idogawa, mayor of Futaba, Fukushima Prefecture, condemned the central government on July 10 for failing to disclose radiation data provided by the United States immediately after the outbreak of the disaster at the Fukushima No. 1 nuclear power plant.

"(Futaba residents) were exposed to radiation that they didn't have to be exposed to," an emotional Idogawa testified during a meeting of the House of Councillors' Budget Committee. "What can we do to make people who haven't been exposed to radiation understand this feeling?"

"If the information had been disclosed efficiently, I would have changed (residents') evacuation routes. Above all, I am in a position of protecting residents," said Idogawa, who spoke as an unsworn witness at the upper house meeting.

At times Idogawa was teary and choked with emotion.

"Being told things like that it's all right because radiation doses are at such and such a level of millisieverts makes me really furious," he said.

Following the mayor's concluding remarks, in which he said that he "cannot accept this cover-up," a hush enveloped the usually lively committee room.

Also present at the meeting was the speaker of the town council of Namie, Fukushima Prefecture. Futaba and Namie are among the areas most severely affected by the nuclear disaster. The two officials were invited to the meeting as unsworn witnesses by the opposition Liberal Democratic Party (LDP).

During the meeting, Prime Minister Yoshihiko Noda apologized over the government's failure to disclose the radiation data, saying, "As a result of insufficient cooperation and information sharing between related organizations, preparedness to disclose information relevant for the protection of residents' lives was weakened. I apologize, too."

TEPCO's analysis of disaster lacks credibility

July 13, 2012

TEPCO's nuclear disaster analysis unreliable: panel

<http://mainichi.jp/english/english/newsselect/news/20120713p2a00m0na011000c.html>

A government panel investigating the ongoing nuclear crisis at a Fukushima nuclear power plant has concluded in its final report, slated for release later this month, that plant operator Tokyo Electric Power Co. (TEPCO)'s analysis of the disaster lacks credibility, the Mainichi Shimbun has learned.

The Investigation Committee on the Accident at the Fukushima Nuclear Power Stations of Tokyo Electric Power Company reconstructed what was happening at the stricken reactors at Fukushima No. 1 Nuclear Power Plant following the Great East Japan Earthquake and tsunami that set off the disaster there, and found that its analysis results differed from those released by the utility, sources close to the case said.

TEPCO released computer analyses on the progression of the disaster in May and November of last year. That June, the Ministry of Economy, Trade and Industry's Nuclear and Industrial Safety Agency (NISA) also released analyses run by the Japan Nuclear Energy Safety Organization (JNES).

According to TEPCO's November results, the core of the No. 1 reactor became exposed at around 6:10 p.m., approximately two-and-a-half hours after tsunami struck the plant on March 11, 2011. The analysis concluded that molten nuclear fuel melted through the reactor's pressure vessel at around 1:50 a.m. on March 12.

The government panel independently reconstructed what happened at the No. 1, 2 and 3 reactors following the onset of the crisis using available data such as reactor temperatures, reactor pressure and water levels, and radiation concentration in the containment vessels.

The committee's results showed that the pressure vessel of the No. 1 reactor suffered damage at around 11 p.m. on March 11, 2011, some two to three hours earlier than TEPCO's estimate. A similar difference was found between the panel's results and TEPCO's results for the No. 3 reactor. A lack of data prevented a comparison of the No. 2 reactor figures.

The difference may have been due to the utility and the government overestimating the amount of water pumped into the reactors -- information used in the analyses -- reflecting in the figures the mistaken understanding that the reactors were cooled more quickly than they were.

The investigation committee pointed out that TEPCO had not been thorough in confirming preconditions that would greatly affect the final results of its analyses.

One insider criticized the utility, saying, "That it didn't more closely scrutinize the data in its November analysis last year (by which information had become available) is an act of negligence."

Sources say the panel's final report, set to be released on July 23, will criticize analyses by both TEPCO and the national government as lacking in credibility.

Video of Kan's "rage" to be made public

July 13, 2012-07-13

Tepco told to air footage of Kan's nuke crisis rage

Kyodo, Jiji

<http://www.japantimes.co.jp/text/nn20120713a3.html#.UAASIJFIwpU>

Tepco said Thursday it will disclose in-house video footage captured during the start of the Fukushima nuclear disaster, including then Prime Minister Naoto Kan ripping into the utility's officials at its headquarters.

The footage was recorded through Tokyo Electric Power Co.'s teleconference system, which connected its head office in Tokyo and the shattered Fukushima No. 1 nuclear complex, the utility said.

Some of the footage shows an enraged Kan lashing out at Tepco officials over what he believed was a request by the utility to pull out all personnel from the stricken plant in March last year, a senior Tepco official said.

Tepco has been reluctant to make the footage public, citing privacy concerns, but has apparently bowed to pressure from Economy, Trade and Industry Minister Yukio Edano, who has repeatedly called for the videos to be disclosed.

"We have no alternative but to make the footage public," the Tepco official said.

Tepco's top executives were to visit Niigata Prefecture on Friday in order to discuss safety measures at its now-idle Kashiwazaki-Kariwa nuclear power plant.

July 12, 2012

TEPCO to disclose footage of Kan scolding officials in nuclear crisis

<http://mainichi.jp/english/english/newsselect/news/20120712p2g00m0dm038000c.html>

TOKYO (Kyodo) -- Tokyo Electric Power Co. plans to disclose in-house video footage recorded during the Fukushima Daiichi nuclear power plant disaster, including footage of then Prime Minister Naoto Kan fiercely scolding utility officials at its head office in Tokyo, a senior utility official said Wednesday.

The footage was recorded through the company's teleconference system that connected the head office and the nuclear complex in Fukushima Prefecture. The scene with Kan shows exchanges over what he believed was a request by the utility to withdraw all its workers from the plant at the height of the crisis.

The utility known as TEPCO has been reluctant to make the footage public, citing privacy concerns. But it has apparently now bowed to pressure from Economy, Trade and Industry Minister Yukio Edano, who has repeatedly called for the video footage to be disclosed.

"We have no way but to make it public," the senior TEPCO official said.

Mamoru Ito on media coverage of Fukushima disaster

Sunday, July 8, 2012

Keeping an eye on TV news coverage of the nuke crisis

<http://www.japantimes.co.jp/text/fd20120708a1.html#.UALuC5FIwpU>

By ERIKO ARITA

Staff writer

In the week immediately after March 11, 2011 — when a magnitude 9.0 earthquake and tsunami hit Tohoku and crippled the Fukushima No. 1 nuclear power plant — most Japanese were closely watching TV news programs — amazed that a nuclear crisis was now threatening their lives.

It didn't take long for people to start feeling unsure about whether they could trust what the government, Tokyo Electric Power Co. (the operator of the plant), and the scientists appearing on TV were saying — because they kept on stressing that the radiation released from the reactors did not pose an immediate threat to the public's health.

After a few weeks, it turned out that radiation contamination had actually been spreading through Fukushima and even to the Kanto region, and those who were potentially facing a risk to their health from this invisible menace lost confidence in what was being said in TV news reports.

Mamoru Ito, author of "Terebi wa Genpatsu Jiko wo Do Tsutaetanoka" ("How TV Reported the Nuclear Accident") and Professor of Media & Cultural Studies at Waseda University in Tokyo, suggests that though TV stations had sent hundreds of reporters to disaster-hit areas, including Fukushima, and had TV crews covering the government and Tepco 24-hours a day, their news almost always repeated the official line, of which the public were growing suspicious.

"The most serious issue (which caused insufficient reporting of the disaster) was TV stations' keen lack of awareness of the danger of possible accidents at nuclear plants," Ito said in a recent interview with The Japan Times. "Of course, it was not only TV news programs. Other media had the same problem."

Between March 11 and March 17, 2011, Ito recorded most Japanese TV news reports on the Fukushima nuclear crisis. With cooperation from a researcher at another university, Ito compared all the news programs on the disaster from key the TV stations — NHK, Fuji TV, TBS, TV Asahi and Nippon Television — and published a book on his findings.

In the book — which was published in March this year and has so far sold 15,000 copies — Ito pointed out that among the TV stations he looked at, only NHK has a science section. But still, the public broadcaster did not report the crisis thoroughly, Ito said, as reporters and producers at NHK news only covered what the government and Tepco were saying, and they, in turn, had failed to discover the meltdown of the reactor cores that led to the release of a tremendous amount of radioactive material into the air.

"Despite such an enormously dangerous situation, NHK consistently failed in reporting the real crisis," Ito said.

In his book, Ito wrote that at around 7:40 p.m. on March 11, the TV stations live-broadcasted the news conference given by Chief Cabinet Secretary Yukio Edano, who explained that the reactors at the Fukushima plant had to be cooled and that the government had declared a state of atomic power emergency.

Immediately after the conference, NHK broadcasted the dialogue between newscaster Shinichi Taketa and a reporter from NHK's science section named Toshiyuki Yamazaki. According to Ito's book, this is what was said:

"What do you think of this situation?" Taketa asked Yamazaki.

"The six reactors at the plant have stopped. They are hot and need to be cooled down and some of the reactors' cooling pumps are not functioning well, according to the authorities," Yamazaki said. "But they say monitoring posts in the area surrounding the plant are not detecting radiation. It means residents don't need to evacuate right now. I think the government declared a state of the emergency so that it can make doubly sure of the security of the residents."

On the other hand, Fuji TV broadcasted its news program on the accident at 8:07 p.m. and aired a comment on the possibility of a meltdown of the reactor cores by physicist Yuko Fujita, former associate professor at Keio University.

"Because nuclear reactors operate at a very high temperature, they must be kept cooled. Even though they have been stopped by the emergency, they will go into meltdown unless they are cooled. If the reactor core melts down and touches water, it will cause a vapor explosion, which means disaster ... I am very concerned that the reactors are in a state of meltdown."

Ito said that **Fujita was the only expert who forecast the meltdown on TV on March 11. But after that, Fujita was no longer invited to discuss the issue on Fuji TV.**

"I speculate that it was because the station management thought Fujita spoke too much on the danger of the nuclear accident," Ito said.

On March 12, an explosion did occur at 3:36 p.m. at the No.1 reactor, which destroyed the walls and roof of the reactor housing. By the morning of March 13, the amount of radiation had reached around 1,000 times normal inside the control room at the plant. On the day, Chief Cabinet Secretary Edano said another reactor, No. 3, might also have overheated but denied it was in a state of meltdown. Tepco began injecting fresh water into the No.3 reactor, and then cooperated with Self Defense Forces, pouring seawater into the reactor.

According to Ito's book, an announcer at TBS news asked Muneo Morokuzu, professor of the University of Tokyo, to comment on this situation:

"Although some people were injured and the reactor building was destroyed, the containment vessel is keeping radioactive materials inside. While (Tepco) cannot use the reactor anymore, I think it is wonderful that (Tepco and SDF) could maintain a safe level (of radiation)," Morokuzu said.

Yet, Ito said that Morokuzu's comment was irrelevant.

"Tepco could not, in fact, maintain the minimum level. Because the radioactive vapor was being released from the reactor that had exploded, the containment vessel was broken," Ito said. "But because the professor apparently wanted to emphasize 'it is safe,' he made such a comment."

Ito maintains that experts on TV should have had the responsibility of forecasting the worst-case scenario and commenting on how to cope with it.

In terms of the opinions of people at the TV stations, Ito said that there were reporters and producers who opposed the broadcasting of the official line, according to his research.

"However, the power of (TV station) staff who emphasized the safety of nuclear power was overwhelming," he said.

While TV stations were unable to inform the seriousness of the disaster, Ito argues that **alternative media on the Internet succeeded, to some extent, in reporting useful information related to the accident.**

For example, the Independent Web Journal, a video streaming site established by freelance journalist Yasumi Iwakami, broadcasted the news conference at the **Citizens' Nuclear Information Center** on March 12. CNIC is the only citizen's organization specializing in nuclear safety issues.

At the conference, Chihiro Kamisawa, a CNIC expert, referred to the government's radiation data and the evacuation order, explaining that he assumed it was based on the forecast that people in the 10-km-radius

would be exposed to 20 to 50 times the radiation limit for normal people in one year, which is 1 millisievert (on top of the 2.4 mSv annually the average person receives from natural sources).

Following Kamisawa, Masayoshi Goto, a former engineer at Toshiba and designer of the containment vessels at the Fukushima plant, said that the reactors' cores were apparently melting and the temperature of the suppression pool in the containment vessels were probably reaching 100 C, which meant the possible breakdown of the pool.

The suppression pool did actually break at 1:50 a.m. on March 12, though it was not made public until one year later.

Another fact that increased distrust of the government and TV news programs was the unreleased System for Prediction of Environmental Emergency Dose Information (SPEEDI) data. According to Ito, only TV Asahi briefly referred to the computerized system for projecting how radioactive materials disperse in March. Ito interviewed NHK staff about SPEEDI and found out that NHK had known about the simulation system since March 12 but it never mentioned it on air in March.

"The NHK staffer said that the TV station knew SPEEDI and questioned the Education Ministry on the system. But the ministry officials said that they could not release the data because it was not accurate. Then NHK didn't report what the ministry said," Ito said. "NHK should have reported that the ministry said such a thing."

In order not to repeat such failure, Ito urges TV stations to investigate their own reporting of the Fukushima disaster.

"They should inspect when and where their reporters received information on every aspect of the crisis. What were the things reporters never covered? The TV stations must check the whole process and the facts of their reporting," Ito said. "They should also reflect whether their judgment on news' values were appropriate."

To improve TV coverage on the ongoing crisis, Ito said that **TV stations, the central and local governments and scientists should create a networked system in which they can share information and data on radiation immediately.**

TV stations must also cooperate with citizens' groups and alternative media on the Internet as well as broadcast videos taken by freelance journalists and citizens, he said.

While public access to TV broadcasting is limited in Japan, an increasing number of people have learned how to take videos and upload them on the Internet, and those videos should then be broadcast on TV, Ito

said, adding that people's participation in news coverage on mass media is called "public access" (broadcasting).

"The power of TV is enormous, which is why public access to TV broadcasting needs to be considered by society."

SPEEDI should have been used to plan evacuations

July 16, 2012

Govt. panel: SPEEDI use may have avoided exposure

http://www3.nhk.or.jp/daily/english/20120716_02.html

A government panel investigating the Fukushima Daiichi nuclear power plant accident will issue its final report next week.

It will say residents could have avoided unnecessary exposure to radiation if the government's system for predicting the spread of radioactive substances had been used to plan their evacuations.

The government activated the SPEEDI system using unconfirmed data from the day the accident occurred because it failed to obtain information on where radioactive materials originated. But officials did not publicize the results.

The panel is studying the Science Ministry's SPEEDI results and the evacuations of residents. It plans to issue its final report on July 23rd.

The report will say SPEEDI predicted in the afternoon of March 15th last year that radioactive elements would spread inland toward the west and northwest. Residents were fleeing in those directions on that day.

SPEEDI also forecast that from the dawn of March 16th a change in wind directions would send radioactive substances out over the Pacific Ocean.

The report will say people could have avoided unnecessary exposure to radiation if the government had used SPEEDI predictions in planning evacuations and if residents had been ordered to stay inside on March 15th and seek refuge on the following day.

Discussions will be held to determine how SPEEDI forecasts can be used in planning future evacuations.

Earlier this month, another panel of experts commissioned by the Diet issued its report which included a different conclusion on SPEEDI from that of the government committee.

It said SPEEDI forecasts cannot be used as a basis to craft initial evacuation plans due to the limited accuracy of weather information to be used in predictions.

Make sure the voices of Fukushima people are heard

July 16, 2012

Nuclear energy hearing disrupted by presence of power company official

<http://mainichi.jp/english/english/newsselect/news/20120716p2g00m0dm005000c.html>

SENDAI (Kyodo) -- A government-sponsored event in Sendai to listen to citizens' views on future energy and environmental policy was temporarily disrupted Sunday after a ranking official of Tohoku Electric Power Co. was found to be among the nine speakers chosen and expressed what he said was the company's view in support of nuclear power generation.

The event was the second in **a series of hearings to sample public views on the government's three options for nuclear power generation in the country's future energy mix -- 0 percent, 15 percent or 20-25 percent.** It was the first held in a city ravaged by the March 2011 earthquake and tsunami.

The official, the head of the planning department that plays a central role in the utility's business strategy, expressed support for the 20-25 percent option, saying, "I will speak by summing up the thoughts of the company."

An uproar ensued among the audience with one person asking, "Hasn't the choice of speaker been manipulated?"

The hearing was temporarily suspended. Nuclear disaster minister Goshi Hosono intervened to calm the audience.

The Tohoku Electric official told reporters after the hearing, "The company has taken steps to stem manipulation. I applied (to speak) in the capacity of a private citizen."

The speakers also included three individuals from the Tokyo metropolitan area rather than from the disaster-hit region, a choice critics said could anger people in the region. Hosono said selection of the speakers was "totally random."

According to the secretariat, 105 people applied to speak at the event on Sunday, and around 70 percent of them wished to express views supportive of the zero nuclear option.

Hosono stressed the need for fairness in selecting speakers but expressed displeasure that a Tohoku Electric official was among the speakers at the event. "Organizations can present their policies in various forms, so it is best that we hear the views of individuals as much as possible," he said.

Referring to the Aug. 1 hearing in the city of Fukushima, Hosono said "efforts are necessary to ensure the voices of people in Fukushima Prefecture are heard," suggesting the speakers will not include employees of power companies or those from outside the prefecture.

Is government being fair?

July 18, 2012

Editorial: Gov't should be fair in listening to public opinion on nuclear power

<http://mainichi.jp/english/english/perspectives/news/20120718p2a00m0na002000c.html>

The government's decision to ban employees at electric power companies from expressing themselves during hearings of opinions from members of the general public on Japan's energy policy should be regarded as only natural.

Such hearings are important opportunities to reflect public opinion on Japan's key policies, and not venues to listen to interested parties' assertions.

One cannot help but wonder why electric power industry insiders were initially allowed to attend public hearings on atomic power policy. As long as members of the public doubt whether the government is serious about listening to their opinions, the government cannot ensure fairness of its policy-making process.

Hearings are being held on three scenarios of Japan's reliance on nuclear power as of 2030: scenario 1 under which nuclear plants would be totally shutdown; scenario 2 under which the ratio of atomic power to Japan's total power supply would be 15 percent; and scenario 3 under which the ratio would be 20-25

percent. Specifically, three members of the public who support scenario 1, three others who back scenario 2 and another three who are in favor of scenario 3 are invited to each hearing to express their opinions. The government has introduced such hearings along with deliberative polls -- which consist of public comments, debate and surveys -- as a means to reflect public opinion in its policy-making.

The government plans to hold 11 such sessions across the country. Three sessions have already been held, and the planning manager of Tohoku Electric Power Co. and a section chief at Chubu Electric Power Co.'s nuclear power department expressed their opinions in favor of atomic power at the Sendai and Nagoya sessions, respectively.

The number of speakers is limited to nine at each hearing. If one of the nine is a high-ranking official of a power supplier that is promoting nuclear power, it obviously runs counter to the hearings' purpose of listening to opinions from members of the general public, and raises serious questions about the fairness of such sessions.

Questions also remain about the way such hearings are being held. Speakers express their own opinions, but nobody asks questions and no discussion is held. Since opinions expressed by speakers are not summarized by the organizer, how can they be reflected in the government's energy policy?

According to an advertising agency that serves as the secretariat of the hearings, of those who have applied to express their opinions at the Nagoya hearing, nearly 70 percent support a total elimination of nuclear plants, while over 20 percent back the 20-25 percent scenario. In Sendai, about 70 percent of applicants are in favor of the abolition of all nuclear power stations. Judging from these figures, the government's decision to allow three people each in favor of the three scenarios to express their opinions at the hearings is highly questionable.

Moreover, three people living in the Tokyo metropolitan area were selected as speakers at the Sendai hearing and underscored the need of nuclear power. In Nagoya, four of the nine speakers were from the Kansai or Kanto regions.

Such hearings have been organized across the country on the assumption that public opinion on nuclear power varies from region to region depending on the local situation, such as whether they host nuclear power stations. Therefore, such hearings should be held in a way local communities' opinions are reflected in energy policy.

Biased opinions were expressed in some past symposia and other sessions on nuclear power policy organized by the government in a bid to manipulate public opinion, inviting public distrust. There are observations that the government is reportedly seeking to settle the issue, with an eye to adopting the 15 percent option. Behind the widespread anti-nuclear power campaigns is strong public distrust of the government's stance.

Hearings on energy policy will continue, and the government is also poised to conduct a deliberative poll on the issue. The government should make every effort to ensure fairness in the way it listens to opinions from the public on nuclear power policy in order not to invite public distrust.

Transparency?

Another utility employee speaks at nuclear energy hearing, draws flak

<http://mainichi.jp/english/english/newsselect/news/20120717p2g00m0dm040000c.html>

NAGOYA (Kyodo) -- At the third meeting sponsored by the government to hear citizens' views on future energy policy on Monday, an official of Chubu Electric Power Co. was picked in a limited quota of speakers and drew flak for expressing a pro-nuclear opinion from some members of the audience, although it was given as a view of a private citizen.

Similar criticism was expressed at the second meeting in Sendai city on Sunday where a ranking official of Tohoku Electric Power Co. expressed a pro-nuclear position.

On Monday, the third speaker started his speech by identifying himself as "an employee of Chubu Electric Power" but saying he is attending as a private citizen, nonetheless creating a tense atmosphere in the venue, with one person in the audience saying, "Is this again manipulation?"

The employee said, "No one died from the direct impact of radiation after the accident at Tokyo Electric Power's Fukushima Daiichi Nuclear Power Station. This situation will not change five or 10 years later."

Another speaker was found to be an employee of the Japan Atomic Energy Agency, which runs the Monju fast breeder reactor project, and said he is skeptical if renewable energy can offer a stable supply of electricity. He did not disclose his affiliation when he spoke.

The secretariat of the event said the nine speakers were selected randomly. Three each are selected to give views on each of the government's three options for energy mix where nuclear power accounts for zero percent, 15 percent or 20 to 25 percent.

The secretariat said a total of 161 applied to speak and 106 were for zero percent, 18 for 15 percent and 37 for 20 to 25 percent.

No exemption for TEPCO

July 20, 2012

Court backs gov't decision not to exempt TEPCO over nuclear disaster

<http://mainichi.jp/english/english/newsselect/news/20120720p2g00m0dm042000c.html>

TOKYO (Kyodo) -- The Tokyo District Court ruled Thursday it was legitimate for the government not to apply an exemption, which relieves utilities of compensation payments over nuclear accidents caused by natural disasters, to Tokyo Electric Power Co. over last year's nuclear crisis.

In handing down the ruling, presiding Judge Masatoshi Murakami said, "The government's interpretation of the exemption in an extremely limited way was reasonable to some extent."

The lawsuit, filed by an individual shareholder of Tokyo Electric, focused on whether the government should have applied the exemption to the utility, known as TEPCO, in connection with the Fukushima Daiichi nuclear plant disaster triggered by the March 2011 earthquake and tsunami.

The law on compensation for nuclear accidents includes a waiver clause under which the government, rather than a nuclear power plant operator, would pay compensation for damage caused by a nuclear accident resulting from "an unusually huge natural disaster or a social upheaval."

Murakami said, "There are various interpretations (of the clause) and it is difficult to draw a primary meaning."

Given that the purpose of the law is to protect disaster victims, the government's understanding that the exemption should be applicable to absolutely unimaginable situations is reasonable, the judge added.

The court rejected the demand for state compensation of 1.5 million yen made by the plaintiff, who argued the government's refusal to apply the exemption caused a decline in TEPCO's stock price.

One way to shield radiation

July 21, 2012

TEPCO sub-subcontractor urged employees to cover up their exposure to radiation

The Fukushima No. 1 Nuclear Power Plant is pictured in this photo taken from a Mainichi helicopter on July 19, 2012. (Mainichi)

<http://mainichi.jp/english/english/newsselect/news/20120721p2a00m0na012000c.html>

An executive of a company commissioned by Tokyo Electric Power Co. (TEPCO) to perform part of the work to bring its crippled nuclear plant under control instructed workers at the site to cover their dosimeters with lead in an apparent attempt to hide their exposure to radiation, it has been learned.

The Health, Labor and Welfare Ministry has launched an investigation into the case suspecting that it could constitute a violation of the Industrial Safety and Health Act, which strictly limits the amount of radiation workers can be exposed to.

"We'll firmly deal with the matter once the practice is confirmed to constitute a violation of any law," the ministry's Labor Standards Bureau said.

In November last year, Buildup, a medium-sized construction company based in Fukushima Prefecture, won a contract to perform part of the work to bring the tsunami-hit Fukushima No. 1 Nuclear Power Plant under control as a sub-subcontractor of TEPCO.

About 10 workers of Buildup were engaged in work in December to cover hoses in the plant's contaminated water purification system with insulation materials.

Sources close to the case said a board member of Buildup instructed the workers at a dormitory to shroud their dosimeters with lead covers shortly before the work began at the power plant in an apparent bid to make it look as if they were exposed to far less radiation than the actual amount.

Buildup officials said they cannot contact the board member now.

Article 22 of the Industrial Safety and Health Act stipulates that employers must take necessary measures to prevent workers' health from being affected by their labor. If employers force workers to shroud their dosimeters with lead while working at facilities where radiation levels are high, it could constitute a violation of the clause. Violators could face up to six months in prison or a fine of up to 500,000 yen.

Buildup President Takashi Wada expressed regret over the revelations. "It's extremely regrettable and we take the matter seriously. We'll conduct an investigation into the case based on information from our employees and report the results," he said in a statement.

An official of Tokyo Energy & Systems Inc., a TEPCO subcontractor that farmed out the work to Buildup, said, "We received a report about the case from (Buildup) President Wada. It appears true that the company produced lead covers, but workers have told us they never used the covers although they had been instructed to use them. In any case, it's outrageous."

TEPCO's public relations department said it has instructed Tokyo Energy & Systems to promptly get to the bottom of the incident and report the results.

Job boss wanted dosimeters encased in lead

Tepco crisis workers faced exposure scam

Kyodo, AFP-Jiji

<http://www.japantimes.co.jp/print/nn20120721x1.html>

ALTERNATIVE, Hearings: Page 2 — An executive at a subcontractor for Tokyo Electric Power Co. forced nine workers dealing with the crisis at the Fukushima No. 1 nuclear plant to encase their dosimeters in lead, the company confirmed Saturday.

The executive is believed to have tried to underreport radiation exposure,

prompting the Health, Labor and Welfare Ministry to launch an investigation on suspicion of violating the industrial safety and health law, officials said.

The unnamed executive, who is in his 50s and works for Build-Up, a construction firm based in Fukushima Prefecture, told the plant workers Dec. 1 to attach the lead plates to pocket dosimeters provided by Tepco to monitor their radiation exposure, the sources said.

He said during questioning that he issued the instruction to them only once and that they worked at the site around three hours that day, according to the company.

The workers were hired for about four months through last March to wrap pipes at a water treatment facility with heat insulators.

Tepco affiliate Tokyo Energy & Systems Inc., which contracted with Build-Up, said it was told the workers did not use the lead plates, but it is looking into the matter to see if the executive was acting on his own initiative.

Lead is one of the main materials for shielding radiation.

Tepco uses the dosimeters to decide how long workers at the Fukushima plant can deal with the crisis without exceeding the government emergency exposure limit of 100 millisieverts a year.

Hourly radiation of between 0.3 and 1.2 millisieverts was recorded near the work site of the subcontractor employees.

"We are currently investigating the incident. **We learned about this incident only on Thursday after being interviewed by a newspaper,**" Build-Up President Takashi Wada said Saturday. "We truly regret this has happened, and we are taking it very seriously."

A newspaper reported Saturday that the executive told the workers they would quickly reach the legally permissible annual exposure limit of 50 millisieverts without faking the exposure level.

The workers reportedly recorded the meeting.

"Unless we hide it with lead, exposure will max out and we cannot work," the executive was heard saying in the recording, the newspaper reported.

Some of the workers who refused to encase their dosimeters left Build-Up, the paper said.

Vested interests?

July 21, 2012

Chugoku Electric intended to dispatch worker to public hearing to support nuclear power

<http://mainichi.jp/english/english/newsselect/news/20120721p2a00m0na011000c.html>

HIROSHIMA -- Chugoku Electric Power Co. intended to dispatch an employee to a government-led public hearing here on energy policy to express the firm's view on nuclear power, an internal document obtained by the Mainichi Shimbun shows.

This is the first time that it has come to light that an electric power supplier attempted as an entity to have an employee attend a hearing, which is aimed at determining the ratio of atomic power to Japan's total power consumption in 2030.

Chugoku Electric Power abandoned the plan after employees of Tohoku and Chubu electric power companies expressed their opinions at similar hearings in Sendai and Nagoya, respectively, and the government decided not to allow industry insiders to make statements at such gatherings.

Chugoku Electric Power's public relations department said it had intended to have an employee attend the hearing, which is scheduled to be held in Hiroshima on July 29, with the organizer's approval.

"We planned to choose one employee to represent the company and apply to take part in the hearing. If allowed to attend it, we intended to have the employee go after gaining approval from the government,"

an official with the public relations department said. "We had no intention of asking multiple employees to apply to participate (to represent the firm)."

"We thought it important to express our opinions as a company responsible for ensuring a stable supply of electric power," the official added.

Tohoku and Chubu electric power companies said their employees expressed their opinions at Sendai and Nagoya hearings as individuals, and denied that the firms were involved as entities.

The internal document, dated July 12, was compiled in the name of the public relations chief of Chugoku Electric Power's business planning department and was addressed to high-ranking officials.

"Workers, mainly those in the business planning department, will apply to participate in the hearing. If they are given an opportunity to attend it, they will express the company's view," the document partly read.

The document said that all employees were free to apply to participate as individuals and submit their opinions on the issue to the hearing organizer.

However, the document banned insiders from asking retirees or business partners to apply to participate in the hearing or submit their opinions to the organizer saying, "It could give the public the impression that we are asking outsiders to express our view on our behalf."

Subcontracting - A new scandal

July 21, 2012

Fukushima contractor covers up worker exposure

http://www3.nhk.or.jp/daily/english/20120721_23.html

A subcontractor has been found to have instructed workers at the damaged Fukushima Daiichi nuclear power plant to underreport the amount of radiation exposure by placing a lead cover on their dosimeters.

On Saturday, health ministry officials inspected an office on the plant premises where worker exposure data are stored. The office belongs to the company that provided work to the subcontractor.

The subcontractor, "Buildup", was in charge of applying antifreeze to pipes in locations where high radiation levels had been detected.

According to its president, one executive told workers to cover the dosimeters they were wearing with lead to show lower doses last December.

Their work was part of the operation to bring about a cold shutdown at the plant.

In a telephone inquiry by his boss on Saturday, the executive reportedly explained that he made 9 workers use lead covers once. He said he did so after he was frightened by an alarm that warned of a sudden rise in radiation while he was inspecting the plant. He told the president that he was sorry.

The health ministry suspects that the company may have violated the law that requires dosimeters to be used properly to protect workers.

How worker exposure is controlled

http://www3.nhk.or.jp/daily/english/20120721_26.html

Japanese health authorities set the permissible cumulative level for radiation exposure for workers at nuclear power plants at 50 millisieverts per year to protect their safety.

If their exposure exceeds the limit, they are not allowed to work inside radiation control areas.

Employers violating the rule can be punished with prison terms of up to 6 months or fines of up to 500,000 yen or about 6,370 dollars.

Worker exposure is measured by dosimeters they wear while at work, and their employer is responsible for managing them.

At the Fukushima plant, workers receive dosimeters before starting work and return them after work.

The plant's operator, Tokyo Electric Power Company, and one of its contractors, Tokyo Energy & Systems, monitored the exposure of workers from Buildup, a subcontractor with an executive suspected of ordering adjustment of dose records. Workers were informed of their doses every day, and cumulative figures were reported to Buildup once a month.

Such data is also reported to the Radiation Effects Association on a regular basis to keep track of workers' cumulative doses even if their employers change.

Buildup's workers were carrying a dosimeter called "Glass Badge" in addition to the digital one they were told to cover with lead.

The health ministry plans to compare the data on both dosimeters for any significant differences, and also compare data records of people working at the same site.

Build-up President Takashi Wada says he's aware of the gravity of the issue.

The president of another subcontractor told NHK that work in a highly radioactive environment is lucrative.

But he said it's out of the question to falsify exposure data. He said he fears the revelation could undermine confidence in nuclear subcontractors.

A man who had worked at the Fukushima plant just after last year's accident says the official dose limit is 50 millisieverts per year but in reality contractors avoid sending workers to the site if the reading goes beyond 20 millisieverts.

He says he himself can no longer work at nuclear power plants as his cumulative dose probably exceeds about 30 millisieverts.

The man says subcontractors cannot send workers to the plant when their doses rise. So, he says, subcontractors want to limit exposure on a daily basis.

The man adds that many veteran employees are now unable to do such work because of their high cumulative doses. He says he wants people to understand the current situation involving a less-experienced workforce.

Covered dosimeters - Follow-up

July 23, 2012

TEPCO subcontractor used Fukushima plant onsite material to cover workers' dosimeters

<http://mainichi.jp/english/english/newsselect/news/20120723p2a00m0na025000c.html>

The material used by an executive of a Tokyo Electric Power Co. (TEPCO) subcontractor to cover the dosimeters of its workers at the damaged Fukushima nuclear power plant in an apparent attempt to hide their exposure to radiation, was taken from inside the plant's site, officials with the firm said.

The executive from Buildup, a Fukushima Prefecture-based construction company that performed part of the work to bring the disaster-hit Fukushima No. 1 Nuclear Power Plant under control as a subcontractor of TEPCO, used a lead plate for radiation shielding from a storehouse inside the nuclear plant without permission, and used the material to make lead covers for its workers' dosimeters.

The used covers were later thrown away, also at the plant's site, company officials told the Mainichi Shimbun in a recent interview.

Buildup officials and other sources close to the matter further clarified that the incident occurred in early December last year, prior to the beginning of the firm's work at the nuclear power plant. The executive in question, along with several other company employees, took a few millimeter-wide lead plate from the storehouse, and using tools, made covers for their dosimeters from it, the officials say.

It is believed that the executive sought onsite material, and later threw away the lead covers at the power plant's site, because workers at the damaged nuclear power plant are required to pass through a compulsory screening of their possessions when they enter and exit the plant.

Buildup officials say that the executive ordered employees to cover up their radiation doses for the first time during the company's work at the plant between early December to Dec. 20 last year, and used the lead covers only once.

Having worked at the nuclear power plant on two occasions prior to December 2011, once in March last year and a second time between May and July also in 2011, the executive was apparently well familiar with where lead was kept.

Radiation dosages 'falsified' / N-plant workers told to cover meters with lead to lower readings

The Yomiuri Shimbun

<http://www.yomiuri.co.jp/dy/national/T120722001780.htm>

The health ministry is investigating allegations that a construction company ordered its workers at the crippled Fukushima No. 1 nuclear power plant to cover their dosimeters with lead to indicate lower exposure levels, according to sources.

The Health, Labor and Welfare Ministry searched several sites in Fukushima Prefecture on Saturday and confirmed working conditions at the nuclear plant operated by Tokyo Electric Power Co.

According to the ministry, the construction company that issued the illegal instruction is Build-up, which is based in Namie, Fukushima Prefecture.

Build-up was a subcontractor of Tokyo Energy & Systems Inc., a Tokyo-based group firm of TEPCO entrusted with restoring the plant, according to sources.

In December, a Build-up executive allegedly instructed nine onsite workers to place lead covers over their dosimeters so they would record lower radiation exposure levels.

Under the Industrial Safety and Health Law, such workers are permitted to receive a maximum exposure of 50 millisieverts a year. Employers are required to accurately measure workers' exposure levels.

If the executive ordered the workers to cover their meters to manipulate exposure readings, it would constitute a violation of the law that is punishable by up to six months in prison or a fine of up to 500,000 yen.

TEPCO said Tokyo Energy & Systems reported Thursday that lead covers for the radiation meters had been produced. However, Tokyo Energy & Systems also said the covers had not been used during work at the stricken plant.

TEPCO said it instructed Tokyo Energy & Systems to further investigate the matter and report its findings. On Saturday, the Fukushima Labor Bureau and the Tomioka Labor Standards Inspection Office inspected Tokyo Energy & Systems' office in Fukushima Prefecture.

===

Exec admits ordering cover use

Later Saturday, Build-up President Takashi Wada admitted to The Yomiuri Shimbun that the executive had ordered nine workers to work for about three hours while covering their dosimeters with lead.

Wada said he spoke with the executive who supervised the on-site work over the telephone Saturday.

The executive reportedly told the president: "When I went to the site in advance, I was surprised that the alarm on my active personal dosimeter started ringing so quickly. To reduce radiation exposure readings, I came up with the idea of using a lead shield."

Wada said the executive admitted workers at the plant had used lead covers.

Wada, 57, said the workers told him the executive instructed about four workers to make the covers.

According to Wada, the executive said the covers were used only once--in December when the workers transported material on higher ground west of the plant's No. 1 reactor.

"Nine workers were involved and they worked for about three hours," the executive was quoted as telling Wada. "That was the first and last time the covers were used."

About lead and dosimeters (Follow-up)

July 24, 2012

Lead used to show less radiation

Probe targets ploy to shield dosimeters

Jiji, Kyodo

<http://www.japantimes.co.jp/text/nn20120724x1.html>

KORIYAMA, Fukushima Pref. — The Health, Labor and Welfare Ministry said Tuesday it is investigating whether dosimeters worn by workers trying to contain the crisis at the Fukushima No. 1 nuclear plant were manipulated to underreport their radiation exposure and may pursue prosecution.

The ministry meanwhile told Tokyo Electric Power Co. to have all workers, including subcontractors, whose dosimeter readings were suspiciously low to come in for checks to determine their actual radiation exposure.

The announcement of the new probe followed recent revelations that five employees of Build-Up, a subcontractor based in Koriyama, Fukushima Prefecture, used lead shields at the Fukushima No. 1 plant to cover their dosimeters late last year, as Build-Up apparently tried to make their radiation readings appear lower than the actual figures.

Build-Up executive Teruo Sagara told reporters Monday in Koriyama, however, that he had no intention of having the workers use the lead shields so their dosimeters would give lower radiation readings than what they were actually exposed to, contrary to a Saturday report indicating otherwise.

The investigation into whether attempts were made to manipulate the dosimeter readings will be carried out by the health ministry's regional labor bureau in Fukushima Prefecture.

If the probe turns up violations of the industrial safety and health law, the ministry said it will send the cases to the Fukushima District Public Prosecutor's Office.

"Any law violation will be strictly dealt with," Health, Labor and Welfare Minister Yoko Komiyama told reporters.

"This is an issue that shakes the foundation of the management of workers' radiation exposure," she said, adding that if manipulations did occur, such actions would be unforgiveable.

The Nuclear and Industrial Safety Agency, which started an inspection of Fukushima No. 1 on Tuesday, said it will also check how radiation exposure is monitored and instruct Tepco to take measures to prevent any dose-reading manipulations. NISA is under the Ministry of Economy, Trade and Industry.

At a separate news conference, METI chief Yukio Edano condemned Build-Up's alleged attempt to manipulate the radiation exposure readings.

Build-Up executive Sagara, 54, claimed Monday he only wanted to reassure workers as much as possible by delaying when the dosimeters beeped frequently, warning of high radiation exposure. He added that he was among the five and that they discarded the lead shields because they were ineffective.

Sagara said that when he visited the Tepco plant in late November, he feared radiation doses there may exceed the government-set limit of 50 millisieverts per year right away.

He instructed several workers to fashion 12 covers out of lead sheets that had been disposed of at the plant.

On Dec. 1, the five worked for 30 to 40 minutes near reactor 1 with the lead-encased dosimeters in their chest pockets.

With no change in the frequency of the beeps, Sagara said he found them meaningless. He said he discarded all 12 dosimeters with lead covers in the metal disposal site for the plant's reactors 5 and 6 on the following day.

Sagara said using the covers was his idea, and they were not used on any other day. This contradicts Saturday's report that a Build-Up executive, who was not named, again told workers last spring to use lead-encased dosimeters, and that they refused.

Sagara emphasized that he did not force any workers to use dosimeters with lead covers. He said he did not allow three employees who declined to use them to work at the site. He said this was only because he was worried they would not obey his instructions.

The workers wore backup glass badges, which measure the cumulative radiation doses during their work.

Tokyo Energy and Systems Inc., which has contracted to do work at the nuclear plant and used Build-Up, said separately that the maximum gap was 1.3-fold between the cumulative doses measured by glass badges and those based on readings of the shielded dosimeters.

"No major differences were detected," an official of the company said.

TEPCO uses dosimeters to decide how long workers at the Fukushima plant can work without exceeding the government-set exposure limit of 100 millisieverts a year.

Lead is one of the major materials to shield against radiation. In the case of Build-Up, it is believed the lead shields were of a thickness that would have only reduced the radiation reading by 15 percent.

Lead covers meant to hide radiation exposure not effective, TEPCO subcontractor says

<http://mainichi.jp/english/english/newsselect/news/20120724p2a00m0na011000c.html>

KORIYAMA, Fukushima -- The lead covers for dosimeters that several workers at the crippled Fukushima nuclear power plant used were in fact not effective in hiding their exposure to radiation, the executive of a company who instructed the workers to cheat on radiation exposure revealed on July 23.

Teruo Sagara, a director of Buildup, a Fukushima Prefecture-based construction company, told a news conference that he had decided not to use the lead covers for dosimeters after he and his workers used them once and found they were ineffective in shielding radiation. He implied, however, that he would have continued to use the lead covers if they were effective in hiding radiation exposure, saying, "If they were effective, we would have gone in the wrong direction." At the news conference, he apologized: "I am sorry for having caused you trouble."

When Sagara visited the work site with his workers in preparation for the actual task to help bring the Fukushima No. 1 Nuclear Power Plant under control on Nov. 28, 2011, he was "upset" by the warning sounds of the alarm pocket dosimeters (APDs), he said. "In order to dispel workers' concerns," he had looked for lead vests that could shield radiation, but he decided not to use them because they were too heavy. Then he thought of lead covers.

On Nov. 30, 2011, six people including Sagara himself made 12 lead covers out of radiation-shielding lead plates at the original contractor's storehouse. Sagara instructed the workers to attach them to their dosimeters on that evening.

Sagara said that he had told those workers who voiced worry, "You won't be able to work if radiation doses rise." On the morning of Dec. 1, 2011 -- the first day of their work -- Sagara removed three workers who refused to use the lead covers from the project and left them at their lodging facility. Five people including Sagara attached the lead covers to their dosimeters and carried out their work in a high-dose area. But because the lead covers were made without measuring the size of the dosimeters properly, they did not fit into the APDs. Therefore, after checking the actual radiation exposure following the day's work, the lead covers were found to be ineffective, Sagara said.

After the news conference on July 23, Sagara and Buildup President Takashi Wada visited the Tomioka labor standards inspection office in Iwaki, Fukushima Prefecture, to report what had actually happened.

Ikuro Anzai, honorary professor at Ritsumeikan University, said, "It is possible that similar things are taking place in other places. The government should deal with it as an issue related to work safety and strictly check whether actual radiation exposure is deliberately underestimated."

Hosono defends Naoto Kan

Nuclear disaster minister defended then PM Kan for handling of Fukushima crisis: panel

<http://mainichi.jp/english/english/newsselect/news/20120726p2a00m0na011000c.html>

Nuclear disaster minister Goshi Hosono had defended then Prime Minister Naoto Kan for his handling of the crisis at the Fukushima No. 1 Nuclear Power Plant, according to details of hearings conducted and released by the Independent Investigation Commission on the Fukushima Daiichi Nuclear Accident.

Hosono, who had served as special advisor to then Prime Minister Kan at the time of the outbreak of the Fukushima nuclear crisis, was quoted as telling the independent panel's closed-door hearing in November last year, "Suppose a prime minister other than Prime Minister Kan was pressed to make decisions there at that time, I have no idea who could be a prime minister capable of making (proper) decisions."

Hosono was questioned by both government and Diet panels tasked with looking into the Fukushima nuclear disaster, but his testimonies to those two separate panels have not been released.

While Tokyo Electric Power Co. (TEPCO), the operator of the crippled nuclear power station, denied the utility had proposed to the government that all workers at the plant be withdrawn in the middle of the crisis, Hosono stressed during the closed-door questioning by the independent panel that he had thought the power company sounded out the government about the "complete withdrawal." Hosono then added, "I hesitated to tell them to stay there. I had no idea what decision I should make."

On Kan's decision to leave the Prime Minister's Office to inspect the troubled Fukushima nuclear power plant himself on March 12, 2011, the day after the outbreak of the crisis, Hosono said, "The decision led to Mr. Kan's mental strength to carry the fate of the country and make decisions without sleeping for several days."

The details of the panel's questioning of Tetsuro Fukuyama, a House of Councilors lawmaker from the ruling Democratic Party of Japan (DPJ), were also released. Fukuyama, who was deputy chief Cabinet secretary at the time of the nuclear crisis, quoted then Prime Minister Kan as telling senior TEPCO officials shortly after the outbreak of the crisis, "Let me talk to nuclear plant chief Masao Yoshida directly by phone." Then, Fukuyama said the TEPCO officials were hiding themselves and "stealthily" checking Yoshida's cell-phone number. Fukuyama said he had taken their behavior as an indication that every bit of information was coming through TEPCO headquarters. He then expressed his sense of distrust in the utility, saying, "I was stunned at the possibility of TEPCO suppressing the Prime Minister's Office's intentions."

Following manuals not enough in case of emergency

July 27, 2012

Ministry admits faults in its Fukushima responses

http://www3.nhk.or.jp/daily/english/20120727_28.html

Japan's education ministry has admitted that its response to the Fukushima nuclear accident was inappropriate in terms of informing residents and addressing parents' concerns about radiation exposure.

A report issued on Friday refers to the government decision not to release radiation maps provided by the United States immediately after the accident began in March 2011.

The report says the government did not have a manual on disclosing results of surveys by foreign organizations.

The ministry admits to mishandling the issue of its radiation exposure limit for outdoor school activities.

In April last year, officials set the limit at 20 millisieverts per year, saying they followed recommendations of an international organization.

But the ministry eventually lowered the limit after parents said it was too high. The report says officials did not fully address the parents' worries.

The report says communication between sections was not smooth because an emergency response framework set up after the accident was different from one referred to in a manual.

Vice education minister Takashi Kii told reporters that following manuals is not enough to protect people's lives and assets during emergencies.

Kii said ministry officials must use their imagination and act without waiting for orders.

Yamaguchi deleted mails about secret meetings

July 27, 2012

Cabinet Office official deleted emails on secret meetings of pro-nuclear parties

<http://mainichi.jp/english/english/newsselect/news/20120727p2a00m0na012000c.html>

An official of the Cabinet Office, who chaired secret meetings of pro-nuclear power members of the Japan Atomic Energy Commission (JAEC), deleted most of the emails on such gatherings before he stepped down, sources close to the case said.

Yoshiharu Yamaguchi, who was a senior policy researcher at the Cabinet Office, deleted the emails after a fact-finding team set up by the Cabinet Office asked those present at such gatherings to submit relevant materials, raising suspicions that he intentionally deleted evidence.

The fact-finding team has launched efforts to restore emails on the server at the Cabinet Office at the instruction of lawyer Tadashi Kunihiro, an adviser to the fact-finding team.

Yamaguchi, who was on loan from Japan Atomic Power Co., returned to the firm on July 1 as part of the restructuring of the secretariat to JAEC following revelations that pro-nuclear power members of the commission, government officials and industry insiders held secret meetings on nuclear power.

Yamaguchi admitted having deleted the emails at the end of June. "I usually delete unnecessary emails. When I left the government, I deleted my email," he said.

When asked whether he did so to cover up what was discussed at secret meetings, he said, "That's not true. I deleted them simply because I thought they were unnecessary. I wasn't instructed by any other person to delete email. I did it at my own discretion."

In early June, Masato Nakamura, counselor at the Office for Atomic Energy Policy of the Cabinet Office, urged its members to submit all emails related to secret meetings.

The fact-finding team, headed by Cabinet Office Senior Vice Minister Hitoshi Goto, subsequently demanded those who attended secret meetings submit all relevant materials including emails in an effort to get to the bottom of the case. They include JAEC Chairman Shunsuke Kondo and four members of the commission as well as officials at the Office for Atomic Energy Policy, the Agency for Natural Resources and Energy, the Education, Culture, Sports, Science and Technology Ministry and electric power companies.

The Office for Atomic Energy Policy printed out about 1,000 relevant emails that officials had kept in their computers and submitted them to the fact-finding team.

However, as they included few emails Yamaguchi, who played a key role in the secret meetings, had exchanged with those present at secret meetings, the fact-finding team grilled him. He then admitted that he had deleted them.

The team has commissioned a private company to restore the deleted emails. Experts at the company are working to restore them.

TEPCO and its costs

July 27, 2012

Reducing Tepco's costs

<http://www.japantimes.co.jp/text/ed20120727a2.html>

Trade and industry minister Yukio Edano, consumer affairs minister Jin Matsubara and Chief Cabinet Secretary Osamu Fujimura on July 20 decided to let Tokyo Electric Power Co. raise its electricity rate for households by an average 8.47 percent from Sept. 1. On Wednesday, Mr. Edano eventually set the increase at an average 8.46 percent. This is down from Tepco's initial plan to raise the rate by an average 10.28 percent. **Since the rate hike will apply to small-scale factories, supermarkets and convenience stores alike, its effect will be great.**

Judging that Tepco is likely to achieve the goals of its special business plan, the government will soon give Tepco a capital injection of ¥1 trillion, acquire more than half its voting shares, and virtually nationalize the power utility.

Therefore, **it is all the more important for the government to strictly watch whether Tepco is making serious efforts to reduce costs and whether all costs included in its business plan can be justified. Tepco should make its cost details transparent.**

In asking for the 10.28 percent rate hike, Tepco said its financial conditions are deteriorating because of the halt in nuclear power plant operations following the severe accident at its Fukushima No. 1 nuclear power plant and the resultant increase in the cost to purchase fuel for thermal power plants, whose weight in power generation became greater after the Fukushima nuclear crisis.

Mr. Edano ordered a panel of experts to review Tepco's rate increase request. It managed to decrease costs by ¥50 billion. In addition, a panel for the Consumer Affairs Agency and pertinent Cabinet ministers managed to cut costs by ¥33 billion.

Although the panel for the Consumer Affairs Agency argued that depreciation costs for the Fukushima No. 2 nuclear power plant as well as for the Nos. 5 and 6 reactors at the Fukushima No. 1 plant should not be included in Tepco's costs, this idea was not included in the rate increase decision.

Tepco's rate hike plan assumes that the reactors at its Kashiwazaki-Kariwa nuclear power plant in Niigata Prefecture will restart, one after another, from fiscal 2013. Currently Tepco's electricity supply without nuclear power generation has overcome any shortfalls due to power-saving efforts by the citizenry and businesses. The government should soon work out a road map for weaning Japan away from nuclear power.

The current electricity pricing system, which allows power companies to add certain markups to costs, should be changed so that they will make serious efforts to buy liquefied natural gas for thermal power plants at cheaper prices.

More scandal about subcontractors?

July 28, 2012

Fukushima disaster worker says subcontractors siphoned money from wages

<http://mainichi.jp/english/english/newsselect/news/20120728p2a00m0na017000c.html>

A man hired to help bring the disaster at the tsunami-hit Fukushima nuclear plant under control has accused subcontractors of forcing him to work under illegal conditions and skimming off part of his wages.

The 45-year-old Nagasaki Prefecture resident has filed a claim with the Tokyo Labor Bureau accusing Nichieidouryoku Co. of dispatching him to a subcontractor through at least one other subcontractor and forcing him to work under a bogus contract.

The man has also filed a petition with the Nagasaki Labor Bureau against four lower-level subcontractors, complaining that they skimmed off part of his wages.

The Labor Lawyers Association of Japan, which supports the man, said that electric power company subcontractors commonly farm out work at nuclear plants to hired hands through several lower-level subcontractors, and skim off workers' wages.

"This case is just the tip of the iceberg. The situation will never change unless Tokyo Electric Power Co. takes responsibility for subcontractors' employment methods and their safety management practices," a spokesman for the association said.

The association said an unnamed company in Nagasaki Prefecture, referred to as "Company A," introduced a job to remove quake and tsunami rubble in an area within 30 kilometers from the Fukushima No. 1 Nuclear Power Plant to the man in June last year.

The company told him that he would be paid 11,000 yen a day, and instructed him to ask an upper-layer subcontractor, referred to as "Company B," about the details of his work and working conditions.

Company B explained that he would be required to work on the premises of the nuclear plant, outside the reactor buildings, and verbally promised to pay him 14,000 yen per day.

The man signed a contract with Yamato Engineering Service, based in Sasebo, Nagasaki Prefecture, a further upper-layer subcontractor. However, the contract did not specify the amount of his wages.

Despite the explanation from Company B, the man was required to work inside the reactor buildings, dressed in protective clothes, from July 1 to Aug. 9, 2011 at the instruction of supervisors belonging to Yamato Engineering and Nichieidouryoku, a further upper-tier subcontractor.

Even though he was told that he would be paid a dangerous work allowance of about 20,000 yen a day in addition to his regular wages, Company A paid him only 11,000 yen per day.

When the man demanded that Yamato Engineering pay the remainder, the company told him that it had paid 14,000 yen as a daily wage, along with danger pay, to yet another company, referred to as Company C, since he had been dispatched to Company C. Company C was an upper-layer subcontractor for Company B.

The Labor Lawyers Association of Japan pointed out that if Company C had dispatched him to a lower-layer subcontractor, it would constitute a "multi-layer dispatch," and that if he was employed by Yamato Engineering but required to work at the instruction of Nichieidouryoku, it would constitute a bogus consignment contract. Both practices are banned by the Act for Securing the Proper Operation of Worker Dispatching Undertaking.

The association has demanded that labor standards inspection authorities order the man's employer to pay him 630,000 yen in unpaid wages and allowances.

Both Nichieidouryoku and Yamato Engineering officials declined to comment on the case.

"We don't know anything about the case because we didn't have a direct employment contract with the man," a Nichieidouryoku official said.

"Our president is away and can't comment on the matter," Yamato Engineering official said.

SPEEDI no use because "based on assumptions"?

July 28, 2012

Ministry tries to justify withholding SPEEDI fallout forecast data from public

Kyodo

<http://www.japantimes.co.jp/text/nn20120728b7.html>

The science ministry claimed Friday it was appropriate to withhold radiation fallout forecast data from the public immediately after the meltdown disaster started at the Fukushima No. 1 nuclear plant in March 2011 because the data were "based on assumptions."

The Ministry of Education, Culture, Sports, Science and Technology said in a report that the data on the predicted spread of radioactivity compiled by SPEEDI, the System for Prediction of Environmental Emergency Dose Information, were an assumed calculation, not necessarily the real situation.

Officials also told reporters the ministry was "not in a position to release the data to the public."

The government has drawn fire for not promptly announcing the SPEEDI data after the crisis started, with critics charging that the lack of information resulted in unnecessary radiation exposure for people who later evacuated from their homes around the Fukushima plant.

In a report published Monday, a government-appointed panel investigating the Fukushima meltdown crisis said the SPEEDI data could have better informed residents about when to evacuate.

The science ministry, which interviewed Yoshiaki Takaki, who was the science minister at the time the crisis started, and other officials as part of its analysis of the actions it took, or didn't, said it is "doubtful" it could have provided trustworthy information to the public. But its report added that "the significance of providing predictions cannot be denied."

The report also admitted the ministry "did not offer enough explanations and caused misunderstandings" regarding the upper limit of radiation acceptable in schoolyards.

The 3.8-microsievert-per-hour limit was set in order to not exceed 20 millisieverts of annual radiation exposure, in line with recommendations by the International Commission on Radiological Protection, the ministry said. ICRP-set annual radiation exposure thresholds in cases of emergency range from 20 to 100 millisieverts.

The ministry said the limit, which triggered harsh protests from children's parents, was just a limit and it did not mean kids playing in schoolyards may actually be exposed to annual radiation amounting to 20 millisieverts.

The report also said the ministry "failed to promptly respond to concerns aired by parents" of elementary and junior high school students in connection with the upper limit of radioactive substances detected in school lunches.

A lot of money

July 31, 2012

TEPCO receives public funds injection

http://www3.nhk.or.jp/daily/english/20120731_23.html

Tokyo Electric Power Company has received one trillion yen or around 13 billion dollars in government funds, putting the operator of the Fukushima nuclear power plant under effective state control.

The power company asked for taxpayer money to bolster its finances under a rehabilitation program created with a state-backed bailout fund in May.

The injection on Tuesday came in the form of Tokyo Electric's issuance of preferred stocks to the government.

This gave the government up to 75 percent of the utility's voting rights.

The capital injection is supposed to help the firm pay the massive cost of compensating victims of the nuclear accident and scrapping crippled reactors.

But Tokyo Electric continues to face rough going. The company was recently forced to lower household rate hikes and fuel costs are rising for thermal plants now making up for the loss of nuclear power.

TEPCO's losses

August 2, 2012

Tepco logs ¥288.39 billion group net loss for the April-June quarter

<http://www.japantimes.co.jp/text/nb20120802a1.html>

Kyodo

Tokyo Electric Power Co. on Wednesday reported a group net loss of ¥288.39 billion for the April-June quarter due to costs stemming from the catastrophe at the Fukushima No. 1 nuclear power plant, and revised downward its earnings projections for the full fiscal year.

The quarterly net loss compares with a loss of ¥571.76 billion incurred the year before, said the utility, which fell under effective government control Tuesday by receiving ¥1 trillion in public funds.

Tepco registered an operating loss of ¥108.84 billion for the first quarter of fiscal 2012, compared with a loss of ¥52.05 billion a year earlier. Revenue rose 15.6 percent to ¥1.31 trillion.

The government bought more than 50 percent of the company's voting shares to prevent its bankruptcy and help it compensate people and companies affected by the nuclear disaster, scrap the crippled Fukushima reactors and continue supplying electricity without interruption.

Its financial standing was also hit by increasing fossil-fuel costs to make up for the loss of nuclear power. For the full year, Tepco projects a group net loss of ¥160 billion and an operating loss of ¥305 billion. It expects revenue to increase by 11.7 percent to reach ¥5.98 trillion.

Massive bank loans

Banks provided Tokyo Electric Power Co. with ¥370 billion in loans Wednesday to help the utility continue producing a stable supply of electricity while dealing with the Fukushima nuclear crisis, sources said.

The loans come on top of the government's ¥1 trillion capital injection into the firm, which has been struggling since the March 2011 disasters. The lenders include Bank of Tokyo-Mitsubishi UFJ, Sumitomo Mitsui Banking Corp. and Mizuho Corporate Bank as well as the government-owned Japan Development Bank.

The loans comprise ¥200 billion in new loans and ¥170 billion in refinancing.

Banks plan to give Tepco a total of ¥1 trillion in loans, including those provided Wednesday, to support the power supplier until it becomes able to issue corporate bonds, according to the sources.

TEPCO continues imposing media restraint

August 2, 2012

TEPCO still limiting media coverage of in-house footage taken shortly after nuke accident

<http://mainichi.jp/english/english/newsselect/news/20120802p2a00m0na013000c.html>

Tokyo Electric Power Co. (TEPCO) is sticking to its media restrictions for news coverage of footage of teleconferences it held immediately after the outbreak of the crisis at its tsunami-hit Fukushima No. 1 Nuclear Power Plant in March 2011.

Despite protests from news organizations and freelance journalists, TEPCO has refused to change its stance.

TEPCO has offered to show its video footage of teleconferences on the nuclear crisis, mainly those between its headquarters and the crippled nuclear plant, from March 11 to 15, to news organizations from Aug. 6.

The utility will show footage totaling about 150 hours, which is stored on a computer at a conference room at the TEPCO headquarters in Tokyo, to journalists on condition that they not film or record any part of the images or identify individual employees except executives. However, it will allow reporters to take notes on the video images.

The power supplier warns that any violators will be asked to leave the office and may be even banned from attending future news conferences organized by the firm.

Initially, TEPCO had offered to allow only one person from each news organization to view the video between Aug. 6 and 10, totaling about 30 hours. At the instruction of Economy, Trade and Industry Minister Yukio Edano, however, the company extended the period to Sept. 7 and decided to allow up to two reporters each at major news organizations to view the footage.

On Aug. 1, the utility finished accepting applications for viewing on Aug. 6 and 7 because it feared it would be flooded with applications for these first two days. From Aug. 8, however, the company will allow news organizations to view the video on the same days they file applications.

TEPCO's public relations department said it has no choice but to ban news media from filming or recording the footage for privacy concerns. "If individual employees were identified by their voices, they could be personally criticized and their families and others around them could be subjected to abuse."

The Mainichi Shimbun urges TEPCO to retract its policy of banning news organizations from recording the footage and even from reporting the contents of footage it obtains through its own news coverage activities.

Keiichi Katsura, former professor of news media at Risho University, criticized TEPCO's policy of press restraints.

"All members of the public are parties concerned with the Fukushima No. 1 nuclear plant accident. **Therefore, the recording of the teleconferences should be viewed as public property.** It's wrong for TEPCO to enforce press restraints to suit its own convenience," Katsura said.

"TEPCO should rather proactively disclose the footage in order to contribute to clarifying the cause of the accident. How to report the details of the footage should be left to the discretion of each news organization," he said.

Strong signals of public distrust in politics and government

August 1, 2012

Editorial: Poll results, nuke protests show public's distrust in gov't at boiling point

<http://mainichi.jp/english/english/perspectives/news/20120731p2a00m0na012000c.html>

Members of the general public have almost simultaneously sent signals from two locations that their distrust in politics has heightened to an alarming level.

In the Yamaguchi gubernatorial election on July 29, a candidate who ran on an anti-nuclear power platform had a strong showing even though he was narrowly defeated by a former bureaucrat backed jointly by the largest opposition Liberal Democratic Party (LDP) and its former ruling coalition partner New Komeito.

Meanwhile, a large number of people surrounded the Diet Building during a major anti-nuclear power demonstration in Tokyo on the same day.

The fact that an anti-nuclear power candidate gained strong support from those who back no particular political party in a conservative stronghold, and that a huge number of citizens participated in a movement regardless of their party affiliation, have sounded an alarm bell to established political parties, including the ruling Democratic Party of Japan (DPJ) and the LDP. In particular, Prime Minister Yoshihiko Noda, who is trying to resume operations at idled nuclear power stations, should face up to the reality that the public's distrust in politics is at boiling point.

The gubernatorial election was a race too close for comfort for the LDP. The party won seats in three of the four single-seat constituencies of the House of Representatives in Yamaguchi Prefecture in 2009 when the DPJ scored a landslide victory. The LDP-New Komeito alliance fielded Shigetaro Yamamoto, a former high-ranking bureaucrat of the Land, Infrastructure, Transport and Tourism Ministry, while the DPJ was unable to field any candidate. Under ordinary circumstances, it would have been an easy win for the LDP and Komeito.

However, the candidacy of Tetsunari Iida, who is an advocate of a breakaway from nuclear power and was the brains behind Osaka Mayor Toru Hashimoto's political rise, drastically changed the situation. During his campaign, Iida demanded that Chugoku Electric Power Co.'s plan to build the Kaminoseki Nuclear Power Plant in the prefecture be scrapped altogether. The LDP and Komeito was alarmed by the growing support Iida gained from prefectural residents by staging a campaign in a way similar to that of Hashimoto's Osaka Restoration Association. Yamamoto, who is in favor of the promotion of nuclear power, insisted that the Kaminoseki nuclear plant project be frozen in a desperate bid to prevent the issue from emerging as a major point of contention during the race.

Even though Yamamoto was elected, no one should downplay the fact that Iida, who launched a grass-root election campaign without the backing of any established political party, only trailed Yamamoto by about 67,000 votes.

According to exit polls by news organizations including the Mainichi Shimbun, 53 percent of voters who support no particular political party, voted for Iida. The possibility cannot be ruled out that prefectural residents directed their criticism of the Noda Cabinet for trying to reactivate nuclear plants and approving U.S. forces' introduction of the Osprey vertical takeoff and landing aircraft to Japan at the LDP and Komeito, which are established political parties. Following the election, these established parties appear to be increasingly wary of any new political parties, including the Osaka Restoration Association, that are planning to field candidates in the next House of Representatives election in a bid to form a third bloc in the Diet.

These moves are closely related to steady growth in the number of participants in anti-nuclear power demonstrations staged in front of the Prime Minister's Office in Tokyo. A massive number of citizens spontaneously participated in the July 29 demonstration organized by a citizens' network despite the scorching heat, filling streets around the Diet Building.

Large-scale, nonpartisan movements, which had not been observed in Japan for decades, should be viewed as citizens' extremely important expression of their will. These movements reflect citizens' growing concerns that the Noda administration is trying to take the opportunity of the reactivation of two idled reactors at the Oi Nuclear Power Plant in Fukui Prefecture to resume operations at other nuclear plants one after the other and that the government will give up its policy of decreasing Japan's reliance on atomic power to revive its nuclear power promotion policy. The movements also illustrate citizens' anger at the lack of a system under which they can directly reflect their concerns in politics. However, top government officials' response to these moves is extremely slack.

The Mainichi Shimbun's latest opinion poll shows that the approval rating for the Noda Cabinet hit a record low of 23 percent since its inauguration. The sharp decline in the approval rating is attributable to various factors, such as a split of the DPJ and the public's opposition to the consumption tax increase. Noda and members of his Cabinet should take its declining popularity seriously as the public's warning

against the high-handed manner in which the Noda administration has decided on policy measures, such as the reactivation of nuclear plants and the introduction of the Osprey aircraft.

Don't ask them where they work

Gov't won't stop power company officials from taking part in energy policy polls

<http://mainichi.jp/english/english/newsselect/news/20120801p2a00m0na008000c.html>

The government will not exclude power company officials from participating in the upcoming deliberative polls aimed at hearing public opinion on the country's future energy policy, it has been learned.

Criticism has arisen over the selection of participants in previous deliberative poll sessions, in which utility officials voiced their opinions in support of the promotion of nuclear power. The government, in response, had once decided to exclude utility workers from taking part in those hearings, but it determined that there will be no problem if utility workers happen to be chosen on a random basis in deliberative polling starting from Aug. 4.

The government is conducting deliberative polling on top of public hearings at 11 locations across the country over what percentage nuclear power should account for in the country's future energy mix by 2030 -- 0 percent, 15 percent, or 20-25 percent. In contrast to ordinary public hearings, deliberative polls allow participants to debate issues and deepen their understanding before they express their opinions.

The organizing committee for the deliberative polling conducted a nationwide telephone survey on men and women aged 20 or older between July 7 and 22, to which 6,849 responded. After confirming their will to participate in deliberative polling, 301 had become eligible to take part as of July 28. The committee said it asked respondents about their age, address and occupation, but that it withheld from asking the names of their workplaces, leaving the possibility that utility workers may be among participants of deliberative polling.

"If we screen participants, it'll be tantamount to manipulating public opinion and constitutes a 'set-up,'" said an official of the organizing committee.

All decided in advance?

August 4, 2012

Official pushed pronuke stance

Kyodo

<http://www.japantimes.co.jp/text/nn20120804a7.html>

A senior **government official in charge of nuclear policy planning** on Friday admitted pressing the Japan Atomic Energy Commission last year over continuing to generate nuclear power.

Industry minister Yukio Edano, who oversees the country's energy policy, expressed regret over the incident, telling a news conference he doesn't want the public to think the government is scheming to maintain Japan's reliance on atomic energy.

Kyoji Yoshino, a director at the Natural Resources and Energy Agency, on Dec. 27 handed a document to the commission's head, Shunsuke Kondo, stating that "analyzing a scenario for abolishing nuclear power could encourage those concerned (about safety issues) and would not help maintain" atomic energy operations, the industry ministry said.

Kondo has been tasked with reviewing Japan's new energy policy.

Yoshino, head of the agency's nuclear energy policy planning division, received a verbal reprimand from the industry ministry.

Edano claimed Yoshino penned the document only in a private capacity, but added, "While the government has yet to decide whether or not to keep nuclear power, (Yoshino's behavior) could be considered by the public as government maneuvering to maintain the atomic energy."

"I submitted the document as a way to exchange views between administrative bodies, but I inadvertently wrote too much," Yoshino said.

In January, a panel under the commission began discussing Japan's future nuclear fuel cycle in light of the Fukushima disaster.

August 3, 2012

Senior gov't bureaucrat discouraged consideration of zero nuclear power option

<http://mainichi.jp/english/english/newsselect/news/20120803p2a00m0na010000c.html>

A senior official at the Agency for Natural Resources and Energy (ANRE) is under fire for writing that analysis of a possible end to nuclear power would threaten the survival of atomic energy in Japan.

ANRE nuclear power policy chief Kyoji Yoshino wrote to the Atomic Energy Commission in December last year, saying, "Analyzing a scenario in which Japan were to give up nuclear power may help shore up the courage of the cautious factions, but it would not aid the continuation of atomic energy." The comment was an apparent attempt to restrain the commission from considering the elimination of nuclear power.

The government is evaluating three scenarios for Japan's energy future, including one that envisages the complete abandonment of nuclear power in 2030.

Yoshino's comments were disclosed at an Aug. 3 news conference by Minister of Economy, Trade and Industry Yukio Edano, who stressed that they were contained in "a memo written by (Yoshino) as an individual," and did not reflect government policy. However, Edano added, "**It's unavoidable that some people will see this as proof the government is scheming to continue atomic power generation.**"

The industry ministry has issued a reprimand to Yoshino over the document.

According to the ministry, Yoshino passed the document to Atomic Energy Commission Chairman Shunsuke Kondo during a visit to the commission in December 2011 to discuss the proceedings of a subcommittee on Japan's nuclear fuel cycle project. The document asked that, before the government decides on the role of nuclear power in Japan's energy plans, the commission restrain discussion and analysis of the future of the nuclear fuel cycle project on the assumption that Japan will completely abandon nuclear energy.

Yoshino has since told a ministry internal inspection that he "deeply regrets" writing the document.

TEPCO never learns

August 4, 2012

Editorial: TEPCO must be condemned for news media restrictions

<http://mainichi.jp/english/english/perspectives/news/20120804p2a00m0na009000c.html>

We must condemn Tokyo Electric Power Co. (TEPCO) over its restrictions on news media access to footage of videoconferences it held immediately after the outbreak of the Fukushima nuclear disaster.

The utility will show the videoconference footage to news organizations on request starting Aug. 6. However, the company has altered parts of the videos out of consideration for the privacy of employees who appear in the videos.

TEPCO has agreed to show the edited footage to the media with various conditions attached. It bans reporters from recording the footage or identifying ordinary employees who are not listed in the company's own crisis investigation report. Furthermore, the utility demands that news organization never release any of the footage or images from it that they obtain through their own sources.

The power company has even hinted it will expel journalists who refuse to comply with these rules from its offices or ban them from attending its future news conferences. Such media restrictions are absurd considering that the footage is public property, as well as the public's right to know and the freedom of the press in Japan. We strongly urge TEPCO to respond to news organizations in a flexible manner when it shows the footage.

About 150 hours of videoconference footage between TEPCO headquarters and the stricken Fukushima No. 1 plant will be released to the press, covering the roughly four days from March 11, 2011 -- the day the Great East Japan Earthquake and tsunami triggered the nuclear crisis -- to March 15.

During that period, hydrogen explosions blew apart the buildings housing the plant's No. 1, 3 and 4 reactors. The No. 2 reactor's cooling function was lost and sea water was injected into the No. 1, 2 and 3 reactors. Amid this critical situation, then Prime Minister Naoto Kan visited the TEPCO headquarters on the early morning of March 15, and warned the utility in no uncertain terms against withdrawing workers from the plant.

The nuclear disaster came as a shock not only to the Japanese public but also the international community. The TEPCO videoconference footage is indispensable for clarifying how the utility tried to bring the crisis under control and how far workers grasped the condition of the overheating reactors, as demanded by the international community.

Since TEPCO has received a massive infusion of public funds and been effectively placed under state control, the company is all the more accountable to the public for the crisis and its response. As such,

TEPCO must release all relevant videos without restrictions for analysis by third parties. The company is set to show the footage only to the media, but researchers and ordinary citizens must be given access to the videos as well. Moreover, it should release footage from March 16 and beyond as well.

Needless to say, news organizations must report on the videos while giving maximum consideration to the privacy of individuals who appear in them. At the same time, however, it is possible for the media to identify ordinary workers who played an important role in responding to the crisis even if they are not in managerial positions. **Assuming the responsibility for the consequences of this is one of the things the news media is supposed to do**, TEPCO should be fully aware of news organizations' role in this regard.

We cannot help but be astounded by the manner in which TEPCO initially proposed to reveal these important videoconferences to the media and the world. Specifically, the utility had planned to allow only one reporter from each media outlet to view the video within about 30 hours over five days starting Aug. 6. TEPCO's plan certainly made it appear as if the company was deliberately trying to make it as difficult as possible for any third party to get to the bottom of the crisis. In the end, the utility extended the period to Sept. 7 at the instruction of Economy, Trade and Industry Minister Yukio Edano.

The Japan Newspaper Publishers & Editors Association urged TEPCO on Aug. 3 to release the relevant videos in their entirety and do away with all press restrictions. TEPCO should humbly accept this demand.

TEPCO's footage of first five days

August 6, 2012

August 6, 2012-08-06

Tepco airs internal crisis footage

<http://www.japantimes.co.jp/text/nn20120806x2.html>

By KAZUAKI NAGATA
Staff writer

Tokyo Electric Power Co. on Monday began allowing journalists to view 150 hours of teleconferencing footage between its headquarters and the Fukushima No. 1 plant, showing how executives interacted with workers in the first five days of the meltdown crisis that erupted on March 11, 2011.

Some of the footage, which was finally disclosed after resistance from Tepco, portrayed the extreme tension and chaos that reigned as the crisis escalated toward hydrogen explosions in reactors 1, 2 and 3, raising fears that the primary containment vessels give way.

The footage also showed Tepco Managing Director Akio Komori, one of the key executives involved in handling the crisis, urging others to decide under which conditions workers would have to be withdrawn as the utility surmised that the fuel rods in reactor 2 were fully exposed at 6:22 p.m. on March 14.

"Somebody needs to come up with a criterion for a pullout. At some point we need to make a decision on whether we can stay at the plant or (its) control rooms. Please start considering the criterion," Komori said around 7:30 p.m.

Tepco claims it was only discussing a partial withdrawal of workers and never considered a total pullout from the plant.

But then Prime Minister Naoto Kan and other government officials suspected that Tepco was considering abandoning the plant for good amid the meltdowns. A total pullout would have triggered even more meltdowns and a much larger release of radioactivity over eastern Japan.

The 150 hours of footage only has audio available for 50 hours, and about 100 of the nonsound hours include teleconferences between Tepco's Tokyo headquarters and the Fukushima No. 1 plant. The teleconference network connects Tepco's major facilities, such as Tepco's headquarters in Tokyo, the Fukushima No. 1 and No. 2 plants, an off-site center and the Kashiwazaki Karia plant. The footage is divided by several screens and shows scenes of these places.

The 50-hour video was recorded at Tepco headquarters, and the 100 hours of nonsound video was recorded through the network at Fukushima No. 2.

Tepco claimed that the audio capture and image capture need to be set up separately, but workers, according to Tepco, failed to turn on the audio recording for the 100-hour footage.

The silent footage includes the time when Kan visited Tepco headquarters early on the morning of March 15.

Apparently Kan had a heated exchange with the utility's officials over their handling of the crisis, but the camera was shooting Kan from behind and facial emotions were not captured.

Kan, fearing Tepco was considering quitting the plant, went to the headquarters to take over emergency operations by setting up a joint headquarters.

Tepco claims the emotional exchange with Kan only served to undermine the morale of the workers, while Kan claimed his visit was useful to the government in handling the crisis.

The footage also showed another heated exchange involving Tepco workers. Soon after reactor 3 was rocked by a hydrogen explosion at around 11 a.m. on March 14, Masao Yoshida, then chief of the plant, hurriedly called Tepco headquarters.

"It's probably reactor 3, and it has just exploded!" Yoshida said.

The report caused a big stir at the plant and Tepco HQ, as the voices of confused workers could be more loudly heard from the footage. Some yelled "Check the parameters of reactor 3!" while others were calling around to check if everyone was OK.

Kan demands full disclosure of TEPCO video

http://www3.nhk.or.jp/daily/english/20120806_31.html

Former Prime Minister Naoto Kan has demanded a full disclosure of the TEPCO teleconference video recorded in the aftermath of last year's nuclear accident. Kan led the disaster response as prime minister.

Kan said an unconditional and full disclosure is necessary to get to the bottom of what happened after the accident. He compared the importance of the footage with the voice recorder of a crashed plane.

Kan said the video showing his visit to the TEPCO headquarters on March 15th last year does not have audio. He said he wants to see everything recorded including the audio.

Manipulation, again

August 7, 2012

Pro-nuclear power experts used secret meetings to manipulate deliberations

<http://mainichi.jp/english/english/newsselect/news/20120807p2a00m0na009000c.html>

Secret meetings of pro-nuclear power experts organized by the Japan Atomic Energy Commission (JAEC) "manipulated" deliberations by a subcommittee on Japan's nuclear fuel cycle by removing policy scenarios that would adversely affect power suppliers, a report by a Cabinet Office investigation team has revealed.

The report, which was submitted to nuclear disaster minister Goshi Hosono on Aug. 6, also revealed that the JAEC held a "coordination meeting" attended by power suppliers to influence the conclusion by the subcommittee. "It was inappropriate from the viewpoint of neutrality, fairness and transparency," the report concluded.

According to the report, the secret meetings -- which were technically called "study meetings" -- "guided discussions by a subcommittee by removing scenarios that would adversely affect utilities. The possibility that those meetings influenced the conclusion by the subcommittee cannot be ruled out."

The team's finding contradicts JAEC's claim that the secret meetings did not influence subcommittee discussion on the nuclear fuel cycle. The subcommittee was set up last September to review Japan's nuclear fuel cycle policy in the wake of the Fukushima nuclear disaster. "We will examine the report and disclose what responses we will make," JAEC Chairman Shunsuke Kondo told reporters.

The initial part of the report examined the characteristics of the secret meetings by analyzing e-mail dispatched by the Cabinet Office. Because one of the e-mails stated that "The direction (of discussions) will be examined by the study meetings, based on which discussions will be made," the report points out that those meetings "were aimed at influencing not only working-level meetings but other discussions as well."

The report then recognizes the fact that a policy scenario that would adversely affect the continuation of research and development of the Monju prototype fast-breeder reactor was deleted from policy options as a result of a secretive meeting held on March 8. "**There was an induction of discussions under the strong influence of the Ministry of Economy, Trade and Industry,**" the report said.

While acknowledging that most of the subcommittee members denied during their interviews that the study meetings influenced their conclusion, the report said, "If the scenarios presented have already been sifted through, that would affect discussions. The possibility that it influenced the (subcommittee's) conclusion cannot be ruled out."

Furthermore, the report disclosed that the JAEC held a coordination meeting attended by its chairman and power industry officials, where they discussed the conclusion to be drawn by the subcommittee.

After the investigation team restored e-mails from the Cabinet Office's computer server, it emerged that JAEC held a "coordination meeting" on May 1 to discuss the subcommittee's conclusion, called a "comprehensive evaluation." The meeting was attended by JAEC Chairman Kondo, Vice-Chairman Tatsujiro Suzuki, officials from the Federation of Electric Power Companies of Japan -- a consortium of 10 utilities -- and Japan Nuclear Fuel Ltd., the operator of the Rokkasho Reprocessing Plant in Rokkasho, Aomori Prefecture.

Prior to the meeting, a draft made by Suzuki was distributed to attendees via e-mail, based on which they adjusted their opinions, according to the report.

Cabinet Office team blasted for failing to get to bottom of secret meetings on nuke power

<http://mainichi.jp/english/english/newsselect/news/20120807p2a00m0na008000c.html>

A Cabinet Office fact-finding team has come under fire for failing to get to the bottom of secret meetings between pro-nuclear officials after it released a report that stopped short of concluding whether the gatherings had influenced policy discussions at the Japan Atomic Energy Commission (JAEC).

The team, comprised of 12 members including Cabinet Office Senior Vice Minister Hitoshi Goto, spent about 1 1/2 months on its investigation into secret meetings of JAEC members and others favoring nuclear power.

The team needed to confirm specifically what was discussed at such secret meetings to determine whether and how far the discussions influenced policy decisions at a JAEC subcommittee that was reviewing the nuclear fuel cycle project in which spent nuclear fuel would be reprocessed for reuse in nuclear reactors.

However, attendees and organizers of the secret meetings claimed that no minutes were compiled on any of the gatherings. The team managed to obtain memoranda on the outline of discussions at some meetings submitted by the Japan Atomic Energy Agency (JAEA), which operates the prototype fast-breeder reactor Monju in Fukui Prefecture, the core of the nuclear fuel cycle project.

Tatsujiro Suzuki, vice chairman of JAEC, told the fact-finding team that those present at such meetings representing the Economy, Trade and Industry Ministry and the Federation of Electric Power Companies of Japan (FEPC) were taking note of what was being discussed.

Nevertheless the ministry said no such memorandum has been found. FEPC admitted keeping memoranda but refused to submit them to the team for privacy concerns.

Akira Yoshikawa, a senior official at the Cabinet Office, raised doubts about Economy, Trade and Industry Ministry officials' denial that they took notes. "I asked the ministry a few times whether it kept memoranda on the meetings, but it responded they didn't. It's extremely doubtful they did."

Lawyer Yasushi Murakami, who served on a special fact-finding team on sumo wrestlers' and stablemasters' involvement in illegal baseball gambling, is paying close attention to the fact that Goto, senior vice minister at the Cabinet Office, asked attendees of secret meetings to cooperate in its investigation.

"Those who refused to follow orders from their appointees would be punished. However, a Cabinet Office senior vice minister has rank only over Cabinet Office officials," Murakami said. "If the investigative team needed to gain cooperation from other ministries and agencies concerned, the prime minister should have issued the order."

Murakami also pointed out that FEPC would have submitted relevant memoranda it keeps if it had been instructed by the Economy, Trade and Industry Ministry, the regulator of the industry, to do so.

However, neither Prime Minister Yoshihiko Noda, nor Economy, Trade and Industry Minister Yukio Edano, took such action, illustrating their lack of awareness of their responsibility, which hindered efforts to get to the bottom of the scandal.

Yoshikawa later said, "We have no choice but to ask them to voluntarily cooperate."

When launched, the fact-finding team was comprised of only seven members. Lawyer Tadashi Kunihiro, who is an expert in crisis management, had not been appointed to the panel until July 13.

"The organization that conducted the investigation was inadequate," said lawyer Nobuo Gohara, who chaired a third-party investigative panel on allegations that Kyushu Electric Power Co. attempted to manipulate public opinion on whether to reactivate idled reactors at its Genkai Nuclear Power Plant in Saga Prefecture. "Even if the number of members of such a panel is gradually increased, it never produces any positive results. Getting to the bottom of an incident is difficult if the top official lacks sufficient awareness about the problem."

TEPCO's videos show situation "out of hand"

August 7, 2012

TEPCO meeting video shows decision to not announce cancellation of rolling blackouts

<http://mainichi.jp/english/english/newsselect/news/20120807p2a00m0na004000c.html>

The vice president of Tokyo Electric Power Co. (TEPCO) said at a teleconference in the early morning hours of March 14, 2011, the first day of rolling blackouts after the Fukushima No. 1 Nuclear Power Plant disaster, that the company would not announce its decision to cancel rolling blackouts that day, it was learned from video released by TEPCO.

In the end, at 6:25 a.m., TEPCO announced the cancellation of rolling blackouts for the first planned area, but disruptions to train services still occurred.

According to the comments made by then vice president Takashi Fujimoto on the video, the decision to cancel the pre-noon rolling blackouts came after then Chief Cabinet Secretary Yukio Edano reproached him over them, saying, "You will kill people using artificial respirators at home. If you proceed while knowing that, **we will hold you accountable for murder.**"

A reason given by Fujimoto on the video for not announcing the cancellation was, "If we hold a press conference (announcing a cancelation), it will instead cause chaos." A person from the company's headquarters said at the time, "We'll just have to let the situation be that it turned out we were able to get by without (pre-noon) blackouts."

Footage shows rift between PM's Office and TEPCO over initial handling of nuclear crisis

<http://mainichi.jp/english/english/newsselect/news/20120807p2a00m0na011000c.html>

Tokyo Electric Power Co. (TEPCO) released video footage on Aug. 6 of teleconferences it held in the crucial first days of the nuclear crisis at the Fukushima No. 1 Nuclear Power Plant, underscoring **a deep rift between the Prime Minister's Office and the utility over the handling of the world's worst nuclear crisis since the 1986 Chernobyl disaster.**

The footage shows how the nuclear crisis got out of hand while the power company and the Prime Minister's Office were at loggerheads over how to bring the crisis under control. A video clip with sound started with bitter complaints about then Prime Minister Naoto Kan by Ichiro Takekuro, who was dispatched from TEPCO to Kan's office to serve as a liaison between the two entities.

In the footage, Takekuro said at around 11 p.m. on March 12, 2011, "He (Kan) got really mad very often. You name it. When I gave him a briefing, he told me, 'On what grounds? Can you say things will be alright that way even if something happens?' He was harshly screaming at me." The footage confirms that discord emerged between the Prime Minister's Office and TEPCO immediately after the outbreak of the nuclear crisis.

The footage also shows scenes of Masao Yoshida, chief at that time of the crippled Fukushima nuclear power station, being hard pressed to handle the emergency situation while radiation levels there kept rising.

In a teleconference soon after 12:30 p.m. on March 14, 2011, Yoshida told TEPCO headquarters, "Exposure doses are reaching their limits. I want you to pay attention to that!" Then TEPCO President Masataka Shimizu told Yoshida in a conciliatory tone, "Please keep trying in one way or another!"

The footage also recorded a scene in which Yoshida got so frustrated by the failure to cool down the nuclear reactors and stop their meltdown. At around 1 p.m. on March 14, 2011, Yoshida asked TEPCO headquarters to take steps to release hydrogen into the atmosphere from the No. 2 reactor, saying, "I want you to think of ways to open a hole (in the reactor building) immediately by using helicopters or whatever."

The footage also shows a scene that suggests that then TEPCO Chairman Tsunehisa Katsumata may not have predicted a hydrogen explosion at the No. 3 reactor at all. In a telephone conversation with Takekuro at around 7 p.m. on March 13, 2011, Katsumata said, "It looks like we may be able to open the vent at the No. 3 (reactor). I think that the problem of hydrogen is very small." In the end, a hydrogen explosion ripped through the No. 3 reactor at around 11 a.m. on March 14, 2011.

Nothing but a "cover-up"

TEPCO news media restrictions nothing but textbook cover-up attempt

<http://mainichi.jp/english/english/perspectives/news/20120807p2a00m0na013000c.html>

Tokyo Electric Power Co. (TEPCO), operator of the Fukushima No. 1 nuclear plant, has at last given the media access to hours of company videoconference footage recorded in the opening days of the nuclear disaster in March 2011. However, this access comes with onerous restrictions devised, or so the utility says, to protect the privacy of individual employees mentioned in the videos.

The some 150 hours of footage covers videoconferences between TEPCO headquarters in Tokyo and the Fukushima No. 1 plant from March 11 -- the day the Great East Japan Earthquake and tsunami triggered the crisis -- to March 15. And though the videoconference content is vital to our understanding of how the nuclear disaster unfolded, TEPCO officials in the company of lawyer Hideaki Terashima informed reporters at a briefing that 1,665 audio segments and 29 video segments had been "masked" to keep the names of non-executives and their jobs off the record. The edits, TEPCO continued, were based on Article 13 of the Constitution, guaranteeing "respect for the individual."

On top of the clipped content, reporters who came to see the videos -- stored on a computer in an audio-visual room inside TEPCO headquarters -- were forced to sign a pledge not to record or photograph any portion of the videoconferences, and not to "slander" specific TEPCO employees. Once the document was signed, the reporters -- up to a maximum of two from each news organization -- were allowed into the AV room.

TEPCO is holding up the defense of privacy codified in the Personal Information Protection Act as its reason for these restrictions on this most essential information. It can rather be said that this is nothing but a textbook sham to help the utility cover up a scandal of the gravest degree.

The videoconference footage that TEPCO has so cavalierly snipped and clipped and altered behind a wall of high-powered legal representation is of the greatest importance; a key to sorting out what the company was doing as three of its reactors melted down and radioactive fallout blanketed the countryside in the worst global nuclear disaster since Chernobyl.

TEPCO is not a government organization with the concomitant requirements for transparency. The videoconferences, however, are the kind of content that must be revealed not just to the news media but to the people at large. The company must also admit that the restrictions it has placed on journalists, whose duty it is to examine and disseminate the information to the people of Japan, are both reprehensible and absurd. (By Hiroshi Dai, "Open Newspaper" Committee, and Ken Aoshima, City News Department)

EDITORIAL

Tepco's actions unacceptable

<http://www.japantimes.co.jp/text/ed20120807a1.html>

Tokyo Electric Power Co. has started showing to media groups and journalists 150 hours of teleconference footage recorded during the first days of the nuclear crisis at its Fukushima No. 1 nuclear power plant. It is deplorable that Tepco did not volunteer to show the footage earlier. At first it refused to disclose it, citing the need to protect the privacy of Tepco employees and subcontract workers. It only agreed to disclose the footage after trade and industry minister Yukio Edano prodded the company to do so.

Although it agreed to release the footage, Tepco attached various conditions to showing the footage, including restrictions on the activities of journalists. Tepco's attitude will deepen mistrust over its activities. It will convey the message that Tepco is not taking serious its responsibility for a disaster that made large areas of Fukushima Prefecture uninhabitable and uprooted the lives of tens of thousands of people.

Given the scale of the disaster, the video footage should never have been regarded as Tepco's private property. It is indispensable in revealing the truth of the unprecedented nuclear disaster. The video footage may provide answers to crucial questions such as whether Tepco planned a full pullout from the plant. It also covers exchanges between the prime minister's office and Tepco over the pumping of sea water into the No. 1 reactor and the release of radiation into the atmosphere. At the very least, media access to this material must be guaranteed, and the government should take steps to ensure the video footage becomes part of the public record.

The footage was recorded for four days from March 11, 2011, when the nuclear disaster began. It mainly covers teleconferences between Tepco headquarters and Tepco officials at the Fukushima No. 1 nuclear plant. Strangely, only about 50 hours of the footage includes audio. Among the silent portions is the footage of then Prime Minister Naoto Kan's March 15 visit to Tepco headquarters, during which he reportedly had heated exchanges with Tepco officials over their handling of the disaster.

The restrictions Tepco placed on reporters who view the video included a ban on making their own recordings of the Tepco footage and a ban on disclosing the names of Tepco officials and workers seen on the footage, except those whose names were disclosed by Tepco's own investigation. Moreover, Tepco has censored the video by blurring its employees' images and disguising their voices. Tepco even prohibits media organizations from disclosing video footage they have collected on their own.

In view of the critical importance of the footage to understanding how the disaster unfolded, Tepco should remove the restrictions. If Tepco refuses, steps should be taken to force them to do so.

"Brilliance without conscience"

August 7, 2012

Yoroku: Morality crucial in dealing with nuclear power

<http://mainichi.jp/english/english/perspectives/news/20120806p2a00m0na008000c.html>

In 1948, three years after the atomic bomb was dropped on Hiroshima, U.S. Army Commander Omar Bradley said, "**The world has achieved brilliance without conscience. Ours is a world of nuclear giants and ethical infants.**"

Nuclear bombs kill tens of thousands of people in one moment, causing long-term emotional and physical suffering for victims and their descendents. Since turning a blind eye to this absurdity, the world has gone without reversing this deranged morality for years.

Aug. 6, 2012, marks the 67th anniversary of the atomic bombing of Hiroshima.

The error of believing that mankind can contain nuclear power is perhaps not caused by any scientific faults, but by the absence of morality. The late anti-nuclear scientist Jinzaburo Takagi warned that the kind of moral restraints necessary to prevent nuclear accidents would not come naturally to scientists accustomed to making calculations on computers, which can later be fixed.

Last year, in commemorating not only the atomic bombings in Hiroshima and Nagasaki on the heels of the Fukushima nuclear disaster, calls for the abolishment of nuclear weapons and the elimination of our dependence on nuclear power intensified. It was an opportunity for Japan to take a close look at its conscience and morals, and ask: **what is the stance that the only nation to have experienced atomic bombing, and one of the most quake-prone countries in the world, should take against nuclear weapons and energy?**

A year has since passed. The current administration has sped along on the path of nuclear reactor restarts, as if the Fukushima disaster never happened. There no longer is any excitement around U.S.

President Barack Obama's push for a "world without nuclear weapons" that he called for in a speech three years ago. The morals of politics must have been full of holes from the very beginning.

There's only one truth that we can arrive at from Bradley's remorseful statement. It is that nuclear weapons and nuclear power are too dangerous to entrust to "brilliance without conscience" and "ethical infants." ("Yoroku," a front-page column in the Mainichi Shimbun)

TEPCO's videos

The Yomiuri on TEPCO's footage of the first days of the Fukushima crisis:

August 8, 2012

TEPCO reveals N-crisis video footage

The Yomiuri Shimbun

<http://www.yomiuri.co.jp/dy/national/T120807005526.htm>

Tokyo Electric Power Co. has shown for the first time video footage of its teleconferences in the days after the March 11, 2011, earthquake and tsunami, showing the firm's response to the crisis at its Fukushima No. 1 nuclear power plant.

The footage, which it began to show to reporters Monday, includes 150 hours of recorded teleconferences among officials at TEPCO's headquarters in Tokyo, the Fukushima Nos. 1 and 2 nuclear power plants and two other locations.

It covers teleconferences held just after the Fukushima No. 1 nuclear plant was hit by tsunami, until March 16.

The footage vividly captures the confusion among TEPCO officials as they tried to manage the hydrogen explosions at the Nos. 1 and 3 reactor buildings, and documents their slow response to the crisis.

TEPCO released only part of its collection of footage and modified the audio, which prompted criticism that it has disclosed insufficient information.

The 150 hours of video footage is in two parts. The first is 100 hours of silent recordings from the the Fukushima No. 2 nuclear power plant, while the second is 50 hours of footage with sound recorded at TEPCO's headquarters.

The issues mainly discussed in the footage include:

- Hydrogen explosions at the Nos. 1 and 3 nuclear reactor buildings.
- Injection of seawater to cool the No. 1 reactor.
- Evacuation of workers from the plant.
- Then Prime Minister Naoto Kan's visit to TEPCO's headquarters.
- Preparations to vent the No. 2 reactor and release steam to reduce pressure inside the reactor, enabling the injection of water to cool it.

In the footage, just after the hydrogen explosion of the No. 3 reactor on March 14, Masao Yoshida, then director of the plant, tensely said: "Headquarters, headquarters, it's a crisis, crisis. An explosion has just occurred."

Officials at the headquarters responded by hastily calling the relevant institutions to report the accident, the footage shows.

Meanwhile, Kan, who visited the headquarters, is shown in the footage giving instructions to officials on two occasions. However, as there is no sound accompanying the footage, Kan's words are unknown.

According to the final report of a government panel charged with investigating the nuclear crisis, Kan strongly said, "Withdrawal is impossible in the face of a crisis that could lead to the nation's collapse."

TEPCO initially refused to reveal the video footage, but later agreed. However, it modified the audio in the footage to prevent individuals other than executives from being identified.

The utility is permitting certain representatives of the media to watch the footage inside its headquarters for one month, but viewers are banned from recording or photographing the video. Instead, TEPCO distributed a 1-1/2-hour summary of the footage.

However, releasing information in this manner has prompted media organizations and observers to demand full disclosure of the footage.

TEPCO video heavily altered / Alternation shows utility's reluctance to make information available

The Yomiuri Shimbun

<http://www.yomiuri.co.jp/dy/national/T120807004826.htm>

The recently disclosed video of Tokyo Electric Power Co. teleconferences that took place just after the outbreak of the crisis at the Fukushima No. 1 nuclear power plant has been significantly altered, with many images blurred and audio heavily obscured.

The media had requested the recording of the teleconferences be released immediately after the nuclear crisis began.

However, the about 150-minute-long video is another example of TEPCO's less than positive attitude toward disclosing information about the crisis.

TEPCO said it edited audio, such as people's speech and other sounds, 1,665 times in the video, and blurred images another 29 times.

"It's to protect the privacy of individual employees and we aren't intentionally [withholding information]," a TEPCO official explained.

However, even then TEPCO President Masataka Shimizu has been blurred in parts of the video, making his face unrecognizable. Even when his face is visible, his expressions are at times unreadable.

Some audio sections have also been bleeped out multiple times, or simply cut mid-speech.

The video screen is evenly split into six sections as teleconferences were held between the utility's headquarters in Tokyo, the Fukushima No. 1 plant and other locations. The quality of the images is generally poor.

However, a technical staffer at a video imaging company suspects the images have been altered more than necessary.

For instance, at one point, then General Manager Masao Yoshida at the No. 1 plant makes an X with both hands in reference to a sea water injection into the No. 1 reactor.

"When he makes the X, only his hands have been blurred out," the staffer said.

TEPCO has until now refused to disclose the video, saying it was protecting the privacy of its employees. The firm's new management, which came into power on June 27, was behind the video's disclosure.

However, TEPCO placed several conditions on the video's disclosure, including prohibitions on recording the video's visual and audio content or naming nonexecutive employees. Should media companies violate these conditions, TEPCO will bar them from viewing the video again and participating in its press conferences.

TEPCO provided the media with an abridged, 90-minute copy of the video. TEPCO has given the media permission to view the full video at its headquarters during a one-month period.

Initially, TEPCO said it would limit the viewing period to five days and permit only one reporter from each company.

Economy, Trade and Industry Minister Yukio Edano requested TEPCO to make accommodations and as a result, the firm extended the viewing period to one month.

The Japan Newspaper Publishers and Editors Association asked TEPCO to disclose all teleconferences in their entirety without any alterations. However, the video only includes footage from the evening of March 11 to March 16, 2011--about five days in total.

This reluctance to readily make information available was evident within the video footage.

Around the time some experts suggested a hydrogen explosion had taken place at the No. 3 reactor building, then TEPCO Chairman Tsunehisa Katsumata was on the phone with a senior TEPCO executive.

"It's my judgment on whether we can cause the general public anxiety. If I'm asked about that [a hydrogen explosion at the No. 3 reactor] at the next news conference, I'll deny it and say it would never happen," Katsumata said.

===

Early morning blackout aborted

TEPCO had also planned a rolling power blackout for early March 14 last year, but decided against it when the Prime Minister's Office strongly urged them to refrain from a morning blackout, video footage revealed Monday.

TEPCO implemented its first rolling blackout the same day, but avoided doing so for the entire morning.

The previous evening, TEPCO had announced it would carry out the planned blackout the next morning in some areas in Tokyo's 23 wards and Isogo Ward in Yokohama, among other places.

However, in a teleconference shortly after midnight, then TEPCO Vice President Takashi Fujimoto revealed then Chief Cabinet Secretary Edano, then Deputy Chief Cabinet Secretary Tetsuro Fukuyama and Renho, then state minister in charge of government revitalization and energy saving, had all demanded that there be no blackout during the early morning hours.

"I was told, 'You would kill people dependent on artificial respirators or artificial heart-lung machines at their homes. If you knowingly do so, we'll accuse you of murder,'" he said.

Many unanswered questions even with the videos

August 8, 2012

Depth of Fukushima No. 1 evacuation plan unclear in videos

By JUN HONGO

Staff writer

<http://www.japantimes.co.jp/text/nn20120808a2.html>

Scrutiny of the 150 hours of teleconferencing footage recorded by Tokyo Electric Power Co. in the initial days of the March 2011 meltdowns at the Fukushima No. 1 plant shows that crucial decisions were being made hastily.

Tepco on Monday started letting journalists view the footage — 50 hours with audio and another 100 without — of the first five days of the crisis.

The video shows top executives discussing the "evacuation" of workers from the nuclear plant. But it didn't give definitive clues on one critical question — whether Tepco was abandoning the plant for good amid the radioactive fallout.

"At what time will all the workers be evacuating from the site?" Akio Takahashi, a senior executive at Tepco's Tokyo headquarters is heard asking Sakae Muto, then executive vice president, at 7:55 p.m. on March 14, the audible portion of the video shows.

By that time, Tepco had already concluded that the nuclear fuel assemblies in reactor 2 were fully exposed because critical coolant water had evaporated in the reactor.

If left uncooled, the nuclear fuel rods will melt and eventually breach the pressure vessel and damage the outer containment vessel, releasing massive amounts of radioactive fallout into the environment.

Takahashi asked again, "all the people will soon evacuate from 1F (a reference to Fukushima No. 1) to the visitor hall of 2F (the nearby Fukushima No. 2 plant), right?"

Tepco President Masataka Shimizu is heard saying at around 8:20 p.m. that "a final evacuation has not been decided yet" and that he is in the process of checking with "related authorities," possibly referring to the office of then Prime Minister Naoto Kan.

Tepco claims it never considered totally abandoning Fukushima No. 1 and maintains that Takahashi was only talking about evacuating only noncritical workers, thus leaving the minimum necessary to deal with the crisis.

But Kan and other top government officials suspected Tepco was preparing a total withdrawal. They have said that a full pullout would have caused meltdowns in all of the plant's six reactors as well as their spent-fuel pools, because there would have been no one there to restore and continue cooling operations. This scenario, they said, would have caused catastrophic radioactive fallout across eastern Japan. Earlier reports even indicated the whole Tokyo area would have been in jeopardy.

Yukio Edano, the chief Cabinet secretary at the time, said Shimizu called him at the prime minister's office early on the morning of March 15, seeking approval to evacuate workers from the plant. The scene was not captured on the video.

Edano concluded from the conversation that Shimizu was looking to have all the workers retreat from the plant. Edano recalled replying: "If we did such a thing, the situation would be out of control. It would become worse and worse and just unstoppable."

Edano said Shimizu was hesitant to answer, apparently realizing the gravity of what a total withdrawal would mean.

Shimizu later claimed he couldn't remember if he placed that call to Edano at that time. The video footage released Monday gave no clue as to whether that exchange took place.

Kan, also gravely concerned by Tepco's apparent intention to withdraw from Fukushima No. 1, visited the utility's head office early on the morning of March 15 to set up a joint headquarters to take over emergency operations at the plant.

The video also included images of Kan's visit. During a roughly 14-minute exchange, he reportedly condemned the Tepco executives present for considering a pullout. There was no audio portion accompanying the footage.

Tepco has claimed about 100 hours of the teleconference footage contained no audio because workers failed to set up and activate the audio recording function.

The footage also showed those on the forefront of the crisis demonstrating their true grit.

Masao Yoshida, then chief of the power plant, is recorded as saying elderly veterans on site "are ready to work as a (suicide) squad" to secure a pipe to be used for pumping seawater into reactor 2 to cool it down. Aged people are less vulnerable to the effects of radiation exposure than younger people.

The 150-hour-long footage was shown at Tepco's HQ and no copying was allowed. The utility only released a 90-minute edited version of the video to the public.

There is no such thing as nuclear safety

Hibakusha: Nuke safety biggest lie

By SHINGO ITO

AFP-Jiji

<http://www.japantimes.co.jp/text/nn20120810f2.html>

HIROSHIMA — The marks that still scar Sunao Tsuboi's face from the 1945 bombing of Hiroshima are a grim reminder of the power of the atom as a wave of wariness about nuclear power sweeps Japan.

Ground zero: Doves fly over Hiroshima Peace Memorial Park during a memorial ceremony Monday to mark the 67th anniversary of the world's first atomic bombing. AFP-JIJI

Nearly 170,000 people perished instantly in the searing heat or from radiation in the days and months after a U.S. plane unleashed the deadliest weapon ever used and ushered in the nuclear age.

Nearly seven decades on, Tsuboi, one of a dwindling number of survivors of the world's first atomic attack, is raising his voice against nuclear power in a country still reeling from the Fukushima No. 1 plant catastrophe that started in March 2011.

"In terms of being nuclear victims, we are the same," Tsuboi, 87, said of those affected by the nuclear disaster.

He was on his way to university when the "Little Boy" A-bomb exploded over Hiroshima in a flash of blinding light and intense heat on Aug 6, 1945. In addition to his burns, Tsuboi has also suffered intestinal

cancer that may be linked to radiation exposure and says he sees little difference in the dangers posed by atomic weapons and atomic power.

"Nuclear technology is beyond human wisdom. . . . I still want to see a nuclear-free world while I'm alive," he said.

He is making his appeal as a bitter debate swirls over the future of Japan's 50 remaining commercial reactors, which once met around a third of the country's electricity needs, but which were idled following the Fukushima meltdowns.

Fears of electricity shortages have led the government to order the reactivation of two reactors at the Oi nuclear plant in Fukui Prefecture, despite an increasingly vocal antinuclear movement in a country where public protests remain rare.

Those who experienced the bombing of Hiroshima and Nagasaki, which took place three days later and killed up to 80,000 people by the end of 1945, said television images of the Fukushima crisis brought back terrible memories.

"The TV reminded me of the dreadful scenes," said a sobbing Misako Katani, 82, one of just a handful of hibakusha who survived both attacks.

No one is officially recorded as having died as a result of the Fukushima disaster, but **many who fled the area and those who remain, including workers decommissioning the crippled plant, worry about the long-term effects of excessive radiation exposure.**

The quake and tsunami knocked out the reactors' cooling systems at the Fukushima No. 1 power station in March 2011, causing three to suffer meltdowns that spewed radioactive fallout over a large area and forced thousands to evacuate.

Scientists have warned it could be decades before it is safe for some residents to return home.

"I think we can share the same sadness with people in Hiroshima and Nagasaki," said Sachiko Sato, a Fukushima evacuee who attended the annual Hiroshima A-bombing commemoration ceremony Monday along with tens of thousands of others. **"In my mind, Fukushima is like a third nuclear victim, following Hiroshima and Nagasaki."**

Toshiyuki Mimaki, a 70-year-old hibakusha, added: "We want to work together with the people in Fukushima and unite in calling for an end to nuclear victims."

But for some aging victims, there are few parallels between 1945 and 2011.

"There is nothing to compare to what I experienced" at the time of the Hiroshima bombing, said Shigeji Yonekura, 79.

"The atomic bomb was dropped in war and no one helped us, while the Fukushima accident occurred in peacetime and a lot of people offered help."

Many people continue to insist the atomic bombings brought World War II to a swift end by forcing Imperial Japan to surrender, preventing many more casualties from a land invasion planned for later that year.

Despite his own experience, Yonekura is resigned to the possibility that resource-poor Japan may not be able to abandon atomic energy altogether. "Nuclear power may be a necessary evil," he said.

But Miyako Jodai, a survivor of the Nagasaki bombing, said the Fukushima crisis and the government's botched response have turned her against atomic energy.

Several reports have heaped criticism on the government and Tokyo Electric Power Co., with one parliamentary probe labeling Tepco's Fukushima nuclear crisis a "man-made disaster."

"I was convinced that the peaceful use of nuclear power should be accepted because reactors were safe," said Jodai.

"But after seeing the accident and the government's handling of the aftermath, I felt like I had been betrayed."

A "culture of irresponsibility" or worse

August 11, 2012

SPEEDI report deepens suspicions

<http://www.japantimes.co.jp/text/ed20120811a1.html>

SPEEDI, a computer simulation system used to determine or predict dispersions of radioactive substances, is supposed to be utilized during a nuclear disaster to help people evacuate to safe areas. But in the early stage of the crisis at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear power plant, the government did not make public the predictions made by SPEEDI. In the absence of relevant information, some people fled to places where radiation levels were actually higher.

On July 27, the education and science ministry, which is in charge of SPEEDI, issued a report based on a probe of its handling of SPEEDI data. The report attempted to justify the ministry's decision to withhold SPEEDI-based predictions of the dispersion of radioactive fallout from Fukushima No. 1.

What is deplorable is that there is no evidence that ministry officials ever seriously considered utilizing SPEEDI to help residents safely escape the radiation danger. The ministry's organizational **culture of irresponsibility** is highlighted by the fact that the probe could not even determine whether ministry officials held discussions on the question of whether SPEEDI-based predictions should be disclosed for evacuation purposes. If someone feels that **a cover-up** is going on in the ministry, he or she cannot be blamed.

SPEEDI — short for System for Prediction of Environmental Emergency Dose Information — is the same system that the Nuclear Safety Commission uses to make risk calculations. It divides the nation into a fine geographic grid of 250-by-250-meter squares to predict how radioactive materials will spread in the event of a disaster at a nuclear power plant.

The ministry could have used SPEEDI to keep the public informed of the geographical distribution of nuclear substances released by Fukushima No. 1, along with the radiation levels, and what the distribution of radioactive substances and radiation levels might be if the situation at the plant worsened.

The ministry report stated that because information on real conditions at the reactors was lacking, the accuracy of SPEEDI predictions on the distribution of radioactive substances could not be known. But attention should be paid to the fact that the government commission to investigate the Fukushima nuclear crisis stated that **even though the amount of radiation released per unit area was not known, SPEEDI-based predictions could have been used to enhance the safety of those residents forced to evacuate.**

If hypothetical amounts of radioactive substances released from the reactors had been fed into SPEEDI in the absence of real data, SPEEDI could have predicted the directions in which radioactive materials would disperse.

It has been known that the education and science ministry utilized SPEEDI-based predictions in choosing the points in Fukushima Prefecture for measuring radiation levels and provided SPEEDI-based predictions to the U.S armed forces.

Given these facts, it is not far-fetched to say that from the very beginning, the ministry had no intention of using SPEEDI for the sake of protecting local residents from radiation hazards.

Another leakage of secrets

August 16, 2012

Prosecutors to probe leak of nuclear policy agenda to power suppliers

<http://mainichi.jp/english/english/newsselect/news/20120816p2a00m0na015000c.html>

The Tokyo District Public Prosecutors Office is poised to launch an investigation into an alleged **leakage of secrets by national public servants to power suppliers over Japan's nuclear policy.**

The move comes as the special investigation unit of the prosecutors' office accepted on Aug. 15 a complaint filed by a group of lawyers against members of the Cabinet Office's Japan Atomic Energy Commission (JAEC) and other officials for leaking the agenda of JAEC subcommittee meetings on the country's new nuclear policy to power suppliers.

According to the complaint, JAEC Chairman Shunsuke Kondo, Vice Chairman Tatsujiro Suzuki and 25 other officials handed to seven officials from the power industry a total of 24 sets of documents spanning 364 pages during secret "study meetings" held between December last year and April this year. The documents included information classified as "Level 2" confidentiality in the three-stage confidentiality designations, which should not be disclosed to anyone outside the government body.

The complaint was filed by 21 lawyers from Tokyo and 11 other prefectures. It was initially filed to the Supreme Public Prosecutors Office by 18 lawyers on July 18, who were later joined by three lawyers from Fukushima and Osaka prefectures.

Prosecutors are poised to **investigate the accused officials on suspicion of violating the National Public Service Law.**

NISA put pressure on TEPCO to keep quiet

August 16, 2012

NISA told Tepco to delay reporting looming explosion

Jiji

<http://www.japantimes.co.jp/text/nn20120816a4.html>

The Nuclear and Industrial Safety Agency ordered Tepco in March 2011 to delay announcing that the pressure level in one of the Fukushima No. 1 plant's wrecked reactors was spiking to critical levels, teleconference footage released by the utility shows.

Images of Tokyo Electric Power Co. teleconferences during the initial stages of the nuclear crisis, as well as other materials and information, confirm that Tepco was forced to defer an announcement after pressure inside the reactor 3 containment vessel suddenly spiked to alarming levels around 6 a.m. March 14.

Masao Yoshida, then manager of the crippled plant, instructed workers to temporarily evacuate the reactor building, fearing a hydrogen explosion was about to rip it apart, and Tepco began preparing to announce the development to the press.

However, the utility was instructed to withhold the information by NISA, which is under the Ministry of Economy, Trade and Industry. The agency then made an announcement shortly after 9 a.m. March 14 — just two hours before a hydrogen explosion destroyed the upper part of the structure housing reactor 3.

The reactor 1 building had suffered a similar blast two days earlier. Both reactors, along with reactor 2, subsequently experienced catastrophic meltdowns.

Before the explosion occurred at reactor 3, a Tepco public relations team based at the Fukushima No. 1 plant prepared a press statement about the surging pressure level.

The footage, however, shows that in a conversation with the utility's headquarters in Tokyo, one member of the team said, "We've been stopped by the government and are being made to wait before issuing any announcement to the press."

"NISA officials are blocking any release of information on the matter," a person who appears to be a head office employee says in the video images. "The agency's officials are saying that (Tepco) should not be the entity to announce this either."

Another voice on the recordings can be heard stating that NISA had refused to give Tepco permission to announce the pressure surge, saying, "We've been strongly requested, instructed not to announce this."

NISA has said it kept Tepco's announcement on hold because officials were unable to get in touch with its chief to obtain the necessary permission.

TEPCO on shaky grounds despite public money

August 17, 2012

Tepco's shaky revival plan

<http://www.japantimes.co.jp/text/ed20120817a2.html>

The government on July 31 injected ¥1 trillion into Tokyo Electric Power Co., virtually nationalizing the utility, which was teetering in the wake of the nuclear crisis at its Fukushima No. 1 nuclear power plant.

Now that Tepco has avoided bankruptcy thanks to the injection of public money and received government approval to raise the prices of electricity for households, it must shed its bureaucratic mindset and its traditional corporate culture, characterized by arrogance toward consumers, and make its operations transparent.

In compensating nuclear disaster victims, Tepco should not delay the processing of compensation claims because of differences with them over minor points.

In addition to the government's capital injection, which has enabled it to acquire a majority of Tepco voting shares, banks provided ¥370 billion in loans to Tepco on Aug. 1. But Tepco is still in a desperate financial situation.

For example, the costs for decommissioning the Fukushima No. 1 nuclear power plant and removing radioactive materials from contaminated areas are putting great pressure on the company. The possibility cannot be ruled out that the costs will swell to several trillion yen.

As Tepco President Naomi Hirose said in reference to the government capital injection and the bank loans, "Tepco has been presented with a last chance by the people."

In the April-June period, Tepco suffered a net loss of ¥288.3 billion on a consolidated basis. It revised the expected net loss for the business year that began in April from ¥100 billion to ¥160 billion. In the three-month period, the fuel cost for thermal power plants, which have been substituting for offline nuclear power plants, shot up 54.3 percent to ¥624.6 billion.

The main pillars of Tepco's special business operation plan for its reconstruction consist of raising electricity prices for households by an average 8.46 percent from Sept. 1 and restarting in phases the Kashiwazaki-Kariwa nuclear power plant in Niigata Prefecture from April 2013.

Although the operation of each reactor at the plant is expected to reduce Tepco's total costs by ¥80 billion a year, the prospects of restarting the Kashiwazaki-Kariwa plant, which has seven reactors, is dim. Clearly Tepco's reconstruction plan is on shaky ground. The government at least has taken the position that Japan's reliance on nuclear power should be reduced. The voice for ending such reliance is strong among the Japanese.

If the government and Tepco try to go ahead with the plan to restart the Kashiwazaki-Kariwa plant, they will face strong opposition from local governments concerned and people opposed to nuclear power.

TEPCO: More problems ahead

August 17, 2012

Tokyo aims to end power sale to TEPCO in March 2013

<http://mainichi.jp/english/english/newsselect/news/20120817p2g00m0dm090000c.html>

TOKYO (Kyodo) -- The Tokyo Metropolitan Government has asked Tokyo Electric Power Co. to terminate in March next year their contract under which the government sells electricity it generates through its power facilities to the utility, sources close to the matter said Friday.

The Tokyo government wants instead to arrange a competitive tender so that it can sell its power to the highest bidder and invigorate the electricity market by allowing new entrants into the electricity business.

Tokyo says it sold electricity produced by its three hydropower plants to TEPCO for around 1 billion yen in fiscal 2011.

In April, Gov. Shintaro Ishihara said that he wanted to change the current system so that Tokyo could sell power to firms other than TEPCO.

Tokyo intends to submit a draft plan to make that happen to the local assembly in September, the sources said.

The current power sale contract between Tokyo and TEPCO is valid until 2019 but Tokyo maintains that it would not have to pay any compensation to the utility even if it cancels the contract.

TEPCO has admitted that the Tokyo government has requested to end the contract but the utility does not intend to do so before the contract's expiration date.

"Dubious" donations from TEPCO and Tohoku

August 20, 2012

TEPCO, Tohoku Power made dubious transactions to Rokkasho nuke plant village

<http://mainichi.jp/english/english/newsselect/news/20120820p2a00m0na008000c.html>

Tokyo Electric Power Co. (TEPCO) and Tohoku Electric Power Co. paid a total of 400 million yen to an Aomori Prefecture village near a nuclear plant under construction following last year's Fukushima nuclear disaster, it has been learned.

TEPCO, the operator of the disaster-crippled Fukushima No. 1 Nuclear Power Plant, and Tohoku Electric paid the massive amount of money to the Aomori Prefecture village of Rokkasho **under the pretext of promoting local fisheries following the nuclear crisis at the plant in March last year.** Rokkasho is neighboring Higashidori village, where the utilities' **Higashidori Nuclear Power Station is under construction.**

Although the utilities denied that the payments were "donations," insisting that the money was earmarked as part of the construction cost of the Higashidori nuclear plant, they were not included in the plant's initial costs such as personnel expenses, based on which electric charges are calculated.

According to the utilities and sources familiar with the Rokkasho Village Office, Rokkasho Mayor Kenji Furukawa demanded that TEPCO and Tohoku Electric "cooperate in regional development" aside from compensating fishermen in connection with the construction of the Higashidori nuclear plant when the utilities negotiated with the village's fisheries cooperative over additional compensation. Mayor Furukawa was serving as a mediator in the talks.

Both parties reached an agreement in 2009 that the utilities pay an annual 200 million yen to the Rokkasho Village Office for five years starting in fiscal 2010, and a total of 400 million yen was paid to the village in May 2011 and May 2012.

The village office earmarked the funds as "miscellaneous income" in its budget and provided the entire amounts to the fisheries cooperative, which were used for replacing squid-fishing boat equipment and other purposes.

According to sources close to the village, the municipal office sought cooperation from the utilities after the village's tax revenue declined due to a delay in the completion of a nuclear fuel reprocessing plant at the village.

In its comprehensive special business plan drawn up by TEPCO in May this year, the utility stated that it would "abolish donations." The company explained that the funds provided to Rokkasho Village "are not interpreted as donations as they were expenses related to construction work."

"There was no problem in receiving the money because it was decided before the disaster (at the Fukushima No. 1 nuclear plant)," said Rokkasho Deputy Mayor Mamoru Toda in defending the transactions. "We will discuss what we will do from now on."

TEPCO and Tohoku Electric are jointly planning to construct four reactors at the Higashidori nuclear plant. The No. 1 reactor run by Tohoku Electric started operations in 2005. The construction of the other No. 1 reactor, run by TEPCO, began in January last year, but the work has been suspended since the Fukushima nuclear disaster broke out in March that year.

Minamiosumi last resort ?

August 25, 2012

Hosono denies nuke disposal report

By KAZUAKI NAGATA

Staff writer

<http://www.japantimes.co.jp/text/nn20120825a7.html>

Environment Minister Goshi Hosono denied on Friday a media report that the government has asked **the town of Minamiosumi, Kagoshima Prefecture**, to be the host for final disposal of radiation-contaminated soil and other waste generated by the Fukushima nuclear crisis.

"We've been looking into various possibilities, but we haven't officially asked any specific municipalities (about the final disposal site) yet," Hosono told reporters, noting there are many complex factors involved so final decisions are still a long way off.

But Hosono did not clearly deny that the town on the Osumi Peninsula, at nearly the southernmost point of Kyushu, is not a candidate site.

TBS TV reported Thursday the government considers Minamiosumi as a strong candidate site and has been talking to the town.

"We have not heard anything about this," said Yuichiro Furutono, an official in the Minamiosumi Municipal Government, adding that officials there were surprised by the report.

He said the town has not been officially contacted by the central government on this topic.

Hosono said he knows the Minamiosumi mayor, as the town has a national park, and that he has talked to him about what's going on in Fukushima and the debris disposal problem. But he said he discusses those issues with all municipal leaders he comes into contact with.

Finding a final disposal site will be a key element in proceeding with decontamination efforts in Fukushima, where a massive amount of radiation-contaminated soil has to be removed and stored along with other waste.

Before the contaminated waste goes to the final disposal site, it is expected to be stored in interim storage facilities in Fukushima for decades, perhaps until 2045.

The government is seeking sites in Fukushima for interim storage facilities, but local leaders are concerned that the waste will end up staying there after 2045, which is why finding the final disposal site is crucial.

Hosono has repeatedly said the final disposal site will be outside Fukushima, as it is not fair to put all of the burden on people in that prefecture.

The government plans to develop technologies to reduce the volume of waste before it goes to the final site.

Simple greetings or leading role?

August 25, 2012

Atomic energy commission head Kondo took leading role in secret pro-nuclear meetings

<http://mainichi.jp/english/english/newsselect/news/20120825p2a00m0na012000c.html>

Shunsuke Kondo, chairman of the Cabinet Office's Japan Atomic Energy Commission (JAEC), told a secret meeting of pro-nuclear power experts that he would have a say over Japan's level of dependence on nuclear power when a task force set up under the commission drew up a new nuclear power policy, it has been learned.

Kondo's comment, made on Dec. 8 last year, appeared in a record of proceedings of the secret meeting, released by the Ministry of Economy, Trade and Industry's Agency for Natural Resources and Energy on Aug. 24 following a disclosure of information request from the Mainichi Shimbun. It is the first time Kondo's comments on the issue have been made public.

Secret meetings of pro-nuclear power experts were held 23 times between November last year and April this year, and Kondo attended the first four meetings. Though he previously admitted having attended the meetings, he had stated that he had merely given greetings.

The records show that Kondo issued instructions pertaining to the agenda of the commission's Shin Taiko Sakutei Kaigi (conference to work out a new outline) and a meeting of experts discussing Japan's nuclear fuel cycle program -- **indicating that he played a leading role in the secret gatherings.**

The Agency for Natural Resources and Energy released a total of 58 pages of records covering seven meetings. In the records pertaining to a Dec. 8 meeting, Kondo was quoted as saying that even if discussions on the formulation of a new nuclear power policy weren't going smoothly, he would "take control of the issue" if it came down to it. He reportedly added that if discussion on nuclear policy remained unsettled and there was wavering over whether or not Japan should adopt a zero-nuclear power policy, then he would "control the final way the issue was presented."

At the time, the commission was planning to create a "new outline" for overall nuclear power policy based on discussions at the Shin Taiko Sakutei Kaigi. "The final way the issue was presented" referred to the new outline. Kondo thus indicated that he would ensure that the commission would decide that Japan would retain nuclear power.

In the records for the Dec. 8 meeting, Kondo was quoted as saying, "I've compiled papers on the points at issue, so how about discussing the formulation of a new outline based on these?" He was also quoted as calling for discussion on the Monju experimental fast-breeder reactor in Fukui Prefecture at a following subcommittee meeting.

The secret meetings -- attended by members of the Agency for Natural Resources and Energy, the Ministry of Education, Culture, Sports, Science and Technology, as well as members of the electric power industry -- were exposed in a report by the Mainichi Shimbun on May 24. The findings caused an uproar among Sakutei Kaigi members and since May 29 the task force has not convened a meeting.

The Japan Atomic Energy Commission plans to replace members of the task force and resume meetings, but the selection of new members has progressed slowly, and the new outline for nuclear power in Japan is at a standstill.

Commenting on his statements in the records, Kondo said, "For me, this is part of the world of greetings. I merely spoke of my resolve as chairman." Referring to the new outline, he said, "In the end I'll take the responsibility.

American advice

August 31, 2012

Ex-US nuclear regulator chief urges transparency

http://www3.nhk.or.jp/daily/english/20120831_16.html

The former head of the US nuclear regulator has stressed the importance of information disclosure for the new nuclear safety agency that Japan will launch next month.

Gregory Jaczko met Fukushima residents during his recent trip to Japan. He served as the chairman of the US Nuclear Regulatory Commission for about 3 years until July.

Jaczko told the residents that nuclear power plants should not be operated without a guarantee that major accidents that involve large-scale evacuations will not occur.

He also commented on the new nuclear regulatory body that will replace the Nuclear and Industrial Safety Agency in the near future.

The Nuclear and Industrial Safety Agency lost the confidence of the public after the accident at the Fukushima Daiichi nuclear plant in March last year.

Jaczko said information disclosure, including the transparency of the decision-making process, is essential for the new regulator to gain public trust.

He said the recent anti-nuclear protests in Japan are understandable as nuclear energy is a controversial subject. He added that dialogue is important as the government and the people will ultimately have to make a decision on this issue.

More official warnings

September 1, 2012

Minister gives verbal warnings to atomic energy panel chiefs over secret meetings

<http://mainichi.jp/english/english/newsselect/news/20120831p2a00m0na012000c.html>

Nuclear disaster minister Goshi Hosono gave verbal warnings to the heads of the Cabinet Office's Japan Atomic Energy Commission (JAEC) on Aug. 30 for holding secret pro-nuclear meetings.

A total of 23 pro-nuclear meetings that took place between November last year and April this year under the guise of study sessions were "inappropriate from the standpoint of neutrality, transparency and fairness," Hosono told the pair.

Shunsuke Kondo, chairman of the JAEC, said he will return one month's salary, some 1,055,000 yen, while Vice Chairman Tatsujiro Suzuki will give back 465,500 yen, or half of his monthly salary, to take responsibility for their actions in connection with a review of the nation's nuclear fuel cycle policy.

But the JAEC did not revise a policy decision statement it submitted to the government in June, insisting that the secret meetings did not affect the outcome of deliberations on a new nuclear power policy.

The JAEC held the 23 closed-door study sessions by inviting only pro-nuclear people, including representatives of the Federation of Electric Power Companies of Japan, and kept them separate from open meetings of a subcommittee on the future of the nuclear fuel cycle. In its policy decision statement, the JAEC said it will be appropriate to pursue a combination of reprocessing spent nuclear fuel and burying it if the government is to set a ratio of nuclear power at 15 percent in 2030.

An investigative team of the Cabinet Office pointed out Aug. 6 that the possibility that the secret meetings have influenced the JAEC's conclusion cannot be ruled out. The JAEC deliberated the issue during a special meeting on Aug. 30 but decided not to change the policy decision statement.

But in order to maintain the transparency and fairness of its policy decision process, the JAEC says it will keep a memo outlining the content of each meeting to be attended by the chairman and at least two other commission members and will not ask private-sector people for comment in advance on future decision documents.

Also on Aug. 30, Cabinet Office Administrative Vice Minister Takashi Matsumoto separately gave verbal warnings to three members of the Cabinet Office's nuclear power policy office for distributing documents to pro-nuclear parties during the secret meetings before those documents were made public.

Tours of nuclear plants reserved to supporters of nukes

September 7, 2012

Nuke plant operator refuses tour for anti-nuke lawmakers

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201209070039>

THE ASAHI SHIMBUN

Hokuriku Electric Power Co. in late August refused a request by Social Democratic Party leader Mizuho Fukushima and other party officials to tour the Shika nuclear power plant in Ishikawa Prefecture because they support a phasing out of nuclear power, sources said.

The Toyama-based utility told the SDP officials that they "could not afford to deal with people who did not share the understanding for the need of atomic energy," according to the sources.

"We are receiving so many requests for tours," said an official at Hokuriku Electric's community relations and development division. "Workers on the ground are very busy. We declined the request because we concluded it was low on our list of priorities. We feel that even if we granted a tour to officials of a political party that espouses a phase-out of nuclear energy, we were not likely to win their support for nuclear power."

"We asked Hokuriku Electric officials for a further explanation of what the problem is," said an SDP official who filed the request for an inspection tour. "But they said they didn't even want us to come and ask questions as long as we were not pro-nuclear. We will be sending Hokuriku Electric a letter of request in the name of our party."

THE ASAHI SHIMBUN

TEPCO can't afford to invest in alternative energy

September 7, 2012

INTERVIEW: TEPCO chief says no money to develop renewables

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201209070017>

THE ASSOCIATED PRESS

The head of the Japanese utility that owns the tsunami-hit Fukushima nuclear power plant said Sept. 6 that he believes nuclear power should be part of the country's energy mix, even though the government and the public seem to feel differently.

Naomi Hirose, president of Tokyo Electric Power Co., also said **the utility can't afford to invest in alternative energy** since the earthquake-tsunami crisis last year, which wiped out the Fukushima No. 1 plant and caused extensive radioactive meltdowns that took months to control.

TEPCO was saddled with huge compensation and cleanup costs after the nuclear crisis. The company was nationalized in July after receiving a trillion yen (\$12.8 billion) public bailout.

The company had attempted some diversification of its energy mix before the March 11, 2011, earthquake-tsunami. **TEPCO built three mega-solar power plants and more than a dozen windmills with its affiliate, Eurus Energy Holdings Corp.**

But the company's difficult financial picture following the crisis means it doesn't have the money to invest in renewable energy, Hirose told The Associated Press at TEPCO headquarters in Tokyo.

"We tried to develop those renewable powers, but unfortunately after 3.11 we do not have much money and we probably cannot spend as much money to build renewable energy," he said.

Hirose, 59, assumed the top post at the struggling company in June with the task of turning around its business. A resumption of TEPCO's idled reactors in northern Japan would help, but gaining local support for that would be difficult, he acknowledged.

"It is true that in order to be in healthy financial condition, nuclear power is helpful," he said, referring to its Kashiwazaki-Kariwa plant in Niigata, northern Japan, which has seven reactors idled for inspections. "But we do not have any specific schedule for a restart."

Hirose said it is preferable to have diverse energy sources, including nuclear energy, "not just for energy security but also for the price."

Following last year's disaster, the government is finalizing a new energy policy to reduce or eliminate nuclear power. Surveys show the Japanese public overwhelmingly supports a complete phase-out of nuclear energy.

Before the accident, Japan relied one-third of its energy needs on nuclear energy and was planning to increase that to 50 percent by 2030.

"Honestly, a change of policy from 50 percent (nuclear dependency) to zero is quite troubling," he said, even though scaling down nuclear operation would have been inevitable for TEPCO given its responsibility in the world's worst nuclear accident since Chernobyl.

Hirose said, however, TEPCO would follow any energy mix the government decides as part of its energy policy.

The Fukushima crisis triggered widespread doubts about the safety of nuclear energy, making it difficult for the government and nuclear operators to restart the country's 50 reactors, which had been shut down for routine inspections. The last one among them went offline in May.

Two of them were restarted in July to avoid a power crunch during high-demand summer season, but that triggered large protests outside the prime minister's office.

Hirose vowed to fully assess the damage and cause of the nuclear crisis at Fukushima.

The Fukushima plant has largely been stabilized but decommissioning it entirely will take decades since the cleanup of its badly melted reactors requires unprecedented work, research and development of necessary technology.

THE ASSOCIATED PRESS

Remuneration of TEPCO's directors and executives down 30%

September 8, 2012

TEPCO leaders receive average 13 million yen in pay

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201209080047>

September 08, 2012

THE ASAHI SHIMBUN

Executives at Tokyo Electric Power Co., operator of the stricken Fukushima No. 1 nuclear plant, will each receive an average of 13 million yen (\$165,000) in annual pay, an outside panel decided on Sept. 7.

TEPCO's "compensation committee," consisting solely of outside directors, decided to allocate a total of 230.34 million yen in remuneration for the utility's **22 directors and executive officers**.

The money will cover the one-year period from the company's general shareholders' meeting of June 2012 to next year's shareholders' meeting.

The figure is less than 30 percent of the corresponding amount for the accounting year that ended in March 2011, the month the Fukushima nuclear crisis started to unfold.

However, a simple comparison is misleading because TEPCO was reorganized into a "company with committees," as stipulated under Japan's Companies Law, in June 2012. The utility, struggling to come up with money to compensate victims of the nuclear accident, effectively came under state control and now has a much different management setup.

"Remunerations are compensation for the performance of duties," a TEPCO representative said. "We believe we should provide a certain amount of remuneration, partly from the viewpoint of securing personnel who are worthy of being entrusted with management."

The pay for TEPCO President Naomi Hirose and 14 other executive officers, who are in charge of practical affairs of management, account for 195 million yen of the total. The remunerations for Chairman Kazuhiko Shimokobe and five other outside directors totaled 20.34 million yen.

Shimokobe, however, turned down all of money allotted to him, TEPCO officials said.

In the March 2011 accounting year, TEPCO's 33 directors and auditors were allocated 864 million yen in remuneration, with 22 inside directors receiving 700 million yen, or **31.81 million yen each on average**.

Then Chairman Tsunehisa Katsumata and then President Masataka Shimizu were allotted about 72 million yen each.

Following the Fukushima nuclear crisis, Katsumata, Shimizu and all executive vice presidents returned their pay from May 2011.

METI's influences nuke policy

September 9, 2012

Industry ministry opposes change to nuclear fuel recycling policy

<http://mainichi.jp/english/english/newsselect/news/20120909p2g00m0fp006000c.html>

TOKYO (Kyodo) -- The Japan Atomic Energy Commission kept alive an option of reprocessing all spent nuclear fuel in its proposal to the government after it faced **opposition from the industry ministry and power companies to scrapping the long-standing fuel recycle policy**, committee documents showed Saturday.

As part of the government's energy policy review process, the commission tasked with setting basic nuclear energy policies initially planned to propose in June that it would be "desirable" to change the full recycling policy, according to the documents seen by Kyodo News.

The documents suggest that the Ministry of Economy, Trade and Industry, which has aggressively sought expansion of nuclear power use, exercised its influence to resist a possible change to Japan's current policy to reprocess all spent fuel from nuclear reactors and recover plutonium for reuse.

Following the March 2011 Fukushima nuclear disaster, the government is considering reducing the portion of total electricity generated by nuclear power in 2030 to zero, 15 percent, or 20 to 25 percent, compared with 26 percent in fiscal 2010.

According to the commission documents and sources close to the matter, the commission initially planned to drop the option of reprocessing all spent fuel from its proposal under the scenario of 20-25 percent reliance on nuclear power.

In the proposal presented to the government, the commission said that both reprocessing and direct disposal of spent nuclear fuel should be pursued if nuclear reliance is to be cut to 15 percent or lower while recycling of all spent fuel is a viable option for the 20-25 percent scenario.

An industry ministry official overseeing the nuclear fuel recycling demanded that the commission's secretariat keep the option of full reprocessing in the proposal, telling it that consideration should be given to a local government in Aomori Prefecture which hosts various nuclear fuel reprocessing and radioactive waste storage facilities, according to the documents and the sources.

The Aomori village of Rokkasho recently decided to seek the removal of spent nuclear fuel accepted from across Japan if the central government gives up on the fuel recycling policy.

Power company employees working at the commission's secretariat also opposed scrapping the full recycling option, according to the sources.

A commission member said a unanimous agreement on the proposal could not be reached and the members decided to reflect the industry ministry's view on it.

Electricity summer demand no problem - Was the restart of Oi reactors necessary?

September 8, 2012

INSIGHT: Utilities clamor for reactor restarts despite meeting summer demand

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201209080057>

September 08, 2012

THE ASAHI SHIMBUN

Electric power companies are becoming increasingly desperate to restart their nuclear plants to stay afloat, warning of rate hikes and blackouts if their reactors remain offline. But the utilities are ignoring the key question of whether nuclear energy is really needed to meet the nation's power demand.

"Unless more nuclear plants are brought back online, our balance sheet will worsen, threatening a stable power supply," Makoto Yagi, president of Kansai Electric Power Co., told a news conference on Sept. 7.

Yagi said the company will consider all possible options, suggesting a rate hike, if the shutdowns continue at nuclear plants.

The utility posted a net loss of 99.5 billion yen (\$1.26 billion) in the April-June period, compared with a net profit of 34.4 billion yen a year earlier.

Despite public opposition, the government in July reactivated two reactors at Kansai Electric's Oi nuclear power plant in Fukui Prefecture before electricity demand hit a peak in summer.

But Kansai Electric figures suggest that electricity demand could have been met without the Oi reactors running largely because of power savings by households and businesses.

Kansai Electric's supply capacity was 11.8 percent higher than power demand on Aug. 3, when consumption peaked in the Kansai region.

If the Oi reactors had not been restarted, the margin would have fallen to 2.7 percent, below the 3-percent benchmark that utilities say is required to prepare for an emergency.

However, experts said Kansai Electric could meet demand if it secured electricity from other companies.

The peak demand in the Kansai region was 26.8 gigawatts on Aug. 3, and the Oi reactors supplied 2.4 gigawatts. But Kansai Electric and other utilities in western Japan, which use the same frequency, had a

combined surplus capacity exceeding 9 gigawatts, according to the energy strategy council of the Osaka prefectural and municipal governments.

“It was highly likely that Kansai Electric could do without any reactors online, given that (households and businesses) saved power even after the Oi reactors were restarted,” said Kazuhiro Ueta, a professor of environmental economics at Kyoto University, who chairs the panel.

“We must analyze how much power-saving efforts have become part of the daily lifestyle and discuss whether nuclear plants are necessary based on the finding.”

Ueta's panel has called for suspending the Oi reactors again after summer.

The government's power-saving campaign ended in the Kansai, Shikoku and Kyushu regions on Sept. 7. Of the 50 nuclear reactors in Japan, only the Oi reactors are in operation.

In the Kansai region, power usage was cut by 11.1 percent from two years earlier, exceeding the target of at least 10 percent. Consumption fell 9.5 percent in Kyushu, largely in line with the 10-percent target, and 8.3 percent in Shikoku, above the 5-percent target.

But electric power companies continue to lobby for restarting nuclear reactors, saying their very survival is at stake.

“We will reach a dead end in a few years,” a senior Kansai Electric official said. “We will not be able to cover the snowballing costs even if personnel expenses are slashed to zero.”

In addition to Kansai Electric, seven regional electric utilities suffered net losses in the April-June period.

Kyushu Electric Power Co.'s net loss ballooned to 101 billion yen from 8 billion yen a year earlier on increased fuel costs for thermal power generation.

The company will skip a midterm dividend for the first time in 32 years as the net loss for the April-September period will reach 165 billion yen.

Michiaki Uriu, president of Kyushu Electric, said the company will consider a rate hike unless nuclear reactors are restarted.

“Electric utilities are eager to restart nuclear reactors for the sake of their operations,” said Takumi Fujinami, a senior researcher at Japan Research Institute. “A rate hike will likely be unavoidable if nuclear reactors remain offline.”

But power companies themselves would likely have to pay a price for increasing their electricity rates.

The government will demand the companies streamline operations if it approves a rate hike for household customers.

Tokyo Electric Power Co., operator of the stricken Fukushima No. 1 nuclear power plant, raised rates for household users by an average of 8.46 percent in September.

The company was forced to lower the average annual income of employees by more than 20 percent from 7 million yen to 5.5 million yen. It also reviewed its fringe benefits and fuel procurement costs.

A senior Kansai Electric official said the company is loath to follow in TEPCO’s footsteps.

“Like TEPCO, we would be made a wreck of by politicians if we raised electricity charges,” the official said.

The government estimates that a household that pays 9,900 yen a month for electricity bill may have to shoulder more than 20,000 yen if nuclear power generation is abolished in 2030.

THE ASAHI SHIMBUN

Vested interests - What impact?

September 16, 2012

New no-nuke plan has vested interests worried

<http://www.japantimes.co.jp/text/nn20120916a6.html>

Kyodo

The official declaration Friday that Japan will pursue a nuclear phaseout by the 2030s is drawing opposition and concern from areas that host atomic facilities and Western countries closely linked to related projects in Japan.

Aomori Prefecture, home to a nuclear fuel recycling plant in the village of Rokkasho, is wary it could become the final disposal site for spent fuel and radioactive waste if the government terminates its recycling policy.

The new energy policy states that fuel reprocessing will have to continue for a while, but with an eye to opening talks on a rethink.

Issei Nishikawa, the governor of Fukui Prefecture, which has the highest concentration of nuclear reactors in the country at 14, said the government's decision "contradicts the prime minister's remarks in June, when he said nuclear power generation is an important source of energy."

"The prime minister should go back to his original stance and promote nuclear power policy by ensuring safety," Nishikawa said at a prefectural assembly meeting.

Yasushi Furukawa, the governor of Saga, home to the Genkai nuclear power plant, raised the risk of global warming.

"If we increase thermal energy as an alternative, how are we going to reduce carbon dioxide emissions?" he asked.

Internationally, Britain and France, where Japan sends its spent nuclear fuel for reprocessing, after which it is shipped back, are concerned about how the decision will affect the future viability of those facilities.

The United States is also expressing concern because the use of Japanese nuclear technology has been spreading after a three-decade moratorium on nuclear power plant construction.

Public reaction has been mixed, with some voicing distrust in the government's resolve and others hailing the move.

"Although the government decided to continue nuclear reprocessing, it might start saying it will stop the project in a year or two," a 47-year-old woman from Rokkasho said.

But a 52-year-old woman in Aomori Prefecture said, "I do not want the government to operate nuclear plants and reprocessing plants, because of safety concerns."

Some experts doubted the viability of the new energy policy and saw it as **a populist political measure ahead of upcoming leadership elections in the major political parties.**

Should culprits have been named?

September 17, 2012

Head of nuclear disaster investigation defends report

<http://www.japantimes.co.jp/text/nn20120917a5.html>

By YURI KAGEYAMA
AP

The head of a major investigation into the Fukushima nuclear disaster is defending his report against criticism that his panel avoided blaming individuals and instead blamed elements of the nation's culture.

Pointing the finger: Kiyoshi Kurokawa, who headed the Fukushima Nuclear Accident Independent Investigation Commission, speaks during an interview in Tokyo Thursday. AP

Kiyoshi Kurokawa, a doctor who headed the Fukushima Nuclear Accident Independent Investigation Commission, said he sticks with his view that the catastrophe was "Made in Japan," underlining collusion

among the regulators and the utility that set off the worst nuclear disaster since Chernobyl. He said his panel intentionally stopped short of naming individual culprits.

"No one takes responsibility in Japan, even those in positions of responsibility," Kurokawa said last week at his commission office in Tokyo. "This is unique to Japan, a culture that stresses conformity, where people don't complain."

People are complaining, however, about the commission's report, not only for lacking specifics on responsibility but for making statements on Japanese culture that appeared in the English-language version of the document but not the Japanese version.

The 641-page report, released in July, compiled interviews with 1,167 people and scoured documents obtained from nuclear regulators and Tokyo Electric Power Co., the utility that ran Fukushima No. 1 nuclear plant.

A devastating March 2011 tsunami set off by a 9.0-magnitude quake destroyed backup generators and sent the quake-damaged Fukushima No. 1 nuclear plant into multiple meltdowns and explosions. About 150,000 people were eventually evacuated from a 20-km no-go zone, and fears remain in Fukushima that cancer and other illnesses will grow as a result of radiation.

The independent panel of 10 experts, including a lawyer, former diplomat and chemist, was appointed by the legislature. It is a style of investigation that was common in Western nations but unprecedented in Japan.

The panel's report has drawn fire from Japanese and overseas critics alike.

"One searches in vain through these pages for anyone to blame," Columbia University professor and Japan expert Gerald Curtis wrote in an opinion piece submitted to the Financial Times. "To pin the blame on culture is the ultimate cop-out. If culture explains behavior, then no one has to take responsibility."

Tatsujiro Suzuki, vice chairman of the government Atomic Energy Commission, which promotes nuclear technology, was critical of the differences between the English and Japanese versions of the report. He said it appeared to be putting on one face to the Japanese people, while presenting another abroad.

The preface of the English version said, "What must be admitted — very painfully — is that this was a disaster 'Made in Japan.' Its fundamental causes are to be found in the ingrained conventions of Japanese culture: our reflexive obedience; our reluctance to question authority; our devotion to 'sticking with the program'; our groupism and our insularity," he wrote in the English version.

The passage wasn't in the Japanese message. But Kurokawa said that he made similar points in other parts of the report in Japanese.

He said he wanted to reach a global audience by pointing to "amakudari," the longtime practice of handing plum jobs to retired bureaucrats, the nation's half-century domination by a single party, and elitist employees taking lifetime jobs for granted, as a peculiar "mindset" that fosters irresponsibility, slow decision-making and dubious governance.

"I didn't want to say it, but it is 'Made in Japan,' " Kurokawa said. "This is about Japanese culture and values. There is nowhere else quite like that."

Tokyo prosecutors recently accepted a request by a group of lawyers to carry out a probe into criminal charges of professional negligence against regulators and the plant's management. If prosecutors move ahead, their power to subpoena records, raid offices and question officials would be far greater than that of Kurokawa's panel.

Kurokawa said such an investigation was welcome as a sign of a "healthy democracy." He said his six-month investigation offered plenty of fodder for a criminal inquiry. He said it showed that bureaucrats brushed off evidence of tsunami risks that had been clear as far back as 2006, and that representatives from international watchdog groups took travel money from the utilities. He said it may not have the names, but the dates and circumstances are there so all the investigators have to do is check, he said.

Japanese media have reported that prosecutors waited for Kurokawa's report before deciding to take up a criminal investigation. The report's finding that the accident was preventable and man-made made it more likely the prosecutors would investigate.

The NRA just a "cosmetic change"?

September 20, 2012

Nuke watchdog a 'cosmetic' change

New regulatory agency faulted for ties to discredited predecessor

<http://www.japantimes.co.jp/text/nn20120920a3.html>

By KAZUAKI NAGATA
Staff writer

Created to replace a nuclear regulatory system discredited by the Fukushima disaster, the new five-member Nuclear Regulation Authority, launched Wednesday, is already being faulted as a cosmetic change.

Experts note that most of the employees at the NRA's secretariat are the same bureaucrats who were working at the old regulatory authority, the Nuclear and Industrial Safety Agency.

Nothing has been done, they said, to dismantle the old bureaucratic culture that blurred the lines of responsibility and made regulators who lacked independence and nuclear expertise reluctant to force utilities to toe the line.

For example, a new regulation forbidding personnel from returning to their original ministries to keep them focused on the new entity has been made toothless by a five-year moratorium.

What's needed to change the culture, they said, are outside pressures to monitor the new system, and government-backed programs, such as those providing overseas training, to keep bureaucrats motivated.

"The most important point is that the secretariat that supports the highly independent five-member commission must have independence and expertise," said Shuya Nomura, a professor at the Chuo Law School who was a member of the Diet panel that probed the causes of the Fukushima No. 1 triple meltdown crisis.

In its final report released in July, the Diet panel said that NISA failed to enforce regulations because the utilities, with their greater nuclear expertise, were able to get the upper hand, a situation known as "regulatory capture."

As a part of the Ministry of Economy, Trade and Industry, which was promoting nuclear power, NISA's independence was always in shaky, and it finally came under heavy fire for that.

To correct the problem, the new regulatory body, which has a staff of about 480, including more than 300 from NISA, will operate as an agency under the Environment Ministry to avoid the influence of the ministries tasked with promoting nuclear power, and to support a new highly autonomous five-member commission.

Nevertheless, the commission's power and autonomy are compromised because "the secretariat under the commission that handles actual work is still pretty much the same as NISA, which means we can't really expect the culture to be changed," said Hiroshi Tasaka, who was a special adviser to former Prime Minister Naoto Kan and helped deal with the Fukushima disaster.

Thus the public's focus on the commission is misguided, the experts said. Although antinuclear activists claim that some of the commissioners, including Chairman Shunichi Tanaka, former vice chairman of the Japan Atomic Energy Commission, are unqualified to run an independent watchdog because of their previous ties to the nuclear industry, the key is the secretariat. Simply separating a regulatory section from METI will not solve the problem because the government has taken a lax stance on personnel oversight.

In general, METI bureaucrats are reassigned every few years, mainly based on seniority, and often shuttle between the nuclear promotion and regulation sections. Consequently, they would usually avoid boldly changing the policies of their predecessors.

Because METI's mission was to promote nuclear power, there was no incentive to place its best people at NISA to tighten regulations, according to Nomura of Chuo Law School.

While experts at the U.S. Nuclear Regulatory Commission are qualified to operate reactors, Kenkichi Hirose, former head of NISA, told the Diet panel that officials were kept busy with paperwork, Nomura said.

Although the government is set to bar bureaucrats from returning to their ministries, loopholes in the rule remain, the experts warned. For example, a moratorium has been placed on that rule for the first five years of the new agency's debut, allowing bureaucrats to go back to their ministries if they choose.

"The next five years will be critically important to grow a new regulatory culture," so the moratorium should not be applied so that they will focus on their job, said Tasaka, a professor of business at Tama University who has a doctorate in nuclear engineering.

The secretariat needs to be a body that people will want to work for, said Nomura, citing the U.S. Nuclear Regulatory Commission as an example of a place considered prestigious by U.S. federal workers.

Furthermore, it's necessary to have outsiders scrutinize the performance of the new regulatory body, Tasaka said. For instance, an expert from overseas, such as a former NRC member, should be included to play a role similar to that of an outside director at a private firm. However, doing this may require changing the law to allow foreigners to take such a position.

The Diet should also form a committee to check the NRA and its secretariat, Tasaka said. "It requires tremendous effort to reform an institutional culture whether it's a private firm or public organization . . . It must have outside pressure," said Tasaka.

Disaster recovery funds diverted to irrelevant projects

September 21, 2012

Yoroku: Noda should 'exterminate termites' that eat away at disaster recovery funds

<http://mainichi.jp/english/english/perspectives/news/20120921p2a00m0na012000c.html>

A book published in ancient China carries a story about termites eating away at money in a government coffer. During the reign of the Kangxi Emperor (1654-1722), the fourth emperor of the Qing Dynasty, enormous amounts of gold bullion disappeared from a safe storing revenue from taxes imposed on salt. Surprised bureaucrats examined the safe and found mountains of powder on the floor along the wall. They dug through the powder and found a huge number of termites.

When burned in a furnace, the powder turned back into gold bullion, but the gold fell short of its original value. The same book also carries a story about termites eating away at silver that Hebei province officials stored in a box.

An article in the Mainichi Shimbun's evening edition published in Tokyo on Sept. 13 quotes a legislator elected from an area hit by the March 2011 Great East Japan Earthquake and tsunami as lamenting that "termites are swarming over funds set aside for the restoration of disaster-hit areas, and **diverting much of the money to projects irrelevant to disaster recovery.**" He is talking about **projects such as those that make government buildings quake-resistant, the purchase of weapons for the Self-Defense Forces, research on nuclear fusion and subsidies for artists' overseas performances.**

On Sept. 9, the "NHK Special" program aired by the public broadcaster reported that funds set aside for disaster recovery projects had been **diverted to anti-terrorism and anti-Sea Shepherd measures**, amazing residents of disaster-ravaged areas. Needless to say, over half of 19 trillion yen allocated for disaster recovery efforts over the five-year period following the quake, tsunami and ensuing nuclear crisis will be raised by tax hikes.

On the other hand, sufficient financial assistance has not been extended to small- and medium-sized companies and small shops in disaster-hit areas, as a result of which many such areas remain deserted.

Taxpayers accepted tax hikes over a 25-year period to cover disaster recovery efforts because they sympathized with residents of disaster-stricken regions -- not because they wanted to help make Tokyo taxation offices quake-resistant.

Before the ruling Democratic Party of Japan (DPJ) took over the reins of government in September 2009, Prime Minister Yoshihiko Noda had compared corporations that offer lucrative post-retirement jobs to bureaucrats who once supervised them to termites and demanded that such "bugs" be exterminated. What the DPJ-led administration called "political leadership" has declined to the worst possible level. However, the Noda administration needs to now show leadership to contribute to the restoration of northeastern Japan, which has been devastated by the disasters. ("Yoroku," a front-page column in the Mainichi Shimbun)

Criminal probes of TEPCO to start soon

September 29, 2012

Criminal probes planned

<http://www.japantimes.co.jp/text/nn20120929a8.html>

JJI

Prosecutors will start full criminal probes over last year's accident at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear power station, informed sources said.

Starting in early October, prosecutors will be gathered from various district offices to launch full-scale investigations, the sources said Thursday, adding that materials for the probes have already been submitted voluntarily by some parties.

Prosecutors are expected to start interviews with Tepco executives and others soon. They are expected to decide by March on whether to file criminal charges.

In August, four district prosecutors' offices received criminal complaints over the nuclear accident triggered by the March 2011 earthquake and tsunami.

Complaints received by the Kanazawa and Nagoya district offices will be transferred to the Tokyo office. Investigations over the nuclear crisis will be covered by the Tokyo and Fukushima offices.

In these complaints, Tepco executives and government officials are accused of causing injury to people who lived near the stricken nuclear plant through professional negligence.

Tepco and government officials failed to take enough precautionary steps against huge earthquakes and tsunami, and failed to make appropriate responses to the crisis, according to the complaints.

Report says Futaba hospital can't be blamed for patients' deaths

October 1, 2012

Hospital blameless in patient deaths during nuke disaster evacuation: report

<http://mainichi.jp/english/english/newsselect/news/20121001p2a00m0na018000c.html>

A hospital near the disaster-stricken Fukushima No. 1 nuclear plant made no mistakes during a hasty evacuation in March 2011 during which 40 patients and nursing home residents lost their lives, according to a report released on Sept. 30 by investigators commissioned by the hospital.

"The deaths were caused by the nuclear disaster," the report on the evacuation of Futaba Hospital in Okuma, Fukushima Prefecture, concluded, adding that "the hospital did everything it could, and committed no errors." The report furthermore emphasized that, **despite the hospital's repeated requests for help from the municipal authorities and the Self-Defense Forces (SDF), the evacuation of the patients began late and took too long once started, both of which played a part in the deaths.**

The report was presented to 124 attendees at a Sept. 30 briefing in Iwaki, Fukushima Prefecture, including 60 surviving family of the deceased patients and families of some residents at the neighboring nursing home Deauville Futaba, who also passed away during the evacuation. **Not all of the attendees were satisfied with the report, put together by two attorneys representing the hospital administration, with some questioning whether the hospital was in fact completely blameless, and others angry that the final document contained no apology for the loss of their loved ones.**

The report stated: "The nuclear disaster forced the hospital to evacuate to a location at least 20 kilometers away, and put the facility in a position where aid was difficult to obtain. As such, there is a causal relationship between the nuclear disaster and the patient deaths."

Hospital Director Ichiro Suzuki, 78, told attendees at the briefing, "It's very unfortunate that so many of our patients died, but I have no intention of apologizing" -- apparently drawing shock and anger from some bereaved family members.

The investigation, led by attorney Kiyonari Inoue, was launched in May 2011, and collected information and statements from several organizations that participated in the evacuation, including the Okuma town government, the Fukushima Prefectural disaster response headquarters, and the SDF. The details of the evacuation contained in the report, however, differed little from those laid out in the central government's investigative report on the nuclear disaster released in July this year. Director Suzuki stated that the hospital plans to continue its investigation, and will also provide surviving family members who are filing compensation claims against nuclear plant operator Tokyo Electric Power Co. (TEPCO) with all the information it has obtained.

One 73-year-old man who said he lost his 43-year-old nephew during the hospital evacuation told the Mainichi he wasn't at all satisfied with the report.

"The director's words were so plain. He didn't communicate any emotion," the 43-year-old said. His nephew, who had a muscle-wasting disease, was among the last group of patients to be evacuated from Futaba Hospital on March 16, 2011 -- five days after the earthquake and tsunami that triggered the nuclear disaster. He died soon after his arrival at a hospital in Nihonmatsu, Fukushima Prefecture.

A woman from Okuma who lost two relatives at the Deauville Futaba nursing home also left the information session unhappy.

"It really looked like the hospital was just trying to justify its actions. I'm not convinced by what they're saying," she said.

One 54-year-old man whose 82-year-old father was a resident at the Deauville Futaba nursing home, however, was more conciliatory, telling the Mainichi, "In my opinion, an earthquake plus a nuclear disaster is sure to cause panic. The late start to the evacuation couldn't be helped."

The evacuation took three routes over the course of four days. According to both the central government and hospital reports, on March 12, 209 of the hospital's 338 patients plus 64 staff boarded buses provided by the municipality for the prefectural town of Miharu, where they spent the night in a junior high school gym before heading to Iwaki the next day.

Director Suzuki, who had stayed behind with the remaining patients, pleaded with the police and the SDF to evacuate them. Aid did not come, however, until about 4 a.m. on March 14, when the SDF took 34 patients and all 98 residents of the Deauville Futaba nursing home to a health care center in Minamisoma, north of the hospital and the nuclear plant.

The passengers were scheduled to take a different set of buses from there to Iwaki, but the head of the health center thought their conditions made the transfer too difficult. This meant that the SDF buses, which were supposed to head back to Okuma to retrieve the people still at Futaba Hospital, ended up taking a circuitous five-hour journey to Iwaki with their first load of patients, eight of whom died en route or soon after arriving in Iwaki.

Back in Okuma, Suzuki waited for the SDF to come back. However, at about 10 p.m. on March 14, a police officer ordered him to evacuate temporarily to neighboring Kawauchi village. This and other moves confused attempts to link up with the SDF again until 9 a.m. on March 15. The remaining Futaba Hospital patients were sent in two groups to Nihonmatsu, the last arriving at midnight.

Four patients died at Futaba Hospital while waiting for evacuation, and one went missing.

What happened to reconstruction funds?

October 2, 2012

Disaster reconstruction funds ending up in the wrong hands, slowing work

Jiji

<http://www.japantimes.co.jp/text/nn20121002a8.html>

Suspensions have arisen that ¥17 trillion reserved for postdisaster reconstruction work in the fiscal 2012 budget has been spent on projects that have little to do with rebuilding the Tohoku region.

Some of the rebuilding funds have been spent outside Tohoku's disaster zones to build roads and quake-proof tax office buildings. Even a project by the Japan Atomic Energy Agency to research nuclear fusion received ¥4.2 billion.

In a third supplementary budget for fiscal 2011, ¥500 billion was earmarked for a postdisaster reconstruction support fund to finance companies setting up factories, but the subsidies were also provided to businesses that built plants outside the afflicted areas.

"To be honest, I cannot approve the way (some of the funds) have been used," reconstruction minister Tatsuo Hirano told a recent news conference.

The budget should be spent on projects that directly contribute to the reconstruction of Tohoku, Hirano said, adding the use of the funds will be reviewed strictly while compiling the fiscal 2013 budget.

With others in the government voicing similar concerns, the Finance Ministry has started reviewing the criteria used to funnel subsidies into reconstruction programs, government sources said.

Senior Vice Finance Minister Yukihiisa Fujita said budget appropriations for projects in prefectures little affected by the disasters will be put on hold to boost reconstruction efforts.

In the three prefectures hit hardest by the March 2011 disasters, about 80 percent of the debris and rubble left by the tsunami has yet to be disposed of in Iwate and Miyagi. In Fukushima Prefecture, work has just started on decontaminating areas affected by fallout from the Fukushima No. 1 plant's crippled reactors.

Evacuees staying away

Jiji

FUKUSHIMA — Many who evacuated areas 20 to 30 km from the Fukushima No. 1 nuclear plant have yet to return home, including in locations where the central government lifted its emergency evacuation preparation advisory more than a year ago.

The government in April 2011 designated parts of the municipalities of Minamisoma, Tamura, Naraha and Kawauchi, as well as the whole of Hirono, in Fukushima Prefecture as areas where residents should be on standby to evacuate depending on radiation levels.

As a result, many people left these areas, located just outside the initial 20-km no-go zone set up around the station after the March 2011 earthquake and tsunami caused three catastrophic core meltdowns.

Though the advisory was lifted Sept. 30 last year, about half of the 59,000 residents remain reluctant to return to the affected areas because of radiation fears.

Work to decontaminate houses is under way in Hirono and Kawauchi but has yet to start on a full scale in Tamura and Minamisoma due to the difficulty of finding facilities to temporarily store contaminated soil.

The slow reconstruction of local infrastructure also has discouraged locals from returning. Going back to communities located extremely near the plant is even more arduous, as many shops and hospitals remain closed.

Of the total 22 elementary and junior high schools that were shut down after the advisory was issued, 16 have resumed classes in their original facilities. But the number of students is far smaller than before.

To make it easier for residents to return home, the municipal governments of Hirono and Kawauchi moved their head offices back to the municipalities after having to temporarily relocate them elsewhere.

Is this just due to lack of funds?

October 2, 2012

Abolishment of Nuclear Energy Library removes 40,000 files from public view

<http://mainichi.jp/english/english/newsselect/news/20121002p2a00m0na016000c.html>

The Nuclear Energy Library, a facility that offered ordinary residents access to information on nuclear power, has been abolished since its jurisdiction was transferred from the former Nuclear Safety Commission to the newly formed nuclear regulatory agency, it has been learned.

There are no signs that the library will reopen, and the fate of roughly 40,000 files in the library that the public can no longer access is up in the air.

The nuclear regulatory agency was formed with the goal of increasing transparency in nuclear power administration, but the library's closure has sparked criticism that the efforts to release information have only deteriorated under the agency.

The closed library, covering an area of about 600 square meters, is located in a private building in Tokyo's Kasumigaseki district close to the former Nuclear Safety Commission. It offered access to copies of application documents and safety screening reports that are required when constructing and operating nuclear power plants, in addition to the minutes of government meetings. After the outbreak of the Fukushima nuclear disaster, about 100 people reportedly used the library each day.

The library was set up in 1997, in the wake of criticism over the way information was released following a sodium leak at Japan's Monju fast-breeder reactor in 1995 and the subsequent cover-up of a video taken after the accident. The facility contains many hard copies of documents that can't be viewed online, and when it was open visitors were able to view and copy the data.

However, when the operations of the now defunct Nuclear Safety Commission were transferred to the nuclear regulatory agency, the secretariat for the new Nuclear Regulation Authority, the library was abolished as of Sept. 14. No replacement facility has been arranged in the private building housing the newly established nuclear regulatory agency in Tokyo's Roppongi district, and most of the files remain in the library's Kasumigaseki office.

When questioned about the abolishment of the library, a representative of the agency's general affairs section told the Mainichi, "The organization has changed and I haven't heard the background to the decision." The representative said it had not yet been decided whether budget funds would be allocated to keep the library in operation.

Kenji Sumita, a professor emeritus at Osaka University and former acting head of the Nuclear Safety Commission, criticized the library's closure.

"An access point for ordinary residents to obtain information about nuclear power should be maintained. The regulatory agency's response is simply shabby, and to restore confidence in nuclear power it should quickly be reopened," he said.

The agency has instructed workers to forbid reporters from entering its office, and it has restricted the scope of the information it releases, barring reporters for political party newspapers from news conferences.

Yukiko Miki, director of nonprofit organization Information Clearinghouse Japan, voiced concerns about the situation.

"It's unforgivable for the level of information release to fall below the level seen before the Fukushima nuclear accident," she said.

More cover -up

October 3, 2012

Secret meetings held on Fukushima nuclear crisis's impact on human health

<http://mainichi.jp/english/english/newsselect/news/20121003p2a00m0na014000c.html>

FUKUSHIMA -- The prefectural government here held secret meetings among a panel of experts on the nuclear crisis's impact on human health to **work out scenarios for official deliberation sessions based on the view that there is no causal relationship between the disaster and the outbreak of cancer**, sources close to the case said.

Fukushima Prefectural Government officials also told the attendees not to reveal to outsiders that such secret meetings took place.

A prefectural government official has told the Mainichi that it convened the preparatory meetings of an expert panel in an effort to prevent any confusion at the official meetings and avoid causing anxiety to prefectural residents. However, the official admitted in an interview with the Mainichi Shimbun that the secret meetings were inappropriate and said they would not take place again.

"We wanted to facilitate the official sessions by listening to the panel members' opinions in advance. We can't argue if we are blamed for holding secret meetings. We regret having such gatherings. We'll not hold such meetings anymore," said the official, who belongs to the prefectural government's health and welfare department.

Fukushima Medical University Vice President Shunichi Yamashita, who chairs the experts' panel, said he did not think attendees were making any secret arrangements in the meetings.

"I understand that preparatory meetings were held for the panel to listen to explanations of the results of health surveys. No decisions were made at these gatherings, and I didn't consider them secret meetings," he said. "If they stir a sense of distrust among members of the public, I don't mind discontinuing such gatherings."

The expert panel was set up in May last year after the March 11 Great East Japan Earthquake and tsunami triggered the crisis at the Fukushima No. 1 Nuclear Power Plant. The panel offers advice on the results of health surveys that Fukushima Medical University is commissioned by the prefectural government to conduct on local residents. Currently, it consists of 19 members, including experts in radiology and medical professors as well as national government officials.

The panel has so far held eight sessions, and the details of what was discussed at most of the meetings as well as their minutes have been disclosed.

However, it has come to light that members of the panel secretly held preparatory meetings shortly before each of the sessions at the proposal of an official of the prefectural government's health and welfare department, which serves as the secretariat of the panel.

All materials distributed to the members at such secret meetings were later recovered and no minutes were compiled in order to cover up the existence of the gatherings.

Before the eighth official session in the city of Fukushima on Sept. 11 this year, a health survey had confirmed for the first time that a child living in the prefecture was suffering from thyroid cancer.

During the preparatory meeting for that session, the members shared the view that there is no causal relationship between the nuclear disaster and the outbreak of the cancer. They then worked out a scenario under which one of the members would ask a question about whether there was a causal relationship between the crisis and the cancer and the university would answer the question.

At the official session, one panel member actually asked whether there was a causal relationship. In response, a Fukushima Medical University professor denied the suspicion, pointing out that it took at least

four years after the Chernobyl nuclear accident in 1986 before the number of thyroid cancer patients increased.

In a preparatory meeting prior to the third session in July last year, prefectural government officials asked members of the panel not to reveal such secret sessions to outsiders.

The health and welfare department official admitted that officials had asked members of the panel to keep secret what they discussed at preparatory meetings and recovered all materials after such gatherings partially to prevent the results of the health survey from leaking to the media before being officially announced.

Official investigation into diversion of disaster funds

October 4, 2012

Diet panel to probe diversion of disaster recovery funds for other purposes

<http://mainichi.jp/english/english/newsselect/news/20121004p2a00m0na014000c.html>

A Diet panel is set to launch an investigation into the diversion of funds allocated from the state budget for disaster recovery efforts to disaster prevention measures outside disaster-stricken regions, legislators said.

State Minister for Disaster Recovery Tatsuo Hirano has already begun a probe into the case as the budget for the restoration of areas devastated by the March 2011 Great East Japan Earthquake, tsunami and the ensuing Fukushima nuclear crisis are mainly funded with a special tax hike.

Officials with the Finance Ministry and other ministries concerned explained the diversion of such funds to top members of the House of Representatives Committee on Audit and Oversight of Administration behind closed doors on Oct. 3. In response, the committee decided to investigate the case through a subcommittee while the Diet is not in session on the grounds that it must get to the bottom of the problem.

During the explanatory meeting, the legislators called into question the diversion of funds earmarked for disaster recovery projects to eight other projects, including boosted measures to protect research whaling ships from attacks by the anti-whaling organization Sea Shepherd and an Okinawa Prefecture national highway improvement and construction project.

The Agriculture, Forestry and Fisheries Ministry argued that the stepped up measures to protect whaling ships is necessary for the recovery of quake- and tsunami-stricken Ishinomaki, Miyagi Prefecture, which is home to key whaling-related facilities.

The Land, Infrastructure, Transport and Tourism Ministry also defended the project to improve and construct national highways in Okinawa because the project is covered with funds for nationwide disaster prevention efforts, which are part of the disaster recovery budget.

Legislators raised questions about the explanations.

"Members of the general public will hardly understand such diversions. It's the responsibility of the Diet to conduct an investigation into the issue although the Diet isn't in session now," one of the top members of the committee said.

"I suspect that officials used various tricks to divert disaster recovery funds," another said.

Furthermore, the Economy, Trade and Industry Ministry has come under fire from the legislators for using funds to extend subsidies for businesses in disaster-hit areas to a contact lens factory in Gifu Prefecture which is outside the disaster areas.

A ministry official explained that it extended the subsidy to the Gifu company because its factory has procured materials for contact lenses from Fukushima and Ibaraki prefectures, which are affected by the disasters.

Apart from the eight projects, the Mainichi Shimbun has also learned that the Education, Culture, Sports, Science and Technology Ministry set aside 4.2 billion yen for the Japan Atomic Energy Agency's project to build nuclear fusion research facilities in Aomori and Ibaraki prefectures.

The ministry justified the practice. "The basic policy of disaster recovery stipulates that the knowledge held by industries in disaster-hit regions should be fully utilized to establish a hub for technological innovation in such areas," an official said.

The diversion of funds is in line with the government's basic policy of disaster recovery set in July last year, which allows funds set aside for disaster recovery to be used for disaster prevention measures across the country.

Following the March 11 quake, numerous local governments asked the national government to strengthen disaster-prevention measures in areas other than quake- and tsunami-stricken regions. In response, the central government decided to use about 1 trillion yen out of an estimated 19 trillion yen -- which is expected to be set aside for recovery funds -- for areas outside disaster regions.

The disaster recovery budget is funded through an increase in residential taxes that local governments levy on their residents.

The basic policy of disaster recovery also calls for the use of funds allocated for recovery efforts to finance measures to prevent manufacturers affected by the March 2011 disasters from moving out of Japan.

By fiscal 2012, the government had allocated approximately 1 trillion yen to cover nationwide disaster prevention expenses. The ministries and agencies concerned demanded that some 940 billion yen be earmarked from the fiscal 2013 state budget for such projects. Therefore, the total amount is viewed as certain to surpass the 1 trillion yen that the government had initially planned.

State Minister for Recovery Hirano as well as Finance Minister Koriki Jojima said they will consider closely reviewing allocations of funds for disaster-prevention measures implemented outside disaster areas.

"I think the use of funds raised through a tax hike for such purposes is questionable," Hirano told a news conference on Sept. 19.

"We'll strictly limit projects to be covered by such funds as we compile the next fiscal year's budget," Jojima told a news conference on Oct. 1 shortly after being appointed to his post.

Decide in advance what people should say

October 5, 2012

Fukushima Prefecture prepared proceedings for nuke radiation meeting

<http://mainichi.jp/english/english/newsselect/news/20121005p2a00m0na015000c.html>

FUKUSHIMA -- The Fukushima Prefectural Government drew up proceedings for a health research panel prior to a formal July 2011 meeting on nuclear radiation, **deciding in advance what members should say**, the Mainichi has learned.

The drafted proceedings included concluding remarks about the results of the research on the health of Fukushima Prefecture residents and asked study panel members not to indulge in questions and answers about reproduced data from the System for Prediction of Environmental Emergency Dose Information (SPEEDI). The system was used to predict the spread of radioactive materials following the disaster at the crippled Fukushima No. 1 Nuclear Power Plant.

When contacted by the Mainichi Shimbun about the choreographed proceedings, a prefectural government official in charge said the Fukushima government "may have produced" a chart of proceedings but declined to make further comment.

Only recently it emerged that the study panel held secret preparatory sessions to compare and adjust opinions about the results of the research, and rehearsed proceedings before a formal meeting in July last year.

During a prefectural assembly session on Sept. 3, Fukushima Vice Gov. Fumio Murata denied that the prefectural government had prearranged the proceedings. But the prepared chart mentioned the need to make arrangements with a particular scholar, whose real name was disclosed.

In its investigations, the Mainichi confirmed that a chart of proceedings had been created for the third meeting of the study panel on health management research. According to sources familiar with the proceedings, prefectural government officials in charge of health and welfare prepared the chart and distributed copies of it to panel members on July 23, 2011, a day before the formal meeting. Members were later found to have held a secret meeting on July 17.

The chart of proceedings runs two pages and lists the content and progress of deliberations. One of the items in the chart referred to test results of whole body counters and urine tests, and ended with the prearranged conclusion that internal exposure to cesium 134 and cesium 137 was less than 1 millisievert in total and extremely low, and that such exposure among residents of other regions was believed to be far lower.

As for progress in the research, the chart referred to SPEEDI, which was not effectively used by the central and prefectural governments. It urged panel members not to delve into questions and answers about SPEEDI's reproduced data due to the possibility that the SPEEDI issue alone might draw attention. If

that happened, the chart says, members were advised to tell the meeting that the issue would be discussed by the dose assessment committee after checking in advance with a scholar on the panel.

Fukushima Prefecture says the third meeting was open to the public for the first time and proceeded in accordance with the chart. A prefectural government official said the chart may have been prepared for the panel chairman, Shunichi Yamashita, vice president of Fukushima Medical University.

Former Miyagi Gov. Shiro Asano, now professor of Keio University's Shonan Fujisawa Campus, says the the prearranged proceedings probably reflected the local administration's emphasis on scheduling, but added that getting caught up in high-profile issues ended up undermining prefectural residents' trust. He said that even if there was confusion during the panel's meeting due to the absence of a scenario, people could have evaluated the meeting highly, saying it was not staged.

"What is required foremost over the handling of the nuclear accident is a sense of trust," he said, adding the Fukushima Prefectural Government lacked that and should start all over again by giving top priority to winning the trust of prefectural residents.

One way of wasting public money

October 5, 2012

250 million yen wasted on doubled real-estate fees for evacuee housing

<http://mainichi.jp/english/english/newsselect/news/20121005p2a00m0na012000c.html>

Municipalities wasted some 250 million yen of taxpayers' money by doubly paying real-estate agents introduction fees for evacuee housing in Iwate, Miyagi and Fukushima prefectures, a probe by the Board of Audit of Japan has found.

The board uncovered the double payments across some 10,000 contracts in the three prefectures, which were hit hardest by the March 2011 earthquake and tsunami disaster and ensuing nuclear crisis. As of Oct. 1, there were 73,675 government-rented apartments offered around the country for evacuees.

The Board of Audit, which reported its findings to the Diet on Oct. 4, says the problem is that the Disaster Relief Act is out of touch with reality.

The board said a notice on the act released by the Ministry of Welfare in 1947 stated that "relief should be given in the form of materials, and cash should only be handed out when it has to be." This prevents disaster evacuees who rent their own apartments from receiving money to cover the rent, so municipalities rent apartments for evacuees instead.

In April last year, the Ministry of Health, Labor and Welfare (MHLW) decided that when municipalities rent apartments where disaster evacuees are already living, they will cover the evacuees' payments for rent and contract fees up until then. This resulted in municipalities paying both their own fees for making the contracts and the fees of the evacuees.

The Board of Audit examined payments in seven prefectures and discovered many instances of double payments. According to sources, there were around 5,000 cases in Miyagi Prefecture, around 4,500 in Fukushima Prefecture, and a few hundred in Iwate Prefecture. In all three prefectures the introduction fees were equivalent to half a month's rent, and for an individual contract the fee was around 25,000 yen.

The MHLW has released a notice asking municipalities not to make double payments, but one municipality official says, "In contractual procedures with real-estate agents, we have no option but make the double payments."

The Board of Audit views the principal of giving assistance in the form of materials rather than cash as the problem, and in its report it concluded, "It is necessary to include a loosening of this principal in future considerations."

A MHLW representative commented, "We will issue calls against double payments, but at this time we are not planning a review of the principal of giving assistance in material form."

In addition to double payments, the Board of Audit's investigation found that municipalities had fallen behind on rent payments in some cases, and that there had been delays in evacuees entering the apartments. These problems occurred because local municipalities were overburdened, causing delays across the board. A Board of Audit official says, "Financial rent assistance (for evacuees), which is a simpler process, should be considered."

However, a MHLW representative noted, "There are people including elderly residents who can't find housing on their own. To provide sound relief to disaster victims, it is important to give housing, not money, which may be spent on things besides rent."

A Hyogo Prefectural government employee who experienced the 1995 Great Hanshin Earthquake says, "Considering the administrative abilities of local governments, I think that financial assistance for self-

rented apartments would be better, but there are pros and cons for both approaches, and there is no right answer."

Gov't to keep an eye on recovery budget

Gov. to review use of reconstruction budget

http://www3.nhk.or.jp/daily/english/20121007_08.html

Japanese officials plan to review whether the special budget is being used appropriately for the reconstruction of areas hit by an earthquake and tsunami in March last year.

The government plans to allocate at least 19 trillion yen, or 240 billion dollars, for reconstruction projects.

The government will finance the budget by issuing bonds and raise taxes to redeem them.

But there are reports that part of the budget is being used for unrelated projects.

Reconstruction Minister Tatsuo Hirano told reporters that he has instructed the Finance Ministry to review several projects to be financed by the budget.

Officials will examine a 29-million-dollar expense for measures to counter anti-whaling activists in the Antarctic Ocean.

They will also review a 53-million-dollar expense to build nuclear-fusion research centers in Aomori and Ibaraki prefectures

Japan shares lessons on disaster preparedness

October 8, 2012

Japan ready to share 3/11 disaster lessons

World to gather in Sendai for meeting on risk management

<http://www.japantimes.co.jp/text/nn20121008x3.html>

Kyodo

When a two-day international conference on disasters and development opens Tuesday in the disaster-hit city of Sendai, Japan will have its moment to shine — relating to the world how it survived last year's catastrophic earthquake and tsunami and sharing lessons about disaster preparedness.

Global leaders, disaster experts and survivors will gather in Sendai for the "Sendai Dialogue," a meeting hosted by the government and the World Bank to focus on ways to reduce the economic impact of natural disasters.

It will draw lessons from the March 11, 2011, earthquake and tsunami that devastated vast areas of the Tohoku region, especially in Iwate, Fukushima and Miyagi prefectures.

The dialogue, part of the annual meetings of the International Monetary Fund and World Bank, which also begin Tuesday, will be attended by finance and development ministers as well as top officials from international institutions including World Bank President Jim Yong Kim and IMF Managing Director Christine Lagarde.

Delegates are scheduled to visit sites in the disaster-stricken areas, including an elementary school that was one of the few buildings in Sendai's Arahama coastal district to remain standing after the tsunami.

With devastation by natural disasters a shared reality for developed and developing nations, the Sendai meeting aims to create a global consensus on how to prepare better for disasters and learn from Japan's multiple disasters last year, organizers said.

The Sendai Dialogue will open with a plenary session in which Japan's experiences will be conveyed through speeches by Sendai Mayor Emiko Okuyama and reconstruction minister Tatsuo Hirano as well as stories told by high school students who survived the disasters.

Japanese delegates are expected to stress the need to both enforce disaster prevention measures and pursue urban development for disaster-resilient infrastructure, while discussions will also focus on challenges facing developing nations when drawing up disaster prevention measures, the organizers said.

Finance Minister Koriki Jojima, who says the meeting will be a good chance for Japan to demonstrate how it has recovered from the disasters, will attend a high-level session Wednesday and call for disaster risk management to become a priority in the global development agenda.

Delegates aim to wrap up the meeting with an agreement to boost disaster preparedness and mitigate related economic risks.

The earthquake and ensuing tsunami left about 20,000 people dead or unaccounted for, with damage estimated at about ¥16.9 trillion, far larger than the 1995 Great Hanshin Earthquake in the Kobe area.

Studies after the disasters have shown that Japan's recovery was faster than expected thanks to its disaster risk management.

Developing countries, however, lack the funds and expertise to reduce the economic consequences of natural disasters, which may become more frequent and costly with rapid urbanization and climate change.

U.N. data show that more than 200 million people are affected by natural hazards every year and annual economic losses exceed \$200 billion. Some disaster experts say investing in disaster resilience instead of disaster response systems is more beneficial and cost-effective.

On the sidelines of the dialogue, prominent figures from various fields such as business and the arts from both Japan and overseas are set to meet Wednesday to share stories about resilience and hope in the face of disasters. Among them will be Sendai-born pianist Michie Koyama.

Create more resilient societies

October 11, 2012

Intl disaster meet wraps up in Sendai

<http://www.yomiuri.co.jp/dy/national/T121010003486.htm>

SENDAI (Jiji Press)--Policymakers and experts from around the world agreed Wednesday on the need to create societies that are more resilient to disasters as they wrapped up their two-day special meeting here on disaster reduction and prevention.

The conference, dubbed the Sendai Dialogue and cohosted by Japan and the World Bank Group, "will further strengthen the global commitment for managing disaster risks for resilient growth and development," Finance Minister Koriki Jojima and World Bank President Jim Yong Kim said in a joint statement.

About 320 delegates from 40 countries and eight international organizations attended the meeting in Sendai.

Ahead of the meeting, which started Tuesday, participants including IMF Managing Director Christine Lagarde visited areas hit hard by the March 11, 2011, earthquake and tsunami.

In the closing session, Lagarde described Japan's postdisaster recovery as showing "incredible resilience." The outcome of the Sendai Dialogue will be reported to an IMF-World Bank Development Committee meeting scheduled for Saturday in Tokyo.

October 10, 2012

Japan, World Bank meeting on disaster risk management opens in Sendai

<http://www.japantimes.co.jp/text/nn20121010b5.html>

Kyodo

SENDAI — Global leaders and disaster experts gathered Tuesday in Sendai for an international conference hosted by Japan and the World Bank on disasters and development, with reconstruction minister Tatsuo Hirano vowing to do more to create disaster-resilient communities.

At the two-day Sendai Dialogue, about 320 delegates from 40 countries, including disaster survivors, will share lessons from the March 11, 2011, earthquake and tsunami that devastated vast areas of the

northeast — especially the prefectures of Iwate, Fukushima and Miyagi — and map out steps to limit the economic impact of natural disasters.

Mayor Emiko Okuyama of Sendai, the capital of Miyagi, said in her opening remarks that about a year and half after the disaster the city continues to "make rapid progress toward reconstruction and revitalization."

Still, Okuyama, delivering her address in English, said the city's "biggest challenge" lies in how to move ahead with reconstruction.

The earthquake and tsunami set off the nuclear crisis at the Fukushima No. 1 power plant. Quake-related damage has been estimated at about ¥16.9 trillion.

Participants in the Sendai Dialogue, which is part of the annual meetings of the International Monetary Fund and World Bank in Tokyo this week, include World Bank President Jim Yong Kim, IMF Managing Director Christine Lagarde, Finance Minister Koriki Jojima and his counterparts from other countries, including Colombia and Thailand.

Some of the delegates are scheduled to visit sites in the disaster areas, including an elementary school that was one of the few buildings in Sendai's Arahama coastal district to remain standing after the tsunami.

In his keynote speech, reconstruction minister Hirano stressed the government's role in strengthening measures to help disaster-hit communities recover. "Our country . . . the disaster-affected communities will certainly bounce back," he said.

He added he hopes Japan, through steps it has taken and will take, can contribute to global efforts toward disaster mitigation.

Representing disaster survivors, two female high school students from Sendai, Rina Iwamoto and Risa Shibahara, recounted how they survived the disaster with the help of local communities.

Jojima will attend a high-level session Wednesday, joined by Kim and Lagarde, to highlight the need to make disaster risk management a priority in the global development agenda, before delegates wrap up the meeting with an agreement to boost disaster preparedness to mitigate related economic risks.

On Tuesday, delegates shared what Japan had learned from a joint study with the World Bank about the benefits of its disaster prevention measures, such as reinforced buildings, early warning systems and education, and the challenges it continues to face in rebuilding the disaster zone.

On the sidelines of the dialogue, prominent figures from business, the arts, politics and science will gather Wednesday to share stories about resilience in the face of disasters.

U.N. data show that more than 200 million people are affected by natural hazards every year and annual economic losses come to around \$200 billion. Experts say investing in disaster resilience is more beneficial and cost-effective than merely focusing on disaster response financing.

Global leaders eye better disaster preparedness in Sendai meeting

Missing minutes of meetings

October 9, 2012

Fukushima gov't hastily compiled minutes of experts' meetings over health survey

<http://mainichi.jp/english/english/newsselect/news/20121009p2a00m0na017000c.html>

FUKUSHIMA -- The prefectural government here hastily compiled the minutes of meetings by experts on a survey on the nuclear crisis' impact on local residents' health and released the details only after being asked by a local resident to disclose such documents, it has been learned.

A Fukushima Prefectural Government official reportedly compiled the minutes based on his notes but the number of pages is less than half that for later sessions.

A critic has pointed out that the act has damaged the confidence in official documents.

"Under the freedom of information system, government organizations are supposed to disclose documents that they created if requested to do so. If such bodies are allowed to compile documents after being asked to disclose them, they could create documents to their own advantage," said Yukiko Miki,

leader of a nonprofit organization working on the disclosure of government information. "Such an act could damage the public's confidence in disclosed public information. It's even worse than the national government's failure to compile minutes on meetings on the Great East Japan Earthquake."

An official with the prefectural government's health and welfare department, who compiled the minutes, said he was too busy when the first to third meetings were held to note the details. "The first three meetings were in chaos. I knew I would have to compile the minutes but later forgot to do so. I was worried because the national government's failure to compile such minutes was called into question."

The official of the health and welfare department, which serves as the secretariat of the panel, compiled the minutes of the fourth session of the experts' panel on Oct. 17 last year and for later meetings of the panel, and posted them on the prefectural government's website.

In early April this year, a man living in the Fukushima Prefecture city of Koriyama noticed that the minutes of the first to third sessions had not been uploaded to the website, and asked for access to the documents under the prefectural government's freedom of information ordinance.

However, the minutes of the first three sessions had not been compiled by that time.

The official in charge hastily compiled the minutes of these sessions based on his notes and showed them to the man in mid-April before uploading them to the prefectural government's website. At the time, the national government was under fire for failing to compile the minutes of meetings on the March 2011 Great East Japan Earthquake.

Each of these minutes consists of less than 10 pages, less than half those of the fourth and later sessions, each of which is about 20 to 30 pages.

The prefectural government is now investigating allegations that the prefectural government held secret "preparatory" meetings to coordinate views among panel members prior to its official meetings, and is expected to announce the results shortly.

First meeting of TEPCO's reform committee

October 13, 2012

TEPCO convenes N-reform panel

The Yomiuri Shimbun

<http://www.yomiuri.co.jp/dy/national/T121012003513.htm>

Tokyo Electric Power Co.'s nuclear reform committee, a third-party group tasked with reexamining the causes of the disaster at the Fukushima No. 1 nuclear power plant and proposing safety measures, held its first meeting Friday at the company's head office in Chiyoda Ward, Tokyo.

Dale Klein, former chairman of the U.S. Nuclear Regulatory Commission, is chairing the Nuclear Reform Monitoring Committee formed by the struggling utility.

At the meeting, Klein said that since nuclear power will continue to play a role in the world's energy supply, TEPCO needs to implement drastic reforms.

TEPCO aims to compile a reform plan for its nuclear energy division, which was responsible for exacerbating the situation during the Fukushima accident, by the end of the year.

At the meeting, a TEPCO official said the reforms would not be limited in subject or scope.

The committee's five members also include Barbara Judge, former chair of Britain's Atomic Energy Authority, and Kenichi Ohmae, a business consultant who previously worked as a nuclear engineer at Hitachi Ltd.

The committee is to propose safety measures for nuclear power plants and will monitor whether the plan is properly implemented.

It is rare for a nuclear energy division at a power company, a type of business usually seen as quite insular, to reflect the opinions of outsiders in its operations.

TEPCO hopes the reform plan will allow it to resume operations at its Kashiwazaki-Kariwa nuclear plant in Niigata Prefecture, which the company sees as key to its rehabilitation.

(Oct. 13, 2012)

Former US NRC chairman urges TEPCO reform

http://www3.nhk.or.jp/daily/english/20121013_08.html

Former chairman of the US Nuclear Regulatory Commission Dale Klein says Tokyo Electric Power Company will not be able to sustain itself without reforming its management. The operator of the troubled Fukushima Daiichi nuclear power plant has come under criticism since the accident in March of last year.

Klein spoke to NHK on Friday after the first meeting of a panel of outside experts set up by TEPCO to improve nuclear safety and corporate management. Klein is the head of the 5-member panel.

Klein said prior to the accident, TEPCO had become overly confident and did not question the safety of its nuclear plants. He said the company was apparently underestimating the power of nature.

Klein said the new third-party panel is proof that TEPCO recognizes the need for reform. He said management acknowledges that the company cannot continue without reform. He urged all employees to share that awareness.

At Friday's meeting, TEPCO presented to the panel a basic reform plan drafted by an in-house team. It admitted for the first time that it failed to take stronger measures to protect the Fukushima Daiichi plant from tsunami. The utility said it will carry out reform with no sanctuaries.

Prior to the meeting, Klein visited the Fukushima Daiichi plant and checked mainly the Number 4 reactor, which is feared to develop problems in the event of another earthquake.

Klein said based on his observation of the reactor's fuel pool and available information, he thinks the building is safe and can withstand quakes.

Klein said widespread uncertainty about the pool among the Japanese public was caused by early misinformation that it had no water inside.

He said once incorrect information is out, it makes it difficult for a company to establish confidence even when the information is later proven to be wrong.

Klein added that TEPCO should undergo investigation by an external body, such as the International Atomic Energy Agency.

Fukushima disaster could have been avoided

October 13, 2012

Utility feared vital safety steps would hurt image

Tepco finally admits crisis was avoidable

AP

<http://www.japantimes.co.jp/text/nn20121013x1.html>

Tokyo Electric Power Co. has acknowledged for the first time that the nuclear disaster at the Fukushima No. 1 power plant could have been avoided.

In a statement Friday, Tepco's internal reform task force said the utility was aware safety improvements were necessary before last year's tsunami resulted in three catastrophic core meltdowns at the facility, but failed to act because it feared the political, economic and legal consequences of implementing additional measures.

"Looking back on the accident, the problem was that preparations were not made in advance," the task force, led by Tepco President Naomi Hirose, said in the statement.

"Could necessary measures have been taken with previous tsunami evaluations? It was possible to take action" by adopting more extensive safety measures, the task force concluded.

But Tepco feared efforts to better protect its nuclear facilities from major natural disasters would trigger antinuclear sentiment, interfere with operations and increase litigation risks, according to the task force.

The utility said it could have mitigated the impact of the meltdowns if it had diversified power and cooling systems by paying closer heed to international standards and recommendations.

Tepco also should have provided training for its employees on practical crisis-management skills, rather than conducting obligatory drills as a mere formality, the task force added.

The admissions mark a major reversal for Tepco, which had defended its preparedness and crisis management since the March 2011 earthquake and tsunami knocked out power to the Fukushima No. 1 plant, leading to the triple meltdowns, massive evacuations and decontamination work that will take decades to complete.

The statement was released after Tepco's Nuclear Reform Monitoring Committee, headed by former U.S. nuclear regulatory chief Dale Klein, held its inaugural meeting Friday. The five-member committee monitors the task force's reform plans.

"It's very important for Tepco to recognize the need to reform and the committee is very anxious to facilitate the reforms necessary for Tepco to become a world-class company," Klein told a news conference Friday. "The committee's goal is to ensure that Tepco develops practices and procedures so an accident like (the Fukushima meltdowns) will never happen again."

The reform plans aim to use the lessons learned at Tepco's Kashiwazaki-Kariwa nuclear plant in Niigata Prefecture. The cash-strapped utility wants to restart the facility's seven reactors, but officials at the utility denied the plans are aimed at improving its public image to gain support for the plant's reactivation.

"The reforms are intended to improve our safety culture, and we have no intention to link it to the possibility of resuming operations at the (Kashiwazaki-Kariwa) plant," said Takafumi Anegawa, Tepco's official in charge of nuclear asset management. "We don't have any preconditions for our reforms."

The Fukushima No. 1 plant has been stabilized to a considerable extent, but is still running on makeshift equipment as workers continue preparations to decommission the four wrecked reactors, a process expected to take as long as four decades.

Additional safety measures have been installed at nuclear power stations nationwide since the Fukushima crisis under government instructions, including bolstering seawalls, adding backup power and coolant water sources, and enhancing crisis-management training. But plant operators will be required to take further steps as the Nuclear Regulation Authority, the new watchdog launched in September, ups safety requirements.

Investigative reports compiled by the government and Diet panels said collusion between Tepco and government regulators allowed lax supervision and allowed the utility to continue lagging in safety measures.

Tepco's Anegawa said the task force plans to compile recommendations by the end of the year "that would have saved us from the accident, if we were able to turn back the clock."

TEPCO admits fault in Fukushima nuclear disaster

<http://mainichi.jp/english/english/newsselect/news/20121013p2a00m0na007000c.html>

Tokyo Electric Power Co. (TEPCO) has for the first time admitted it failed to take adequate measures to prevent the disaster at its Fukushima No. 1 nuclear plant.

The statement marks a major turnaround from TEPCO's previous insistence that the meltdowns were the result of "unforeseeable tsunami."

"If we had taken measures based on previous tsunami evaluations and adopted sufficient countermeasures against severe accidents, (the nuclear disaster) could have been handled," TEPCO stated on Oct. 12.

The statement is a stark contrast to an in-house accident investigation report compiled in June, which made the "unforeseeable tsunami" claim and sparked harsh accusations against the utility of base self-justification.

Also on Oct. 12, TEPCO held the first meeting of an expert panel to its executive board, called the Nuclear Reform Monitoring Committee. The firm's new mea culpa was incorporated into a draft presented by the firm's Nuclear Reform Special Task Force. The task force is designed to map out detailed reform plans for the utility's nuclear energy department, under the supervision of the Nuclear Reform Monitoring Committee.

The draft pointed out that the nuclear disaster could have been dealt with if the company had taken into consideration the possibility of tsunami beyond expectations, and that the utility could have diversified its safety equipment in reference to severe accident measures adopted overseas.

"You can take this as our company's view," said Takafumi Anegawa, chief of the secretariat of the task force and general manager of TEPCO's Nuclear Asset Management Department. His remarks affirmed that the latest views conflict with those of the in-house investigation panel, but Anegawa stopped short of explaining the reasons for the discrepancy in detail.

Dale Klein, former chairman of the Nuclear Regulatory Commission (NRC) in the United States and who now chairs TEPCO's Nuclear Reform Monitoring Committee, stressed the need to drastically reform TEPCO in order to continue to use nuclear power as an energy source. The committee is tasked with screening reform proposals made by the Nuclear Reform Special Task Force and supervising its progress.

October 12, 2012

TEPCO admits to insufficient tsunami measures

http://www3.nhk.or.jp/daily/english/20121012_29.html

Tokyo Electric Power Company has admitted for the first time that its measures to protect the Fukushima Daiichi nuclear power plant from tsunamis were insufficient.

The company acknowledged its failure at the first meeting of an independent panel on Friday.

The 5-member panel, headed by former chairman of the US Nuclear Regulatory Commission Dale Klein, aims to help the utility reform its management. The firm has been the focus of criticism since the nuclear disaster in March last year.

The firm presented to the panel a reform plan drafted by an in-house team. It said the utility was able to take necessary steps to prepare for tsunamis before the accident, and should have had more effective organization and held practical disaster prevention drills.

The team said TEPCO should address issues pointed out by the government and Diet investigative panels, and carry out reforms without exceptions.

The plan is an about-face from the utility's final report on its probe into the accident, released in June.

The report said the firm was not fully prepared for a nuclear disaster, but defended its decisions and responses after the Fukushima Daiichi accident. The government and Diet investigative panels severely criticized the report.

Team member Takafumi Anegawa says the company's stance on the accident has changed. He adds that TEPCO will not win public understanding by saying the company did all it could but failed to prevent the accident.

What sort of a safety system is that?

October 12, 2012

J-Alert emergency warning system not functioning at 40 percent of municipalities

<http://mainichi.jp/english/english/newsselect/news/20121012p2a00m0na001000c.html>

Although 99 percent of 1,742 cities, towns and villages, including Tokyo's 23 wards, across the country have hooked up with the nationwide J-Alert emergency warning system, only 998 of them, or less than 60 percent, are capable of broadcasting emergency information through automatic activation of community wireless systems, a survey by the Board of Audit shows.

The survey reveals that the automatic broadcasting system does not activate in 569 municipalities even during an emergency because the locations either do not have a community wireless system, or have fallen behind in digitalizing the wireless system or have heeded complaints from residents about the midnight wails of sirens.

The Board of Audit compiled a report stressing the need to implement a system that properly notifies residents of emergency information and submitted it to the Diet on Oct. 11.

Developed by the Fire and Disaster Management Agency, the J-Alert system is operated by local governments. The Board of Audit's survey, excluding 14 cities, towns and villages in Iwate, Miyagi and Fukushima prefectures hardest hit by the March 11, 2011 Great East Japan Earthquake and tsunami and subsequent nuclear disaster, shows that 1,719 of 1,728 municipalities are equipped with the J-Alert system.

The system can automatically activate community wireless systems via a communications satellite, but 478 local governments have not installed automatic activation gear. Meanwhile 294 of them do not have a wireless system or their wireless systems are analog and cannot respond to digitalized information because of a price tag of 200 million yen to 300 million yen to modernize the system.

A total of 91 cities, towns and villages have refrained from utilizing the J-Alert system even after installing the automatic activation system because of complaints about the incessant drone of sirens from residents and a series of false alarms after the disasters. The Board of Audit survey also shows that 152 local governments can broadcast to only certain sections of their municipalities because of delayed coordination after mergers.

Shocking misappropriation of disaster funds

October 12, 2012

Editorial: Gov't must move fast to ensure disaster recovery cash flows to areas in need

<http://mainichi.jp/english/english/perspectives/news/20121012p2a00m0na002000c.html>

Revelations that large portions of the national budget allocated to recovery from last year's Great East Japan Earthquake, tsunami and ongoing nuclear disaster have been funneled to non-disaster areas has caused wide repercussions. The opposition bloc sought to hold a meeting of a House of Representatives Audit and Oversight of Administration Committee subcommittee to get to the bottom of the matter, but it was called off when members of the ruling Democratic Party of Japan (DPJ) failed to show up.

It is disgraceful that not only have funds been effectively misappropriated for purposes that are not necessary related to post-quake reconstruction, but that the government's response has been so passive once the facts emerged. Prime Minister Yoshihiko Noda's attitude toward the issue is too lax, and we demand that the government address the issue promptly, including conducting a fundamental review of the reconstruction budget.

The party that once led investigations into "vanished pensions" and other money issues seems to be no longer. In spite of questions being raised about how taxes are spent, the DPJ will not agree to a deliberation in the Diet, which is in recess. It is a sign that the party has begun to put its guard up.

Examples of the questionable use of the reconstruction budget continue to emerge. According to reports, a total of 12 billion yen was spent on seismic renovations of government agency facilities. Did it not occur to the Ministry of Land, Infrastructure, Transport and Tourism or the Ministry of Finance to demand that priority be placed on seismic

renovations of local government facilities in disaster areas, since the funds were set aside for reconstruction? Whatever happened to a sense of responsibility among those in government service?

Reconstruction Minister Tatsuo Hirano has requested the Finance Ministry to conduct a fact-finding survey, and the Government Revitalization Unit of the Cabinet Office has launched its own investigation. However, it's already been one month since the airing of public broadcaster NHK's special program that first uncovered the questionable spending, and over two weeks since we demanded that the issue be

resolved. Perhaps the reason the government has been so slow to respond is because the prime minister has not shown a willingness to lead the way.

Among the examples of spending that have come under fire, there are cases that do not deserve criticism. The first task is to comb through all spending so far, and sort it into that which was truly related to reconstruction efforts and that which wasn't. Some cases may call for a halt to budget implementation.

Once that sorting process is completed, the approximately 1.2 trillion yen of the "national disaster countermeasures" budget not under the jurisdiction of the Reconstruction Ministry should be split off from the approximately 4.5 trillion yen in the fiscal 2013 special budget request for reconstruction. Without such drastic moves, reconstruction funding will end up in non-disaster areas. Such a situation will not appease taxpayers, now burdened with a 25-year tax increase to fund the reconstruction efforts.

Some in the opposition bloc see this as a prime opportunity to attack the current administration. However, the basic policy laid out by the government last year was worded in such a way that allowed for the possibility of allocating reconstruction funds to non-disaster areas. Plus, it's unlikely that the use of past budgets was ever pursued so fervently in the Diet.

We are now at a point where the opposition should actively let the government know what it should do. Our first priority should be to correct the government's past errors so that necessary and sufficient reconstruction funding is delivered to areas struck by last year's triple disasters.

Careful with that money!

October 15, 2012

Gov't urged not to use quake reconstruction budgets for other areas

<http://mainichi.jp/english/english/newsselect/news/20121015p2a00m0na015000c.html>

The government should hammer out a clear-cut policy not to direct budgets for the reconstruction of areas affected by the Great East Japan Earthquake and tsunami for other purposes, Democratic Party of Japan (DPJ) Policy Research Committee Chair Goshi Hosono stated over the weekend.

Hosono made the remarks during a Fuji TV program on Oct. 14, following a string of revelations that massive amounts of "reconstruction budgets" have been diverted to measures unrelated to disaster recovery efforts, drawing fire from the public.

"The government should set out a clear direction that reconstruction budgets would not be used in areas other than those hit by the quake disaster," Hosono said.

"The government had initially proposed the law with the idea of limiting the budgets' use to disaster-affected areas, but it was later decided that the budgets be authorized for all of Japan based on the opinions of the Liberal Democratic Party. I believe the idea was not mistaken as a whole," he said.

"Areas outside the disaster-hit zone are settling down, so it is fine to change the course (of the budgets)," he added.

Regarding the DPJ's nuclear energy policy to be incorporated into the ruling party's manifesto for the next House of Representatives election, Hosono said, "The government and the DPJ have laid out a policy to inject all necessary resources into a goal of zero nuclear reactors in operation by the 2030s, and the policy will be clearly stipulated in the manifesto."

Funds allocated to suicide prevention projects from quake reconstruction budgets

<http://mainichi.jp/english/english/newsselect/news/20121015p2a00m0na014000c.html>

Over 3 billion yen has been allocated to nationwide suicide prevention projects out of reconstruction budgets set aside for areas devastated by the Great East Japan Earthquake and tsunami, it has been learned.

The revelation is the latest in a series of much-criticized diversions of budgets for quake reconstruction to projects that have little or no connection to disaster recovery efforts.

According to the finding, the Cabinet Office has granted 3.7 billion yen to suicide prevention projects nationwide as part of the third supplementary budget for fiscal 2011 and demanded another 3 billion yen in the fiscal 2013 budget -- out of budgets for "nationwide disaster prevention measures," which are part of the reconstruction budgets. The nationwide disaster prevention budgets are intended for use in preparation for potentially imminent major disasters, such as a quake hitting Tokyo or a temblor occurring in the Nankai Trough in the seabed off central to western Japan.

An official of the Office for Policy of Suicide Prevention of the Cabinet Office defended the budgetary measures, saying, "Suicide prevention projects constitute disaster prevention in that they are meant to prevent psychological damage emanating from the quake disaster."

The suicide prevention projects, called "regional suicide prevention emergency stepped-up measures," are intended to support projects such as suicide hotlines operated by municipal governments and counselor training -- through prefectural governments across the country.

The projects have heretofore been funded by general accounts since fiscal 2009. At a press conference on Oct. 12, Minister of State for Disaster Management Mikio Shimoji said, "In light of the urgency, I wonder if it's right to demand budgets for suicide prevention projects from the nationwide disaster prevention budgets, while the Cabinet Office has demanded general account budgets since before the quake disaster," suggesting that the Cabinet Office's budget demand for the next fiscal year is likely to be reviewed.

The Cabinet Office has earlier defined expenditure prerequisites for nationwide disaster prevention budgets as projects that have immediate effects, taking into consideration that reconstruction budgets are funded by tax hikes for disaster recovery efforts.

A representative of the Office for Policy of Suicide Prevention said, "The number of suicides increased on the heels of the Great East Japan Earthquake. The suicide prevention budgets are also intended to prevent suicides in case a major quake hits the Nankai Trough area and from other quakes, but it may be a bit hard to understand."

The nationwide disaster prevention budgets were created with the aim of preparing for mega disasters, taking heed to the lessons left by the Great East Japan Earthquake and tsunami. However, the idea of funding future disaster prevention measures from reconstruction budgets for a past disaster is hard to understand for the public. A spate of revelations that reconstruction budgets have been diverted to projects that are not highly urgent or effective have also raised questions.

"I think some twists are needed, such as separating nationwide disaster prevention budgets from reconstruction budgets," said Minister of Land, Infrastructure, Transport and Tourism Yuichiro Hata.

Out of the approximately 19 trillion yen set aside as reconstruction budgets, some 1 trillion yen is expected to be earmarked for nationwide disaster prevention budgets. In December last year, the Cabinet Office cited possible future disasters subjected to the nationwide disaster prevention budgets. They included major aftershocks of the Great East Japan Earthquake, a Nankai Trough tremor, a quake directly hitting the Tokyo area, and a tremor around the Japan Trench and Chishima Trench.

The ministries and agencies have allocated the nationwide disaster prevention budgets to projects in areas outside the disaster-hit zone as well, such as work on national roads in Okinawa Prefecture and anti-quake and anti-tsunami measures at government buildings. By fiscal 2012, some 1 trillion yen has been earmarked for those purposes, and another 940 billion yen in budgets is demanded for fiscal 2013. Criticism has been mounting over delayed budget implementations for disaster-affected areas.

Financially-strapped coastal prefectures, where potential damage from the Nankai Trough quake is projected, have demanded an increase in nationwide disaster prevention budgets. A representative of the Wakayama Prefectural Government criticized the central government, saying, "We have been taking only direct measures, such as setting up evacuation routes, as part of projects covered by the nationwide disaster prevention budgets. I wonder why they budget for projects that have nothing to do with disaster prevention."

"Write articles that make good use of voices that are being suppressed"

Editorial: Newspapers should deepen coverage of quake, tsunami and nuclear crisis

<http://mainichi.jp/english/english/perspectives/news/20121015p2a00m0na005000c.html>

One year and seven months have passed since the Great East Japan Earthquake, tsunami and ensuing nuclear crisis occurred on March 11, 2011. Since the outbreak of the triple disasters, newspapers and other media outlets have been called into question over how they should face the serious damage caused by the temblor and tsunami as well as the nuclear disaster and what they should convey to their readers and viewers.

Newspaper publishers should take the opportunity of Newspaper Week that began on Oct. 15 to consider how to deepen their coverage of the triple disasters.

Many questions have been raised over disaster countermeasures as recovery work progresses in disaster-hit areas. One of these questions is how funds allocated for disaster recovery efforts have been used. Reporters have patiently covered the situation of disaster-ravaged areas and checked whether the government's response to the situation is appropriate. They have also tried to deeply examine important challenges to the restoration of disaster areas. These are important roles that newspapers should carry out.

In particular, newspapers should continue to pay close attention to the situation in Fukushima Prefecture where the serious nuclear crisis has been prolonged.

The government has declared that the tsunami-stricken Fukushima No. 1 Nuclear Power Plant has been brought under control on the grounds that it has been brought to a stable condition called a "cold shutdown." Still, photos of the inside of one of its nuclear reactor containment vessels, which were taken recently, show that it was filled with steam.

Radiation levels inside the containment vessels remain high and the amount of water contaminated with radioactive substances has kept increasing at the power plant. There are no prospects that the crippled power station can be decommissioned and dismantled in the foreseeable future.

The situation concerning Fukushima residents' daily lives remains serious. The government has begun re-designating evacuation zones but its efforts to build infrastructure in affected areas has been delayed. Many residents' lives have drastically changed since the March 11, 2011, disasters.

Discussions were held on how journalism should cover the nuclear disaster during a national meeting of the deliberative panel on news media's ethics last month. Jun Sakuma, city news editor with the local newspaper Fukushima Minpo, reported the worries of residents near the power plant.

He pointed out there are differences in views on radiation contamination even within a family, and that there are residents of the same area who have evacuated to other areas and others who remained in their neighborhoods, while different areas in the same municipality have been designated as different evacuation zones.

"There is division in many communities in the disaster-hit area. We sometimes wonder whether we can help local residents by describing their differences in our articles," Sakuma told the meeting, highlighting the viewpoint of the local newspaper that is particularly close to local residents. The regional daily received this year's Japan Newspaper Publishers & Editors Association Award for its coverage of the nuclear disaster because its coverage "exposed problems involving the disaster from various perspectives and verified the numerous aspects that have been behind the disaster and whether the countermeasures have been appropriate."

During discussions at the national meeting of the ethics panel, a reporter of another local daily warned that it would be inappropriate if the nuclear crisis was simply bracketed as the "Fukushima problem" and treated merely as a local issue. We must take his opinion seriously.

In May, the Mainichi Shimbun exposed that secret meetings were held between pro-nuclear experts and power company and government officials on the promotion of the nuclear fuel cycle project -- in which plutonium is extracted from spent nuclear fuel and used for fast-breeder reactors. Its reports revealed through journalists' patient coverage that nuclear experts, businesses and government officials colluded behind closed doors to draw up a tactic to lead official discussions in favor of the project.

The Japan Newspaper Publishers & Editors Association selected as one of its official slogans the phrase, "**Write articles that make good use of voices that are being suppressed,**" which was originally written by Yoshiharu Oiwake, a resident of Iwaki, Fukushima Prefecture, from among numerous entries. The Mainichi Shimbun is determined to continue to confront and report what is going on in Japan and the world.

Little food coop sues TEPCO over loss of confidence

October 14, 2012

Food co-op sues Tepco over soiled reputation

<http://www.japantimes.co.jp/text/fl20121014x2.html>

By TOMOKO OTAKE
Staff writer

Nanohana Seikyo — a Chiba Prefecture food distribution cooperative with about 11,500 members — made headlines last month when it took on the role of David by suing the corporate Goliath that is Tokyo Electric Power Co. for losses in sales incurred as a result of the March 2011 nuclear disaster.

In its civil suit filed on Sept. 24 at the Chiba District Court, the co-op is seeking ¥22.91 million in damages from the utility company that operates the stricken Fukushima No. 1 nuclear power plant.

The amount being sought is minuscule set against the hundreds of billions of yen Tepco has already paid to corporations and individuals affected by the disaster — let alone the estimated ¥4.5 trillion that it, with massive injections of public money, is likely to have to pay in damages and compensation due to the explosions and reactor meltdowns at the plant, and the resulting releases of radioactive materials.

Nonetheless, the case is of crucial importance, since it raises the fundamental question of who bears ultimate responsibility for all the public anxiety over — and the loss of confidence in — food safety in post-Fukushima Japan.

Shinji Kase, head of the 38-year-old co-op, told The Japan Times in a recent interview that his organization had long sourced food from Fukushima, with the goal of delivering pesticide- and additive-free non-genetically modified foods to its members. However, to do this, he explained, it has been vital to establish long-term relationships with farmers in order for them and the co-op to work together toward the goal of delivering safe food.

Since the March 2011 disaster, Kase said Nanohana Seikyo — which has become active in the anti-nuclear campaign — had started independently testing the food it handled, including produce from Fukushima, applying radiation limits far stricter than those set by the government. Despite its testing, however, the co-op's sales have plummeted and some of its members have left.

"Around 50 members who had trusted us withdrew from our co-op, citing clearly their fears of radiation risks as the reason," Kase said. "Many more have quit without exactly saying why — but we think it's attributable to the disaster."

In its restitution scheme, Tepco already has a provision for compensating businesses that have incurred financial damage as a result of *fūhyō higai* — a term that means "damage from speculation or a bad reputation."

Nanohana Seikyo's current suit follows an out-of-court compensation claim it filed in November 2011 for ¥18.73 million to cover lost revenue and its extra costs due to the radiation testing. After examining that claim, Tepco paid a total of ¥10.51 million in January and April this year. In June, however, the utility informed Nanohana it was under no obligation to pay the ¥8.22 million balance since the co-op's loss in sales had no causal relationship with the accident, according to a letter from Tepco to the co-op, a copy of which has been obtained by The Japan Times.

Kase said he suspects that recent moves by other co-ops to file compensation claims made Tepco wary, and that's why it had taken that position.

What really enraged Kase about Tepco's move, though, was not so much its withholding of money but the way it rejected the claim — hence the suit now filed claiming damages from the utility, he said.

Specifically, in that letter from Tepco it was the following sentence that so offended Kase: "With regard to food products that your co-op deals in, when there is a possibility that (member consumers) will refrain from buying products and cause damage based on speculation that those products might be tainted with radioactive materials, your co-op has the option of taking preventive measures, such as sourcing your food from other suppliers," Tepco wrote.

In other words, as Kase regards it, Tepco was effectively telling the co-op, "If your consumers don't buy from Fukushima farmers for fear of radiation risks, you should get your food from somewhere else."

What's more, Kase said Tepco also hinted that Nanohana Seikyo's independent food testing was an extra frill that didn't warrant compensation. To support that claim he cited the following from that letter: "The results of your radiation tests show no radioactive substances have been detected in almost all of the foods. It cannot be judged, therefore, that the tests are absolutely necessary. It can be considered that you have been conducting (radiation tests) to allay your members' concerns as part of your business judgment."

Hence at issue here, as Kase sees it and has asked the court to rule on, is whether or not it is the responsibility of distributors to pay costs incurred when they try to meet consumer demand by monitoring food independently, because their consumers do not entirely believe the government's testing or its safety limit. And further, when consumers don't even trust the results of such independent tests, and stop buying food from safety-conscious retailers, who should be blamed?

So clearly, despite the relatively petty amount being sought, Nanohana Seikyo's damages suit raises major issues.

"Ideally, it should be Tepco — as a party that spread radiation all around — conducting radiation tests of food and making sure all foods are safe," Kase said. "If we change our policy and drop our producers (when our test results show their food is safe), we won't be ourselves — because we have long championed the idea of building trust with producers."

The Japan Times contacted Tepco to discuss the lawsuit and the issues it raises, but its spokesman said it had no comment to make.

The Chiba District Court will have its first hearing on the case on Nov. 27. A ruling is not expected until sometime next year.

Former Fukushima Governor convicted

October 18, 2012

Conviction to be set for ex-Fukushima gov.

<http://www.yomiuri.co.jp/dy/national/T121017003732.htm>

The Yomiuri Shimbun

The Supreme Court has rejected appeals by both the prosecution and former Fukushima Gov. Eisaku Sato, who was convicted of bribery related to a dam building project, meaning his sentence of two years imprisonment suspended four years is set to be finalized.

Sato, 73, is suspected of urging a construction contractor to purchase land from his brother. The court also rejected appeals from the prosecution and Sato's brother Yuji, 69, who was convicted of bid-rigging and bribery, and sentenced to 18 months in prison suspended four years.

October 17, 2012

Ex-Fukushima governor loses appeal over bribe-taking conviction for dam project

<http://mainichi.jp/english/english/newsselect/news/20121017p2a00m0na006000c.html>

The Supreme Court has upheld a suspended prison term for former Fukushima Gov. Eisaku Sato, known as a critic of the central government's nuclear power policy, for accepting a bribe over a dam construction project.

The top court dismissed an appeal by Sato, 73, against a Tokyo High Court ruling that sentenced him in October 2009 to two years in prison, suspended for four years. The court also upheld a high court ruling that sentenced Sato's 69-year-old brother, Yuji, to 18 months in prison, suspended for four years, for conspiring with the former governor in the case.

Former Gov. Sato criticized the top court ruling. "I never received any bribe, and the ruling is unacceptable. I'm disappointed at the judicial branch that was unable to clarify the facts," he said in a statement released by his defense lawyer.

In a symposium held at Fukushima University in February, Sato criticized prosecutors for pressing false charges against him. "I was hit with a false accusation because I voiced opposition to the national government's policy."

The defense counsel may seek a retrial in the case.

According to the indictment, Sato gave preferential treatment to Maeda Corp. in a tender for the Fukushima Prefectural Government's Kido Dam construction project in 2000.

In return, the then governor conspired with his younger brother to sell a land lot owned by a company run by the brother to Mizutani Kensetsu, a subcontractor of Maeda, for 973.72 million yen, a figure higher than the property's market price of 800 million yen, sometime between August and September 2002, giving the pair 173.72 million yen as a bribe, prosecutors alleged.

The former governor pleaded not guilty to the charges during his trials.

In August 2008, the Tokyo District Court recognized that the pair accepted approximately 73.72 million yen as a bribe, and sentenced the former governor to three years in prison, suspended for five years, and his brother to 30 months in prison, suspended for five years.

The Tokyo High Court scrapped the ruling after deeming that it could not determine that the market price of the land lot was 80 million yen at the time of the deal and refused to recognize the difference in the selling price and what was claimed to be the market price as a bribe. In an extremely rare move, however, the appeal court recognized the proceeds of selling the property to Mizutani Kensetsu as a bribe.

Both the defendants and the prosecution appealed the ruling to the Supreme Court.

Kurokawa in Washington on lessons from "man-made" disaster

October 17, 2012

Fukushima panel chair calls for sharing lessons

http://www3.nhk.or.jp/daily/english/20121017_20.html

The Japanese scientist who led an expert's panel on the Fukushima nuclear accident says it is important to share the lessons learned from the disaster with the rest of the world.

Kiyoshi Kurokawa, who chaired the Japanese Diet panel's investigation into the accident, gave a speech in Washington on Tuesday.

Kurokawa explained the main points of the report the panel submitted in July. The report criticized the nuclear regulatory authorities and the operator, Tokyo Electric Power Company, for their lack of preventive measures.

It termed the nuclear accident a "man-made disaster," and called for the creation of a permanent Diet committee to oversee the work of nuclear regulatory authorities.

Kurokawa told his audience that the report has been translated into English and is now available on the panel's website. He said this will enable people around the world to share the lessons of the disaster.

He also referred to the measures at nuclear plants in the United States. The country introduced new measures after the September 11th attacks in 2001. For example, it is now mandatory for plants to have additional backup power systems.

Kurokawa said Japan did not introduce such measures although the government was aware that they had been installed in the US. He pointed out that if those systems had been in place at Fukushima, the accident could have been prevented.

Shortage of funds or misuse?

October 20, 2012

Misuse of reconstruction funds

<http://www.japantimes.co.jp/text/ed20121020a1.html>

It has surfaced that a special account budget to fund the reconstruction of communities devastated by the 3/11 earthquake, tsunami and nuclear disasters has been used to pay for unrelated projects. As to be expected, the shortage of funds due to budget mismanagement has angered affected residents. The Diet should scrutinize the use of the fiscal 2012 reconstruction budget and disclose dubious projects. The government and the Diet also should prevent bureaucrats from including projects that do not bring direct benefits to disaster-hit communities in their requests related to the fiscal 2013 disaster reconstruction budget.

The basic policy for disaster reconstruction adopted by the government in July 2011 includes provisions that bureaucrats can take advantage of to utilize budget money for projects not directly related to the disaster areas. It says in part that the true reconstruction of the disaster-hit areas will be impossible without the resuscitation of the Japanese economy. This provision can be interpreted very liberally. The policy in fact allows the use of budget money for projects in locations that have close connections to areas directly affected by the disasters, and for disaster-prevention projects in locations outside the 3/11 disaster zones.

Nonetheless, the government and the Diet should sincerely respond to complaints from people in Iwate, Miyagi and Fukushima prefectures who were directly affected by the 3/11 disasters. For example, it is reported that more than 60 percent of associations of medium-size and small business owners in the disaster areas that requested aid to revive their companies had their requests turned down due to a shortage of funds.

The absurdity of this situation is revealed by the dubious projects funded out of the reconstruction budget. They include efforts to cope with activities of the anti-whaling Sea Shepherd organization (¥2.3 billion), quake-proofing work for 12 buildings of the National Tax Agency (¥1.2 billion), job training-related expenditure for prisons in Hokkaido and Saitama Prefecture (¥30 million), the purchase of six C130 transport planes for the Maritime Self-Defense Force and two C2 transport planes for the Air Self-Defense Force (¥15 billion and ¥25 billion, respectively), and training for ASDF fighter pilots in the United States (¥1.44 billion).

Despite the questionable nature of these projects, in an extremely partisan move the Democratic Party of Japan recently boycotted a Lower House Audit and Oversight of Administration Committee session to delve into the budget mismanagement. An Upper House committee held a session on Thursday.

The reconstruction budget is expected to amount to ¥19 trillion in a five-year period from fiscal 2011. It will include ¥10.5 trillion from a surcharge on income and residents' taxes, which will continue to be imposed for 10 to 25 years. The commonsense principle that use of the reconstruction budget should be limited to funding projects in the disaster-hit areas must be strictly followed.

Is the NRA compatible with transparency?

October 22, 2012

NRA must ensure transparency

<http://www.japantimes.co.jp/text/ed20121022a1.html>

More than a month has passed since the Nuclear Regulatory Authority was inaugurated on Sept. 19. The NRA started in a deplorable manner. In a political maneuver, Prime Minister Yoshihiko Noda used a provision of the relevant law and appointed the five commission members without Diet approval.

Given the suspicions the public harbors toward the NRA due to the way in which its members were appointed, it is imperative it strictly oversee matters related to nuclear power generation free from the influence of politicians, government ministries and agencies, and the power industry. But the staffing of the NRA's secretariat, the Nuclear Regulatory Agency — which is composed of up to 473 officials and workers — raises concerns because many of its high-ranking officials used to work for government ministries and agencies that promoted nuclear power.

The agency's chief to cope with emergencies at nuclear power plants was formerly a councillor at the ministry of trade and industry. While he was head of the nuclear policy section of the ministry's Natural Resources and Energy Agency in 2004, he calculated the cost of underground disposal of spent nuclear fuel, but then denied the existence of the calculation before the Diet. For this he was disciplined.

The agency's deputy head is from the Environment Agency, which pushed nuclear power generation as a means of combating global warming. The agency head and the agency's chief for the safety of local areas near nuclear power plants in the event of a disaster were selected from the Metropolitan Police Department because it is hoped that they will be adept at crisis management.

Of the three councillors at the agency, one worked for the atomic energy bureau of the now-defunct Science and Technology Agency, another served as head of a section of the Natural Resources and Energy Agency, whose task was to insist that nuclear power plants were safe in lawsuits filed by local residents, and still another was with the trade and industry ministry's Nuclear and Industrial Safety Agency and dealt with the Fukushima nuclear crisis as safety chief. In June 2012, the last official apologized in a news conference for the government's failure to distribute maps displaying the dispersion of radioactive substances to evacuating residents.

Given the **NRA's vital tasks**, which include writing new post-Fukushima standards for nuclear power plants, examining suspected geological faults near or inside nuclear power plants sites, working out safety measures for local residents in the event of a severe nuclear accident, and judging whether to allow nuclear plants to remain in operation for an additional 20 years once they have reached the end of their standard 40-year operational life, it must ensure its operation and decisions are transparent.

The NRA on Sept. 26 excluded reporters from the Japan Communist Party newspaper Akahata from its news conference on the grounds that it is a party organ and its reporting has a specific bias. It later changed its reason for excluding Akahata, and then eventually decided on Oct. 2 to accept Akahata. This kind of behavior only deepens suspicions about its integrity.

" A wrong sense of security"

October 24, 2012

Japanese government radiation monitoring posts not showing reality: Greenpeace

<http://www.japantimes.co.jp/text/nn20121024b7.html>

Kyodo

Greenpeace said Tuesday a survey it carried out has found that many of the official radiation monitoring posts set up after the Fukushima nuclear crisis provide lower readings than nearby locations and the environmental group is urging the government to disseminate more accurate data to the public.

Greenpeace said its survey, conducted from Tuesday to Friday of last week in the city of Fukushima, showed that 30 of the 40 government-set monitoring posts recorded lower radiation levels than the environmental group found in spots just 5 to 40 meters away.

One monitoring post in a park showed less than one-twelfth the radiation levels seen in nearby areas in the same park, it said.

The differences may be a result of land at the monitoring posts being decontaminated when they were set up, Greenpeace said. Concrete and metal plates on the monitoring posts' bases are also believed to be screening the instruments from radiation.

"The government should not offer a wrong sense of security to citizens," a Greenpeace official said.

Give the money to the people who need it

October 26, 2012

Misuse of disaster 'reconstruction' money runs rampant

Expert finds 25% going toward projects that won't benefit Tohoku

<http://www.japantimes.co.jp/text/nn20121026f1.html>

By MIZUHO AOKI and REIJI YOSHIDA

Staff writer

A year and a half after the Tohoku region was devastated by the Great East Japan Earthquake and monster tsunami, shocking revelations are deepening the sorrow and frustration of the survivors and throwing a harsh light on the government and the Diet.

Still standing: Municipal employees in Minamisanriku, Miyagi Prefecture, used this tower, seen last month, to broadcast evacuation orders as monster tsunami swept in and engulfed the town on March 11, 2011.

To help hundreds of thousands of people mainly in Miyagi, Iwate and Fukushima prefectures, the government has allocated as much as **¥19 trillion** for "reconstruction," asking taxpayers to bear the extra burden to support the disaster victims and help them reconstruct their local infrastructure.

But much of the disaster recovery money has been allocated for projects that have little to do with the disaster victims, media reports have revealed.

These projects include ¥500 million for road construction work in Okinawa, ¥330 million for repairs to the National Stadium in Tokyo's Yoyogi district and ¥10.7 billion in subsidies for a government-linked nuclear power research organization, much of which will be used to study nuclear fusion.

The Justice Ministry meanwhile secured about ¥30 million to purchase power shovels for prisons in Hokkaido and Saitama prefectures, and the fisheries ministry was given ¥2.3 billion for countermeasures against the Sea Shepherd antiwhaling group.

Yoshimitsu Shiozaki, a professor at Ritsumeikan University in Kyoto who is an expert on reconstruction of disaster areas, has examined the third supplementary budget for fiscal 2011, which included ¥9.2 trillion for 488 "reconstruction" projects.

He found that about ¥2.45 trillion, or a quarter of the total, was allocated for projects outside Iwate, Miyagi and Fukushima, or for national projects he concluded are unlikely to directly benefit anyone in the three hardest-hit prefectures.

"Legally speaking, there are no problems with these projects. Similar things happened after the (1995) Great Hanshin Earthquake, when reconstruction funds were used for other purposes," Shiozaki said. "But this time (the funds) are being used in a more deceptive way."

Of the ¥19 trillion earmarked for reconstruction, the government will come up with ¥10.5 trillion by keeping higher rates for income, corporate and residential taxes by up to 25 years.

"Taxpayers accepted the tax hikes because (they thought) the money would be used for helping disaster victims. And disaster victims were thanking them," Upper House member Kuniko Tanioka of the parliamentary group Midori no Kaze said during a recent Audit Committee session to scrutinize reconstruction spending.

"But it has turned out that (the funds) have been used for (projects) they never imagined. . . . It has dampened the disaster victims' will to rebuild their lives," she said.

Under a budget guideline originally proposed by the Democratic Party of Japan-led administration in May 2011, the government would have been allowed to use reconstruction funds only for projects directly related to the stricken areas.

But later, responding to demands from opposition lawmakers, the ruling parties agreed to revise the guideline so the ¥19 trillion will also be used to "reinvigorate Japan," leaving geographical boundaries unclear and widening the scope of use for the "reconstruction" funds.

The budget guideline also called for "disaster prevention" measures across the country based on lessons from the Tohoku tragedy.

This has allowed, for example, the government to spend ¥12 billion to strengthen the quake resistance of various government buildings outside the Tohoku prefectures.

Takayoshi Igarashi, a professor at Hosei University and an expert on public works spending, said bureaucrats by nature try to use up all the money available as there is no incentive for them to save taxpayer funds.

"That's a fundamental characteristic of bureaucrats. It is the Diet that should check how money is used, but the Diet hasn't put any effort into it," Igarashi said.

During the 2009 Lower House election campaign, the DPJ scored well with voters by pledging to thoroughly scrutinize government spending and drastically cut waste, public works projects in particular. As it turned out, the DPJ defeated the Liberal Democratic Party, which had been long criticized for its government budgets bloated with pork-barrel public works spending.

"But this time, the DPJ behaved the same as the LDP. So the feeling of disappointment among the public is now much bigger" than it would have been under an LDP-led administration, Igarashi said.

The fisheries ministry argues that the budget to counter Sea Shepherd will eventually benefit areas in and around the city of Ishinomaki, Miyagi Prefecture, where about 1,200 people work in whaling-related industries.

The Justice Ministry has insisted that buying power shovels for the Hokkaido and Saitama prisons will eventually benefit the disaster-hit areas because the machines will be used to train prisoners for future jobs and thus help ease the shortage of such workers in the Tohoku region.

Meanwhile, Tohoku coastal towns severely hit by last year's tsunami are still suffering from money shortages as well as manpower, according to Shiozaki, who has analyzed how reconstruction funds were used after the Hanshin quake.

Such facts should be remembered when discussing allocation of the reconstruction budget, he said.

Municipalities that lost many of their officials are **too short on manpower** to handle the massive amount of work necessary to recover from the disasters, he said.

Shiozaki also said many residents who lost their jobs and homes are financially struggling, making the task of rebuilding their lives even harder.

Under the law to help disaster victims' restore their livelihoods, the government is supposed to provide up to ¥3 million in cash to each household that lost a home in the March 11 disasters.

That amount is far from enough to rebuild a house, Shiozaki pointed out.

"If that amount was doubled, more people would be able to think of ways to reconstruct their lives," he said.

"Up until now, less than ¥300 billion has been distributed under the system. So even if (the government) were to double the amount paid, it would only be ¥600 billion, which is nothing compared with ¥19 trillion," Shiozaki said.

He stressed that Diet members as well as bureaucrats actually need to go to disaster sites and **come up with ways not only to cut wasteful spending but also to direct money where it is most needed.**

"They can't study ways to provide funding for places truly in need merely by reviewing documents," he said. **Lawmakers and officials "must go to the devastated areas.** Problems are occurring in the disaster zone, not in Kasumigaseki," the government center in Tokyo.

Now that it is facing harsh criticism, the administration has pledged to review reconstruction spending and says it will hammer out new approaches in early November.

Yutaka Harada, an economics professor at Waseda University, said **the best and cheapest way to reconstruct the disaster areas is to hand cash directly to the victims.**

"In that way, a ¥4 trillion budget would be enough," he said. "Everybody says it would create a moral hazard, but the ¥19 trillion reconstruction budget is already a moral hazard."

More on misuse of disaster money

October 28, 2012

Noda meets with Iwate gov. on funds

<http://www.yomiuri.co.jp/dy/national/T121027001982.htm>

MORIOKA (Jiji Press)--Facing mounting criticism that government funds for postdisaster reconstruction have been used for projects outside affected areas, Prime Minister Yoshihiko Noda stressed he will give the highest funding priority to those areas.

Meeting Saturday with Iwate Gov. Takuya Tasso in Morioka, Noda expressed his willingness to review allocation of the funds earmarked after the March 2011 earthquake and tsunami by examining how the money is actually used.

He is determined to deal with the budget allocation problem "under the policy of placing top priority on disaster-hit areas," Noda said.

In reply, Tasso said, "Reconstruction [of the disaster areas] will lead to the revival of Japan as a whole." At the meeting, Noda explained new government measures to push forward reconstruction efforts, such as "group subsidies" to be provided from fiscal 2012 budget reserves to help damaged small and mid-sized companies restart operations.

NRA corrects own projections

October 30, 2012

Errors found in projections for spread of radiation in severe accidents

<http://mainichi.jp/english/english/newsselect/news/20121030p2g00m0dm012000c.html>

TOKYO (Kyodo) -- Japan's nuclear regulatory authority apologized Monday after finding errors in its recently announced projections for the spread of radiation from reactors nationwide in the event of severe accidents.

The Nuclear Regulation Authority corrected the projections to show that the city of Nagaoka, rather than Uonuma, both in Niigata Prefecture, would be the most distant point from Tokyo Electric Power Co.'s Kashiwazaki-Kariwa plant where the amount of radiation released a week after an accident could reach 100 millisieverts, the level where evacuation is recommended.

The authority initially said the amount of radiation could reach that level in locations around 40 kilometers from the plant, reaching Uonuma, about 40.2 km away from the plant.

The NRA also revised the projections for Japan Atomic Power Co.'s Tokai Daini plant in Ibaraki Prefecture and Tsuruga plant in Fukui Prefecture, Hokuriku Electric Power Co.'s Shika plant in Ishikawa Prefecture, Kyushu Electric Power Co.'s Genkai plant in Saga Prefecture and Sendai plant in Kagoshima Prefecture.

An official of the NRA secretariat said many of the mistakes had occurred during the conversion of weather data received from each utility for use in a computer program.

The NRA detected the mistakes after being notified by Hokuriku Electric, the official said.

The regulatory body announced radiation projections for 16 atomic plants on Wednesday to provide references for local governments to expand areas that should be subject to special preparations against nuclear disasters following the meltdowns at Tokyo Electric's Fukushima Daiichi complex last year.

The simulation showed the distances at which doses could reach 100 millisieverts a week after severe accidents at the plants like the one at the Fukushima Daiichi complex last year.

The International Atomic Energy Agency calls for evacuation when effective doses exceed 100 millisieverts in the first seven days of an emergency exposure situation.

Another mass complaint

November 2, 2012

Second mass complaint coming over Fukushima disaster

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201211020069>

November 02, 2012

By MASAKAZU HONDA/ Staff Writer

FUKUSHIMA—More than 10,000 people from across Japan are seeking criminal charges against officials of Japan's government and the utility that operates the Fukushima No. 1 nuclear power plant, after a similar mass complaint this summer accused 33 officials of causing death and injury through negligence.

Prosecutors in Fukushima Prefecture are currently examining the earlier complaint, filed in June by 1,324 people who were residents of the prefecture at the time of the accident in March 2011.

Complainants behind the new case plan to file it with the Fukushima District Public Prosecutors Office on Nov. 15. The group numbers about 10,850 individuals, from Hokkaido in the north to Okinawa in the south.

The group is led by Ruiko Muto, 59, who traveled around the country seeking support.

Complainants argued that a broadly backed complaint would show that the general public is seeking criminal accountability for those who promoted nuclear power—and hold them responsible for damage from the disaster and for exposing victims to radiation.

The first complaint named 33 individuals, including 15 current and former officials of Tokyo Electric Power Co., the company that operates the Fukushima No. 1 nuclear plant.

It said they should be charged with professional negligence resulting in death and injury because they failed to take safety measures and furthermore released wrong information.

Prosecutors have had TEPCO submit video footage of teleconferences conducted between the head office and the Fukushima plant in the aftermath of the earthquake and tsunami.

They are expected to question concerned individuals before deciding whether to issue indictments.

Prosecutors have asked complainants to submit documents relating to people who died during the evacuation.

In addition to those documents, complainants plan to submit medical certificates for evacuees who were diagnosed as suffering mental trauma as a result of their ordeal.

They have argued that victims suffered "injuries" from radiation exposure. But it is thought to be difficult in law to establish a causal relationship between those purported injuries and the nuclear accident.

Officials drafting new regulations raked in millions

Nuke industry funded NRC's safety experts

<http://www.japantimes.co.jp/text/nn20121104a1.html>

Kyodo

Four of the six members on a government panel drafting new nuclear safety regulations each received between ¥3 million and over ¥27 million in payments, donations and grants from entities in the atomic energy industry in the last three to four years, the Nuclear Regulation Authority said.

But after disclosing the data Friday, the new nuclear watchdog's secretariat said all four members "were selected in line with regulations, and there should thus be no problem" over their appointment.

Critics, however, cited the risk of their judgment being swayed by power companies and other nuclear-related bodies, and of the possibility that new safety regulations could be watered down.

The NRA requires experts involved in drafting safety standards for nuclear plants and other matters to disclose their remuneration and other payments received, but it has no provision to disqualify them if previously withheld information comes to light.

Of the four members, Akira Yamaguchi, a professor at Osaka University's graduate school, and Akio Yamamoto, a Nagoya University professor, each received payments in excess of ¥500,000 annually from entities including Nuclear Engineering Ltd., an affiliate of Kansai Electric Power Co.

In addition, Yamamoto received more than ¥27 million in donations and research grants from Mitsubishi Heavy Industries Ltd., which manufactures equipment for nuclear reactors, while Yamaguchi raked in a total of ¥10.1 million from Japan Atomic Power Co., a constructor and operator of atomic plants, and from other nuclear-related parties.

Meanwhile, University of Tsukuba professor Yutaka Abe was paid a combined ¥5 million by a variety of bodies, including a research laboratory affiliated with Tokyo Electric Power Co., and Tomoyuki Sugiyama, a researcher at the state-run Japan Atomic Energy Agency, was awarded roughly ¥3 million in total from Nuclear Fuel Industries Ltd.

The only two panel members who did not receive any funds from entities in the nuclear power industry are Norio Watanabe, a researcher at the Japan Atomic Energy Agency, and Meiji University associate professor Tadahiro Katsuta.

Discrimination against journalists

article available also in Japanese and in French on the RSF site

<http://en.rsf.org/japon-journalists-barred-from-anti-06-11-2012,43640.html>

Journalists barred from anti-nuclear protest coverage

Published on Tuesday 6 November 2012. Updated on Thursday 8 November 2012.

Reporters Without Borders declares its support for a legal demand to the Tokyo regional court by three freelance journalists seeking access to an official press club building that would allow them to cover anti-nuclear demonstration.

Yu Terasawa, Michiyoshi Hatakeyama and Yuichi Sato filed their demand on 31 October. They have been trying since June to enter the building of the Kisha club of the National Diet (parliament). The building offers the perfect vantage point for coverage of anti-nuclear demonstrations held every Friday in front of the prime minister's residence, directly across the street. Club director Toshiyuki Saga has prohibited the freelancers from entering.

“This obstruction of freelancers’ work is arbitrary and illegal under Japanese law and violates the fundamental principle of freedom of the press,” Reporters Without Borders said. “The court will not provide legal cover for obstruction of access, especially given that the request for legal action comes from journalists themselves.”

Freelance journalists play an essential role in ensuring diversity in news coverage, the press freedom organization noted, calling that diversity essential to a democracy. The Kisha clubs not only embody a system of unfair privileges but systematically display contempt for an entire part of the media community, the organization said.

The three journalists who went to court belong to a freelancers’ liaison group created in October of last year to fight for freelancers’ access to press conferences held by the government and TEPCO, the electric utility. The freelancers have tried to film the weekly anti-nuclear demonstrations.

Before making their legal move, the journalists wrote on three occasions to club director Saga, a former journalist with Kyodo News. The letters, dated 17 July, 16 August and 10 October, have gone unanswered.

But Saga, in a video released on YouTube on 13 October, expressed hostility to the freelancers who had come to cover the protests.

On 2 November, Saga refused to answer questions from a Reporters Without Borders correspondent.

Freelance journalists are routinely discriminated against in Japan. Officials typically attempt to justify this policy on a variety of grounds: lack of space, lack of time, extra cost. Notably, these constraints apply only to freelancers – not to journalists employed by media companies.

Nuclear policy remains an extremely sensitive issue in Japan. Freelance journalist Minoru Tanaka has suffered systematic legal harassment since last May. He has been accused of libel as a result of his investigation of the disaster at the Fukushima-Daiichi nuclear plant.

Reporters Without Borders has opposed for years the censorship exercised by the Kisha clubs and the danger to press freedom that they represent.

Are the news about Fufushima (self-)censored?

Cleaning up: Workers at a school sports field in Hirono, outside the Fukushima nuclear exclusion zone, prepare bags of radiation-contaminated earth for shipment to a dumping ground. AP

MEDIA MIX

Local media are too vague on Fukushima radiation risk

<http://www.japantimes.co.jp/text/fd20121111pb.html>

By PHILIP BRASOR

Earlier this year, NHK rebroadcast a documentary it made in the late 1980s about the 1986 Chernobyl nuclear reactor accident. It showed how the Soviet Union and European countries tested people for effects of radiation throughout the region. Appended to the doc was a discussion with experts who compared the accident with the one that happened at the Fukushima No. 1 reactor in 2011, implying that Fukushima wasn't as dire as Chernobyl but stopping short of saying it was nothing to worry about. As long as radiation levels and residents' health were continually monitored, the situation could be managed.

Still, the documentary left a chilling impression, if only for its repeated use of the phrase "ashes of death" (*shi no hai*). Though the commentary was meant to be reassuring in that Fukushima was presented as being less dangerous than Chernobyl, where radioactive ash actually fell from the sky, the language conveyed the feeling that any nuclear accident is potentially deadly and the farther it is from your backyard the more dramatic you can be in describing it.

It follows that you should be less dramatic in your own neighborhood. Remember how after the Fukushima accident then-Minister of Economy Trade and Industry Yoshio Hachiro was pilloried for calling the evacuated area "cities of death"? Even now you have to be cautious about making any public pronouncements regarding the safety situation in the affected regions.

There is a group of self-appointed social-media police who audit related information coming from the press for anything that might cause anxiety. Their main target is the foreign media, which, in line with the above-mentioned credo about backyards, are seen to be carelessly "sensational" in their coverage. This group denies it is trying to censor the news. It only demands the press be "responsible," but the end result is much the same as far as the affected people are concerned. The argument this group advances, that there is still no scientific consensus about the long-term effects of radiation on the human body, has no traction with the residents of Fukushima. If there is the slightest possibility that even low-level exposure is harmful, they want to know.

On Nov. 1 the mayor of Minamisoma in Fukushima Prefecture, Katsunobu Sakurai, who became world famous after posting a YouTube video calling for help shortly after the accident, spoke to reporters at the Foreign Correspondents Club of Japan and blasted the government, business community and media for acting as if the accident were a tragedy the country has already gotten over. Sakurai was talking about the push to restart nuclear power plants, which requires that the Fukushima story be closed, but he was also suggesting that cleanup cannot proceed smoothly until everyone recognizes it as something that is not only necessary for people in the contaminated areas, but vital to the interests of Japan.

The domestic media has been vague about what the cleanup (*josen*) entails, except to say that irradiated waste is being shipped to other localities that don't want it. Again, it was foreign media that first explained

the difficulties involved. Last February the New York Times and CBS News, to name just two, ran stories that described how no one carrying out the cleanup at the time knew what they were doing.

Several weeks ago, NHK broadcast a new documentary that detailed the effort so far. In fact, it focused on Minamisoma, which lies just outside the evacuation area but in the path of the radiation drift from the crippled reactors. Though residents weren't forced to evacuate, many did, especially if they had children, and they were impatient to commence with cleanup operations, which started in a piecemeal fashion a year ago. Immediately, the residents realized the problems they faced, not just in terms of physical work — it takes one hour to clean 10 sq. meters — but in terms of measuring achievement. Their target radiation level of 0.23 microsieverts/hour turned out to be elusive. After cleaning, some areas were below the target while others were above it, and these levels kept shifting with time. "You can't remove radiation just by cleaning once," said Tatsuhiko Kodama of the University of Tokyo, who was advising residents. "You need at least three cycles to understand where radiation is concentrated."

The 0.23 level is important because the government will subsidize cleanup when radiation exceeds it but not when it drops below. Some families want to get their levels even lower, so they clean their properties themselves, going as far as destroying gardens and trees, even though the effectiveness isn't clear. What's more, contaminated water, soil and vegetation have nowhere to go. The current policy involves moving materials to temporary storage sites while the government works on locating and building a final permanent site, but so far localities chosen for the temporary sites have resisted. Most of the contaminated materials are being stored on the properties from which they were removed.

Meanwhile, costs are skyrocketing, and these localities realize that government guidelines dictating payments don't apply to the real situation on the ground. As one resident put it, they are "fumbling toward a solution" on their own while the government does nothing. Some localities have come up with their own solutions, but if they use different means than those sanctioned they won't be reimbursed.

The ramifications of this confusion can be seen in last week's Asahi Shimbun scoop about companies hired to do cleanup work that have not passed on special allowances the government contributed for workers. Some subcontractors said they never received the allowances from contractors while others passed it on but lowered wages accordingly. In its February article the New York Times reported that commercial interests were exploiting the confusion for their own gain — which isn't to say that the Asahi is behind the curve, only that when it comes to stories as controversial as this one, better late than never.

Decisions made in advance at "secret meetings"

November 14, 2012

Fukushima held 'secret meetings' on format of health surveys

<http://mainichi.jp/english/english/newsselect/news/20121114p2a00m0na012000c.html>

The Fukushima Prefectural Government held "secret meetings" to make key decisions on how to conduct health surveys on local residents in the wake of the outbreak of the crisis at the Fukushima No. 1 Nuclear Power Plant, prior to exploratory panel meetings on the issue, it has been learned.

The Fukushima Prefectural Government released the minutes of the "secret meetings," which it called "preparatory meetings," under a freedom-of-information request filed by the Mainichi Shimbun. When the Fukushima Prefectural Government conducted an internal investigation in October, it said the meetings were "forums for advance briefings on materials." But **the minutes of the meetings confirm that important policies and even the scope of subsequent discussions at exploratory panel meetings were decided in advance at the meetings.**

The Fukushima Prefectural Government told the Mainichi Shimbun in September that it "did not draw up the minutes of preparatory meetings." But the minutes were released after the Mainichi Shimbun demanded under a freedom-of-information request in October that the prefectural government release all minutes of its preparatory meetings.

A Fukushima Prefectural Government representative said the minutes had been regarded as "memos."

"They were compiled as memos, and they were not drawn up as minutes based on confirmed remarks by attendees," the representative said. The prefectural government said minutes of the second and eighth preparatory meetings held on June 12, 2011 and Sept. 11, 2012, respectively, did not exist.

According to the minutes released by the prefectural government, the meeting held on July 17, 2011 in preparation for the third exploratory panel meeting on July 24, 2011 lasted for about 3 1/2 hours -- roughly 1 1/2 hours longer than the exploratory meeting itself. Regarding the age at which people could qualify for thyroid gland examinations, Fukushima Medical University Vice President Shunichi Yamashita, who chairs the exploratory panel, told the secret meeting, "We will make a decision at this meeting." After hearing the opinions of other panel members, Yamashita said, "We will set it at age 18, as the committee has recommended."

There was no objection from other panel members, and at the subsequent full-fledged exploratory panel meeting, another professor from Fukushima Medical University explained, "We will set the qualifying age at 18 or younger." The prefectural government started to conduct thyroid gland examinations in October 2011.

The fifth secret meeting, held on Jan. 25, 2012, dealt with the issue of conducting a survey on local residents' estimated external radiation exposure. The prefectural government had planned to set a certain

criterion for subjecting people to health checks by the end of fiscal 2011. Some panel members objected to the idea, with one of them saying, "It is difficult to draw the line." To this, Yamashita responded, "It's better for us to arm ourselves with a theoretical backing. We won't discuss the issue this time. A final decision will be made after the end of this fiscal year."

At the exploratory panel meeting held on the same day, no one made a reference to a criterion for health checks on external radiation exposure. The criterion has not been decided yet.

The prefectural government described the preparatory meetings as forums for briefings on topics of discussion. The results of its internal investigation, released on Oct. 9, stated, "There were no coordination of views and induction of discussions, but **there was conduct that could provoke suspicion.**"

Fukushima disaster not just TEPCO's responsibility

November 12, 2012

Editorial: TEPCO's request for more funds a payback for gov't dodging responsibility

<http://mainichi.jp/english/english/perspectives/news/20121112p2a00m0na014000c.html>

In a new management plan compiled by Tokyo Electric Power Co. (TEPCO), the operator of the stricken Fukushima No. 1 Nuclear Power Plant is seeking additional assistance from the government. TEPCO's previous restoration plan was only just drawn up in May. That it has already been reassessed shows that the government is paying sorely for having left its own responsibility ambiguous.

In addition to providing relief to victims of the nuclear disaster, TEPCO, which has a one-third market share in Japan, has a responsibility to take on a leading role in reforming the utility system.

The government should make its responsibility for the nuclear disaster explicit, and sincere efforts should be made by TEPCO to alleviate burdens shouldered by the public before a provision of additional assistance to TEPCO is approved.

To pay for victim compensation, TEPCO is receiving a maximum 5 trillion yen from the government through the Nuclear Damage Liability Facilitation Fund, which will be paid back every year from the company's profits. Ostensibly, the public is ultimately meant to shoulder none of the burden.

However, TEPCO is now seeking direct assistance -- which, if approved, will not require repayment -- citing the possibility that compensation, including decontamination costs, may balloon to around 10 trillion yen. The request must not be approved without thorough evaluation, but the decision to make the request was one reached by the external board members selected by the government.

If TEPCO were to become a body existing just for the purpose of repaying debts, it would suffer from talent drain and other phenomena that would weaken the company. It would have to prioritize generating profits to pay off its loans, which would prevent it from taking initiative in reforming the utility system. The current setup, in which all responsibility for compensation is left up to TEPCO, appears to have run into a brick wall.

The promotion of nuclear power was a government policy. **TEPCO bears a heavy responsibility for causing the disaster, but the government bears a responsibility for having given its stamp of approval on the safety of the company's reactors. The government needs to stop carrying out half-measures in an attempt to leave the question of its own responsibility for that unanswered.**

Thus far, the government has gone without bearing any responsibility for compensation, because no provision in the Act on Compensation for Nuclear Damage forces it to do so. It was the lack of an alternative body to provide compensation to victims that comprised the main argument against TEPCO's legal liquidation. In that case, the Act on Compensation for Nuclear Damage must be revised to clearly assign responsibility to both TEPCO and the government before the government can grant additional assistance to the utility.

If the government is going to approve the reactivation of halted nuclear reactors for the time being -- despite putting forth a new energy policy of independence from nuclear power by the 2030s -- a revision of the Act on Compensation for Nuclear Damage is indispensable in preparing for the chance that victims of another nuclear disaster will need relief.

Direct assistance funded by taxes means a direct burden on the public. To gain the understanding of the public, the government must sort through the problems of its past nuclear policy through deliberations on law reform. The public is bound to object to pumping taxes into TEPCO without holding its creditors, such as shareholders and major banks, accountable. The pros and cons must be thoroughly debated in the process of rethinking nuclear policy.

In its new management plan, TEPCO has mapped out ways to contribute more to Fukushima's reconstruction, proposed further streamlining, and promoted management reform that would take it

toward a holding company system. These are all a matter of course if TEPCO is to receive further government assistance, and we hope to see them put into practice.

More excuses over secrecy

November 19, 2012

Fukushima health survey committee chair apologizes over secret meetings

<http://mainichi.jp/english/english/newsselect/news/20121119p2a00m0na017000c.html>

FUKUSHIMA -- The chair of a committee overseeing a prefectural health survey issued an apology Nov. 18 after revelations the body had held secret "preparation" gatherings to harmonize members' opinions ahead of official meetings.

"I have caused a great deal of trouble to committee members, and I sincerely apologize," said Chairman Shunichi Yamashita at the body's first meeting since the secret consultations were discovered, adding, "I hope to make all meetings properly public from now on."

The committee headed by Fukushima Medical University Vice President Yamashita was created by the prefecture to conduct a health survey of its residents in response to the ongoing disaster at the Fukushima No. 1 nuclear plant and analyze its results.

The prefecture has revealed it will revise the committee's platform such that all the body's meetings must be open to the public and the minutes be recorded.

The head of the prefecture's health and welfare division will furthermore be removed from the committee and replaced with the head of the medical association of Futaba County -- where the stricken nuclear plant is located -- and the deputy chief of the prefectural clinical psychologists association.

According to the prefecture, the committee did not hold a "preparation" meeting before the Nov. 18 open session.

"Our committee was formed in the confusion just after the (March 2011) disasters, so I think it couldn't be helped that we have not performed perfectly," Yamashita told reporters at a news conference after the Nov. 18 committee meeting. When asked if he would take the blame for the secret gatherings, Yamashita stated, "My future in this position is up to the prefecture."

In related news, health survey results reported at the committee meeting revealed that possible thyroid cancer had been detected in one girl aged at least 16 in the prefecture, and that a second test was required.

Revelations - Urine tests or not?

November 20, 2012

Fukushima releases full expert panel minutes on internal radiation exposure

<http://mainichi.jp/english/english/newsselect/news/20121120p2a00m0na009000c.html>

FUKUSHIMA -- The Fukushima Prefectural Government on Nov. 19 revealed the full minutes of an expert panel meeting on internal radiation exposure following revelations that significant portions of a previous release had been deleted.

The original minutes, released in response to freedom-of-information requests from local residents, excised sections revealing the prefecture was reluctant to accept a central government proposal to conduct urine sample testing as part of a health survey following the March 2011 meltdowns at the Fukushima No. 1 nuclear plant. When the omission was discovered, experts lashed out at the prefectural government.

"They apparently didn't want to reveal that they wanted to avoid conducting urine tests in an effort to underestimate the damage to residents' health," said Katsuma Yagasaki, professor emeritus at the University of the Ryukyus. Urine sample testing can detect even minor internal radiation exposure.

The urine sample debate is included in the newly released full minutes covering a closed-door exploratory committee meeting held on June 18, 2011. At the meeting, experts and other participants discussed possible examinations of about 28,000 residents of Namie, Iitate and Kawamata's Yamakiya district in Fukushima Prefecture for internal radiation exposure.

According to the full minutes, senior Cabinet Office officials who attended the meeting as observers said urine testing should be used as a main tool to check internal radiation exposure, as opposed to whole body counters (WBCs). The prefectural government, however, was reluctant to do so, saying, "We can't turn around and decide on urine testing because everybody is calling for WBCs."

In the end, the prefecture examined less than 200 local residents using both urine testing and WBCs in late June 2011, and stated that it had not detected levels of radiation that could affect human health. The

prefecture has since continued to use WBCs to examine some local residents for internal radiation exposure, but has shown persistent reluctance to take urine samples.

It had already been revealed that proper minutes of the committee's first, second and third panel meetings had not been compiled before residents requested their disclosures under the freedom-of-information act. Instead, minutes were hastily patched together based on notes taken by prefectural government staff and released. In an internal investigation, the results of which were released in October, the prefectural government admitted that part of the minutes had been left out because the process was "handled improperly, and the minutes were drawn up without some staff memos."

According to the prefecture, despite the fact that notes of the proceedings existed, it left out some of those notes when assembling the minutes of the meetings in response to the freedom-of-information requests. Keiichi Sasa, head of the health management research office at the prefectural government, said, "The original minutes were here, but I don't know who omitted the missing sections (from the release version) and for what purposes."

Not a good start

November 22, 2012

Faulty fallout forecasts' firm industry-linked

<http://www.japantimes.co.jp/text/nn20121122x2.html>

Kyodo

A consulting firm linked to the nuclear industry produced erroneous projections for the spread of radiation from reactors in the event of meltdowns, sources said Wednesday.

The revelation casts doubt on the ability of the Nuclear Regulation Authority to serve as a watchdog, as it outsourced the projection work to the consultancy through the Japan Nuclear Energy Safety Organization, which originally made a contract for the project and merely released the forecasts.

The projections were created by CSA of Japan Co. According to a credit research firm, CSAJ is a member of the Japan Atomic Industrial Forum nuclear industry body and does business with JNES and a subsidiary of Tohoku Electric Power Co.

The radiation spread projection work was outsourced to the consulting firm for ¥9.77 million by JNES, which took on the project from the predecessor of the NRA in March, the sources said.

The predecessor Nuclear and Industrial Safety Agency set the deadline for the projection work at the end of May, but that was delayed until shortly before Oct. 24, when the NRA released its first projections for the spread of radiation from reactors in the case of a meltdown crisis like the one at Fukushima No. 1.

JNES subcontracted the project to CSAJ due to a lack of manpower, it said. But the sources doubted this, as only one worker at the consultancy was told to enter data into a simulation program the U.S. Nuclear Regulatory Commission created, the sources said.

The data used for the forecasts, including wind directions, were provided by utilities that operate nuclear plants, they said.

NRA spokesman Hideka Morimoto apologized for errors as the projections were for evacuation plans.

UN not so optimistic

November 26, 2012

UN HR expert criticizes Fukushima response

http://www3.nhk.or.jp/daily/english/20121126_28.html

A UN human rights expert says the Japanese government should do more to protect the rights of those affected by the accident at the Fukushima Daiichi nuclear power plant.

UN Special Rapporteur Anand Grover was speaking to reporters on Monday in Tokyo. Grover had been in the disaster-stricken northeast since last Thursday. He was studying whether the rights and the health of evacuees and others affected by the accident are being properly protected.

Grover criticized the Japanese government for not adequately responding to the accident in terms of protecting the people it affected. He said an example would be the government's not immediately disclosing forecast data from the SPEEDI system, which charts the spread of radioactive substances.

He also criticized the government for not conducting long-term follow-up medical checkups on those working to decommission the damaged reactors.

Grover said the needs of pregnant woman, children, the elderly and other socially disadvantaged people are not fully reflected in the decision-making process for decontamination and other issues. He said he will urge Japan to improve the situation.

The UN Human Rights Council will soon submit to the Japanese government the results of Grover's visit. A final report will be submitted to the Council in June of next year.

U.N. envoy: Japan should do more for nuke victims

<http://mainichi.jp/english/english/newsselect/news/20121126p2g00m0dm064000c.html>

TOKYO (AP) -- A United Nations rights investigator has said Japan hasn't fully served the health needs of residents and workers affected by the nuclear crisis and address their concerns.

Anand Grover, UN Special Rapporteur on the right to health, said Monday that Japan has over-emphasized optimistic views of radiation risks and conducted limited health checks after a meltdown at the Fukushima nuclear power plant caused by an earthquake and tsunami in 2011.

Many plant workers on short-term contracts have no access to permanent health check.

Grover wrapped up his 11-day survey in Fukushima and other areas. He also cited residents' complaints about the lack of access to their own health-check results.

Japan's government has been criticized for coverups and delays in disclosing key radiation information, causing deep-rooted public distrust.

Of the importance of trust

Editorial: Trust more than anything important for governance

<http://mainichi.jp/english/english/perspectives/news/20121126p2a00m0na001000c.html>

As political parties' rush to prepare for the general election, former Prime Minister Yukio Hatoyama of the Democratic Party of Japan (DPJ) announced his decision not to contest the election, citing his refusal to commit to the party's policy line -- a requirement in receiving party endorsement.

There's a tragic gap between the exit of Hatoyama, who has come to symbolize the DPJ administration's meandering leadership record, and the national excitement three years ago over the changeover in government, of which he was at the center. At least this time, Hatoyama made good on his word to retire from politics, a promise he once made and broke when stepping down from his post as prime minister.

So what was the biggest mistake that Hatoyama made as prime minister? The confusion he caused over the relocation of U.S. Marine Corps Air Station Futenma was undoubtedly a fatal error. However, it must be said that Hatoyama's failure to immediately establish the legal framework necessary to realize politician-led policymaking was just as costly.

In the upcoming lower house election, Japan's system of governance itself has come under question. The DPJ strayed off course from its attempt to break away from bureaucracy-centered politics, and a political gridlock persisted under a "twisted" Diet. Calls to revamp the Diet's fundamental structure, including the possible adoption of unicameralism, emerged, and there are signs of a revived push for the introduction of a popular vote for prime minister. As such, a debate over the nation's governing structure possess elements that could lead to pressure for constitutional revision. What kind of framework is conducive to a smooth political process? It is time to stare the reality of systemic fatigue in the face, and press forth with the debate.

To do so, a review of the DPJ administration of the past three years is crucial. To curb bureaucratic meddling in politics, the DPJ first entrusted decision making in each ministry to the "seimu sanyaku," or the three posts of minister, senior vice minister, and parliamentary secretary appointed from among legislators. Administrative vice minister meetings were abolished, and the Government Revitalization Unit's waste-cutting commission attracted widespread attention. Meanwhile, the creation of a framework -- including the legislation of the National Policy Unit (NPU), which would ideally serve as the command center for politician-led decision making, and a large-scale increase in senior vice ministers and parliamentary secretaries -- was left on the back burner.

As a result, in many ministries the "seimu sanyaku" were overburdened with administrative work that should have been left to bureaucrats, while the laying down of policy direction and accountability were abandoned. It's undeniable that communication between politicians and bureaucrats fell into disarray, and distrust and fear of rocking the boat spread.

In contrast, the Naoto Kan and Yoshihiko Noda administrations were characterized more by an increased tendency to leave significant decision-making to bureaucrats. The diversion of reconstruction funds that recently caused a public uproar was the result of the central bureaucracy taking advantage of the administration and jockeying for a bigger share of the budget.

The question of redefining the relationship between politicians and bureaucrats remains wholly unresolved. Reducing red tape and allowing more flexibility in bureaucratic appointments would be the first step. A bill to centralize the personnel management of all senior ministry and agency officials by establishing a Cabinet personnel affairs bureau was submitted three times by the coalition Liberal Democratic Party (LDP)-New Komeito government and the DPJ government but has been met with the unfortunate fate of being scrapped. Postponement of pressing concerns such as this is no longer acceptable.

Learning from the lessons of the last three years, politicians must search for a system that will make full functional use of bureaucrats; it goes without saying that bureaucrat bashing must be avoided. Many issues await reform, including the budget-drafting process and the disclosure of public information.

The DPJ has upheld regional sovereignty reform as being on the same level of importance as politician-led decision making in achieving its goal of breaking with bureaucracy-centered politics. This is based on the idea that through decentralization and increased restriction on the role of central government offices, regional areas around the country will regain vitality, leaving more of the national government's manpower for other issues such as foreign diplomacy and defense, and economic policy.

The Act on the Forum for Deliberation between National and Local Governments was passed in 2011, pushing into motion the abolition and review of regulations that had until then allowed central government offices to restrict the administration of local municipalities. Regional administration has achieved increased freedom, and it is inappropriate to one-sidedly judge regional sovereignty reform as little more than an empty slogan.

Little headway was made, however, regarding items that faced fierce resistance from central government offices, such as the transfer of local branches of central government agencies to regional municipalities. Because debate had been pushed forward without a clear vision of the future distribution of roles between the central and regional governments, opinions were split even within regional municipalities.

In the next election, parties such as the LDP, the New Komeito and the Japan Restoration Party (JRP) are seeking debate on possible "doshusei" regional administrative reform -- reorganizing prefectural governments into larger local bodies. The system is indeed an attractive option in boldly assigning power to regional blocks and promoting decentralization.

However, in considering regional administrative reform, it is important to indicate a clear vision of the distribution of roles and authority between central and regional governments, as well as financial resource allocation. The fact that there was once a push for a centralized form of "doshu" administration must be examined. If "doshu" administration is to be introduced to facilitate decentralization, it's only logical to take a proactive stance toward the preliminary step of transferring local branches of central government agencies to regional municipalities.

As a step toward adopting the "doshu" system, the JRP is advocating that consumption tax be levied at the regional level, and the abolition of local tax grants. How does the party believe the burden should be shared between central and regional governments, at a time when social security costs are only expected

to rise? If the party suggests that local taxes levied under current prefectural and municipal demarcations be used for fiscal management, it must explain how it will gain the approval of residents to do so.

The public's distrust toward politics was surely aggravated with the collapse of the DPJ's 2009 election manifesto, created without an adequate assessment of government coffers. It is of course important to come up with a governing structure, but politics does not function if the public cannot trust the political parties and the politicians that comprise the governing structure.

Constant alignment and realignment, in which politicians suddenly switch parties and compromise their fundamental policies shortly before an election, will only invite more distrust from voters. We would like to point out, once again, that recovered confidence in politics constitutes the most extensive foundation for governance.

Dependance on nuke money continues

November 26, 2012

Sentaku Magazine

Municipal nuclear addiction

<http://www.japantimes.co.jp/text/ea20121126a1.html>

Municipalities hosting nuclear power plants throughout Japan have received large amounts of central government subsidies, donations from utilities and lucrative business contracts.

Now, 1½ years after the Fukushima nuclear disasters, those municipalities realize how much their finances depend on the nuclear power-induced money.

"They're like drug addicts cut off from supplies," said a member of the assembly of Niigata Prefecture, which hosts Tokyo Electric Power Co.'s Kashiwazaki-Kariwa nuclear power plant on the Sea of Japan coast. All the reactors at the plant remain shut down after its No. 5 and 6 reactors went offline earlier this year.

After the Fukushima nuclear power plant meltdowns in March 2011, the government refused to give the go-ahead for restarting reactors at other plants throughout Japan that had gone offline for regular

inspections, until it approved reactivating two reactors at Kansai Electric Power Co.'s Oi plant in Fukui Prefecture in July.

"I was scared to death when the Fukushima accident happened, but now I am thankful that the plant resumed operations," said a resident of the town of Oi who works for a subcontractor to the power station. "I think that most of the local people here feel the same way."

Many newspaper reporters and TV crew rushed to Oi — along with anti-nuclear power activists — when the town was at the center of nationwide attention over the government's decision to reactivate the reactors. The man says he did not feel like talking to media crews, who he thought were trying to paint a stereotype picture of the local residents worried about the dangers of reactivating the plant.

There are indeed gaps among local residents and businesses on how they benefit financially from hosting the nuclear plants.

Host prefectures and municipalities receive central government grants based on laws designed to promote development of power generation facilities.

These subsidies are heavily distributed while siting research and construction are going on, but are gradually reduced once the plants starts operation. After that, only the local residents who work at the plant and related businesses continue to get the rewards.

"People who do not benefit from the plant are a minority here. Still, it's true that some residents who don't directly get the money were unhappy about the restart," said an Oi town assemblyman.

Media reports played up the voices of residents who spoke up in opposition to the restart. But it was "never a consensus of the local residents" to oppose the plant restart, the assemblyman said.

People in other host municipalities have mixed feelings toward the restart of the Oi plant.

"A growing number of residents ask me when the plant here will be restarted," says a politician from Tsuruga, Fukui Prefecture, where Japan Atomic Power Co. has a power station and Japan Atomic Energy Agency operates the Monju fast-breeder reactor, which constitutes the core of the nation's nuclear fuel cycle policy.

A reporter with a local newspaper says "special financial consideration" has been given to the Tsugaru area as part of the effort to achieve the nuclear fuel cycle, which he called "a pie in the sky" to begin with. **Money kept flowing in generously from the nuclear community even after Monju was kept mostly offline following a serious sodium coolant leak in 1995.**

The city of Tsuruga has so far received a total of over ¥100 billion in "official" grants. In addition, another ¥10 billion has been provided to the city coffers in the name of "anonymous donations."

Such funds are then used to benefit local businesses in the form of public works projects contracts. One construction industry insider in Fukui Prefecture explains that **bid-rigging is still rampant in such projects in municipalities hosting nuclear plants, resulting in higher costs.**

For example, the municipal government paid well in excess of ¥100 million for a road improvement project, but the sum would have been more than 20 percent less if the same work had been undertaken in other cities, he said.

There will be additional construction orders from a utility after a nuclear plant starts operations — at costs mostly above the industry average, according to a source familiar with the construction industry in the Kansai region. Some of the money will likely go from construction firms to local politicians, the source said.

Kansai Electric Power Co., which operates three nuclear power plants in Fukui Prefecture, is a private company and may not see a problem in paying whatever price is bid for its construction work. But under relevant laws, utilities are allowed to pass all of such costs on to electricity bills charged on consumers.

Even among host municipalities, there are differences in attitudes depending on the extent to which they rely on financial assistance and benefits linked to nuclear energy. In February, Kashiwazaki Mayor Hiroshi Aida expressed his support for a policy to reduce and eventually eliminate the nation's dependence on nuclear energy, but his counterpart at Kariwa said his village cannot survive without the nuclear power station.

While they both host Tepco's Kashiwazaki-Kariwa plant, nuclear plant-related subsidies or donations from the utility account for 14 percent of Kashiwazaki's annual budget and as high as 30 percent of Kariwa's.

An insider in the construction industry in Kashiwazaki says that **local politicians and contractors continue to hunt for new sources of nuclear power-related income even after the Fukushima plant**

disasters. Even though it is now next to impossible to hope for construction of new nuclear plants, they are looking into the possibility of building facilities for temporary storage of spent nuclear fuel from nuclear power plants around the country, or a storage site for contaminated materials from Fukushima, he points out.

Another example of a local community dependent on money related to nuclear facilities is in Rokkasho, Aomori Prefecture, formerly a poverty-stricken village where most of its 11,000 residents relied on agriculture and fisheries for their livelihood. The village is now called one of Japan's wealthiest municipalities.

Nippon Nuclear Fuel Ltd., which plays the central role in the nation's nuclear fuel cycle project, has its headquarters in Rokkasho and accounts for ¥6 billion of the estimated ¥6.8 billion in local tax revenue for fiscal 2012. Rokkasho's general account budget for the year is ¥13 billion — double the amount of a village in Kumamoto Prefecture with roughly the same population.

If the government's plan to phase out nuclear power in Japan is to be implemented, the whole concept of a nuclear fuel cycle in this country would collapse, which in turn would deal a serious blow to Rokkasho's fiscal foundation.

Alarmed by such a prospect, the village assembly in September unanimously adopted a resolution demanding that if the nuclear fuel cycle program were to be stopped, all spent fuels that had been shipped to the reprocessing facility in Rokkasho be moved out of the village immediately. It was an outright threat to both the central government and the power companies.

Spent fuel storage pools at nuclear plants throughout the country are filled almost to capacity, and would overflow if the fuel rods at Rokkasho were returned to the power plants where they originated. This would make it impossible to restart any of the nuclear plants in Japan.

A journalist who covers nuclear power issues for a major newspaper notes that Rokkasho's special status among host municipalities gives it enormous leverage.

"It's like a drug addict engaging in robbery to get the money to buy more narcotics," the journalist said.

The episode shows that the system in which money flows from the nuclear community into host municipalities remains intact, and unless the link is cut off, those municipalities will continue to rely on the nuclear industry.

This is an abridged translation of an article from the November issue of Sentaku, a monthly magazine covering Japanese political, social and economic scenes.

US Committee to draw lessons from 3/11

November 27, 2012

TEPCO failed to take enough safety measures before Fukushima disaster

<http://mainichi.jp/english/english/newsselect/news/20121127p2g00m0dm033000c.html>

TOKYO (Kyodo) -- A senior official of Tokyo Electric Power Co. said Monday at a U.S. panel meeting in Tokyo that the company failed to take sufficient safety measures before last year's disaster at its Fukushima nuclear complex, fearing that taking such measures could "fuel the anxiety" of local people.

On the first day of the U.S. National Academy of Sciences' committee meeting through Wednesday, Akira Kawano, general manager of Tokyo Electric's Nuclear International Relations and Strategy Group, said the company "was concerned that safety measures, if taken, might rather fuel the anxiety of local people."

Kawano also said the nuclear crisis was caused because multiple protection measures at the complex were "not enough to fend off the tsunami that was beyond earlier assumptions."

Kiyoshi Kurokawa, who headed a Japanese Diet-appointed panel to investigate the Fukushima disaster, cited findings of his panel and told the U.S. committee those in responsible positions assumed nuclear power plant accidents would not occur.

The committee is tasked by the U.S. Congress to compile a report by the spring of 2014 to draw lessons from the nuclear crisis at the Fukushima plant crippled by the March 2011 earthquake and subsequent tsunami.

The committee's members will visit the Fukushima Daiichi complex on Friday.

How to waste public money

November 29, 2012

Gov't-funded nuclear body outsourced projects worth 23 mil. yen to sum up accident reports

<http://mainichi.jp/english/english/newsselect/news/20121129p2a00m0na003000c.html>

The government-funded Japan Nuclear Energy Safety Organization (JNES) outsourced four projects worth about 23 million yen to summarize reports on the Fukushima nuclear accident that had been compiled separately by the government, Diet and private investigation committees, it has been learned.

The JNES explained that it had done so due to a "manpower shortage," but the revelation would likely call into **question whether there was in fact a need for the government-funded nuclear organization to spend such a large amount of money to summarize reports that had already been released and publicized.**

Of the four companies that received the orders from the JNES, two are **Mitsubishi Heavy Industries Ltd.**, which produces nuclear plants, and an affiliated company. The JNES's budget is about 20 billion yen, and most of it comes from grants for management expenses from the central government. Therefore, the revelation shed light on the fact that government subsidies were funneled to companies in the nuclear industry, which is regulated by the government.

Three companies, including Energis Co., Mitsubishi Heavy Industries' affiliate firm in Kobe, Hyogo Prefecture, received orders for three projects -- worth about 2.9 million yen each -- to summarize reports compiled by the government, Diet and private investigation committees. In June this year, the JNES was asked by the Cabinet Secretariat's Office for the Preparation of Nuclear Safety Regulatory Organization Reform to lecture on the content of the nuclear investigation panel reports at a training session for nuclear regulatory agency staff. Then in July, the JNES placed orders for the projects to summarize the investigation panel reports on a no-bid contract basis.

The remaining project was on research on the behavior of local evacuees at the time of the accident at the Fukushima No. 1 Nuclear Power Plant. Under competitive bidding organized by the JNES for the project, Mitsubishi Heavy Industries won the order in July after proposing to sort out the content of the investigation panel reports in chronological order and evaluate them. The order was worth about 14.17 million yen.

Chuo University professor Shuya Nomura, who had served as a member of the Diet investigation committee, said it was clearly a waste to spend over 20 million yen for the summary of the reports. The

general public would never accept that, he said. If there was anything not understandable in the reports, they should have asked investigation committee members, he added.

TEPCO's safety cultured blamed- again

November 29, 2012

'Something wrong' in TEPCO's safety culture: regulatory body chief

<http://mainichi.jp/english/english/newsselect/news/20121129p2g00m0dm035000c.html>

TOKYO (Kyodo) -- The chief of Japan's nuclear regulatory authority on Wednesday suggested that Tokyo Electric Power Co. needs to improve its safety culture if it wants to resume its idled reactors, touching on a series of problems seen before the nuclear crisis at the Fukushima Daiichi complex last year.

Referring to deformed sections of spent fuel rods at TEPCO's Kashiwazaki-Kariwa plant in Niigata Prefecture and the revelation in 2002 of the utility's coverup of defects, Shunichi Tanaka told a press conference, "To tell the truth, I think there may be something wrong (with this utility)."

"People on site, with their enthusiasm, knowledge and ability, should serve as a defense that prevents accidents and problems from occurring. But I wonder whether that function is working properly," he said, stressing the need for a change if the utility wants to "keep operating nuclear plants."

TEPCO operates the Fukushima Daiichi and Daini plants, in addition to the Kashiwazaki-Kariwa plant, none of which are currently online. TEPCO is aiming to restart reactors at the Kashiwazaki-Kariwa plant from April next year.

Earlier in the day, Tanaka ordered the secretariat of the Nuclear Regulation Authority to conduct hearings on the "determination" of TEPCO's management personnel to address the string of problems.

"I know TEPCO's management team is in an extremely difficult situation because it has to deal with the nuclear accident, but I cannot overlook this matter," Tanaka said during a meeting of nuclear regulatory authority members.

More about UN criticism of gov't handling of 3/11 victims

Nuke victim aid falls short: U.N. envoy

AP

<http://www.japantimes.co.jp/text/nn20121128a9.html>

A United Nations rights investigator says the government hasn't done enough to protect the health of residents and workers affected by the Fukushima nuclear accident.

Anand Grover, U.N. special rapporteur on the right to health, said Monday the government has adopted overly optimistic views of radiation risks and has conducted only limited health checks after the partial meltdowns at three of the reactors at the Fukushima No. 1 power plant.

Several investigations, including one conducted by a Diet-appointed panel, have criticized the government for alleged coverups and delays in disclosing key information, causing evacuees to be unnecessarily exposed to radiation. That has also caused deep-rooted public distrust of the government and the nuclear industry.

Although he welcomed ongoing health checks of affected residents, Grover said they are too narrow in scope because they are only intended to cover Fukushima's 2 million people, and that only children are being given thyroid tests, even though the impact of radiation went far beyond Fukushima's borders. He said the health survey should cover "all radiation-affected zones" stretching across much of northeastern Honshu. So far, only one-quarter of Fukushima's population has been covered.

Many nuclear plant workers on short-term contracts have no access to permanent health checks, and many residents are complaining that they have not been allowed access to their own health check results, Grover said.

"The scope of the survey is unfortunately narrow as they draw on the limited lessons from the Chernobyl accident and ignore epidemiological studies that point to cancer as well as other diseases in low-dosage radiation," Grover said. "Chernobyl is not a good example, whose study in the first three years was a blackout. So we don't have data."

He said the government's use of a radiation threshold of 20 millisieverts per year — an annual cap set for nuclear industry workers that is more than 10 times the three-year limit for ordinary citizens — in determining off-limits areas around the plant conveys a misleading message that doses up to that level are safe. The government has emphasized that message by saying in official publications, school booklets and

in conferences that there is no clear evidence of a direct risk of cancer if a person is exposed to radiation doses of up to five times that level.

He said in Chernobyl the obligatory resettlement threshold limit was just one-quarter of Japan's.

There are some studies that say radiation exposures of up to 100 millisieverts per year show no clear evidence of higher cancer risks, he said. "But that is controversial. And there are a lot of studies which indicate otherwise. The government need not say which is right. The government has to err on the side of caution and be inclusive," he said.

Doctors at Fukushima Medical University say the estimated radiation exposure from the crisis was much smaller than from the 1986 Chernobyl nuclear disaster, and that an increased risk of thyroid cancer among children is unlikely. In September, they found thyroid cancer in a teenage girl — the first case in checkups following the Fukushima crisis.

But Shinichi Suzuki, a thyroid expert at the university, said he believes it is too early for radiation from Fukushima to have been responsible because it took about four years before the first cases of thyroid cancer began appearing among children after the Chernobyl accident.

Grover also said the government should work harder to include residents in decision-making, monitoring and implementation of measures that affect their health.

"I personally think experts only know part of the real situation. Communities must be involved," he said. Grover wrapped up an 11-day survey in Fukushima and other areas Monday after submitting a draft interim report of his findings to the government. A final report is to be released in June.

UN Special Rapporteur on Fukushima

<http://www.beyondnuclear.org/home/2012/11/26/un-special-report-on-fukushima-criticizes-handling-of-radiat.html>

UN special report on Fukushima criticizes handling of radiation catastrophe, suggests positive steps forward

http://www.youtube.com/watch?feature=player_embedded&v=DeWz2Xj8jH0UN

Anand Grover, the United Nations *Special Rapporteur* reports on Fukushima, some highlights:

- potassium iodine was not handled properly.
- government did not evacuate properly or communicate radiation doses and implications to the public.
- government neglected hotspots and used 20msv/year limit implying this was safe which is not.
- radiation monitoring stations did not adequately reflect exposure data. Therefore all validated data, alot being collected by private individuals, should be made public.
- provide holistic and comprehensive treatment for ALL radiation effected zones and include wider health consequences than the current health survey.
- err on side of caution and monitor health outcomes for an extensive period of time.
- allow individuals access to their health data and that of their children.
- initiate long-term monitoring of sub-contract workers at the ruined plants.
- evacuation centers did not provide adequate facilities for women with children and the disabled and elderly. Separation of families due to inadequate evacuation procedures has caused unnecessary anguish.
- government needs to strengthened food contamination monitoring.
- adopt an action plan with clear timeline to reduce contamination to 1msv per year.
- restore subsidies to all evacuees so they can make proper decisions about whether to return or leave.
- government ensure that TEPCO is held financially accountable and that taxpayers are not.
- ensure participation of effected people, particularly vulnerable groups during all parts of decision-making process, including health services and decontamination. This is not currently being done.
- implement the “act on protection and support for children, and other victims of the Tepco disaster” which was enacted in June, 2012. This act provides a framework for those affected by the disaster and provides opportunity to enlist affected people in decision-making.

Update on November 28, 2012 by admin

<image: <http://www.beyondnuclear.org/universal/images/transparent.png>>

The position of *UN Special Rapporteur on the right to health* was created in this century. This interim report on the Fukushima disaster appears to represent the first time an investigation has linked health impacts of industrial radiation from a nuclear catastrophe to human rights -- in this case the right to health for both children and adults. A final report will be issued in June of 2013. Stay tuned to Beyond Nuclear for updates. See the UN press release. [NECN.com](http://www.necn.com)

TEPCO releases previously withheld footage

December 1, 2012

Fukushima plant chief defied TEPCO headquarters to protect workers

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201212010043>

By NAOYA KON/ Staff Writer

Exasperated by his superiors, the manager of the Fukushima No. 1 nuclear power plant rejected orders to send workers back into the crippled plant a week after the disaster struck.

“My people have been working day and night for eight straight days,” Masao Yoshida barked at officials of Tokyo Electric Power Co.’s head office in Tokyo during a teleconference on March 18, 2011. “And they’ve been going to the site a number of times. They pour water, make checks and add oil periodically. I cannot make them be exposed to even more radiation.”

TEPCO, the operator of the plant, allowed journalists on Nov. 30 to view the video footage of its in-house teleconference following the disaster.

Like earlier footage released by the utility, the latest clips underscored the chaos and confusion at the plant and TEPCO headquarters after the Great East Japan Earthquake and tsunami caused the triple meltdown.

“All workers are approaching 200 (millisieverts) in exposure or have even topped 200,” Yoshida said. “I cannot tell them to go and connect wires under high radiation.”

Yoshida had asked for an increase in manpower since the accident began. His frustrations over TEPCO’s lack of progress in providing additional support boiled over in the teleconference with the head office.

“If we do the work under a plan with no feasibility, it will end in failure. We cannot do it unless we have thorough help,” he said.

Sakae Muto, an executive vice president at the Tokyo office, could not provide a specific plan for extra help.

“We are now seeking people from a wide range, including former employees, and are planning to figure out the necessary manpower by tomorrow morning,” Muto said. “We will prepare to send those people to you as soon as possible.”

Yoshida stepped down as the plant’s chief for health reasons in December 2011. Muto also resigned.

We'll die if it explodes': Gov't ignored Fukushima plant manager's plea

<http://mainichi.jp/english/english/newsselect/news/20121201p2a00m0na008000c.html>

The government prioritized spraying water from helicopters at the tsunami-hit Fukushima nuclear plant after a high-level political decision, spurning the plant manager's request that water be promptly sprayed from fire engines, footage of a teleconference of the plant operator shows.

Tokyo Electric Power Co. (TEPCO), operator of the crippled Fukushima No. 1 Nuclear Power Plant, released to the media on Nov. 30 the video footage of **about 336 hours of meetings that had been previously been withheld.**

The footage shows teleconferences held between TEPCO headquarters and workers at the plant, as well as with a local accident task force and at other locations between March 16 and 23 and between March 30 and April 6, 2011.

In the meetings, executives and employees talked about a response to the nuclear disaster, such as how water should be poured into a pool holding spent nuclear fuel in the power station's No. 3 reactor building and whether to discharge water contaminated with radioactive substances. It also records the voice of a politician who was at the company headquarters.

In August, the utility had released footage of about 150 hours of TEPCO teleconferences between sometime immediately after the March 11 accident and March 15 last year.

The newly released footage shows that then plant manager Masao Yoshida protested at TEPCO headquarters on March 16 for failing to issue any clear order to spray water into the No. 4 pool for spent nuclear fuel although it was feared that water levels would decline considerably.

"We'll die if it explodes," Yoshida said.

Goshi Hosono, then aide to the prime minister, tried to calm down Yoshida saying, "We'll continue efforts to reduce such risks as much as possible."

Hosono then asked Yoshida whether the plant manager and other workers wanted water to be sprayed from the ground.

"We'd like to do so promptly," Yoshida replied, insisting that water be sprayed from fire engines.

In the end, however, Hosono rejected Yoshida's request, and told him that the government would spray water from Self-Defense Forces (SDF) helicopters. "We made the decision after consulting with Prime Minister Naoto Kan and others in an emergency meeting," Hosono told Yoshida.

At 9:48 a.m. on March 17, SDF helicopters began to drop water onto the plant's No. 3 reactor building. The footage shows employees at TEPCO wavered between hope and despair when they watched the SDF operations on television.

"Good. It hit the target. One more time," one employee said.

"The water hasn't reached the target," he said shortly afterwards. "It's just like a mist."

Plant workers appeared irritated at the headquarters' slow response to the buildup of radioactive water on the premises of the power station.

"There's no time to create a new water tank. Dealing with water is an urgent task," Yoshida said in one of the teleconferences, hinting at the **need to release water contaminated with low levels of radioactive substances into the sea.**

TEPCO went ahead with the release of such tainted water into the sea on April 4, drawing fire from the public.

Of the 336 hours of footage, TEPCO only picked up parts recording discussions on the release of radioactive water into the sea and other matters, edited them into about 110 minutes of footage and uploaded the video to its website (<http://photo.tepco.co.jp>) after altering sections that would otherwise identify individual employees.

Violations of labour standards at Fukushima

December 5, 2012

'Labor violations rife' at Fukushima N-plant

<http://www.yomiuri.co.jp/dy/national/T121204004443.htm>

Jiji Press

Many of those who worked at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear power plant after it was crippled by the March 2011 earthquake and tsunami may have been there under illegal labor conditions, a TEPCO survey revealed Monday.

Such conditions may have applied to nearly half of the employees of subcontractors to companies dealing with work at the plant after the crisis began.

According to the survey, 47.9 percent of such workers said the companies directing them at the plant were different from those that paid their wages. This could indicate disguised subcontracts in violation of the employment security law.

About 36 percent of such workers had not been given written or verbal explanations about their employment terms although the Labor Standards Law requires employers to issue documents setting out employment terms

December 4, 2012

Rampant illegal hiring practices suspected at Fukushima nuke plant

<http://mainichi.jp/english/english/newsselect/news/20121204p2a00m0na024000c.html>

Nearly half of all subcontract workers at the crippled Fukushima No. 1 Nuclear Power Plant received work assignments from companies that were different from those that actually hired them, a revelation that could shed light on rampant illegal hiring practices, according to a survey conducted by Tokyo Electric Power Co. (TEPCO).

The results of the survey released on Dec. 3 show that nearly one-third of subcontract workers at the Fukushima nuclear plant did not receive any written documents on working conditions from their employers. "Deceptive work contracts" are banned under the Employment Security Act. At the same time, the Labor Standards Act requires employers to state working conditions clearly in writing. The Agency for Natural Resources and Energy in the Ministry of Economy, Trade and Industry instructed TEPCO verbally to improve hiring practices on Nov. 3.

The survey was conducted on 3,974 people working for companies that were hired by 27 prime contractors from Sept. 20 to Oct. 18, and 3,186 workers, or 80.2 percent of them, responded to the poll.

The survey asked 2,423 workers, excluding managers, whether they received work assignments at workplaces from the same companies as those from which they actually received their pay. Some 1,173 of

them, or 48 percent, said "yes," while 1,160 of them, or 47.9 percent, said "no." The results suggest the possibility that nearly half of the subcontract workers were hired under "deceptive work contracts."

Asked about what they were forced or instructed by their employers to do, 158 workers said they had been told by their employers to "work on the spot as instructed by other companies." The survey shows 125 workers being instructed by their employers to "write down the name of a different company in documents to be submitted to prime contractors or TEPCO."

It also shows that 1,146 workers, or 36 percent of all respondents, did not receive any written documents on working conditions such as the nature of their work, workplaces and wages from their employers. Furthermore, 198 workers, or 6.2 percent, did not even receive verbal explanations from their employers.

On hourly wages, 71.8 percent of the workers received at least 837 yen, 2.8 percent of the workers received at least 658 yen but less than 837 yen, 1 percent received between 645 yen and 657 yen and 1.1 percent of them received less than 645 yen.

Masayuki Ono, a TEPCO official, said, "We realize that there are conditions that need to be improved."

Active faults - 50,000 years in 1987 - 400,000 years now

December 7, 2012

Dangerous fault alleged 25 years ago at Shika nuclear plant site

<http://mainichi.jp/english/english/newsselect/news/20121207p2g00m0dm074000c.html>

TOKYO (Kyodo) -- Experts had said there was a dangerous fault at the planned site of the Shika nuclear plant in Ishikawa Prefecture in 1987, well before a similar suspicion arose earlier this year, according to government documents given Friday.

The previous claim had been left unaddressed until the government stated in July that a fault beneath the first reactor of the two-reactor nuclear plant was active and dangerous, triggering a detailed survey by the plant's operator, Hokuriku Electric Power Co.

In Japan, nuclear reactors are not allowed to be built on any site that includes an active fault.

If survey determines that the fault is active, the power utility could be forced to decommission the reactor, currently offline, and reconsider its safety check standards for nuclear plant sites.

In an interim survey report given to the Nuclear Regulation Authority on Friday, Hokuriku Electric said it found no data indicating the fault underneath the reactor is active. Its final survey report is planned to come by the end of June.

The documents released by the NRA said that experts serving as advisers to the government checked the site and found a shear alleged to have been caused by an active fault in May-June 1987, before the construction of the reactor began in 1988.

A Hokuriku Electric official said the shear was then concluded to have been caused by tidal erosion and posed no problem.

The shear, which was found in a layer that was 120,000 to 130,000 years old, might have failed to attract attention because safety check standards in 1987 had defined a dangerous fault as having been active up to 50,000 years ago.

The standards were revised in 2006 to define it as having done so up to 130,000 years ago. **A dangerous fault is now defined as having been active up to 400,000 years ago.**

Monju reactor - Somebody didn't do their jobs properly

December 6, 2012

Violations of safety regulations found at Monju reactor

- Previous Article New expressway will have to accommodate burning reed bed
- Next Article Japan scientists took utility money

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201212060044

By JIN NISHIKAWA/ Staff Writer

The Japan Atomic Energy Agency failed to take proper procedures, including confirming safety, when it postponed inspections for nearly 10,000 pieces of equipment at the Monju prototype fast-breeder reactor, an industry watchdog said.

The Nuclear Regulation Authority said Dec. 5 that the agency extended inspection intervals at the reactor in Fukui Prefecture in violation of the safety program based on the Nuclear Reactor Regulation Law.

The NRA will soon order the agency to investigate the cause and compile measures to prevent a recurrence.

Under the safety program, if inspection intervals for equipment are to be extended, the inspection plans must be revised after confirmation that the extensions will not compromise safety.

A total of 40,000 pieces of equipment at the Monju reactor are subject to inspections. However, the Japan Atomic Energy Agency did not revise its inspection plans for 9,679 items since July 2010.

For 1,551 of these items, including key equipment to detect neutrons in the reactor, the agency did not confirm safety or set the next inspection dates, according to the NRA and other sources.

Follow-up panel

December 7, 2012

Response to Fukushima accident probe faces check

http://www3.nhk.or.jp/daily/english/20121207_28.html

A panel has begun checking whether Japan's government is following the advice of 3 investigative commissions that probed the Fukushima nuclear accident.

The 15-member follow-up panel consists of experts and academics who sat on the government, Diet and private commissions that investigated last year's accident.

Private commission chief Koichi Kitazawa was appointed on Friday to head the panel. At its first meeting, he told members that they should check whether the government's new Nuclear Regulation Authority is truly functioning as an independent body.

The watchdog was launched in September to improve safety supervision at nuclear plants.

One member said the panel should verify the government's follow-up measures with the understanding that the Fukushima accident isn't over.

The 3 investigative commissions have pointed out flaws in the government's crisis management, disaster preparedness and nuclear safety regulations.

The follow-up panel is due to interview the Nuclear Regulation Authority officials. It will write an interim report by next March.

Conflict of interest (again) and twisted views about radiation risk

December 6, 2012

Japan scientists took utility money

THE ASSOCIATED PRESS

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201212060087>

Influential Japanese scientists who help set national radiation exposure limits have for years had trips paid for by the country's nuclear plant operators to attend overseas meetings of the world's top academic group on radiation safety.

The potential conflict of interest is revealed in one sentence buried in a 600-page parliamentary investigation into last year's Fukushima No. 1 nuclear power plant disaster and pointed out to The Associated Press by a medical doctor on the 10-person investigation panel.

Some of these same scientists have consistently given optimistic assessments about the health risks of radiation, interviews with the scientists and government documents show. Their pivotal role in setting policy after the March 2011 tsunami and ensuing nuclear meltdowns meant the difference between schoolchildren playing outside or indoors and families staying or evacuating.

One leading scientist, Ohtsura Niwa, acknowledged that the electricity industry pays for flights and hotels to go to meetings of the International Commission on Radiological Protection, and for overseas members visiting Japan. He denied that the funding influences his science, and stressed that he stands behind his view that continuing radiation worries about Fukushima are overblown.

"Those who evacuated just want to believe in the dangers of radiation to justify the action they took," Niwa told the AP in an interview.

The official stance of the International Commission on Radiological Protection is that the health risks from radiation become zero only with zero exposure. But some of the eight Japanese ICRP members do not subscribe to that view, asserting that low dose radiation is harmless or the risks are negligible.

The doctor on the parliamentary panel, Hisako Sakiyama, is outraged about utility funding for Japan's ICRP members. She fears that radiation standards are being set at a lenient level to limit costly evacuations.

“The assertion of the utilities became the rule. That's ethically unacceptable. People's health is at stake," she said. "The view was twisted so it came out as though there is no clear evidence of the risks, or that we simply don't know."

The ICRP, based in Ottawa, Canada, does not take a stand on any nation's policy, leaving that to each government. It is a charity that relies heavily on donations, and members' funding varies by nation. The group brings scientists together to study radiation effects on health and the environment, as well as the impact of disasters such as Chernobyl and Fukushima. In Japan, ICRP members sit on key panels at the prime minister's office and the education ministry that set radiation safety policy.

The Fukushima meltdowns, the worst nuclear disaster since Chernobyl, brought a higher level of scrutiny to Japan's nuclear industry, revealing close ties between the regulators and the regulated. Last month, some members of a panel that sets nuclear plant safety standards acknowledged they received research and other grant money from utility companies and plant manufacturers. The funding is not illegal in Japan.

Niwa, the only Japanese member to sit on the main ICRP committee, defended utility support for travel expenses, which comes from the Federation of Electric Power Companies of Japan through another radiation organization. Costs add up, he said, and he has spent tens of thousands of yen (thousands of dollars) of his personal money on ICRP projects and efforts to decontaminate Fukushima. All ICRP members fly economy, except for long flights such as between Argentina and Japan, he said.

The Federation declined comment.

Clouding the debate about radiation risks are the multiple causes of cancer, including diet, smoking and other habits. That's why it is extremely difficult to prove any direct link between an individual's cancer and radiation, or pinpoint where one cause begins and another ends.

The ICRP recommends keeping radiation exposure down to 1 millisievert per year and up to 20 millisieverts in a short-term emergency, a standard that takes into account the lessons of Chernobyl.

"Health risks from annual radiation exposure of 20 millisieverts, the current level for issuance of orders to evacuate an affected area, are quite small particularly when compared against the risks from other carcinogenic factors," the ICRP says.

The risk of getting cancer at 20 millisieverts raises the already existing 25 percent chance by an estimated 0.1 percent, according to French ICRP member Jacques Lochard, who visits Japan often to consult on Fukushima.

While that's low, he says it's not zero, so his view is that you should do all you can to reduce exposure.

Kazuo Sakai, a Japanese ICRP member, said he was interested in debunking that generally accepted view. Known as the "linear no threshold" model of radiation risk, the ICRP-backed position considers radiation harmful even at low doses with no threshold below which exposure is safe.

Sakai called that model a mere "tool," and possibly not scientifically sound.

He said his studies on salamanders and other animal life since the Fukushima disaster have shown no ill effects, including genetic damage, and so humans, exposed to far lower levels of radiation, are safe.

"No serious health effects are expected for regular people," he said.

The parliamentary investigation found that utilities have repeatedly tried to push Japanese ICRP members toward a lenient standard on radiation from as far back as 2007.

Internal records at the Federation of Electric Power Companies obtained by the investigative committee showed officials rejoicing over how their views were getting reflected in ICRP Japan statements.

Even earlier, Sakai received utility money for his research into low-dose radiation during a 1999-2006 tenure at the Central Research Institute of Electric Power Industry, an organization funded by the utilities.

But he said that before his hiring he anticipated pressures to come up with research favorable to the nuclear industry, and he made it clear his science would not be improperly influenced.

Niwa, a professor at Fukushima Medical University, said that residents need to stay in Fukushima if at all possible, partly because they would face discrimination in marriage elsewhere in Japan from what he said were unfounded fears about radiation and genetic defects.

Setting off such fears are medical checks on the thyroids of Fukushima children that found some nodules or growths that are not cancerous but not normal.

No one knows for sure what this means, but Yoshiharu Yonekura, president of the National Institute of Radiological Sciences and an ICRP member, brushes off the worries and says such abnormalities are common.

The risk is such a non-concern in his mind that he says with a smile: "Low-dose radiation may be even good for you."

THE ASSOCIATED PRESS

New panel to ensure transparency

December 8, 2012

Panel set up to monitor new nuclear watchdog

<http://www.japantimes.co.jp/text/nn20121208a5.html>

By KAZUAKI NAGATA

Staff writer

The government set up a panel Friday to monitor whether the nation's new nuclear administrative and regulatory bodies are following the recommendations made by the two committees set up by the state and the Diet that investigated the causes of the Fukushima catastrophe.

The panel will be chaired by **Koichi Kitazawa, who led a team set up by the Rebuild Japan Initiative Foundation, better known as the "private sector" Fukushima investigation panel.** The panel is to compile its first report around March after holding several hearings with government officials and regulators from the Nuclear Regulation Authority.

The NRA, a new authority that got off the ground in September, is legally independent but still in its infancy, so the panel will check how the state and NRA are following the recommendations of the Fukushima panels, said Kitazawa, who headed the Japan Science and Technology Agency.

For its **March report**, the panel, which is expected to monitor the government's nuclear regulatory activities for three years, will basically focus on how the new system is working and whether measures to prevent nuclear disasters are actually improving.

The triple meltdown at the Fukushima No. 1 power plant occurred after the March 11, 2011, magnitude 9 megaquake rocked the Tohoku region and set off tsunami up to 15 meters high that slammed into the plant, knocked out all electricity and took out vital reactor cooling systems.

The two panels said the regulatory system was flawed because it lacked independence from the Ministry of Economy, Trade and Industry, which was tasked for decades with promoting the nuclear safety myth.

The panels also said the country was ill-prepared for the Fukushima crisis because the notion of handling a disaster of that scale, despite the warnings, was totally out of its scope.

Thus, the investigation panels stressed the need for a strongly independent regulator with greater expertise. **Such an authority should actively disclose information to maintain high transparency**, the panels concluded.

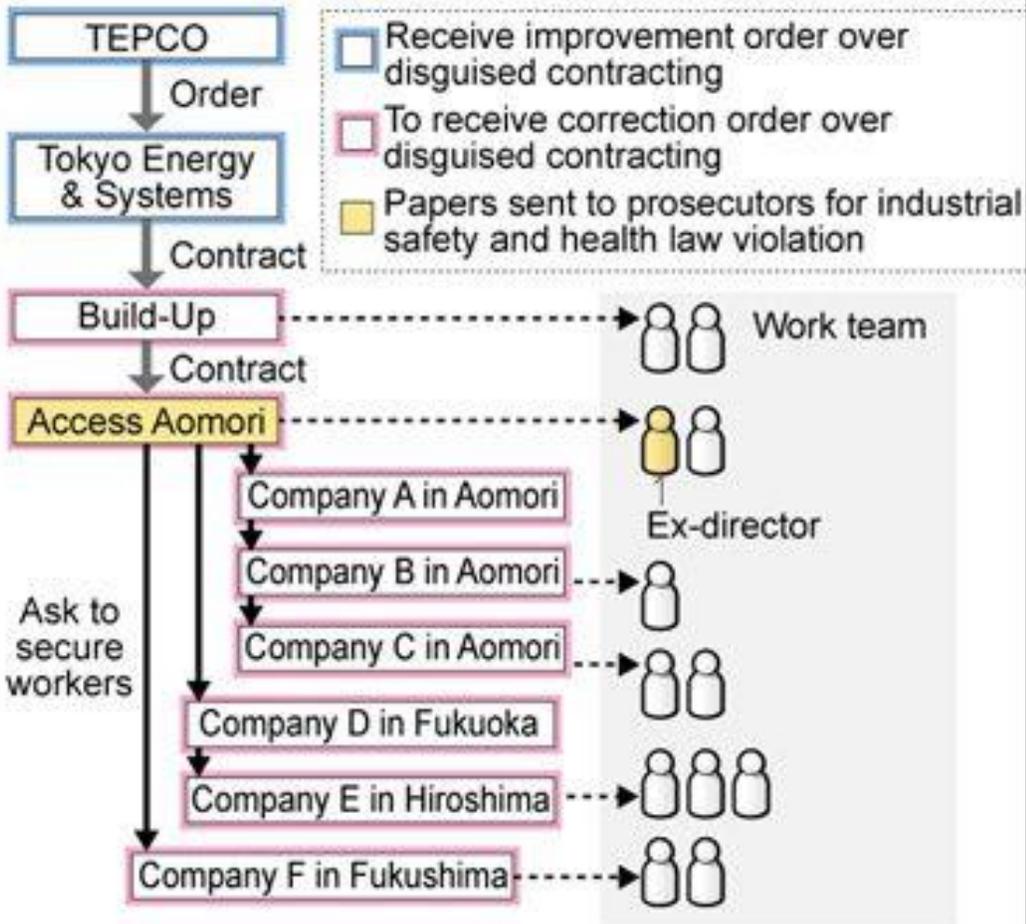

Other recommendations include a drastic review of the government's crisis-management and disaster-prevention systems to prevent a repeat of the disarray that afflicted the chain of command in the early stages of the crisis and hampered the evacuation of residents in harm's way. The new panel launched Friday also includes **Yotaro Hatamura, who headed the state's Fukushima panel, and Kiyoshi Kurokawa, who led the Diet's version**, as well as Fukushima Gov. Yuhei Sato.

TEPCO at the top of illegal contractors structure

8 companies face order to stop illegal labor practice at Fukushima plant

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201212100065

Companies in radiation dose cover-up at Fukushima plant

December 10, 2012

By TOSHIO TADA/ Staff Writer

The government will order eight companies to end an illegal dispatch arrangement that allowed a subcontractor to instruct workers to labor under dangerous conditions at the stricken Fukushima nuclear plant.

The labor ministry has already called on plant operator Tokyo Electric Power Co. and Tokyo Energy & Systems Inc., a TEPCO group company, to enhance monitoring over subcontractors at the plant.

The decision means the ministry has effectively acknowledged that an illegal structure of multilayer contractors threatened the safety of workers. TEPCO has consistently denied any illegal setup.

In the scandal, the president of Access Aomori, a construction company in Aomori Prefecture, ordered workers to cover their dosimeters with lead plates to keep radiation dose readings artificially low during pipe work on Dec. 1, 2011, at the Fukushima No. 1 nuclear plant. The workers were not allowed to continue working at a nuclear plant if their dose readings exceeded safety levels.

A criminal investigation is expected against Access Aomori and its president over the practice.

But Access Aomori also violated labor laws by engaging in a practice known as disguised contracting. Although it was a subcontractor, it accepted 10 workers dispatched by other companies and directly gave them instructions for work at the plant.

TEPCO awarded Access Aomori a contract through its parent, Build-Up, a construction company in Fukushima Prefecture. The president of Access Aomori, 55, served as a director at Build-Up.

The labor ministry concluded that the arrangement violated the Employment Security Law as well as the Worker Dispatch Law, which bans dispatching temporary workers to the construction industry.

It plans to order Build-Up, Access Aomori and six other businesses, which are either small or owned by individual operators, to end the practice.

“We knew it was illegal, but we had no other choice to secure profits,” said the manager of one of the six businesses.

It will be the first time for the labor ministry to issue a correction order to more than one company in connection with recovery work at the Fukushima plant.

The ministry effectively recognized the structure of multilayer contractors with TEPCO at the top. It called on TEPCO and Tokyo Energy & Systems to improve the situation because the arrangement makes it unclear who controls the safety of workers.

The ministry also acknowledges that it was difficult for the workers to reject the orders from Access Aomori because of their unstable employment status.

The practice of disguised contracting has come under fire because the employers' responsibility for workers becomes ambiguous and the businesses involved keep the workers' wages low.

In February, the labor ministry said the practice appeared to have spread to recovery work at the Fukushima No. 1 plant and called for improvements.

TEPCO has not made a full-scale investigation, denying violations on grounds that it asked primary contractors to abide by laws and regulations.

But after it received the labor ministry's improvement order, TEPCO said it will ask primary contractors to prevent a recurrence and will conduct on-site inspections to confirm compliance.

A labor standards inspection office in Fukushima Prefecture on Dec. 7 sent papers to the Fukushima District Public Prosecutors Office, accusing Access Aomori and its president of violating the Industrial Safety and Health Law.

According to the labor standards inspection office, the president ordered four workers, including one Access Aomori employee, to cover their dosimeters with 3-millimeter-thick lead plates, which kept dose records 30 percent lower.

More than 30 years of cover-up

Urasoko fault near Tsuruga nuclear plant underestimated for over 30 years

<http://mainichi.jp/english/english/newsselect/news/20121211p2a00m0na022000c.html>

It has been more than 30 years since the Urasoko fault, which lies near the Tsuruga nuclear power plant in Fukui Prefecture, was first suspected of being active.

"If we had known that there was an active fault on the Tsuruga site, we would never have built nuclear reactors there," Nuclear Regulation Authority (NRA) commissioner Kunihiko Shimazaki, head of the team of experts who examined the Tsuruga nuclear station, said at a news conference on Dec. 10.

Not only has it been more than three decades since the Urasoko fault was suspected of being active, the central government took two years to acknowledge a crush zone under the Tsuruga plant's No. 2 reactor could move in tandem with the major fault line after that fact had been pointed out.

Nagoya University professor Yasuhiro Suzuki says that suspicions have surfaced again that "unreasonable interpretations of inspection results" had been made repeatedly, resulting in lax safety assessments. A similar pattern is also seen at other nuclear plants, meaning many other reactors may face challenges to reactivation.

The Urasoko fault was unknown at the time construction of the Tsuruga station's No. 1 reactor was approved in 1966, but in the 1970s experts began pointing out the fault could be active. Tsuruga plant operator Japan Atomic Power Co. applied to build the plant's No. 2 reactor in 1979, insisting that the Urasoko fault was not active. Although the central government instructed Japan Atomic Power to conduct additional research and dig a test trench during the screening process, it accepted Japan Atomic Power's assertions and green-lit the No. 2 reactor in 1982.

Showing drawings from additional research at the NRA panel meeting on Dec. 10, Suzuki said, "We can clearly see a fault structure. It is regrettable that such information was not used."

In "Active Faults in Japan: A New Edition," published in 1991, the Urasoko fault was introduced as an active fault. When Japan Atomic Power applied to build a third and fourth reactor at Tsuruga in 2004, however, the utility declared that the Urasoko fault was not active.

In 2005, the now-defunct Nuclear and Industrial Safety Agency (NISA) at the Ministry of Economy, Trade and Industry instructed Japan Atomic Power to conduct additional research. As instructed by the agency and experts, the company dug a trench and found traces of fault movement less than 4,000 years ago. At long last in 2008, the company acknowledged that Urasoko was an active fault.

Experts estimated that the 25-kilometer-long Urasoko fault could cause quakes as large as magnitude 7.2, resulting in ground motion of up to 800 gals -- far higher than the 532 gals projected previously. Japan Atomic Power, however, has insisted that its reactor and other buildings would have no problem surviving such a temblor. In April 2010, NISA concluded that Japan Atomic Power's assertions were reasonable.

Multiple experts disagreed, and issued a warning stating, "Because the Urasoko fault lies extremely close (to the Tsuruga plant), the possibility of crush zones on the plant premises, including those beneath reactor buildings, jolting out of alignment must be taken into account."

Despite this, Japan Atomic Power did not conduct any further on-site checks before the Great East Japan Earthquake of March 2011. In November 2011, NISA instructed Japan Atomic Power to conduct inspections. During inspections made in April together with experts, suspicions emerged that the crush zone right beneath the No. 2 reactor is an active fault that could move in tandem with the Urasoko fault.

Furthermore, in March this year a team of experts from the National Institute of Advanced Industrial Science and Technology concluded that the Urasoko fault is in fact at least 35 kilometers long and could trigger 7.4-magnitude earthquakes that release twice the energy previously estimated.

NISA started to conduct inspections of faults on the premises of all nuclear power plants across the country in July this year, and the NRA took over the mission thereafter.

TEPCO's mea culpa

Tepco president admits No. 1 plant workers hired via murky system

AP

<http://www.japantimes.co.jp/text/nn20121211x3.html>

The head of Tokyo Electric Power Co. has acknowledged that hundreds of workers at the Fukushima No. 1 plant were mobilized through a murky hiring system.

President Naomi Hirose on Monday attributed the hiring problem to high worker turnover at the highly contaminated work site, adding that the problem became prevalent as Tepco tried desperately to recruit workers willing to take jobs with high risks of radiation exposure.

The plant has been substantially stabilized since it was devastated by the March 2011 quake and tsunami, but full decommissioning is expected to take decades.

Hirose said Tepco is working to fix the hiring problem, which he attributed to an industrywide hierarchical contract system. But he said that **the deep-rooted practice cannot be changed overnight, and that a full overhaul will be difficult.**

"Ideally, it would be best if we reform the contract hiring system and start from there, but it will be extremely time-consuming," he said. "It's a difficult task we cannot do on our own. It will take heavy-duty work. It involves history and business ties, and could even hurt the industry."

In a recent Tepco survey of some 2,400 contract workers, dozens said they were instructed to falsify affiliations, while some complained they never received a written contract. The survey, taken in September and October, showed that about half were being paid by different companies than the ones that hired them — an indication of illegal labor contracts.

Nearly 90 percent said their employers were ranked from second to fourth in the hierarchy of subcontractors. About one-quarter said their employers never notified them of their radiation exposure details.

The hiring problem has intensified since last year's disaster, and some workers have come forward and complained that their salaries have been siphoned off or allowances not given.

Hirose said securing a workforce that can last through decades-long postdisaster operations will be critical to cleanup efforts.

Japan and foreign expertise

December 15, 2012

INSIGHT: Japan largely excludes foreign firms in Fukushima clean-up

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201212150015>

REUTERS

Nearly two years after a massive earthquake and tsunami caused meltdowns at the Fukushima nuclear plant, Japan is failing to keep a pledge to tap global expertise to decommission its crippled reactors, executives at nuclear contractors from the United States and Europe say.

The result, they warn, is that a process expected to take more than 30 years and cost at least \$15 billion could take longer and cost more as contracts are channeled through domestic heavyweights such as nuclear reactor makers Toshiba Corp and Hitachi Ltd, and general contractors such as Taisei Corp.

A review of bidding records by Reuters shows companies from outside Japan have failed to win any of the 21 contracts awarded this year to develop technologies crucial for the unprecedented job of scrapping the four damaged reactors at Fukushima.

"There appears to be a desire to treat this as a science project and reinvent the wheel," Jeffrey Merrifield, senior vice president of U.S. nuclear engineering firm Shaw Group Inc.'s power division told Reuters.

Contracts awarded since January represent only the initial work at Fukushima. But a half-dozen executives at companies with nuclear industry experience raised questions about the Japanese government's and TEPCO's oversight of the process.

Some executives worry that being shut out now risks their ability to tap a growth market, since Japan could scrap dozens of reactors over the coming decades. Most asked not be named for fear of jeopardizing their ability to win future work in Japan.

Takuya Hattori, president of the Japan Atomic Industrial Forum, a group representing the nuclear industry in Japan, said the government has not been responsive to complaints about the bidding process. "They are shutting that criticism out incredibly deftly," said Hattori, a 36-year veteran of Tokyo Electric Power Co Inc., the operator of the Fukushima plant.

A 9.0 earthquake on March 11 triggered a 15-metre tsunami that smashed into the 40-year-old seaside Fukushima Daiichi nuclear plant, setting off a series of events that caused its reactors to start melting down.

Hydrogen explosions scattered debris across the complex and sent up a plume of radioactive steam that forced the evacuation of more than 80,000 residents near the plant about 240 km (150 miles) northeast of Tokyo.

The repeated failures that dogged the government and TEPCO in the months after the disaster undercut confidence in their response to the disaster and dismayed outside experts, given corporate Japan's reputation for relentless organization.

After that, Japan promised to accept more outside assistance.

COLD SHUTDOWN

The Fukushima plant was declared to be in "cold shutdown" a year ago, a stable phase when water used to cool fuel rods remains below its boiling point. That marked the start of a decommissioning process that could take 40 years.

Under a roadmap drafted by TEPCO, radioactive fuel rods will be removed from Reactor No. 4 starting next November. After that, melted fuel inside three other reactors damaged by meltdowns and hydrogen explosions would be extracted. The work is projected to take more than a decade.

A government oversight panel has estimated it will cost \$15 billion to decommission the reactors, not counting for the costs of disposing of radioactive waste.

But large uncertainties hang over the overall cost of the disaster. TEPCO recently said compensation for evacuated residents and decontamination of areas outside the boundary of the Fukushima plant could double from previous estimates to almost \$125 billion.

Louisiana-based Shaw Group worked on clean-up projects after the Three Mile Island and Chernobyl accidents and in decommissioning eight U.S. commercial reactors.

"There seems to be a real desire to rely on Japanese contractors to do this work," Merrifield said. "You can try and do it all yourself, which takes a lot more time without benefit of prior experience, making a lot of mistakes along the way."

But an executive with a Japanese nuclear firm said that given the long-term nature of the clean-up project, it makes sense to go with firms at home.

"Foreign firms simply sell their product without providing back-up services or maintenance. We can't sign a contract with a company that we can't get in touch with immediately and one that will rush to deal with any problems right away," the executive said.

TRANSPARENCY 'NO. 1 PRIORITY'

The majority of contracts for Fukushima have been awarded directly by TEPCO, which outsources decontamination and debris-clearing to general contractors. Decontamination contracts outside of the plant site are handled by Japan's environment ministry and local governments.

Japan's Ministry of Economy, Trade and Industry has so far allocated about \$11 million to Toshiba Corp, Mitsubishi Heavy Industries and Hitachi GE Nuclear to fund technology development for the year to March. That includes a project to develop sensing robots that can enter highly radiated areas to pinpoint the site of the meltdown.

"This is a project we are pursuing with taxpayer funds, so we believe it is our No. 1 priority to be transparent," said Kentaro Funaki, director of the ministry's nuclear accident restoration office.

Funaki said METI was pushing to double the bidding period to four weeks and pointed to a recent contract offered by Japanese radiation management firm Atox Co Ltd specifically to foreign contractors as a sign of increased openness.

METI and the heavy manufacturers held workshops in March and April to gather information on foreign technology that could be used at Fukushima.

British Amec PLC, Areva, Westinghouse and the Idaho National Laboratory pitched technologies that can be used to remotely inspect and repair damaged reactors.

Japan's three major nuclear companies say they post notices of bids on their websites.

Hitachi GE Nuclear posts bid notices on its website in both English and Japanese. The company said it was working as quickly as possible to restore and rebuild Fukushima and the short bidding periods were not designed to shut out foreign firms.

Toshiba said it posted contracts on its website, but deletes them after a vendor is selected. Contracts are awarded by an outside panel of experts with the highest score given to technology and cost. Toshiba declined to comment on the lack of foreign involvement in research contracts.

Mitsubishi Heavy recently posted a notice on its website that it would soon invite bids for equipment to investigate the pressure containment vessels at the Fukushima Daiichi plant.

"THE DOORS ARE OPEN"

Japan's government and TEPCO have emphasized the importance of international involvement in the Fukushima clean-up. In an interview with Reuters in October, TEPCO president Naomi Hirose said the utility was seeking expertise from all over the world.

To be sure, U.S. and European companies have had some success.

California-based Kurion and French nuclear giant Areva designed the first water purification systems at Fukushima. That was followed by equipment supplied by Toshiba and Shaw that doubled TEPCO's ability to process contaminated water. The latest water purification equipment made by Toshiba and Utah-based Energy Solutions was installed earlier this year.

"I would tell you that if the roles were reversed, Americans would want American firms leading the way," said John Raymont, president and CEO of Kurion. "For companies that have the special know-how that is transferable, the doors are open."

Shaw's Merrifield said his company was no longer working on any projects in Fukushima. Shaw sold its stake in nuclear plant company Westinghouse Electric Co to Toshiba for \$1.6 billion in October.

Many of Japan's 50 nuclear plants are expected to be decommissioned in the coming years. The Japanese government has pledged to eliminate nuclear power from the energy mix by the 2030s and popular opinion is turning against the industry.

"At the end of the day, it's not about just Fukushima," said one executive at an overseas engineering company, who asked not to be named because of the company's business interests in Japan. "You get in now, establish a relationship and build trust and there is a lot of work that you can do."

Vested interests in Fukui Prefecture?

December 15, 2012

Idled reactors' fate holds center stage in nuclear hub Fukui

Verdict on fault holds candidates, hosts hostage

<http://www.japantimes.co.jp/text/nn20121215f1.html>

By ERIC JOHNSTON

Staff writer

TSURUGA, Fukui Pref. — On a snowy afternoon just a few days before the general election, local politicians and many residents of Fukui Prefecture were in a state of shock and wondering what the future holds, after a team of nuclear experts declared it is highly likely that a fault under the Tsuruga nuclear plant's reactor 2 is active.

"We're heavily reliant on the atomic energy industry for jobs and for the subsidies it brings. What are we going to do if the power stations aren't reactivated?" asked Ayako Kawamura, 32, a local resident. She is not alone in posing that question. The prefecture hosts 13 commercial atomic energy reactors, as well as the Monju prototype fast-breeder unit. All are located in the middle and southern parts of the prefecture — the largest concentration of nuclear reactors in the world.

As well as the Tsuruga plant, Fukui's nuclear complexes are situated in Mihama, Takahama and Oi, all four of which fall within the prefecture's No. 3 electoral district. Four candidates are running in Sunday's Lower House election, but the real race is between Tsuyoshi Takagi, 56, backed by the Liberal Democratic Party and New Komeito, and Isao Matsumiya, 68, who is running on the ruling Democratic Party of Japan's ticket.

Also in the mix and hoping to win at least a proportional representation seat is Takashi Tsukamoto, 38, a Nippon Ishin no Kai (Japan Restoration Party) candidate who is also supported by Your Party. The Japanese Communist Party's Masahiko Yamamoto completes the lineup.

Prior to the news of a possible active fault running directly beneath reactor 2 at Tsuruga by the Nuclear Regulation Authority's experts, local media polls showed the LDP's Takagi leading the pack. In the 2009 general election, which saw a voter turnout rate of about 76 percent, he beat DPJ candidate Matsumiya by around 6,000 ballots.

In addition to the two main opposition parties' support, Takagi is backed by virtually all atomic energy-related businesses and pronuclear politicians in the district.

But the realization that not only the Tsuruga reactor 2 but also reactor 1, only a few hundred meters away and 42 years old, may now be shut down for good has Takagi's camp concerned he might be suddenly vulnerable. "We're never going to say we're confident of victory. The DPJ candidate (Matsumiya) continues to present a strong challenge," said Yoshikazu Takenaka, a staffer at Takagi's campaign office. Takagi responded to the NRA's findings by emphasizing that he would push the central government to assist workers at atomic plants who may soon find themselves out of a job.

"We need a policy to maintain employment, even if (Fukui's) nuclear plants are not restarted. The worst thing to do is to keep everything in limbo," he said.

Matsumiya, though considered Takagi's main rival, is surprisingly close to him on the issue of nuclear energy. He agrees with Takagi about the need for an employment policy no matter what the future brings, and like the LDP candidate, he says that he favors restarting reactors if their safety is guaranteed. But

given the NRA's conclusion, Matsumiya, and the local DPJ chapter, have been left wondering about their next move.

Nippon Ishin's Tsukamoto was also unprepared for the news, but declared himself happy nonetheless, calling it a major turning point for Japan's nuclear power policy. A last-minute entrant in the race, Tsukamoto's campaign is based on his party's platform: eventually getting out of nuclear power and into renewable energy, and providing better child care.

But he has kept something of a low profile. A campaign car driving him around the district has Tsuruga's name on it, but the recorded message it broadcasts is that of Nippon Ishin founder and deputy leader Toru Hashimoto. Nippon Ishin officials in Osaka say they'll be happy if Tsukamoto wins a Lower House seat as a proportional representation candidate.

Hashimoto, who also serves as Osaka mayor, visited Tsuruga on Dec. 2 to campaign on Tsukamoto's behalf. It was his first visit to the prefecture since two reactors at the Oi plant were controversially restarted in July, and many pronuclear residents in Fukui were angered by Hashimoto's efforts to stop Oi's reactors 3 and 4 from being put back online.

"To be honest, I hadn't sufficiently studied the problem," Hashimoto said in the city of Fukui, as a way of apology. "I want to scrap nuclear power by the 2030s. But we're in the middle of drawing up a detailed plan to do so, and this process will take two or three more years."

That is of little comfort to residents in the Fukui No. 3 district, for whom nuclear power has meant jobs, public works projects and income for local service industries since the No. 1 reactor at Tsuruga commenced operations in 1970.

According to a June report by the Bank of Japan's Fukui branch, around 3,000 people in total are employed locally by Kansai Electric Power Co., which operates 11 reactors in the prefecture, Japan Atomic Power Co., which has the two Tsuruga units, and the Japan Atomic Energy Agency, which has been trying to complete the Monju unit — the nation's only fast-breeder reactor — since the 1960s, also in Tsuruga.

Though official data are not available, the bank estimated that another 9,000 jobs are generated by affiliated companies in the vicinity of the power plants, and during inspection periods, an additional 1,000 people are temporarily hired as security guards. The report noted that the local hospitality industry in particular relies on these inspection periods to make money.

In fiscal 2012, 10 cities and towns in Fukui received about ¥20 billion in atomic energy subsidies from the central and prefectural governments. Of this, about ¥19 billion went to the four nuclear hubs in the No. 3 district, accounting for 60 percent of Takahama's budget, 58 percent of Oi's, 44 percent of Mihama's and 19 percent of Tsuruga's.

Money is also behind two other nuclear-related election issues: what to do about spent-nuclear fuel pools that are rapidly filling up, and what will become of plans to build two new reactors in Tsuruga.

Projections show the spent-fuel pools of Fukui's reactors will reach maximum capacity within the next five to eight years, if the plants continue to run at the pace seen before the Fukushima meltdowns put the nuclear industry on ice.

In the hope of securing more central government funding for his town, Mihama Mayor Jitaro Yamaguchi said earlier this month that he wants to discuss the possibility of building an interim storage facility for spent fuel from not only the local power station but from the Takahama and Oi plants as well.

Mihama officials have been pursuing such a facility since 2004, when the municipality asked Kepco to survey the area. But the utility, citing a request from Fukui's governor, said it was considering building a storage site outside the prefecture.

Despite a recent Fukui Shimbun poll of local residents showing two-thirds oppose the plan to construct two more units at Tsuruga, candidates in the No. 3 constituency have to contend with local business concerns and must consider the dire implications if the project is scrapped.

A poll by the Tsuruga Chamber of Commerce and Industry last summer of 268 companies indicated construction and manufacturing businesses in particular were pushing hard for the proposed reactors 3 and 4 to be built at the Tsuruga plant, saying the town's economy will continue to deteriorate otherwise. LDP candidate Takagi backs moving forward with the project, while the DPJ's Matsumiya wants further discussions. Tsukamoto of Nippon Ishin is opposed.

But in a district that has relied more heavily than any other in the country on the financial benefits of nuclear power for over four decades, when seismic data argues against restarting a reactor, local residents grow scared.

Whatever their positions, those campaigning in the district must now speak carefully, ever aware that there are many who view the NRA findings not as an opportunity to embrace political change but as a reason to fight it, no matter what the rest of the prefecture, or the rest of the country, may think.

Fukushima gov't tries to block opinions (again)

December 19, 2012

Fukushima gov't tried to kill proposal to store baby teeth for future radiation checks

<http://mainichi.jp/english/english/newsselect/news/20121219p2a00m0na016000c.html>

FUKUSHIMA -- The Fukushima Prefectural Government has tried to kill a proposal by a local assemblyperson to store local children's milk teeth to examine their internal radiation exposure stemming from the Fukushima nuclear disaster, it has been learned.

In September 2011, Fukushima Prefectural Assembly member Junko Yaginuma asked the prefectural government if it should urge local residents to store baby teeth that came out after the March 2011 reactor meltdowns for future analysis of children's strontium-90 exposure. Strontium-90, released in the Fukushima No. 1 nuclear plant disaster, has biochemical features similar to calcium and can easily accumulate in bones and teeth.

After receiving Yaginuma's query, the prefecture sent an email to members of a committee overseeing a prefectural health survey and asked them to provide plausible reasons to reject the proposal. The prefectural government called the proposal a plant by anti-nuclear groups.

The survey committee has been mired in a string of other problems, including holding advance "secret meetings" to harmonize expert opinions over how to do health checks of local residents in the wake of the meltdowns. **The latest revelation is yet more evidence that the Fukushima Prefectural Government tried to block opinions it considered unfavorable.**

According to sources with knowledge of the issue, an official at the prefecture's health and welfare division -- which serves as the health check committee's secretariat -- sent an email to committee members. In the email, the official said, "Are there any findings or information that suggest that there is not much point in storing baby teeth?" adding, "It is not the assembly person who asked that question, but it appears to be an argument made by anti-nuclear people. So, we don't wish to take up the question."

It is not clear whether the expert committee accepted the prefecture's request. On Oct. 4 last year, however, Yaginuma raised the issue at a plenary session of the prefectural assembly. The then head of the prefecture's health and welfare division responded, "I understand that there are various opinions even among experts over the validity (of storing baby teeth). We would like to explore it while taking into account the circumstances surrounding the scattering of radioactive materials and experts' research and arguments."

The same official has since told the Mainichi Shimbun, "I don't even remember how I answered (Yaginuma's) question. I may have told (an official in charge) to ask experts for opinions, but I haven't heard who and what kind of email they sent." The official in charge said, "I don't remember, and I can't confirm anything about the issue."

Meanwhile Yaginuma stated, "I thought it was a negative answer to my question, but they were doing things like this behind the scenes," referring to the email. "That's an insult to the people of the prefecture," and, "the prefecture, which sustained damage from the nuclear accident, must not do that," she continued.

A dental clinic in Matsudo, Chiba Prefecture, has collected about 200 baby teeth so far and sent them to a research institute in the United States for analysis. Takemasa Fujino, head of the clinic, said, "I can't believe that the Fukushima Prefectural Government is reluctant even to call for (storing baby teeth). It has abandoned its responsibility to protect children."

Katsuma Yagasaki, professor emeritus at University of the Ryukyus, said that research conducted in the U.S. after the 1950s confirmed a correlation between childhood cancer and their internal exposure to strontium-90. He said Fukushima children's baby teeth should be stored so that the danger to their health can be examined in the future.

On Dec. 19, Hiroyuki Kanno, head of the prefecture's health and welfare division, apologized for "having caused a misunderstanding with the people of the prefecture."

NRA says it won't be influenced

December 20, 2012

Nuclear regulatory body nixes any impact from change of gov't

<http://mainichi.jp/english/english/newsselect/news/20121220p2g00m0dm033000c.html>

TOKYO (Kyodo) -- Japan's nuclear regulatory authority chief said Wednesday his organization will not be influenced by a change of government following Sunday's general election, which will likely lead Japan to retract a goal to phase out nuclear power in the 2030s.

"Whatever (the government) is going to be, we do not intend to change (nuclear) safety regulations and they will not change," Shuichi Tanaka, chairman of the Nuclear Regulation Authority, said at a press conference.

The LDP, which won the election in a landslide, has termed as "irresponsible" a goal to abandon nuclear power generation included in an energy strategy compiled by the government led by the outgoing Democratic Party of Japan.

Under the LDP-led government, reactors that are deemed safe by the regulatory authority are expected to be allowed to restart.

Tanaka said at press conference that the NRA will probably not start the safety screening process for idled reactors until next July because it needs time to set new safety standards following last year's nuclear disaster at Tokyo Electric Power Co.'s Fukushima Daiichi complex.

"We can't conduct a review even if utilities apply for reactivation as long as (necessary) law is not in place. So it can't be helped that the process will start in July or later," he said.

While the LDP has said in its election promises that it will be decided within three years whether all of the country's reactors can be restarted, Tanaka did not make clear that the authority can finish the screening process in the time frame.

Tanaka said politicians "always give various opinions and (what they say) changes from time to time."

"It would be troublesome if safety regulations were changed (in accordance with the views of such politicians," he added.

The entity was launched in September as a highly independent organization after the Fukushima nuclear crisis raised questions over the closeness of regulators and promoters of atomic power that may have resulted in lax supervision of nuclear facilities.

Forty-eight of the nation's 50 commercial nuclear reactors currently remain offline amid safety concerns. Utilities, meanwhile, are struggling due to increasing fuel costs for boosting thermal power generation to make up for the loss of nuclear power.

TEPCO President Naomi Hirose, in an interview with Kyodo News on Wednesday, expressed hope the controversial energy strategy will be reviewed under the new government.

"Crude oil prices could rise and wars could break out (in the Middle East). There's a need to keep options that can respond to huge waves," he said.

He also reiterated that the new government needs to consider a fresh scheme to assist the utility due to costs for compensation and land decontamination after the nuclear crisis, which he says are too massive for a company to shoulder.

TEPCO was placed under state control earlier this year, receiving an injection of 1 trillion yen in public funds to avoid insolvency.

Credibility of nuclear safety regulation

December 22, 2012

EDITORIAL: Nuclear safety watchdog's quake risk assessments deserve respect

<http://ajw.asahi.com/article/views/editorial/AJ201212220034>

The Nuclear Regulation Authority has said that the Higashidori nuclear power plant operated by Tohoku Electric Power Co. in Aomori Prefecture sits on faults that are probably active.

The assessment was supported by all members of the NRA expert panel, according to the nuclear safety watchdog.

We cannot help but wonder why experts who examined the same faults before the construction of the nuclear power plant and later didn't realize this.

The panel's opinion came as a fresh reminder that the government's past inspections of plans to build new nuclear power plants were disturbingly slipshod. The actual safety assessments were left totally to the electric utilities planning to build the facilities.

Before examining the faults running under the Higashidori plant, the NRA also checked the faults underneath two other nuclear power plants--Kansai Electric Power Co.'s Oi plant in Fukui Prefecture and Japan Atomic Power Co.'s Tsuruga plant, also in Fukui Prefecture.

The assessments have all delivered a heavy blow to claims by the electric power companies that the plants are safe.

Some executives within the power industry are complaining that the NRA's commissioners and experts involved in the fault checks are dominated by people in the anti-nuclear camp.

But the experts commissioned to assess the faults are independent researchers selected from a list of candidates recommended by the Japanese Society for Active Fault Studies and other organizations after their relations with utilities were checked for a possible conflict of interest.

The panel's field surveys and assessment meetings were open to the public, and final judgments were made through a transparent process. Both the government and the private sector should heed the panel's conclusions seriously.

The utility and the governor of the prefecture where the plant is located have questioned the "scientific grounds" on which the assessment was made. Behind their criticisms are concerns that the safety warning could put the utility in serious financial trouble and have a huge negative impact on the local economy.

These are certainly important concerns that should be dealt with, but they don't provide justification for modifying the safety assessment by the scientists.

If scientists allow concerns about economic interests to affect their safety assessments in any way, the credibility of nuclear safety regulation will be destroyed.

This is a lesson that must never be lost in light of the earthquake and tsunami disaster last year that triggered meltdowns at the Fukushima No. 1 nuclear power plant.

If electric utilities and local communities challenge the credibility of the expert assessments concerning faults, the NRA should call on them to prove their arguments in public.

Basically, which side has a stronger case should be determined through exhaustive and purely scientific debate.

The problem is that the appointments of the members of the watchdog have yet to be approved by the Diet due to political conflict and the Lower House election held earlier this month.

Some politicians of the victorious Liberal Democratic Party are arguing that the NRA's commissioners should be selected anew now that the party has returned to power. They say the choices of the members of the body were made by the Democratic Party of Japan before the party fell from power and have not yet been formally approved.

But the NRA's commissioners should not be replaced according to the political motives of a party.

It was the LDP itself that demanded that the NRA be a highly independent agency based on Article 3 of the national government organization law. Unreasonable political intervention in the NRA must not be allowed.

To be sure, the NRA has shown some signs that it still has a lot to learn about the way it carries out its job. It has, for instance, made repeated revisions to its forecasts concerning the spread of radioactive materials in case of severe nuclear accidents. But the blunders have not been sufficiently serious to demand that the commissioners be replaced.

The ruling and opposition parties should work together to make sure that the appointments of the NRA commissioners will be swiftly approved by the Diet during the next session.

There are many safety assessments the body needs to make.

December 22, 2012

Editorial: NRA should re-examine faults, crustal structure below Aomori nuclear plants

<http://mainichi.jp/english/english/perspectives/news/20121222p2a00m0na006000c.html>

An expert team under the government's Nuclear Regulation Authority (NRA) has concluded that a fault that runs below the premises of Higashidori Nuclear Power Plant on the Shimokita Peninsula in Aomori Prefecture is active. This is the second time that the NRA has recognized that a fault below a nuclear plant is active -- following the Tsuruga Nuclear Power Plant in Fukui Prefecture -- even though its operator denies that.

The move has demonstrated that the electric power companies that operated the plants did not sufficiently examine the crustal structures around these facilities, and that the government's nuclear power regulator had failed to detect the faults. The move has also raised questions about safety inspections on other nuclear plants.

Tohoku Electric Power Co., the operator of the Higashidori power station, has claimed that the fault below the premises of the facility was created when strata containing clay was swelled by underground water, and was not active. The utility did not take the fault into account in its quake-resistance assessment of the plant.

However, all five members of the expert team have concluded that the fault is active. The members were selected from among experts who had never previously been involved in safety assessments of nuclear plants and who were recommended by academic societies including the Japanese Society for Active Fault Studies. Therefore, the assessment can be lauded as neutral. Past safety assessments, conducted by experts selected mainly by the ministries and agencies concerned, had been criticized as being lenient toward power suppliers.

The NRA is considering methods of judging whether faults around nuclear plants are active in line with new nuclear safety standards, which is necessary because it is extremely difficult to precisely predict local vibrations and the shear of the ground caused by a temblor. It is essential to ascertain the scale and other details of the active fault and reassess how far the plant can withstand a quake in accordance with the new standards. However, such measures alone are far from sufficient.

The active fault that the expert team confirmed also stretches onto the premises of a neighboring nuclear plant that Tokyo Electric Power Co. is building. Furthermore, nuclear power-related facilities are concentrated on the Shimokita Peninsula, including a spent nuclear fuel reprocessing plant and the Oma Nuclear Power Plant. An 84-kilometer-long fault also runs from north to south off the east coast of the peninsula.

Although the operators of nuclear facilities on the peninsula have denied the fault is active, some experts have asserted it is an active fault and pointed to the possibility that it could move in tandem with other faults including those beneath nuclear plants in the area.

Now that the past safety assessment of the Higashidori plant has been called into question, the **NRA should re-examine all faults and the crustal structure of the Shimokita Peninsula as a whole**. Some of the members of the expert team have called for detailed studies of the fault. The NRA should review the system in which safety assessments has been left to the discretion of nuclear plant operators, and play a leading role in re-examining the fault.

What is of great importance is to ensure the independence and transparency of the NRA. To that end, the appointments of top officials of the NRA need to be approved by the Diet.

Three months have passed since the NRA was set up by reorganizing the government's nuclear regulating bodies. Still, procedures for gaining approval of appointments of the body's top officials from the Diet have been postponed under the Democratic Party of Japan (DPJ)-led administration. The new administration to be inaugurated by the end of this year should promptly refer the appointments to the Diet for approval.

US sailors sue TEPCO for downplaying radiation risk

December 28, 2012

U.S. sailors sue Tokyo Electric over Fukushima radiation

<http://mainichi.jp/english/english/newsselect/news/20121228p2g00m0dm022000c.html>

NEW YORK (Kyodo) -- Eight of the U.S. sailors who took part in a relief operation in Japan in the wake of the March 2011 disaster have lodged a damages suit against Tokyo Electric Power Co., saying they were exposed to radiation and suffered injury because the utility misled them about the impact of its crippled Fukushima nuclear power plant.

In the lawsuit filed Dec. 21 with U.S. federal court in San Diego, each plaintiff is seeking \$10 million in compensatory damages. The suit also calls for punitive damages of \$30 million.

The sailors were among the members of the U.S. Navy crew attached to the aircraft carrier Ronald Reagan that was dispatched to off the coast of northeastern Japan for "Operation Tomodachi," right after the region was devastated by a magnitude 9 earthquake and tsunami on March 11. Tomodachi means "friends" in Japanese.

The utility, also known as TEPCO, said this is the first lawsuit against the company filed with an overseas court that concerns its handling of the crisis at the Fukushima Daiichi plant and said, "We would like to withhold any comments since we have not received the lawsuit documents."

The suit lists as the plaintiffs Lindsay Cooper, who served as an aviation boatswain's mate on the flight deck, and seven other sailors as well as a daughter born to one of the sailors in October 2011.

"The defendant, TEPCO, created an increased risk of radiation exposure to the plaintiffs by failing to provide them with warning of the actual increased risk of exposure," the suit said.

Relying on TEPCO's misrepresentations about health and safety, "the U.S. Navy was lulled into a false sense of security" and the crew of the Reagan "believed it was safe to operate within the waters adjacent to the Fukushima plant, according to the suit.

"Solely a result of the defendant's negligence, carelessness and recklessness, the plaintiffs were caused to suffer severe and serious personal injuries to mind and body," it said.

Operation Tomodachi started on March 13, two days after the quake and tsunami struck the Pacific coast of northeastern Japan and mangled the Fukushima plant. The operation delivered supplies and undertook other relief works mobilizing the aircraft carrier and other U.S. military resources and personnel.

Eight U.S. sailors sue Tepco for millions for falsely downplaying Fukushima radiation exposure

<http://www.japantimes.co.jp/text/nn20121228a3.html>

Bloomberg

Tokyo Electric Power Co. is being sued for tens of millions of dollars by eight U.S. Navy sailors who claim that they were unwittingly exposed to radiation from the Fukushima No. 1 nuclear plant meltdowns and that Tepco lied about the dangers.

The sailors aboard the nuclear-powered aircraft carrier USS Ronald Reagan were involved in the Operation Tomodachi disaster relief operations following the March 11, 2011, earthquake and tsunami that devastated the Tohoku region and led to the nuclear catastrophe, according to their complaint filed in U.S. federal court in San Diego on Dec. 21.

Tepco and the Japanese government conspired to create the false impression that radiation leaking from the Fukushima No. 1 plant didn't pose a threat to the sailors, according to the complaint. As a result, the plaintiffs rushed to areas that were unsafe and too close to the facility, exposing them to radiation, their lawyers said.

The Japanese government was "lying through their teeth about the reactor meltdown" crisis, as it reassured the USS Reagan crew that "everything is under control," the plaintiffs' lawyers said in the complaint. "The plaintiffs must now endure a lifetime of radiation poisoning and suffering."

The sailors are each seeking \$10 million in damages, \$30 million in punitive damages and a judgment requiring the creation of a \$100 million fund to pay for their medical monitoring and treatments.

"We can't comment as we have not received the complaint document yet," Yusuke Kunikage, a Tepco spokesman, said Thursday. "We will consider a response after examining the claim."

In July, the Nuclear Damage Liability Facilitation Fund took control of Tepco in return for a ¥1 trillion capital injection after the disaster left the utility on the brink of bankruptcy. The utility received ¥1.4 trillion in state funds to compensate those affected by the disaster.

More lies

December 29, 2012

Atomic Energy Commission lied about secret meetings to prime minister's office

<http://mainichi.jp/english/english/newsselect/news/20121229p2a00m0na011000c.html>

The Cabinet Office's Japan Atomic Energy Commission (JAEC) submitted falsified reports on the clandestine "study sessions" it hosted for pro-nuclear parties, newly obtained emails have shown.

The new revelations bring into question the responsibility of the Cabinet Office's investigative team, which released a final report on the case in August without any references to the bogus communications.

According to emails obtained through the Freedom of Information Act, at 7:56 a.m. on May 24, then Chief Cabinet Secretary Osamu Fujimura's secretary instructed a Cabinet Office staffer involved in nuclear power policy to compile anticipated questions and answers by 10 a.m. sharp regarding the Mainichi Shimbun's report on the JAEC's clandestine meetings.

In a reply sent to Fujimura's secretary at 9:59 a.m., the staff member denied the Mainichi Shimbun report, which claimed that a document on the nuclear fuel cycle had been altered in alignment with pro-nuclear utilities. At 10:33 a.m., the same staffer sent the materials Fujimura's secretary had requested earlier that morning, along with reassurances that "no explanations or debates (like those that were reported) took place."

Fujimura told a press conference beginning at 11:08 a.m. that the committee document on the nuclear fuel cycle had not been altered, and while it had been distributed to participants in the secret meetings, there had been no explanation or discussion of it. According to sources close to the case, however, at a closed-door meeting held April 24, participants were given the document, were told it was a draft report to the government's Energy and Environment Council, and discussed it.

Earlier reports by the Mainichi Shimbun have revealed that during the meeting, an executive from Japan Nuclear Fuel Ltd. -- operator of the Rokkasho Nuclear Reprocessing Plant in Aomori Prefecture -- appealed for support behind a policy that would entail reprocessing of some spent nuclear fuel, with the direct disposal of the remaining spent fuel underground. During a Cabinet Office investigation, one participant from the meetings said, "Comments like the ones that were reported in the media were made."

Some of the emails corroborate allegations that the draft report had been altered. An email sent by a Cabinet Office staffer involved in nuclear power policy on May 4 says, "More comments arrived from the Federation of Electric Power Companies of Japan (FEPC), and are already reflected (in the draft report)."

Requests by the Mainichi Shimbun to the Cabinet Office's nuclear policy division to release the contents of FEPC's comments and the changes made to the draft report have gone unanswered as of Dec. 28.

The government changed hands from the Democratic Party of Japan (DPJ) to the Liberal Democratic Party (LDP) before a conclusion was reached in a review of JAEC promoted by DPJ administrations. **The three-year terms of chairman Shunsuke Kondo and the four other JAEC members all end by Jan. 5, 2013, but with no successors on the immediate horizon, their terms are to be extended automatically.**

US sailors sue TEPCO (follow-up)

December 30, 2012

U.S. sailors sue Japanese utility over radiation

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201212300020>

THE ASSOCIATED PRESS

SAN DIEGO--Eight U.S. sailors are suing the Tokyo utility that operates the Fukushima nuclear power plant, charging that the company lied about the high level of radiation in the area where they were carrying out a humanitarian mission after the tsunami that triggered the reactor crisis.

The lawsuit was filed in U.S. District Court in San Diego last week against Tokyo Electric Power Co., which is owned by the Japanese government. Plaintiffs include the infant daughter of two of the sailors who was born seven months after the March 2011 disaster.

The sailors served on the San Diego-based aircraft carrier USS Ronald Reagan, which was carrying out "Operation Tomadachi" ferrying food and water to citizens in the city of Sendai in the wake of the earthquake and tsunami.

The sailors claim the Japanese government repeatedly said there was no danger to the carrier crew "all the while lying through their teeth about the reactor meltdowns" so rescuers would "rush into an unsafe area."

The U.S. Navy, the suit said, relied on information from the Japanese government, which only belatedly admitted that radiation had leaked into the atmosphere from the damaged power plant.

An email seeking response from the utility's corporate office in Tokyo was not immediately returned.

The 37-page suit, which cites numerous reports about the Fukushima crisis and response, said that after discovering the truth of how much radiation they were exposed to, the sailors have undergone extensive medical testing and will be required to undergo periodic examination in the future.

They say they are at risk for developing cancer and a shorter life expectancy, and are undergoing considerable mental anguish as a result.

The sailors are suing for more than \$100 million in damages.

US CMRT radiation data (March- May 2011) ignored

December 31, 2012

U.S. nuke crisis team's Fukushima findings wasted

<http://www.japantimes.co.jp/text/nn20121231x3.html>

Kyodo

The United States sent a special nuclear response team to Japan right after the Fukushima meltdown disaster started in March 2011, but Japan was slow to make use of radiation data from the unit, according to U.S. and Japanese government sources.

This dispatch of the Consequence Management Response Team was the first approved for an emergency outside the United States. The CMRT, affiliated with the National Nuclear Security Administration, a semiautonomous agency of the Energy Department, is tasked with dealing with nuclear accidents and terrorism in the U.S. by detecting and analyzing radiation contamination.

The Japanese government, however, did not acknowledge the significance of the team's mission and failed to immediately utilize the initial data it provided for evacuating residents living around Fukushima No. 1.

In recent interviews, U.S. sources involved in making the decision to dispatch the team said that on March 14, 2011, three days after the crisis began, the White House's National Security Council decided to send the CMRT to Fukushima Prefecture at the request of U.S. Forces Japan and the U.S. Embassy in Tokyo.

The CMRT is dispatched to nuclear disaster zones with the Aerial Measuring System, an airborne system using military aircraft to detect gamma rays from altitudes of about 150 to 700 meters and calibrate doses of radiation with the help of highly advanced analytical software.

The AMS technology was first developed in the 1960s in the context of the Cold War when the United States and the Soviet Union conducted atmospheric nuclear tests. Since the Sept. 11, 2001, terrorist attacks on the United States, its capability to deal with nuclear terrorism has been enhanced.

The U.S. military and embassy requested the team's dispatch as U.S. forces were engaged in the Operation Tomodachi (Operation Friendship) relief mission in the early weeks after the nuclear disaster, which was triggered by the March 11, 2011, Great East Japan Earthquake and tsunami.

The AMS data "helped confirm that there was no significant threat to the health and safety of the people" at U.S. bases in Japan, one U.S. government source said. "So I think that was the primary reason" for the special team's dispatch, the source said.

According to this source, AMS operations concerning Fukushima No. 1 confirmed there was no fire in reactor 4's spent-fuel pool, which senior officials and scientists of the U.S. administration were seriously worried about in the first week of the crisis.

The CMRT, consisting of 33 scientists and engineers, arrived at Yokota Air Base on March 16 from Nellis Air Force Base in Las Vegas and initiated test flights within 12 hours of arriving, according to an NNSA senior official. The CMRT conducted the first round of AMS operations from March 17 to 19, using two U.S. military aircraft.

The AMS flight operations over Fukushima were conducted around 100 times totaling 525 flight hours until the CMRT left Japan on May 28, 2011, an NNSA official said.

The CMRT provided radiation data from the first round of AMS operations to the Nuclear and Industrial Safety Agency, then Japan's nuclear regulatory body, and to the Education, Culture, Sports, Science and Technology Ministry from March 18 to 20 via the Foreign Ministry.

These initial data, however, were not effectively used to make decisions about the early evacuation of residents around the plant, several Japanese sources reiterated recently.

Yukio Edano, then chief Cabinet secretary, said: "We did not get any briefing (about the AMS flights from lower-level officials). At my level, we did not go into any detail (about the operations)."

Unsafe cables may be too expensive to replace

January 1, 2013

Over 10 nuclear plants in Japan have flawed fire-prevention equipment: sources

<http://mainichi.jp/english/english/newsselect/news/20130101p2a00m0na004000c.html>

More than 10 nuclear power plants in Japan are plagued by flaws in their fire-prevention equipment, nuclear regulatory sources have revealed, raising the possibility some reactors may be shut down.

Sources close to the secretariat of the Nuclear Regulation Authority (NRA) and the Ministry of Economy, Trade and Industry (METI), respectively, say that deficient equipment includes flammable electric cables in wiring. They say apparatuses important to safety are also installed close to each other, increasing the risk that fire could spread from one apparatus to the other.

The Agency for Natural Resources and Energy has already launched an investigation into the matter, while the NRA is poised to interview electric company officials in the near future.

METI anticipates that some nuclear reactors may be decommissioned due to the high cost of exchanging cables and repairing equipment. It also expects that reactivation of other plants could be delayed by several years.

Since December 1975, utilities obtaining approval for reactor construction have been required to use flame-resistant cables in important safety equipment and to appropriately space apparatuses to prevent fires from spreading. However, due to the absence of regulations for reactors built before then, the decision on whether to improve such equipment has been left up to each plant operator.

The total number of plants using flawed equipment has not been determined, but the Mainichi Shimbun interviewed power companies across the country and found that cables made of such flammable materials including vinyl and polyethylene are used at 13 out of 50 nuclear reactors. Because the surfaces of those cables are coated with fire-resistant agents using special types of resin, utility officials say they are on par

with flame-resistant cables. However, the NRA secretariat and METI officials dismissed the utilities' claims.

"Even if the fire-resistant agents do not burn, the flammable cables inside would burn," one source told the Mainichi. "Those cables may also be aging and deteriorating. We can't recognize them as being equivalent (to non-flammable cables). Most of the cables are fraught with problems in terms of fire prevention and need to be renewed."

At some plants, it has also emerged that equipment controlling the so-called reactor "safety system," which includes control rods, the core cooling system, and instrument surveillance at the time of a nuclear accident are flawed in terms of fire-prevention measures. Although the principle of "system separation" that allows one failed electric system to be complemented by another one is prioritized in safety systems, at some plants electric cables for two separate systems are installed in close proximity. Cooling water pumps are also set up next to each other, raising the risk of such critical apparatuses catching fire simultaneously. Both the NRA secretariat and METI officials are expecting that such flaws will be found at more than 10 reactors.

The NRA is planning to include both the "system separation" rule and stipulations on the use of flame-resistant cables in new safety standards to be drawn up by July. However, as **each reactor has roughly 1,000 to 2,000 kilometers of cables, including several hundred kilometers which are important to safety**, it will take more than one year and cost a huge amount to renew the cables. Due to the prospect of unrecoverable costs, some reactors may be forced to be decommissioned, the sources said.

Japanese media and nukes

An extract from the book **Fresh Currents**

that helps to understand the uncomfortable position of Japanese media towards nuclear power.

ERIKO ARITA

Self Restraint and Nuclear Reporting in the Japanese Media

A huge amount of advertising income came from the power companies and the government. For instance, each local newspaper in prefectures hosting nuclear power plants or other nuclear power facilities would carry dozens of electricity ads—often full- or half-page ones—every month.

In 1988, at age 14, I first saw the pictures of atomic bomb victims at Hiroshima Peace Memorial Museum. I was shocked by the inhumane power of nuclear weapons, and realized they must be abolished. Thus, it was natural for me to later participate in activities against nuclear weapons with Peace Boat, a Tokyo-based nongovernmental organization, where I got a job in the group that organizes round-the-world study tours.

In May 1998, India and Pakistan conducted nuclear tests and the international community became afraid these two traditional antagonists would resort to nuclear weapons. A couple of months later, Peace Boat held photo exhibitions on Japan's atomic bomb victims in India and Pakistan. At the time, few Peace Boat staff members were actively against nuclear power. One said: "I oppose nuclear weapons. But I'm not sure about nuclear power." I thought nuclear power should be considered just as deadly dangerous as nuclear weapons. Yet because I didn't know enough about it, I could not debate the point with him.

This ambivalent attitude towards nuclear power was common among Japanese citizens' groups traditionally opposed to nuclear weapons, even though

radiation from the April 1986 Chernobyl accident had threatened the world. Kazuyoshi Fujita, president of Daichi wo Mamoru Kai, a Chiba-based organic food delivery company and one of the organizers of the 3/11 commemorative in Hibiya Park in Tokyo on March 11, 2012, said there was a notable lack of cooperation back then among groups opposed to nuclear weapons. Although many citizens' groups were shocked by Chernobyl and spoke about the risk of Japan's own nuclear power program, Fujita said, they failed to create a mass movement against it due to conflicts over what amounted to minor differences of opinion.

The majority of mainstream organizations opposed to nuclear weapons like the Japan Confederation of A-and-H-Bomb Sufferers Organizations, the biggest group of Hiroshima and Nagasaki victims, had accepted the idea of the "peaceful use of nuclear power." This was due to the propaganda of the government, the utilities, and other businesses in the nuclear power industry, as well as international opinion on the matter—opinion led by the International Atomic Energy Agency. This attitude of acceptance was also supported by the self-restraint the Japanese mass media exercised when reporting the problems of nuclear power. Thus even after Chernobyl, the Japanese general public had no interest in nuclear power's dangers.

On September 30, 1999, a nuclear accident was caused by negligence at a uranium processing plant in the village of Tokai, Ibaraki Prefecture. Two workers died. I was horrified that this fatal accident had occurred in a "technologically advanced" country, and quit Peace Boat to work as a freelance journalist. In October 1999, I attended a conference in Niigata on nuclear issues hosted by the Tokyo-based Nuclear Free Zone Citizens Network Japan, covering the event for an NHK English radio news program.

One of the speakers was Hideyuki Ban, of Citizens' Nuclear Information Center. CNIC has been practically the only anti-nuclear-power organization studying nuclear power problems. Their reports and conclusions are based on thorough

research by specialists outside the nuclear power lobby. CNIC was established in 1975 by Jinzaburo Takagi, a nuclear physicist who had formerly worked in the nuclear power industry.

Ban said the Tokai accident was a small example of the problems of nuclear power, and that it's impossible to control nuclear power in absolute safety using current technologies. Impressed, I spoke to him after the conference and asked to work as a volunteer at CNIC.

While CNIC has always researched technological and structural problems in the nuclear power industry and governments that back the industry, it has also promoted renewable energy sources as an alternative to atomic power. In December 1999, CNIC organized a conference in Thailand on renewable energy sources and strategies for sustainability. One of the Japanese researchers in attendance was Tetsunari Iida, a pioneer of renewable energies in Japan. Formerly an engineer at Kobe Steel Ltd., Iida had helped design the dry storage casks for spent nuclear fuel at the Fukushima No. 1 nuclear power plant.

Today, he is one of Japan's most notable experts on renewable energy, advising government officials and often appearing in the media. But in 1999, Iida was not that popular, especially with the media. I had covered a renewable energy conference for NHK Radio Japan, and later got a job as a part time interviewer and producer of that same program. I had planned a number of interviews, including a series of interviews with people working for radiated victims in Hiroshima, Tahiti and other countries. The program's chief producers and manager approved all my interview plans except one.

The plan they rejected was a series of interviews with various renewable energy experts, including Iida. It was initially accepted at a meeting of full-time producers but rejected at the managerial level. Although I asked the producers why the manager didn't like the plan, they provided no explanation. One possible reason was self-restraint by NHK on covering alternative energy sources that could re-

TIERY LE ..

place nuclear power, which was promoted as national policy. The public broadcaster, as well as other media, the majority of citizen organizations opposing nuclear weapons, and the general public, all seemed to accept the peaceful use of nuclear power.

In 2000, I quit NHK and joined *The Japan Times*. Fortunately, I enjoyed more freedom to report the problems of nuclear power and advantages of renewable energy sources in the English daily, although I was required by the editors to include the opinions of nuclear power promoters. As one of the first stories of its kind, I wrote a feature in 2001 on a bill obliging power companies to purchase electricity generated from renewable sources.

Work on the bill had begun in 1999. It had the support of a nonpartisan group of 260 lawmakers. It was also backed by Iida's group, as well as many other NGOs and local municipalities. However, the Diet did not enact it. We in Japan had to wait another decade for similar legislation to finally pass in August 2011. But only after Fukushima, and only after the greatest efforts of then Prime Minister Naoto Kan to make the bill a reality.

Yet while I could write stories on renewable

energy issues in *The Japan Times*, I faced strong pressure by the nuclear power industry when writing about atomic energy. In 2008, I interviewed Mycle Schneider, an independent consultant on energy and nuclear policy and an advisor to the French Environmental Minister's Office. Schneider explained that recycling spent nuclear fuel is far more dangerous and expensive than advertised, and that maintaining Japan's policy of recycling fuel to be used at normal nuclear reactors and fast-breeder reactors would impose the huge cost of reprocessing on future electricity consumers.

Schneider presented data from French authorities showing that radioactive waste from power generation using reprocessed spent nuclear fuel costs 83 percent more to dispose of than the cost of disposing spent nuclear fuel from conventional reactors. In the article, I mentioned that, based on Japan's policy of recycling spent nuclear waste, Japan Nuclear Fuels Ltd., a company in the village of Rokkasho, Aomori Prefecture, planned to turn the plutonium and uranium produced through reprocessing into mixed oxide uranium-plutonium fuel (MOX) for use in conventional nuclear reactors and fast-breeder reactors.

France used to be the leader in fast-breeder reactors, but later turned away from the technology. Electricite de France, a major French utility, closed the Super Phoenix fast-breeder reactor in 1997 and the Phoenix fast-breeder reactor in 2010. Schneider told me that EDF had many safety-related problems with its reactors. "EDF was afraid significant accidents might occur because they had indications of accidents whose cause they could not identify," Schneider said.

In Japan, the Monju plutonium fast-breeder re-

actor in Tsuruga, Fukui Prefecture was shut down after a sodium leak and fire in 1995. Schneider said the structure of fast-breeder reactors is much more complicated than conventional reactors, and that their facilities have to be operated in perfect harmony, almost impossible using current technology. After the article was published, Japan Nuclear Fuel Ltd. telephoned and faxed to *The Japan Times*. JNFL claimed my article had a number of mistakes and was biased against the company. They insisted reprocessing makes radiation of spent nuclear fuel far less dangerous, and that its cost has been fairly and reasonably shared by consumers of different generations.

JNFL phoned several times to complain. As a result, I had to run a correction on two points. One was that power companies have set aside financial reserves since 1981 to cover the cost of reprocessing so that the cost will be shared among past and future electricity users. Another "correction" was that a 2004 estimate by the Japan Atomic Energy Commission showed power generation using reprocessed spent nuclear fuel would cost about 0.5 yen to 0.7 yen per kwh more than conventional nuclear power generation, which would be equivalent to roughly 1 percent of an average household's annual electricity bill.

However, the amount set aside for reprocessing in 2007 was ¥2.9 trillion. According to an estimate by the Federation of Electric Power Companies of Japan in 2003, a major investor of JNFL, the total cost for the reprocessing will actually be around ¥11 trillion. So, as of 2007, future consumers will be made to pay ¥11 trillion minus the ¥2.9 trillion in current financial reserves—around ¥8.1 trillion. Is that not an immense cost to be imposed on future power consumers, even when split among succeeding generations? I was very much frustrated by that fact compared to JNFL's claims.

Pressure on the media concerning nuclear power problems is quite common, according to Satoshi Kamata, a freelance journalist who has covered the nuclear power industry since the

1970s. Kamata spoke to me about this issue during an interview that was published in *The Japan Times* in September 2011.

“Newspapers have finally begun to report the reality of the nuclear industry. But why didn’t they do so before? Reporters were effectively paralyzed because whenever they wrote articles about such problems, their newspapers declined to publish them.”

Why weren’t the articles published? Kamata said, “I am not completely sure. However, a huge amount of advertising income came from the power companies and the government.

For instance, each local newspaper in prefectures hosting nuclear power plants or other nuclear power facilities would carry dozens of electricity ads—often full- or half-page ones—every month.”

After March 11, 2011, power companies stopped running advertisements in major national newspapers, though I’m not sure about local newspapers in prefectures hosting nuclear power plants. Still, one positive outcome of the Fukushima tragedy is that the media in general have a bit more freedom to report the problems of nuclear power industry and its cozy relationship with the government. But many major newspapers and TV stations continue to restrain their criticism of the “nuclear power village.”

In addition to the news media, television actors and personalities remain silent on nuclear power, with exception of a few brave actors. One is Taro Yamamoto, who first spoke out against nuclear power in April 2011. For taking such a stance, the only major entertainment celebrity in Japan to do so, his role in a TV drama was canceled. Now most TV stations refuse to employ Yamamoto because

ANNUAL AMOUNT SPENT BY JAPANESE UTILITIES ON SALES PROMOTION AND ADVERTISING

Source: Yuryoku Kigyo no Houkoku Sendenshi, 2010; figures rounded to nearest million yen

Company Name	For Sales Promotion	For Advertising
Tokyo Electric Power Co.	23.89 billion	24.35 billion
Chubu Electric Power Co.	6.58 billion	6.82 billion
Kansai Electric Power Co.	5.93 billion	19.8 billion
Chugoku Electric Power Co.	5.03 billion	5.18 billion
Hokuriku Electric Power Co.	1.49 billion	5.71 billion
Tohoku Electric Power Co.	5.17 billion	8.67 billion
Shikoku Electric Power Co.	2.39 billion	3.13 billion
Kyushu Electric Power Co.	11.2 billion	7.98 billion
Hokkaido Electric Power Co.		4.72 billion
Okinawa Electric Power Co.	591 million	515 million
J-Power		1.52 billion

he joined citizen protests calling for abolishing nuclear power and promoting renewable energies.

Despite such pressure on actors and journalists, we must work both to expose nuclear power’s problems and speak out with like-minded citizens. Otherwise, Japan could face another nuclear disaster before it finally closes atomic power stations for good.

Finally, I would like to refer to the last message of the late Jinzaburo Takagi, the prominent nuclear physicist who devoted his life to abolishing nuclear power and who passed away in 2000. Takagi had long voiced his fear of serious nuclear disasters. His message has even greater meaning for the world today.

“I wish from the bottom of my heart that people, who have the intelligence to anticipate history and the will to take bold action to tackle reality, put a full stop to the era of nuclear power.”

20 years monopoly on benefits program

January 3, 2013

Foundation filled with 'nuclear village' officials monopolizes nuclear benefit program

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201301030065

THE ASAHI SHIMBUN

A foundation that provides high-paying jobs for retired industry ministry officials has held a two-decade monopoly on the program that pays benefits to residents living near nuclear power plants, The Asahi Shimbun has found.

The Center for Development of Power Supply Regions receives contracts from local governments for the work. But the center has outsourced most of the operations to electric power companies, enabling it to secure a profit of around 38 million yen (\$435,000) in fiscal 2010.

The benefit program is part of the grant system under the three laws on electric power sources. The central government provides grants to local governments that host or are located near nuclear-related facilities. The money comes from part of the electricity bills paid by consumers and businesses.

The center has long been in control of the benefit program. But the accident at the Fukushima No. 1 nuclear power plant in March 2011 sparked heavy criticism against the “nuclear village” of pro-nuclear politicians, industry bureaucrats and utilities. The central government ordered prefectural governments to open up the benefit program to other bidders.

“Under the guidance of the central government, the prefectural governments in fiscal 2012 changed the system to one in which the business that undertakes the operation is chosen from a wide range of applicants,” the center said in a statement to The Asahi Shimbun. “As a result, the center has been conducting the work.”

In response to questions from The Asahi Shimbun, 14 prefectural governments involved in the benefit program said they started accepting applications from any business to run the program in fiscal 2012.

They all said the center was the only one that applied.

The center outsources such work as calculating the size of the benefits for individual households and providing the payments, but it remains in charge of making plans and reporting the results to the local governments.

In its 22 years of existence, the center has been engaged in amakudari, the “descent from heaven” practice of retired bureaucrats landing jobs at organizations or companies once under their jurisdiction.

After its foundation in 1990, the center’s first four presidents were former industry ministry officials. The current president, Kinju Atarashi, is former director-general of the Small and Medium Enterprise Agency, an affiliate of the Ministry of Economy, Trade and Industry.

According to published data, being president of the center is considered a full-time job, with annual compensation of 16.58 million yen.

Makoto Yagi, chairman of the Federation of Electric Power Companies of Japan and president of Kansai Electric Power Co., is the current chairman of the center.

The names of executives at utilities and companies that build nuclear plants are on the lineup of part-time directors at the center. And 15 of the 46 staff members are temporarily on transfer from utilities.

The benefit program itself has been criticized as a way to offer “bribes” to residents to prevent them from opposing nuclear power facilities in their neighborhoods.

In fiscal 2011, the 14 prefectures provided 7.6 billion yen in benefits to 1.03 million households, according to figures obtained by The Asahi Shimbun.

(This article was written by Satoshi Otani and Takuho Shiraki.)

"Tainted" donations to universities

January 4, 2013

Universities receive 1.7 bil. yen in donations from power industry

<http://mainichi.jp/english/english/newsselect/news/20130104p2g00m0dm012000c.html>

TOKYO (Kyodo) -- Eight state-run universities involved in nuclear studies have received donations totaling 1.74 billion yen from utilities and other power industry members in the five years through fiscal 2011, information disclosed upon Kyodo News requests showed Thursday.

As most of the donations were directed to specific researchers, including those participating in the Nuclear Regulation Authority's meeting for setting new standards of nuclear power plant safety, some experts voiced concerns that it could affect the country's regulations.

According to the information disclosed by the universities, the University of Tokyo received the most, with 560 million yen, followed by Tohoku University (417 million yen), Nagoya University (251 million yen) and Kyoto University (212 million yen). The Tokyo Institute of Technology received 104 million yen, Kyushu University 83 million yen, Osaka University 79 million yen and Hokkaido University 38 million yen.

The donated funds were used, among other research-related purposes, to purchase equipment needed in research and to cover researchers' travel expenses when they attended conferences, according to the universities.

The donators included eight utilities, such as Tokyo Electric Power Co. and Japan Atomic Power Co., nuclear reactor makers such as Mitsubishi Heavy Industries Ltd. and Hitachi-GE Nuclear Energy Ltd., and other power-related companies and organizations.

Tokyo Electric no longer makes donations following the nuclear crisis at its Fukushima Daiichi power plant in March 2011.

Infringement on workers' rights

January 5, 2013

Kawamata decontamination workers required to sign personal info release

<http://mainichi.jp/english/english/newsselect/news/20130105p2a00m0na013000c.html>

KAWAMATA, Fukushima -- Workers hired to do decontamination work in this town have been required by the municipal government to sign a release of their personal information to police, it has emerged.

Workers hired to decontaminate parts of Kawamata designated as evacuation zones following the outbreak of the Fukushima No. 1 Nuclear Power Plant disaster are required to submit personal information including their name and blood type, as well as an ID photo. By signing the form, workers agree to allow their employers to hand the information over to police when they deem it necessary.

The Kawamata Municipal Government's nuclear disaster division said the town government composed the release form in late October last year, and urged the five joint ventures serving as prime contractors

for decontamination work to have their workers sign them. Residents' concerns over break-ins and risk minimization were cited as the reasons for the measure, but some privacy experts say the arrangement infringes on personal privacy.

According to Fukushima Prefectural Police, multiple decontamination workers have been arrested on suspicion of stealing from homes whose residents evacuated due to the nuclear crisis.

Safety complaints ignored by Gov't

CROOKED CLEANUP: Government mishandled complaints about shoddy cleanup work

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201301050037>

THE ASAHI SHIMBUN

Environment Ministry officials failed to act on a flood of complaints from residents in Fukushima Prefecture about companies carrying out shoddy decontamination work.

No effort was even made to record the number or contents of those complaints, in part because staffing shortages made such work difficult, and many of the companies involved were not instructed on how to improve their performance.

The Asahi Shimbun broke a story on Jan. 4 about shoddy decontamination work at three municipalities in Fukushima Prefecture that could constitute violations of contracts signed with the Environment Ministry and infractions of a law that prohibits the dumping of radioactive waste materials.

Following the March 2011 accident at the Fukushima No. 1 nuclear power plant, the Environment Ministry set aside an initial amount of 650 billion yen (\$7.4 billion) for decontamination work.

The ministry established a local office in Fukushima Prefecture to oversee the work, which began last summer and involved cleaning areas within 20 meters of buildings and roads.

Soon after the work began, local residents called to complain that the grass was not being mowed properly and that water used for cleaning had leaked.

Such observations could constitute violations of the work rules the Environment Ministry had established for the construction companies and subcontractors that were contracted to do the work.

However, an official said, "Because there was a continuous stream of phone calls coming in, we were unable to keep records of every call."

In response to questions from Asahi, an official at the Fukushima local office said, "Whenever we received a complaint, we cautioned those doing the work to follow what was written in the contracts."

At the same time, however, officials also admitted that no records were kept of the specific contents of each complaint, the companies involved or the total number of complaints. Companies that were the subject of a large number of complaints were also not singled out for special instructions about improving their work. As a result, officials at the local office said it was impossible to determine what response was made to every individual complaint.

In addition, information about such complaints never reached the Environment Ministry headquarters in Tokyo, which is tasked with overall supervision of the decontamination work.

One high-ranking ministry official said, "We were not even aware that a large number of complaints had come in."

An official at the local Fukushima office said, "Considering that we are using taxpayer money, we have not been able to provide sufficient explanations to local residents or the general public."

The Ministry of Land, Infrastructure, Transport and Tourism has a system for organizing complaints submitted about public works projects and using that information to provide guidance to the companies involved.

However, **the Environment Ministry lacks the know-how to handle large public works projects and its oversight function is inadequate.** The local Fukushima office only has about 200 staff, with most involved mainly in patrolling local areas and helping at meetings where explanations are given to local residents. That meant there were only a few workers on hand to field complaints.

Doubts have also been raised about the quality of the responses by the hotline set up by Environment Ministry headquarters.

A worker who was ordered by the on-site supervisor of a construction company to dump vegetation in Naraha, Fukushima Prefecture, called the Environment Ministry and admitted to dumping vegetation at the bottom of a slope. The person who took the call said, "We will pass on the information to the relevant section."

However, orders for such dumping continued for more than a month until work in that area was completed. Under the rules established by the Environment Ministry, the cleared vegetation should have been placed in bags and moved to temporary storage areas.

The worker who blew the whistle said, "Because they didn't ask for my contact number, nothing changed. It was meaningless to have made the call in the first place."

The worker did send in a document late last year that outlined what was observed.

Fukushima residents show distrust over lack of explanation about interim storage facility

<http://mainichi.jp/english/english/newsselect/news/20130109p2a00m0na005000c.html>

AIZUWAKAMATSU, Fukushima -- The Ministry of the Environment held a briefing session here for residents of a Fukushima Prefecture town hosting a candidate site for an interim storage facility for radiation-contaminated soil, sparking voices of distrust from them over a lack of explanation over the controversial construction plan.

The meeting on Jan. 8 -- the first of its kind held by the ministry -- was attended by some 150 residents from the prefectural town of Okuma who evacuated to Aizuwakamatsu following the Fukushima No. 1 nuclear plant disaster. Two other prefectural towns have also been listed as candidate sites for the planned facility.

While the residents, all from a district hosting the candidate site, raised questions about reparations for the construction site and surrounding areas and the method to treat radioactive soil, the Environment Ministry officials stopped short of presenting concrete plans and conditions, only saying, "We don't know until we survey the area."

"They're probably going to conduct the survey without explaining anything and force through construction," said a distrustful resident during the meeting.

Regarding the ministry officials' explanation that the tainted soil will be transferred to a final disposal site outside Fukushima Prefecture within 30 years, one skeptical resident said, "No one would take it, as is the case with U.S. military bases in Okinawa. The promise should be legislated so that we can be at ease."

The Environment Ministry is poised to start on-site surveys on candidate sites as early as this month and is planning to hold five more briefing sessions for Okuma residents through Jan. 10 at three locations in the prefecture.

Meanwhile, the Naraha town government notified the ministry on Jan. 8 that a briefing session about an interim storage facility survey for the town's ward mayors would be postponed from Jan. 10, following recent revelations of shoddy decontamination work on radioactive materials in the town and other parts of the prefecture.

"It is an outrageous situation that could destroy the entire plan for our residents' return to the town in two years," said Naraha Town Mayor Yukiei Matsumoto.

Decontamination - Cutting corners

January 8, 2013

Tainted water allowed to run off

Fukushima cleanup crews cut corners

<http://www.japantimes.co.jp/text/nn20130108x1.html>

By MIZUHO AOKI
Staff writer

Two construction joint ventures hired to wash radioactive substances off buildings in two Fukushima Prefecture communities in December allowed the tainted water to run off into street gutters, an Environment Ministry official said Tuesday.

Although not illegal, the conduct of Taisei Corp., Maeda Corp. and other firms involved in the venture illustrates the types of corners that contractors cut in doing cleanup work.

A special law passed for the nuclear disaster makes dumping of contaminated substances into the environment punishable by up to five years in prison or a fine of up to ¥10 million. However, contractors are only asked to collect tainted runoff, with no penalty for failing to do so.

Recent media reports that contractors were possibly illegally dumping radiation-tainted waste into rivers and elsewhere in Fukushima Prefecture prompted the Environment Ministry's Fukushima office for

environmental restoration to question managers of four joint ventures Monday. They were all hired by the government to do decontamination work near the stricken Fukushima No. 1 nuclear power plant.

The ministry investigation turned up the cases of tainted runoff in the village of Iitate and the town of Naraha.

In Iitate, workers washing a post office and its premises allowed some of the contaminated water to run freely into a gutter in the street, said the ministry official, who declined to be named, citing ministry policy.

Though workers blocked the gutter at one end, contaminated water was allowed to flow away in the other direction.

In Naraha, contractors used high-pressure water hoses to decontaminate the roof and walls of a house without taking steps to collect the tainted runoff, he said.

On Monday, a ministry task force ordered the contractors to re-examine their methods for dealing with contaminated waste. The ministry plans to come up with countermeasures by the end of next week, he said.

"We must figure out why this happened, and what is really going on at decontamination sites first," the official said.

As of Monday, 50 ministry officials and hired supervisors were monitoring decontamination work in Naraha, Iitate, Tamura and Kawauchi.

But work is currently halted in some areas in the prefecture due to a lack of temporary storage sites for tainted waste, the official said.

Radiation-tainted water left after decontamination work in 2 Fukushima districts

<http://mainichi.jp/english/english/newsselect/news/20130108p2a00m0na010000c.html>

FUKUSHIMA -- In yet another revelation of shoddy decontamination work in the aftermath of the Fukushima No. 1 nuclear plant disaster, two joint ventures failed to collect radiation-tainted water in two municipalities in Fukushima Prefecture last month, the government has disclosed.

The Ministry of the Environment's local office in the city of Fukushima announced on Jan. 7 that two joint ventures including general contractors that undertook the government-run decontamination project failed to retrieve water generated by decontamination work in the town of Naraha and the village of Iitate in mid-December last year.

The ministry will strive to uncover the whole picture of the situation and step up on-site monitoring and supervision of decontamination work. The finding comes on the heels of a series of revelations of illicit dumping of radioactive waste by subcontractors in nuclear disaster-hit areas.

The latest case emerged after the ministry's Fukushima environmental rehabilitation office interviewed officials of the two joint ventures, who admitted to contract violations such as not recovering contaminated water.

Also on Jan. 7, the ministry decided to set up a headquarters for promoting proper decontamination work in an attempt to strengthen the monitoring of such efforts. While ministry officials had been patrolling more than 10 zones subject to decontamination, ministry officials and patrol assistants will hereafter be deployed to all zones on a regular basis.

Furthermore, the ministry also suggested a review of its complaint processing system after admitting that its Fukushima office had left reports of illicit treatment of radioactive waste unaddressed.

Ministry slow to react

January 10, 2012

CROOKED CLEANUP: Environment Ministry failed to act on Asahi tip-off

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201301100070>

THE ASAHI SHIMBUN

Environment Ministry officials in December received details and photographic evidence of shoddy decontamination work in Fukushima Prefecture, but they dithered on taking action by citing “manners” and the need to confirm the information.

New Environment Minister Nobuteru Ishihara has also been slow to react since The Asahi Shimbun ran its first story on the issue on Jan. 4.

Asahi Shimbun reporters, who witnessed slipshod work at 13 locations between Dec. 11 and 18, visited the Fukushima Office for Environmental Restoration, which is responsible for overseeing decontamination work around the crippled Fukushima No. 1 nuclear power plant, on Dec. 25.

The reporters told a senior representative that general contractors instructed workers to dump potentially contaminated vegetation and not to bother with the proper recovery of water used for cleaning.

The journalists explained about the 13 locations and dates and showed photographs taken at the sites. The office representative said it is a matter of “manners.”

“It appears that workers (dumped vegetation) not out of malice but because they removed more radioactive materials than they had expected,” the representative said.

The same day, Asahi Shimbun reporters met with two senior officials at the Environment Ministry in Tokyo and provided the list of 13 locations.

“We cannot do anything unless we confirm the facts,” Masaaki Kobayashi, director-general of the Environment Management Bureau, said. “We will contact the Fukushima office.”

The ministry also appeared to largely ignore information about the dodgy decontamination work from a person on the front line.

A worker in his 20s who said he was ordered to dump vegetation sent a fax to the Environment Ministry in Tokyo and the Fukushima Office for Environmental Restoration on Dec. 26.

The fax explained what was happening at the work sites and contained his real name and e-mail address. But the man had not received any response as of Jan. 8.

Asahi Shimbun reporters visited the Fukushima Office for Environmental Restoration again on Dec. 26 and showed director Takashi Omura a photograph of a site supervisor kicking fallen leaves into a river in Tamura.

“It is a grave problem if it is true,” Omura said. “I will immediately consult with those in charge.”

However, Omura did not discuss the issue with Environment Ministry officials in Tokyo until Dec. 28, the last business day of 2012 for government workers.

By that day, two general contractors contacted by The Asahi Shimbun had informed Omura's office that water used for cleaning may have not been properly recovered at decontamination sites.

In late afternoon on Dec. 28, Kobayashi said, “I do not know about the situation because I have not received reports from (the Fukushima office).”

Local government leaders in Fukushima Prefecture expressed outrage after reading The Asahi Shimbun's report on Jan. 4. Omura called them and apologized for “causing worries.”

Yoshimi Okunishi, a councilor at the Minister's Secretariat at the Environment Ministry, told reporters in Tokyo that the ministry will investigate whether the report is true.

“Our ministry will not move unless a newspaper article appears,” one employee said.

The ministry did not begin questioning general contractors until Jan. 7, when it set up a task force on the issue headed by Senior Vice Environment Minister Shinji Inoue.

But subcontractors and workers have changed at many decontamination sites since the start of the new year, which could make it difficult for the task force to obtain first-hand information.

On Jan. 9, Inoue visited Tamura, where the site supervisor kicked leaves into the river on Dec. 14. The leaves on the ground were gone, and it was impossible to tell if they were removed by workers or fell into the river and flowed away.

The response of Ishihara, who became environment minister on Dec. 26, has been unclear.

Ishihara and the Environment Ministry also plan to rely on voluntary investigations by general contractors instead of interviewing front-line workers.

“We will not have enough information to make a judgment until we read reports (from the contractors),” Ishihara said.

The ministry expects to receive the reports by Jan. 11 and compile measures on Jan. 18 to prevent a recurrence.

During questioning on Jan. 7, the companies only admitted that water used for cleaning was not properly recovered in two instances in December.

Ishihara did not come to his Environment Ministry office on Jan. 4, the first business day for government workers this year.

When asked what he did on the day, Ishihara said on the night of Jan. 8, “I do not remember.”

The Asahi Shimbun asked the same question through the ministry’s public relations office. A written reply said Ishihara issued instructions to a senior vice minister to confirm facts and respond strictly.

Ishihara did not appear in the Environment Ministry until Jan. 6, when he attended a briefing scheduled from last year. He and other senior ministry officials discussed what to do and decided to set up the task force.

Ministry officials hope to minimize the fallout of the scandal because only general contractors can handle the contracts, which are awarded for each municipality.

The officials have relied on the companies to carry out the decontamination project worth 650 billion yen (\$7.4 billion), an extremely large amount for a ministry project.

Slipshod work can constitute violations of not only government contracts but also a special measures law on dealing with contaminated waste.

If serious offenses are found, the ministry could be forced to exclude a general contractor from the project.

Japan Atomic Power posts record profits with all its reactors offline

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201301110084>

By SHIN MATSUURA/ Staff Writer

Japan Atomic Power Co. posted record net profits for the first half of the current fiscal year, despite all of its reactors being taken offline following the 2011 Fukushima nuclear disaster.

The company, which supplies five regional electric utilities with power generated at its nuclear power plants, logged 20.9 billion yen (\$238 million) in consolidated net profits in the April-September period in 2012, according to its half-year financial report submitted late last year to a regional office of the Finance Ministry.

It was able to post a profit despite generating no electricity because it was paid a combined 76 billion yen in "basic fees" by Tokyo Electric Power Co., which owns the crippled Fukushima No. 1 nuclear plant, Kansai Electric Power Co. and three other utilities.

The unlisted Japan Atomic Power receives these basic fees based on its contracts with the utilities. The company says its contracts are renewed every year and that it receives the payments even if it supplies no electricity to them.

According to the report, the company logged 76.2 billion yen in group sales, a year-on-year drop of 10 percent. Most of those revenues came from basic fees paid by the utilities.

Group net profits shot up because there were no costs from generating power as all three of its reactors were idled.

The company is expected to set a record in the current fiscal year ending in March if it does not suffer any major losses, surpassing its highest full-year group net profits of about 3.2 billion yen in fiscal 2008.

But posting profits without supplying power could rouse public ire because utilities pass these fees on to their customers.

The utilities include basic fees, along with other expenses to generate and transmit electricity, such as fuel and payroll costs, when they calculate electricity rates for general households.

Japan Atomic Power defended its receipt of basic fees, however, saying it is based on its contracts.

"They are paid to finance our expenses to maintain and manage our plants," a public relations official said. TEPCO, too, justified the payment.

"We have jointly developed Japan Atomic Power's reactors," said an official at TEPCO's publicity department. "We are in a long-term contract with the company to purchase its power and therefore pay basic fees, whether power is generated or not."

TEPCO included the payment of its basic fees in the electricity rates it raised last September.

Kansai Electric also included basic fees in its application for a rate increase, which is now under review by an industry ministry panel of experts.

TEPCO paid the most in basic fees at 27.7 billion yen, followed by Kansai Electric, which paid 16.2 billion yen. Chubu Electric Power Co. paid 14.6 billion yen, Hokuriku Electric Power Co. paid 10.2 billion yen, and Tohoku Electric Power Co. paid 6.8 billion yen.

It is difficult, however, to predict when Japan Atomic Power will be able to resume supplying power to its clients despite its contracts with them.

Following the disaster at the Fukushima No. 1 nuclear plant, all of the nation's remaining 50 reactors were taken offline for safety checks, and so far, only two reactors at Kansai Electric's Oi plant in Fukui Prefecture have been put back into service.

The Nuclear Regulation Authority, a new industry watchdog set up last year, is set to make a fresh review of each of the reactors after compiling new safety guidelines by summer.

Japan Atomic Power, based in Tokyo, was established in 1957 as a company specializing in nuclear power generation, with most of its investment poured in from the nuclear power industry.

Its single-reactor Tokai plant in Ibaraki Prefecture went into service in 1966 as the nation's first commercial reactor. The reactor is in the process of being mothballed.

Japan Atomic Power faces bleak prospects for the rest of its reactors--two at the Tsuruga plant in Fukui Prefecture and one at the Tokai No. 2 plant in Ibaraki Prefecture, with a combined capacity of 2.62 gigawatts.

The No. 1 reactor at the Tsuruga plant went online in 1970.

It is more than 40 years old, the life span after which a reactor is set to be decommissioned in principle under the law concerning nuclear reactors.

The No. 2 reactor could be instructed to be decommissioned because the NRA concluded that a seismic fault directly below the building housing the reactor is likely active. Under the government's guidelines for quake resistance of nuclear facilities, a reactor is not permitted to be built above an active fault.

The outlook for restarting the Tokai No. 2 plant also appears dismal due to local opposition.

Japan Atomic Power and its group companies have a total work force of 2,294.

Officials with TEPCO and Kansai Electric have served as presidents of the company.

Tsunehisa Katsumata, former president and chairman of TEPCO, serves as an external director of Japan Atomic Power.

Companies deny violations

January 16, 2013

CROOKED CLEANUP: Ministry to investigate after companies admit only 3 violations in Fukushima

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201301160062>

By TAMIYUKI KIHARA/ Staff Writer

The Environment Ministry decided to conduct its own investigation into the shoddy decontamination work around the stricken Fukushima nuclear plant, unsatisfied with the probes by companies believed responsible for the scandal.

“We will punish those involved in malicious cases,” Senior Vice Environment Minister Shinji Inoue told a news conference on Jan. 15. “We are moving to interview the workers.”

The ministry plans to release its investigation results on Jan. 18.

The ministry had instructed four general contractors that won lucrative contracts to decontaminate areas of Fukushima Prefecture to investigate Asahi Shimbun reports that workers were dumping potentially radioactive soil, water and debris into the environment instead of properly storing them for disposal.

Some workers said they were instructed by their supervisors to speed up the decontamination process by ignoring the Environment Ministry’s rules.

The Asahi Shimbun and other parties reported 14 cases of suspected violations of the ministry’s rules. The ministry also said it has received information on about 30 other cases.

The companies admitted to shoddy work in only three cases.

The general contractors’ surveys were based mainly on talks with the supervisors of work sites. Many decontamination workers who felt guilty about carrying out orders to do the sloppy work said they were never interviewed by the construction companies.

One worker said the company investigation involved the cleanup crew standing in front of the supervisor and asked to raise their hand if they had been ordered to dump debris in the environment. The worker said he and his colleagues were reluctant to tell the truth in front of their boss.

“The Environment Ministry has to look into the matter on its own,” said a senior official of Tamura, a city being decontaminated near the Fukushima No. 1 nuclear plant.

The companies did acknowledge that workers allowed water used for cleaning to flow into the environment in both Naraha and Iitate. They also said workers cleaned off their boots in a river in Tamura.

But they denied violations in the other cases, including one in which Asahi Shimbun reporters took photos of a person believed to be a supervisor kicking fallen leaves into a river. They also denied infractions in a case in which Asahi Shimbun reporters videotaped decontamination workers cleaning a rake and other equipment in a river.

A consortium including Maeda Corp. is responsible for decontamination work in Naraha, while a group led by Taisei Corp. is overseeing work in Iitate and companies led by Kajima Corp. are undertaking the cleanup in Tamura.

The central government plans to spend 650 billion yen (\$7.4 billion) for the decontamination project.

Keep on probing

January 16, 2013

2 more cases of sloppy decontamination work uncovered in Fukushima

<http://mainichi.jp/english/english/newsselect/news/20130116p2a00m0na006000c.html>

A probe into sloppy decontamination work following the Fukushima nuclear disaster has discovered two fresh cases of improper disposal, Environment Ministry officials revealed on Jan. 15.

Contaminated water from workers' boots was released into the environment in the latest cases, following two previous incidents, according to the Ministry of the Environment (MOE). A taskforce headed by Senior Vice Minister of the Environment Shinji Inoue that aims to improve decontamination procedures will announce more details on Jan. 18 as well as how it will deal with the problems.

The findings come after the MOE had instructed seven general contractors handling decontamination work in eight municipalities to conduct investigations after receiving word that some workers were illegally disposing of removed soil and leaves in places such as rivers. By Jan. 11, the MOE had received a report from the contractors.

The newly discovered cases are said to have occurred in Tamura, Fukushima Prefecture, during work undertaken by a joint-venture company consisting of Kajima Corp, Sumitomo Mitsui and Hitachi Plant Technologies. Following reports that workers had washed mud off their boots into ditches, the company conducted an internal investigation, which confirmed the suspicions, but that the mud's radiation levels were within limits.

There had also been reports that after decontamination work, two workers had washed off their boots and other equipment into a river. The company admitted that this had occurred early on in its operation, but said that no incidents have been reported recently.

Previously, two other cases of sloppy decontamination work by a different joint-venture company were found to have occurred when contaminated water was left behind in Naraha and Iitate, Fukushima Prefecture.

2.4 trillion yen to promote nukes

January 17, 2013

9 utilities spent 2.4 trillion yen to sell public on nuke power

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201301170013>

THE ASAHI SHIMBUN

Nine of Japan's electric utilities spent a combined 2.4 trillion yen (\$27.6 billion) to sponsor TV programs and run ads in print media over four decades to promote nuclear power and underscore the safety of their plants, The Asahi Shimbun has found.

The lavish campaign apparently helped utilities to expand their influence on media outlets and allowed them to hold considerable sway in objecting to negative reporting on nuclear power.

The utilities' PR spending began to soar in the late 1970s and, in 1986, topped twice the level registered around the 1979 Three Mile Island nuclear accident in the United States, according to the investigation by The Asahi Shimbun. In 1986, the Chernobyl disaster occurred in what is now Ukraine.

The utilities are regional monopolies, meaning they have no competitors in the areas they serve.

But in fiscal 2005 through 2007, the combined annual spending by the utilities on PR topped about 100 billion yen, on par with the ad expenses of a leading automaker or electronics manufacturer.

An employee with an advertising agency that handled the promotion of nuclear power said electric power companies generously spread their PR money around.

"The nuclear industry paid exceedingly more to advertise than other industries did," the employee said. "It was meant to get media organizations to support nuclear power."

A public relations official at Tokyo Electric Power Co. (TEPCO), which owns the crippled Fukushima No. 1 nuclear plant, denied that the utility engaged in a high level of ad spending or pressured news outlets for favorable coverage.

"Our PR spending is not huge, compared with other companies," the official said. "We have never exerted pressure on news organizations concerning their coverage."

The exorbitant spending is potentially contentious because utilities had been allowed to calculate electricity rates by listing the expenditures as part of expenses to generate and transmit electricity, such as fuel and payroll costs.

In addition, utilities could also include expected profits as total costs before they applied to the government for approval of an electricity rate hike.

The Ministry of Economy, Trade and Industry, however, decided in March 2012 not to authorize ad expenses as part of costs unless they are considered absolutely necessary under the new rules.

Advertising expenses consist of expenditures to sponsor TV and radio programs and run ads in print media, including advocacy ads, as well as to run PR facilities.

In some cases, utilities spent some of the PR funds to wine and dine members of media outlets. They also ran ads in the mouthpiece publication of the ruling Liberal Democratic Party, which has long promoted nuclear power, and sponsored popular TV news shows.

The Asahi Shimbun examined utilities' financial reports, in which advertising costs are posted, from fiscal 1970 to fiscal 2011, which ended in March 2012.

In fiscal 1970, Kansai Electric Power Co.'s Mihama plant in Fukui Prefecture became the first nuclear power station to be brought into service by a leading operator, and more nuclear plant construction projects were under way in the late 1970s.

The nine regional utilities together spent 2.42 trillion yen on ad campaigns over the 42-year period from fiscal 1970.

The utilities expended a combined 20 billion yen a year on their PR efforts until the Three Mile Island accident. Then, the spending doubled to top 40 billion yen following the Chernobyl disaster and continued to soar in the early 1990s.

Hiroyoshi Sunakawa, associate professor of media theory at Rikkyo University, said the surge reflects utilities' intention to try to expand their influences on news organizations.

"It is easy to see that by spending a large sum on ads, utilities tried to keep a close eye on media organization's negative reporting on nuclear power plants," he said.

Sunakawa said utilities are obliged to explain to the public about ad spending because the costs were factored into their electricity rates. He also urged media outlets to examine if they considered it "taboo" to negatively report on nuclear power.

The investigation found that TEPCO spent more than any other utility, with 644.5 billion yen over the 42-year period. It was followed by Kansai Electric, which shelled out 483 billion yen.

Tohoku Electric Power Co., Chubu Electric Power Co. and Kyushu Electric Power Co. posted expenses somewhere between 250 billion yen and 270 billion yen, respectively. Of the nation's 10 regional utilities, only Okinawa Electric Power Co. in Okinawa Prefecture does not own a nuclear power plant.

In April 2011, TEPCO released details of its ad spending for fiscal 2010, the first time it has done so.

The utility spent 7 billion yen to sponsor TV and radio programs, 4.6 billion yen on ads for print media and 4.3 billion yen to operate PR facilities.

In September 2012, household electricity rates were hiked in the area that TEPCO serves.

Criticism of media organizations flooded Twitter after the nuclear disaster occurred at the Fukushima No. 1 nuclear plant in March 2011.

“Media organizations have become a member of the ‘nuclear village’ after the nuclear industry shelled out huge sums for ads,” a user tweeted.

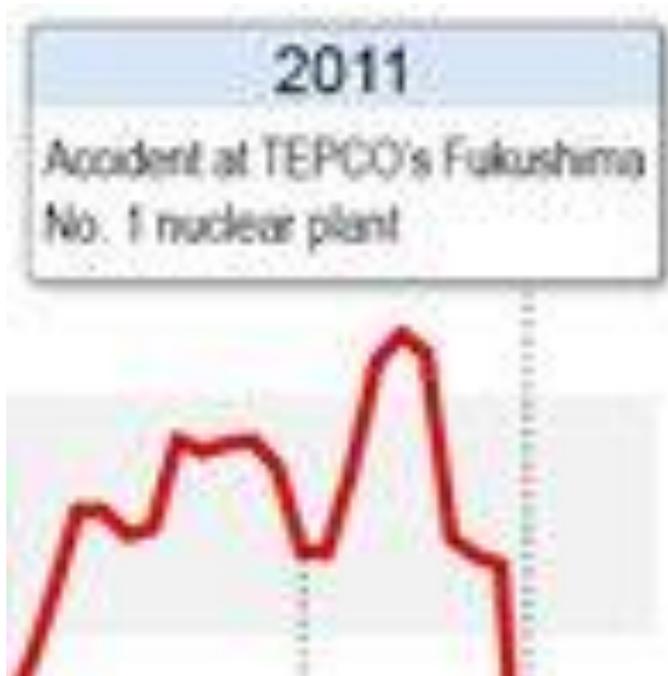

In November 2011, Tatsuo Hatta, visiting professor of economics at Gakushuin University, echoed the criticism at a meeting of a panel of experts with the industry ministry tasked to prepare a review of the electricity rate system.

“With advertising money, media organizations became dependent on utilities for revenue and found it hard to criticize nuclear power,” said Hatta, a member of the panel.

The late Tatsuru Suzuki, former head of the publicity department at the Federation of Electric Power Companies of Japan, reportedly told a meeting of presidents of utilities that promoting nuclear energy costs a lot of money.

“It is expensive to promote nuclear power,” Suzuki was quoted as saying in his book. “You should think of it as part of construction costs, not just publicity expenses.”

More photos and videos to document shoddy work

January 17, 2013

CROOKED CLEANUP: Photos, videos show contractors lied in decontamination reports

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201301170063>

See also the video :

http://www.youtube.com/watch?feature=player_embedded&v=ly0W2D95_Z0

THE ASAHI SHIMBUN

Photos and videos taken by The Asahi Shimbun show that general contractors lied in their reports about shoddy decontamination work around the Fukushima nuclear plant.

The companies, which received lucrative contracts for the project, admitted to slipshod work in three cases. But it is clear that many other violations of the Environment Ministry's rules have occurred.

The Asahi Shimbun carried a set of three photos on the front page of its morning edition on Jan. 4, when it broke the story about workers dumping potentially contaminated water and debris into the environment. The photos show a man repeatedly kicking fallen leaves into a river in Tamura, Fukushima Prefecture, on Dec. 14. A pink line on his helmet indicates he is a site supervisor.

In its report submitted to the Environment Ministry, a group of companies responsible for decontaminating Tamura, including general contractor Kajima Corp., denied such acts.

According to the report, the supervisor acknowledged he was the person in the photos. But he said he was recovering a rake that had fallen in the river and never kicked leaves into the water.

The report contained two photos: one showing a rake that Kajima's group said was retrieved from the river; the other showing company officials inspecting the site and re-enacting how the rake was recovered.

But The Asahi Shimbun captured the supervisor's actions in a series of 27 photos. Those taken before and after the three photos carried in the newspaper show a rake had never fallen into the river and the supervisor moved to another site immediately after kicking the leaves into the river.

The photos were taken just after 11 a.m. The Asahi Shimbun reporter who took the photos observed the site until the day's work ended around 4 p.m. The supervisor never recovered a rake.

Kajima's group said the rake had slid down a slope into the river. But the slope was covered with thick branches and foliage, making it impossible for a rake to slide down.

A Kajima representative told The Asahi Shimbun on Jan. 16 that the group's report is based on what the supervisor told its officials, and that the company believes his account.

A photo carried in the city news section of The Asahi Shimbun's Jan. 4 morning edition shows a man in white work clothes cleaning the balcony of a home in Naraha, Fukushima Prefecture, on Dec. 17.

The man was using a pressurized sprayer, and potentially contaminated water spread around the balcony. The use of pressurized sprayers is limited to gutters and other areas. And the water used in such cleaning must be properly collected.

In its report submitted to the Environment Ministry, a group of companies responsible for cleaning Naraha, including Maeda Corp., admitted that a pressurized sprayer was used in cleaning the balcony and that water spread around it.

The report also said a pressurized sprayer was not used to clean the roof.

But a video taken by an Asahi Shimbun reporter shows a man in black work clothes using a pressurized sprayer on the roof immediately after the man in white finished cleaning the balcony.

The photo carried on the Jan. 4 edition did not show a worker cleaning the roof.

The Environment Ministry's work rules clearly state that roofs must be wiped by hand or brushes to remove radioactive materials, but they do not include a provision for balconies.

A supervisor at one subcontractor said Maeda's group probably thought it could contain the damage by admitting the use of a pressurized sprayer only on the balcony, not on the roof.

A Maeda representative told The Asahi Shimbun on Jan. 16 that the report describes what the company found through its investigations.

A story in the city news section of The Asahi Shimbun's Jan. 4 morning edition describes an incident involving workers using a pressurized sprayer to clean a parking lot of a post office in Iitate, Fukushima Prefecture, on Dec. 18.

The story says an Asahi Shimbun reporter told one of the workers that the water was flowing into a gutter without being recovered. The worker said he could not comment because he was not a supervisor.

The conversations were recorded in a video. The reporter pointed to the gutter and said, "Here it is." The worker stammered and left the site quietly.

In its report to the Environment Ministry, a group of companies responsible for cleaning Iitate, including Taisei Corp., said workers were not told that water was flowing into the gutter.

The report said a worker was asked when the work would end, and he said he could not answer because he was a security guard. The report said none of the workers was aware that water was flowing out.

A Taisei representative told The Asahi Shimbun that the company believes the report is correct.

COMMENTARY: Ministry must listen directly to front-line workers

The Environment Ministry has received reports from The Asahi Shimbun and others about 14 cases of shoddy decontamination work in Fukushima Prefecture. General contractors admitted to only three of those cases.

The slipshod work caught in photos and videos by The Asahi Shimbun is just the tip of the iceberg. The contractors failed to conduct thorough investigations--even in the cases that have been reported.

The ministry plans to release the results of its own investigations on Jan. 18. But if it continues to rely on the words of the contractors, the actual situation will never become clear.

A team of Asahi Shimbun reporters covering the issue has called on the ministry and contractors to look into what happened at the cleanup sites, particularly at those that were photographed and recorded. Separately, more than 30 decontamination workers told The Asahi Shimbun that they had cut corners. There is no doubt that violations of the ministry's rules are rampant. Contractors have refused to admit improper practices, merely closing their eyes to the inconvenient truth. An audio recording was taken when workers in Naraha dumped potentially contaminated leaves and branches on the instructions of a supervisor from a general contractor. But the company said it could not confirm that such instructions had been given. One worker said he and his co-workers were told to raise their hand in front of the supervisor if they received such orders from him. He said they were reluctant to speak out in such a situation. Investigations entirely dependent on contractors have reached their limits. The Environment Ministry has received information on more than 30 cases of slipshod work. If the ministry releases the results of insufficient investigations, public distrust of the government will only grow, making it difficult for the ministry to justify spending huge sums of taxpayer money on decontamination projects. The ministry must listen directly to as many front-line workers as possible in addition to confirming violations reported by media organizations. It may seek cooperation from the infrastructure ministry, which has overseen the work of general contractors, and the labor ministry, which is experienced in workplace inspections. The Environment Ministry should not release the results of its investigations on Jan. 18 if it needs more time. (This article was written by Toshio Tada.)

Investigation continues

January 18, 2013

CROOKED CLEANUP: Government confirms 5 cases of shoddy decontamination work

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201301180075>

THE ASAHI SHIMBUN

The Environment Ministry on Jan. 18 said that there have been five cases of shoddy decontamination work around the crippled Fukushima No. 1 nuclear power plant and has punished the general contractors involved in the cleanup effort.

In the five instances, three general contractors were ordered to take corrective actions, the ministry said on Jan. 18 in its report on the investigation into the central government-commissioned work, following reports of the suspected such dumping of potentially radioactive debris. Two other contractors were given guidance on following proper procedures.

The ministry also announced that countermeasures would be taken for preventing illegal dumping in the future.

With some parts of the report saying, "There was insufficient evidence to prove it," the ministry plans to continue its investigation.

"It is important to continue to investigate, inspect and improve decontamination work," Environment Minister Nobuteru Ishihara said in a press conference on Jan. 18.

The ministry also admitted to having problems in dealing with reports about shoddy decontamination work being done.

The ministry task force to promote proper decontamination work met on Jan. 18 and came up with measures to avoid a repeat of illegal dumping practices.

Shinji Inoue, senior vice environment minister who heads the task force, announced the measures, including quadrupling the number of field supervisors and imposing stricter punishments on chief contractors commissioned to do the decontamination work if they violate the rules.

According to the ministry, there were 19 suspected cases of inappropriate decontamination work. Of those, the ministry judged that there were five inappropriate cases, including three instances attributed to four general contractors and two newly investigated cases, including one where workers dumped collected grass and debris into a river.

The ministry has instructed contractors involved in three of the most blatant cases to improve their work procedures.

In one of the three instances, a worker in Naraha, Fukushima Prefecture, was observed by an Asahi Shimbun reporter using a pressurized sprayer to clean the veranda of a private home, with water splashing the walls of neighboring structures and not being properly collected.

Lies and more lies

January 19, 2013

Probe reveals 45% of cleanup subcontractors violated labor laws

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201301190050>

THE ASAHI SHIMBUN

Nearly half of the 242 companies involved in decontamination work in Fukushima Prefecture were found to have violated labor laws in 219 instances, the labor ministry said Jan. 18.

The Ministry of Health, Labor and Welfare said 45 percent of the companies fell into this category.

The findings show that many of the cleanup workers were thrust into inadequate work environments, fueling argument that was part of the reason slipshod decontamination work proliferated in many sites, as was reported by the media.

The labor standards inspection offices in Fukushima Prefecture reported 34 cases in which radiation levels were not measured prior to the start of cleanup work, despite a requirement under the Industrial Safety and Health Law to do so.

The offices investigated the conditions under which those workers toiled from April to December last year.

They found that in eight incidences, hazard pay, which comes from public funds, was not paid to workers.

There were 11 cases in which subcontractors did not specify wages and other details of working conditions to workers, a violation of the Labor Standards Law.

In many cases, workers were not paid their wages or did not have a health checkup.

The offices said they have instructed violators to take corrective actions and that they reported on the nonpayment of hazardous pay to workers to the Environment Ministry, which is overseeing decontamination operations.

Most of the offenders are smaller subcontractors that are commissioned by general contractors.

Among them are a number of small companies that scrambled to jump on the bandwagon after the government earmarked a huge budget for cleanup efforts.

A tendency to ignore the spirit of the law was particularly marked among subcontractors, experts said. Meanwhile, the Environment Ministry stopped short of recognizing two-thirds of the 19 suspected cases of slipshod cleanup work around the stricken Fukushima No. 1 nuclear power plant.

The ministry said in its report on Jan. 18 that it certified five instances as shoddy and disciplined the general contractors responsible.

But it said it found no fault with two cases.

For the rest, the ministry did not reach a conclusion on whether or not general contractors undertaking decontamination work did a substandard job. It cited vigorous denials over the allegations.

However, the ministry acknowledged it had been slow to react, despite being alerted by thousands of telephone calls and e-mails citing suspicious cleanup efforts.

“Since the ministry is not a law enforcement body, there are limitations to the way we look into cases,” Shinji Inoue, senior vice environment minister, said Jan. 18. “We acknowledge that our investigation, coupled with time constraints, has not been adequate.”

The ministry said it will continue to investigate if those tip-offs are well-founded and open a new investigation if additional information on suspected cases is reported.

The ministry began its investigation after The Asahi Shimbun reported on suspected dumping of potentially radioactive debris in the central government-commissioned work.

Problem with utilities' awareness of own responsibility for nuke safety

January 20, 2013

Power suppliers, individuals should be responsible for ensuring safety of nuclear plants

<http://mainichi.jp/english/english/perspectives/news/20130120p2a00m0na003000c.html>

The Liberal Democratic Party (LDP) that regained control of the government following its landslide victory in the Dec. 16 House of Representatives election is set to overturn the previous administration's policy of ending Japan's reliance on nuclear power.

"Nuclear power reactors that will be built in the future are completely different from the old ones installed 40 years ago or those at the Fukushima No. 1 Nuclear Power Plant where an accident occurred," Prime Minister Shinzo Abe said in a TV program late last year.

His remarks could be interpreted as suggesting that his government is ready to approve the construction of new nuclear reactors on the grounds that they are safe.

It is true that aging nuclear reactors have higher risks, but one cannot help but wonder whether new reactors are absolutely safe.

In December last year, three people -- U.S., French and British nationals -- were appointed as international advisers to the Nuclear Regulation Authority (NRA) and attended a meeting in Japan. The advice they gave as representatives of these countries that rely heavily on atomic power is noteworthy.

Andre-Claude Lacoste, former chairman of the French Nuclear Safety Authority, said he was shocked at the Japanese industry's attitude toward the safety of nuclear power. Specifically, the fact that officials of power suppliers simply repeated that they had strictly abided by relevant regulations came as a shock to him.

He pointed out that Japanese utilities' belief that it is all right as long as they simply follow the rules is dangerous.

The responsibility of the electric power industry for the safety of nuclear power plants tends to be obscured in Japan, where private companies have operated nuclear plants to supply a significant ratio of electric power in accordance with the government's energy policy. Under international standards, however, power suppliers are fully responsible for ensuring the safety of the nuclear plants they operate, as stipulated by the 10-point safety rules enforced by the International Atomic Energy Agency.

In Japan, the awareness of utilities' responsibility for nuclear safety is lacking even after the outbreak of the Fukushima nuclear disaster in March 2011. There is no point in replacing nuclear reactors with the most advanced ones unless such awareness is changed.

Richard Meserve, former chairman of the U.S. Nuclear Regulatory Commission, said the Three Mile Island nuclear disaster in 1979 drastically changed the established view in the United States that the most important thing in nuclear plants was their design. This idea led to the belief that nuclear reactors are safe as long as they are new.

In the United States, nuclear plant operators have formed the Institute of Nuclear Power Operations (INPO), in which member companies evaluate each other's safety measures. The president of the company whose nuclear safety measures are ranked lowest in the INPO's annual meeting is required to submit and explain improvement measures. In other words, INPO members take advantage of their concerns that they could be embarrassed in front of their fellow members to enhance safety measures.

Japanese power suppliers founded a similar organization called the Japan Nuclear Technology Institute, but the body was reorganized into a new entity last year after failing to fulfill its role. The new

organization claims it is aiming to be the Japanese version of the INPO, but has failed to show its specific plan to achieve this goal.

Moreover, individual responsibility for the safety of nuclear plants is far more obscure in Japan than in other countries.

Mike Weightman, head of the U.K. Nuclear Directorate, proposed that the managers of atomic power stations be required to sign documents pledging that their facilities are absolutely safe as a precondition for reactivating idled nuclear reactors. If so, the managers cannot evade their responsibility for any accidents at their plant by claiming that they were strictly abiding by safety regulations.

The three experts agree that what matters is a culture of safety among nuclear plant operators. The LDP is partly responsible for failing to rectify -- and even contributing to flaws in the industry's safety culture as it was in power for decades.

After listening to advice from the three, NRA Chairman Shunichi Tanaka suggested that idled nuclear reactors should not be reactivated unless the responsibility for safety among power suppliers and individual employees is clarified.

"The safety of nuclear plants in Japan is dissatisfactory in light of the need for individual employees in charge at power suppliers to fulfill their responsibilities to consider the matter and for their management to support their efforts. This is my personal view, but operations at idled nuclear reactors may not be allowed to be resumed unless the nation has confidence in their safety," he said. (By Yuri Aono, Expert Senior Writer)

Customers charged to cover nuke payouts

January 21, 2013

Nuclear plant operators payout amount revealed

http://www3.nhk.or.jp/daily/english/20130121_11.html

NHK has learned that **nuclear power plant operators in Japan have charged users about 90 million dollars a year to cover payouts to local authorities hosting their facilities.**

NHK interviewed 9 power companies about their annual payments since 2008 to prefectures and municipalities hosting nuclear power plants.

The payments have been covered by utilities fees users pay to electric companies. But the details of just how much users are shouldering the cost of such payouts had not been revealed.

The survey has found the annual amount that Kansai Electric Power Company had been charging users to cover the cost was about 40 million dollar, with Tokyo Electric charging about 22 million dollars.

Kyushu Electric charged about 10 million dollars; Chugoku about 8 million; and Chubu about 4 million.

The central government last year said that it does not consider such donations as an expense, and that it will not allow utilities to charge users to cover them.

Following the government decision, Kansai and Tokyo Electric Companies removed the amounts from their calculations of electric fees last year. Other companies are considering following their suit.

Osaka University Professor Tatsuo Hatta says utilities may be able to find other ways for such payouts. He is calling for further transparency

More cases of "amakudari"

January 21, 2013

2 key industry ministry bureaucrats landed lucrative jobs after retirement

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201301210093>

By ATSUSHI KOMORI/ Senior Staff Writer

Two industry ministry officials who played a central role in Japan's nuclear policy at the time of the Fukushima disaster went on to land senior positions at major financial institutions after they retired from public life.

The practice of retired bureaucrats ending up in jobs at organizations or companies that were often once under their jurisdiction is called "amakudari," which translates as "descent from heaven," and has come under severe criticism due to fears it fosters collusion between bureaucrats and private companies.

Kazuo Matsunaga, 60, was formerly vice minister of the Ministry of Economy, Trade and Industry, and Tetsuhiro Hosono, 60, served as director-general of the Agency for Natural Resources and Energy.

They held these key posts during the reactor meltdowns at the Fukushima No. 1 nuclear power plant triggered by the March 11, 2011, Great East Japan Earthquake, which spawned towering tsunami that devastated coastlines of northeastern Japan.

Their re-employment will likely ignite controversy, because even now, more than 150,000 people affected by the disaster have not been able to return to their homes because of high radiation levels and other reasons.

Matsunaga became an adviser at Sompo Japan Insurance Inc. on March 15 last year, and Hosono assumed his new position as an adviser of Mizuho Corporate Bank on May 14, 2012.

Sompo Japan Insurance and Mizuho Corporate Bank have not disclosed the compensation packages for the two men. But generally, amakudari posts are very lucrative.

Matsunaga and Hosono were replaced by then industry minister Banri Kaieda in summer 2011 “to breathe fresh air into the ministry.”

Due to the fact they retired below the official retirement age, Matsunaga and Hosono received more than 10 million yen (\$110,000) more in allowances than that given to those who voluntarily quit their posts.

As for why Matsunaga and Hosono were able to find re-employment, a Sompo Japan Insurance official said, “We hope to get advice on response measures to policy issues,” while an official of Mizuho Corporate Bank said, “We want (Hosono) to advise on general management matters.”

What special allowance?

Contractors fail to pay decontamination workers

http://www3.nhk.or.jp/daily/english/20130120_25.html

NHK has learned that some contractors failed to pay a special allowance to workers who remove radioactive fallout from the Fukushima nuclear accident.

The government pays the risk allowance of 110 dollars per day on top of the daily wage to people who work in places with relatively high levels of radiation.

The government has commissioned major construction companies to carry out the decontamination. But the actual work is performed by their subcontractors.

NHK found that 2 subcontractors hired to work in Tamura City, Fukushima Prefecture, did not pay the allowance.

Several workers say when they started their jobs in mid-2012, they were told they would receive 110 dollars a day with free accommodation and meals. They say their employers did not mention the special allowance.

The workers say that between November and December the subcontractors presented them with a new document about their working conditions.

The allowance was paid on paper, but the daily wage was cut to 67 dollars. Accommodation and meal expenses were deducted from the payment. The workers say the amount they received did not change.

The subcontractors reportedly asked the workers to sign the document as if it were the original one. The employers reportedly admitted that it was a fake.

The workers say their employers apparently tried to conceal the non-payment of the risk allowance.

The 2 subcontractors admitted to NHK that they failed to pay the allowance. But they declined to answer whether they made the new document.

The labor ministry and the Environment Ministry have been looking into the alleged non-payment since November after receiving a tip-off.

The labor ministry says it has found 8 cases of non-payment.

Breach of trust

January 22, 2013

Editorial: Inappropriate decontamination work betrays disaster victims

<http://mainichi.jp/english/english/perspectives/news/20130121p2a00m0na005000c.html>

Cases of sloppy government-run decontamination work in areas affected by the Fukushima No. 1 Nuclear Power Plant disaster -- such as letting water used to wash radioactive materials off structures run off into ditches -- have emerged. According to an Environment Ministry report released on Jan. 18, there have been at least five such cases. The ministry has instructed contractors involved in three of the cases to make improvements.

The ministry said there were no instances of malice that violated the Act on Special Measures concerning the Handling of Pollution by Radioactive Materials. However, what did take place is undoubtedly a breach of trust of the local residents who are longing to return to their homes as soon as possible. Ministry officials are set to reinforce on-site oversight and supervision, and have indicated government intentions to cancel contracts in the case of such sloppy work in the future. Such measures should promptly be implemented.

All those involved must keep in mind that if inappropriate decontamination work takes place repeatedly, people's confidence in decontamination work will wane, pushing Fukushima's recovery even further off into the future.

Government-run decontamination is being undertaken in special decontamination zones, spanning 11 municipalities across the prefecture, whose residents are still in evacuation. Under current plans, decontamination where radiation levels are 50 millisieverts or lower per year -- for residences, farmland, roads, and forests within about 20 meters from residential areas -- is set to be completed by the end of fiscal 2013.

Such large-scale decontamination is unprecedented worldwide. In nine municipalities for which decontamination plans have been worked out, more than 20,000 hectares of land are subject to decontamination. The cost will be staggering; in just four municipalities including Tamura, for which the Environment Ministry has already commissioned decontamination work for the current fiscal year, the cost comes out to approximately 34 billion yen.

Although an advance decontamination model project confirmed the effectiveness of the work to a certain extent, differences between the model and actual decontamination conditions mean that the national government, contractors and workers are all fumbling through the process, according to officials at an Environment Ministry division in charge of proper implementation of decontamination methods.

One decontamination worker previously told the Mainichi Shimbun, "In reality, decontamination hasn't been very effective. From our point of view, it's a waste of tax funds." Residents have been ordered to evacuate from areas where decontamination work is being conducted, which means they cannot keep an eye on what's taking place. It's likely there have been more than five cases of inappropriate decontamination.

To prevent a reoccurrence, it will be necessary not only to reinforce oversight, but to think about the pain of the people who have been driven from their homes.

Some residents harbor deep-seated distrust toward the effectiveness of decontamination efforts injected with massive funds, and are calling instead for more support for evacuees and toward relocation.

In response to such voices, the government must **secure transparency** regarding the progress of decontamination efforts, while also gathering in-depth data on radiation levels based on location and methods to understand the efficacy and limitations of decontamination work. Forest decontamination, which has yet to be started for the most part, is another major challenge we must confront.

TEPCO still cover its tracks after almost 2 years

Videos show crisis at Fukushima nuclear plant 2 weeks after tsunami

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201301240077>

THE ASAHI SHIMBUN

Confusion spread, tempers flared and disaster loomed at two reactors of the Fukushima No. 1 nuclear plant, nearly two weeks after the crisis started in March 2011, footage of the plant operator's teleconferences showed.

At issue were whether to vent the No. 1 reactor after its internal pressure neared the limit and how to keep the temperature in the No. 5 reactor under 100 degrees.

Tokyo Electric Power Co. on Jan. 23 released to reporters 312 hours of videos of teleconferences between March 23 and 30 and April 6 and 12, 2011.

At 11:20 a.m. on March 23, 2011, Masao Yoshida, then chief of the Fukushima No. 1 plant, asked the Tokyo head office to confirm procedures for venting a containment vessel.

"It will be an extremely major issue, and we need to coordinate with the head office," Yoshida said.

At that time, pressure at the No. 1 reactor was climbing to the maximum level the reactor was designed to withstand. The pressure did not fall until the night of March 24.

At 8:58 p.m. on March 23, another serious problem was revealed when a report said temperature could rise again in the No. 5 reactor. The temperature had fallen below 100 degrees three days earlier.

A cooling system stopped working when its power was being switched from a temporary-use diesel generator to a permanent outside source.

"Something may be wrong with a motor or a power source of a pump," an official said. "We are trying to determine the cause."

If such temperatures rise above 100 degrees, the pressure and water levels in the reactor must be re-adjusted.

Yoshida was furious because he had not received the report immediately.

"This is a very, very important issue," Yoshida said. "If there is something abnormal, tell us without delay. It is the most basic of basic actions."

At a meeting in the morning of March 24, another report said the No. 5 reactor would be repaired by noon. But the repairs were not completed until past 4 p.m.

"The pump rotated at 4:14 p.m.," an official said. "Water temperature remains low at 99 degrees."

The videos also showed that TEPCO officials failed to take effective measures for two weeks after receiving a report that highly radioactive water could be flowing into an ordinary drain at the plant.

Plant officials reported to the Tokyo head office on March 25 that water was apparently flowing out of the No. 2 reactor building via a hatch for large equipment.

Officials detected radiation levels of 40 millisieverts per hour, four times higher than surrounding areas. But traces of water were again found at the same location 13 days later. They appeared to show that water went through the hatch and fell into the drain.

The water had almost all evaporated, but radiation levels were 50 millisieverts per hour.

A plant official said the space under the hatch's door would be sealed with concrete or through other measures the following day.

In the videos released on Jan. 23, TEPCO beeped out audio in 1,133 cases and blurred images in 347 cases.

The videos released by TEPCO so far cover the initial one month after the Great East Japan Earthquake and tsunami crippled the nuclear plant on March 11, 2011.

TEPCO said it is considering whether to release videos for the following period.
(This article was compiled from reports by Takashi Sugimoto and Toshihiro Okuyama.)

Just wait for the snow to melt

January 25, 2013

Heavy snow forcing some illegal layoffs of decontamination workers

THE ASAHI SHIMBUN

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201301250084>

Heavier seasonal snowfall than usual is disrupting cleanup and decontamination efforts around the crippled Fukushima No. 1 nuclear plant, forcing some subcontractors to illegally lay off workers while the work is suspended.

The labor ministry says it will investigate the practice of laying off these workers without proper notice or payment of wages.

In mid-January, most of Fukushima Prefecture experienced severe snowfall. Fukushima city recorded 18 centimeters of snow on Jan. 14 and the accumulation measured 41 cm five days later, according to the Fukushima Local Meteorological Observatory. The average snow depth around mid-January is 5 cm.

The Environment Ministry started decontamination efforts in four municipalities last summer and hopes the work for this fiscal year, worth 34.2 billion yen (\$378 million), will be concluded by the end of March. But the schedule could be delayed due to the weather.

The Environment Ministry and local governments said most of the work has been disrupted in Tamura city, Iitate village and Kawauchi village among the four municipalities. In Naraha town, a relatively small amount of snow recorded there only forced the disruption of four days of work, officials said.

The ministry and local governments said workers continue hauling bags of potentially radioactive soil, branches and leaves collected through decontamination work, but it is difficult for crews to clear the snow and collect more debris in the mountains. Residential areas have many places where snow has frozen and turned to ice, and water used for cleaning would also collect and freeze.

A full resumption of operations is projected to begin in March or even later, depending on the weather.

Under the harsh winter conditions, some subcontractors have already let workers go.

The Labor Standards Law stipulates that employers must inform employees of their dismissal at least 30 days in advance or must pay them the equivalent of at least 30 days of their average wages.

However, the companies--which cannot receive enough payments to cover the labor costs from their general contractors while the operations are suspended--violated the law. And they are believed to be planning to rehire the workers when the cleanup and decontamination effort is restarted.

A worker in his 60s said when he submitted his request for payment on Jan. 21, he was told that his employment would be discontinued because no work could be done due to the snow. He said the firm told him it would recruit workers again, after the snow melts. He said about 60 people lost their jobs without any compensation.

In the case of another worker in his 50s, he said the manager at the subcontractor told dozens of employees on Jan. 21 that their work would conclude at the end of the month, and the firm wanted them to return when the operation resumes in March. He said there was nothing said on 30 days of wages to be paid.

The Environment Ministry isn't saying much on the worker complaints.

"We are closely watching the effects of the snow, but we have yet to acknowledge there is a wage problem," a ministry official said.

The general contractors involved in the decontamination work said they do not comment on individual cases.

THE ASAHI SHIMBUN

Beware ! 60,000 potential terrorists in Japanese plants

January 27, 2013

Background checks planned for N-workers

<http://www.yomiuri.co.jp/dy/national/T130126003221.htm>

The Yomiuri Shimbun

The Nuclear Regulation Authority will strengthen counterterrorism measures at the nation's nuclear facilities and will seek mandatory background checks for workers at such facilities to that end, according to informed sources.

The authority will launch an expert study panel next month tasked with suggesting improvements in security at nuclear facilities.

Under the NRA's plan, people applying to work at nuclear facilities would be required to undergo background checks for such things as criminal records to prevent possible collaboration with terrorists.

Japan is the only developed country with nuclear power plants that has not established a counterterrorism program to protect its nuclear facilities, the sources said.

The NRA plans to prepare a rough draft of its nuclear counterterrorism plans in time for the Nuclear Security Summit to be held in the Netherlands in March next year.

Risks at the nation's nuclear facilities include radiation leaks if they should be attacked and theft of nuclear materials and technology that could be diverted to the production of nuclear weapons.

There are also concerns that employees with access to classified information such as locations of facilities could pose a security risk.

Background checks have been in place for workers at nuclear facilities in Europe and the United States for more than 10 years.

Those checks cover such things as criminal records, debts and alcohol or drug dependence. The checks are carefully analyzed to determine if the applicant's problems could be exploited by terrorists.

The NRA's expert panel plans to discuss concrete measures for the counterterrorism system, including the division of roles between the government and operators of facilities.

In Japan, the government and operators of nuclear facilities have been reluctant to put such a system in place partly out of concerns over invasion of privacy. Presently, applicants only have to produce a driver's license or other specified forms of identification.

The outbreak of the crisis at the Fukushima No. 1 nuclear power plant on March 11, 2011, highlighted the dangers of not having a more rigorous system in place when 10 employees working to bring the crisis under control at the plant went missing. [??????]

The International Atomic Energy Agency recommended background checks for nuclear workers in all countries in 1999 and 2011.

===

Information control needed

By Sho Funakoshi / Yomiuri Shimbun Staff Writer

The Japanese government once considered adopting background checks for employees at nuclear facilities after the 2001 terrorist attacks in the United States. However, the plan was shelved due to fear of criticism that the checks would constitute invasion of privacy.

However, the recent Algeria hostage crisis showed that taking measures to prevent insiders from abetting terrorism is imperative.

The Nuclear Regulation Authority, which is scrutinizing safety standards at nuclear facilities with lessons learned from the nuclear crisis at the Fukushima No. 1 nuclear plant in mind, should urgently close security holes to meet international standards.

However, the NRA faces a difficult task.

According to a survey by the Japan Nuclear Energy Safety Organization, more than 60,000 workers enter radiation control areas near nuclear reactors nationwide every year.

It is essential to make a system that facilitates the collection and storage of background information. In the United States, collected information is digitized into a database for use in subsequent investigations.

It is also critically important to ensure the security of personal information such as criminal records and applicants' debts.

Protecting information against cyberterrorism at public offices is also important, as are measures against use of the information unrelated to terrorism by business operators who may want to justify layoffs or use it for other purposes.

TEPCO's unreasonable request to Gov't

January 26, 2013

Tokyo Gov. Inose balks at TEPCO demand for hefty cancellation charge

<http://mainichi.jp/english/english/newsselect/news/20130126p2g00m0dm003000c.html>

TOKYO (Kyodo) -- Tokyo Gov. Naoki Inose balked Friday at Tokyo Electric Power Co.'s demand that the local government pay a hefty charge to cancel its contract to sell the utility electricity generated by government-owned facilities.

Inose indicated that the metropolitan government, which intends to select a buyer through competitive bidding, is not planning to pay a sum of around 5.18 billion yen requested by TEPCO.

The company is seeking the amount to cover the costs it will incur in switching to a different supplier as well as for having to dip into reserves set aside from electricity sales for renovating power-generating facilities, according to the government.

A TEPCO official said of the cancellation charge, "It's necessary for the metropolitan government to shoulder it in order not to impact our users."

At a news conference, Inose likened TEPCO's action to "a bar ripping off a customer" and said it was "not reasonable."

In October, the metropolitan government revised an ordinance to enable it to sell power generated by its hydro power stations to power suppliers other than TEPCO. Before the revision, the government notified TEPCO about its intention to cancel the contract -- valid until 2019 -- at the end of this March.

The government is planning to start preparing for a competitive bid to search for a new buyer by the end of this month. "We can hold a bid without TEPCO's consent," a government official said. "We would like to conduct negotiations concurrently for the cancellation."

The metropolitan government has three hydro power stations and generated around 1 billion yen in revenue for power sales to TEPCO in fiscal 2011.

Before the ordinance change, TEPCO was the only entity to which the government could sell power.

A total of 26 local governments including Tokyo operated power generation facilities at 296 locations and produced a maximum 2,460 megawatt of power as of April 2010, according to the Public Electric Utility Enterpriser's Forum.

Secret cable - Fukushima disaster as a series in the Asahi

January 28, 2013

PROMETHEUS TRAP (1): U.S. frustrated with Japan's initial response to Fukushima

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201301280006>

THE ASAHI SHIMBUN

Editor's note: This is the first part of a series that has run in the past under the overall title of The Prometheus Trap. This series deals with the differences between Japan and the United States in dealing with the Fukushima nuclear accident of 2011. The series will appear on Mondays, Wednesdays and Fridays.

Between late on March 14, 2011, and early the next morning, a top secret diplomatic cable arrived at the Foreign Ministry.

Sent three days after the accident at the Fukushima No. 1 nuclear power plant, the document detailed the major concerns that Adm. Mike Mullen, chairman of the U.S. Joint Chiefs of Staff, had voiced to Japan's ambassador to the United States, Ichiro Fujisaki. At the time, the Japanese government had still not decided to use Self-Defense Force helicopters to dump water into the crippled nuclear plant.

Fujisaki, 65, sent the cable electronically under the highest level of confidentiality. Information included on the cable indicated which government agencies had the necessary clearance to read it and how long the

document was to be kept. When it was printed, watermarks on the document identified the government agency it was intended for as well as the document number.

Because civil servants can face criminal charges for disclosing state secrets, no government source would publicly admit the cable existed.

Even after Fujisaki stepped down as ambassador in November last year, he denied the existence of such a cable when questioned by The Asahi Shimbun. And although Naoto Kan as prime minister at the time would have seen the cable, he said, "I do not remember" when asked about it.

However, a number of individuals who actually read the cable confirmed the contents of the document, which outlined the general frustration the United States felt over the inaction of the Japanese government. Mullen frequently visited the White House for direct meetings with U.S. President Barack Obama. The cable depicts Mullen as raising serious doubts about how Japan was dealing with the situation because the overall view in Washington was that the response to the accident was being left in the hands of Tokyo Electric Power Co., the operator of the Fukushima plant.

On the morning of March 14, 2011, an explosion occurred at the No. 3 reactor following a similar explosion days earlier at the No. 1 reactor. In the afternoon, core pressure at the No. 2 reactor also began to rise as its cooling functions deteriorated.

However, Mullen's major concern was with the situation at the No. 4 reactor. He is reported as saying that the SDF should be used to cool the reactors.

"The U.S. military believes the No. 4 reactor is in danger. It feels every step should be taken to cool the reactor, including using the SDF," the cable said.

The No. 4 reactor had 1,535 nuclear fuel rods in its storage pool, a much greater number than the other three reactors. A meltdown would occur once the pool was empty of water, releasing huge volumes of radiation into the atmosphere and affecting not just Fukushima, but potentially all of Japan.

"The United States has made various preparations to deal with the nuclear accident. The president is also very concerned," the cable went on to say.

By invoking the White House, Mullen impressed upon Japanese Embassy officials that not just the U.S. military but the entire U.S. government was worried about how the situation was developing.

The Foreign Ministry distributed the cable to Kan and other central government ministries, with limits on who could access it.

A few hours after the cable reached Tokyo, at about 6 a.m. on March 15, Mullen's fear--an explosion at the No. 4 reactor--materialized. The pressure gauge at the No. 2 reactor also showed abnormal readings.

At 7 a.m., a situation arose which the U.S. military is still keeping quiet about.

At Yokosuka Naval Base, which lies about 300 kilometers from the Fukushima No. 1 nuclear power plant, alarms went off indicating an increase in radiation levels. All women and children on the base were immediately ordered to evacuate.

Because the U.S. Navy has nuclear-powered aircraft carriers, it has strict safety standards for radiation levels. The alarm was likely triggered by radiation that had reached the base from Fukushima.

U.S. government officials who were notified became very concerned because of the possibility that the Yokosuka Naval Base, considered of major strategic importance in East Asia, would become inoperable if the situation at the Fukushima plant worsened.

Such developments, coupled with Japan's failure to indicate it was dealing seriously with the situation, led Washington to take matters into its own hands.

PROMETHEUS TRAP (2): U.S. officials feared for loved ones still in Japan

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201301300006>

By HIDEFUMI NOGAMI/ Staff Writer

Editor's note: This is the second part of a series that has run in the past under the overall title of The Prometheus Trap. This series deals with the differences between Japan and the United States in dealing with the Fukushima nuclear accident of 2011. The series will appear on Mondays, Wednesdays and Fridays.

One day after the top-secret diplomatic cable was sent from the Japanese Embassy in Washington to the Foreign Ministry, at 1:30 a.m. on March 16, 2011, U.S. Eastern Standard Time, a teleconference was hosted by the U.S. State Department. It was the afternoon of March 16 in Japan.

Among the 60 or so participants were officials of U.S. federal government departments, including the Defense Department, as well as the U.S. Nuclear Regulatory Commission and the U.S. Embassy in Tokyo.

The theme of the meeting was the safety of U.S. troops and citizens living in Japan.

The meeting was held as events in the No. 1 to No. 3 reactors at the Fukushima No. 1 nuclear power plant were spiraling out of control and as a report surfaced that Tokyo Electric Power Co., the operator of the plant, had asked that its workers be allowed to evacuate and, in effect, abandon the No. 4 reactor.

Because the storage pool at the No. 4 reactor contained a large number of nuclear fuel rods, everyone taking part in the conference realized they faced issues that called for serious discussions.

The conference was chaired by Kurt Campbell, assistant secretary of state for East Asian and Pacific affairs. A high-ranking military officer began the discussions by pointing out that there was no guarantee there was no danger involved in the Fukushima situation.

The view of the commander of the U.S. Pacific Fleet was also expressed by an associate who said no officer wanted a subordinate exposed to radiation.

The previous day, the U.S. Navy distributed a memo to the U.S. State and Defense departments that outlined its forecast for how the accident would evolve. The memo said there was a danger of Tokyo being contaminated with highly radioactive materials if the storage pool at the No. 4 reactor emptied of water and the nuclear fuel began a reaction.

The U.S. Navy had strict safety standards for radiation as well as a deep well of knowledge. That background gave the Navy's memo additional weight.

As the discussion continued, one phrase was repeatedly uttered, "While we can."

Everyone who used it realized that time was of the essence and that whatever could be done should be carried out quickly before further disaster developed.

Agreement was reached on one measure that could be implemented--immediately evacuating all U.S. citizens living near Tokyo, including members of the U.S. military.

The sense of crisis held by those in Washington was magnified by their view that the Japanese government was not taking decisive action. Participants in the teleconference representing the U.S. Embassy as well as the

U.S. military based in Japan were especially aware of the dangers facing their loved ones who were still in Japan.

The meeting demonstrated the huge gap that existed between the Japanese government, which only considered the Fukushima nuclear accident as an internal TEPCO matter, and the U.S. government, which had reached the conclusion that there was the possibility of a major disaster that could spread to a global scale.

Amateurish indeed

January 29, 2013

Amateur doctor

Posted by **Mochizuki**

<http://fukushima-diary.com/2013/01/column-amateur-doctor/>

Tepco tried to open a hole to look inside of the torus room of reactor2.

Torus room is where S/C is located. S/C is the coolant facility of nuclear reactor shaped like a donut.

They assume Reactor2 had S/C damaged after 311, so it is important to look into torus room.

Fractured nuclear fuel might be in it.

After all, Tepco failed in it. They commented, "Pipes and gratings were in the way, where they shouldn't have been. It's different from the map." (cf, [Unanticipated] Tepco failed in investigating the torus room of reactor2 "Different from the map" [Link])

The map was probably made in 60s or 70s. Tepco hasn't even announced when it was made.

Anyway, it turned out that Tepco doesn't even understand the inside of the reactors.

Nuclear was called "dream technology". Still some people believe so. and since 311, Tepco has been commenting everything was under control, they have the clearest grasp of the situation.

Actually they do not know anything.

Tepco is like a driver. They have the basic technic to drive but they don't know the mechanism of engine, they don't know how to dismantle it.

It is estimated that decommissioning of Fukushima plant takes more 38 years. This is an estimate of the government so it may take even longer.

Probably Tepco should not be in charge of decommissioning. They don't even know the details of the inside of the torus room. Financially and technically, it is obvious that Tepco can't handle it.

Since the very beginning of 311, it has been obvious that Tepco can't handle everything only by themselves.

It seems like they have to hide something so they are not forward in asking for more international help.

The destiny of the entire world is in the hand of the amateur driver, Tepco.

US angry at Japanese (lack of) reaction

PROMETHEUS TRAP (3): Japanese ambassador felt something not right before State Department meeting

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201302010004>

By HIDEFUMI NOGAMI/ Staff Writer

Editor's note: This is the third part of a series that has run in the past under the overall title of The Prometheus Trap. This series deals with the differences between Japan and the United States in dealing with the Fukushima nuclear accident of 2011. The series will appear on Mondays, Wednesdays and Fridays.

* * *

The consensus that was developing in the teleconference that began at 1:30 a.m. on March 16, 2011, U.S. Eastern Standard Time, demonstrated the extent to which the U.S. government was willing to take a bold step because it called for immediately evacuating all U.S. citizens living in Japan, including members of the U.S. military.

That would, of course, mean that Washington was prepared for a situation in which the U.S. military had no presence in Japan.

However, the evacuation of the military would require a decision by U.S. President Barack Obama. Because the teleconference ended at 2:30 a.m. on March 16, there was still some time before the White House would begin making any move.

A special team was assembled at the State Department and various scenarios drawn up for any possible evacuation.

It was already the afternoon of March 16 in Japan.

About 90,000 Americans live in and around the Tokyo area. If an estimate of only a few hours was made for the time it would take for radioactive materials to reach the atmosphere above Tokyo, it would be extremely difficult to evacuate all of those Americans.

As a first step, two private passenger jets each were chartered at Haneda and Narita airports.

That was a time when Self-Defense Forces helicopters were trying to dump water on the crippled Fukushima No. 1 nuclear power plant to cool down overheating reactors. However, high radiation levels led to a scrapping of the plan on March 16. The decision had been made to make another attempt on March 17.

As dawn broke in Washington, calculations from a supercomputer reached the desk of Kurt Campbell, assistant secretary of state for East Asian and Pacific affairs. The Nuclear Regulatory Commission and Energy Department had calculated the possible spread of radioactive materials based on weather information. The result of the calculation was that even in a worst-case scenario, Tokyo would likely be spared from any radioactive fallout.

After discussing the matter with White House officials, Campbell reached the conclusion that the calculations meant an immediate evacuation from Tokyo was no longer necessary.

Instead, the U.S. government came up with its own proposal for how to respond to the Fukushima nuclear accident.

One measure would be to issue an evacuation advisory to all U.S. citizens living within a 50-mile (80-kilometer) radius of the Fukushima plant. The other was to allow family members of U.S. government workers to voluntarily evacuate from Japan.

Those measures were put together while referring to procedures that would be followed should a similar accident occur in the United States as well as based on the opinions of experts. The evacuation area was much wider than the 20-kilometer radius implemented by the Japanese government.

Campbell decided to inform Japanese officials about the U.S. decision. He also felt there was something else he had to pass on--the **"anger" felt toward the Japanese government.**

At about 8 a.m. on March 16 in Washington, Japanese Ambassador Ichiro Fujisaki was called by Campbell to come to his office. Fujisaki headed toward the State Department with three embassy officials.

At the entrance to the State Department, staff members were waiting to hold open the elevator door. "There is something different about the mood here today," Fujisaki whispered.

The Japanese officials were kept waiting for a while in front of Campbell's office.

Profiteering in disaster areas

February 1, 2013

Police struggle to prevent gangsters from profiting in disaster areas

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201302010083>

THE ASAHI SHIMBUN

Police are trying to prevent gangsters from profiting on the many rebuilding projects in the Tohoku region, but the huge demand for workers is making it difficult to keep yakuza out of the disaster areas. A number of gang-related arrests have been made, and workers and companies are being checked for ties to crime syndicates. Yet officials suspect mob involvement is rife in areas still recovering from the 2011 Great East Japan Earthquake, tsunami and nuclear disaster.

"Gangs are capitalizing on the post-quake labor shortage," an official of the Iwate prefectural police said. Miyagi prefectural police say they have been flooded with inquiries from local governments on whether businesses planning to take part in disaster-related public works projects are connected to gangs.

The number of such inquires has doubled since the disasters struck on March 11, 2011, due to the sharp increase in public works projects.

Many businesses from outside Miyagi Prefecture have approached the Miyagi prefectural government seeking involvement in the reconstruction projects.

Miyagi police, at the request of prefectural government officials, researched the companies and identified some with gang ties. Those companies were not hired by the prefectural government.

However, a police official said the yakuza-related companies that police can identify are "just the tip of the iceberg."

Police suspect that crime syndicates are even pretending to expel members so that they can be sent to the disaster areas disguised as honest volunteer workers.

The gangs' members can befriend residents, seek information on money-making schemes and set up a foothold for their organizations to conduct business, according to police.

At least two gangsters were arrested in 2011 on suspicion of sending laborers to construction sites in Iwate Prefecture. The Worker Dispatch Law prohibits the use of staffing services for construction projects.

One of the suspects is a senior member of a gang affiliated with the Sumiyoshi-kai crime syndicate. He was arrested in July in connection with temporary housing construction projects in Otsuchi.

The other suspect is a member of a gang affiliated with the Yamaguchi-gumi. He was arrested in October over a project to repair a quake-damaged commercial facility in Kitakami.

The laborers in those two cases allegedly received only part of their wages, indicating that the gangsters had siphoned off the remainder, according to police sources.

Gangs are also targeting projects related to the accident at the Fukushima No. 1 nuclear power plant.

On Jan. 31, a senior member of a gang affiliated with the Sumiyoshi-kai was arrested on suspicion of sending laborers to a decontamination project in Date, Fukushima Prefecture, in November.

It was the first arrest of a gangster over suspected involvement in a project to remove radioactive substances in areas around the Fukushima plant.

The suspect did not have a license for staffing services. He was also arrested earlier in January on suspicion of sending laborers to construction projects.

“We check lists of laborers to see whether they have ties with anti-social forces,” a Date official said, using the euphemism for crime syndicates. “But it requires too much effort to find out who dispatched those laborers.”

An official of a company based in Fukushima city and involved in decontamination work expressed concerns that gang-tied laborers could sneak into its work force because businesses are all shorthanded

January 31, 2013

Gangster illegally hired workers for decontamination projects

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201301310080>

By KENJI OGATA/ Senior Staff Writer

Criminal organizations are cashing in on the disaster that shook Japan nearly two years ago by sinking their claws into all aspects of recovery operations to skim off handsome profits.

Police have just turned up an instance of a gang member brazenly providing laborers to help clean up contaminated areas in Fukushima Prefecture, and pocketing part of their wages.

The Yamagata prefectural police said 40-year-old Yoshinori Arai broke the law because he did not have a license to dispatch day laborers.

Police said Arai, a resident of Higashine, Yamagata Prefecture, is a top member of a yakuza gang affiliated with leading crime syndicate Sumiyoshi-Kai. He was arrested Jan. 31.

According to an investigative source, Arai dispatched three day laborers to a Yamagata Prefecture subcontractor doing decontamination work in Date on 10 occasions in November. Their tasks included weeding.

It also emerged that the workers took home only half of less than 20,000 yen (\$220) in salary a day-- suggesting that the difference was pocketed by Arai and his mob associates.

Arai was taken into custody earlier this month for a similar offense. Police said he dispatched two laborers to assist in the construction of temporary housing.

“The recovery operations involve a lot of money, so they are a godsend for gangs that have trouble making money due to a police crackdown on gang activities,” a gang insider said.

The man said these groups have been involved in the demolition of buildings and the disposal of waste in devastated areas. He also said some of them have been working as bouncers for restaurants and bars in the Tohoku region by offering lower rates than those demanded by local gangs.

Law enforcement authorities have been on alert against organized crime groups cashing in on recovery operations after the 2011 Great East Japan Earthquake that spawned towering tsunami and triggered the nuclear disaster.

Police have detected 37 cases so far, but this is the first arrest over a gang member's suspected involvement in decontamination work.

Exchange of pleasantries

February 2, 2013

Senior NRA official axed over data leak

Secretariat exec slipped Tsuruga report to Japan Atomic Power

<http://www.japantimes.co.jp/news/2013/02/02/national/senior-nra-official-axed-over-data-leak/#.UQ0r1vL1tEs>

Nuclear regulator sacked for leaking information to nuclear operator

<http://mainichi.jp/english/english/newsselect/news/20130202p2g00m0dm013000c.html>

TOKYO (Kyodo) -- Japan's Nuclear Regulation Authority said Friday that it sacked a senior official of its secretariat for having an inappropriate exchange with officials of a nuclear power plant operator, noting that his action could have undermined the newly-launched organization's transparency and neutrality. According to the NRA, the 54-year-old official, Tetsuo Nayuki, handed over to Japan Atomic Power Co. on Jan. 22 a draft assessment report on geologic faults running beneath the firm's nuclear complex in western Japan, just about a week before the draft was scheduled to be made public by an NRA-appointed panel. The NRA said that the leaked information was not necessarily confidential because it was a summary of discussions that had been open to public, but the incident is still a blow to the NRA, which was launched in the wake of the 2011 Fukushima Daiichi nuclear power plant disaster to restore public confidence in regulations.

"It is extremely regrettable that a senior official did such a thing. It was a thoughtless act, because we should be careful especially when having contacts with parties subject to regulations and should be transparent in the exchanges," NRA Chairman Shunichi Tanaka was quoted as saying by spokesman Hideka Morimoto.

The NRA, launched in September last year, was endowed with greater independence than the former nuclear safety agency in a bid to prevent close relations developing between regulators and promoters of atomic power, something said to have caused safety issues to be neglected.

Other than in an emergency, the NRA does not allow its staff to meet alone with officials of nuclear power plant operators so as to ensure transparency.

But Nayuki met with Japan Atomic Power officials alone and "carelessly" handed over the draft report, Morimoto told a press conference. The meeting came to light because Nayuki himself reported the matter the next day.

The draft report, officially disclosed Monday, said that a fault running directly underneath a reactor at Tsuruga plant is likely to be active -- a judgment Japan Atomic Power opposes and that could force the operator to scrap the unit.

Japan Atomic Power, which separately held a press conference Friday, said the company was eager to have an opportunity to speak to the members of the panel discussing the issue before the report is finalized.

"We told (Nayuki) on Dec. 21 that if we are given a chance to express our opinions about the draft report during the panel meeting, we want to learn the content in advance so that we can make an accurate counterargument instantly," a company official said.

Both Morimoto and Japan Atomic Power denied that Nayuki received any financial reward or gifts in exchange for handing over the report. The plant operator also said there was no "lobbying" based on the information it gained.

The panel members basically agreed on the content of the draft report on Monday, but it was not finalized. The panel also decided to listen to outside experts and opinions from Japan Atomic Power.

Effective Friday, the NRA reprimanded Nayuki and transferred him to the Ministry of Education, Culture, Sports, Science and Technology, where he originally came from.

Nuclear watchdog in hot water over leaked report to Tsuruga plant operator

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201302020068>

THE ASAHI SHIMBUN

A senior official of the Nuclear Regulation Authority secretariat was removed for leaking a draft report by an expert panel on seismic activity at the site of the Tsuruga nuclear power plant in Fukui Prefecture to Japan Atomic Power Co., operator of the facility.

Tetsuo Nayuki, 54, director-general for nuclear regulation policy, received an official reprimand Feb. 1 and was transferred to his old post at the science and technology ministry, the watchdog body said.

The NRA said Nayuki met with three officials of Japan Atomic Power, including one of its managing directors, Taiki Ichimura, in the NRA office building on Jan. 22 and handed copies of the draft report, which had yet to be released to the public, to those present.

The 30-minute meeting started around 3 p.m. It had been requested by Japan Atomic Power, and Nayuki met with the three officials alone, in violation of an NRA bylaw that requires at least two NRA officials to be present during meetings with power utility officials unless such gatherings are held purely to exchange pleasantries.

According to the NRA, Japan Atomic Power officials had put out feelers to get a copy of the draft report. Nayuki initially thought that providing one would help ensure more in-depth discussions at assessment meetings. But he had second thoughts, and on Jan. 23 acknowledged to colleagues what he had done.

The NRA stripped him of his duties by the end of that day.

"The document was a summary of discussions during open-door meetings of an expert panel, and contained no confidential information," NRA Deputy Secretary-General Hideka Morimoto told a news conference on Feb. 1. "But he acted extremely unwisely, because neutrality was an important part of his duties."

The NRA expert panel was tasked with assessing the seismic activity of fault lines beneath the premises of the Tsuruga nuclear plant. On Jan. 28, it endorsed a draft report saying that one of the faults, which runs directly beneath one reactor building, was likely active and could affect the safety of the complex in the event of an earthquake.

The NRA said the document handed to Japan Atomic Power was not the same as the final version presented to the Jan. 28 meeting. It also said that Nayuki, who had been put in charge of earthquakes and tsunami issues, was authorized to modify text in the draft but did not do so.

The latest revelation would seem to suggest that a cozy relationship still exists with power utilities. The NRA was only set up last September.

There has been intense criticism of the so-called nuclear village grouping bureaucrats, industry and academics in the aftermath of the Fukushima nuclear disaster in 2011, especially in light of official government policy to promote nuclear energy.

The NRA was established to end that perception. It is defined as an independent body by Article 3 of the National Government Organization Law, in the same category as the Japan Fair Trade Commission.

As such, the regulatory functions of the industry ministry, which promotes the use of atomic energy, were spun off.

To ensure transparency, the NRA instituted a bylaw on protocol for meetings with power industry officials. It also requires that a record of such talks be kept.

The date, duration, names of those attending and a summary of discussions are posted on the NRA website for anybody to view.

But the NRA decided to exempt meetings to exchange pleasantries to help Nayuki ease into his job and build up a relationship with Japan Atomic Power.

Morimoto said he thought the provision was too vague to be properly enforced.

"The distinction between visits to exchange pleasantries and substantial meetings is not always clear," he told the Feb. 1 news conference.

Japan Atomic Power officials met Nayuki on five occasions in December and January. The utility held a news conference of rebuttal immediately after the draft report was released on Jan. 28.

"We have asked (NRA officials) to let us know in advance about what (the draft report) says, but we have never applied pressure of any sort," a Japan Atomic Power representative said.

Experts who had never been involved in safety screenings for nuclear reactors were called in to conduct on-site surveys at the Tsuruga nuclear plant and compile the draft report. They concluded the fault line in question was "likely active," a clear departure from the stance of the former Nuclear and Industrial Safety Agency, the NRA's predecessor.

That agency never reached a conclusion on the seismic risks posed by the fault line, although the problem had long been pointed out.

"We have been doing our best to draw up a trustworthy report," said Yasuhiro Suzuki, a professor of active fault studies at Nagoya University who served on the expert panel. "It is embarrassing that an official of the NRA secretariat acted in a way that could arouse questions about that trustworthiness."

Officials at a nuclear regulation office in Tsuruga, which reports to the NRA, also were clearly embarrassed.

"It is regrettable that this problem has occurred just as we were trying to regain confidence in nuclear power administration," said one employee.

"We, at the forefront, will be the most affected," said another. "Local residents may look at us with distrustful eyes."

Harumi Kondaiji, an anti-nuclear activist in the Tsuruga city assembly, a body that is dominated by proponents of atomic energy, said she thought the revelation symbolized a revival of the "nuclear village."

"That's no different from the former Nuclear Safety Commission of Japan," said Kondaiji, 62, referring to another predecessor of the NRA.

Tsuruga Mayor Kazuharu Kawase issued a statement to decry the development.

"(Nuclear regulators) should not behave in a way that could feed distrust at a time when they are trying to restore public trust," the statement said. "I am concerned about the negative impact on future discussions."

Checking on nuclear workers

January 31, 2013-02-02

Japan to consider background checks for nuke plant workers

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201301310069>

By JIN NISHIKAWA/ Staff Writer

The Nuclear Regulation Authority said Jan. 30 it may introduce mandatory background checks for workers at nuclear power plants as a way to prevent terrorist attacks.

The NRA plans to set up a panel of outside experts in February to consider this and other steps to shore up anti-terrorism measures at nuclear facilities.

The background checks will be conducted on workers employed by power utilities and their partner businesses who would be in a position to learn confidential information or enter key facilities at nuclear plants and other similar establishments. Workers will be screened for any criminal history, as well as for debt, drug addiction or other personal information terrorists could use to extort information from them. Japan is the only major nation using nuclear power that has not introduced a similar system. The International Atomic Energy Agency recommended in 1999 that power utilities carry out background checks on their nuclear plant workers, and Japan's industry ministry considered introducing such checks in 2005 but ended up shelving the plan.

The IAEA went on to recommend in 2011 that governments institute background checks on nuclear plant workers. Following the recommendation, an expert panel of the Japan Atomic Energy Commission compiled a report in March 2012 to call on the government to introduce such a system.

The Great East Japan Earthquake and tsunami destroyed emergency power sources and transmission lines at the Fukushima No. 1 nuclear power plant in March 2011, highlighting the vulnerability of nuclear plants to potential terrorist attacks.

It was learned following the Fukushima nuclear disaster that some nuclear plant workers who had been employed by subcontractors could not be identified.

Madarame questioned

February 4, 2013

Prosecutors grill nuclear safety chief over Fukushima

AFP-JJI

http://www.japantimes.co.jp/news/2013/02/04/national/prosecutors-grill-nuclear-safety-chief-over-fukushima/#.UQ6LP_L1tEs

In a possible prelude to criminal charges, prosecutors have questioned Haruki Madarame, former chief of the now-dissolved Nuclear Safety Commission, about delays in announcing radiation fallout data when the Fukushima crisis began and the failure to protect power plants against tsunami, news reports said Sunday.

Madarame was responsible for giving the government technical advice on the crisis, NHK quoted sources as saying. He appeared voluntarily for questioning and was apparently asked to explain how he dealt with the disaster, the public broadcaster said.

Fukushima residents have filed a criminal complaint with prosecutors against Madarame on suspicion of professional negligence that resulted in deaths and injuries.

The complaint alleges that Madarame was responsible for delaying the public release of computerized projections that showed how radioactive fallout from the meltdowns might spread, the NHK report said.

It also reportedly faults him for failing to take the steps necessary to shield the plant against the tsunami that triggered the meltdowns in the first place.

NHK said prosecutors have also questioned executives of plant operator Tokyo Electric Power Co., including former Chairman Tsunehisa Katsumata, but expert observers say it was far from clear if any individuals could be charged over the disaster, which tainted wide swaths of the agriculturally productive prefecture.

A report last July by a Diet investigation panel said Fukushima was a man-made disaster caused by Japan's culture of "reflexive obedience." Tepco has admitted it played down known tsunami risks for fear of the political, financial and reputational damage.

Fukushima Directorate General to ease recovery

February 3, 2013

New umbrella body gets to work on Fukushima's postdisaster recovery

JJI

http://www.japantimes.co.jp/news/2013/02/03/national/new-umbrella-body-gets-to-work-on-fukushimas-postdisaster-recovery/#.UQ4le_L1tEs

FUKUSHIMA – An umbrella body to help Fukushima Prefecture recover from the 2011 quake, tsunami and nuclear triple whammy began its first day of work Saturday, following its official launch the day before.

The Fukushima Directorate General, based in the prefectural capital, the city of Fukushima, is “aimed at speeding up local recovery based on the standpoint of the prefecture’s residents,” postdisaster reconstruction minister Takumi Nemoto told a meeting of senior officials.

“We will push forward with Fukushima’s recovery with two headquarters,” Nemoto said, referring to the directorate general and a new office set up within the Reconstruction Agency in Tokyo to boost reconstruction efforts.

The umbrella body, designed to make decision-making more comprehensive, will control Reconstruction Agency and Environment Ministry units based in Fukushima Prefecture, as well as the central government’s local headquarters for overseeing recovery work following the Fukushima No. 1 nuclear plant’s three core meltdowns in March 2011.

The directorate general, with a staff of around 60, is headed by Nemoto. Former vice reconstruction minister Yukiyoshi Minehisa serves as its secretary general.

Rebuilding Fukushima, however, has proven an uphill battle so far and an internal affairs ministry report released last month showed no letup in the prefecture’s population outflow

The Yomiuri on Nayuki's discharge

February 3, 2013

N-safety official fired over leak

<http://www.yomiuri.co.jp/dy/national/T130202003272.htm>

The Yomiuri Shimbun

The Nuclear Regulation Authority has dismissed a senior official of its secretariat because he gave a copy of a report about possible earthquake faults at a nuclear power plant to executives of the company operating the plant.

Tetsuo Nayuki, a director general of the Secretariat of the NRA, gave the document to executives of Japan Atomic Power Co. before its official release, according to the NRA.

The report is about the results of inspections of so-called crush zones suspected to be active faults in the precincts of the Tsuruga nuclear power plant in Fukui Prefecture.

The NRA reprimanded Nayuki and discharged him from the post effective Friday.

Hideka Morimoto, deputy secretary general of the Secretariat of the NRA, said at a press conference, "The action was too careless for an official of the regulatory organization, who should always remain neutral."

But he said the NRA will not further investigate the case because it was "due to the actions of an individual."

According to Morimoto and other sources, the document was a copy of a draft report of an assessment in which the NRA's expert team concluded that faults running beneath the plant's reactor buildings are highly likely active.

The conclusion was first unveiled at an assessment meeting held Monday.

Nayuki was one of three directors general of the Secretariat of the NRA, the authority's No. 3 positions after the secretary general and the deputy secretary general.

He was in charge of nuclear regulation policy for safety guidelines about earthquakes and tsunami.

He also helped prepare the draft report based on results of on-site inspections and debates at the assessment meeting as a coordinator for the team of experts.

On Jan. 22, six days before the assessment meeting, three officials of Japan Atomic Power, including its managing director, visited the office of the Secretariat of the NRA for what they said was a "courtesy call." Nayuki met them in his office and handed over the document.

On Jan. 23, Nayuki voluntarily told NRA officials that he had given the document to the company executives.

The Secretariat of the NRA removed him from all duties on the same day. After Nayuki was questioned by the secretariat, the NRA quoted him as saying, "I wanted to make debates at the assessment meeting fruitful."

But Morimoto would not answer questions about why Nayuki handed over the document or how Japan Atomic Power used it. He said, "I don't know the details."

Secretariat rules stipulate that when its officials meet with businesspeople:

- Appointments should be made in advance.
- At least two officials should attend the meeting.
- Details of the meeting should be transcribed.

The NRA said Nayuki's meeting with Japan Atomic Power executives was an exception because it was only a courtesy call.

But because Nayuki handed over a document before its official release and because it dealt with issues related to business interests, the NRA said that it concluded his action risked damaging the NRA's trustworthiness.

The NRA reprimanded Nayuki based on the internal rules and recommended he be transferred to the Education, Culture, Sports, Science and Technology Ministry, where he worked before the Secretariat of the NRA was established. Nayuki was not punished under the National Civil Service Law.

As to why Nayuki was not punished, Morimoto said, "The document handed to Japan Atomic Power was a summary of debates held at the assessment meetings, which were open to the public. Thus it's not subject to a confidentiality requirement."

Japan Atomic Power, based in Chiyoda Ward, Tokyo, on Friday acknowledged its executives asked Nayuki to provide a copy of the draft report in advance.

The company issued a statement that said: "We obtained the document believing it was provided with the approval of NRA officials. Our company has not made requests or taken any other actions since seeing the document."

Yoshida's records of gov't interviews seized by justice

February 4, 2013

Prosecutors seize testimony of former Fukushima nuclear plant chief

<http://mainichi.jp/english/english/newsselect/news/20130204p2a00m0na019000c.html>

Prosecutors investigating responsibility for the Fukushima No.1 Nuclear Power Plant disaster have seized testimony from the plant's former chief, who cannot currently be questioned due to poor health.

Prosecutors obtained records documented by a government disaster investigation team, apparently judging them necessary in deciding whether they can form a criminal case against the former chief, Masao Yoshida. Normally, disaster investigations are performed on the basis that they won't be used to lay blame on the parties involved.

Government sources said the investigation team began questioning Yoshida around five months after the onset of the nuclear disaster. He faced dozens of hours of questioning, spread out over several sessions. The team released an accident report based on the questioning in July 2012.

That report states that in 2008, Tokyo Electric Power Co. (TEPCO), which operates the Fukushima nuclear plant, estimated the damage that would result from tsunamis measuring up to 15.7 meters in height -- much higher than they had calculated before. At the time, Yoshida was head of a nuclear plant equipment management division at TEPCO and was in a position to evaluate safety measures at the Fukushima plant. However, he reportedly put off taking measures on the grounds that a 15.7-meter tsunami was only a worst-case scenario and wouldn't come.

Prosecutors began investigating TEPCO in the summer of 2012, on suspicion of professional negligence resulting in injury and death. In order to form a case, prosecutors need to determine whether officials could have predicted a complete loss of power at the plant from a tsunami. They sought to question Yoshida to learn more about TEPCO's safety measures in 2008. However, according to TEPCO sources, Yoshida, who has been reported as having esophageal cancer and having suffered a stroke, is in worse shape now than when he was questioned by the government team, and it would be almost impossible to question him.

Prosecutors apparently obtained records of Yoshida's testimony to shed light on his assessments, as he was a key person involved with pre-disaster safety measures as well as the on-site response to the disaster.

In the past, prosecutors' use of accident-probe data has stirred controversy. After a Japan Airlines flight in 1997 made abrupt flight-path changes that led to one death and injured 13, prosecutors sought and were granted the use of an accident-probe report as evidence against the flight captain, who was charged with professional negligence resulting in death and injury. The captain's defense team objected, saying the probe had been conducted to prevent future accidents, and shouldn't be used to blame anyone.

In the nuclear disaster case, the head of the government's accident investigation team, Yotaro Hatamura, stressed that the team was not seeking to place blame on anyone. A prosecution source commented that prosecutors probably "kept the scale (of the seizure of information) within reasonable bounds," because Yoshida and other TEPCO officials questioned by the team were not told that they had the right to remain silent, and because the recorded testimony had been kept private.

Tokai University law professor Yoshihiko Ikeda, who is familiar with the legal aspects of professional negligence, says, "The global trend is to place more emphasis on uncovering the causes of disasters (rather than pursuing blame). The government should quickly make relevant rules for disaster probes that also take punishment for negligence into account."

Tepco exec's interview records seized in probe

JJI

<http://www.japantimes.co.jp/news/2013/02/04/national/tepcO-execs-interview-records-seized-in-probe/#.UQ-msPL1tEs>

Prosecutors have seized records of a government panel's interviews with Masao Yoshida, the former manager of Tokyo Electric Power Co.'s Fukushima No. 1 power plant, as part of their criminal probe into Japan's worst atomic plant disaster, sources said Monday.

The seizure was initiated because Yoshida cannot present himself for long interviews with the prosecution because of an illness, the sources said.

The action is unusual in that the records of the interviews conducted to shed light on the disaster, instead of an actual witness, will be used in the criminal investigation.

Yoshida dealt with the crisis until he resigned in December 2011 due to esophageal cancer.

He is among the parties accused of negligence for failing to ensure the six-reactor nuclear plant could withstand a major temblor and monster tsunami, and for failing to respond to the crisis in an appropriate manner.

Yoshida was in charge of Fukushima No. 1's tsunami preparedness as head of Tepco's Nuclear Asset Management Department in 2008, when the utility compiled an estimate that the complex was at risk of being hit by 15-meter-plus tsunami.

Cattle cesium varies

A team recently determined that radioactive cesium distribution varied from organ to organ in cattle abandoned in the 20-km-radius hot zone around the Fukushima No. 1 plant, which suffered three reactor core meltdowns in March 2011.

The density of radioactive cesium released from the plant was highest in muscle tissue but lower in thyroid glands, said the team, which was led by professor Manabu Fukumoto of Tohoku University's Institute of Development, Aging and Cancer.

Japan must accept "heroic sacrifice"

PROMETHEUS TRAP (4): U.S. official sought 'heroic sacrifice' from Japan

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201302040001>

By HIROYOSHI ITABASHI/ Staff Writer

Editor's note: This is the fourth part of a series that has run in the past under the overall title of The Prometheus Trap. This series deals with the differences between Japan and the United States in dealing with the Fukushima nuclear accident of 2011 following the Great East Japan Earthquake. The series will appear on Mondays, Wednesdays and Fridays.

At 9 a.m. on March 16, 2011, Kurt Campbell, assistant secretary of state for East Asian and Pacific affairs, invited Japanese Ambassador Ichiro Fujisaki into his office in Washington, D.C.

It was 10 p.m. in Japan.

After apologizing for calling him in so early in the morning, Campbell sat in a yellow leather chair with his back to the window. A small coffee table had been set up in that corner of Campbell's office. Fujisaki sat diagonally across from Campbell.

Also attending the meeting was Rust Deming, 71, director of Japan affairs at the State Department.

Campbell skipped the usual niceties of shaking hands and engaging in small talk. Instead, he got right down to business and started out with criticism of the lack of serious effort by the Japanese government to deal with the accident at the Fukushima No. 1 nuclear power plant.

The three embassy officials who had accompanied Fujisaki to the meeting hurriedly took notes of what Campbell said.

Not only did he say that the Japanese government had to make every effort to respond to the situation, but he added that the government also had to make decisions. He said the accident was not an issue for Tokyo Electric Power Co., the plant operator, but for the nation of Japan.

Campbell went on to say that the Fukushima plant was in a very dangerous state and that immediate action was necessary. One phrase that caught the attention of embassy officials was "**heroic sacrifice.**" Campbell said such sacrifice was necessary by the several hundreds of workers who would have to go in while realizing what dangers were in store for them at the Fukushima plant.

Fujisaki entered the Foreign Ministry in 1969. In the late 1990s, he served as political minister at the Japanese Embassy in Washington while the administration of then President Bill Clinton engaged in what was described as "Japan passing," referring to the practice of leaving Japan out of the discussion in making various policy decisions.

Fujisaki later served as director-general of the North American Affairs Bureau at the Foreign Ministry. After building up a vast network of personal ties in the United States over many years, he became ambassador in 2008.

Because Fujisaki has known Campbell for many years, the consensus within the Foreign Ministry was that the two had a close relationship built on trust.

Despite their past, Campbell had harsh words for Fujisaki in their meeting. He also informed Fujisaki of the U.S. government decision to issue an evacuation advisory calling on U.S. citizens to leave an area in an 80-kilometer radius of the Fukushima plant.

Campbell said that protecting Americans was the primary responsibility of the U.S. government and that it would be forced to think about further measures if the Japanese government made no decisions. Campbell added that the policy also covered the U.S. military, and that there was **no intention of sacrificing [American] military personnel.**

With that, Campbell stood up. The meeting was over. Fujisaki and the embassy officials rushed back to the Japanese Embassy.

The three officials immediately began preparing a diplomatic cable to send to Tokyo. They put into words what Campbell said, what response Fujisaki gave, as well as how Campbell ended the discussion by leaving the meeting.

That style of explaining not only the gist of what was discussed, but also giving a feel for the atmosphere of the meeting, is known within the Foreign Ministry as being "the Fujisaki style."

PROMETHEUS TRAP (5): Tears from an old Japan hand at the State Department

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201302060007>

By HIROYOSHI ITABASHI/ Staff Writer

Editor's note: This is the fifth part of a series that has run in the past under the overall title of The Prometheus Trap. This series deals with the different responses between Japan and the United States in dealing with the Fukushima nuclear accident of 2011 following the Great East Japan Earthquake. The series will appear on Mondays, Wednesdays and Fridays.

For the second time that day, shortly before noon on March 16, 2011, in Washington, Ichiro Fujisaki, Japan's ambassador to the United States, was meeting with Kurt Campbell, assistant secretary of state for East Asian and Pacific Affairs, at the State Department.

Some two hours had passed since their meeting in the morning. Fujisaki, together with Japanese Embassy staff members, had come to the State Department again after discussing their exchanges in the morning meeting with top government officials in Tokyo. The Japanese diplomat had to ask Campbell some questions raised by the Japanese government.

Fujisaki asked how the U.S. government intended to evacuate American citizens from Japan, which was facing a nuclear crisis.

Many of the State Department officials present at the meeting thought Japanese officials were concerned about the possibility that the evacuation of Americans from the country could develop into a political issue.

Campbell responded by saying it was not a political issue. It was a question of whether Japan can survive or not, he stressed.

Fujisaki was bombarded by a barrage of critical comments and acidic remarks from Campbell.

Campbell accused the Japanese government of failing to understand the seriousness of the situation. He also criticized Tokyo for leaving it to Tokyo Electric Power Co., the operator of the disaster-stricken Fukushima No. 1 nuclear power plant, to deal with the crisis.

Campbell also said Washington, as Tokyo's ally and close partner, was deeply concerned about what was happening in Japan. He repeatedly used the phrase "heroic sacrifice" in discussing the disaster and Japan's needed response to it.

How did the State Department assess the way the Japanese government was responding to the nuclear crisis?

An internal report on the issue secretly circulated among top State Department officials on that day contained one word that would answer that question--"FUBAR," or F----- Up Beyond All Recognition.

The internal report also voiced the suspicion that the Japanese government might be holding back some vital information and commented that Tokyo was not making any visible and effective response to the crisis.

Also on that day, Campbell attended a meeting of senior officials at the State Department's Bureau of East Asian and Pacific Affairs. He informed the attendants of the department's decision to declare a "voluntary evacuation" from Japan.

Many of the senior officials attending the meeting were taken aback by the announcement, because Japan had been regarded as a safe evacuation site in East Asia.

While evacuations of American citizens from Asian countries in political turmoil to Japan had been done from time to time, the State Department had never evacuated Americans from Japan to another country.

One of the senior officials present at the meeting recalls seeing tears in Campbell's eyes.

One of the leading experts on Japan in Washington, Campbell had spent some 20 years devoting his efforts to deepening his country's ties with Japan. Now, he was facing the possibility of those ties being broken.

It was probably a painful situation for Campbell, the official said.

Revise TEPCO's rehabilitation plan?

February 5, 2013

TEPCO turnaround plan faces review as reactor restarts remain elusive

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201302050044>

By KENTARO UECHI/ Staff Writer

A government-backed fund set up to help compensate victims of the Fukushima nuclear disaster will review Tokyo Electric Power Co.'s business rehabilitation plan because of expected delays in restarting its key nuclear plant.

"We have no choice but to review the plan at an appropriate time," Yoshiharu Kawabata, who chairs the steering committee of the Nuclear Damage Liability Facilitation Fund, said Feb. 4.

TEPCO's rehabilitation plan is based on the assumption that the utility will post a profit in fiscal 2013 after seven reactors at its Kashiwazaki-Kariwa nuclear power plant in Niigata Prefecture are restarted in succession from April.

Utilities need to obtain approval from the Nuclear Regulation Authority to restart idled reactors. But the new nuclear industry watchdog will not begin screening applications until it introduces new safety standards for nuclear plants by July.

The standards are expected to require utilities to install filtered venting equipment at boiling water reactors, such as those used at the Kashiwazaki-Kariwa plant.

There is also a possibility that the No. 1 and No. 2 reactors at the plant will have to be decommissioned if the NRA concludes that an active fault line runs beneath them.

TEPCO, however, appears reluctant to revise its rehabilitation plan.

"We will review the plan if necessary, but we want to keep it as is (for the time being)," President Naomi Hirose said Feb. 4.

TEPCO said it expects a net loss of 120 billion yen (\$1.3 billion) for the year through March, compared with a previous forecast of a 45-billion-yen net loss, as the weaker yen increased fuel costs for thermal power plants.

Compensation for nuclear disaster victims and costs for decontaminating areas around the crippled Fukushima No. 1 nuclear power plant are also expected to increase.

"We remain in a severe condition," Hirose said. "We have to continue to streamline our operations."

For the nine months through December, TEPCO reported a net loss of 2.2 billion yen on sales of 4.33 trillion yen, up 14 percent from a year earlier.

The net loss shrank from 623 billion yen during the same period the previous year because extraordinary losses for compensation and other issues substantially fell, from 2 trillion yen to 653 billion yen.

TEPCO raised electricity rates for corporate users by 14.9 percent on average in April and those for households by 8.46 percent in September. The rate hikes increased sales by 227 billion yen.

TEPCO caught red-handed.. again

TEPCO misled Diet panel, averted quake-damage inspection at Fukushima plant

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201302070058>

By HIDEAKI KIMURA/ Staff Writer

Tokyo Electric Power Co. misled a Diet investigation panel and cited “dreadfully high” radiation levels to effectively block an inspection for possible quake damage at the crippled Fukushima No. 1 nuclear plant. “(TEPCO’s explanation) was absolutely false and seriously obstructed the investigation,” Mitsuhiko Tanaka, a former member of the now-disbanded Diet commission, said in a statement submitted to the chiefs of the two Diet chambers on Feb. 7.

Tanaka asked the Diet to inspect the No. 1 reactor building to see if isolation condensers--key safety components at nuclear plants--were damaged by the Great East Japan Earthquake of March 11, 2011. If the emergency cooling system was damaged by the magnitude-9.0 earthquake, stricter quake-resistance standards would be required for nuclear power plants, further delaying the restarts of idled reactors around the country.

The isolation condensers stopped working soon after the earthquake struck, which is believed to have contributed to the early meltdown of the No. 1 reactor.

TEPCO has denied they were damaged by the quake.

Tanaka, a former reactor design engineer, was responsible for on-site inspections for the Fukushima Nuclear Accident Independent Investigation Commission.

He and other commission members planned to visit the plant on March 5-6 last year after receiving reports that subcontracted workers had seen water on the fourth floor of the No. 1 reactor building following the earthquake. Two tanks and piping were holding water for the isolation condensers.

But Tanaka gave up on that plan after TEPCO said the reactor building was pitch-black and dangerous to enter.

In reality, a cover over the building transmitted 10-16 percent of sunlight. It was also equipped with powerful mercury lamps.

Toshimitsu Tamai, then chief of TEPCO's corporate planning department, visited Tanaka at a Lower House annex building around 7 p.m. on Feb. 28. Others were present during the meeting that lasted for more than one hour.

Tamai said the fourth floor had no lighting, and he repeatedly emphasized the potential dangers of wandering around in the dark, according to an audio recording obtained by The Asahi Shimbun.

"If you got lost, you would run into areas with dreadfully high levels of radiation," Tamai said. "You would face a considerable danger and could be thrown into a panic."

Tamai also cited other risks, such as the debris scattered around the site and the heavy dosimeters visitors must carry.

During the meeting, Tamai showed an image of a modestly lit fourth floor of the No. 1 reactor building, whose roof was blown off in a hydrogen explosion. He said it was taken before a cover was installed to keep radioactive materials from spreading.

Tamai never said TEPCO would reject the inspection, but he urged Tanaka to withdraw the plan.

"I might say it would be better if you would not go ahead with something that reckless," Tamai said.

Tanaka eventually chose not to visit the plant after Tamai asked him to make a decision on that day.

"We concluded that it would be dangerous to carry out the inspection at a completely dark site," Tanaka said in the statement to the chiefs of the two Diet houses. "We had no choice but to give up the inspection."

The Diet commission was authorized to ask the Diet to use its powerful investigation rights to uncover the causes of the Fukushima nuclear crisis. TEPCO was supposed to cooperate with the panel.

A TEPCO spokesman admitted that the utility gave wrong information to the Diet commission but said it did not intentionally make false reports.

The image shown during the meeting was actually taken four days after the cover was installed over the reactor building in October 2011. Tanaka and others in October found the image with the correct date on TEPCO's website.

The spokesman said the TEPCO officials who gave the explanation to the Diet commission mistakenly believed that the image was taken before the cover was installed.

The Asahi Shimbun found that the cover was equipped with lighting while checking a story in a construction industry magazine featuring cover installation work in January.

A set of five mercury lamps, as bright as the headlights of more than 40 vehicles, has been operational on the cover's ceiling since October 2011. An additional set of five mercury lamps is on standby.

An isolation condenser condenses steam into water that flows down into a reactor. It can lower pressure within the reactor and cool it even without a power source.

Although the Diet commission suspected the isolation condensers were damaged by the quake, a separate investigation panel set up by the government said it is reasonable to believe the condensers' functions were not lost in the disaster.

PROMETHEUS TRAP (6): SDF poised for dangerous mission into Fukushima

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201302080003>

By HIDEFUMI NOGAMI/ Staff Writer

Editor's note: This is the sixth part of a series that has run in the past under the overall title of The Prometheus Trap. This series deals with the different responses between Japan and the United States in dealing with the Fukushima nuclear accident of 2011 following the Great East Japan Earthquake. The series will appear on Mondays, Wednesdays and Fridays.

* * *

Around 10:30 a.m. on March 15, 2011, after a strictly confidential diplomatic cable from Ichiro Fujisaki, Japan's ambassador to the United States, reached his government in Tokyo, Defense Minister Toshimi Kitazawa canceled his entire schedule for the day.

Kitazawa convened an emergency meeting of senior ministry officials to discuss the possibilities of Self-Defense Forces operations being brought in to cool the overheating reactors at the Fukushima No. 1 nuclear power plant.

The discussions at the meeting focused on the No. 4 unit at the plant, which had just suffered an explosion that morning. The attendees were also informed that the confidential cable had said top U.S. military officer Michael Mullen, chairman of the Joint Chiefs of Staff, was deeply concerned about the risk posed by the No. 4 unit.

Nobushige Takamizawa, director-general at the ministry's Defense Policy Bureau, briefed Kitazawa on the opinions of the U.S. government. Takamizawa told Kitazawa that the U.S. military had pointed out the possibility that the spent fuel pool for the No. 4 reactor might be empty and urged that measures be taken immediately to cool the reactor first, including utilizing the SDF in the effort.

Hideo Suzuki, the ministry's secretariat counselor, conveyed the views of the Nuclear and Industrial Safety Agency to the defense chief.

The agency had said TV footage of the explosion showing white steam rising from the No. 4 reactor indicated the presence of water in the pool, Suzuki told Kitazawa.

The debris scattered by the explosions at the No. 1 and No. 3 reactors had made it difficult to spray water on the crippled reactor from the ground.

By March 14, Prime Minister Naoto Kan had proposed to Kitazawa the use of SDF helicopters to spray water on the reactors. Kitazawa thought, without being indicated by the United States, that it was obvious that there was no choice but to use the SDF for the mission to cool the reactors.

A list of possible options compiled by the SDF included plans for spraying water from the ground or the air, as well as aerial drops of boric acid to prevent nuclear fission.

Kitazawa told top ground forces officer Yoshifumi Hibako, the chief of staff of the Ground Self-Defense Force, to carry out the mission after making careful preparations.

“We will do it with a firm resolve; leave it to us,” Hibako told Kitazawa.

Kitazawa, however, wanted to avoid any death-defying mission that risked casualties among SDF personnel. He voiced his concerns about the safety of the SDF personnel that would be involved in the mission, which would require work amid high levels of radiation.

Kitazawa suggested that married SDF officers be excluded from the units involved in the operations at the disaster-stricken nuclear power plant.

Kitazawa, who had painful memories of the Pacific War, strongly believed in making every possible effort to ensure that troops didn't have to perform any heroic acts that required them to put their lives at risk.

Immediately after the emergency meeting, Gen. Ryoichi Oriki, chief of staff of the SDF's Joint Staff, Japan's top military officer, received a phone call from Burton Field, commander of U.S. Forces Japan.

Field stressed the need to inject water into the spent fuel pool for the No. 4 reactor from above, effectively reiterating the point made by Mullen and described in the secret cable.

At 2 p.m. on the day, two section chief-level officials from Tokyo Electric Power Co., the operator of the disabled plant, met with Suzuki and other senior government policymakers at the Defense Ministry.

Suzuki had asked for information needed for helicopter operations, such as the structure of the building housing the reactor and the height of steel towers around the building.

But the two TEPCO employees produced nothing but a ground plan showing the locations of facilities within the complex. It offered no information useful for the planned water-dumping operations involving helicopters.

"What did you come here for?" Suzuki yelled at the employees of the utility.

TEPCO caught red-handed (2)

February 8, 2013

Probe at reactor bldg blocked by false info from TEPCO

<http://www.yomiuri.co.jp/dy/national/T130207005595.htm>

The Yomiuri Shimbun

Tokyo Electric Power Co. falsely told a Diet commission that a facility at its Fukushima No. 1 nuclear power plant was completely dark, causing the commission to abandon plans for an on-site inspection of the building housing the facility last March, it was learned Thursday.

Tasked with investigating the crisis at the plant in Fukushima Prefecture, the commission sought to examine the facility on the fourth floor of the building that contained the plant's crippled No. 1 reactor. However, a TEPCO official allegedly told them, "It would be dangerous, as it's pitch dark."

"There was a serious obstruction to our investigation due to a false explanation," Mitsuhiro Tanaka, then a member of the Diet commission, wrote in a letter submitted Thursday to the economy minister and the speakers of both houses of the Diet.

In the letter, Tanaka sought for the commission to conduct an on-site investigation of the building.

According to its written request, the commission tried to inspect the fourth-floor facility because they suspected the emergency isolation condenser there had been damaged by the earthquake, rather than by the tsunami that followed on March 11, 2011.

On Feb. 28, shortly before their planned inspection, TEPCO officials, including the then planning department chief Toshimitsu Tamai, visited the Diet to see Tanaka and others. They showed them dimly lit footage from inside the fourth floor facility.

While showing the footage, they reportedly told the commission members, "This was taken before the cover [to hamper the dispersal of radioactive materials] was installed. Now the building is covered, and there's no light inside."

However, the footage was later found to have been taken after the protective cover was installed. It was also learned that lighting had been installed there.

The commission compiled its final report in July, without confirming whether the condenser was damaged, and if damaged, how.

February 7, 2013

TEPCO suspected of false account to Diet panel

http://www3.nhk.or.jp/daily/english/20130207_19.html

The operator of the disaster-stricken Fukushima Daiichi nuclear power plant has been accused of trying to block a Diet panel probe into the March 2011 nuclear accident at the facility.

Mitsuhiko Tanaka, a former Diet panel member, submitted a document to the leaders of both chambers of the Diet on Thursday, asking for an investigation into the matter.

Tanaka claims in the document that Tokyo Electric Power Company told the panel last February that the inside of the building housing the plant's No.1 reactor was pitch-dark as it was covered by a sheet, rendering it too dangerous for an onsite inspection to be carried out.

This explanation, he says, led the panel to give up the idea of conducting the on-site inspection.

TEPCO reportedly showed the panel a video depicting the interior of the reactor building, explaining that the footage was shot before the installment of the cover.

But Tanaka says it was later discovered that the images were shot after the installment and the inside was

not completely dark regardless of the existence of the cover.

Tanaka says TEPCO's false explanation constitutes a serious obstruction of the panel's business. He is demanding that the Diet look into the developments and conduct an onsite investigation.

TEPCO refuted the allegation, saying officials in charge made a mistake in dating the footage.

TEPCO's full cooperation is essential for safety's sake

February 8, 2013

EDITORIAL: New Diet probe into Fukushima disaster called for

<http://ajw.asahi.com/article/views/editorial/AJ201302080044>

An unbelievable act of folly has come to light.

A year ago, Tokyo Electric Power Co. misled a Diet investigation panel looking into the March 2011 disaster at Fukushima No. 1 nuclear power plant, causing it to abandon an on-site inspection of the plant's crippled No. 1 reactor.

Even though there was lighting, TEPCO erroneously informed the panel that the building housing the reactor was "pitch dark and dangerous."

From the outset of the disaster, some experts have suggested that crucial equipment designed to keep the reactor cool could have been damaged by the impact of the magnitude-9.0 Great East Japan Earthquake before the tsunami struck. The Diet panel's on-site inspection was supposed to uncover what really happened there.

In response to the recent revelation, TEPCO's public relations department said it did not intentionally make a false report. But this is utterly unconvincing. If it had looked into the situation with the intent of fully cooperating with Diet investigators, it would have immediately ascertained there was no problem as far as lighting was concerned.

On Feb. 7, a former member of the Diet panel that received the original TEPCO finding submitted written requests to the chiefs of the two chambers of the Diet calling for an on-site investigation and a hearing for TEPCO.

Although the Diet panel has already disbanded, a Lower House special commission on the nuclear energy problem was established in the Diet in late January.

Since the revelation showed that TEPCO did not take the authority of the Diet seriously, the new commission should exercise its full powers to unravel the truth. There is also a need to consider setting up a new Diet panel to mount a fresh investigation with more experts.

Getting to the bottom of the Fukushima disaster is closely related to the question of steps that need to be taken to prevent a recurrence of similar accidents.

The Nuclear Regulation Authority, the new nuclear industry watchdog, is currently engaged in drafting new safety guidelines for nuclear plants. Whether crucial equipment was damaged by the initial shaking in the Fukushima disaster will be an important factor in outlining measures for reactors to withstand the impact of a major quake.

Of the three investigative panels set up by the government, the Diet and the private sector, respectively, the government panel decided that the functions of important equipment were not impaired by the quake. Its finding was based mainly on reports by TEPCO. The private panel failed to secure TEPCO's cooperation and was unable to dig directly into the cause of the accident.

The Diet panel demanded an on-site inspection on grounds that emergency condensers used to cool nuclear reactors in emergencies could have been damaged by the impact of the earthquake. But the inspection was thwarted due to TEPCO's false explanation.

If nothing is done to rectify the situation, the new safety guidelines the NRA is now working on may end up riddled with holes in terms of quake preparedness.

TEPCO, for starters, should come forward to provide full details of what happened at the plant. If a new Diet investigation gets under way, the company should offer its fullest cooperation.

TEPCO had a history of repeatedly covering up accidents and making false reports to the government on its nuclear facilities even before the Fukushima disaster occurred.

After the accident, it made progress in terms of accountability by partially disclosing images of in-house video conferences. As for safety reform, however, the steps taken to date are far from adequate.

More than anything else, clarifying the cause of the accident serves the public interest. Having received a massive amount in public funds, if TEPCO fails to recognize this point, it does not deserve to be called a public-interest corporation.

--The Asahi Shimbun, Feb. 8

The investigation is not over

February 9, 2013

Editorial: Fukushima nuclear disaster investigation must continue

<http://mainichi.jp/english/english/perspectives/news/20130209p2a00m0na003000c.html>

Looking at the Fukushima nuclear disaster, many have wondered if some vital equipment at the power plant was knocked out by the March 2011 quake and not by the ensuing tsunami as plant operator Tokyo Electric Power Co. (TEPCO) claims. Finding out is a lot harder than it should be, as TEPCO has sabotaged the disaster investigation meant to answer these types of questions.

In February last year, when the Diet's nuclear disaster investigative committee decided to carry out an on-site survey of the Fukushima No. 1 plant and asked TEPCO, the power company refused. TEPCO claimed that the No. 1 reactor building interior was "pitch black," making inspections impossible, and also said it was concerned investigators would wander into high-radiation zones. The truth was that light was shining into the shattered reactor buildings. Even a year after the event, this revelation is shocking.

Now TEPCO is saying the falsehood "was not intentional." That's hard to believe. Even if this was a crime of omission, if TEPCO simply failed to adequately check conditions at the plant for the Diet investigators, that in itself would be a major problem.

In a disaster as major as the Fukushima nuclear meltdowns, finding the cause must be given highest priority. The Diet investigation was working on behalf of the Japanese people, and thus TEPCO was duty-bound to cooperate with it to the greatest possible extent, for the sake of digging up as much truth about the disaster as there is to find.

If TEPCO gets an inspection request like the one from the Diet committee, it must assess conditions on-site and make sure the investigators can do their job without risking their health. If TEPCO had performed these common-sense tasks, there is no way the utility could have claimed the No. 1 reactor building was "pitch black" inside, because it wasn't. At the very least, TEPCO displayed a shocking lack of respect and sincerity to the Japanese people.

What the government inspectors wanted to see was the emergency isolation condenser, or IC, on the fourth floor of the No. 1 reactor building. They wanted to check if the unit had been damaged during the March 11, 2011 earthquake, before tsunami inundated the plant. The IC is supposed to pump water into the reactor core and keep it cool if the plant loses power, but it did not function properly on that day.

TEPCO insists that the IC unit was not damaged by the magnitude-9 Great East Japan Earthquake. According to one Diet investigative committee member, however, one witness stated that a water leak had been detected on the fourth floor before the tsunami hit, suggesting at least the possibility that the piping in the IC unit had been damaged in the quake.

But this issue is not just about unraveling the Fukushima disaster. **Whether the quake damaged vital equipment at the plant also affects future reactor risk evaluations and safety standards.** New safety standards are at this very time under evaluation at the Nuclear Regulation Authority (NRA). If reactor systems were in fact seriously damaged by the quake, that would be ample basis for demanding very strict regulations on vibration resistance.

Furthermore, after being stymied by TEPCO on its first attempt, the Diet must renew inspections, and not just of the No. 1 reactor's IC unit. The investigation into the cause of the meltdowns is not over. The Diet nuclear disaster investigative committee and its government cousin have been dissolved, their final reports filed, but **the investigation must continue.**

Last month, the House of Representatives established a permanent expert investigative commission on the nuclear power issue. We call on this organization to take up the mantle laid down by the previous disaster investigations and continue their work, to find out once and for all what caused the Fukushima nuclear disaster. The NRA, now building Japan's new nuclear safety standards, needs this information.

Lastly, leaving the cause of the disaster so indistinct would not just be a loss to Japan, but to the world at large. We cannot allow this to happen.

At least 30 illicit meetings with utilities

Nuclear watchdog execs held 30 illicit meetings with power firms

JJI

http://www.japantimes.co.jp/news/2013/02/10/national/exec-at-japans-nuclear-watchdog-held-30-illicit-meetings-with-power-firms/#.URd0I_L1tEs

A former senior official of the Nuclear Regulation Authority held at least 30 meetings with power company executives in violation of the new watchdog's internal rules, it was learned Saturday.

Tetsuo Nayuki, who served as director general of the NRA secretariat, met with representatives of regional utilities and power firms on his own even though the organization's regulations prohibit its officials from participating in such meetings alone.

The finding arose through interviews with the nine utilities that operate nuclear power plants, as well as Japan Atomic Power Co., Electric Power Development Co. (J-Power), the Japan Atomic Energy Agency and Japan Nuclear Fuel Ltd.

In the four months after the NRA's launch last September, Nayuki held eight meetings with executives from Japan Atomic Power, seven with Hokuriku Electric Power Co., and four each with Kyushu Electric Power Co. and Tohoku Electric Power Co., among other huddles with senior power company officials.

The Japan Atomic Energy Agency, Japan Nuclear Fuel and Chugoku Electric Power Co. refused to give concrete responses, saying they do not have detailed data on possible meetings between Nayuki and their executives.

Nayuki was removed from his post after the revelation earlier this month that he handed Japan Atomic Power a draft report by an NRA team of experts about a critical geological survey of a possibly active fault directly beneath the firm's Tsuruga nuclear complex in Fukui Prefecture, before the draft was publicly released.

Before Nayuki's blunder came to light, introductory meetings between NRA officials and power company officials were treated as an exception to the nuclear watchdog's ban on unaccompanied confabs.

Tangled in its own lies

February 10, 2013

TEPCO botches apology for misleading Diet investigatory panel

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201302100051>

By HIDEAKI KIMURA/ Staff Writer

Tokyo Electric Power Co. has been caught in another lie in its apology on its website for misleading a Diet panel that was investigating the 2011 accident at its Fukushima No. 1 nuclear power plant.

TEPCO officials already had been forced to backtrack on telling a member of the Fukushima Nuclear Accident Independent Investigation Commission that the No. 1 reactor was too dark to allow for on-site inspection of the damage caused by the March 11, 2011, earthquake and tsunami.

After The Asahi Shimbun broke a story on Feb. 7 that the TEPCO explanation was false and given to block an inspection, TEPCO posted a statement on its website that a panel member had asked about the degree to which light was entering the No. 1 reactor. The utility said the explanation of darkness was given based on an incorrect understanding of the facts.

The utility explained that there was no intent to willingly submit a false report to the panel.

However, when TEPCO officials visited the panel member to offer an explanation last February, no panel member inquired about the visibility in the reactor.

In fact, Toshimitsu Tamai, then chief of TEPCO's corporate planning department, himself broached the subject of darkness within the reactor. In the course of their discussion, Tamai said, "The reactor is now pitch black because the building is covered."

In actuality, a cover over the damaged building allowed some sunlight in, and there were powerful mercury lamps on the cover's ceiling.

At a Feb. 7 Lower House Budget Committee session, Toshimitsu Motegi, the minister of economy, trade and industry, said in reference to the misleading comments by TEPCO officials, "If false information was given with the intent to mislead, it will be absolutely unforgivable."

TEPCO President Naomi Hirose is scheduled to appear before the Lower House Budget Committee on Feb. 12 to respond to questions about the issue as an unsworn witness.

A TEPCO official avoided responding directly when asked about the utility's explanation on its website. "We will proceed with an appropriate investigation based on instructions from the central government," the official said.

Press freedom and nukes don't mix

February 10, 2013

<http://fukushima-is-still-news.over-blog.com/article-japanese-media-and-nukes-114018098.html>

Nuclear power and press freedom

http://www.japantimes.co.jp/opinion/2013/02/10/editorials/nuclear-power-and-press-freedom/#.URd0g_L1tEs

Japan fell from 22nd place to 53rd in the rankings of press freedom last year, according to the nonprofit organization **Reporters Without Borders**. Japan's plummet was attributed to a single factor — the lack of access to information related to the disaster at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear power plant.

In the past, Japan could be relatively proud of its reputation for press freedom compared with that of most countries. But being ranked lower lately than countries such as El Salvador or Haiti is an embarrassing reminder that press freedom can quickly erode under pressure from the government and corporations.

In reporting on the serious disaster at the Fukushima No. 1 nuclear power plant, many reporters have met with restricted access, lack of transparency and even lawsuits.

Though investigation reports were issued by the government, the Diet and a private-sector committee as well as by Tepco, a genuine account of the crisis has yet to be completed.

So far, no one has been charged with crimes related to the nuclear power plant disaster. However, better access to Tepco's records, as well as to what was known by affiliated companies and the government, is the first step to determine possible negligence, collusion or criminal responsibility.

For that process to be fair and thorough, independent verification, one of the most important duties of a free press, is essential. The public deserves to know what the records of Tepco and of the government might reveal.

Tepco has consistently barred access to documents and to people. When freelance and independent reporters were finally allowed into the plant, Tepco demanded final say over their video and images. That does not constitute press freedom.

An investigative reporter was sued by one of Tepco's subsidiaries to keep his reporting quiet. The corporation, which was one of Tepco's primary affiliates, apparently sought to silence the reporter. Freelance journalists and magazines were sued after publishing articles on the alleged collusion among politicians, nuclear plant construction companies and Tepco.

It must be concluded that the intent of taking reporters and publications to court is to cover up the truth.

Another issue with regard to press freedom in general is **that freelance journalists are still not allowed full access to all official press club briefings**. This antiquated *kisha* (reporters') club system has started to allow registered freelance journalists to attend Friday news conferences given by the chief Cabinet secretary at the prime minister's official residence. But this is still insufficient.

All journalists should have access to official information directly. Journalists covering protests against nuclear power should also be free from any restrictions.

The reporting on how companies, ministries and agencies and the government handled the disaster at the Fukushima nuclear plant stands as a test case for Japan's commitment to press freedom. The most serious crisis in modern Japan deserves increased reporting, not decreased transparency.

People deserve to know the facts from multiple sources. Open access to crucial information is the only real test of press freedom. That is especially true when the issue is of such vital, ongoing importance. The right of the public to hear from multiple sources means that independent reporting must continue **without intimidation, limitation or smoke screens**. Determining the causes of the disaster is a difficult, demanding process even with sufficient access. Much still remains unknown.

Other ensuing problems, such as high levels of radiation in the soil or the question of where waste from Fukushima will be handled also deserve clear, full reporting. The Nuclear Regulation Authority should not shroud its examination of the safety of nuclear power plants in secrecy.

Reporting on their safety should not be just a matter of citing press releases. For the sake of fair and independent reporting, it must be ensured that journalists can verify what the NRA and power companies say so that they can be sure that safety measures are being followed.

Japan's press freedom is different from that of other countries. Japan is unlike Russia, ranked 148th in press freedom, where investigative journalists have been jailed without trial. Japan is also very different

from Pakistan, ranked 159th, where a young girl, Ms. Malala Yousufzai, was shot in the head for campaigning online for girls' educational rights.

However, Japan's press suffers from other problems. Noncooperation and the covering up of records are another way of reducing press freedom and keeping the truth from the public.

The latest low ranking of Japan is particularly disturbing because the issues surrounding the Fukushima No. 1 plant are just as important outside of Japan as inside Japan. Reporting exactly what happened and why is an issue that extends to every country with nuclear power plants.

Full, accurate reporting on the Fukushima meltdowns can help ensure that such a disaster will not occur again anywhere else. What happened should not be covered up. It is the right of the public of Japan and the rest of the world to know what happened so it will not happen ever again.

Freedom of the press helps guarantee that right and helps ensure accountability from the government and corporations. If the Fukushima nuclear power plant disaster is covered by a truly free press, Japan's ranking will move back up to where it should be; Japan, and the world for that matter, is likely to be a safer place.

900,000 pages to be published on the web

February 11, 2013

Nuclear crisis info to be put on Web / About 900,000 pages of documents to be digitized, available in about 2 years

The Yomiuri Shimbun

<http://www.yomiuri.co.jp/dy/national/T130210002924.htm>

Tokyo Electric Power Co.'s Fukushima No. 1 nuclear power plant

A locker at the Nuclear Regulation Authority Secretariat contains a huge number of files regarding the Fukushima nuclear crisis.

The Nuclear Regulation Authority plans to digitize about 900,000 pages of documents related to the Fukushima nuclear crisis, with an eye to making them publicly available online in about two years, it has been learned.

According to NRA officials, some of the material has not been released before, and includes radioactivity monitoring results, how people were irradiated and evacuation plans worked out by local governments. The project is intended to bring together--and make accessible--the masses of documents stored by ministries and agencies on the crisis at the Fukushima No. 1 nuclear power plant.

The digitization will not include material compiled by the plant's operator, Tokyo Electric Power Co. The officials said these documents do not belong to the government.

"There are 300,000 A-4 pages of documents here alone," one official of the NRA Secretariat said in a room of the building that houses the NRA in Tokyo's Roppongi district.

The official opened one locker, revealing a huge number of binders that the NRA took over from the Nuclear and Industrial Safety Agency, which was abolished in September. The contents of the binders were sorted into many files.

Some documents appeared to contain radioactivity monitoring data recorded in Fukushima Prefecture immediately after the nuclear crisis started after the March 11, 2011, Great East Japan Earthquake and tsunami. Radiation readings had been underlined several times. Some notes jotted on the documents were little more than a scrawl, indicating the urgency with which they had been written by people trying to handle the nation's worst nuclear crisis.

The documents have been stored by an array of entities, including the NRA, the government countermeasures headquarters against the nuclear crisis in Fukushima city, and the Economy, Trade and Industry Ministry's Emergency Response Center in Kasumigaseki, Tokyo.

Many of the documents were thrown in files out of chronological order, and not all the documents on a common topic have been stored together. Some files were lumped together in boxes.

"The volume of documents is so huge that many have been left wherever they were put," admitted an NRA Secretariat official.

The documents to be digitized were written in the first 12 months after the crisis started. They include data stored by the central government's local countermeasures headquarters, and will include some internal documents drawn up by government bodies, the official said. Some of the documents have already been made public.

The NRA can keep documents provided by TEPCO and the Fukushima prefectural government, but not internal documents of TEPCO and other businesses because they are not government property, he said.

In addition, some documents handled separately by such government organs as the Prime Minister's Office and ministries and agencies will not be included, according to the official.

When completed, the documents can be searched by keywords online and will be available for anyone, he said.

This will enable people to verify how TEPCO and government organizations and their leaders tried to deal with the crisis. The documents will show, for example, what information was exchanged between the local countermeasures headquarters in Fukushima and the Emergency Response Center, and what instructions the center issued and when, the official said.

Arranging and sorting the 900,000 pages is a time-consuming process. Each document must be electronically scanned, so they will not be made public until at least two years from now, he said.

An expert panel will decide whether any personal information in the documents should be redacted, according to the official.

"We'll first digitize as many documents as we can," the NRA Secretariat official said. "Later, we'll try to expand the range of documents by asking TEPCO and various government organizations for cooperation."

PROMETHEUS TRAP (7): Gratitude expressed by Japan's commander in chief

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201302110006>

By HIDEFUMI NOGAMI/ Staff Writer

Editor's note: This is the seventh part of a series that has run in the past under the overall title of The Prometheus Trap. This series deals with the different responses between Japan and the United States in dealing with the Fukushima nuclear accident of 2011 following the Great East Japan Earthquake. The series will appear on Mondays, Wednesdays and Fridays.

By the afternoon of March 15, 2011, the Defense Ministry had prepared a rough plan to cool the overheating reactors at the Fukushima No. 1 nuclear power plant by using Self-Defense Forces helicopters for water air drops.

Around the same time, Prime Minister Naoto Kan was in his office on the fifth floor of the Prime Minister's office agonizing over a decision he had to make shortly.

The prime minister is the SDF's commander in chief. In the event of an invasion of Japan by a foreign country, there would be no hesitation in issuing an order to mobilize the SDF.

But what the nation was facing at the moment was a nuclear accident at home and the invisible threat of radiation from the crippled nuclear power plant. Kan was wondering what his decision should be.

In the wake of the Chernobyl nuclear disaster in 1986, Soviet soldiers were sent into the site to deal with the consequences in the face of life-threatening danger posed by high levels of radiation.

Kan was recalling what happened to these "liquidators," or cleanup workers at the Chernobyl accident site. He was unsure whether he could issue an order to send SDF personnel into the Fukushima plant on an extremely dangerous mission.

Legally speaking, it is the responsibility of Tokyo Electric Power Co., the operator of the Fukushima plant, to deal with the situation. But the fact is that Kan, as the prime minister, was the only person who could make the decision to mobilize the SDF to contain the rapidly developing nuclear crisis.

At 3:58 p.m., Defense Minister Toshimi Kitazawa came into Kan's office, carrying a sheaf of documents describing a plan for SDF helicopters to spray water on the reactors.

"We have crafted a plan for spraying water on the reactors in the best possible way for preventing casualties (among the SDF personnel involved)," Kitazawa said, presenting the documents to Kan. "What do you think?"

Kan repeatedly expressed his gratitude. "I really appreciate that. I really appreciate that."

Gen. Ryoichi Oriki, chief of staff of the SDF's Joint Staff, the highest-ranking SDF officer, was accompanying Kitazawa to brief Kan on the plan. After explaining the operation to the prime minister, Oriki said, "Protecting the lives of people is our job, and we are ready to make all-out efforts (to carry out the mission) if we receive an order."

"I really appreciate that," Kan said again.

Oriki's words were reassuring to Kan, who was to issue an unprecedented order to mobilize the SDF to deal with the nuclear disaster.

During the hours leading up to this meeting, Japanese Ambassador to the United States Ichiro Fujisaki called the integrated government-TEPCO headquarters, which was responding to the nuclear crisis, to report that U.S. officials were urging the mobilization of the SDF to cope with the situation.

Immediately on the spot, Kan issued an order to the SDF to spray water to cool the reactors.

According to the plan, water would be sprayed on the No. 3 reactor from the air and on the No. 4 unit from the ground. There was the possibility that dumping water on the No. 4 reactor from above could cause a hydrogen explosion. The operations were to be carried out on the following day, March 16.

Kan's order was passed by Oriki through the chain of command to SDF troops chosen for the mission.

The Ground Self-Defense Force's 1st Helicopter Brigade was assigned to the water-dumping operation.

The brigade is composed of some 700 troops and a fleet of more than 30 aircraft, including Boeing CH-47 Chinook heavy-lift helicopters.

The unit had been carrying out airlifts to transport relief goods to areas hit by the March 11 Great East Japan Earthquake and tsunami, operating from the GSDF's Camp Kasuminome in Sendai, Miyagi Prefecture, which has the Kasuminome Air Field.

Lead plates and protective sheets to shield SDF personnel from radiation during the operations were brought to Kasuminome and other SDF camps.

Whispers about the impending operations at the disaster-stricken plant started circulating among SDF members.

"It seems we will be used for operations at the No. 1 nuclear plant," some whispered. "We could die if we are sent to the plant," others said.

[Surrealism] MOE reinforces radiation monitoring for the nuclear test of N. Korea

Posted by **Mochizuki** on February 12th, 2013 ·

<http://fukushima-diary.com/2013/02/surrealism-moe-reinforces-radiation-monitoring-for-the-nuclear-test-of-n-korea/>

In the afternoon of 2/12/2013 (JST), North Korea announced the success of its third underground nuclear test. *1

In order to protect Japan from the radioactive contamination, Ministry of the Environment reinforced their radiation monitoring system.

They were monitoring radiation every one hour but changed it to every 2 minutes at 10 monitoring posts. *2

Also, Japanese self-defense force started dust sampling that may reach Japan by aircrafts before 15:00 of 2/12/2013. *3

(10 million Bq of Cs-134/137 is still released from Fukushima plant every single hour. [URL])

Russian emergency agency reported they didn't measure seismic activity or any change in radiation level. *4

More apologies from TEPCO

February 12, 2013

TEPCO head apologizes for false info stopping disaster site probe

<http://mainichi.jp/english/english/newsselect/news/20130212p2g00m0dm072000c.html>

TOKYO (Kyodo) -- Tokyo Electric Power Co. President Naomi Hirose on Tuesday apologized for the false information which prevented a parliamentary panel from conducting an on-site inspection of a reactor building severely damaged in the March 2011 Fukushima Daiichi nuclear plant disaster.

The false explanation stemmed from a TEPCO official's ungrounded perception that the inside of the No. 1 reactor building was dark, Hirose told the House of Representatives budget committee.

A former member of the Diet-appointed panel recently said the panel suspended a plan to physically inspect the building in February 2012 after being told the inside was in complete darkness.

In fact, sunlight was able to penetrate the outer cover of the building and lamps were available.

The panel member has criticized TEPCO, the operator of the nuclear plant, for effectively blocking the on-site inspection.

At the Diet committee, Hirose said TEPCO will fully cooperate in any future investigation.

Nuclear Regulation Authority Chairman Shunichi Tanaka told the committee the authority plans to investigate the plant as early as possible, although radiation levels there are still high.

TEPCO president blames one official for misleading Fukushima investigative panel

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201302120085>

By HIDEAKI KIMURA/ Staff Writer

Naomi Hirose, president of Tokyo Electric Power Co., denied an organization-wide effort to interfere with a Diet investigation into the crippled Fukushima nuclear plant, saying one official was responsible for spreading misleading information.

Hirose was summoned as an unsworn witness before the Lower House Budget Committee on Feb. 12 to respond to questions from Kiyomi Tsujimoto, a member of the opposition Democratic Party of Japan.

"We would like to cooperate as much as possible," Hirose said when asked about future on-site inspections of the Fukushima No. 1 nuclear power plant.

Hirose's statements came after The Asahi Shimbun reported on Feb. 7 that a TEPCO official provided false information to a member of the Diet panel investigating the March 2011 nuclear accident.

Toshimitsu Tamai, then chief of TEPCO's corporate planning department, explained in February 2012 that the No. 1 reactor building was "pitch black" due to covering and was too dangerous for an on-site inspection, given the high radiation levels in parts of the building.

In reality, the cover over the No. 1 reactor building still allowed 10-16 percent of sunlight to enter. It was also equipped with powerful mercury lamps.

The Diet panel member wanted to determine if key equipment at the plant was damaged by the March 11 earthquake, not the tsunami. Such damage would have led to stricter quake-resistance standards at nuclear plants and delayed the restarts of idled reactors.

But after Tamai's warning, the panel member decided not to visit the building.

Hirose explained that the misleading explanation was due to a misunderstanding by Tamai, who served as a liaison with the now-disbanded Fukushima Nuclear Accident Independent Investigation Commission established by the Diet.

Tamai was likely under the impression that the interior of the No. 1 reactor building was dark, Hirose said, reiterating what the utility has been saying over the past few days.

Hirose also said Tamai, who was a nuclear energy expert of sorts since he had worked at both the Fukushima No. 1 plant and the Kashiwazaki-Kariwa plant in Niigata Prefecture, gave the explanation without consulting with his direct superior.

Tsujimoto asked the TEPCO president who within the TEPCO organizational structure gave instructions to Tamai about his explanations to the Diet panel member.

Hirose ducked the question by saying that Tamai did not explain anything to his superior.

But the president also cast doubt on the supposed lack of knowledge among TEPCO executives on what Tamai was doing.

Hirose, who became TEPCO president last June, said it would have been natural for the TEPCO president to be involved in any explanation given to Diet panel members about an on-site inspection.

He also indicated that the TEPCO chairman and president at the time of Tamai's explanation would be covered in the utility's investigation into Tamai's false explanation. Hirose added that the company wanted to include outside experts on its investigative panel.

Tsujimoto called for a highly independent outside panel to look into the false explanation. She also asked that Tamai be called before the Budget Committee as an unsworn witness.

Shunichi Tanaka, chairman of the Nuclear Regulation Authority, also appeared before the Budget Committee and was asked what the industry watchdog would do if the Diet asked for a probe into the matter.

"We would quickly proceed with such an investigation," Tanaka said.

The Diet investigative panel decided early last year to conduct an on-site inspection after receiving reports that subcontracted workers had seen water on the fourth floor of the No. 1 reactor building following the earthquake.

Those reports indicated that the quake had damaged isolation condensers on that floor.

When Tamai gave his warning to the Diet panel member in February 2012, he showed images of the fourth floor that was receiving light in some locations.

Tamai explained that the pictures were taken before the covering was placed over the reactor, and that lighting was no longer available there.

In fact, the images that Tamai showed were taken four days after the cover was placed over the reactor.

TEPCO added to its embarrassment by including false information in its apology for Tamai's misleading information.

The company's apology, which appeared on its website, said a member of the Diet investigative panel had asked how much light was entering the No. 1 reactor building. In reality, it was a TEPCO official who brought up the topic of light in the reactor.

In its Feb. 11 post on the website, TEPCO again apologized and explained, "As a result of further confirmation, it was learned that a TEPCO official brought up the subject."

The utility repeated that there was no intent to willingly submit a false report to the Diet panel.

Workers on decontamination jobs cheated again

Ministry: Many Fukushima laborers deprived of danger pay

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201302090067>

February 09, 2013

By TOSHIO TADA/ Staff Writer

The Environment Ministry has admitted danger pay has not been reaching some laborers entitled to a hefty bonus for their work on decontamination projects near the Fukushima No. 1 nuclear plant.

Unscrupulous employers likely pocketed the missing cash, but the ministry says it will neither penalize them nor name and shame them because that "would have a big adverse effect," an official in charge of the matter said.

Many cleanup workers are eligible to daily allowance of 10,000 yen (\$108) on top of their regular wage in recognition of the risk they face from radiation exposure.

It is thought that hundreds of workers failed to receive this, but the number could be much higher.

On Feb. 8, the ministry said it had identified seven projects in which workers did not receive the full amount.

In November 2012, The Asahi Shimbun aired allegations of nonpayment. Following that reporting, about 100 alleged victims petitioned the Environment Ministry for action.

The ministry took its time in responding. But on Jan. 22, it ordered contractors, including those with central- or local-government decontamination contracts, to investigate the allegations of nonpayment.

The contractors reported to the ministry that they found evidence that it happened in six of the 33 projects already completed and in one project that was still ongoing.

The ministry does not know exactly how many workers received less than they should have because it did not oblige contractors to reveal those figures.

But a decontamination project often involves anywhere from several hundred to several thousand laborers.

Therefore, the number of individuals deprived of danger pay is likely to be in three figures and could be significantly higher.

The Environment Ministry plans to issue a written demand to contractors involved that they now make back-payments to the workers concerned. But it will stop short of naming them publicly or imposing punitive measures.

The nonpayment issue is one that, under normal conditions, could result in the offending contractors being suspended temporarily from bidding for further public-works projects from the Environment Ministry.

In muting its response, the ministry apparently hopes to prevent the scandal from spreading.

PROMETHEUS TRAP (8): Burning the midnight oil for a plan to drop water on a reactor

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201302130005>

By HIROYOSHI ITABASHI/ Staff Writer

Editor's note: This is the eighth part of a series that has run in the past under the overall title of The Prometheus Trap. This series deals with the different responses between Japan and the United States in dealing with the Fukushima nuclear accident of 2011 following the Great East Japan Earthquake. The series will appear on Mondays, Wednesdays and Fridays.

* * *

In the middle of the night on March 15, four days after the Fukushima nuclear disaster broke out, Col. Masahiro Onishi of the Ground Self-Defense Force was working at the SDF's Camp Kasuminome in Sendai to craft a plan for a dangerous mission.

Onishi, who heads the GSDF's 1st Helicopter Brigade, was drawing up the plan by using a pencil and a close-ruled notebook.

The brigade is experienced in aerial firefighting operations using helicopters to extinguish wildfires. But this was no wildfire. Onishi had been ordered by a higher officer to map out a plan to use SDF helicopters to spray water over crippled reactors at the Fukushima No. 1 nuclear power plant in a desperate attempt to cool them.

Usually, the development of plans of operations is the responsibility of helicopter pilots and other personnel involved.

But there was not enough time for the usual planning process, with the mission set for the next day. Sufficient advance training was also impossible.

Onishi took on the task of planning the mission and let the crew members go to bed early. He knew he had to work all night long.

The basic idea was simple. What Onishi's squad was expected to do was to dump 7.5 tons of seawater on a reactor from a huge bucket suspended on a cable carried by a helicopter.

But water had to be dropped precisely on the target without exposing the crew to dangerously high levels of radiation. It was a tricky task.

It would be easier to strike the target if the helicopter carried out the task while hovering over the reactor at a low altitude. But that would expose the crew to high levels of radiation. The only option was to drop water from a moving helicopter.

Trying to work out the best possible plan to deliver water accurately to the reactor while protecting the safety of the crew, Onishi made many trial calculations in his notebook.

After hours of work, he finally solved the equation: dropping water from a helicopter flying 20 knots (about 37 kilometers per hour) at an altitude of 91 meters (about 300 feet).

He was confident that if the mission was carried out according to this plan, its objective would be achieved up to a point.

Assuming that the average level of radiation above the reactor was 60 millisieverts per hour, the crew's total radiation dose during the mission would be a sufficiently low 0.236 millisievert.

Onishi then used the data and his computer to create a document describing the plan he had worked out. He completed the document showing the procedure for helicopter operations to spray water on the reactor with an illustration for quick understanding of the scheme.

Then, he gathered equipment and materials to be installed into the helicopter to shield the interior from radiation.

Onishi joined the SDF after dropping out of Hokkaido University. He then entered the National Defense Academy to become a high-ranking officer.

Although he had actually climbed through the ranks and became a senior officer, Onishi had made a point of always paying attention to the burden shouldered by SDF personnel on the front lines.

In the early morning on March 16, Onishi distributed the document among the crew members assigned to the mission. Some of them looked fully prepared, while others were showing signs of uneasiness.

Onishi thought nobody would welcome such a task. He imagined what was going through the minds of his men.

At 4 p.m., the first helicopter to carry out the mission took off. But the level of radiation over the reactor was 247 millisieverts per hour at an altitude of some 30 meters (100 feet), higher than the maximum permitted for work at the plant. The mission was called off, to the great disappointment of policymakers at the prime minister's office and the Defense Ministry.

But it was not for nothing. The crew clearly saw the glittering surface of the water inside the spent fuel pool for the No. 4 reactor even though the U.S. military had warned that the water might have evaporated. The top priority target of the water-spraying operation was switched to the No. 3 reactor.

Diet should restart investigation and TEPCO cooperate

February 14, 2013

Tepco's investigation obstruction

http://www.japantimes.co.jp/opinion/2013/02/14/editorials/tepcos-investigation-obstruction/#.URv-i_L1tEs

It has surfaced that Tokyo Electric Power Co. provided misleading information to the Diet investigation committee tasked to determine the causes of the March 11, 2011, nuclear catastrophe at Tepco's Fukushima No. 1 nuclear power plant, thus preventing the examination of critical components of the No. 1 reactor, one of three Fukushima reactors that suffered meltdowns.

It is impossible to believe Tepco's explanation that it had no intention of obstructing the committee's work. **The Diet should restart its investigation and Tepco should fully cooperate.**

The committee had learned from eyewitness accounts by subcontract workers that, shortly before the reactor was hit by the March 11, 2011, tsunami, water was leaking on the fourth floor, where two isolation condensers (ICs) are located, of the building housing the No. 1 reactor. Isolation condensers turn steam vapor into water without using electricity and inject water into reactors to cool them by utilizing gravity in emergencies. The ICs in question stopped functioning shortly after the plant was hit by the 3/11 earthquake.

Suspecting that quake tremors might have broken the ICs and related piping, the committee scheduled an on-site inspection of the fourth floor for early March 2012. But in late February, the then head of Tepco's corporate planning department showed Mr. Mitsuhiro Tanaka, a former reactor designer and a member of the investigation committee, a video taken during Tepco's inspection of the ICs on Oct. 18, 2011. The planning department head explained that because the building was later encased to prevent radioactive materials from leaking, the inside of the building was dark enough to cause panic and that there was risk of injury from debris and of exposure to high radiation levels of 60 to 70 millisieverts per hour. As a result, the committee shelved the idea of conducting the on-site inspection.

Recently, however, it was found that the building's encasement had been completed four days before the Tepco inspection video was made, that the encasement cover lets through some sunlight and that Tepco installed powerful mercury lighting on the fifth floor 10 days after the video footage was made. Thus it is clear that Tepco lied to the committee about the amount of light available inside the building. It seems fair to say that not only did Tepco treat the committee with derision, as Mr. Tanaka stated, but actively sought to disrupt the committee's investigation.

While a government investigation committee ruled out the possibility that earthquake tremors had damaged the ICs, the Diet investigation committee has not. If it is found that quake tremors indeed damaged important components of the Fukushima nuclear power plant, the Nuclear Regulation Authority will be required to strengthen relevant post-Fukushima safety standards for nuclear power plants, which it is now in the process of writing.

Although the Diet investigation committee was disbanded in July 2012, the former committee members should proceed with their on-site inspection. If Tepco refuses to cooperate, the Diet should exercise its legal authority and reactivate the committee, then force Tepco to allow the inspection to take place.

PROMETHEUS TRAP (9): Politicians pushed for quick SDF water drop on nuclear plant

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201302150001>

By HIROYOSHI ITABASHI/ Staff Writer

Editor's note: This is the ninth part of a series that has run in the past under the overall title of The Prometheus Trap. This series deals with the different responses between Japan and the United States in dealing with the Fukushima nuclear accident of 2011 following the Great East Japan Earthquake. The series will appear on Mondays, Wednesdays and Fridays.

* * *

The first attempt to use Self-Defense Forces helicopters to dump seawater on the crippled Fukushima No. 1 nuclear power plant on March 16, 2011, was called off due to high radiation readings.

That night, Prime Minister Naoto Kan called the Defense Ministry with instructions to proceed with the mission the following day.

A consensus was developing among Defense Ministry officials that the flights could be attempted because helicopter crews would not be exposed to very high levels of radiation.

The order was immediately transmitted to Camp Kasuminome in Sendai, Miyagi Prefecture, where snow flurries were falling.

Col. Masahiro Onishi, a unit commander at the 1st Helicopter Brigade, received a phone call from the brigade commander, Maj. Gen. Akihiko Kanamaru, 51.

All Kanamaru said was, "Dump water one time tomorrow, no matter what."

After a short pause, Onishi replied, "I understand."

In the SDF, the response to orders is usually a more obedient, "Roger."

However, Onishi chose to use a phrase that he has used whenever he felt uneasy about a particular order. That was his way of showing a little resistance.

The real meaning behind Kanamaru's order was to dump water regardless of the radiation levels in the air above the Fukushima No. 1 plant.

At about the same time, in Washington, Kurt Campbell, the U.S. assistant secretary of state for East Asian and Pacific affairs, was referring to the need for "heroic sacrifice" in dealing with the Fukushima accident during a meeting with Japanese Embassy officials.

What gave Onishi a degree of hope was the plan to spray water from the ground in the direction of the nuclear plant before any water was dumped from the air. That spraying would likely lower the radiation level in the air.

However, at 7:30 a.m. on March 17, Onishi received another phone call from Kanamaru.

"Head to the area immediately."

That meant the dumping of water from the air would precede any spraying from the ground.

Again, Onishi said, "I understand."

With a tight grip on the phone, Onishi said, "Give me 100 minutes to prepare for the deployment." That led other unit members who were standing near Onishi to realize there had been a sudden change of plans.

Onishi slammed the phone down and shouted, "Damn it!"

He slowly became angry at himself because he would be unable to provide sufficient safety or training to unit members flying in the helicopters.

Onishi's shout froze unit members, but Maj. Teruki Ito, 42, a veteran pilot, realized what was behind Onishi's frustration and knew there was only one thing to do.

"Prepare as quickly as possible," Ito said. "Let's go."

It was the decision of the prime minister's office to first dump water from the air.

There was a planned phone call between Kan and U.S. President Barack Obama for the morning of March 17. As was made clear in the top secret diplomatic cable sent from the Japanese Embassy to the Foreign Ministry, Obama was clearly concerned about how the Japanese government was leaving the response to the nuclear accident up to Tokyo Electric Power Co., the plant operator.

About 90 kilometers from Camp Kasuminome stood the No. 3 reactor of the Fukushima No. 1 plant toward which Ito and his crew were headed. White smoke had been billowing from that reactor from the morning of the previous day.

Steam containing radioactive materials was spreading rapidly.

Check those condensers

February 14, 2013

Thwarted once, inspectors again seek truth about cause of Fukushima disaster

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201302140058>

By JIN NISHIKAWA/ Staff Writer

The Nuclear Regulation Authority is to inspect a building at the stricken Fukushima No. 1 nuclear plant that may contain evidence proving whether it was the powerful tsunami or the earthquake that triggered reactor meltdowns.

The No. 1 reactor building houses isolation condensers, key safety devices which failed in the March 11, 2011, disaster. They should have withstood the magnitude-9.0 Great East Japan Earthquake.

"We want to begin an investigation soon," agency chairman Shunichi Tanaka said Feb. 13.

In February 2012, plant operator Tokyo Electric Power Co. lied about conditions inside the building, apparently to prevent an inspection taking place at that time.

A Diet investigation committee requested access. TEPCO replied that an inspection would be dangerous because the building was "pitch black" inside, an assertion later exposed as false.

An inspection could settle a fundamental difference of opinion between the Diet committee and a separate investigating panel set up by the government over the root cause of the disaster. The Diet committee believes it was the temblor, but the government panel says it was the tsunami.

If the condensers are found to show damage consistent with shaking in an earthquake there would be case for higher standards in nuclear plant design—with important implications for existing reactors built to lesser tolerances.

But the Nuclear Regulation Authority chairman warned against premature conclusions.

"We will not pre-judge the investigation," Tanaka said.

He added that an investigation "is essential if we are to learn full lessons from the Fukushima nuclear accident."

"We are now discussing how to approach it," he said.

However, inspecting the condensers will not be easy and investigators may find that they are unable to linger there for long. Radiation levels are extremely high inside the No. 1 reactor building. In some areas, levels are several tens of millisieverts per hour.

The NRA will now decide details of when and how the inspection should take place.

NRA's position at odds with Gov't policy?

February 15, 2013

Nuclear body's stance on reactor checks not consistent with LDP gov't policy

<http://mainichi.jp/english/english/newsselect/news/20130215p2a00m0na015000c.html>

Nuclear Regulation Authority (NRA) Chairman Shunichi Tanaka's stance to strictly judge whether idled nuclear reactors should be reactivated is inconsistent with the atomic power policy of the Liberal Democratic Party (LDP) government.

In September last year, then Prime Minister Yoshihiko Noda appointed Tanaka as head of the atomic power regulatory body at his own discretion. Noda did not seek the Diet's approval of his appointment while he was in office.

Prime Minister Shinzo Abe declared on Dec. 23 last year, before he took office, that he would not replace Tanaka or four other commissioners in the NRA. The appointments were approved by the House of Representatives on Feb. 14 and by the House of Councillors on Feb. 15.

However, Abe's decision has raised questions as to the consistency between the appointments and the Abe administration's decision to fundamentally review the Democratic Party of Japan (DPJ) administration's goal of eliminating atomic power by the 2030s.

Moreover, whether to resume operations at idled nuclear reactors is closely related to the economic revitalization policy on which the prime minister placed top priority.

Chief Cabinet Secretary Yoshihide Suga told a news conference on Feb. 14 that there is no problem with the appointments of Tanaka and four other NRA commissioners. "The NRA commissioners should draw up safety standards with confidence. The government will decide whether to reactivate nuclear reactors at its own discretion," he said.

Despite a gap in the nuclear power policy between the NRA and the Abe administration, LDP legislators have refrained from openly criticizing Tanaka.

During a meeting of the party's Research Commission on Oil, Resources and Energy on Feb. 4, a junior legislator who previously worked as a bureaucrat at the Economy, Trade and Industry Ministry demanded that the NRA's commissioners be replaced. However, Taku Yamamoto, chairman of the commission, took no notice of the demand.

"No matter how we replace the commissioners, we would be criticized for being arbitrary. We must retain Mr. Tanaka so that the appointments can be approved by the Diet (because the House of Councillors is controlled by opposition parties)," a top government official said.

However, Tsuyoshi Takagi, who represents Fukui Prefecture that hosts nuclear plants, and some other LDP legislators did not attend a House of Representatives plenary session on Feb. 14 that voted to approve the appointments of the NRA commissioners, highlighting opposition smoldering within the party.

Still, the party had no choice but to tacitly approve such a move. "The party has no intention of taking any action against opponents," said LDP Secretary-General Shigeru Ishiba.

On the contrary, opposition parties praised Tanaka for his stance toward nuclear power. It was only the Japanese Communist Party, People's Life Party and the Social Democratic Party that voted against the appointments in the lower house plenary session.

NRA members finally have "official" status

February 15, 2013

Diet OKs nuclear regulatory officials 5 months after they took posts

<http://mainichi.jp/english/english/newsselect/news/20130215p2g00m0dm061000c.html>

TOKYO (Kyodo) -- Japan's parliament on Friday approved the appointment of five experts who have been working as the new nuclear regulatory body's commissioners since September last year, a move that will bring an end to criticism that they lacked official status.

The appointments of Nuclear Regulation Authority Chairman Shunichi Tanaka and four others were endorsed by the House of Representatives on Thursday and by the House of Councillors on Friday.

Diet approval of the appointments had been an issue left over from the previous Democratic Party of Japan-led government amid criticism that Tanaka's past career suggests he could be influenced by vested interests promoting nuclear energy.

Fearing that an internal feud could intensify inside the DPJ, then Prime Minister Yoshihiko Noda used his authority to appoint the five members in September as an extraordinary measure, rather than seeking a vote at the Diet.

The NRA was launched later in that month as part of the country's efforts to enhance nuclear regulations in the wake of the Fukushima Daiichi complex disaster, triggered by a huge earthquake and tsunami in March 2011.

Tanaka had said his uncertain status would not affect his work, but the NRA has faced criticism from some quarters for producing views that could affect the fate of Japan's nuclear power plants even though members lacked parliamentary authorization.

Tanaka is a former vice chairman of the Japan Atomic Energy Commission, a key panel involved in setting the country's pro-nuclear policy before the Fukushima nuclear crisis.

The other four NRA members are Kenzo Oshima, former ambassador to the United Nations, Kunihiko Shimazaki, former head of the Coordinating Committee for Earthquake Prediction, Kayoko Nakamura from the Japan Radioisotope Association, and Toyoshi Fuketa from the Japan Atomic Energy Agency.

PROMETHEUS TRAP (10): SDF crew fought fear in dumping water on Fukushima plant

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201302180005>

By HIDEFUMI NOGAMI/ Staff Writer

Editor's note: This is the tenth part of a series that has run in the past under the overall title of The Prometheus Trap. This series deals with the different responses between Japan and the United States in dealing with the Fukushima nuclear accident of 2011 following the Great East Japan Earthquake. The series will appear on Mondays, Wednesdays and Fridays.

Early on the morning of March 17, 2001, six days after the Great East Japan Earthquake, Self-Defense Force members at Camp Kasuminome in Sendai received a sudden order to deploy toward the Fukushima No. 1 nuclear power plant.

Before 9 a.m., three CH-47 transport helicopters of the 1st Helicopter Brigade took off. Crew members took unusual steps to prepare for that day's mission. They wore lead vests weighing 20 kilograms and protective face masks. Each crew member also ingested two iodine tablets.

Sgt. Maj. Tsutomu Kimura, 42, a maintenance crew member on the lead helicopter, was taken aback by the bright red wrapping used for the tablets. There were five members on the helicopter--the crew chief, Lt. Col. Kenji Kato, 41, the pilot, Maj. Teruki Ito, his co-pilot and two maintenance crew members.

Two of the helicopters would handle the dumping of water while the third provided rear support. Kimura's responsibility was to look down on the Fukushima plant from a hatch on the floor in the center of the aircraft and push the button that would release water from the bag that was hanging down from the helicopter.

On his hands and knees in front of the hatch, Kimura kept a dosimeter by his side.

The helicopter flew out over the ocean to the east soon after takeoff and scooped up about 7.5 tons of seawater. With the coast to its right, the helicopter flew due south.

Kimura informed crew members that there were no irregular readings at intervals of 15 minutes, shorter than usual procedure. He called out, "Maintenance panel, normal."

While the crew was used to flying over the Tohoku region during training exercises, what they saw below them that day was unlike anything they had ever seen before.

Kimura thought about the smile of his second daughter, Ruka. Her first birthday was just two weeks away.

He imagined what would happen if the nuclear plant exploded just as the helicopter flew right above it. He thought to himself, "Am I to die without seeing Ruka turn 1?"

The selection of crew members was left up to those who would actually do the work. The previous night, Kimura asked the 10 maintenance crew members what they wanted to do. Since no one spoke up, he decided to exclude single, young crew members.

Although two younger members insisted they be allowed to ride the helicopters, Kimura assigned them to rear-line support duties.

His thoughts while in the air were interrupted when the co-pilot said, "We have a reading of 100." The figure on the dosimeter, which had been at zero, slowly began climbing.

Kimura began perspiring profusely. He was also slightly hyperventilating, and began to drool and developed a runny nose. He turned to the side to avoid showing the younger crew member that he was becoming nervous. He inhaled for four seconds and exhaled for four seconds. Using this method he had been taught four or five times helped to calm him.

At 9:48 a.m., the helicopter approached the No. 3 reactor, where smoke was rising through the exposed framework of the structure.

"Prepare the water!" Ito shouted.

Kimura and the younger crew member placed their thumbs on the release button.

The tactical plan called for flying at a height of about 91 meters (about 300 feet), but the helicopter approached the reactor at a lower altitude.

Col. Masahiro Onishi, the unit commander who drew up the plan, watched the operation through a video monitor back at Camp Kasuminome.

"Don't fly any lower!" he shouted.

Did TEPCO lie?

February 18, 2013

Panel to look into TEPCO's alleged falsifications

http://www3.nhk.or.jp/daily/english/20130218_25.html

The operator of the stricken Fukushima Daiichi nuclear plant has launched a third-party committee to look into alleged false explanations by the company of conditions inside one of the reactors.

The move follows accusations by a former Diet panel member that the company's explanation was aimed at blocking an on-site probe at the plant.

Tokyo Electric Power Company, or TEPCO, set up the committee on Monday. It is led by a former judge, Yasuhisa Tanaka.

Earlier this month former panel member Mitsuhiro Tanaka accused TEPCO of having lied in February of last year about the state of the plant's number one reactor. The Diet panel was planning an on-site survey at the time.

Mitsuhiro Tanaka says the panel had to give up the survey because the TEPCO officials said it was too dangerous to work inside the reactor, which they described as pitch-dark. He is demanding that the Diet look into the matter.

TEPCO denies that the officials handling the matter lied, saying rather that their perception of the

situation was wrong.

The new panel will determine whether or not the officials lied and how TEPCO responded to the call for the survey.

TEPCO says the company will not become involved in the panel's investigation but will cooperate with it. The company says it will make public the findings of the investigation as soon as possible.

The Nuclear Regulation Authority says it wants to meet former panel member Tanaka's request for a survey of the reactor, but has as yet made no plan to do so due to high radiation levels.

Lawyers to check on TEPCO

February 19, 2013

TEPCO forms 3rd-party verification panel over false info to block on-site reactor probe

<http://mainichi.jp/english/english/newsselect/news/20130219p2a00m0na013000c.html>

Tokyo Electric Power Co. (TEPCO) set up a third-party verification panel on Feb. 18 to examine why and how the utility firm gave false information to block an attempt by a Diet-appointed investigative panel to enter the No. 1 reactor building at the crippled Fukushima No. 1 Nuclear Power Plant.

The third-party panel plans to hold its first meeting on Feb. 21. The panel is to investigate why and how TEPCO, the operator of the troubled Fukushima nuclear power station, gave false information last year to block the Diet-appointed panel from conducting on-site inspections of the reactor building as well as whether senior TEPCO officials were involved in the wrongdoing.

The verification panel, which is comprised of three lawyers, is headed by Yasuhisa Tanaka, former justice chief of the Sendai High Court. Two other lawyers on the panel are Zenzo Sasaki, former chief prosecutor at the Kyoto District Prosecutors Office, and Takashi Kondo, professor at Omiya Law School. On the selection of the three lawyers, Masayuki Ono, acting head of TEPCO's nuclear power and facilities section, told a news conference, "We selected legal experts who had not been involved in the management of our company."

In February 2012, the Diet-appointed panel tasked with investigating the Fukushima nuclear disaster asked TEPCO to allow its members to conduct an on-site inspection of the inside of the fourth floor of the

No. 1 reactor building to check the emergency isolation condenser -- a key component behind the outbreak of the accident at the No. 1 reactor. But TEPCO told the panel, "It is completely dark inside the reactor building." Therefore, the panel decided not to conduct the inspection. But in fact, sunlight penetrated the inside of the reactor building.

February 18, 2013

Panel to look into TEPCO's alleged falsifications

http://www3.nhk.or.jp/daily/english/20130218_25.html

The operator of the stricken Fukushima Daiichi nuclear plant has launched a third-party committee to look into alleged false explanations by the company of conditions inside one of the reactors.

The move follows accusations by a former Diet panel member that the company's explanation was aimed at blocking an on-site probe at the plant.

Tokyo Electric Power Company, or TEPCO, set up the committee on Monday. It is led by a former judge, Yasuhisa Tanaka.

Earlier this month former panel member Mitsuhiko Tanaka accused TEPCO of having lied in February of last year about the state of the plant's number one reactor. The Diet panel was planning an on-site survey at the time.

Mitsuhiko Tanaka says the panel had to give up the survey because the TEPCO officials said it was too dangerous to work inside the reactor, which they described as pitch-dark. He is demanding that the Diet look into the matter.

TEPCO denies that the officials handling the matter lied, saying rather that their perception of the situation was wrong.

The new panel will determine whether or not the officials lied and how TEPCO responded to the call for the survey.

TEPCO says the company will not become involved in the panel's investigation but will cooperate with it. The company says it will make public the findings of the investigation as soon as possible.

The Nuclear Regulation Authority says it wants to meet former panel member Tanaka's request for a survey of the reactor, but has as yet made no plan to do so due to high radiation levels.

Japan Atomic Power Co. to pay for road to Tsuruga plant

Power company agrees to fund road to idle Tsuruga nuke plant

February 19, 2013

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201302190070

THE ASAHI SHIMBUN

Japan Atomic Power Co. has agreed to donate about 700 million yen (\$7.5 million) in fiscal 2013 to the city of Tsuruga for the construction of a road between the city's center and the utility's idled Tsuruga nuclear power plant, according to a source close to the city government.

The agreement came after it became highly likely that the plant's No. 2 reactor will be decommissioned as the Nuclear Regulation Authority has determined that a seismic fault beneath the reactor building is probably active.

Japan Atomic Power owns the No. 1 and No. 2 reactors of the Tsuruga plant in Fukui Prefecture, and the reactor of the Tokai No. 2 plant in Ibaraki Prefecture. All three reactors have been offline mainly due to the March 2011 Great East Japan Earthquake.

Some prefectural assembly members said Japan Atomic Power promised to cover the entire cost of the 3.8-kilometer road around 2002, at a time the city agreed to the construction of No. 3 and No. 4 reactors at the Tsuruga plant.

Due to the March 11 quake, however, there are no expectations that the construction of the Tsuruga No. 3 and No. 4 reactors will ever break ground.

"As the plant operator, we will shoulder an appropriate amount of the road construction costs because it will be useful as a means of access to the plant in the event of a nuclear disaster as well as be convenient for local residents," a Japan Atomic Power representative said.

But there are no prospects of Japan Atomic Power's three reactors--including the two at the Tsuruga plant--being brought back online.

It has been 42 years since the Tsuruga No. 1 reactor was first operational, exceeding the 40-year threshold the NRA is considering for decommissioning.

As for the Tsuruga No. 2 reactor, the regulation authority in January compiled a draft report that recognizes high possibilities of a fault directly under the reactor building being an active one. The reactor will highly likely be decommissioned.

Japan Atomic Power is objecting to the draft report, saying, "The draft is unacceptable."

Despite its three nuclear reactors being shut down, Japan Atomic Power has been receiving "basic fees" from five utilities--including Kansai Electric Power Co.-- through electricity sales contracts.

Kansai Electric, which filed an application to raise power rates, has announced that it will exclude contributions to local governments hosting nuclear plants and other related bodies from "costs" to calculate power rates, starting in fiscal 2013.

Even so, the utility does include the fees it pays to Japan Atomic Power into the costs, raising concerns that power rates paid by individuals and businesses could be used for the donations.

Prefectural assembly members said the city of Tsuruga received 440 million yen between the fiscal 2009 construction start and fiscal 2011 from Japan Atomic Power, and is expected to collect 1.08 billion yen at the end of March as the fiscal 2012 donation.

Around 700 million yen in contributions for fiscal 2013 was agreed upon in February, sources said.

Donations for fiscal 2014 and 2015 are undecided. The road is planned to be completed in fiscal 2015.

Elsewhere, Japan Atomic Power's idle Tokai No. 2 plant has been facing increasing local opposition. (This article was written by Hideki Muroya and Satoshi Otani.)

Transparency and trust - Still a long way to go for the NRA!

February 19, 2013

NRA secretariat must halt collusion

<http://www.japantimes.co.jp/opinion/2013/02/19/editorials/nra-secretariat-must-halt-collusion/#.USNGNPL1tEs>

The Nuclear Regulation Authority's secretariat on Feb. 1 disciplined a high-ranking official for leaking information to a nuclear power plant operator. But the inadequate nature of the disciplinary measure indicates that the secretariat does not realize the grave nature of the incident.

In the past, collusive relations existed between Japan's nuclear regulation organizations and the power industry. For example, the then Nuclear Safety Commission in 1992 asked the power industry to think up reasons for not taking measures to cope with the loss of all power sources at a nuclear power plant and adopted a composition written by Tokyo Electric Power Co.

The latest incident shows that such collusive relations have not been eradicated. A full investigation should be launched.

The NRA secretariat reprimanded Mr. Tetsuo Nayuki, the No. 3 official of the secretariat, and seconded him to the secretariat of the education and science minister as part of his punishment for giving Mr. Taiki Ichimura, managing director of Japan Atomic Power Co., and other officials of the company a draft assessment report on geologic faults running beneath the power company's Tsuruga nuclear plant in Fukui Prefecture on Jan 22. Mr. Nayuki is originally from the education and science ministry.

Six days later, on Jan. 28, the members of a panel appointed by the NRA in principle agreed to adopt the draft, which says that there is a strong possibility that a fault running beneath the plant's No. 2 reactor is active.

It is known that Mr. Nayuki met officials of the company five times in and after December. Despite this, NRA head Mr. Shunichi Tanaka said that the relationship between Mr. Nayuki and the officials of Japan Atomic Power Co. cannot be characterized as collusion. In announcing the disciplinary measure against Mr. Nayuki, the NRA secretariat's No. 2 official Mr. Hideka Morimoto did not offer any apology for what he did.

At the very least, it is a grave lapse in judgement for the No. 3 official of the NRA secretariat to meet officials of a power company so often within four months of the NRA's Sept. 19 establishment.

The decision to second Mr. Nayuki to the secretariat of the education and science minister is also problematic. The NRA secretariat was established by integrating the now-defunct Nuclear and Industrial Regulation Agency of the trade and industry ministry, the NSC and the radiation monitoring section of the education and science ministry.

When the NRA secretariat started with some 450 workers and officials, a rule was introduced to not send them back to organizations that they had earlier belonged to help ensure the independence of the NRA

secretariat from these organizations. Seconding Mr. Nayuki to a ministry where he previously worked is a clear violation of this rule. After Mr. Nayuki was disciplined, it was learned that he held at least 30 meetings with executives of power companies, violating the NRA's internal rules. **To regain the public's trust, the NRA must take strict steps to prevent the recurrence of such incidents.**

Nukes: It's high times to do something about it

February 19, 2013

EDITORIAL: Why wait for the election? Abe should address nuclear power issues

<http://ajw.asahi.com/article/views/editorial/AJ201302190028>

About 70 percent of voters want to see an end to nuclear power generation in Japan, according to an Asahi Shimbun opinion poll conducted on Feb. 16 and 17.

Respondents were asked to pick their preferred scenario from among five choices on the future of nuclear energy in this country. Nuclear power generation should be: "stopped immediately," "stopped before 2030," "stopped in the 2030s," "stopped after the 2030s," and "continued without being stopped."

The poll results indicate about 60 percent of Japanese want the use of nuclear energy to terminate by the end of the 2030s. Only 18 percent supported the choice that nuclear power generation should continue.

The poll shows that Japanese sentiment toward nuclear power has remained mostly unchanged despite the transition of power from the government led by the Democratic Party of Japan to one headed by the Liberal Democratic Party.

However, politicians are currently showing little interest in holding in-depth discussions for building a society that is not dependent on nuclear energy.

Prime Minister Shinzo Abe has also advocated a reduction in Japan's dependence on nuclear power. However, his administration appears to be tilting toward changing the direction from reduction to promotion of nuclear power. For example, it has vowed to review the policy of the DPJ-led government toward phasing out nuclear power. But the Abe administration has yet to make clear what elements of the policy it will change and how it will implement such changes.

The administration is adopting a wait-and-see attitude as the Nuclear Regulation Authority is working on new safety standards and determining if active faults are running under nuclear reactors. The government has apparently decided to avoid making any risky political move until the Upper House election in summer.

The Diet has exhibited no great zeal, either, in holding serious debate over the future of nuclear power in Japan.

Any major change in the nuclear power policy would have a huge economic and social impact.

That's why any significant change in the policy requires careful preparations and enormous efforts to secure a broad public consensus. It is vital to minimize the negative effects of the policy shift and ensure it will lead to renewed economic growth and beneficial structural changes.

The NRA's more rigorous safety inspections and assessments are certain to increase the number of reactors that are likely to be decommissioned or left idled for prolonged periods.

This prospect raises some important questions. **What types of procedures are needed to decommission reactors? How should the government mitigate the effects on local economies and on the system for a stable supply of electricity? How should spent nuclear fuel and radioactive waste be stored?**

All these questions must be tackled immediately. The government should sort out all issues that need to be addressed, and the Diet should start discussing them immediately.

Late last month, based on a proposal by the Diet's Fukushima Nuclear Accident Independent Investigation Commission, the Diet set up a special committee to study issues related to nuclear power generation. The investigation panel called for close public monitoring of nuclear regulators through the special committee so that they will not serve the so-called nuclear village, a close-knit community of politicians, businesses, academics and bureaucrats with vested interests in nuclear power.

While respecting the purpose of creating the special committee, the Diet should consider using it as a forum for broad policy debate on reducing the nation's dependence on nuclear energy.

Another idea worth serious consideration would be starting a fresh initiative to promote discussions among citizens, such as last summer's "national debate" programs.

If political leaders avoid grappling with tough policy challenges and postpone necessary actions, they will only exacerbate future confusion.

Greenpeace wants nuke industry to stop evading responsibility

February 20, 2013

Greenpeace wants nuclear plant suppliers held accountable for Fukushima crisis

Kyodo

<http://www.japantimes.co.jp/news/2013/02/20/national/greenpeace-wants-nuclear-plant-suppliers-held-accountable-for-fukushima-crisis/#.USPaMvL1tEs>

The international environmental group Greenpeace launched an online campaign Tuesday saying nuclear power plant manufacturers should be held accountable for the crisis at the Fukushima No. 1 power plant.

Greenpeace wants Japan's law on compensation for nuclear damage to be revised so that the companies who designed and built the reactors pay as well.

Currently, compensation is being paid by Tokyo Electric Power Co., the operator of the Fukushima plant that has been crippled since the massive earthquake and tsunami on March 11, 2011.

Greenpeace said only India, Russia and South Korea have legislation under which nuclear plant suppliers are held liable in the event of a disaster.

The environmental group is calling for a system that does not allow the nuclear industry to evade responsibility for compensating the public for disasters.

“The Fukushima disaster exposes the shameful defects in a system that only requires nuclear operators to pay a fraction of the costs of a disaster and does not require suppliers of reactors to pay anything,” Aslihan Tumer, Greenpeace International nuclear campaigner, said in a press release dated Tuesday.

“It is not fair that the nuclear industry benefits while the public is left to pay the heavy price for its failures,” Tumer said.

<http://www.greenpeace.org/international/en/publications/Campaign-reports/Nuclear-reports/Fukushima-Fallout/?accept=5b933ccb585ee78e2032646122812f85>

Fukushima Fallout

Nuclear business makes people pay and suffer

Publication - February 15, 2013

From the beginning of the use of nuclear power to produce electricity 60 years ago, the nuclear industry has been protected from paying the full costs of its failures. Governments have created a system that protects the profits of companies while those who suffer from nuclear disasters end up paying the costs.

The disaster at the Fukushima Daiichi nuclear power plant in March 2011 proves again that industry profits and people pay. Almost two years after the release of massive amounts of radiation from the Fukushima nuclear disaster, hundreds of thousands of people are still exposed to the long-term radioactive contamination caused by the accident. The daily lives of victims are disrupted. They have lost their homes, their jobs, their businesses, their farms, their communities, and a way of life they enjoyed.

This new Greenpeace report demonstrates how **the nuclear sector evades responsibility for its failures**. The nuclear industry is unlike any other industry: it is not required to fully compensate its victims for the effects of its large, long-lasting, and trans-boundary disasters. In this report, the current

status of compensation for victims of the Fukushima disaster is analysed as an example of the serious problems due to lack of accountability for nuclear accidents. The report also looks into the role of nuclear suppliers in the failure of the Fukushima reactors.

We learned from Fukushima that **nuclear power can never be safe**. The nuclear industry, largely protected from the financial liability for the Fukushima accident, continues to do business, while the Fukushima victims still lack proper compensation and support. Would things be different if the next big nuclear disaster happened in your country? You would likely be facing the very same problems. **We have to phase out dangerous nuclear power entirely, and do so as soon as possible**. Yet, if there is another major nuclear accident, people could be given better protection if we hold the nuclear industry fully accountable and liable. We need to **learn the lessons from Fukushima**, and change the system in order to **make all companies in the nuclear industry responsible for the risks they create**.

30 billion yen a year

Panel eyes KEPCO upkeep fees

<http://www.yomiuri.co.jp/dy/national/T130219003564.htm>

The Yomiuri Shimbun

An expert panel of the Economy, Trade and Industry Ministry examining the rate hike planned by Kansai Electric Power Co. has begun coordinating views to allow KEPCO to include in initial costs its payments to maintain nuclear reactors at Japan Atomic Power Co.'s Tsuruga plant, according to informed sources.

The focus of discussion is the more than 30 billion yen a year in expenses that KEPCO pays to Japan Atomic Power for the maintenance of two nuclear reactors at the plant in Fukui Prefecture.

The panel, tasked with examining the electricity rate of power companies, is examining the average 11.88 percent rate hike for general-household users sought by KEPCO.

As the operation of the two nuclear reactors in question is suspended, KEPCO is not buying any electricity from the plant.

With regards to the No. 2 nuclear reactor at the plant, a Nuclear Regulation Authority expert panel has said there is a high likelihood that active faults run below the reactor.

Yet Japan Atomic Power denies the possibility of active faults running below the reactor, maintaining a stance that it will not decommission the reactor, but aims to restart it in the future.

The expert panel therefore finds the granting of approval to KEPCO to include maintenance expenses paid to Japan Atomic Power in its original costs to be unavoidable. The ministry is expected to confirm the panel's decision.

If approved, the sense of unease over the corporate management of Japan Atomic Power will be eased somewhat. But there is a possibility KEPCO customers will criticize the utility's payments for the maintenance of reactors that have such dim prospects of being restarted.

The government plans to scrutinize KEPCO's personnel costs and fuel procurement costs so as to hold the margin of its rate hike to a minimum.

Japan Atomic Power has signed contracts to sell power generated at its Tsuruga plant to KEPCO, Chubu Electric Power Co. and Hokuriku Electric Power Co.

PROMETHEUS TRAP (11): We are still alive!

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201302200001>

By HIDEFUMI NOGAMI/ Staff Writer

Editor's note: This is the 11th part of a series that has run in the past under the overall title of The Prometheus Trap. This series deals with the different responses between Japan and the United States in dealing with the Fukushima nuclear accident of 2011 following the Great East Japan Earthquake. The series will appear on Mondays, Wednesdays and Fridays.

* * *

At 9:48 a.m. on March 17, six days after the nuclear crisis broke out at the Fukushima No. 1 nuclear power plant, the lead aircraft for the water-dropping mission, a helicopter belonging to the Ground Self-Defense Force's 1st Helicopter Brigade, reached the sky above the plant's crippled No. 3 reactor.

The captain of the helicopter, Maj. Teruki Ito, a veteran pilot, pushed the collective lever, located on his left side, forward while pulling the cyclic stick he was holding with his right hand. He moved the helicopter at a slower speed and lower altitude than planned in advance.

Ito was looking at the building that housed the reactor through the narrow space between his legs. The moment the building disappeared out of sight, he growled a command. "Drop water!"

When Ito slowed the aircraft further, bringing it close to hovering speed, the flight engineer pushed a button. Seven and a half tons of seawater fell into the building, whose ceiling had been blown off.

Ito felt the helicopter become lighter as it released water.

The document describing the water-dropping mission showed one number in yellow to draw special attention: 250 millisieverts. It was followed by a comment: "clinical observations necessary."

That means an accumulated radiation dose of 250 millisieverts can cause significant adverse health effects.

The figure 250 had been etched into the minds of all the crew members involved.

Then, the co-pilot, looking at a dosimeter, cried out, "256! We are going to die!"

Ito yelled back, "We are still alive, aren't we?"

When the captain started working the flight controls hastily to get the helicopter away from the site, a radio call came in.

"Order from the brigade's commander to all the aircraft. Drop water again!"

The order was passed to the crews by the Air Self-Defense Force's flight control. When asked about the reading on the dosimeter, the co-pilot answered, "Two, five, six!"

“Man! We went the whole nine yards because we were told to do it just once,” Ito said in his mind while dipping the bucket his helicopter was carrying in the sea to fill it with seawater. Then, he steered his aircraft toward the No. 3 reactor again.

The two helicopters assigned to the mission released water on the reactor twice each for a total of four drops.

After the mission was carried out, the aircraft landed in the J-Village, a soccer-training complex in Fukushima Prefecture, located 20 kilometers south of the disaster-stricken plant. The complex was now serving as a staging area for efforts to contain the nuclear crisis.

After Ito stopped the engine, the co-pilot began to cry, saying, “I’ve been exposed to radiation.”

“Don’t cry,” Ito said harshly to the co-pilot, but felt sorry for the man, whom he had chosen for the mission without asking his opinions.

As he took off a lead vest and got out of the aircraft, the captain of a logistics support helicopter that had been on standby came running toward the crew. “Let me take a look,” the captain said and grabbed the dosimeter from the co-pilot.

“It’s in micro. Don’t worry,” he said, referring to the fact that the dosimeter’s readings are shown in microsieverts.

The co-pilot mistakenly thought that the reading was in millisieverts, 1,000 times larger than microsieverts.

Ito breathed a long sigh of relief.

Thirty minutes after the helicopters dumped water on the overheating reactor, Prime Minister Naoto Kan was speaking with U.S. President Barack Obama over the phone.

“We Japanese, including the SDF, are making all-out efforts to deal with the situation at the nuclear plant,” Kan told Obama.

Obama responded by saying he thought Japan was working hard.

* * *

A vital ongoing issue of safety

February 21, 2013

Disclosure of nuclear crisis data

http://www.japantimes.co.jp/opinion/2013/02/21/editorials/disclosure-of-nuclear-crisis-data/#.UST_xDf1tEs

It’s research time! Over the next two years, the Nuclear Regulation Authority is going to make public around 900,000 pages of documents concerning the Fukushima nuclear crisis. The plans to digitize the material, much of it previously unreleased, will mean that independent researchers, academics, the media and the general public will have access to important information about the truth of the 3/11 nuclear catastrophe.

The project will make accessible documents from all ministries and agencies connected with the crisis at the Fukushima No. 1 nuclear power plant, but it will not include material from the plant's operator, Tokyo Electric Power Co. (Tepco). Those documents should also be made accessible since they contain critical information about the disaster that cannot be found elsewhere. Considering that Tepco owes its continued existence as a private company to the fact that it was bailed out with taxpayer money, it should not try to hide facts about the disaster from the public. If it does not voluntarily release the information, the government should pursue all available means to force it to do so.

The documents in the NRA's computer system will be searchable by keywords online and available to anyone. This access is what a democratic society demands. The public has a right to know this information and how the ministries and agencies made decisions based on that information. They can decide then what failures and mistakes happened. Without knowing the facts, the public essentially remains in the dark about the most serious crisis in Japan in decades.

The release of information will be an important turning point in understanding what happened, but more importantly it will help to decide what should be done in the future. The problems associated with nuclear energy in Japan remain unresolved, and these documents will be crucial to shaping the best energy policy for the nation. The information can help to evaluate how well nuclear energy has, or has not, been regulated in the past and how well a crisis can, or cannot be, handled in the future.

The information will help to establish responsibility, upgrade safety standards, and determine whether nuclear energy really can be made safe or not.

These documents are not about historical trivia. **They are about a vital ongoing issue of safety in the lives of Japanese. Their release is an important step forward and an example of why freedom of information is one of the most important means to ensure the safety of citizens.** This is all the more reason why it is critical that Tepco release all documents in its possession that are related to the Fukushima nuclear crisis.

PROMETHEUS TRAP (12): Inject more water into the reactor

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201302220006>

By HIROYOSHI ITABASHI/ Staff Writer

Editor's note: This is the 12th part of a series that has run in the past under the overall title of The Prometheus Trap. This series deals with the different responses between Japan and the United States in dealing with the Fukushima nuclear accident of 2011 following the Great East Japan Earthquake. The series will appear on Mondays, Wednesdays and Fridays.

* * *

At 11:40 a.m. on March 17, shortly after the Ground Self-Defense Force's 1st Helicopter Brigade completed the mission to spray water on a crippled nuclear reactor that was dangerously overheating, Charles Casto of the U.S. Nuclear Regulatory Commission (NRC) met with Defense Minister Toshimi Kitazawa at the minister's office in Tokyo.

Casto was chief of the team of experts the NRC had sent to Japan immediately after the March 11 earthquake and tsunami to help deal with the nuclear crisis at the Fukushima No. 1 nuclear power plant. Before his meeting with Kitazawa, Casto had visited Tokyo Electric Power Co. (TEPCO), the operator of the disaster-stricken nuclear plant, the Nuclear and Industrial Safety Agency (NISA), the now-defunct body then responsible for regulating and supervising the nuclear power industry, and other organizations concerned, but had not got the detailed information he needed. It was not even clear which organization he should contact in the first place.

After several days of frustrating attempts to get what he wanted, Casto ended up visiting the defense chief.

The American nuclear energy expert immediately got down to business. The effects of the GSDF brigade's work to cool the reactor would be limited, Casto said. **The amount of water that had been poured into the reactor was insufficient, he added, urging additional injections of water.**

Casto didn't give much value to the dangerous mission that had just been accomplished by the GSDF in terms of its contribution to the efforts to contain the fast-moving nuclear crisis.

Kitazawa nodded as he listened to Casto's opinion. He and other top Japanese defense officials were fully aware that the volume of seawater that had been dropped on the reactor was insufficient.

Casto then demanded detailed information about the condition of the disabled reactors.

Defense Counselor Hideo Suzuki, who was present at the meeting, conveyed to the American official the information that had been provided by the NISA.

It was the kind of information Casto should have asked the agency to give him. But he opted to request the information from the Defense Ministry for a reason.

Three days earlier, on March 14, U.S. Ambassador to Japan John Roos asked the prime minister's office to allow NRC experts to be permanently stationed at the office to cooperate with the Japanese government in handling the crisis. But his request was politely declined.

That, along with the Japanese government's reluctance toward information disclosure, provoked the criticism within the U.S. government that Japan was hiding some vital information.

Concerned about the straining of Tokyo's ties with Washington at this crucial moment, Prime Minister Naoto Kan asked Kitazawa to do whatever he could do to keep the bilateral relationship from deteriorating further. Accordingly, the defense chief arranged his meeting with Casto.

The NRC official switched the subject to the No. 4 reactor, the main source of concern for the United States.

The Defense Ministry informed him that the GSDF's helicopter crew actually saw water in the spent fuel pool for the No. 4 reactor.

If so, Casto said, he wanted to know the temperature and the level of radiation being released from the reactor.

Kitazawa ordered an immediate survey to get these data.

The task was assigned again to the GSDF's 1st Helicopter Brigade. A few days later, a helicopter of the brigade flew above the nuclear power plant to do the survey.

It was then decided that the NRC and the Japanese ministries and agencies concerned would hold regular meetings, starting on March 18, to share information and discuss efforts to deal with the nuclear crisis.

On the Japanese side, officials from the NISA, TEPCO, the Foreign Ministry and the Defense Ministry would attend the meetings.

The United States wished to work with Japan to put the situation at the Fukushima plant under control.

But the Japanese ministries and agencies were in disarray, not ready to make concerted and well-coordinated responses to the crisis.

The United States was in for serious conflict with its close ally in tackling the formidable safety challenge facing Japan.

PROMETHEUS TRAP (13): U.S. officials frustrated with Japanese at crisis meetings

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201302250001>

February 25, 2013

By HIROYOSHI ITABASHI/ Staff Writer

Editor's note: This is the 13th part of a series that has run in the past under the overall title of The Prometheus Trap. This series deals with the different responses between Japan and the United States in dealing with the Fukushima nuclear accident of 2011 following the Great East Japan Earthquake. The series will appear on Mondays, Wednesdays and Fridays.

* * *

With the crisis raging at the Fukushima No. 1 nuclear power plant, the U.S. Nuclear Regulatory Commission (NRC) and the Japanese government agreed to hold regular meetings to share information and discuss responses.

At 10 a.m. on March 18, 2011, the conference between NRC representatives and Japanese officials began at the Defense Ministry, in accordance with the agreement reached the previous day.

Representatives of the U.S. forces stationed in Japan and the U.S. Embassy in Tokyo were also present.

The meeting was presided over by the Defense Ministry, which was acting under instructions from the prime minister's office.

Nobushige Takamizawa, head of the ministry's Defense Policy Bureau, opened the meeting by declaring the strict confidentiality of the conference. He told the attendees not to disclose any information about the conference, including its very existence, not even to their colleagues in their organizations.

This declaration of secrecy at the outset of the meeting cast doubts on the very purpose of the forum, which was supposed to be the sharing of information.

Takamizawa had a list at hand. **It showed the types of support the U.S. military had offered to provide. Among the dozens of items on the list were radiation management, decontamination and the supply of chemical technology.**

But Takamizawa only read out part of the list without distributing copies to the attendees, who were only allowed to make notes.

The Defense Ministry classified the list as confidential.

The meeting that started at 4:40 p.m. on the following day, March 19, was also attended by officials from the Nuclear and Industrial Safety Agency (NISA), including Hisanori Nei, deputy director-general for nuclear fuel cycle.

The NRC was prepared to offer complete cooperation to Japan's struggle with the nuclear crisis and asked for updates on the conditions of the reactors.

But the NISA showed little interest in sharing such information with the NRC. The agency's representatives at the meeting just kept saying they didn't know about the matter because they were not in charge of it. It was clear that they saw no point in having such discussions with the U.S. regulatory body. The NRC staff protested angrily. They said they wanted to cooperate with Japan but couldn't if they didn't have access to vital information.

Defense Counselor Hideo Suzuki urged the agency officials to be more cooperative, saying the Americans were trying to help Japan. But **the agency refused to change its attitude.**

Behind their recalcitrance was a directive from the Ministry of Economy, Trade and Industry, which told them not to speak on their own at a meeting whose purpose was unclear.

On the other hand, Economy, Trade and Industry Minister Banri Kaieda called Defense Minister Toshimi Kitazawa on his cellphone and asked for the list compiled by U.S. forces of all the types of support they could provide.

The representative of Tokyo Electric Power Co. (TEPCO), the operator of the Fukushima No. 1 nuclear plant, at the meeting was a senior executive in charge of general affairs, instead of an engineer. **The TEPCO official was unable to answer technical questions from the NRC** and kept saying he would convey the questions to the company's headquarters.

An assistant director at the Foreign Ministry said nothing throughout the meeting except for introducing himself.

Time was wasted as even the roles and responsibilities of the attendees at the meeting were not clear. The talks only increased discontent among the Americans about the way their efforts to help Japan were being foiled as well as their distrust of the Japanese government.

The tension and friction between the two countries over the battle to bring the crisis under control began to decrease only after Japanese and U.S. officials started consultation on March 22 in a new conference established under the prime minister's office. The conference was designed to unify the policies and operations of all Japanese ministries and agencies concerning the bilateral cooperation over the Fukushima disaster.

Eleven days had already passed since the crisis broke out.

 By HIDEFUMI NOGAMI/ Staff Writer

Editor's note: This is the 14th part of a series that has run in the past under the overall title of The Prometheus Trap. This series deals with the different responses between Japan and the United States in dealing with the Fukushima nuclear accident of 2011 following the Great East Japan Earthquake. The series will appear on Mondays, Wednesdays and Fridays.

A misunderstanding arose between the United States and Japan over disaster relief activities one day after the Great East Japan Earthquake struck.

During a telephone call on March 12, 2011, U.S. President Barack Obama told then Prime Minister Naoto Kan that the United States was prepared to provide every form of assistance possible.

Based on that discussion, the Defense Ministry set up coordination offices between Japan and the United States at the Self-Defense Force Sendai base, the U.S. Yokota Air Base in Tokyo and at the Defense Ministry. On March 15, Col. Jiro Hiroe, who was the group leader for defense exchange at the Ground Staff Office, was dispatched to Sendai to serve as the liaison officer there.

When he entered a building at the Sendai base, Hiroe found about 20 U.S. military personnel in camouflage gear. They were members of the 3rd Marine Expeditionary Force based in Okinawa. However, they did not know what to do because no requests were being made by Japan.

Sitting on stairways with no heating, the military personnel were gathering information over the Internet using notepad computers.

On March 16, the first joint meeting between Japanese and U.S. personnel was held.

Col. Christopher Coke said a number of times, "Tell me whatever you want."

According to Coke, the Marines arrived in Sendai on March 13. However, he said although the Marines wanted to help, they did not receive any requests or any information. Hiroe felt frustration and distrust toward Japan on the part of Coke.

On March 14, the SDF established a joint structure involving the Ground, Maritime and Air SDF in Sendai to provide support for local disaster victims. However, it would take **another week for a logistics system to be established in the area**. Because of the SDF's own delay in setting up a logistics network, its members had its hands full and were unable to liaise with the U.S. military.

All Hiroe could do was apologize and ask that the U.S. military personnel wait another two or three days. One example brought up by U.S. officers was the relief effort made in 2004 after an earthquake and tsunami struck off the coast of Sumatra in Indonesia. At that time, U.S. military helicopters dropped relief supplies from the air, which was greatly appreciated by local residents.

However, Hiroe said, "That would be counterproductive to the Japanese mentality. Assistance must be conducted in an orderly fashion. Please wait a while longer."

Hiroe spent a considerable amount of time dealing with his U.S. counterparts on such matters.

It took about 10 days after the disasters for there to be greater synchronization between the two sides.

Through Hiroe's coordination efforts, U.S. Marines were sent to the Oshima district of Kesenuma, Miyagi Prefecture, where the harbor was devastated. They took on the task of rebuilding that facility.

However, the Marines did not simply use bulldozers right away to clear away debris. They first searched for and collected by hand photo albums and wallets that had been scattered in the area.

During Operation Tomodachi, the name given to the U.S. forces relief effort in the Tohoku region, as many as 16,000 U.S. military personnel were sent to the disaster-stricken areas. They were involved in such tasks as restoring the Sendai Airport back to a state in which it could resume operations as well as cleaning schools in the area before the start of the new school year in April 2011.

TEPCO does not reports workers' radiation data - No laws on reporting data

February 28, 2013

TEPCO fails to report worker radiation levels

http://www3.nhk.or.jp/daily/english/20130228_24.htm

1

Tokyo Electric Power Company has failed to report to a national body the radiation exposure doses of 21,000 workers mobilized to contain the crisis at the Fukushima Daiichi plant.

Operators of nuclear plants in Japan are required to report such exposure every year to the Radiation Effects Association to keep each worker's dose below 50 millisieverts.

The missing data is for the year starting in March 2011, when the accident took place.

The firm says it has taken a long time to digitize data after the meltdown.

It apologized for the delay and said it will submit the data to the national database center in March.

Nuclear workers in Japan carry personal databooks to record their exposure. The system was introduced to manage such data in an integrated manner as the number of nuclear plants rose and an increasing number of staff worked at more than 2 plants.

Feb. 28, 2013 - Updated 08:14 UTC (17:14 JST)

TEPCO fails to submit dose data on 21,000 Fukushima plant workers

```

Tokyo Electric Power Co. failed to submit radiation dose data to an industry database, compromising the health of 21,000 people who worked at the Fukushima No. 1 nuclear plant after the March 2011 disaster.

The development shows that Tokyo Electric Power Co. remains lax about protecting the safety of workers, many of whom are employed by subcontractors. It also underscores flaws in the private records system to prevent nuclear plant workers from being exposed to dangerous accumulated doses.

A big problem is that many nuclear plant workers often switch companies—including unscrupulous ones—and they can be exposed to more radiation than legally allowed unless the dose data are kept at a centralized database.

The Ministry of Health, Labor and Welfare has repeatedly told TEPCO to submit the dose data of the 21,000 people to the Central Registration Center of Radiation Workers, operated by the Radiation Effects Association, a public-interest corporation that manages dose data of nuclear plant workers in an integrated manner.

The workers were at the Fukushima plant between March 11, 2011, the day the plant was destroyed by the Great East Japan Earthquake and subsequent tsunami, and March 31, 2012, or the end of fiscal 2011. More than 80 percent of those workers, or 17,600, were from other companies, including subcontractors. TEPCO on Feb. 18 agreed with the Radiation Effects Association to submit workers' accumulated data for fiscal 2010 and 2011 by the end of March. The provisional data will be replaced when full-fledged records, including the names of employers and other details, are ready.

"We are extremely sorry for the delay," a TEPCO spokesman said.

The company has said it took several months before data were retrieved from a computer system damaged by the tsunami. After the disaster, records were initially kept on paper, and it took time to convert them into electronic form.

In May or June each year, electric power companies submit dose data for the previous fiscal year to the center.

Around June 2011, TEPCO said the submission of data for fiscal 2010 would be delayed, and it also did not provide data for fiscal 2011. Records for fiscal 2010, excluding the post-disaster period, were submitted around July 2012.

Electric power companies, primary contractors and subcontractors are legally required to measure doses of nuclear plant workers and keep them under 50 millisieverts a year and 100 millisieverts over five years.

Many primary contractors set 20 millisieverts as the annual ceiling.

Of the 25,000 people who worked at the Fukushima No. 1 plant between March 11, 2011, and Dec. 31, 2012, more than 4,800 were exposed to an excess of 20 millisieverts a year, compared with seven for all of Japan in fiscal 2009.

The average among 76,000 nuclear plant workers across the country that year was 1.1 millisieverts.

Electric power companies have said data management in an integrated manner is not essential. They argue that they can check information in radiation management records--a dose record book kept by individual workers--when new workers arrive at their nuclear plants.

The companies say they make inquiries to the central registration center only when they need to confirm entries in the record books. The center receives 60,000 to 90,000 inquiries a year.

However, workers themselves say dose data cannot be strictly managed by radiation management records alone.

Primary contractors or subcontractors enter data into the record books. But some do not comply with laws and regulations.

One subcontractor had workers cover dosimeters with lead plates at the Fukushima No. 1 plant to keep readings low so that they could continue working at nuclear facilities. Other lax practices about dose management have been uncovered.

A man in his 40s who left the Fukushima No. 1 plant more than a year ago said accurate dose data have not been written into his radiation management record.

The worker was illegally sent there as an employee of a company he does not know well. Moreover, a different company's name is listed in his record book.

The worker could be exposed to more radiation than legally allowed if he continues to work at nuclear plants with his dose data being left uncorrected.

The Radiation Effects Association says both the system based on the central registration center and radiation management records are essential to manage dose data accurately.

The record book usually includes the latest data available for the worker, but the figures may be revised later. Some workers even lose the record book.

The central registration center, on the other hand, keeps closely examined data, but they are updated only once a year.

The dose data management system including the central registration center was established in 1977 with financial support from the government.

But it is a private-sector framework based on contracts between electric power companies and the Radiation Effects Association. The utilities and other parties are paying 275 million yen (\$3 million) to administer the system in fiscal 2012.

It remains unclear whether the utilities, or layers of contractors involved in the nuclear power industry, are responsible for managing workers' dose data and protecting their safety.

The government is not directly responsible, although the science ministry, the health ministry, the Nuclear Regulation Authority's secretariat and other branches are involved.

"No ministry or agency is expected to take the lead because the health of individuals is at stake and the responsibility is heavy," a government official said.

The momentum for change could come from politicians.

Some lawmakers, led by those in the Liberal Democratic Party and New Komeito, submitted a bill to establish a state management system in August, when the two parties were in the opposition camp.

Under the bill, utilities would be required to enter dose data into a government-issued record book and the government would collect and manage the data in an integrated manner.

The bill was scrapped when the Lower House was dissolved in November for a snap election. But some politicians plan to submit the bill to the Diet again.

(This article was written by Jun Sato and Toshio Tada.)

Radiation exposure data for over 20,000 nuclear cleanup workers still not submitted

<http://mainichi.jp/english/english/newsselect/news/20130228p2a00m0na013000c.html>

Tokyo Electric Power Co. has not yet submitted radiation exposure records for over 20,000 workers who helped in the cleanup at its disaster-hit Fukushima No. 1 Nuclear Power Plant to the association charged with managing the data, it has emerged.

Nuclear power plant contractors and subcontractors record exposure data in workers' radiation handbooks, and power companies digitalize it and send it to the Radiation Effects Association's central registration center for workers exposed to radiation, which manages the information. However, **officials say there are no laws on reporting data**; rather, companies in the industry send it under a self-imposed rule.

Power companies and employers must measure workers' radiation exposure and make sure it doesn't exceed 50 millisieverts in a single year or 100 millisieverts over five years. When workers take on new employment at a nuclear power plant, officials check their handbooks for radiation exposure data, comparing it with data held by the Radiation Effects Association's central registration center. The center's

information is also used when reissuing lost handbooks. The association says it receives between about 70,000 and 100,000 data requests from power companies each year.

Around May or June each year, utilities hand the association radiation exposure records for the preceding fiscal year. Around June 2011, TEPCO told the association that it would be late in submitting records for fiscal 2010, which overlapped with the onset of the nuclear disaster.

In July 2012, TEPCO submitted data recorded before the start of the nuclear disaster, but it has still not handed over data for over 20,000 workers since then.

"We managed the records on paper, and it has taken a long time to convert them to digital data," a TEPCO representative said when questioned over the delay.

1 trillion yen to meet new safety standards

Nuke plant operators put tab on new safety standards at 1 trillion yen

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201302270063>

February 27, 2013

THE ASAHI SHIMBUN

Japan's 10 nuclear power plant operators said it will cost close to 1 trillion yen (\$10.87 billion) to bring them in compliance with government-mandated safety standards on disaster preparedness, according to an Asahi Shimbun survey.

The final tab could increase further because the companies currently cannot accurately estimate the expenses that will be required to take measures against disasters.

The utilities cannot restart any idle reactors unless they meet the safety standards. Currently 48 of the nation's 50 nuclear reactors are offline.

The draft outline of the new standards, presented in late January by the Nuclear Regulation Authority, calls on operators to take broad measures against natural disasters and accidents. But some details of the new standards have yet to be determined, so plant operators have not finalized specifications of some safety measures.

The 10 companies estimated the costs at 998.7 billion yen for their 15 plants, excluding the crippled Fukushima No. 1 plant and the nearby No. 2 plant, both operated by Tokyo Electric Power Co.

The costs mainly consist of expenses for emergency safety measures, such as the construction of levees to guard against tsunami. The measures also include the provision of emergency power supply vehicles, which were required by the Nuclear and Industrial Safety Agency, the predecessor of the NRA, immediately after the March 2011 Fukushima nuclear disaster.

Kansai Electric Power Co. projects it will have to spend 38 billion yen by the end of March and a total of 285.5 billion yen by the end of March 2018, the largest amount among the 10 operators.

Kansai Electric hosts 11 reactors at its three nuclear plants of Mihama, Oi and Takahama. Its degree of dependence on nuclear power generation was about 50 percent in fiscal 2010.

Because of this high dependency, early restarts of idle reactors are necessary for the company to improve its financial performance.

Chubu Electric Power Co. estimated the costs needed to take measures against tsunami at its Hamaoka plant at 150 billion yen. The Hamaoka plant is located in an area of a possible Tokai earthquake, which seismology experts expect to occur in the near future.

Chubu Electric is currently constructing a 1.6-kilometer-long levee at the Hamaoka plant. The utility originally planned to erect an 18-meter-tall levee, but the government's predicted highest tsunami exceeded that height, making it necessary for Chubu Electric to spend an additional 10 billion yen to raise the levee by 4 meters.

Kyushu Electric Power Co. estimated it will need 200 billion yen to meet the new regulations.

The new safety standards are expected to go into effect in July.

The NRA plans to strictly uphold the regulations so that plant operators will take the necessary measures to guard against severe accidents, earthquakes and tsunami.

New nuclear safety measures to cost power companies 1 trillion yen: Mainichi survey

<http://mainichi.jp/english/english/newsselect/news/20130228p2a00m0na011000c.html>

Japan's 10 nuclear power plant operators estimate they will spend nearly 1 trillion yen on new safety measures stemming from the Fukushima nuclear disaster and new safety regulations, a Mainichi survey has found.

The Mainichi poll, conducted in February, asked the 10 companies to estimate their total spending on measures taken based on the Fukushima meltdowns as well as expected spending on measures mandated under new Nuclear Regulation Authority (NRA) rules set to go into effect in July this year. The latter mandates a number of new requirements, including the construction of facilities to deal with a major disaster, forcing up costs.

The survey found the firms' estimated new safety spending at a total of 998.7 billion yen, or about 22.7 billion yen per reactor. This number, however, did not include as yet unreleased estimates on the cost of protecting nuclear materials, and the actual total likely tops 1 trillion yen.

The largest safety expenses were for anti-tsunami sea wall construction, emergency generators, and pumper trucks that could supply coolant water to reactors in an emergency. The three companies set to spend the most were Kansai Electric Power Co. at 285.5 billion yen, Kyushu Electric Power Co. at a flat 200 billion yen, and Chubu Electric Power Co. at 150 billion yen.

The power companies have complained, however, that it is "difficult to estimate costs at this time" as the NRA has yet to reveal many details of the new regulations. However, a number of provisions the NRA has released -- including mandatory filters on reactor vents to prevent radioactive contamination of the atmosphere in an accident -- will certainly increase the companies' operations costs.

"The new anti-disaster measures alone will cost some tens of billions of yen more," Chubu Electric stated. Meanwhile Chugoku Electric Power Co., which has estimated its new safety costs at 50 billion yen, wrote that "considerations regarding the vent installation will necessitate a reappraisal of total costs."

Breaking silence

March 1, 2013

CROOKED CLEANUP: Workers break silence to allege boss ordered corner-cutting

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201303010084>

THE ASAHI SHIMBUN

Three laborers involved in radioactive cleanup around the Fukushima No. 1 nuclear plant have alleged that a supervisor told them to dump debris in a river without regard for correct decontamination procedures, becoming the first workers to confirm publicly that corner-cutting took place.

At a news conference in the Diet building on Feb. 28, the men said a foreman ordered them to discard fallen branches and leaves into a river in an upland forest in Tamura, Fukushima Prefecture, in November 2012. The material was potentially contaminated with radioactive fallout and should have been collected for safe disposal.

"I dropped branches and leaves into the river, wondering whether it was all right," said one of the men, who is in his 40s. "I was afraid that I might be fired if I refused. But the supervisor was doing the same thing right in front of me."

The men identified the supervisor as one working for a subcontractor.

Slipshod cleanup work in Fukushima Prefecture has already been widely reported, but this is the first time that decontamination workers have publicly come forward.

Another of the men, in his 50s, said the supervisor told the workers they needed to dump the material because a deadline was approaching.

"We looked at each other when we received the instruction," he said. "We thought we were not supposed to do that."

The third man, in his 40s, said he related what had happened to officials at the Environment Ministry. He spoke to them for more than an hour, he said, but they appeared not to believe him.

The government has said it has no evidence of substandard work in that locality.

PROMETHEUS TRAP (15): U.S. maintained sense of urgency over nuclear accident

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201303010012>

By HIROYOSHI ITABASHI/ Staff Writer

Editor's note: This is the final part of a series that has run in the past under the overall title of The Prometheus Trap. This series deals with the different responses between Japan and the United States in dealing with the Fukushima nuclear accident of 2011 following the Great East Japan Earthquake.

* * *

Adm. Mike Mullen, chairman of the U.S. Joint Chiefs of Staff, summoned Ichiro Fujisaki, the Japanese ambassador, to the Pentagon at 4:30 p.m. on March 29, 2011. It was 5:30 a.m. the next day in Tokyo. On March 14, 2011, three days after the Great East Japan Earthquake, Mullen pressed Fujisaki to have the Self-Defense Forces dump water on the crippled Fukushima No. 1 nuclear power plant.

Even though more than two weeks had since passed, Mullen still had concerns about whether the reactors at the Fukushima plant were being properly cooled.

By that time, piping was being used to pump in water to the fuel storage pools in the reactors to cool them. In the immediate aftermath of the nuclear accident, fire trucks had been spraying water into those pools.

Although cooling had been switched to the use of piping, Mullen still asked Fujisaki for further steps to strengthen the cooling process.

He told Fujisaki that the nuclear plant was not yet stabilized and there was no telling when another accident could occur.

On March 28, at Tokyo Electric Power Co. headquarters, a U.S. brigadier general asked Sakae Muto, an executive vice president, to allow participation at meetings of the joint task force to deal with the nuclear accident set up by the Japanese government and TEPCO.

The brigadier general stressed the **importance of having real-time information.**

The U.S. military is dispatched to handle critical disasters in order to secure the safety of U.S. citizens. That policy remains the same whether the disaster occurs in the United States or abroad.

The brigadier general said there was a need for complete understanding of the situation in order to protect Americans living in Japan. TEPCO officials agreed to allow the brigadier general to attend the task force meetings.

Rust Deming, who was director of Japan affairs at the State Department at the time of the nuclear accident, was asked about the differences in the response between Japan and the United States. Deming sat in on the meeting between Fujisaki and Kurt Campbell, the assistant secretary of state for East Asian and Pacific affairs, that was held on March 16, 2011, at the State Department.

Deming said the United States was most concerned about whether the Japanese government actually had a response in mind to deal with the Fukushima crisis. He added that **because information was not provided quickly or accurately, there was a sense of distrust toward Japan.**

Under the Japanese special measures law to deal with nuclear disasters, primary responsibility for dealing with nuclear accidents rests with the utilities that operates the plant.

As a result, water was dumped from helicopters six days after the nuclear accident occurred, and it was 11 days after the accident before a joint body was created with the United States to deal with the situation.

In 1979, a meltdown occurred at the Three Mile Island nuclear plant in the United States.

Deming explained that because the initial response was left up to the plant operator, confusion continued for about a week. He added that U.S. officials used the lessons from that accident to review their crisis management setup. He expressed expectations that Japan would implement similar revisions.

He was asked what the United States would have done if Japan failed to bring the nuclear accident under control.

Deming said he would not respond to hypothetical questions and ended the interview.

Misleading info on workers real radiation doses

63 workers exposed to higher radiation than logged in their records

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201303020048>

THE ASAHI SHIMBUN

Dozens of workers at the crippled Fukushima No. 1 nuclear power plant were exposed to radiation levels higher than those registered in their personal records, according to a health ministry investigation.

Misleading information was kept in at least 63 cases.

The Ministry of Health, Labor and Welfare has instructed the plant operator, Tokyo Electric Power Co., and its contractors to correct their records, based on the finding.

Data for 49 workers was put right as of Feb. 25, but records for 14 have yet to be updated because their whereabouts are unknown, the ministry said.

The ministry instructed TEPCO and its 37 contractors report to it for the investigation, which looked into radiation exposure levels of those who worked at the plant between November 2011 and October 2012.

These companies introduced a system in November 2011 that used two types of dosimeters: one monitors the radiation dose a worker was exposed to daily and the other tallies cumulative radiation exposure.

The investigation found that 63 workers had the lower of the two readings registered in their individual records despite at least a 20-percent discrepancy between the two devices.

The ministry said the higher reading should be logged for the safety of the workers.

In the largest discrepancy, one worker's monthly exposure was revised from 4.4 millisieverts to 6.35 millisieverts.

Those whose records are not updated could end up working at a nuclear facility beyond the legal annual limits for radiation exposure.

The number of workers with inaccurate personal radiation exposure records is expected to increase because the ministry has yet to start an investigation into the eight-month period immediately following the disaster that unfolded in March 2011.

In those months, radiation levels were much higher than the period investigated and TEPCO and its contractors did not rigorously monitor radiation levels to which the workers were exposed.

Electric utilities and their contractors are obliged to issue personal records for workers at nuclear facilities and in cleanup work and monitor their radiation exposure to keep it within legal limits: up to 50 millisieverts annually and 100 millisieverts over five years.

The records also include the results of their health checks.

Workers receive their records when their contracts end, and new employers are supposed to use them to ascertain the accumulated radiation dose of each individual.

In addition to tracking the radiation exposure of their workers themselves, utilities are also supposed to submit the data in electronic form to the Radiation Effects Association, a public entity, for centralized management.

Earlier, TEPCO was found to have failed to send the association data for a total of 21,000 workers employed over a period from the nuclear accident through fiscal 2011.

The ministry's recent investigation followed reports by The Asahi Shimbun last summer that subcontractors manipulated readings of dosimeters for their workers by covering them with lead shields.

The ministry announced in October that it confirmed 19 instances of irregularities, including non-use of dosimeters.

(This article was written by Toshio Tada and Jun Sato.)

Same old story about workers' exposure

March 4, 2013

Fukushima decontamination workers' exposure doses go unchecked

<http://mainichi.jp/english/english/newsselect/news/20130304p2a00m0na015000c.html>

Radiation dose management for workers engaged in decontamination work near the Fukushima No. 1 Nuclear Power Plant has gone unchecked, it has been revealed, raising questions about the government's control of businesses supplying workers for the hazardous work.

The Radiation Effects Association (REA), a public interest corporation keeping track of individual radiation workers' exposure data, has not received any data on workers carrying out government-led decontamination work near the Fukushima plant, despite an agreement last year between the REA and the Ministry of the Environment that the workers' employers send the data to the association. The failure apparently came because the ministry's instructions to those employers were insufficient.

Under the Industrial Safety and Health Law, the employers of decontamination workers are obliged to keep track of the workers' exposure doses. However, there is no framework for such data to be collected and managed in an integrated manner. If a worker was engaged in decontamination work under multiple employers, that worker's exposure doses cannot be aggregated, allowing the possibility of the total dose topping the legal limit of 50 millisieverts a year or 100 millisieverts over five years.

In the case of nuclear plant workers, radiation doses of individual workers are managed under the industry's voluntary rules, called the "exposure doses registry management system." Under the system, the REA's center for registering workers' radiation doses produces and manages a database on those doses in a uniform manner. Employers of nuclear plant workers are supposed to record individual workers' exposure doses in radiation control handbooks, and the data is then sent to the REA's registration center by power companies.

In May last year, the Environment Ministry produced common contract forms to be used with general contractors and other companies that receive decontamination work orders. The forms clearly state that, as much as possible, contractors must have their workers obtain radiation control handbooks. The REA requested the ministry have contractors send their workers' exposure data to the REA's center on occasions such as when the workers leave their jobs, which the ministry agreed to. However, no such data has been received by the center to date.

An official with the ministry's decontamination work team defended its position, saying that the data transmission is left up to contractors and the REA, and that the ministry hasn't given detailed instructions to contractors. The REA, on the other hand, insisted that for uniform dose management, radiation control handbooks and dose data transmission are inseparable, adding that it has requested the ministry give detailed instructions to contractors.

Out of a total of 25 government-led decontamination projects in 10 municipalities in Fukushima Prefecture initiated in December 2011, 18 have thus far been completed. In three-month model decontamination projects in the prefectural town of Okuma in 2011 and 2012, at least one worker was exposed to 11.6 millisieverts of radiation -- nearly one-fourth of the annual legal limit.

"The government needs to accurately grasp radiation doses workers are exposed to during decontamination work. Otherwise, workers will suffer disadvantages when they apply for workers' accident compensation. If the current framework isn't working, the government should establish a new system," said Kazumitsu Nawata, professor at the University of Tokyo graduate school, who is specialized in the situation of radiation workers.

Asahi "new" series : Shadow Units (1)

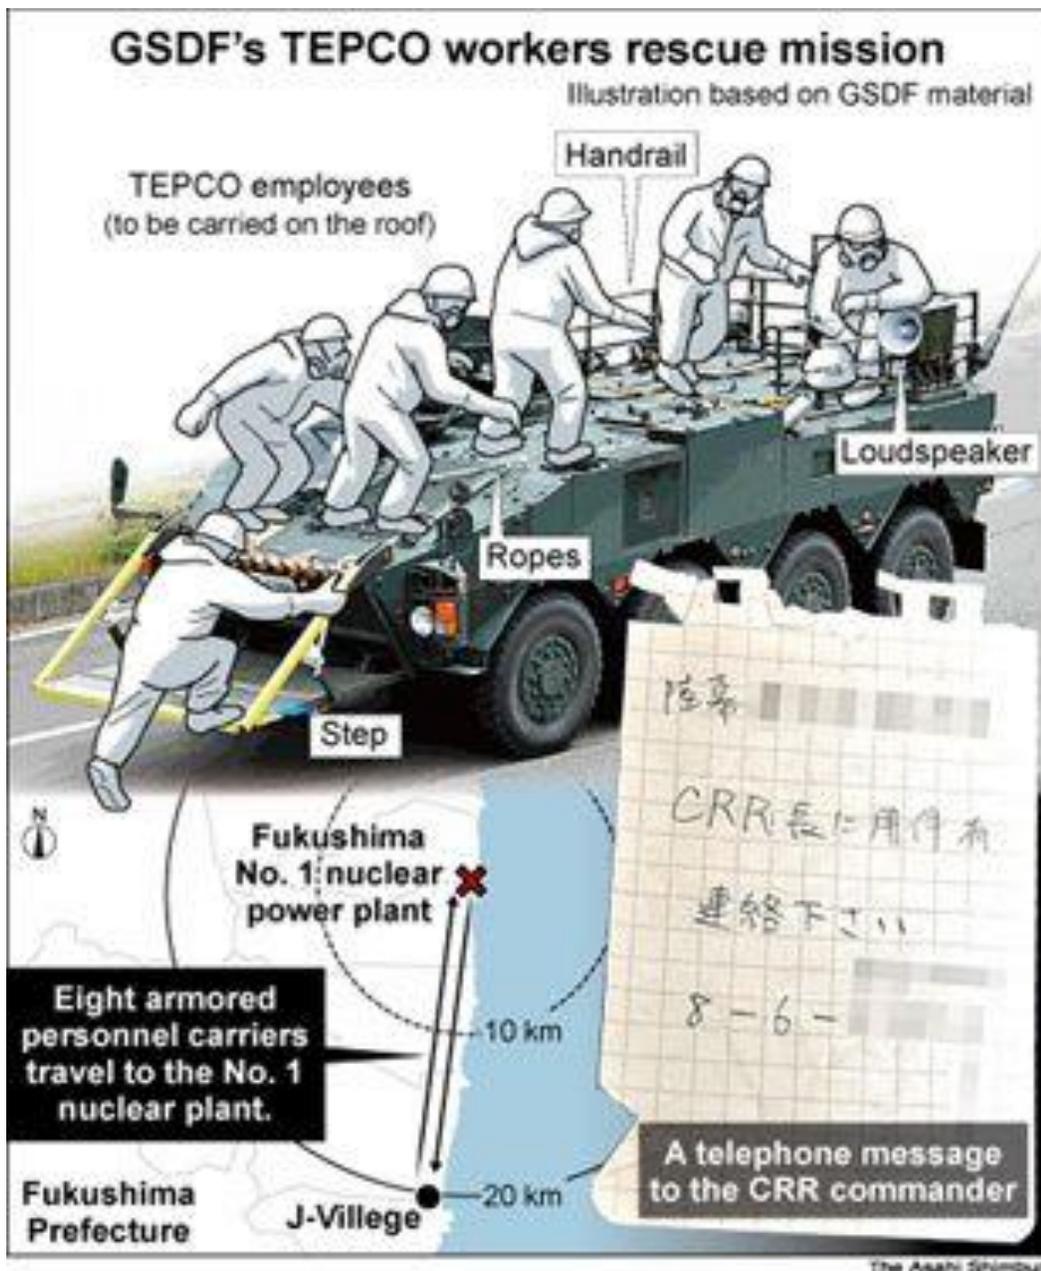

PROMETHEUS TRAP/ 'Shadow units' (1): Secret rescue mission at the Fukushima plant

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201303040001>

THE ASAHI SHIMBUN

Editor's note: This is the first part of a new series that has run in the past under the title of The Prometheus Trap. This series deals with the secret missions assigned to the "shadow units" of the Ground Self-Defense Force when the Fukushima nuclear disaster was unfolding following the Great East Japan Earthquake of 2011. The series will appear on Mondays, Wednesdays and Fridays.

* * *

After the nuclear crisis broke out at the Fukushima No. 1 nuclear power plant on March 11, 2011, a special "shadow unit" of the Self-Defense Forces got the call to mobilize for a secret mission.

The Ground Self-Defense Force's Central Readiness Regiment (CRR) is one of the SDF's special units whose operations are shrouded in secrecy and "invisible" to the public.

When the SDF participates in United Nations' peacekeeping operations, the CRR is the first to be dispatched to the operation site. The unit makes preparations for billeting and guarding ahead of the start of peacekeeping operations. Members of the unit regularly receive vigorous physical training to be ready for contingencies.

On March 19, 2011, Col. Kazunori Yamaguchi, the 48-year-old commander of the CRR, was at the GSDF's Camp Koriyama in Fukushima Prefecture. At 9 p.m., when he returned to his desk, Yamaguchi found a telephone message from an officer at the Defense Ministry's Ground Staff Office.

"We have something to discuss," it said. "Call me."

On that day, the Tokyo Fire Department's Hyper Rescue team had been continuously spraying water on the overheating No. 3 reactor at the disaster-stricken nuclear power plant. Yamaguchi thought it must be something related to the ongoing nuclear crisis. Since water had started being poured into the crippled reactors, he assumed that his unit would be assigned to an even tougher mission.

As he called the Ground Staff Office, Yamaguchi found that he had guessed correctly.

"We are considering a plan to deal with the worst possible situation at the nuclear plant," said the officer. "That would involve rescuing the Tokyo Electric Power Co. employees who would have been left behind (within the compound)."

The proposed mission to rescue TEPCO employees would probably force Yamaguchi's team to head into the accident site amid high levels of radiation. "Would it be safe?" Yamaguchi asked despite himself. The answer was not quite reassuring. "I ... would guess so."

When the phone conversation was over, the Defense Ministry officer told Yamaguchi to keep the mission secret.

The reason for the secrecy was fear that disclosure of the mission would provoke anxiety and speculation among the public. Even now, information about the mission is still being kept from the public.

Details of the mission dribbled out bit by bit from senior officials at the Defense Ministry through interviews. Through them, contours of the plan gradually emerged.

The 700-man-strong CRR was created in 2008 and is headquartered in the GSDF's Camp Utsunomiya in Tochigi Prefecture. It comprises four companies, including infantry companies equipped with armored fighting vehicles and mortars.

Yamaguchi's unit was dispatched to Camp Koriyama on March 17, two days before the phone call for him came in.

The unit helped evacuate residents living between 20 and 30 kilometers from the disaster-stricken nuclear power plant. But Yamaguchi was convinced that there were tougher tasks in store for his squad.

In the dead of night on March 19, shortly after the telephone conversation, eight-wheeled armored personnel carriers mobilized from SDF bases all over the country began to arrive at Camp Koriyama.

These armored vehicles are equipped with eight special reinforced tires that can keep the vehicle running even when they have blown out. They are used for land transport of personnel at a maximum speed of 100 kilometers per hour.

The rescue plan called for the unit's entry into the nuclear plant compound no matter what was happening there to save dozens of workers. That required converting the vehicle for the mission.

The rescued workers would be carried on the roof to spare the time needed for them to get into the vehicle and finish the mission as quickly as possible. To ensure that the rescued workers could climb up onto the vehicle's roof quickly, a step was attached to the front while a handrail was fixed on the roof. Two ropes with knots at intervals of 50 centimeters were hung from the roof.

A loudspeaker was also installed to make the vehicle's arrival known to the workers. The driver's station was covered with a protective sheet to shield the crew from radiation.

Early March 20, a formal order was issued. Yamaguchi's unit was ordered to carry out four tasks: preparing meals; communications support; search for missing victims; and "various support" in response to the needs of organizations concerned.

The "various support" cited last referred to the rescue mission.

Yamaguchi found it hard to eat as he wondered how he should explain the mission to his men.

At 8 a.m., Yamaguchi briefed 220 members of the unit about the mission at an exercise area where they were quartered.

“We will carry out tasks assigned to us, with the principal focus on rescuing TEPCO employees in an unforeseen emergency,” he said. “Don’t fear or underestimate the crisis.”

The unit members were standing in silence on the grounds, which was slushy with melting snow.

Yamaguchi told them to say nothing about the mission to anyone and called it a night.

“This is going to be a long operation. Take a bath and rest for what starts tomorrow.”

PROMETHEUS TRAP/ 'Shadow units' (2): SDF rescuers don heavy protective gear plus diapers

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201303060001>

Editor's note: This is the second part of a new series that has run in the past under the title of The Prometheus Trap. This series deals with the secret missions assigned to the “shadow units” of the Ground Self-Defense Force when the Fukushima nuclear disaster was unfolding following the Great East Japan Earthquake of 2011. The series will appear on Mondays, Wednesdays and Fridays.

On the night of March 20, 2011, the Ground Self-Defense Force’s Central Readiness Regiment (CRR) started preparing for a secret mission to rescue Tokyo Electric Power Co. employees working at the Fukushima No. 1 nuclear power plant.

The CRR left Camp Koriyama in Fukushima Prefecture and moved to Iwaki Seaside Nature Center, a seaside recreation complex, located 70 kilometers southeast of the camp.

The complex, which features accommodations, a gymnasium and various facilities for camping and other outdoor activities, is often used by elementary and junior high schools for their summer school camps.

Located in an inconspicuous place on a hill at 60 meters above sea level, the facilities are ideal for launching such a secret mission.

At 9:30 p.m., Kazunori Yamaguchi, the regiment commander, held a meeting to discuss the game plan.

Some 30 GSDF officers, including company commanders and section chiefs, gathered in a meeting room.

Yamaguchi briefed the attendees on an outline of the operation, drawing charts on a whiteboard.

According to the plan, the regiment was to move from the recreation center to J-Village, a soccer training complex located 10 kilometers north, and use the facilities as the operation base for the mission.

From J-Village, members of the unit were to make a round trip to the nuclear plant, 20 kilometers north, in a convoy of eight-wheeled armored personnel carriers.

The TEPCO workers rescued and carried back from the plant as well as the vehicles would be decontaminated at J-Village.

Yamaguchi told the attendants to make the necessary preparations to conduct the tasks they were in charge of by March 25.

Details of the rescue plan were gradually worked out.

The vehicles would use the highway in their travel to the nuclear plant as much as possible. But other possible routes, including those using narrow farm roads, were also checked to secure alternatives in the event of the highway being totally or partially impassable.

After entering the nuclear plant, the unit would use loudspeakers attached to the vehicles to announce their arrival and urge workers inside buildings to exit them and get on the roofs of the vehicles quickly.

The CRR hastily converted the vehicles for the special rescue operation.

The regiment began training for the high-risk mission on the morning of March 21.

The regiment members assigned to the mission would wear 20-kilogram lead vests over their protective suits to shield their bodies from radiation and also put on protective masks. The garments were the same kind of heavy protective clothing as that worn by members of the GSDF's 1st Helicopter Brigade when they carried out the mission of dropping water on overheating reactors from the sky.

In addition, all members of the regiment participating in the mission were to wear disposable diapers because there would be no time for them to take off their gear to go to the bathroom.

One round of the rescue operation, from leaving J-Village to finishing the decontamination, would take at least five hours.

If there were many workers to be rescued, the process would have to be repeated many times without rest.

At a corner of a room with a straw-mat floor used for standby, Sgt. 1st Class Takayuki Saito, 36, who was assigned to serve as the driver of a vehicle, tried both urinating and defecating while standing.

Saito decided to cut back on his intake of both water and food.

It was decided that each vehicle would be manned by a team of just two--the driver and the commander. Typically, the driver operates the vehicle with his head sticking out of the hatch. But the hatch would remain closed during the mission for safety, forcing the driver to operate by using only three periscopes provided for observation.

Depending totally on the three periscopes, which are each roughly the size of a rear-view mirror, meant there would be many blind spots.

However, there are six periscopes for wider observation available to the commander seated to the rear of the driver. The commander would help the driver operate the vehicle by providing supplementary information through in-vehicle radio communications.

Covered with a protective sheet, the interior of the vehicle was extremely narrow, effectively immobilizing the crew inside.

Their protective masks caused their faces to be drenched in sweat and made it difficult to breathe.

Some members vomited due to the heat and a feeling of being suffocated.

Three anti-nuke activists dropped from Central Environment Council

March 5, 2013

LDP boots anti-nuke advocates from environment panel

http://ajw.asahi.com/article/behind_news/politics/AJ201303050071

By TETSU KOBAYASHI/ Staff Writer

Japan's ruling party, while hardly a champion of environmental issues, is apparently rather touchy about any criticism of its policies in that area.

That may explain the decision by the Liberal Democratic Party to drop three anti-nuclear activists from the government's Central Environment Council.

The three individuals were approached about becoming or staying on as panel members last December, before the Lower House election that brought the LDP back into power, but have subsequently been told their services are no longer required.

While Environment Ministry officials cited a need for fewer members so as to energize discussions, it has not gone unnoticed that the three are vocal opponents of nuclear energy and forceful advocates of more drastic measures to combat global warming.

Ministry officials said Nobuteru Ishihara called for a review of the number of panel members after he was named environment minister following the LDP's landslide victory on Dec. 16.

January is traditionally when the Central Environment Council appoints new members. By early December 2012, the ministry had a roster of 30 people.

However, after the change in government, the first council meeting scheduled for Jan. 10 was postponed and the council membership reconsidered.

A new lineup was appointed on Feb. 8, but only 25 members were included.

Among the individuals left off the new list are Mie Asaoka, a lawyer who heads the environmental nongovernmental organization Kiko Network, Kazuhiro Ueta, an economics professor at Kyoto University, and Junko Edahiro, an environmental journalist.

Asaoka has campaigned for Japan to maintain its international pledge of reducing greenhouse gas emissions by 25 percent in 2020 over 1990 levels. However, the Abe administration has said it wants to review that promise in light of the 2011 nuclear disaster that has forced Japan to rely more sharply on thermal power generation.

Ueta chaired a panel tasked with considering whether that 25-percent reduction goal was achievable under the previous government led by the Democratic Party of Japan.

All three individuals advocate greater use of natural energy sources. Prior to the nuclear disaster that has left nearly all reactors idled, they had proposed wide-ranging reforms of the electricity supply system to sharply reduce the nation's dependence on nuclear energy.

Asaoka had been a member of the council since 2005. She said a ministry official told her privately in early December that her reappointment was a done deal.

However, in early February, a high-ranking ministry official contacted her to say she had been dropped from the new roster because the number of council members was being reduced.

Both Ueta and Edahiro served as temporary members of a subcommittee discussing measures to deal with global warming until last year. According to them, they were informed late last year that they would be included as full members of the council. However, they were contacted this year by ministry officials and told the earlier decision had been rescinded.

Regarding the postponement of the first council meeting, Ishihara said at a Jan. 8 news conference, "Now that there is a new Cabinet (under Prime Minister Shinzo Abe), members need time to get used to the new policies that are being put forward."

In response to questions from The Asahi Shimbun about the thinning out of council members, the Environment Ministry's Policy and Coordination Division said, "We have decided to streamline the council in order to improve discussions."

According to sources in the policy division, ministry officials showed Ishihara the proposed lineup of council members shortly after he became environment minister, expecting him to approve the list. Instead, he called for a review of the number and makeup of panel members.

In addition to specialists, the council includes members who represent local governments, business organizations and labor unions.

A high-ranking ministry official said: "We cannot simply eliminate members who have been recommended by various organizations. As a result, a number of those considered pro-environmental were not included in the council."

PROMETHEUS TRAP/ 'Shadow units' (3): Keeping the public in the dark

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201303080009>

By HIDEFUMI NOGAMI/Staff Writer

Editor's note: This is the third part of a new series that has run in the past under the title of The Prometheus Trap. This series deals with the secret missions assigned to the "shadow units" of the Ground Self-Defense Force when the Fukushima nuclear disaster was unfolding following the Great East Japan Earthquake of 2011. The series will appear on Mondays, Wednesdays and Fridays.

The Ground Self-Defense Force's Central Readiness Regiment (CRR), a "shadow unit" trained for special operations, made every effort to guard the secrecy of their planned mission to rescue Tokyo Electric Power Co. employees from the Fukushima No. 1 nuclear power plant if the need arose.

The CRR had to ensure that even its training for this highly confidential mission would not be seen by anyone outside the organization.

Even TEPCO, the operator of the nuclear plant, was kept in the dark on the rescue plan.

Yoshifumi Hibako, 61, GSDF Chief of Staff, says TEPCO was then believed to be too preoccupied with dealing with the nuclear crisis to cooperate with the SDF in any way.

"We were also concerned that disclosure of the rescue operation could upset the company," he says.

Starting on March 21, 2011, members of the CRR expected to take part in the mission repeatedly practiced quickly donning protective masks and lead vests. They also practiced operating the armored vehicles to be used with the hatches closed. They carried out rescue drills to check if members pretending to be TEPCO employees could climb onto the roofs of the vehicles quickly.

The CRR members also did simulations of using loudspeakers attached to the vehicles to call on TEPCO employees within buildings to come out and get onto their vehicles.

What they would tell to the employees was as follows: "We have come to rescue you. Please get onto the roofs of our vehicles swiftly. Act calmly."

But the unit had to ensure that the voices saying these words in simulation exercises would not be heard. It was also necessary to prevent their exercises from being seen by the public.

Initially, the unit conducted rescue exercises secretly in an industrial park near the Iwaki Seaside Nature Center, the recreation complex where they were camped. But they changed the location after their drills were seen by local residents.

In its efforts to keep the mission secret, the unit constantly changed the locations for the exercises, using various sites between 20 and 30 kilometers from the disaster-stricken nuclear power plant, including a public playground and a municipal parking lot.

At 9:30 a.m. on March 26, the CRR conducted an exercise involving entry into the premises of the nuclear plant for the first time.

The unit asked TEPCO employees to guide the members to the plant, but didn't tell them that it was a rescue drill. The TEPCO employees were only told that the objective was reconnaissance of the route. The massive armored vehicles to be used for the rescue mission posed a big problem.

During the actual rescue operation, a convoy of eight such vehicles would travel in a row. But a line of eight armored personnel carriers with reinforced tires would inevitably be very conspicuous.

The unit members told the TEPCO employees that they wanted to use a variety of vehicles because various situations would be possible.

The convoy used for the exercise was composed mostly of smaller four-wheel armored vehicles, with only one being the carrier that would be used in the actual mission.

Kazunori Yamaguchi, the regiment commander, was on board the personnel carrier. The convoy came to the side of a reactor building whose framework had become exposed due to an explosion.

At least once every week, the CRR rehearsed the entire operation, from receiving an emergency order to rescuing workers at the plant.

Maj. Atsushi Kikuchi, 37, who was the first company commander, imagined finding TEPCO employees lying on the ground when they arrived at the plant for the rescue operation. He thought that CRR members would also collapse as they exited their vehicles to save the employees. He prepared himself to die.

Master Sgt. Yasuyuki Machida, a 41-year-old member of the public relations section, produced an extra of the regiment newspaper to allay concerns among the families of the members. The extra, of course, said nothing about the secret mission.

The first extra after the decision on the rescue mission was made was published on March 29 in the middle of training for the mission.

The paper only reported on the CRR's operation of transporting local residents on buses from an evacuation center to a hotel where they could take a bath.

Beside a big headline saying, "Assistance produces smiles," was a large photo showing a girl smiling and waving.

PROMETHEUS TRAP/ 'Shadow units' (4): Selection of personnel for Fukushima mission limited by unit makeup

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201303110012>

March 11, 2013

By HIDEFUMI NOGAMI/ Staff Writer

Editor's note: This is the fourth part of a new series that has run in the past under the title of The Prometheus Trap. This series deals with the secret missions assigned to the "shadow units" of the Ground Self-Defense Force when the Fukushima nuclear disaster was unfolding following the Great East Japan Earthquake of 2011. The series will appear on Mondays, Wednesdays and Fridays.

* * *

On March 27, 2011, one week after the Ground Self-Defense Force's Central Readiness Regiment received the order to rescue employees at the Fukushima No. 1 nuclear plant, the 50 personnel involved in the mission went to Camp Koriyama for a briefing.

The talk was given by Lt. Col. Katsumi Nakamura, 53, who heads the chemicals section at the Kanto Logistics Depot.

The service members were all novices when it came to radiation. That was evident when one asked, "What is a meltdown?"

All the participants were seriously taking notes because they were well aware that not understanding any bit of information could mean the difference between life and death.

The question was raised to what extent protective sheets applied to the armored vehicles would protect personnel from radiation.

When Nakamura said, "about 20 to 30 percent," a gloomy silence prevailed in the room because of the seriousness of the situation.

Although the briefing was originally scheduled to last one hour, it was extended for about 30 minutes because of the many questions the participants had.

Selection of the commander and driver for the armored vehicles that would enter the site of the Fukushima No. 1 nuclear plant to rescue the employees of Tokyo Electric Power Co. was left up to those who would be involved in the mission. That was similar to what happened in selecting members of the 1st Helicopter Brigade, who were tasked with dumping water on the reactor buildings.

Sixteen personnel would be needed for the eight armored vehicles. That meant choosing 14 members in addition to the regiment and company commanders.

Atsushi Kikuchi, the 1st Company commander, isolated himself in the strategy room to look over a list of about 60 personnel. He wanted to exclude single members as well as those who were about to start families. However, because mainly young members were on the list, he designated 14 personnel without enlisting any opinions or giving a reason for his selections.

Those members who were not chosen for the mission assisted in training by helping the driver don his protective gear as well as inspecting the vehicles. Two to three personnel were assigned to each armored vehicle to provide backup support.

Driving using periscopes meant there would be many blind spots. The armored vehicles also would have to be navigated into the nuclear power plant, which was experiencing an emergency in which no one knew what was unfolding there. Such conditions naturally called for veteran personnel to serve as drivers.

One such individual was Sgt. 1st Class Yasufumi Suzuki, 30, who had about 7,000 kilometers of driving experience. On March 11, 2011, Suzuki was bench pressing 70-kilogram barbells at Camp Utsunomiya when the earthquake struck.

A standby order meant he could not go home, so he called his wife, Mineko, 30, that night.

"Cancel the wedding reception," Suzuki said.

While they had married the previous year, they had not yet held their reception. It had been scheduled for March 21, 2011.

Taken aback, Mineko asked, "What? Won't everything be all right in 10 days?"

Suzuki shot back, "Stop kidding around."

They had planned to hold the reception at a hotel in Yokohama and had already sent out invitations to 60 people, including relatives and senior officers. They had planned to have Suzuki carry a beer server on his shoulder while Mineko passed out snacks as they made their way around to guests sitting at the tables at the reception.

During training, Suzuki could not divulge to his wife what the mission would entail. After dinner, he would e-mail her with simple messages such as, "I just ate."

How independent was that panel?

March 14, 2013

ANALYSIS: TEPCO inquiry admits 'misinformation,' but critics demand more

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201303140095>

By HIDEAKI KIMURA/ Staff Writer

An inquiry by Tokyo Electric Power Co. into allegations the utility misled Diet investigators and thereby thwarted an inspection of a particular building at the Fukushima No. 1 nuclear plant has agreed that there was misinformation, but insisted it was unintentional.

But the findings were dismissed by one official who believes TEPCO willfully prevented the pursuit of truth, Mitsuhiko Tanaka, who sat on the National Diet's Fukushima Nuclear Accident Independent Investigation Commission.

"I am not interested in a token investigation that only cited arguments in TEPCO's favor," he said. "I hope the Diet will take up the matter at an early date."

On Feb. 7, The Asahi Shimbun reported on a conversation that Toshimitsu Tamai, general manager of TEPCO's Corporate Planning Department, had with Mitsuhiko Tanaka and other commission members on Feb. 28, 2012.

During that conversation, Tamai dissuaded the committee from visiting and examining the plant's No. 1 reactor building by falsely insisting that it was pitch black inside.

A recording of the conversation, obtained by The Asahi Shimbun, makes clear that Tamai put pressure on Tanaka to abandon the proposed inspection.

"Would it not be better to drop it?" Tamai is heard saying.

Tamai also tells the Diet officials that conducting an on-site survey would set an awkward precedent which might trigger an onslaught of similar requests.

"People such as war photographers might start pestering us, saying: 'I'll risk it. I don't care about my life. I'm going in at all costs,'" Tamai is heard telling Tanaka. "If you'll allow me to say this, that would place a burden on our company."

And Tamai tries the hard-sell: "I'd like you to make a decision today," he says.

The committee did, indeed, drop its plans to visit, even though some observers believe an on-site examination could answer an important unresolved question: Did the plant fail because of the tsunami, as TEPCO insists; or because of damage sustained in the earlier earthquake? It should have been built to withstand the size of the temblor that struck on March 11, 2011.

Under pressure to confirm or dispel suspicions that it misled the committee, TEPCO commissioned a third-party panel to examine what happened.

In a report submitted to TEPCO on March 13, the investigative panel declared that Tamai had misled the Diet committee, but that he had not done so on purpose. In other words, the report said, he did not misinform investigators such as Tanaka with the aim of dissuading them from carrying out an on-site inspection.

The panel argued that Tamai would have had no motive to tell a lie that would have been rapidly exposed had the inspectors gone ahead with their visit. It would be hard to assume that he had lied on purpose, it said, because by doing so, he would have dug a hole from which it would have been hard to climb out.

But that logic is flawed because the lie would not have been exposed if TEPCO had successfully blocked the visit.

One major problem with the TEPCO-commissioned panel is that all 26 people it interviewed are TEPCO insiders.

The panel initially asked members of the now-disbanded Diet investigation commission if they would cooperate. The former Diet investigators said they would cooperate if the Diet gave them permission to do so. But the panel then never requested such permission and, therefore, conducted no interviews with the former Diet investigators.

The panel also said its investigations included a review of media reports. However, here, there are indications to the contrary.

There was no mention in the panel's report of Tamai's remarks that could have indicated his intention, such as his pressure to "make a decision today." It contained no investigation of the reported voice recording.

On Feb. 7, Tanaka asked the heads of the two chambers of the Diet--the Lower House speaker and the Upper House president--to investigate the allegations and to press ahead with an on-site survey.

But the Diet has since left it to TEPCO to investigate the case of alleged misinformation--and has left it to the Nuclear Regulation Authority to decide whether to inspect the site.

The Lower House secretariat said March 13 that Tanaka's request is "not under discussion." The Upper House secretariat said: "There is no particular move at this stage."

By HIDEAKI KIMURA/ Staff Writer

March 13, 2013

Panel says no cover-up attempt by TEPCO

THE ASSOCIATED PRESS

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201303130112>

An independent panel says the operator of Japan's tsunami-crippled nuclear plant misinformed investigators and blocked inspection of key equipment last year, but that there was no cover-up attempt. The case involves a parliamentary probe of equipment at the Fukushima No. 1 nuclear plant's No. 1 reactor. A member of the investigative team said investigators had to scrap an inspection of the reactor's emergency cooling equipment, accusing plant operator Tokyo Electric Power Co. of falsely saying the building was dark and dangerous.

After the incident caused an outcry from lawmakers and the public, TEPCO commissioned a panel to look into the matter.

On March 13, the panel attributed the problem to a TEPCO official's misunderstanding of the situation at No. 1 reactor building, and said TEPCO wasn't trying to hide the equipment from the inspectors.

PROMETHEUS TRAP/ 'Shadow units' (5): CRF units aligned against common enemy, the crippled nuclear plant

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201303130007>

By HIDEFUMI NOGAMI/ Staff Writer

Editor's note: This is the fifth part of a new series that has run in the past under the title of The Prometheus Trap. This series deals with the secret missions assigned to the "shadow units" of the Ground Self-Defense Force when the Fukushima nuclear disaster was unfolding following the Great East Japan Earthquake of 2011. The series will appear on Mondays, Wednesdays and Fridays.

On March 11, 2011, after the Great East Japan Earthquake and tsunami struck a wide area of eastern Japan, then Defense Minister Toshimi Kitazawa issued an order at 7:30 p.m. to the Self-Defense Forces to prepare for deployment.

Their mission would be to deal with the crisis at the Fukushima No. 1 nuclear power plant, which was quickly spiraling out of control.

Under the direction of the commander of the Northeastern Army, SDF members based in Fukushima Prefecture, as well as the northern Kanto and Shinetsu regions, were among the first to respond to the nuclear accident.

But that deployment changed at 11:05 a.m. on March 14, 2011, when all response to the Fukushima nuclear accident was unified under the Ground Self-Defense Force's Central Readiness Force (CRF). The CRF is made up of so-called "shadow units," which are trained for special operations and whose missions are shrouded in secrecy. The Central Readiness Regiment that was preparing for a possible rescue of employees of Tokyo Electric Power Co. is just one element of the CRF. The force has five major units with the equipment and capabilities to deal with various emergencies and a total of about 4,000 members.

The commander was Gen. Toshinobu Miyajima, 59.

He gave specific orders to the various units under his command. While the Central Readiness Regiment was given the top-secret order to rescue TEPCO employees at the plant, the 1st Airborne Brigade was ordered to prepare to evacuate residents in the event of an emergency. The brigade, the only parachute unit in Japan, is based in Narashino, Chiba Prefecture.

The Central Readiness Regiment set up its living quarters about 30 kilometers south of the Fukushima No. 1 nuclear plant. The 1st Airborne Brigade was divided into three units, which were dispersed to locations north, west and south along an arc 30 kilometers from the nuclear plant.

The Central NBC Weapon Defense Unit, which is specialized to deal with acts of terrorism involving nuclear, biological and chemical weapons, had already begun preparations by setting up its base in Okuma, the town where the Fukushima No. 1 plant is located.

The unit went into action when the Aum Shinrikyo cult spread sarin gas in the Tokyo subway system in 1995 and again in 1999 when a criticality accident occurred in Tokai, Ibaraki Prefecture. Unit members not only are accustomed to working while wearing protective gear and face masks, but are also knowledgeable about the dangers of radiation.

The 1st Helicopter Brigade was dispatched to Sendai and would handle the dumping of water on the Fukushima No. 1 plant as well as the transport of relief supplies and disaster victims.

In that manner, the various "shadow" units of the CRF were set up around the Fukushima No. 1 plant, almost as if they were surrounding an enemy force.

The most highly classified unit under the CRF is the Special Forces group, which specializes in taking on terrorists. The 300 members of that group were not dispatched to deal with the natural disasters, but were on hand to deal with any other possible military-related development.

The decision to deploy the CRF units was made by Gen. Ryoichi Oriki, 62, chief of staff of the SDF's Joint Staff, Japan's top military officer. As he observed the growing crisis unfolding at the nuclear plant, Oriki felt that the SDF had to be called into action. He also decided that a command structure to deal with the nuclear accident should be separate from that to help provide relief to the disaster-stricken areas.

The direct catalyst for his decision to deploy the CRF units was the explosion at the No. 3 reactor of the Fukushima No. 1 plant, which occurred at 11:01 a.m. on March 14, 2011. Four minutes later, command for dealing with the nuclear accident was shifted from the Northeastern Army to the CRF.

At that same time, an emergency report was filed with CRF command at Camp Asaka in Tokyo's Nerima Ward.

"Members appear to have encountered a problem," the report said. "We cannot make contact with them." Members of the Central NBC Weapon Defense Unit had been sent to the No. 3 reactor to provide support for supplying water.

The emergency report said six members were missing, including the commander of the unit, Col. Shinji Iwakuma, 51.

"Don't die," was the thought running through the mind of CRF commander Miyajima.

Regulators are there to say no and resist industry's pressure

March 14, 2013

INTERVIEW: Former U.S. nuke watchdog chair says regulators must stay independent

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201303140050>

By SHIRO NAMEKATA/ Correspondent

As it is poised to impose strict regulatory measures on the operation of nuclear power plants, the Nuclear Regulation Authority is increasingly met by opposition that it is making the resumption of plants that are currently offline virtually impossible.

In a recent interview with The Asahi Shimbun in Washington, Gregory Jaczko, former chairman of the U.S. Nuclear Regulatory Commission (NRC), said it is crucial for a nuclear watchdog to stay independent from the nuclear industry.

Jaczko, who, unlike his four colleagues, opposed the first new construction and operation of a nuclear plant in the United States since the 1979 Three Mile Island accident, also discussed the future of nuclear energy. Excerpts from the interview follow:

Question: Japan's Nuclear Regulation Authority is an independent watchdog modeled after the U.S. Nuclear Regulatory Commission, but the nuclear industry in Japan has criticized it for being too strict. What do you think?

Jaczko: If the industry is unhappy with the regulatory body, it is probably a good thing. Independence in decision-making, in particular, licensing decisions, is crucial, and I believe that exists in Japan.

The regulators need to have technical expertise, because without technical expertise they rely on others for information and cannot make independent judgments.

They are there to say no, sometimes when the industry does not want them to do so. It is the role of the regulators.

After the Fukushima nuclear accident, everyone turns around and says, "why didn't they make TEPCO analyze the tsunami hazard earlier?"

Had they been doing it earlier, TEPCO probably would have complained, saying it would cost too much money or there was no scientific basis.

But it would have been the right thing, and then the accident never would have happened.

It is always easy to criticize the regulators before you have an accident, and then, if they have not done their jobs, it is easy to criticize them after.

That is the nature of being a regulator.

Q: Last year, when you were chairman, you were the only one to vote against approval of new reactors. Wasn't that unusual?

A: Yes, well, it was very simple. You would not buy a car if somebody was telling you that they were trying to fix the brakes.

You would wait until they had fixed the brakes, and then you would go ahead and buy the car.

Unfortunately, there was tremendous pressure for the Nuclear Regulatory Commission to issue these licenses.

I suggested putting in a requirement or a "condition" in the license, that said that they would not operate the plant until all of the Fukushima changes were implemented.

My colleagues on the commission rejected that proposal. Given that they rejected it, I had no choice but to disapprove issuing the licenses.

Q: The United States has implemented anti-terrorist measures for nuclear power plants after the Sept. 11 attacks. How would that be effective for disasters and other challenges?

A: It does not really matter whether it is terrorist-induced, whether it is earthquake-induced, or some type of other accident.

In many cases, the problems are still the same, which is how do you ensure that the reactor stays cool, that the integrity of the fuel is maintained, so that you can provide adequate cooling.

After the Fukushima accident, many people, including myself, said that the anti-terrorism measures would have prevented the accident. I am not so convinced that is the case today.

When we inspected nuclear plants in the United States after the Fukushima accident, we found many of the anti-terrorism measures had not been implemented appropriately the way they were designed. The plants would not necessarily have survived a tsunami or an earthquake, because the safety measures were designed to be used in the event of a terrorist attack.

If you are worried about the plant being attacked, the kind of backup safety equipment you want to put somewhere far away from the plant. But, the plant would not necessarily be protected from hurricanes and earthquakes.

So, even if that equipment had been at Fukushima No. 1 plant, it probably would have been destroyed along with many of the other equipment that was destroyed. There were some areas there for improvement.

Q: The NRC has implemented its first measurements, so-called "Tier 1 recommendations," following the Fukushima accident. Would you still vote against approval of a new reactor even now?

A: I certainly would, if I were in that position. I would think that the regulatory body would want to make sure that they could not operate, before the Fukushima lessons had been implemented.

I visited Japan after the accident to hear directly from the people who had been impacted. It was important to me to hear what the effects were, how the people were dealing with challenges of being evacuated and how the evacuation was progressing.

It is not acceptable, to the people who had to be evacuated, the people of Namie, the people around that site who had their lives disrupted because of this accident.

There is nothing like being removed from your home. You, your friends and your family are displaced, and you are no longer in the place that you are the most comfortable.

It is something that the industry, the regulators and anyone involved in nuclear power should all agree on that this is simply not acceptable.

We have to rethink this technology in such a way that these kinds of accidents simply cannot happen and that I could, as a regulator or as anyone else, comfortably say to you: "that accident will never happen."

Q: What was the problem facing the NRC even before you became chairman?

A: The biggest problem with the NRC continues to be the heavy influence that the industry has in selecting the members of the commission. It is a very political process.

There are few commissioners who ever get onto the commission who are not endorsed by the industry, including myself and the current chairman.

There are many good people, who are very technologically sophisticated, but especially in the last few years that I was on the commission, there was very strong influence from the industry on the commission members. You need to have much more diversity in the views of the commissioners.

It would be virtually impossible for someone who is publicly skeptical of nuclear power to ever be confirmed as a commissioner on the NRC. That is fundamentally wrong.

If you look at the state of nuclear power in the United States, it is not very good.

There are very difficult and challenging things, but the culture that exists now is one of not wanting to have the NRC involved, wanting to do more things by the licensees themselves and having less oversight from the NRC.

A lot of what I fought against when I was chairman was to re-instill that culture that our job is to ensure safety and to do what we need to do. And that was met with tremendous opposition from my colleagues on the commission.

Q: Was there pressure from the industry?

A: That pressure is always there. The nuclear industry, very early on, learned that I was not going to respond to a lot of pressure, so they stopped. And, they applied pressure elsewhere.

Q: What was the exact pressure like?

A: It is ultimately meetings with senior executives of the utilities, who demand certain things and ask certain things of the chairman, and expect it to be done.

Then it turns into political pressure from members of Congress, as utilities will work with members of Congress to have them apply pressure.

Most of it is in the form of dialogue, discussion and questions, and that is the type of pressure that is applied. It is very pervasive.

What I saw is that we have very good staff at the agency, and the challenges really come in from the leadership, in the direction that is set by the commission.

That is really where the problems lie. The commissioners come in with strong connections to the industry and are very open with the industry.

It would not be uncommon for a reviewer at the agency to have a challenge with the utility and the utility goes directly to a commissioner and say, "I am having trouble with this particular review. Can you help move this along?"

Q: You resigned the chairmanship a year before your term expired after your former colleagues made accusations against how you managed the commission. Did the industry play a role behind that?

A: I cannot say for sure what role the industry played, but I have been told that there were some in the industry who wanted me out of my position.

But it was exclusively my decision. It was an opportunity to have a replacement for me who was, I believed to be, reform-minded and safety-focused.

There are very few times in which non-industry people have become chairman of the NRC, and for me to resign early was one way to do that.

Q: How difficult is it for the watchdog to stay independent from industry pressure?

A: if you have the legal and technical independence, it is the leadership that really gives you that true independence in your operation. It is the tone that the leadership sets.

When I look at the NRC, almost all the people were there because they believed in safety. That was what their number one job was. It was what they came to work every day to implement.

A lot of what I spent my time at the NRC was setting a tone that our job as regulators was to put safety first.

There is no one else who has the authority to say no to a utility, other than the regulator. Maybe the bank could in some way, but when it comes to safety, the only people that can say no are the regulator.

Q: In the United States, the development of shale gas is outperforming nuclear power in cost effectiveness. How do you think of the future of nuclear energy?

A: It is hard to say, but I think there are two futures for nuclear power.

One is a future in which the industry continues to kind of degrade, that more plants, as they get older, start to shut down, do not restart. And you have very little interest in people studying nuclear technology, nuclear engineering, nuclear science, and the industry slowly disappears.

It will probably not disappear completely. There will probably always be some nuclear reactors, but there will not be growth.

Here we are, 50 years since the first reactor ideas were born, or the first plants were built, and now we are talking about a significantly new safety feature in the United States.

This is not things that you would expect to be adding now, 50 years after this technology had been developed.

Every time there is something we did not expect, then we add on a new safety system to fix that hole. **It is like a dike leaking everywhere.**

And, if you look at the projections, right now, for the number of plants that will ultimately be nearing the end of their licenses in the next 20 years or so, you will probably see a reduction in the total number of plants in the United States.

We have four units that are being built right now, but that has not sent a good signal for new construction. It will be difficult for there to be more nuclear plants built, absent specific legislation to address climate change.

But there certainly are attractive features of nuclear power. We need to rethink the current design to have better designs such as small modular reactors.

If we have a reactor that is 100 megawatts, the quantity of material and the energy we have to disperse that material is significantly reduced.

It will not contaminate a 10-kilometer radius area, because it does not have enough material.

Q: How about the problem of nuclear waste?

A: Everybody knows how to solve the problem. It is just finding a place to do it.

Q: In a democracy, it is difficult to find a place to dispose of it with the consent of local residents.

A: I do not think it is impossible. But in the United States, for instance, we have tried to do exactly the opposite.

We try to find a place without getting the consensus of the local populace, and as a result, it has been a disaster--the Yucca Mountain disaster.

Yucca Mountain was not chosen because the people of Nevada held a referendum and said they want this waste dump in Nevada. It was chosen because of a very political process that left Nevada as the only state left after all the other ones were taken off the table, for political reasons.

Done in the right way, you can do it, and then it is a very difficult science to predict.

I always think of it this way: it is not easy to find out where your roof is leaking. Sometimes it takes a lot of trial and error and you still get a leak somewhere, and somebody comes and they fix it.

Well, now imagine trying to do that in a rock for the next 100,000 years. That is what you are trying to do to determine the safety of geological repositories.

It is not easy to do that science, and there may be some people who might say you cannot really do it, because the assumptions you make are so far-fetched and you are over time scales of which you have absolutely no ability to really predict.

There will always be people who will say the analysis is flawed, but if you cannot really do it, then it is hard to say it is going to be safe. You have to just kind of go back to some first principles.

Fundamentally, the way I look at it is that we know how to maintain nuclear fuel in the short term. For the most part, we think it maintains its integrity. It does not need a lot of active systems, and dry casks work very well as far as we know.

The biggest challenges may be in a couple hundred years you may have some degradation in the fuel and it loses its integrity. It changes how you have to keep it and maintain it, but in principle, it should not create a problem.

But at a certain point, if we do not want to deal with the waste, and if nobody wants a repository, you just have to stop generating nuclear power. There is no other answer.

Transparency - The new energy panel

March 15, 2013

6 of 8 panelists who voted to phase out atomic power by 2030s axed

Abe purges energy board of antinuclear experts

Bloomberg

<http://www.japantimes.co.jp/news/2013/03/15/national/abe-purges-energy-board-of-antinuclear-experts/#.UUM0Wjf1tEs>

Prime Minister Shinzo Abe's government has removed most of the antinuclear researchers appointed to a post-Fukushima energy policy board that was advising the state, it was learned Friday.

After his Liberal Democratic Party won a landslide victory in December's Lower House election, Abe said the ousted Democratic Party of Japan administration's policy of abandoning atomic power had to be reconsidered by his own team to help revive the economy.

Six of the eight members who voted for phasing out nuclear power while advising the DPJ have been dropped from the panel. Another 10 were reappointed, including Akio Mimura, an adviser to Nippon Steel & Sumitomo Metal Corp.

Mimura, now chairman of the panel, which resumed discussions Friday, once headed an energy advisory board under a previous LDP government that promoted nuclear power.

"Mimura may have a wonderful personality and good policy ideas, but it's wrong to let the same man who led discussions on pre-Fukushima energy policy be in charge," said Tetsunari Iida, executive director of the Institute for Sustainable Energy Policies and one of the members dropped from the advisory board.

In September, the DPJ-led administration endorsed the elimination of nuclear power by the 2030s in response to the March 2011 quake-tsunami that caused three reactor meltdowns at the Fukushima No. 1 plant. Around 160,000 people were evacuated because of radioactive fallout.

Three options were considered for the country's future nuclear energy supply: zero, 15 percent, and 20 to 25 percent of the total electricity generated annually. A government poll last August found 47 percent of citizens favored the zero atomic power option, with the remainder split on the other two alternatives.

"The LDP wants to avoid the zero nuclear scenario at all costs and is looking for a point of compromise between 15 and 20 percent atomic energy," said Hiroshi Takahashi, a research fellow at Fujitsu Research Institute who was also dropped from the advisory panel. "Nobody, not even power companies, would try to revive the pre-Fukushima plan for boosting nuclear power's share of electricity to 50 percent."

The government has added five new people, including Issei Nishikawa, governor of Fukui Prefecture, which has 14 reactors. Hajimu Yamana, a nuclear engineering professor at Kyoto University, was also appointed. Overall, the number of advisory board members was cut to 15 from 25.

The people selected have different views on not only nuclear power, but also renewable energy and electricity industry reform, Economy, Trade and Industry Minister Toshimitsu Motegi said March 1. "We took into account specialities in their fields, not whether they agree or disagree on individual issues," he said.

Mimura, former vice chairman of Keidanren, Japan's biggest business lobby, made his view known at a Sept. 18 meeting of the post-Fukushima policy group, stating that the nation should continue using nuclear power.

The group didn't meet again for almost two months. The delay "made me furious," said Hideyuki Ban, codirector of the Citizens' Nuclear Information Center and yet another member dropped from the board. "I demanded that (METI) ministry officials dismiss Mimura."

PROMETHEUS TRAP/ 'Shadow units' (6): SDF members exposed to high radiation levels in reactor explosion

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201303150009>

By HIDEFUMI NOGAMI/ Staff Writer

Editor's note: This is the sixth part of a new series that has run in the past under the title of The Prometheus Trap. This series deals with the secret missions assigned to the "shadow units" of the Ground Self-Defense Force when the Fukushima nuclear disaster was unfolding following the Great East Japan Earthquake of 2011. The series will appear on Mondays, Wednesdays and Fridays.

Six members of the Central NBC Weapon Defense Unit, including unit commander Col. Shinji Iwakuma, could not be contacted after an explosion occurred at the No. 3 reactor of the Fukushima No. 1 nuclear power plant on March 14, 2011.

The explosion was also heard at the off-site center, located five kilometers southwest of the plant, where the central government had established a local response headquarters to deal with the nuclear accident. A mushroom cloud was also visible from that center.

Lt. Col. Kazunori Hishinuma, 54, was nearby installing equipment to be used for decontamination work when a subordinate told him that radio communications with Iwakuma had been cut off.

Hishinuma instinctively knew that Iwakuma and his unit must have been affected by the explosion. The lieutenant colonel ran to the off-site center.

The entrance to the building was sealed off to prevent radiation from entering, so Hishinuma had to shout to attract the attention of someone inside.

"Radio contact with the unit commander has been cut off!"

Eventually, a Self-Defense Force member appeared, and a piece of paper was held against the glass in the door. The paper said, "Go to the hospital at the Fukushima No. 2 nuclear power plant."

The instruction meant that any injured personnel should be taken to the hospital at the Fukushima No. 1 nuclear plant's sister facility, located about 12 kilometers to the south.

It was at that point when Hishinuma heard a voice behind him.

"If you're looking for me, I'm here."

It was Iwakuma. The other five members of his unit were with him.

About 40 minutes had passed since the explosion.

All six wore protective gear that was covered with dust and dirt. One member was dragging his leg due to an injury. There was blood on the protective gear.

"We have all been contaminated with radiation," Iwakuma said, spreading his arms wide. "Clean us up in a hurry."

Hishinuma took the six to the Fukushima prefectural environmental medical research institute next to the off-site center.

The institute had the equipment necessary for radiation testing and decontamination work. However, it had become inoperable after the natural disasters because of a blackout and water outage.

Hishinuma had been trying from the morning of March 14, 2011, to convert the building into a site where decontamination work could be conducted.

After clearing away fallen lockers, a generator was brought in and shower facilities installed. All the equipment belonged to the Central NBC Weapon Defense Unit.

After work was completed, a trial run for decontamination was conducted in cooperation with specialists from the National Institute of Radiological Sciences (NIRS). The explosion at the No. 3 reactor occurred right after the trial run was completed.

Although the decontamination facility had been prepared to decontaminate workers at the Fukushima plant, the first actual users would be members of the unit Hishinuma belonged to.

Before the decontamination work began, NIRS specialists checked the radiation exposure levels of Iwakuma and his men.

"These are very high," one specialist said. "It will be dangerous if all six of you are together in one place. Move away from each other."

If people who have been exposed to high levels of radiation stand in close proximity to each other, they will only further heighten the levels, just by being close to one another.

Iwakuma realized then the grave severity of the dangerous situation he had experienced.

No nukes without the yakuza

Cleanup and the yakuza

By Philippe Mesmer

LE MONDE/Worldcrunch

<http://worldcrunch.com/culture-society/how-the-japanese-mafia-is-making-millions-from-the-fukushima-cleanup/japan-corruption-yakuza-mob-nuclear/c3s10837/#.UUJI1Tf1tEs>

TOKYO – It has been almost two years since the nuclear disaster in Fukushima, and since then there have been multiple allegations about the role played by the Japanese mafia – the yakuza – in the reconstruction process.

On Jan. 31, Japanese police arrested a yakuza boss on suspicion of illegally sending workers into the disaster zone. According to the police, Yoshinori Arai is the head of a crime gang operating in the Yamagata prefecture – in northern Japan. His gang is affiliated with the Sumiyoshi-kai crime syndicate, the second most powerful crime syndicate in all of Japan with 12,600 members.

Arai is accused of sending day laborers to a nuclear decontamination project in the city of Date, in the Fukushima prefecture. The workers only got paid half the promised 20,000 yens (\$216) per day. The rest of the money went to Arai's crime gang.

The reconstruction of the regions devastated by the March 2011 earthquake, tsunami and nuclear disaster – and the billions of yens involved – is very appealing to the Japanese mafia.

The chance to cash in came at the right time for the yakuza, who have fallen on hard times in recent years. They have lost a huge chunk of revenue as the result of stricter anti-gang laws introduced in October 2011 and increased police crackdowns. The new laws made it illegal to do business with crime syndicates or have ties with gangs.

In Tohoku – the region devastated by the earthquake and tsunami – crime gangs are allegedly implicated in all different aspects of the reconstruction, from demolition to waste removal. The police are investigating 37 cases involving crime syndicates active in the rebuilding and cleanup effort. In May 2012, they arrested Makoto Owada, another high-ranking member of the Sumiyoshi-kai, for illegally dispatching workers to the Fukushima power plant through local front companies.

Jobs no one else wants

The close ties between the yakuza and the nuclear industry have been known for a long time. Journalist **Tomohiko Suzuki wrote about it in 2011 in his book: *Yakuza and Nuclear Energy: Diary of An Undercover Reporter Working at the Fukushima Plant.***

He reports that yakuza have been around the Fukushima site since the nuclear disaster -- working to stem the effects of the plant's meltdown. They "find people and send them to the site," recruiting men who owed money to the yakuza, who were homeless, unemployed or even mentally handicapped. According to Suzuki, this system didn't start with Fukushima – the nuclear industry has always used the yakuza to recruit people for the most dangerous tasks, the jobs no one else wants.

In the first days following the nuclear disaster, Tepco, the electricity company managing the plant, who was short on manpower, asked recruiters to fetch "those who are not afraid of dying."

In July 2011, Tepco was forced to make a public statement announcing they would be cutting ties with the yakuza. The company also decided to ask its subcontractors to sign a document stating they had no ties to the mob. But since subcontractors use front companies, this is virtually impossible to verify.

The announcement of Arai's arrest came just as Tetsuo Nayuki, a senior official with the Japanese Nuclear Regulation Authority (NRA), which was set up in September 2012 to "restore public trust in Japan and abroad regarding nuclear regulation," was being sacked. On Jan. 22, Nayuki leaked a report on the nuclear sector to the Japan Atomic Power Company (JAPC). He shared a draft report about a site survey of the company's Tsuruga nuclear plant before its public release.

The NRA was evaluating seismic risks at every Japanese nuclear plant, and found that there was an active fault under the Tsuruga plant and that the reactors would have to be decommissioned. The JAPC wanted to get their hands on the document before its public release to be able to prepare its rebuttal. The JAPC had denied lobbying the nuclear watchdog, saying it never gave Nayuki any money. Read the article in the original language.

How the Yakuza went nuclear

What really went wrong at the Fukushima plant? One undercover reporter risked his life to find out

<http://www.telegraph.co.uk/news/worldnews/asia/japan/japan-earthquake-and-tsunami-in/9084151/How-the-Yakuza-went-nuclear.html>

By Jake Adelstein

11:30AM GMT 21 Feb 2012

On March 11 2011, at 2:46pm, a 9.0 magnitude earthquake struck Japan. The earthquake, followed by a colossal tsunami, devastated the nation, together killing over 10,000 people. The earthquake also triggered the start of a triple nuclear meltdown at the Fukushima Nuclear Power Plant, run by Tokyo Electric Power Company (Tepco). Of the three reactors that melted down, one was nearly 40 years old and should have been decommissioned two decades ago. The cooling pipes, “the veins and arteries of the old nuclear reactors”, which circulated fluid to keep the core temperature down, ruptured.

Approximately 40 minutes after the shocks, the tsunami reached the power plant and knocked out the electrical systems. Japan’s Nuclear Industrial Safety Agency (Nisa) had warned Tepco about safety violations and problems at the plant days before the earthquake; they’d been warned about the possibility of a tsunami hitting the plant for years.

The denials began almost immediately. “There has been no meltdown,” government spokesman Yukio Edano intoned in the days after March 11. “It was an unforeseeable disaster,” Tepco’s then president Masataka Shimizu chimed in. As we now know, the meltdown was already taking place. And the disaster was far from unforeseeable.

Tepco has long been a scandal-ridden company, caught time and time again covering up data on safety lapses at their power plants, or doctoring film footage which showed fissures in pipes. How was the company able to get away with such long-standing behaviour? According to an explosive book recently published in Japan, they owe it to what the author, Tomohiko Suzuki, calls “Japan’s nuclear mafia... A conglomeration of corrupt politicians and bureaucrats, the shady nuclear industry, their lobbyists...” And at the centre of it all stands Japan’s actual mafia: *theyakuza*.

It might surprise the Western reader that gangsters are involved in Japan’s nuclear industry and even more that they would risk their lives in a nuclear crisis. But the *yakuza* roots in Japanese society are very deep. In fact, they were some of the first responders after the earthquake, providing food and supplies to the devastated area and patrolling the streets to make sure no looting occurred.

As the scale of the catastrophe at Fukushima became apparent, many workers fled the scene. To contain the nuclear meltdown, a handful of workers stayed behind, being exposed to large amounts of radiation: the so-called “Fukushima Fifty”. Among this heroic group, according to Suzuki, were several members of the *yakuza*.

The *yakuza* are not a secret society in Japan. The government tacitly recognises their existence, and they are classified, designated and regulated. *Yakuza* make their money from extortion, blackmail, construction, real estate, collection services, financial market manipulation, protection rackets, fraud and a labyrinth of front companies including labour dispatch services and private detective agencies. They do the work that no one else will do or find the workers for jobs no one wants.

“Almost all nuclear power plants that are built in Japan are built taking the risk that the workers may well be exposed to large amounts of radiation,” says Suzuki. “That they will get sick, they will die early, or they will die on the job. And the people bringing the workers to the plants and also doing the construction are often *yakuza*.” Suzuki says he’s met over 1,000 *yakuza* in his career as an investigative journalist and former editor of *yakuza* fanzines. For his book, *The Yakuza and the Nuclear Industry*, Suzuki went undercover at Fukushima to find first-hand evidence of the long-rumoured ties between the nuclear industry and the *yakuza*. First he documents how remarkably easy it was to become a nuclear worker at Fukushima after the meltdown. After signing up with a legitimate company providing labour, he entered the plant armed only with a wristwatch with a hidden camera. Working there over several months, he quickly found *yakuza*-supplied labour, and many former *yakuza* working on site themselves.

Suzuki discovered evidence of Tepco subcontractors paying *yakuza* front companies to obtain lucrative construction contracts; of money destined for construction work flying into *yakuza* accounts; and of politicians and media being paid to look the other way. More shocking, perhaps, were the conditions he says he found inside the plant.

His fellow workers, found Suzuki, were a motley crew of homeless, chronically unemployed Japanese men, former *yakuza*, debtors who owed money to the *yakuza*, and the mentally handicapped. Suzuki claims the regular employees at the plant were often given better radiation suits than the *yakuza* recruits. (Tepco has admitted that there was a shortage of equipment in the disaster's early days.) The regular employees were allowed to pass through sophisticated radiation monitors while the temporary labourers were simply given hand rods to monitor their radiation exposure.

When Suzuki was working in the plant in August, he had to wear a full-body radiation protective suit and a gas mask that covered his entire face. The hot summer temperatures and the lack of breathability in the suits ensured that almost every day a worker would keel over with heat exhaustion and be carried out; they would invariably return to work the next day. Going to the bathroom was virtually impossible, so workers were simply told to "hold it". According to Suzuki, the temperature monitors in the plant weren't even working, and were ignored. Removing the mask during work was against the rules; no matter how thirsty workers became, they could not drink water. After an hour fixing pipes and doing other work, Suzuki says his body felt like it was enveloped in flames. Workers were not checked to see if they were coping, they were expected to report it to their supervisors. However, while Tepco officials on the ground told the workers not to risk injury, it seemed that anyone complaining of the working conditions or fatigue would be fired. Few took their allotted rest breaks.

Those who reported feeling unwell were treated by Tepco doctors, nearly always with what Suzuki says was essentially cold medicine. The risk of radiation exposure was 100 per cent. The masks, if their filters were cleaned regularly, which they were not, could only remove 60 per cent of the radioactive particles in the air. Anonymous workers claimed that the filters themselves were ill-fitting; if they accidentally bumped their masks, radiation could easily get in. The workers' dosimeter badges, meanwhile, used to measure an individual's exposure to radiation, could be easily manipulated to give false readings. According to Suzuki, tricks like pinning a badge on backwards, or putting it in your sock, were commonplace. Regular workers were given dosimeters which would sound an alarm when radiation exceeded safe levels, but it made such a racket that, says Suzuki, "people just turned them off or over and kept working."

The initial work, directly after a series of hydrogen explosions in March, was extremely dangerous. Radiation was reaching levels so high that the Japanese government raised the safety exposure levels and even ordered scientists to stop monitoring radiation levels in some areas of the plants. Tepco sent out word to their contractors to gather as many people as possible and to offer substantial wages. *Yakuza* recruited from all over Japan; the initial workers were paid 50,000 yen (£407) per day, but one dispatch company offered 200,000 yen (£1,627) per day.

Even then, recruits were hard to find. Officials in Fukushima reportedly told local businesses, "Bring us the living dead. People no one will miss." The labour crunch was eased somewhat when the Japanese

government and Tepco raised the “safe” radiation exposure levels at the plant from pre-earthquake levels of 130-180cpm (radiation exposure per minute) to 100,000cpm.

The work would be further subcontracted to the point where labourers were being sent from sixth-tier firms. A representative from one company told Suzuki of an agreement made with a Tepco subcontractor right after the accident: “Normally, to even enter the grounds of a nuclear power plant a nuclear radiation personal data management pocketbook is required. We were told that wasn’t necessary. We didn’t even have time to give the workers physical examinations before they were sent to the plant.”

A former *yakuza* boss tells me that his group has “always” been involved in recruiting labourers for the nuclear industry. “It’s dirty, dangerous work,” he says, “and the only people who will do it are homeless, *yakuza*, or people so badly in debt that they see no other way to pay it off.” Suzuki found people who’d been threatened into working at Fukushima, but others who’d volunteered. Why? “Of course, if it was a matter of dying today or tomorrow they wouldn’t work there,” he explains. “It’s because it could take 10 years or more for someone to possibly die of radiation excess. It’s like Russian roulette. If you owe enough money to the *yakuza*, working at a nuclear plant is a safer bet. Wouldn’t you rather take a chance at dying 10 years later than being stabbed to death now?” (Suzuki’s own feeling was that the effects of low-level radiation are still unknown and that, as a drinker and smoker, he’s probably no more likely to get cancer than he was before.)

A recent report in Japan’s *Mainichi* newspaper alleged that workers from southern Japan were brought to the plant in July on false pretences and told to get to work. Many had to enter dangerous radioactive buildings. One man was reportedly tasked with carrying 20kg kilogram sheets of lead from the bottom floor of a damaged reactor up to the sixth floor, where his Geiger counters went into the danger zone. One worker said, “When I tried to quit, the people employing me mentioned the name of a local *yakuza* group. I got the hint. If Tepco didn’t know what was going on, I believe they should have.” Former Tepco executives, workers, police officials, as well as investigative journalist, **Katsunobu Onda, author of *TEPCO: The Dark Empire***, all agree: Tepco have always known they were working with the *yakuza*; they just didn’t care. However, the articles Suzuki wrote before his book was published, and my own work, helped create enough public outcry to force Tepco into action. On July 19, four months after the meltdowns, they announced that they would be cutting ties with organised crime.

“They asked the companies that have been working with them for years to send them papers showing they’d cut organised crime ties,” Suzuki says. “They followed up by taking a survey.” Tepco has not answered my own questions on their anti-organised crime initiative as of this date; they’ve previously called Suzuki’s claims “groundless”.

The situation at Fukushima is still dire. Number-two reactor continues to heat up, and appears to be out of control. Rolling blackouts are a regular occurrence. Nuclear reactors are being shut down, one by one, all over Japan. Meanwhile, there is talk that Tepco will be nationalised and its top executives are under

investigation for criminal negligence, in relation to the 3/11 disaster. As for the *yakuza*, the police are beginning to investigate their front companies more closely. “*Yakuza* may be a plague on society,” says Suzuki, “but they don’t ruin the lives of hundreds of thousands of people and irradiate the planet out of sheer greed and incompetence.” Suzuki says he’s had little trouble from the *yakuza* about his book’s allegations. He suspects this is because he showed they were prepared to risk their lives at Fukushima – he almost made them look good.

Gov't should not interfere with the NRA

March 12, 2013

Editorial: Japan's nuclear crisis the starting point for new energy policies

<http://mainichi.jp/english/english/perspectives/news/20130312p2a00m0na015000c.html>

Two years after the outbreak of the Fukushima nuclear disaster, some 3,500 subcontract workers press on with efforts to clean up the Fukushima No. 1 Nuclear Power Plant under the threat of radiation.

The crippled frame of the building housing the plant's No. 3 reactor is still exposed following the hydrogen explosion that ripped through the building, and radiation levels are high.

The embankment next to the plant's No. 4 reactor was carved away by the massive tsunami on March 11, 2011, and a truck on the coastal side of the plant remains on its side. It is expected to take four decades to decommission the plant and there is seemingly no end to work to bring the disaster under control.

Prime Minister Shinzo Abe has stated his party will revise a pledge by the former Democratic Party of Japan (DPJ) administration to eliminate all nuclear power plants in Japan by the 2030s. Calls have increased, notably from the economic world, to restart nuclear power plants at an early stage, but we cannot allow backtracking on a zero-nuclear policy. We must remember that the Fukushima nuclear crisis is the starting point in a new approach to the nation's nuclear energy policy.

At the Fukushima No. 1 Nuclear Power Plant, a massive amount of water continues to be injected into the reactors to cool down melted nuclear fuel. Some 30 to 40 tons of contaminated water is expelled from the reactor buildings every hour, and transferred to storage tanks on the grounds of the nuclear plant. The plant's operator, Tokyo Electric Power Co. (TEPCO), plans to build more tanks, but the vessels are expected to be filled in two years.

In the building housing the No. 4 reactor, whose roof was blown apart in a hydrogen explosion, a pool containing over 1,500 spent nuclear fuel rods remains exposed. Work to remove these rods is slated to begin in November, and the rods are due to be placed in temporary storage at the plant, but no decision has been reached over what to do with them after that.

Problems like these represent nuclear power's main trade-off. It is impossible, when running a nuclear power plant, to sidestep the problem of how to dispose of radioactive waste.

The Abe administration says it will retain a national policy to reprocess spent nuclear fuel. But the nuclear fuel cycle, under which fuel is reprocessed and used once again in nuclear power plants, has ground to a standstill.

The nuclear reprocessing plant being constructed by Japan Nuclear Fuel Ltd. in Rokkasho, Aomori Prefecture, is supposed to be completed in October, but it has faced a spate of problems, causing its construction to be extended 19 times. In addition, the Monju fast breeder reactor in Tsuruga, Fukui Prefecture, which is supposed to use plutonium extracted from spent fuel, has been stopped due to operation problems.

In light of technical demands, safety issues and cost, Japan should draw the curtains on its nuclear fuel cycle.

The disposal of highly radioactive nuclear waste involves burying it in a stable geological layer hundreds of meters underground. But it takes tens of thousands of years for the radioactivity of such waste to drop to a safe level, and it remains uncertain whether any geological layer can actually be guaranteed as stable.

The Nuclear Waste Management Organization of Japan is seeking a final disposal site for the nation's nuclear waste, but so far no local bodies have come forward and agreed to accept it. As a result, spent nuclear fuel from the nation's nuclear power plants continues to pile up. Japan should quickly seek to reduce its dependence on nuclear power to prevent the burden of nuclear waste being passed on to future generations.

In spite of all this, it appears that the Abe administration is trying to turn the clock back on the nation's nuclear power and energies policies to the period before the March 2011 quake and tsunami that triggered the nuclear crisis. Symbolic of this stance is its selection of members on panels handling energy policies.

The Coordination Subcommittee of the Advisory Committee for Natural Resources and Energy, a consultative body to the minister of economy, trade and industry, is to discuss the nation's mid- to long-term energy policy. Under the previous DPJ administration, seven of the 24 members of the fundamental issues committee, which performed the same role, were clear opponents of nuclear power. But now the number of committee members has been cut to 15, leaving just two opposing dependence on nuclear power. Meanwhile the governor of an area hosting a nuclear power plant has been added to the panel's ranks.

The panel operating under the previous DPJ administration engaged in fierce debate in 33 heated sessions. The discussions were open to the public, which heightened interest in the issue. The members failed to reach a unified decision, but the target that emerged following national debate was to eliminate nuclear power in Japan by the 2030s.

Of course, the government administration has now changed hands, but still, the public will not agree to a sudden scrapping of this goal.

The Central Environment Council, a consultative body to the minister of the environment mulling environment-related policies such as the nation's response to global warming, previously accommodated three members in favor of reducing dependence on nuclear power, but after Abe's Liberal Democratic Party (LDP) took over from the DPJ, their appointments were revoked.

The Abe administration is seriously mistaken if it thinks it can create the impression that its policy changes have been approved simply by removing opponents of nuclear power from government panels.

In his policy speech to the Diet last month, Abe stated, "Under the Nuclear Regulation Authority (NRA), we will foster a new culture of safety. ... After doing so we will restart nuclear power plants where safety has been confirmed."

If nuclear power plants are allowed to be restarted for economical reasons and to secure a supply of electricity, safety is an utmost priority. The NRA is to set new safety standards by July, incorporating tough measures such as requiring the latest safety standards to be applied to existing nuclear power plants.

Proponents of nuclear power have heaped criticism on the conclusions drawn from earthquake fault surveys that the NRA is conducting at nuclear power plants, as well as on the way the surveys are being conducted. But **let us not forget that it was the LDP, during its stint as an opposition party, which called for a high level of independence in the agency. The current administration must not disdain the severity of regulations or interfere in the NRA's judgments on safety.**

Abe has stated that over a period of three years, the government will provide support to spur innovation in developing alternative forms of energy. Efforts to make renewable energy the key to recovery have been witnessed in areas hit hardest by the quake and tsunami disaster. We call on the government to develop nuclear power and energy policies truly focusing on the public, while remaining mindful of the accomplishments stemming from such efforts.

Vulnerable and unreliable

March 20, 2013

No. 1 fuel pool power to be restored: Tepco

Repairs of makeshift switchboards to rectify woes; tardy reporting hit

by Reiji Yoshida

Staff Writer

<http://www.japantimes.co.jp/news/2013/03/20/national/no-1-fuel-pool-power-to-be-restored-tepco/#.UUihejf1tEs>

Critical cooling systems for four pools containing thousands of nuclear fuel assemblies at the Fukushima No. 1 power plant shut down due to a loss of power overnight Monday, highlighting the **vulnerability** of the ad hoc equipment set up after the meltdowns two years ago.

Tokyo Electric Power Co. said repairs to fully recover the cooling functions of the fuel pools at reactors 1, 3 and 4 were completed on Tuesday night. Meanwhile, the utility said another huge common fuel pool would be fully functional by 8 a.m. Wednesday.

Tepco was still trying to pinpoint the cause of the power loss Tuesday afternoon, raising concern about the soundness of the facilities at the badly damaged nuclear plant, where decommissioning work will take decades.

Tepco emphasized that it would take at least three more days for the water in the spent fuel pool in the damaged reactor 4 building, potentially the most dangerous one, to reach the threshold control temperature of 65 degrees, giving the operator ample time to restore power before the coolant water started to boil and evaporate.

The utility speculated that a makeshift switchboard set up after the meltdowns of reactors 1-3 probably malfunctioned Monday evening, causing two more switchboards and other equipment to automatically shut down.

It is thought that this led to the power loss to the cooling systems for the fuel pools in the reactor 1, 3 and 4 buildings as well as the large common pool, which contains 6,377 nuclear fuel assemblies, Tepco said.

The injection of coolant water into the damaged cores of reactors 1, 2 and 3 was not disrupted, Tepco said.

“We are still trying to identify the cause (of the power loss). We need to investigate further,” said Tepco executive Masayuki Ono, who served as a spokesman at the news briefing Tuesday morning.

Tepco announced the loss of cooling functions shortly after 10 p.m. Monday, about three hours after the power went out, drawing criticism from the media.

Tepco said the information was withheld because it took several hours to figure out which equipment was affected by the power disruption.

Chief Cabinet Secretary Yoshihide Suga, meanwhile, sought to ease concern by assuring the public that the plant has backup equipment on hand for worst-case scenarios.

“We are preparing (backup safety) measures so that you don’t need to worry,” Suga told a news conference Tuesday morning.

According to Tepco, fire engines are deployed at the Fukushima plant, and other water pumps are available as well to inject water into any of the pools in the event the cooling equipment goes down for an extended period.

Radiation monitoring posts in and around the Fukushima plant showed no abnormal readings, according to both Tepco and the government.

But the current problem pulls back the curtain on the unreliability of the cooling systems at the Fukushima plant.

Containing 1,533 fuel assemblies, the reactor 4 pool is the hottest of the four. Its water temperature was estimated at 30.5 degrees at 10 a.m. Tuesday, and would rise 0.368 degree per hour while the cooling system is out, Tepco said.

At 100 degrees, the water would boil and evaporate. If all the water was lost, the fuel assemblies would melt down and the pool collapse, releasing vast amounts of radioactive material into the environment.

Tepco now plans to transfer all the fuel assemblies from the reactor 4 pool to the sturdier common pool by the end of this year.

But the cooling system for the common pool was also shut down by the recent power loss.

It is expected to take more than three decades to decommission the three troubled reactors at the Fukushima complex, which has six reactors. It has not been decided what will happen with the rest of the crippled plant. Tepco will have to keep the cooling systems running throughout the long process to prevent further meltdowns of the still-hot reactor cores.

Ono said that for now at least Tepco believes the makeshift switchboard either lost current or surged, tripping other switchboards and equipment connected to the network, and cutting power to the cooling systems.

PROMETHEUS TRAP/ 'Shadow units' (8): SDF unit commander angered at lack of warning at Fukushima No. 1 plant

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201303200010>

By HIDEFUMI NOGAMI/ Staff Writer

Editor's note: This is the eighth part of a new series that has run in the past under the title of The Prometheus Trap. This series deals with the secret missions assigned to the "shadow units" of the Ground Self-Defense Force when the Fukushima nuclear disaster was unfolding following the Great East Japan Earthquake of 2011. The series will appear on Mondays, Wednesdays and Fridays.

* * *

After surviving the explosion at the No. 3 reactor of the Fukushima No. 1 nuclear power plant on March 14, 2011, Col. Shinji Iwakuma, a unit commander within the Central NBC Weapon Defense Unit, headed for the central government's off-site command post.

First, Iwakuma had to undergo the decontamination process in the building next door. But he was fortunate to have escaped injury in the blast.

One of his unit members suffered a cracked spine, which would require one month to heal. Three other personnel suffered bruises. It was only later that Iwakuma learned that the unit member who was exposed to the highest radiation level totaled an exposure of 27.4 millisieverts.

After entering the off-site center, located five kilometers southwest of the plant, where a local response headquarters had been established to deal with the nuclear accident, Iwakuma was checked for radiation a number of times at the entrance. Even after showering eight times, he was unable to completely rid his body of radioactive materials.

A worker who was handling the radiation measurement suggested to Iwakuma that he wear protective gear, not to protect him from further exposure, but to prevent him from bringing the radioactive materials into the center.

Tables were arranged in a U-shape fashion in a large conference room. Iwakuma sat in the seat reserved for the individual with the least authority. The meeting began with six to seven participants, including Motohisa Ikeda, the senior vice minister of the Ministry of Economy, Trade and Industry, who was serving as head of the local response headquarters.

In addition to the protective gear, Iwakuma also wore slippers reserved for patients at a medical facility. He was the only one at the meeting dressed in that manner.

Officials of the Nuclear and Industrial Safety Agency and Tokyo Electric Power Co. spoke in a businesslike manner. While there was a brief mention of the explosion at the beginning of the meeting, most of the discussion focused on the situation at the reactor core and how to cool it.

Iwakuma was the last one allowed to speak.

He had spent many years in research and development of chemicals. His slim frame and the glasses he wore gave him the appearance of a quiet scholar. So, he took the others by surprise when he said in a stern tone, "It was my subordinates who were injured. Did you know beforehand that an explosion was possible or did it occur because of an error in how things were handled? Tell me which is it!" Silence fell over the meeting.

The meeting ended without any reply to Iwakuma's question.

Immediately thereafter, a TEPCO official ran up to Iwakuma and bowed. "I am truly sorry for the terrible thing that has happened," the official said.

The decision to have Iwakuma and his unit head for the No. 3 reactor was made earlier that morning. Ikeda made the request. "The situation is one which requires water to be pumped in immediately," he said. "The Self-Defense Force is the only one we can ask."

Before leaving for the reactor, Iwakuma asked TEPCO officials about the situation at the reactor. Although the details were unclear and radiation levels were high, a TEPCO official would guide the unit. The explanation was also made that workers were still at the site.

That led Iwakuma to conclude that the possibility of an explosion was low. Because of the urgency of the matter, his unit headed to supply water in a lightly equipped vehicle.

According to a recording of a TEPCO teleconference that was only released much later, white haze had formed at the No. 3 reactor from the afternoon of March 13, 2011. Because a similar chain of events occurred at the No. 1 reactor before an earlier explosion there, TEPCO officials were on the alert for an explosion at the No. 3 reactor.

However, that important piece of information was never given to Iwakuma.

PROMETHEUS TRAP/ 'Shadow units' (7): Reactor explosion heavily damaged SUV driven by SDF personnel

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201303180005>

By HIDEFUMI NOGAMI/ Staff Writer

Editor's note: This is the seventh part of a new series that has run in the past under the title of The Prometheus Trap. This series deals with the secret missions assigned to the "shadow units" of the Ground Self-Defense Force when the Fukushima nuclear disaster was unfolding following the Great East Japan Earthquake of 2011. The series will appear on Mondays, Wednesdays and Fridays.

* * *

The six personnel of the Ground Self-Defense Force's Central NBC Weapon Defense Unit were exposed to radiation as a result of the hydrogen explosion at the No. 3 reactor of the Fukushima No. 1 nuclear power plant on March 14, 2011.

They showered at the Fukushima prefectural environmental medical research institute in an attempt to wash away the radiation. Specialists from the National Institute of Radiological Sciences checked radiation levels in the room next to the showers.

"The radiation level still has not fallen," one specialist said.

The SDF member returned to the shower room for another round of washing and scrubbing.

"It's still high. One more time."

The soldier took another shower.

"Still not enough. There is still a lot of radiation around your face."

The unit commander, Col. Shinji Iwakuma, ended up **showering eight times**.

Because he had no clothes to wear, he put on new protective gear while wearing nothing underneath.

He looked around at the other personnel in his unit. While there was a soldier who was injured, they were all talking, so a relieved Iwakuma said, "I am glad to see that everyone is all right."

Iwakuma described the reactor explosion to Lt. Col. Kazunori Hishinuma, another unit member.

Iwakuma explained that to supply water to the No. 3 reactor to prevent a meltdown of its reactor core, he and another member headed for the Fukushima No. 1 plant in a retrofitted Pajero SUV, manufactured by Mitsubishi Motors Corp. The four other personnel followed in two five-ton water tankers.

At around 11 a.m., the group stopped next to the water supply pump near the No. 3 reactor. As they were about to open the door, the explosion occurred.

In addition to the blast, the force from the explosion blew the Pajero to the side. Chunks of concrete came raining down, cracking the vehicle windows and smashing through the canvas roof. Some of the larger chunks were 30 centimeters long. Gray smoke swirled in the area.

Iwakuma kicked the door out to escape the vehicle. The dosimeter was blaring away, a warning that accumulated radiation levels exceeded 20 millisieverts.

They tried using their radio to contact the off-site center, but could not get through.

"We will become exposed to radiation if we remain here for long," Iwakuma told the other personnel. "We are leaving the area."

Abandoning their vehicles, they walked back along the road they had traveled. There were a dozen or so plant workers also walking unsteadily away.

They spotted an abandoned truck with the keys still in the ignition. They loaded the plant workers onto the truck and received permission to have an SDF member drive it away.

They left the truck at the main gate because they felt they should not take the vehicle off the plant grounds. They hitched a ride in another truck that happened to pass by and finally reached the off-site center.

After Iwakuma concluded his explanation to Hishinuma, he said sternly, "Tokyo Electric Power Co. officials explained that the situation was not so dangerous that an explosion would occur. I wonder if TEPCO officials knew about the danger of an explosion. It would be a major problem if they had us go to the plant knowing about that danger."

"The plant has not yet been stabilized"

March 20, 2013

ANALYSIS: Cooling failure brings renewed criticism of lax TEPCO

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201303200086>

THE ASAHI SHIMBUN

Tokyo Electric Power Co. is facing sharp criticism both for its **delay in resolving the loss of cooling functions** at its Fukushima No. 1 nuclear power plant and for the lax practices that led to the scare.

The blackout cut power to cooling equipment at several nuclear fuel storage pools and had **the potential to become catastrophic**. With the cooling functions shut down, the temperature of the fuel rods in the pools could have risen enough to evaporate the cooling water, possibly leading to a meltdown of the fuel.

"This clearly shows that the plant has not yet been stabilized," said Shiro Izawa, who on March 10 became mayor of Futaba, one of the municipalities that hosts the plant.

TEPCO officials apparently were not seriously concerned by the possibility of a meltdown of fuel rods in the pools.

Though the company has taken measures to provide several backup electricity sources for the cooling of the reactors at the Fukushima No. 1 plant, it has not implemented such measures for the cooling equipment used in the storage pools. One reason is that utility officials apparently believe the rise in water temperatures in the event of a temporary blackout would be slower than that for reactors, meaning they will likely have more time to deal with a loss of power to the storage pool cooling equipment.

But at a March 19 news conference, Shunichi Tanaka, chairman of the Nuclear Regulation Authority, said TEPCO needed to take measures to ensure backup power sources for the cooling equipment.

At the same time, Tanaka indicated **there was a possibility of similar blackouts occurring in the future because the high radiation levels at the plant made it difficult to conduct reinforcement work**.

"What will be important is to implement measures to prevent fatal events from happening," he said.

Cooling functions at the No. 1 and No. 4 reactor storage pools were restored between noon and the evening of March 19, but resumption of cooling at the No. 3 reactor storage pool only came at about 10:40 p.m. Cooling of the common storage pool, which contains 6,377 fuel assemblies, the most of any storage pool at the plant, resumed at about 12:10 a.m. on March 20, some **29 hours after the blackout occurred.**

TEPCO officials believe the blackout, the longest since the March 2011 accident at the plant, was likely caused by a malfunctioning temporary switchboard. The switchboard is connected to the cooling systems for the No. 3 and No. 4 reactor storage pools and the cooling equipment for the common pool.

The malfunction also affected the switchboards used for the cooling equipment for the No. 1 reactor pool and a separate cooling system for the No. 4 reactor pool.

TEPCO officials said March 20 they found a charred terminal on the temporary switchboard believed to be the cause of the blackout. While a further investigation will be conducted to determine what caused the burning, officials suspect an overcurrent occurred.

To restore cooling functions, TEPCO had to bypass the temporary switchboard to route electricity to various equipment.

Because the switchboard is situated outside, its usage environment is less stable than ones used indoors. For that reason, TEPCO officials had planned to convert some of them to indoor switchboards by the end of March.

But such temporary equipment is still in use at the plant for other functions beyond the supply of electric power.

Local government leaders, meanwhile, criticized TEPCO for the slow manner in which it dealt with the blackout.

Katsunobu Sakurai, the mayor of Minami-Soma, located north of the plant, called TEPCO officials to the municipal government building and asked for an investigation into the cause of the incident, the rapid resumption of electricity and a speedy transmission of information.

"There were many people who were shaken by the news they heard," Sakurai told utility officials. "There is the possibility that some people who thought of returning in the new fiscal year will not be able to do so."

The Fukushima prefectural government also submitted a request to TEPCO to conduct a thorough investigation, restore electricity, diversify power source equipment and provide information on problems at the plant.

The longest previous blackout at the plant was about 10 hours. There have also been planned blackouts in the past when electricity was temporarily shut down to inspect switchboards.

For TEPCO it was just an "event", not an accident

March 21, 2013

Editorial: TEPCO must build system to prevent accidents

<http://mainichi.jp/english/english/perspectives/news/20130322p2a00m0na010000c.html>

On the evening of March 18, a major power cut hit Tokyo Electric Power Co. (TEPCO)'s Fukushima No. 1 Nuclear Power Plant, disabling nine facilities at the plant including equipment to cool pools of spent nuclear fuel. It took over 19 hours for all equipment to be restored to order.

The power outage is believed to have been caused by a short circuit that occurred when a rat found its way into a temporary switchboard. After more than two years following the March 11, 2011 earthquake and tsunami that crippled the plant, why has TEPCO not managed to create a system that could defend itself against such an incident? Apart from local residents, many other members of the general public were no doubt left wondering whether the power company should be left to handle the nuclear crisis.

TEPCO labeled the power cut an "event," not an "accident," but the international community has a strong interest in the state of pools containing spent nuclear fuel, and the issue is of concern to residents. We call on TEPCO to quickly step up measures to prevent a recurrence.

The pools whose cooling systems were knocked out contain some 9,000 rods of spent nuclear fuel. If the pools aren't cooled the water temperature rises. Left unchecked, this will eventually cause the water to evaporate, and, in a worst-case scenario, could lead to a meltdown.

The switchboard that short circuited had been brought in immediately after the outbreak of the nuclear crisis in 2011 and placed on the bed of a truck. Since it takes some time for the temperature of the water in spent fuel pools to rise, TEPCO had not prepared a backup system like those in place to inject water into reactor cores. Officials at the utility had planned to adopt measures this month.

The Fukushima nuclear crisis showed us the importance of having multiple layers of protection and diverse protection methods in place at nuclear plants. Officials were lax in not preparing a backup system. Many pipes, tanks and other equipment at the Fukushima No. 1 plant are merely temporary, as workers are still busy responding to the disaster. Officials must move to quickly upgrade this peripheral equipment.

In the latest incident, the temperature of the pools for spent fuel were kept below the prescribed level, but if officials are lax in maintaining some equipment on the grounds that it is merely peripheral, it could result in a major, unforeseen accident.

The Nuclear Regulation Authority (NRA) has set up a panel to screen the Fukushima decommissioning plans. The panel and TEPCO should use the power outage as a lesson to re-examine whether there are any holes in safety measures at the plant.

TEPCO is due to set up an "international advisory team" in the near future to gather technical advice and other recommendations from overseas experts on the decommissioning process. There is great significance in having third parties with experience and technical expertise check the decommissioning plans, and in publicly disclosing problems in an easily understandable format.

At the same time, TEPCO's delay in publicly announcing the power cut cannot be overlooked. The utility alerted the NRA soon after the outage, but waited an hour before reporting the problem to the Fukushima Prefectural Government and over three hours before telling the media. Does TEPCO answer to the public, or only to regulatory authorities? The latest incidents have probably only served to fuel residents' distrust in TEPCO. We want to see a response that places priority on the disclosure of information.

Has TEPCO find a loophole

March 22, 2013

Decontamination law loophole?

Tepco snubs ¥10.5 billion cleanup tab

Kyodo

<http://www.japantimes.co.jp/news/2013/03/22/national/tepcosnubs-%C2%A510-5-billion-cleanup-tab/#.UUxo5Tf1tEs>

Tokyo Electric Power Co. is ¥10.55 billion in arrears to the Environment Ministry over work to decontaminate land around the Fukushima No. 1 nuclear plant, government officials said Friday.

The sum is part of a total ¥14.9 billion the ministry asked Tepco to pay by February, based on a special law on decontamination enacted after the March 2011 meltdowns. **But its provisions do not clarify the extent to which the utility is obliged to pay back the money.**

Tepco has not yet agreed to pay back the ¥10.55 billion, with one of the company's officials saying it "cannot judge whether it is a demand based on the special law."

"We will continue to demand that (Tepco) pay the bills," Environment Minister Nobuteru Ishihara told a news conference Friday.

In November, the ministry demanded a combined ¥7.6 billion in decontamination costs through last August, but Tepco has only stumped up ¥1.7 billion for cleanup work the government has been directly in charge of.

The remaining ¥5.9 billion was used to subsidize work conducted by local governments and publicity-related expenses, but Tepco has yet to repay it.

The ministry then requested another ¥7.3 billion in February, for decontamination costs incurred between last September and November, but the utility has put a payment of ¥4.65 billion on hold.

The special law stipulates that Tepco will pay the costs for decontamination procedures. While the state initially pays for the work using taxpayer money, Tepco will ultimately be billed for the costs. However, indirect costs arising from the cleanup process are a gray area.

The law also calls on Tepco to make the payments swiftly after receiving a request. The ministry has continued to bill Tepco for the costs once the decontamination work is complete.

The Environment Ministry requested ¥199.7 billion for decontamination work in the supplementary budget for fiscal 2011 and ¥372.1 billion in the fiscal 2012 budget. **It is seeking a whopping ¥497.8 billion in the budget for the next fiscal year, which starts April 1.**

Separately Friday, Tepco agreed with the city of Kashiwazaki, Niigata Prefecture, home to its largest nuclear plant, to pay a spent nuclear fuel tax to the city for the next five years from fiscal 2013, which starts in April, the city said.

According to the city, revenue from the tax will mount to about ¥2.87 billion in the five years. The tax, at ¥480 per kg, is a key revenue that the city can use at its discretion.

Apologies - again

March 22, 2013

TEPCO apologizes for delay in reporting plant power outage

<http://mainichi.jp/english/english/newsselect/news/20130322p2a00m0na012000c.html>

Tokyo Electric Power Co. (TEPCO) apologized on March 21 for a delay of around three hours in reporting a power outage at the disaster-stricken Fukushima No. 1 Nuclear Power Plant that left it unable to cool spent nuclear fuel.

"We sincerely apologize. We are deeply regretful over the delay in reporting the incident and for causing anxiety to residents," said Yoshiyuki Ishizaki, representative of the TEPCO Fukushima recovery headquarters, at a press conference at the prefectural office in Fukushima.

The power outage occurred at 6:57 p.m. on March 18, stopping cooling systems for facilities including the number 1, 3, and 4 reactors' spent nuclear fuel pools. By 12:12 a.m. on March 20, power had been restored.

TEPCO notified the Fukushima Prefectural Government and the governments of 13 municipalities near the plant of the outage around one hour after it occurred, but it did not contact the media until around three hours after the outage.

"We were focused on finding out what was going on at the site, and did not think enough about prefectural residents. In the two years since the accident we thought we had prepared ourselves to quickly make announcements, but we will do so from now," said Ishizaki.

Meanwhile, the Nuclear Regulatory Agency on March 21 decided that it will call on TEPCO to speed up the implementation of additional power sources, installing long-term equipment, and improving its ability to recovery from power outages. The agency will consider specifically what to instruct at a meeting of experts on March 29, after receiving a report from TEPCO.

The agency took around three hours to announce the power outage after being notified of it by TEPCO, and has said that it will "endeavor to appropriately release information" from now on.

So many problems remain unresolved

EDITORIAL: Latest failure shows Fukushima crisis far from resolved

March 22, 2013

<http://ajw.asahi.com/article/views/editorial/AJ201303220053>

A power blackout at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear power plant resulted in a long stoppage in the circulation of water that cools spent fuel in several pools.

If the blackout had continued for days, the heat that the spent fuel constantly emits could have caused water in the cooling pools to evaporate, potentially resulting in accidents such as meltdowns and hydrogen explosions.

Fortunately, power was restored before it was too late, and the rise in water temperature did not go beyond 6 degrees at most.

But many people must have been alarmed.

The incident drove home the reality that even two years after the March 2011 disaster, the accident is still not over. Anxiety will continue until all fuel is removed. This is to be expected in a nuclear disaster.

Once again, the government and TEPCO are urged to step up efforts to eliminate unstable factors one by one.

The crippled nuclear reactors themselves have been fitted with backup power sources because even a short shutdown of cooling systems could cause them to return to the state of two years ago. But the fuel pools have no backup power sources.

Although the cause of the blackout has yet to be established, the possibility has arisen that a small animal, such as a rat, short-circuited a switchboard.

In building management, it is common practice to cover electrical systems with special nets to protect them from rodents. Such measures were not taken for the temporary switchboard, which was installed in May 2011, that caused the blackout.

Radiation levels in the nuclear complex remain high. The dose near the accident site is about 300 microsieverts per hour and workers are required to wear special protective clothing and full-face masks. Their work hours are restricted.

Priority is given to urgent work such as reinforcing pipes to cool reactors. Lower-priority tasks are inevitably put off.

But that is all the more why "such situations can happen again in the future," as Shunichi Tanaka, chairman of the Nuclear Regulation Authority, put it.

We must learn lessons from the incident so that we can deal calmly with future emergencies, by being prepared with a specially formed task force equipped with response measures.

What is troublesome is that conditions at the site change daily because of the various maintenance projects under way. This time, too, the blackout had a greater impact because two power networks that are usually independent from each other had been connected together. This was because of ongoing work to reinforce tsunami preparedness.

When multiple maintenance projects take place simultaneously, the risk of accidents rises. Therefore, what is indispensable is a system to constantly monitor the entire nuclear power plant as a whole.

Be that as it may, why did it take as long as three hours for TEPCO to inform media organizations about the blackout? Although the company had immediately reported the situation to the relevant central and local governments, if it is to inform the public at nighttime, it needs to do it through the media.

The mayor of Minami-Soma requested that TEPCO promptly pass on information.

The nuclear crisis is still ongoing. TEPCO should not forget that many people are watching closely.

--The Asahi Shimbun, March 22

The series will appear on Mondays, Wednesdays and Fridays.

* * *

The explosion that went off in the No. 3 reactor at the Fukushima No. 1 nuclear power plant on the morning of March 14, 2011, caused serious damage to the neighboring No. 2 reactor as well.

The electrical circuits were destroyed, making it impossible to let steam out of the reactor. Pressure inside the reactor core rose, while the water level fell. If the water level kept sinking, fuel rods would become exposed, possibly causing a core meltdown.

At 4 p.m. on March 14, Maj. Gen. Yuki Imaura, 54, vice commander of the Ground Self-Defense Force's Central Readiness Force (CRF), arrived at the disaster-stricken plant's off-site center, a facility used as an operational base for dealing with emergencies.

The off-site center, located five kilometers southwest of the plant, was used to house the government's nuclear emergency response headquarters. It served as the local headquarters for the battle against the galloping nuclear crisis.

Around the time Imaura arrived at the facility, the No. 2 reactor was in an increasingly dangerous situation. Exactly at 4 p.m., the prime minister's office became aware of the possibility that fuel rods in the reactor could become exposed.

As it turned out, Imaura stayed at the off-site center for only 18 hours until the government's crisis response headquarters were moved to the Fukushima prefectural government's building the following morning. The GSDF major general would never forget the stormy night he spent at the off-site center amid the chaos of responding to the nuclear disaster.

According to records left by Imaura, at 6:45 p.m., he went to the office of Motohisa Ikeda, senior vice minister of the Ministry of Economy, Trade and Industry, who supervised the headquarters. The office was a private room on the second floor of the building.

Ikeda convened an emergency meeting of top officials in the room. Besides Ikeda and Imaura, the meeting was also attended by Masao Uchibori, vice governor of Fukushima Prefecture; Shinichi Kuroki, deputy

director-general for nuclear power at the Nuclear and Industrial Safety Agency; and Akio Komori, a managing director at Tokyo Electric Power Co., the operator of the crippled nuclear plant.

“The No. 2 reactor is in a dangerous situation,” Komori said to Ikeda. “We are worried that the nuclear core may have started melting down” at the reactor. “The worst possible case could occur four hours from now,” he warned.

Komori’s dire warning prompted the attendees to consider moving the headquarters to a safe location. They chose the Fukushima prefectural government’s building, 60 kilometers from the plant, as the evacuation site.

But they didn’t determine when to start the evacuation and decided instead to dispatch an advance unit led by Uchibori to start preparations for the relocation.

The people who were at the meeting also heard the report that some 350 local residents appeared to be still within 20 kilometers from the Fukushima plant. But they didn’t discuss the evacuation of the residents.

At 8 p.m., a general meeting of all those working at the off-site center was held in a large room. Ikeda informed the staff of the decision about evacuating. Immediately after the meeting, Uchibori headed off to the prefectural government building.

At 12:30 a.m. on March 15, a radiation warning was announced over the facility’s public address system. “Radiation levels are rising. Put on a protective suit and a protective mask immediately,” the announcement said.

When SDF personnel asked TEPCO employees about radiation levels, they were told that the readings were 700 microsieverts per hour within the building and 1 millisievert outside.

At 2 a.m., the headquarters staff was instructed to take potassium iodine pills that could protect their thyroid glands if taken before or shortly after exposure to radiation.

After the advance unit left the off-site center, it was found that many people other than the members of the unit had also gone.

In a general meeting held before dawn on March 15, Ikeda raised his voice and said some people other than those who had been assigned to the unit had lost their nerve and left the facility.

“We have not decided to abandon this place yet,” he said. “Hold your ground and do your jobs,” he yelled.

Leaks about official inspections, misinformation and cover-up

March 23, 2013

Fukushima cleanup contractors told workers to lie about pay in 'surprise' inspections

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201303230057>

Contractors were tipped off about “surprise” inspections of decontamination work around the stricken Fukushima nuclear plant, giving them time to order workers to lie about hazard pay they weren’t receiving, The Asahi Shimbun learned.

One company official warned that failure to mislead the inspectors could cause every worker to lose financially.

The Ministry of Health, Labor and Welfare has inspected about 110 companies and confirmed that 11 withheld hazard pay from their workers. The ministry's inquiries came after The Asahi Shimbun reported on Nov. 5 that contractors in the radioactive cleanup work were apparently pocketing the taxpayer-funded daily hazard allowance of up to 10,000 yen (\$106).

The number of confirmed nonpayment cases could increase.

The labor ministry plans to question contractors and other parties connected to the suspected cover-ups, which may constitute a violation of the Labor Standards Law or "coercion" as defined in the Penal Code.

The ministry also plans to review the inspection methods to prevent further information leaks.

"It would be a problem if there was a cover-up," said an official with the ministry's Labor Standards Bureau. "We will be conducting full and true snap inspections in the future."

The Asahi Shimbun obtained a document that Maeda Corp., a general contractor that won a contract for cleanup work in Naraha in Fukushima Prefecture, distributed to its subcontractors on or around Nov. 12. It states clearly that inspectors of the Tomioka Labor Standards Inspection Office would visit on Nov. 15 and directly ask workers if they were receiving the hazard pay.

The document mentioned "eight lunchboxes," an apparent reference to the eight inspectors expected.

On Nov. 14, officials of different subcontractors were summoned to a Maeda conference room on the work site. They were told to instruct the cleanup workers to tell the inspectors that they were receiving the special allowances, an official with one of the subcontractors said.

The subcontractors were also told which company would come under heavy scrutiny, the official added.

The information in the document was accurate. Eight inspectors arrived at the decontamination work site around 10:30 a.m. on Nov. 15.

All 20 or so workers said they were receiving the hazard pay.

One worker told The Asahi Shimbun that a subcontractor instructed him to tell the labor standards inspectors that he was receiving the allowances, although he was not.

At least one other worker said he had a similar experience.

Tatsuo Ito, director of the Tomioka Labor Standards Inspection Office, said he was the one who told Maeda about the planned inspection.

"I informed Maeda officials verbally about a week in advance to have them prepare the necessary documents," Ito said. "It was inappropriate for them to learn about our intention to interview the workers directly."

A Maeda representative acknowledged the company created the document but denied Maeda employees ordered a cover-up.

Information also leaked on a supposedly "surprise" inspection by the Koriyama Labor Standards Inspection Office in Tamura on Dec. 6.

"The leak probably occurred on the day of the inspection, after we had arrived at the work site," said a representative of the Koriyama Labor Standards Inspection Office.

A worker recorded the words of an official of one subcontractor after he summoned about 30 workers just before the inspection began. The official offered specific advice on how the workers should misinform the inspectors.

"You workers will likely be interviewed on an individual basis," the official was recorded as saying. "I'd be pleased if you told (the inspectors) the full amount, not the actual amount you are receiving. Your take-home pay does not include fees for room and board. The correct answer is 15,700 yen, which is the minimum wage plus the allowances."

The official also implied that all jobs would be lost if the illegal siphoning-off practice came to light. "Each of you may have your own questions, but I hope you will behave in consideration of what could happen to other people," the official said.

The subcontractor in question said the matter is "under review."

Subcontractors were earlier found to have been cutting corners in the decontamination project by dumping radioactive debris back into the environment.

It was a big mistake

March 25, 2013

Ministry ignored call to enhance Fukushima off-site center

The Yomiuri Shimbun

<http://www.yomiuri.co.jp/dy/national/T130324002698.htm>

The industry ministry failed to improve nuclear protection at an off-site center (OFC) of the crippled Fukushima No. 1 nuclear power plant at the request of the internal affairs ministry because it assumed a similar crisis at the plant was not possible, according to government sources.

The Internal Affairs and Communications Ministry pointed out two years before the outbreak of the nuclear crisis at the plant in March 2011 that the OFC, which is supposed to serve as a control center during a nuclear disaster, had such flaws as insufficient protection against radioactive substances.

The Economy, Trade and Industry Ministry instead prepared a list of anticipated questions and planned answers to emphasize the safety of the OFC, according to documents released by the ministry after an information-disclosure request by The Yomiuri Shimbun.

An OFC is meant to serve as a countermeasure headquarters in the event of a nuclear crisis. OFCs have telecommunications equipment and computer terminals with systems for simulating nuclear accidents. The OFC of the Tokyo Electric Power Co. plant became inoperative after the crisis due to high radiation levels.

As the ministry's inaction relied on the "myth of nuclear plant safety," questions are emerging as to the laxness of safety standards and responses at the time.

===

Myth of safety

In February 2009, the internal affairs ministry asked the industry ministry to improve nuclear safety measures at five nuclear plant OFCs within 10 kilometers of the Fukushima plant, Tohoku Electric Power Co.'s Onagawa plant, Chubu Electric Power Co.'s Hamaoka plant, Hokuriku Electric Power Co.'s Shika plant, and Shikoku Electric Power Co.'s Ikata plant.

The ministry pointed out that as the OFCs did not have ventilation systems with air-cleaning filters, there was a risk that radioactive substances could flow into the facilities during a nuclear disaster.

According to one document from March 2009, the industry ministry's defunct Nuclear and Industrial Safety Agency (NISA) discussed how to respond to the internal affairs ministry's recommendation.

At the time, NISA officials used as a reference the government's nuclear disaster prevention guideline, which mentioned the 1986 disaster at Chernobyl nuclear power plant in the former Soviet Union. The disaster, in which a massive amount of radiation was scattered, was designated a Level 7 nuclear crisis, the most severe rating for nuclear accidents at the time.

As the guideline stipulated that Chernobyl "was an accident that occurred at a nuclear plant with different design concepts from Japan's," **the then economy ministry concluded "Japan does not need to assume" the possibility of a nuclear accident on a similar scale.**

Six months after the internal affairs ministry's request, the economy ministry replied that "ventilation [of the OFCs] would be halted to keep the inside airtight," on the assumption that radioactive discharge would occur for a short time even if a nuclear incident occurred.

The economy ministry's explanation of the safety of the OFCs was aimed at alleviating concerns from officials of local governments hosting nuclear power plants. The planned answers included such phrases as "filters aren't needed," and "the OFCs have no flaws."

===

'It was a big mistake'

In the aftermath of the Fukushima nuclear disaster, radiation levels rose in the Fukushima No. 1 plant's OFC about five kilometers away, as the facility's backup generator had been damaged by the preceding earthquake on March 11, 2011.

NISA and other officials who were stationed in the OFC evacuated to the city of Fukushima, about 60 kilometers from the plant, four days after the outbreak of the crisis.

Incorporating lessons learned from the disaster, in September 2012, the government set a new guideline making the installation of radiation filters and other safety equipment mandatory for OFCs-- improvements that were already pointed out by the internal affairs ministry.

"The safety guideline at the time stipulated that 'It is very unlikely that an accident similar to the Chernobyl disaster will occur,'" a former NISA official told The Yomiuri Shimbun. "We followed the view. However, it was a big mistake."

The OFCs were set up in the wake of a 1999 criticality accident caused by JCO Co. in Tokai, Ibaraki Prefecture.

Sixteen OFCs were set up in 16 commercial nuclear power plants and six in other nuclear facilities, such as a reprocessing plant for spent nuclear fuel.

PROMETHEUS TRAP/ 'Shadow units' (10): SDF general left food for pets at Fukushima

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201303250001>

By HIDEFUMI NOGAMI/ Staff Writer

Editor's note: This is the 10th part of a new series that has run in the past under the title of The Prometheus Trap. This series deals with the secret missions assigned to the "shadow units" of the Ground Self-Defense Force when the Fukushima nuclear disaster was unfolding following the Great East Japan Earthquake of 2011. The series will appear on Mondays, Wednesdays and Fridays.

At dawn on March 15, 2011, Maj. Gen. Yuki Imaura, vice commanding general of the Ground Self-Defense Force's Central Readiness Force, was in the dining room on the first floor of the off-site center for the Fukushima No. 1 nuclear power plant when he twice heard a loud boom and then felt the room shaking.

As it turned out, the explosions occurred in the No. 4 reactor at the crippled plant.

At 6:40 a.m., top officials at the headquarters gathered in the room of Motohisa Ikeda, senior vice minister of economy, trade and industry, who was leading the crisis response task force.

Imaura proposed compiling a list of conditions that should trigger a withdrawal of the headquarters staff from the off-site center, which was being used as the operational base for the government's nuclear emergency response headquarters.

Ten minutes later, Akio Komori, managing director of Tokyo Electric Power Co., the plant operator, presented to the top officials a piece of paper on which three sentences had been scribbled down.

1. Pressure levels within the No. 2 reactor's pressure vessel and containment vessel exceed the design limits.

2. Radiation levels in areas surrounding the off-site center rise above 500 microsieverts per hour.

3. An explosion, a fire or other emergency situation takes place at the No. 2 reactor.

It was decided that the entire headquarters staff would be evacuated from the off-site center to the Fukushima prefectural government's building if all the three conditions were to occur.

At 8:35 a.m., someone shouted that the three conditions were all met.

"We are withdrawing now and going to the prefectural office," Ikeda shouted in the large room.

TEPCO employees and officials from the Nuclear and Industrial Safety Agency working at the off-site center moved quickly. Who should get on which vehicle had been determined in advance.

Imaura saw Ikeda, sitting in the backseat of a van, salute him.

The vehicles left the facility around 9 a.m., if Imaura remembers correctly.

Imaura remained at the center.

In the dining room, he found half-eaten canned provisions and chopsticks abandoned in the middle of breakfast. He put them in a garbage bag and walked around the center, turning off lights.

As his last act, Imaura placed a cardboard box outside the center building. Inside the box were four days worth of portable emergency provisions for five SDF officials, including Imaura.

He decided to leave the food for dogs and cats that had been left behind. He himself kept a dog, a miniature dachshund. It was painful for him to see many now homeless dogs and cats strolling around deserted towns and villages within 10 kilometers of the disabled nuclear power plant.

Imaura opened one pack of sukiyaki so that animals could recognize the provisions as food.

At 10 a.m., Imaura and four other SDF members left the off-site center in a converted Mitsubishi Pajero SUV.

As they were traveling through the town of Futaba, where part of the Fukushima No. 1 nuclear plant is located, a man in his 70s came out of a private residence and called to them. The man said he and his wife had failed to escape with other residents of the town. Both of the old couple were carrying one large piece of baggage each.

Imaura put some equipment in the vehicle down onto the road and let the two elderly residents get into his vehicle and transported them to an evacuation center.

Imaura and his team arrived at the Fukushima prefectural office at 4 p.m., just 24 hours after he had pulled up to the off-site center.

NRA wants to start charging for documents

March 24, 2013

Criticism arises over nuclear agency's fees to view documents

<http://mainichi.jp/english/english/newsselect/news/20130324p2a00m0na006000c.html>

Criticism has arisen over a decision by the secretariat to the Nuclear Regulation Authority (NRA) to charge a fee to view nuclear power-related documents that were previously free, in a move that goes against the agency's policy of information transparency.

The change occurred in September last year when the agency was created and inherited the documents -- around 40,000 binders of files such as application forms for the construction and operation of nuclear plants and safety evaluation forms -- from a nuclear power resource center that it replaced. The center had made the documents available for browsing by the public, but under the NRA secretariat they are now kept in storage and have to be specifically requested to be seen.

According to the NRA secretariat's general affairs department, the Tokyo building the agency resides in lacks the facilities to accept visitors wanting to see the documents, and in order to allow them to be read, it followed procedures under the Freedom of Information Act that designated the resources as "administrative documents," which cost money to view. Those wanting to view the documents have to write their name and address on a request form and pay a 300-yen fee. In addition to users having to specify the documents they want, it can take up to 30 days until they are able to see them.

At the time of its founding, the agency decided on a policy of transparency, saying it would "voluntarily release information without waiting for requests from citizens."

An official of the agency's general affairs department said, "The charging of fees was due to the absence of facilities for visitors and was unavoidable, but we apologize. We would like to quickly set up the necessary facilities, but there is no prospect for it."

Yukiko Miki, head director of an NPO that seeks information transparency, said, "The NRA secretariat's actions and its stated policy do not match. They should quickly secure the budget and administrative means to publically release the documents."

Over 10 billion yen in unpaid decontamination expenses

March 23, 2013

TEPCO owes over 10 billion yen to gov't in unpaid decontamination costs

<http://mainichi.jp/english/english/newsselect/news/20130323p2a00m0na010000c.html>

Tokyo Electric Power Co. (TEPCO) owes 10.5 billion yen to the Ministry of the Environment in unpaid expenses for decontamination of radioactive materials emanating from the Fukushima No. 1 nuclear power plant, it has been learned.

TEPCO is required under a special measures law to shoulder the costs for the decontamination work. The Environment Ministry has asked the utility to pay 14.9 billion yen in decontamination-related expenses, but most of the amount remains outstanding.

"It is necessary to scrutinize whether the (ministry's) request is in accordance with the law," TEPCO was quoted as telling the ministry.

The central government has on behalf of TEPCO been paying the costs of decontamination work carried out by the central and local governments. In November last year, the Environment Ministry demanded TEPCO pay a total of 7.6 billion yen -- including 1.7 billion yen in expenses for decontamination work in specially designated areas -- but TEPCO has thus far paid only the 1.7 billion yen.

Although the ministry filed an additional payment request of 7.3 billion yen with TEPCO in February this year, the utility has paid only 2.6 billion yen and has reportedly held back payment of the remaining amount.

Puppet show orchestrated by TEPCO

March 25, 2013

'Housewives' educating children on energy linked to TEPCO PR firm

<http://mainichi.jp/english/english/newsselect/news/20130325p2a00m0na010000c.html>

A puppet theater troupe advertising itself on its website as "started by a group of housewives concerned about energy" was in fact founded by staff from Tokyo Electric Power Co. (TEPCO)'s PR firm, the Mainichi has learned.

According to the website of the puppet theater troupe in question -- Kappa no Kawataro Ichiza -- in 2000 a group of housewives set up an online "energy club" to exchange their views on energy after taking their "children to visit a nuclear power plant and discovering the great efforts being taken to supply energy to private households."

The puppet troupe was launched after club members decided they "wanted to pass on the importance of energy to (their) children," the website continues. In 2002, the troupe was certified as the Japan Industrial Location Center (JILC)'s "energy theater caravan nonprofit organization project."

According to a leading member of the group, however, **all five members of the troupe belong to a research firm doing publicity work for TEPCO. Their PR work involves holding parties at their homes for fellow housewives and informing participants of the necessity of nuclear power. One troupe member threw approximately 300 such parties at her home.**

Upon hearing from participants at the parties that they wanted their children to learn the same information, the group responded to a JILC call for theater troupes to educate young children about energy. Group members said they made a presentation at the Agency for Natural Resources and Energy -- which commissioned the JILC competition -- before the public competition, and were promised assistance on the spot. The members did not explain, however, whether they went to the agency on their own initiative or were encouraged by another party to do so.

One puppet show plot entails "kappa," a creature from Japanese folklore, receiving a letter from a polar bear asking for help. The kappa set out to find that melting ice has separated a baby polar bear from its mother. While the mother and cub are reunited, the kappa are dumbfounded to hear about global warming. Another of the group's shows features a trip to the Edo period (1603-1868) in a time machine to get a glimpse of life without electricity and an understanding of how convenient life has become because of it.

Through 2005, the troupe received up to 2.5 million yen a year in assistance as part of the agency and JILC program, **performing at schools in areas hosting nuclear power stations, and at events in the Tokyo metropolitan area.** Each member received 7,000 yen per performance. After financial assistance subsequently plummeted to 600,000 yen per year, however, the group chose to cut off its affiliation with the project. Since the March 2011 Great East Japan Earthquake, the troupe has performed for children at the request of the Atomuseum in Niigata Prefecture.

The members admit to some feelings of discomfort with their dealings with TEPCO PR officials.

"TEPCO employees sometimes come to our parties for training, but they say they want us to keep their presence a secret from the people we've invited," one member said. "There are things (TEPCO) won't tell even us."

Some will never learn

March 25, 2013

Utilities gave money to group led by atomic energy commissioner even after Fukushima disaster

<http://mainichi.jp/english/english/newsselect/news/20130325p2a00m0na014000c.html>

Power industry entities such as Tokyo Electric Power Co. (TEPCO) and the Federation of Electric Power Companies of Japan (FEPC) have extended large sums of money to a nonprofit organization led by Etsuko Akiba, a commissioner of the Japan Atomic Energy Commission (JAEC), the Mainichi has learned.

The nonprofit group, ASCA Energy Forum, based in Tokyo's Chuo Ward, has received at least 18 million yen from TEPCO, the FEPC and others even after the outbreak of the nuclear crisis at TEPCO's Fukushima No. 1 nuclear plant.

The revelation comes after the resignation of Akira Omoto, a former TEPCO executive, as a JAEC commissioner for having accepted advisory fees from TEPCO even after the Fukushima disaster triggered by the March 11, 2011 Great East Japan Earthquake and tsunami. Omoto, 64, stepped down after Prime Minister Shinzo Abe said it was hard for his government to gain the public's understanding of Omoto's action.

Akiba, 64, established ASCA Energy Forum in 2001 when she was a consumer advocate. The group acquired NPO status in 2003 and Akiba quit as its chief after assuming a JAEC commissioner post in January 2010. However, she has stayed on with the NPO as an adviser.

In business reports submitted to the Tokyo Metropolitan Government, ASCA Energy Forum posted 20-40 million yen in annual revenue from fiscal 2009 to 2011, mainly from TEPCO, the power federation and related sources, according to ASCA officials. Even after the Fukushima catastrophe, ASCA registered revenue of over 22.8 million yen in fiscal 2011, including over 6 million yen from the federation, over 1.63 million yen from TEPCO and about 2.5 million yen from the Japan Atomic Energy Relations Organization (JAERO).

JAERO is an incorporated foundation created by the atomic power industry and academia to promote public understanding of nuclear power. It is now headed by a former executive of Chubu Electric Power Co. and its executive director is a former official of Kansai Electric Power Co.

In fiscal 2012, ASCA has received at least 18 million yen from the utilities industry, including more than 6 million yen from the power federation and about 1.5 million yen from JAERO. Despite its status as a nonprofit organization, ASCA chalked up net assets of over 38 million yen at the end of fiscal 2011.

Armed with these funds, ASCA has conducted study session primarily aimed at housewives on nuclear power plants and radiation, and published a journal. It was entrusted with consumer questionnaires from TEPCO, for which it received 800,000 yen a month through May 2011 and 9.6 million yen annually in fiscal 2009 and 2010.

In addition, ASCA has received an order for subcontract work to foster public understanding of high-level nuclear waste as an entity authorized by the Economy, Trade and Industry Ministry, getting about 10 million yen in fiscal 2011. Certain details about the subcontract deal have been made public, but ASCA has not disclosed funds received from TEPCO, the power federation or JAERO.

ASCA's secretariat says it cannot identify its partners but has briefed these partners on the ASCA's projects while releasing business reports. It also says it has provided venues for neutral study and its activities do not reflect the intentions of the power industry.

The secretariat also says Akiba works with no remuneration and is consulted only in a pinch because of her in-depth knowledge and network.

JAERO says it has entrusted ASCA with activities within the scope of funds it has given the nonprofit group, while TEPCO and the power federation declined to comment on individual dealings. Akiba has declined to respond to repeated requests for comment.

ASCA & nuclear waste project

March 26, 2013

Atomic energy bigwig's NPO favored for nuke waste disposal project

<http://mainichi.jp/english/english/newsselect/news/20130326p2a00m0na011000c.html>

A nonprofit organization set up by Etsuko Akiba, commissioner of the Japan Atomic Energy Commission (JAEC), has received exclusive orders from a government-authorized corporation for a nuclear waste disposal project she played a part in introducing, it has been learned.

The scheme -- called "high-level nuclear waste workshop project" and run by the Nuclear Waste Management Organization of Japan (NUMO) -- was deliberated on and introduced by a government energy committee when Akiba was a committee member before she joined JAEC. Her NPO group, ASCA Energy Forum based in Tokyo, has received exclusive orders from NUMO, a corporation authorized by the minister of economy, industry and trade.

Because NPOs cannot accept orders directly from NUMO, ASCA Energy Forum has received orders for the project by way of a third-party contractor. Despite a change in original contractors, however, ASCA Energy Forum has continued to receive the orders as a sole subcontractor. The amount of the order totals more than 140 million yen over the past six years.

The revelation comes in the wake of the disclosure that power industry entities such as Tokyo Electric Power Co. and the Federation of Electric Power Companies of Japan have extended large sums of money to Akiba's NPO.

The nuclear waste workshop project was brought forth after the Kochi Prefecture town of Toyo withdrew its application in April 2007 for a feasibility survey for setting up a nuclear waste final disposal site in the town following residents' protests. In November that year, the nuclear waste subcommittee under the Agency for Natural Resources and Energy's Advisory Committee for Natural Resources and Energy recommended the introduction of the project, citing the necessity of creating a venue for learning about nuclear waste disposal at grass-roots level. At the time, Akiba was serving as a member of the nuclear waste subcommittee and supported the project initiative, stating at a meeting in September that year, "I was disappointed at the Toyo town's withdrawal. I want public relations for the entire nation to be enhanced." At the time, Akiba was also doubling as a member of NUMO's committee for adjusting disclosure of information.

According to NUMO and other sources, the project was launched in February 2008 and was on a free contract basis with planning competitions among two to five corporate applicants a year until fiscal 2010. Although NPOs cannot apply, the ASCA Energy Forum joined hands with the Japan Productivity Center (JPC), a public interest incorporated foundation, to receive the order, **with JPC serving as an original contractor and ASCA as a subcontractor**. In fiscal 2011 on the heels of the Great East Japan Earthquake, **JPC and ASCA were jointly awarded the project order without competition**.

After JPC withdrew from energy projects in fiscal 2012, ASCA teamed up with an advertisement company in Tokyo, with the latter successfully bidding for the project at some 40 million yen.

Under the project, the original contractor secured venues for workshops on nuclear waste while the NPO solicited participants through its networks and took charge of event proceedings. According to sources close to ASCA, it received some 10 million to 20 million yen a year in operating expenses.

"Basically, the project utilizes the networks of NPOs. Because JPC had affiliations with ASCA, we received its application for the project," said a representative of NUMO. Asked why ASCA continues to exclusively receive the orders, the representative said, "It is possible that past achievements are taken into account during screening. The ad agency (that participated in the fiscal 2012 bid) may have also thought it would be able to carry out the project with confidence if it teamed up with ASCA."

Meanwhile, the secretariat of ASCA Energy Forum said, "There were no advance consultations or prearrangements with NUMO." Akiba has declined to respond to interviews by the Mainichi.

Asahi - Shadow Units (11)

March 27, 2013

PROMETHEUS TRAP/ 'Shadow units' (11): You're specialists, shoot water into the reactor

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201303270012>

By HIDEFUMI NOGAMI/ Staff Writer

Editor's note: This is the 11th part of a new series that has run in the past under the title of The Prometheus Trap. This series deals with the secret missions assigned to the "shadow units" of the Ground Self-Defense Force when the Fukushima nuclear disaster was unfolding following the Great East Japan Earthquake of 2011. The series will appear on Mondays, Wednesdays and Fridays.

On March 15, 2011, when the government's nuclear emergency response headquarters was moved to the Fukushima prefectural government's office, it also ushered in a new phase for dealing with the galloping nuclear crisis by both the prime minister's office and the Defense Ministry.

Early in the morning of that day, Prime Minister Naoto Kan stormed into Tokyo Electric Power Co.'s head office in Tokyo and set up integrated government and TEPCO headquarters for responding to the nuclear disaster, triggered by the Great East Japan Earthquake and tsunami.

Around that time, the United States was urging Japan to make truly national efforts to contain the crisis, including the use of Self-Defense Forces, instead of leaving it to the utility to bring the emergency under control.

The "shadow units" of the Ground Self-Defense Force's (GSDF) Central Readiness Force (CRF) were to play the leading role in the government's response to the nuclear disaster.

The 1st Helicopter Brigade of the CRF was deployed to spray water on the overheating reactors at the Fukushima No. 1 nuclear power plant from the sky. On March 16, the brigade was forced to abort the operation to dump water onto the No. 3 reactor. But the unit succeeded in its mission on the morning of the following day, March 17.

That day, attempts were also made to spray water on the reactor from the ground.

Kan, 66, asked Tokyo Gov. Shintaro Ishihara, 80, to deploy the Tokyo Fire Department for emergency operations at the Fukushima nuclear plant.

The Metropolitan Police Department dispatched a riot police unit on a high-pressure water-cannon truck. The SDF unit assigned to the dangerous mission was the Central Nuclear Biological Chemical Weapon Defense Unit, under the command of Lt. Col. Kazunori Hishinuma.

A total of 11 SDF fire engines had been moved to Fukushima from around the country. Of the 11 vehicles, Hishinuma picked five that had the capability of shooting water over a longer range.

On the evening of March 17, the SDF fire engines left the J-Village, a sports complex being used as a base for operations to deal with the crisis, accompanied by chemical protection vehicles. Equipped with an air cleaning system, these vehicles can move freely even in polluted areas.

From the window of the fire engine, Hishinuma saw an eerie landscape. Towns and villages were totally deserted, with no lights or people to be seen.

The landscape reminded Hishinuma of the scene following the sarin nerve gas attack against the Tokyo subway system, perpetrated by the Aum Shinrikyo doomsday cult, on March 20, 1995.

On that day, Hishinuma, clad in a chemical protective suit, rushed to the Kodenmacho Station of the subway Hibiya Line and sprinkled a decontamination agent onto the platform and train cars and then scrubbed them with a brush.

It was eerily silent within the station. As Hishinuma remembered the profound silence, strangely, calmness descended upon him.

On the night of the day, Hishinuma's unit arrived at the disaster-stricken nuclear power plant and entered the crew room near the front gate. There were three TEPCO employees wearing white protective suits with their family names written on their left chest.

When he asked them how to access the reactor, they said there was no way to approach the reactor because the entire area was strewn with rubble.

It was decided that the SDF fire engines would line up from some 100 meters from the No. 3 reactor and move close to the reactor one by one to spray water at point-blank range.

When a fire engine sprays water on the reactor, it would be flanked by two chemical protection vehicles serving as a shield from radiation.

The fire engines would be manned by Ground, Maritime and Air Self-Defense Force members trained for fighting fires aboard SDF aircraft. In the crew room, Hishinuma gave them instructions.

He told them that there was no doubt a hole on the building housing the No. 3 reactor.

"You are firefighting specialists, so spray water precisely into the hole," he told them.

At 7:35 p.m., water nozzles were raised and directed toward the reactor building from one of the fire engines. The loudspeaker of a chemical protection vehicle blared, "Shoot."

As the fire engine shot water toward the reactor, the crew saw steam rise from the building.

"Back down," the loudspeaker cried out.

At 8:09 p.m., the fifth and last fire engine finished spraying water on the reactor. Thirty-five tons of water had been released from the five vehicles.

New investigation by NRA could take decades

March 27, 2013

Japanese regulators to investigate nuclear crisis

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201303270097>

THE ASSOCIATEDPRESS

Japanese government regulators say they'll conduct their first investigation into the country's nuclear crisis to address key unanswered questions.

Several groups have published findings of their own investigations into the Fukushima No. 1 nuclear power plant, which was ravaged by the March 2011 earthquake and tsunami. Previous investigations have largely blamed the disaster on botched crisis management, government-industry collusion and the tsunami.

But questions remain, and experts still suspect that the quake, not the tsunami, may have triggered a meltdown at the plant. This is a key point that could affect anti-quake measures at nuclear facilities nationwide.

The Nuclear Regulation Authority said on March 27 that its investigation will start by the end of April and **could take decades** because parts of the plant are in such poor condition.

Another NPO offering pronuke propaganda

March 29, 2013

KEPCO-funded NPO seen as nuclear power propaganda tool

<http://mainichi.jp/english/english/newsselect/news/20130328p2a00m0na010000c.html>

Kansai Electric Power Co. (KEPCO) pays over 20 million yen a year to support the activities of an Osaka city NPO that appears to spread nuclear power propaganda, it has been learned.

The NPO is called "Josei Shokuno Shudan WARP-LEENET," and was founded in July 1993, mostly by housewives who participated as public monitors in a KEPCO PR event. It achieved corporate status in July 2001.

Every year, the NPO holds educational lectures for groups of around 100 people, and it advertised them in newspapers and on an informational website set up by KEPCO geared mainly for housewives until the site was shut down in February.

The newspaper ads tout the lectures as being about energy resources, including bus tours and cooking classes using electric cookers. The ads mention nothing about nuclear plants, but according to the blog of

someone who participated, they toured nuclear plant facilities in Fukui Prefecture, and were also served luxury Japanese cuisine on the tour.

For people who finish taking the lectures, the NPO offers a chance to join more in-depth study groups on nuclear power, radiation and other such themes. According to the NPO's representative, Chiiko Inoue, KEPCO covers over 20 million yen of its annual expenses of around 45 million yen.

"Receiving requests to handle certain duties and receiving money for those duties as we do is no different than what an advertising agency does. The lectures are not only about nuclear power, and we do not show favor to nuclear power, either," Inoue says. However, the NPO's website heavily featured nuclear power-related events, and soon after a Mainichi reporter pointed that out in January this year, the site was taken down.

Inoue was also a member of a committee that worked on a nuclear power policy outline passed by a Cabinet decision in October 2005. In August the same year at a public hearing on the outline in Fukui, a few dozen senior members of the NPO attended, and one spoke out and called for more pro-nuclear power advertising.

A representative of KEPCO's PR office said the company agrees with and supports the NPO's educational activities, saying, "We are providing a proper amount of funds in accordance with our support." However, the representative also said that as the company is in the middle of streamlining its finances, it could reconsider the funding.

Inoue complained, "The funding might be cut, and if that happens, we won't be able to hold the lectures."

Yes, nuclear power IS expensive

Idled reactors still cost utilities 1.2 tril. yen per year: gov't

<http://mainichi.jp/english/english/newsselect/news/20130329p2g00m0dm031000c.html>

TOKYO (Kyodo) -- Japan's nine utilities that own nuclear power plants need a total of 1.2 trillion yen a year just to maintain their idled reactors, a government estimate showed Thursday.

Anti-nuclear lawmakers disclosed the estimate by the Ministry of Economy, Trade and Industry at a meeting in Tokyo. The power companies cannot avoid huge costs associated with the nuclear plants, even if they are offline, as they are unable to slash personnel expenses and allowances for depreciation immediately.

In the estimate, compiled at the request of the lawmakers, the ministry did not reveal the amount of money each utility needs for the maintenance of idled reactors.

In any case, the nine regional firms include nuclear-related expenses in their bills, meaning that **consumers ultimately have to shoulder such costs.**

Currently, 48 of Japan's 50 functional commercial reactors are offline amid heightened concerns over the safety of nuclear energy in the wake of the 2011 Fukushima disaster.

Idled reactor upkeep bleeding utilities by ¥1.2 trillion

Kyodo

<http://www.japantimes.co.jp/news/2013/03/29/business/idled-reactor-upkeep-bleeding-utilities-by-%C2%A51-2-trillion/#.UVXJ6Df1tEs>

The nine utilities that own nuclear power plants need a total of ¥1.2 trillion a year just to maintain their idled reactors, according to the latest government estimate.

Antinuclear lawmakers disclosed the estimate, which was developed by the Ministry of Economy, Trade and Industry, at a meeting Thursday in Tokyo.

The power companies can't avoid the huge costs associated with their nuclear plants as they are unable to immediately slash personnel expenses or write off depreciation fees.

In the estimate, compiled at the request of the lawmakers, METI did not break down how much money each utility needs to maintain the reactors.

All nine firms include nuclear-related expenses in their billing, meaning consumers ultimately have to shoulder such costs.

Forty-eight of Japan's 50 functional commercial reactors are offline amid heightened concerns over the safety of nuclear energy in light of the Fukushima triple-meltdown disaster, which started in 2011. The reactors also face new safety standards.

PROMETHEUS TRAP/ 'Shadow units' (12): Should SDF really take over fire department's task?

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201303290006>

BY HIROYOSHI ITABASHI / Staff Writer

Editor's note: This is the 12th part of a new series that has run in the past under the title of The Prometheus Trap. This series deals with the secret missions assigned to the "shadow units" of the Ground Self-Defense

Force when the Fukushima nuclear disaster was unfolding following the Great East Japan Earthquake of 2011. The series will appear on Mondays, Wednesdays and Fridays.

* * *

A week after the March 11 Great East Japan Earthquake, the site of the Fukushima No. 1 nuclear power plant was a scene of utter chaos.

The grounds were clogged with fire engines, heavy machinery, transport vehicles and other types of machines and vehicles belonging to police, the fire department, the Self-Defense Forces and Tokyo Electric Power Co.

The compound was also teeming with people from these organizations.

On March 17, 2011, the previous day, the SDF and police had carried out operations to spray water on the overheating No. 3 reactor from the ground. High-pressure water cannon trucks were used for the operations.

In order to prevent the crippled reactors from spiraling out of control, various organizations had deployed a broad array of vehicles and machinery to the Fukushima plant.

But there was no one who was supposed to take command of all the organizations to lead the efforts to contain the nuclear crisis.

Concerned about the situation, the prime minister's office on that day issued a directive that the SDF should supervise the operations at the plant.

The principal reason for the government's decision was that the SDF had accumulated much experience in responding to disasters and other emergencies, including such situations overseas.

Maj. Gen. Masato Taura, 51, vice commanding general of the Ground Self-Defense Force's Central Readiness Force (CRF), was appointed as head of the on-site coordination. It was decided that Taura and Maj. Gen. Yuki Imaura, who was also the CRF's vice commanding general, would take turns directing operations at the plant on a five-day rotating basis.

Taura had commanded SDF operations in Iraq and also in Haiti following the devastating earthquake in 2010.

The first thing he did was to convene a general meeting of top officials of the organizations involved.

In front of the top officials, Taura deliberately took a lower seat in a display of deference. He thought things would not work well if the SDF tried to exert strong control over the proceedings.

"I've been appointed to serve as a coordinator," Taura said, indicating his intention to work behind the scenes, and smiled.

He soon faced the first test of his ability to handle this delicate situation.

Shortly past 10 p.m., the grim-faced chief of the Tokyo Fire Department unit deployed to the disabled nuclear power plant was on the phone, apparently getting a dressing-down.

The fire department's mission to spray water on the No. 3 reactor had been delayed by about five hours, as huge amounts of debris were blocking fire engines from approaching the reactor.

The fire chief was being berated for the delay by an official at the government's nuclear emergency response headquarters who had called the chief.

"What are you doing?" the caller roared. "If you can't do it right now, let the SDF do it."

As Taura took the phone from the fire chief, the caller was also replaced by an SDF officer on the other end.

Taura asked the officer whether headquarters was really demanding that the SDF take over the mission.

"Yes, they are demanding that."

Taura thought that headquarters didn't understand the situation at the plant. If the SDF took over the mission, that would damage the morale of the firefighters of the Tokyo Fire Department.

Taura explained the situation at the plant to the SDF officer on the phone.

Roads in the site were littered with debris, making it impossible for two vehicles to travel past each other. There was no detour, either. It would take at least three hours for the SDF unit to make the necessary preparations to spray water on the reactor. In addition, the fire department could deliver more water on the target than the SDF. After describing the situation, Taura said to the SDF officer, "Ask headquarters again whether we should still take over the mission."

Headquarters withdrew the order.

The Tokyo Fire Department's unit succeeded in spraying water on the reactor before dawn on March 19. After hearing the news, Taura shook hands with the fire brigade chief and noticed tears in his eyes.

Insiders at public hearings, fake e-mail scams

March 28, 2013

Kyushu Electric made 150 insiders attend public hearing on nuclear policy in 2005

<http://mainichi.jp/english/english/newsselect/news/20130328p2a00m0na015000c.html>

Kyushu Electric Power Co. had a total of 150 of its workers attend a government-sponsored public hearing on the country's nuclear energy policy guidelines in August 2005, it has been learned.

The 150 people account for more than 80 percent of the total number of people who attended the public hearing held in Saga, Saga Prefecture.

In what was called a "fake e-mail scam," Kyushu Electric was found to have urged its employees and other related people to send comments to a TV program supportive of restarting nuclear reactors at the Genkai Nuclear Power Plant in Saga Prefecture in 2011. A Kyushu Electric spokesperson said of the latest case, "We think that the same thing as the e-mail scandal was done at the public hearing. We are reflecting on it seriously."

The public hearing was officially called the "public hearing to listen to opinions on a draft guideline for nuclear energy policy." The Japan Atomic Energy Commission sponsored such hearings at five locations across the country from Aug. 18 to 26, 2005, to incorporate citizens' opinions into the country's nuclear energy policy guideline. One of the hearings was held at a hotel in Saga, Saga Prefecture, on Aug. 22, 2005. Of the 21 people who stood up and expressed their opinions at the hearing, 11 were suspected to have come from Kyushu Electric, and therefore the Mainichi Shimbun tried to confirm it with the utility. The company consequently conducted an in-house investigation.

The probe found that all of the 11 people were Kyushu Electric's employees (one of them is currently a retiree), and most of them belonged to the company's Saga branch. Through its nuclear power department and public relations department at the company headquarters, the utility urged its employees and employees of its subsidiaries to attend the public hearing. According to internal data kept at the company,

a total of 150 employees of the utility and its subsidiaries attended the hearing. That means that of the 179 people who attended the hearing, 83 percent were people related to Kyushu Electric.

The 11 Kyushu Electric employees expressed their views in favor of the draft guideline for the country's nuclear energy policy at the public hearing such as "Nuclear power is needed to maintain standards of living," and "There is no solution to the energy problem other than nuclear power." Kyushu Electric looked into whether the company had instructed its employees to express such views at the hearing, but there was no mention of whether such an instruction was given in the internal document prepared at that time. Kyushu Electric said it could not say whether the company had in fact instructed its employees to express such opinions because they said they "don't remember."

On top of that, Kyushu Electric acknowledged that the latest case was the same as the "fake e-mail" scandal. The utility commented, "With respect to our calls for our employees to take part in government-sponsored symposiums and so on, we regard it constitutes a lack of consideration of the intent of such events. We will ensure transparency of our corporate activities, improve our organizational climate and prevent a recurrence (of such misdeeds)."

In October 2005, the government adopted the country's nuclear energy policy guidelines at a Cabinet meeting. The guideline covering the next 10 years said nuclear power would account for 30 to 40 percent of the country's total power supply and the nuclear fuel cycle program would be promoted the way it had been.

The then president and chairman of Kyushu Electric resigned to take responsibility for the "fake e-mail" scandal in which the utility had urged its subsidiaries and its clients to send a government-sponsored TV program aired on June 2011 their comments in favor of the reactivation of nuclear reactors at the Genkai Nuclear Power Plant in Saga Prefecture. Kyushu Electric was also found to have allocated prepared questions to its employees and had them ask the fixed questions at a public debate on "pluthermal" energy generation plans sponsored by the Saga Prefectural Government in December 2005.

TEPCO's changed its mind : it is guilty after all...

March 30, 2013

Japanese utility takes blame for nuclear crisis

<http://mainichi.jp/english/english/newsselect/news/20130330p2g00m0dm009000c.html>

TOKYO (AP) -- The utility that operates Japan's crippled atomic plant said Friday that it deserves most of the blame for the country's nuclear crisis, in its strongest remarks about its own shortcomings.

Tokyo Electric Power Co. acknowledged in a report that it was not adequately prepared to deal with the massive earthquake and tsunami that ravaged northeastern Japan in March 2011. The twin disasters cut power at TEPCO's Fukushima Dai-ichi nuclear plant, causing meltdowns at three reactors. Massive radiation leaks contaminated air, water and soil around the plant, forcing about 160,000 residents to evacuate.

"Our safety culture, skills and ability were all insufficient," TEPCO President Naomi Hirose told a news conference. "We must humbly accept our failure to prevent the accident, which we should have avoided by using our wisdom and human resources to be better prepared."

The report said TEPCO's equipment and safety provisions were inadequate and that the meltdowns should have been avoided. TEPCO said it was complacent about safety measures and delayed upgrading them until after the accident. It also said TEPCO didn't adequately inform the public of risks and troubles at the plant.

The acknowledgement is a major reversal from TEPCO's initial investigation report.

In the June 2012 report, TEPCO maintained that the tsunami was mostly to blame for the world's worst nuclear disaster since Chernobyl in 1986. It defended its crisis management and criticized excessive interference from the Prime Minister's Office.

After the company's reluctance to come to terms with its responsibility triggered public outcry, it launched an internal reform task force, led by Hirose, to reinvestigate the crisis. The task force was overseen by a five-member committee of outside experts, including former U.S. Nuclear Regulatory Commission chief Dale Klein.

In October, TEPCO acknowledged that it underestimated the tsunami risk and could have mitigated the impact of the accident if it had backup power and cooling systems and trained employees with practical crisis management skills. Friday's report urged TEPCO to introduce effective training programs and oversight by outside experts.

Klein said the nuclear industry has to "expect the unexpected and have margins of safety."

"I do think it would have been appropriate for TEPCO have thought about what they would have done if there would have been a large tsunami and that would have mitigated a lot of actions," he said. "We are unable to turn the clock back in time and stop the accident. What is important for the reform committee and TEPCO is to move forward, learn from mistakes and make sure that never happens again."

Critics have raised doubts as to whether TEPCO is seriously trying to change, and an extended blackout at the plant last week was a reminder that the crisis is not over.

The blackout occurred after a rat short-circuited an outdoor switchboard, but TEPCO waited three hours to make an announcement. The outage left four fuel pools without cooling functions for up to 30 hours. TEPCO officials denied Friday that the incident posed safety threats outside of the plant, but acknowledged they lacked sensitivity about how Fukushima residents felt about the loss of power and cooling.

"We learned that it only takes one rat, not even an earthquake or tsunami, to paralyze the plant," said Yukihiro Higashi, an Iwaki Meisei University engineering professor who is on a government nuclear regulatory panel overseeing Fukushima Dai-ichi safety.

"People in Fukushima are under constant fear of another serious incident that requires evacuation," Higashi said.

The full cleanup of the plant, which is still running on makeshift equipment, is expected to take decades. Officials said Friday that rats and snakes are frequently spotted at the plant, even inside its emergency command center. Rats are particularly a concern because they can chew on power cables and water hoses, said TEPCO official Kazuhiko Yamashita, adding that officials are considering further anti-rodent measures.

The reform plans aim to use the lessons learned at TEPCO's Kashiwazaki-Kariwa plant in northern Japan. The cash-strapped utility wants to restart the plant, and officials say they have upgraded safety measures, although they have not specified any timeline.

Government, parliamentary and private groups have separately published the results of their investigations into the crisis, largely blaming the disaster on botched crisis management, government-industry collusion and the tsunami.

All in transparency's name

March 30, 2013

All seats in NRA's radiation council vacant since Sept.

<http://mainichi.jp/english/english/newsselect/news/20130330p2a00m0na006000c.html>

All the seats in the Nuclear Regulation Authority (NRA)'s Radiation Council have remained vacant since September 2012, apparently as a result of tougher membership requirements.

The NRA has stiffened requirements for council membership as the Japanese public places more scrutiny on atomic power policy in the wake of the Fukushima nuclear crisis that broke out in March 2011, NRA officials say.

The government, which is preparing to lift evacuation orders in some disaster-hit areas, is considering radiation-protection measures to help residents return home quickly. However, the current lack of Radiation Council members could certainly delay its deliberations on the issue, and adversely affect its efforts to speed up the overall disaster recovery effort.

The council, which previously operated under the jurisdiction of the Ministry of Education, Culture, Sports, Science and Technology, was transferred to the NRA, a highly independent body, in September last year under the previous administration led by the Democratic Party of Japan (DPJ). However, the term of all 19 of its members, including Chairman Otsura Niwa, expired on Sept. 18, 2012. The NRA is now selecting candidates to fill the vacancy.

The NRA has stiffened the qualifications for membership in the Radiation Council to enhance its transparency and independence.

As a result, executives and researchers at companies operating atomic power plants are disqualified from serving as members of the council. Moreover, the NRA has decided to require all members of the council to report remuneration they receive from any single nuclear plant operator over a three-year period prior to their appointments when such remuneration totals 500,000 yen a year or more. They must also report donations extended to their research institutes over the same period. The NRA is set to fully publicize such information.

The government decided on March 7 to draw up measures to protect residents from radiation and lessen radiation contamination based on scientific knowledge in an effort to help evacuees to return home at an early date. It will also consider setting a new upper limit on annual radiation exposure in areas whose current cumulative dose is less than 20 millisieverts a year -- where the government is preparing to lift evacuation orders.

At the request of ministries and agencies concerned, the Radiation Council set upper limits on radiation exposure for workers engaged in decontamination efforts, as well as on levels of radioactive substances contained in foods, following the outbreak of the nuclear crisis.

Chief Cabinet Secretary Yoshihide Suga said the government will clarify its basic view on measures to protect against radiation and lessen radiation levels in affected areas by the end of this year.

However, unless the council resumes its work at an early date, the government's efforts to allow residents of evacuation zones to return home at an early date could be stalled.

All set for re-born TEPCO

March 30, 2013

TEPCO to get watchdog division / Plans to establish new division specializing in enhancing nuclear safety

The Yomiuri Shimbun

<http://www.yomiuri.co.jp/dy/national/T130329003344.htm>

Tokyo Electric Power Co. is expected to establish a new division specializing in enhancing nuclear safety under the direct control of its board of directors, the company said in the final draft of its plan for nuclear power safety reform released Friday.

The utility also admitted to inadequate preparation and the weakness of its executives' risk management at the time of the crisis at its Fukushima No. 1 nuclear power plant.

The draft was submitted to the Nuclear Reform Monitoring Committee, a third-party supervisory panel led by former U.S. Nuclear Regulatory Commission Chairman Dale Klein, and was approved by the panel on the day.

The draft said the company will invite an outsider to be chief of the new division, to be named the nuclear power safety observation office. The office is independent of TEPCO's other nuclear power-related

departments and will likely observe and provide advice on the company's actions aimed at improving safety.

Regarding the fact that TEPCO gave false explanations about the crisis at the plant to the Diet's Fukushima Nuclear Accident Independent Investigation Commission and that it took three hours for the company to announce a blackout at the plant on March 18, the draft concludes TEPCO was "insensitive to the feelings of people living near the plant and created anxiety among them."

To solve those problems, TEPCO will invite a public relations specialist from outside the company and set up a "social communication office" that aims to smoothly disclose information to the public and raise employees' awareness.

The draft also incorporates lessons learned from the confusion in the chain of command for the nuclear plant at the time of the crisis. It promises to greatly strengthen the power of the directors of nuclear power plants and to clarify the command structure to be used in cases of emergency.

March 29, 2013

Tokyo Electric compiles reform plan

http://www3.nhk.or.jp/daily/english/20130329_22.html

Tokyo Electric Power Company, or TEPCO, has compiled a reform plan based on lessons learned from the accident at the Fukushima Daiichi nuclear power plant.

A third-party panel set up by TEPCO approved on Friday the plan drawn up by an in-house task force.

TEPCO launched the task force after it was criticized for defending its response to the accident in a report it put together following an internal probe.

The task force says the company should not put all the blame for the accident on the huge tsunami that hit the plant on March 11th, 2011. It concluded that the accident would have been preventable if the company had been fully prepared for the tsunami.

The reform plan includes 6 measures to address issues that came to light in the accident.

One measure is the creation of an independent, in-house supervising body to keep watch on the company's approach to safety. The task force criticizes the company for pursuing economic efficiency and not putting enough effort into risk management.

Another is to clarify the chain of command in case of an emergency. The number of people that one supervisor can manage will be limited to 7 people to make sure that everyone is up to date in the event of a crisis.

The task force also says the company was reluctant to disclose risks associated with nuclear power plants and it calls for assigning "risk communicators" who will advise the management and nuclear division chiefs.

The reform plan is an apparent effort to persuade authorities and the public to agree to allow it to resume operations of the Kashiwazaki Kariwa nuclear plant along the Japan Sea coast in Niigata Prefecture.

But TEPCO President Naomi Hirose ruled out speculation that the reform plan is intended to help restart the Kashiwazaki Kariwa plant soon.

Hirose promised to rid his company of arrogance and carry out drastic reforms to ensure nuclear safety. He said if the company fails to do this, it does not have the right to operate nuclear plants.

The head of the third-party panel, Dale Klein, said TEPCO has acknowledged its mistakes and come up with the reform plan so it will not cause a similar accident.

He said the company has just started a long journey for reform and that he and other panel members will keep watching its efforts.

PROMETHEUS TRAP/ 'Shadow units' (13): SDF members recruited for Fukushima mission brought emotional baggage

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201304010003>

By HIROYOSHI ITABASHI/ Staff Writer

Editor's note: This is the 13th part of a new series that has run in the past under the title of The Prometheus Trap. This series deals with the secret missions assigned to the "shadow units" of the Ground Self-Defense Force when the Fukushima nuclear disaster was unfolding following the Great East Japan Earthquake of 2011. The series will appear on Mondays, Wednesdays and Fridays.

The hasty manner in which the Self-Defense Forces firefighting unit was assembled near the Fukushima No. 1 nuclear power plant to spray water onto the overheating reactors concerned Maj. Gen. Masato Taura, the vice commander of the GSDF's Central Readiness Force, who was in charge of operations at the site.

The firefighting unit was made up of members assembled from the three branches of the SDF from various bases in Japan. For that reason, most members did not know one another, and there was little conversation among unit members.

In addition to the weak sense of solidarity within the unit, Taura was also worried about the physical and psychological stress that unit members had undergone.

On March 19, 2011, Taura gathered unit members in a room in J-Village, the soccer training complex that was serving as the operation base for the SDF mission to deal with the nuclear accident. He had unit members sit in a circle, and he took out a notebook to write down their comments.

"I want to know the process that brought you here and anything else you may have in mind," Taura said. With that, he opened the floor to the other unit members and concentrated on writing down what they said.

One member said his wife angrily opposed having him go to the Fukushima nuclear plant.

In trying to convince his wife, the member told her, "Let me go. If I don't go, I will regret it for the rest of my life, and it would only mean that someone else had to go."

Another member spoke up. "I am originally from Miyagi Prefecture," he said. "A relative in Sendai died. I volunteered for this mission because I felt that would help disaster victims."

A Maritime SDF member who was close to retirement age gave his take on why he came.

"Younger members have a long future before them," he said. "I came here because I thought this was an opportunity for older members. After the Persian Gulf War, that is what some of my seniors told me when they were preparing to leave for the overseas dispatch."

One SDF member revealed the conversation he had with his superior officer in requesting to be sent.

"I will go because I am single," the member told his superior. "Since you are a newlywed, I want you to remain behind. If something happened to you, I would never be able to face your wife."

Other members told about clashes that arose at their base over the selection of those to be dispatched to Fukushima.

At one base, members with families insisted that members who were single not go, while those single shot back, "Those with families have someone they have to protect. They should not go."

Another member told his superior officer, "Don't ask us what our wish is, but just tell us to go because you know we will go if you say so."

In the course of the meeting, some members began describing their thoughts at how the mission had fared so far.

"Because only 10 tons of water can be transported by a firetruck, that is all used up in under three minutes of spraying," one said. "I wanted to spray a much larger volume of water."

Another said, "We have to wear protective gear, goggles and a lead vest. The heat and weight of the gear saps our strength. Standing in front of the No. 3 reactor, I realized the seriousness of the situation. I cannot explain the reason, but tears welled up in my eyes."

TEPCO paid 1.8 billion yen to Federation of Electric Power Companies of Japan in 2011

March 31, 2013

TEPCO paid membership fee to nuclear lobby group after Fukushima disaster

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201303310027

THE ASAHI SHIMBUN

Following the nation's worst nuclear accident in 2011 and while requesting governmental assistance to help it stay afloat, Tokyo Electric Power Co. paid 1.8 billion yen (\$189 million) to maintain its membership in a nuclear power lobbying group, The Asahi Shimbun has learned.

The payment to the Federation of Electric Power Companies of Japan came at a time the utility was seeking financial support from the government, while announcing a streamlining plan to come up with the funds to contain the nuclear crisis and compensate victims and evacuees.

The utility's Fukushima No. 1 nuclear power plant was stricken by three reactor meltdowns in March 2011 following the Great East Japan Earthquake and tsunami.

TEPCO's annual membership fee for fiscal 2011, which began in April 2011, was included in electricity rates as operating costs, which had been approved before the 2011 accident.

"We paid 1.8 billion yen as a membership fee for fiscal 2011 as we believe the federation's activities have a great significance," a TEPCO official said. "We plan to pay the membership fee from funds in the future that are not associated with electricity rates. And we are not in a position to tell how the fee was spent."

The federation, comprising 10 regional utilities, is the nuclear industry's lobbying group. Its stated mission is to educate and inform the public about nuclear energy and to formulate the industry's position statement, in addition to conducting various research concerning nuclear power.

It is a private association and is not obligated to release its budget, financial dealings, size of its staff and details of its operations.

This is the first time the amount of a member company's annual membership fee has come to light. An official with the federation declined to comment and to disclose details concerning its revenues and spending as well as individual operations, citing the privacy of its member companies and business partners.

In fiscal 2011, TEPCO asked the government to provide financial assistance to help it contain the nuclear crisis and to pay compensation to victims and evacuees, and announced a series of cost-cutting measures, including a reduction in remuneration of its board members and the sale of some properties.

Two months after the crisis began, the government approved a plan to assist the utility with the injection of public funds.

A government panel of experts, which began to look into the utility's management in June, concluded in a report in October that the membership fee to the federation is "not essential to the stable supply of electricity."

An advisory panel to the industry ministry examining a proposed electricity rate hike recommended in March 2012 that passing on the membership fee under operating costs should not be done.

In keeping with the recommendation, TEPCO did not incorporate the fee into its operating costs when it applied for a 10-percent rate hike two months later.

PROMETHEUS TRAP/ 'Shadow units' (14): SDF commander had to see for himself if order could be carried out

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201304030091>

By HIROYOSHI ITABASHI/ Staff Writer

Editor's note: This is the 14th part of a new series that has run in the past under the title of The Prometheus Trap. This series deals with the secret missions assigned to the "shadow units" of the Ground Self-Defense Force when the Fukushima nuclear disaster was unfolding following the Great East Japan Earthquake of 2011. The series will appear on Mondays, Wednesdays and Fridays.

* * *

A few hours after the meeting with the Self-Defense Force firefighting unit tasked with dealing with the Fukushima nuclear accident, Maj. Gen. Masato Taura received an urgent order from the central government's nuclear emergency response headquarters on the evening of March 19, 2011.

"Spray water from the ground onto the No. 4 reactor before the day is out."

A series of explosions had rocked the Fukushima No. 1 nuclear power plant over the past week. Explosions hit the No. 1 reactor building on March 12, the No. 3 reactor building on March 14 and the No. 4 reactor building on March 15. Problems had also emerged at the No. 2 reactor, leading to the spewing of large amounts of radioactive materials.

There was concern about the large number of nuclear fuel rods stored in the pool of the No. 4 reactor building. Failure to maintain cooling of that pool could lead to a catastrophic problem.

Cooling of the reactors began with the dropping of water on the No. 3 reactor from an SDF helicopter on March 17. However, no spraying of water into the No. 4 reactor had been attempted until the March 19 order.

Taura had many questions related to the instruction, including if space could be obtained for the firetrucks to spray from, considering the amount of debris that had been scattered throughout the plant by the explosions.

On the previous night, a unit from the Tokyo Fire Department needed more than six hours to remove debris before its members could begin spraying the No. 3 reactor.

Those concerns led to hesitancy on the part of Taura in immediately replying to the government order.

He turned to a veteran member of the Air SDF firefighting unit who had just taken part in the meeting of all members.

"Do you think we can go ahead right now?" Taura asked.

The member replied frankly, "I am not confident we could do it."

He then added a comment that led Taura to consider the situation from a different angle.

"We could do it if there was space to turn the firetruck around in order to leave the scene in thinking about the worst-case scenario, including an explosion."

During the exchange between Taura and the ASDF member, an official with the central government's response headquarters called frequently, wanting to know when the water spraying operation would begin.

Taura felt he could only make a decision on whether to send the unit to the No. 4 reactor after checking conditions at the site.

"I will take a look," Taura told a subordinate.

Even though the subordinate said it was too dangerous, Taura refused to listen, and he got into the retrofitted Pajero SUV to drive to the Fukushima No. 1 plant, about 20 kilometers away. The headlights pierced the darkness, revealing the structural skeleton of the No. 4 reactor building. Debris lay scattered about from the various explosions.

Taura called the central government's response headquarters.

"Come morning, we will remove the debris to clear a space for spraying and for a possible escape in an emergency," he said. "We will then carry out the spraying, but we cannot do it tonight."

Those at headquarters agreed to the proposal, and spraying of the No. 4 reactor began from after 8 a.m. on March 20, 2011.

At about that time, reports were emerging of high radiation levels in the vicinity of Iitate, located between 30 and 50 kilometers northwest of the Fukushima No. 1 plant. This was despite previous reports that areas beyond 30 kilometers from the plant were considered safe.

Even as Iitate residents continued to stay in their homes despite the various concerns they held, they were joined by another SDF unit--the 1st Airborne Brigade. The brigade had been given the special mission of rescuing residents in the event of an emergency.

* * *

That will teach them, no doubt

http://www.tepco.co.jp/en/press/corp-com/release/2013/1226071_5130.html

Delayed reports and public announcements as well as the long hours spent on restoration in response to the power supply failure of Units 1-4 at Fukushima Daiichi Nuclear Power Station that occurred on March 18th, 2013 has caused tremendous inconvenience and anxiety to the people of Fukushima and broader society.

Effective today, a decision has been made to implement the following disciplinary actions.

President Naomi Hirose: 5% salary cut for a one month period

Executive Vice President Zengo Aizawa: 5% salary cut for a one month period

Managing Executive Officer Akio Komori: 5% salary cut for a one month period

In addition to the above action, a severe warning will be issued to four other employees.

TEPCO sends its own employees to public hearings

April 5, 2013

TEPCO sent workers to public hearing on nuclear framework in Fukushima

<http://mainichi.jp/english/english/newsselect/news/20130405p2a00m0na006000c.html>

Tokyo Electric Power Co. (TEPCO) has launched an internal investigation to determine whether it had staff members make comments in favor of promoting nuclear power at a public meeting held in Fukushima in 2005 before the government formulated a basic outline for the nation's long-term nuclear policy.

It has emerged that the company, operator of the crisis-hit Fukushima No. 1 Nuclear Power Plant, sent at least 35 workers, including its own staff members, to a public hearing that the Cabinet Office's Atomic Energy Commission (AEC) held that year in preparation for the establishment of its Framework for Nuclear Energy Policy.

TEPCO and commission officials said that at least 35 of the 135 participants at the hearing were employees of TEPCO or its affiliates. Six of the 23 people who gave opinions when asked about the pros and cons of nuclear power were associated with the utility.

"We are investigating the content of their statements, and whether those present were asked to make statements in favor of promoting nuclear power," a representative of TEPCO's Fukushima public relations division said, admitting that workers were sent to the hearing.

Public hearings were held in five locations across Japan in August 2005, with between 135 and 271 people present at each meeting. It has already emerged that 150 of the 179 participants at the hearing in Saga, or about 80 percent of those present, were dispatched by Kyushu Electric Power Co. Of these, seven spoke in favor of nuclear power. At the end of March, the AEC asked power companies to investigate whether there were any similar cases.

It was earlier learned that TEPCO asked its employees and members of subcontractors to attend a town meeting on the safety of nuclear power plants that the government held in Fukushima Prefecture in 2003, explaining to them in advance how to fill in questionnaires that were distributed at the meeting.

The impact of multiple layers between original contractor and cleanup workers

April 5, 2013

Deductions strip daily wage of nuclear cleanup workers down to 1,000 yen

<http://mainichi.jp/english/english/newsselect/news/20130405p2a00m0na014000c.html>

Dinner is a few boiled vegetables. At lights out, each person lies down to sleep in a space the size of two tatami mats, or just over three square meters. This is no prison camp scene, but the reality of workers cleaning up radioactive contamination from the Fukushima nuclear disaster.

The central government has awarded contracts for most of this decontamination work to large construction companies, which have in turn hired sub-contractors, which have themselves hired third companies, and on down through several layers of firms to the people doing the actual cleanup job. **And these people, not counting their danger pay, are working for almost nothing.**

"We weren't treated like human beings," said one 59-year-old from Aomori Prefecture, who did a two-month stint as a nuclear decontamination worker in Tamura, Fukushima Prefecture, starting in September last year. During his contract, he was billeted with three other men in a bungalow measuring just 12.4 square meters. The first dinner he ate there was a shock as well: a plate of boiled eggplant, green peppers and alfalfa sprouts. He complained to his employer, which eventually added "a couple of slices of ham" to the evening meal.

The man spent his days cutting grass on a hillside about 20 kilometers from the shattered Fukushima No. 1 nuclear plant. The lunch provided by his company consisted of plain rice balls and pickled vegetables, and there were no shops nearby where he could buy something extra. When the man approached the woman in charge of meals, she told him she'd been ordered by the company to keep breakfast costs at 100 yen and dinner costs at 200 yen per worker.

"We were treated almost unbelievably roughly, especially as we were doing hard physical labor," the man told the Mainichi. The conditions apparently proved too difficult for at least one man, a 54-year-old worker who died of a heart attack on the job in the village of Kawauchi in February this year.

The acquaintance who introduced the 59-year-old to the cleanup job told him he'd be "cutting grass along roadsides. You'll get a place to stay, plus two meals and 11,000 yen a day." The man actually got about that amount, but only after adding the daily 10,000 yen in danger pay provided by the central government. His company was paying him just 1,000 yen a day, or less than one-fifth of the prefecture's per diem minimum wage.

A month after he started the job, the man's employer sent him a new contract and told him to sign it. The space for the daily wage was blank. When he looked at a coworker's contract, he saw that the basic daily wage was 15,700 yen -- 10,000 yen in national government danger pay and 5,700 yen in wages from the company. However, the company then deducted 1,000 yen a day for food and 3,700 yen for accommodation, leaving 11,000 yen.

The firm, which is three layers of subcontracts below one of the construction companies hired by the government, told the Mainichi, "We did pay the workers danger pay in addition to their pay, but in the absence of a labor agreement with the workers concerning deductions, we subtracted costs for room and board."

This is the result of the subcontractor structure, putting multiple layers between the original contractor and the workers.

"Once the contracts got down to us, the danger pay had already been eaten away," one construction company representative told the Mainichi. The firm passed the entire work order off to another company run by a friend. "At that stage, you can't really turn a profit unless you hit the workers' wages or shave them down somehow. In the end, the whole system is designed to make money for the big construction companies at the top."

Asahi - Shadow Units (15)

PROMETHEUS TRAP/ 'Shadow units' (15): SDF members in protective gear worried local residents

April 05, 2013

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201304050004>

By HIROYOSHI ITABASHI/ Staff Writer

Editor's note: This is the 15th part of a new series that has run in the past under the title of The Prometheus Trap. This series deals with the secret missions assigned to the "shadow units" of the Ground Self-Defense Force when the Fukushima nuclear disaster was unfolding following the Great East Japan Earthquake of 2011. The series will appear on Mondays, Wednesdays and Fridays.

Despite the best efforts of the Self-Defense Forces to help local residents in the wake of the 2011 accident at the Fukushima No. 1 nuclear power plant, unexpected barriers arose that delayed the work.

On March 16, 2011, the 1st Airborne Brigade of the Ground SDF's Central Readiness Force received an order to rescue residents from afflicted areas of Fukushima Prefecture. The brigade is the only parachute unit in Japan, but the approximately 1,700 brigade members were dispatched to Fukushima with a different mission.

At that time, a directive had been issued to residents living between a radius of 20 kilometers to 30 kilometers from the Fukushima No. 1 plant to remain indoors. Brigade members were instructed to rescue those residents who could not evacuate on their own in the event a major abnormality arose at the Fukushima plant.

The commander of the 1st Airborne Brigade was Maj. Gen. Tetsuro Yamanoue, 52. He issued instructions to compile a list of all residents, including senior citizens, who would be unable to evacuate by themselves. "Make preparations so we can rescue everyone without leaving anyone behind," Yamanoue told his subordinates.

Brigade members initially contacted local governments to obtain detailed information about residents, such as any illnesses they had, the level of elderly care required and whether caregivers would also have to be evacuated at the same time. The lack of information meant SDF members themselves had to visit individual homes to collect the needed data.

Lt. Col. Toshio Akabane, 54, was a regiment commander of the 1st Airborne Brigade. His regiment established its base in Iitate, about 40 kilometers northwest of the Fukushima No. 1 plant.

He had the 400 or so members of his regiment divide into groups of five to first visit homes in Minami-Soma to gather information about those requiring special assistance.

It was during such a visit that Akabane encountered some of the problems that arose in dealing with local residents.

An elderly woman wearing a jacket was walking by herself. Akabane got out of his dark green four-wheel-drive vehicle. In talking to the woman, the regiment commander tried to soften his tone.

"Hello," he said.

"Are you from the SDF?" the woman replied.

"That's right."

"We were instructed not to go outdoors, but that causes various problems."

Although it was Akabane who wanted to collect information from the woman, she fired questions at Akabane.

"Why are SDF members dressed like that?" she asked. "Is this area that dangerous?"

Akabane and his regiment members wore white protective gear and face masks to prevent inhaling radioactive materials or having them stick to their bodies.

Trying not to further alarm the woman, Akabane tried his best to reassure her there was no major danger to worry about. Still, he could not help but feel that he did not sound very convincing.

With the SDF members wearing protective gear and the local residents who had to be helped in everyday clothing, Akabane felt the situation should have been reversed.

The conversation was but one example of the difficulty of communication between the two sides. Not only was it becoming difficult to compile the list of residents in need of assistance, but the SDF members were spending most of their time trying to assuage the suspicions held by local residents.

Akabane felt a different approach was needed.

PROMETHEUS TRAP/ 'Shadow units' (16): SDF members take off protective gear to ease concerns of residents

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201304080001>

By HIROYOSHI ITABASHI/ Staff Writer

Editor's note: This is the 16th part of a new series that has run in the past under the title of The Prometheus Trap. This series deals with the secret missions assigned to the "shadow units" of the Ground Self-Defense Force when the Fukushima nuclear disaster was unfolding following the Great East Japan Earthquake of 2011. The series will appear on Mondays, Wednesdays and Fridays.

* * *

To change the way a list of individuals needing special assistance to evacuate from the nuclear accident was being compiled, Lt. Col. Toshio Akabane had Maj. Gen. Tetsuro Yamanoue, the commander of the 1st Airborne Brigade, see for himself what the situation was like.

Akabane escorted Yamanoue on March 19, 2011, to Minami-Soma, which lay in a radius between 20 and 30 kilometers from the Fukushima No. 1 nuclear power plant.

"Doesn't this seem like a very strange picture?" Akabane asked his superior.

The brigade was compiling a list of residents who would require special attention if an evacuation was needed because of the worsening situation at the Fukushima No. 1 plant. Akabane and other SDF members making the rounds of homes all wore white protective gear. Residents who came out to speak to the SDF members were dressed in ordinary clothing.

Facing the SDF members in their bulky outfits, many residents found it difficult to respond calmly and frankly.

Akabane had also received reports from his subordinates that they never got very far in questioning residents because they wanted explanations of just how dangerous the area was in terms of radiation.

Akabane asked Yamanoue, "Will you allow us to end the wearing of the protective gear?"

The rule had been to wear protective gear to guard against radioactive materials.

Reflecting on the situation, Yamanoue felt the large gap in appearance between SDF members and the local residents the members were supposed to help. The difference may be creating a wall between the two sides. Preparing for an emergency was an urgent task because there was no way of knowing when the situation at the nuclear plant would worsen.

Yamanoue decided on the spot, "OK, let's stop wearing the gear."

However, to prepare for a possible emergency, SDF members still had to carry their gear with them. Removing the protective outfits helped in gaining valuable information from local residents. Still, visiting each and every home was time consuming. It was worse when residents were not at home because there was no way of knowing if the resident had moved to an evacuation center, or had simply stepped out temporarily or could not respond because they were bedridden.

SDF members used whatever means they could think of, such as checking the electricity meters and peeking into the mailbox, to track down residents at home, often after repeated visits.

In the course of that work, SDF members began voicing concerns about radiation. To respond to those concerns, Akabane asked a senior officer who was knowledgeable about radiation control to lecture the regiment members.

The members had various concerns, such as "Will there be abnormalities in my sperm?" and "What are the effects on rainy days?"

The officer said, "Under the present circumstances, there will be no fundamental effect on sperm. On rainy days, it would be preferable to remain indoors if at all possible."

Akabane noticed the visible relief wash over the faces of his subordinates.

After March 20, 2011, the 1st Airborne Brigade divided into three units based to the north, west and south of the Fukushima No. 1 plant and continued with the work to confirm the status of residents. A list was compiled of about 400 residents who would require special help if evacuation became necessary.

* * *

"Obviously, the crisis is not yet under control"

Leakage increases doubt over TEPCO risk control

<http://the-japan-news.com/news/article/0000114850>

[Takashi Ito / The Yomiuri Shimbun]

A recent string of operational issues at Tokyo Electric Power Co.'s crippled Fukushima No. 1 nuclear power plant have called into question the company's risk management ability.

"We understand the gravity of the leakage of contaminated water," TEPCO official Masayuki Ono said somberly at a hastily arranged press conference Saturday.

The company had announced earlier that about 120 tons of water contaminated with radioactive substances had leaked from an underground storage pool at the plant.

This incident is just the latest in a series of accidents that have recently occurred at the Fukushima plant.

On March 18, the cooling system for storage pools containing spent nuclear fuel for three reactors was down for about a day. The accident was attributed to a rat that had caused a short circuit in an outdoor temporary switchboard.

To prevent a recurrence of such an incident, TEPCO on Friday began installing wire nets to protect the switchboards. On the same day, an operational error caused a loss of electricity from a switchboard. Furthermore, the trial operation of a new device to remove radioactive substances, called the Advanced Liquid Processing System, were suspended due to an oversight.

This string of accidents served to highlight the vulnerability of the equipment and devices that have been temporarily installed at the plant. It has also shone a light on TEPCO's impaired crisis management ability.

In the leakage of contaminated water, it took three days for TEPCO to start transferring the water after detecting signs indicating a problem, causing the extent of the leakage to expand.

Ono said, "It's difficult to completely prevent problems given the current situation at the Fukushima No. 1 plant."

Muneo Morokuzu, a former adjunct professor at the University of Tokyo and an expert in nuclear safety regulations, said, "TEPCO's handling of [safety] measures resembles a game of whack-a-mole."

"The required level of management for the Fukushima No. 1 plant may be beyond TEPCO's capability. It's time to review the overall decommissioning operation," Morokuzu said.

Ex-head of Diet panel probe say nuclear disaster still not under control

<http://mainichi.jp/english/english/newsselect/news/20130408p2a00m0na009000c.html>

The former head of the Diet investigative panel on the Fukushima nuclear disaster told a House of Representatives special committee on April 8 that the crisis has still not been brought under control.

Kiyoshi Kurokawa, former chairman of the panel, pointed out that a series of problems, including the leakage of water contaminated with radioactive substances from an underground water tank, have hit the plant and said, "Obviously, the crisis is not yet under control."

"There are also problems including contaminated water and a power blackout caused by a rat. Moreover, a response to victims of the crisis has not been progressing," Kurokawa said. "The world is paying close attention to how the government will respond to problems pointed out in a report compiled by the panel."

Kurokawa is one of nine former members of the Diet's fact-finding panel on the crisis at the tsunami-hit Fukushima No. 1 Nuclear Power Plant who have been summoned to testify at the lower house's special committee on nuclear power. The other former member, Kenzo Oshima who now serves as a member of the Nuclear Regulation Authority (NRA), did not attend the session.

Lawyer Shuya Nomura urged the Diet to actively get involved in efforts to bring the crippled power plant under control. "Is it all right to leave the response to contaminated water and other problems to the discretion of Tokyo Electric Power Co. and the executive branch of the government? As representatives of the people, Diet members should have expertise and get involved in the response with the mindset of the general public."

The Diet special committee on nuclear power was set up in January this year with the aim of supervising the NRA and its secretariat.

In a report it issued in July last year, the investigative panel recommended that the Diet set up a standing committee on nuclear power on the grounds that the legislative branch should constantly supervise the government's nuclear power policy. However, it took nine months before the Diet convened the special committee on April 8 because of a conflict between ruling and opposition parties.

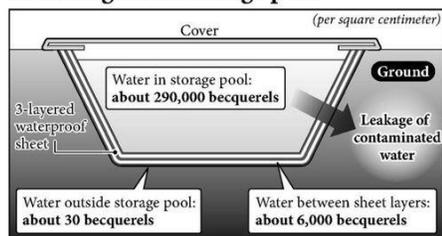

The report issued by the Diet's fact-finding panel in July 2012 recognized the accident at the tsunami-hit atomic power station as "a man-made calamity." It also criticized the now defunct nuclear regulatory bodies -- the Nuclear and Industrial Safety Agency and the Nuclear Safety Commission -- for being "captive to electric power companies."

TEPCO underestimates danger again - What credibility?

April 9, 2013

TEPCO 'underestimated' leak severity

Concentration of radioactive substances in underground storage pool

The Yomiuri Shimbun

<http://the-japan-news.com/news/article/0000116890>

Tokyo Electric Power Co. may have underestimated by as much as 50 times the amount of radioactive

substances contained in water that leaked from an underground storage pool at its crippled Fukushima No. 1 nuclear power plant, according to experts.

The power company has estimated that the leaked water contains a total of 710 billion becquerels of radioactive substances.

However, TEPCO used the concentration level of radioactive substances contained in water trapped between a three-layered waterproof sheet that lines the pool as the basis for its calculation.

If the utility used the concentration of radioactive substances contained in water inside the pool as the basis of its calculation, the estimated figure would be about 50 times larger--about **35 trillion becquerels**. This suggests environmental impact of the leak could also be much bigger than TEPCO's estimate.

TEPCO announced the water leakage Friday. According to the utility, about 120 tons of contaminated water has seeped from the storage pool, the largest water leak since the government announced that the power plant achieved a state of cold shutdown in December 2011.

According to TEPCO, the concentration of radioactive substances contained in water trapped between the second and third layers of the protective waterproof sheet was about 6,000 becquerels per square centimeter.

Based on this figure, the power company estimated that about 710 billion becquerels of radioactive substances was contained in the 120 tons of leaked water.

However, if the calculation was based on the concentration level of radioactive substances contained in water inside the pool--about 290,000 becquerels--the total amount leaked would be about 35 trillion becquerels.

Prof. Hideo Yamazaki of Kinki University, who specializes in environmental analysis, said: "I cannot understand why TEPCO used a lower figure as the basis for this calculation. Such calculations should be conducted strictly from the viewpoint of ensuring safety."

A TEPCO spokesman said the water trapped between the second and third layers of the waterproof sheet were chosen because the contaminated water is believed to have leaked from there. The spokesman stressed that neither calculation method is wrong.

However, TEPCO said it is unclear why the concentration of radioactive substances in water from the waterproof sheet was lower than that of water inside the pool. If the decline of the concentration level was caused by an inflow of water from outside the pool, the total amount of water leaked through the sheet could be bigger than the initial estimate of 120 tons.

The water became contaminated when it was poured on damaged reactor cores at the nuclear plant to keep them from overheating.

Prof. Masanori Aritomi of Tokyo Institute of Technology, who specializes in nuclear reactor engineering, said: "There's a common understanding that such calculations should be based on the initial concentration of radioactive substances. I'm afraid TEPCO is underestimating the seriousness of this incident."

Construction checks 'insufficient'

The underground storage pool was exempted from the pre-operation checking required by the law on nuclear material and reactors when it was built by TEPCO late last year, according to sources. Safety inspectors stationed at the Fukushima No. 1 nuclear power plant inspected construction work on the pool, but their inspections were nothing more than a formality. Strict checking, such as confirming whether there were any errors in the construction work, was not conducted, the sources said.

According to the Nuclear Regulation Authority's Secretariat, the now-defunct Nuclear and Industrial Safety Agency decided the storage pool would not be subject to the regulations of the Law on the Regulations of Nuclear Source Material, Nuclear Fuel Material and Reactors, as with other makeshift facilities built at the plant to speed up measures to deal with water contaminated with radioactive materials.

The agency hosted a hearing to ask the opinions of experts on the safety of the storage pool. At the hearing, TEPCO explained that leakage would be prevented by the three-layered waterproof sheet and a leakage detector, and the experts did not raise serious objections to the plan, the secretariat said.

The NRA, which took over the role of the agency, ordered safety inspectors to examine some aspects of the storage pool's construction in late last year. However, the inspectors merely confirmed the progress of the construction.

As the NRA was busy dealing with the transfer of operations from the agency, the NRA did not have time to assess the agency's evaluation of the pool's construction, the secretariat said.

However, the NRA said it believes the leakage from the storage pool has undermined the overall credibility of measures for dealing with the contaminated water. The NRA plans to discuss measures on dealing with contaminated water at regular meetings of NRA members and meetings of experts tasked with evaluating work at the Fukushima No. 1 nuclear plant.

The NRA plans to promptly draw up its plan to move contaminated water from the underground storage pool to tanks above ground, the secretariat said.

Clearly pro-nuclear panel criticised

April 9, 2013

Criticism, doubts greet new Diet panel on nuclear issues

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201304090066>

THE ASAHI SHIMBUN

The Lower House established a committee to monitor nuclear power administration, but **the overtly pro-nuclear panel was immediately criticized as long overdue and doubts were raised about whether it would provide effective oversight.**

The Special Committee for Investigation of Nuclear Power Issues was created under the Abe administration following a recommendation from the Diet's investigation commission on the accident at the Fukushima No. 1 nuclear power plant.

"The accident has not been brought under control," Kiyoshi Kurokawa, who chaired the now disbanded Fukushima Nuclear Accident Independent Investigation Commission, told the inaugural session of the committee on April 8.

Former commission member Reiko Hachisuka, who heads the commerce and industry association of Okuma town, home to the Fukushima No. 1 plant, relayed the complaints of residents at the session.

“Disaster victims have been frustrated by the Diet’s response. Give us peace of mind,” she said.

In its 641-page final report released in July, the Diet investigation commission defined the nuclear accident as “a man-made disaster,” and called the responsibilities of the government and plant operator Tokyo Electric Power Co. into question.

The report recommended the establishment of a permanent committee on nuclear power issues at the Diet to monitor the work of regulatory authorities.

The Democratic Party of Japan, which was in power when the disaster unfolded on March 11, 2011, was reluctant to embrace the proposal, fearful that its own responsibilities would be pursued.

The committee was finally set up after the Liberal Democratic Party regained power in the Lower House election in December.

Kurokawa implicitly criticized the delay.

“I have been given an opportunity (to attend a session) nine months after submitting the report to the Lower House speaker,” he said.

Yasuhisa Shiozaki, an LDP member who sits on the committee, said, “We offer an apology on behalf of the Diet because it has taken so long.”

Former commission members said the Diet has its work cut out dealing with the Fukushima nuclear plant and overseeing regulations of an industry long criticized for its cozy ties and lax supervision.

Shuya Nomura, a lawyer, said the Fukushima No. 1 plant remains unstable, citing recent leaks of radioactive water.

“Can it be entirely left in the hands of TEPCO and the government to handle the crisis?” Nomura said. “**We urge the representatives of the people to oversee the situation in an independent manner and through the eyes of the public.**”

The Nuclear Regulation Authority, the government's nuclear industry watchdog, is compiling new regulation standards for nuclear power plants.

But **the NRA's draft standards have already been criticized as extremely insufficient.**

"We cannot say the world's top-class safety measures will be in place (as the NRA claimed)," said Katsuhiko Ishibashi, a seismologist.

The Diet investigation commission had also called on lawmakers to continuously monitor problems found during its investigation and ask the government to regularly report on the monitoring procedures.

But the Diet has not acted on these proposals.

"The Diet commission's report is not the end. It is the start," said Masafumi Sakurai, a former commission member and a former superintending prosecutor.

The LDP has traditionally promoted nuclear power. Under Prime Minister Shinzo Abe, the party plans to allow idled reactors to be brought back online based on the NRA's new regulation standards that take effect in July.

Of the 40 members of the Special Committee for Investigation of Nuclear Power Issues, 24 belong to the LDP. Six of the LDP members represent constituencies that host a nuclear power plant.

Some other members clearly support nuclear power generation.

"We avoided anti-nuclear lawmakers," said a senior official of the LDP's Diet Affairs Committee.

LDP lawmaker Taro Kono, a key member of a multi-party group of anti-nuclear lawmakers, wanted to join the Lower House committee, but he was snubbed.

The panel is also tasked with following up on the investigation into the causes of the Fukushima nuclear disaster.

Mitsuhiko Tanaka, a former commission member and a former reactor design engineer, dropped his plans for an on-site inspection of the No. 1 reactor building after a TEPCO official gave him false

information in February 2012. The official said the building was pitch black inside and too dangerous to enter.

“The new regulation standards will be toothless unless the causes of the accident are brought to light,” Tanaka said April 8. “We ask the Diet to inspect the site on its own.”

Some opposition members, including Akira Kasai of the Japanese Communist Party and Yasuko Komiya of the People’s Life Party, supported Tanaka’s proposal.

But an LDP member said an investigation will be difficult.

Another pro-nuclear committee member was more frank.

“If we conduct an additional on-site investigation, the establishment of the regulation standards will be pushed back from July, delaying the restarts of reactors,” the member said.

A former commission member said: “The LDP has delayed the establishment of the committee but will try to do more than just that. It may apply pressure to loosen regulations, instead of overseeing the NRA.”

The Lower House has not yet scheduled the next session of the committee.

TEPCO and its "corporate culture of underestimating risks"

Yoroku: Expert needed to judge if TEPCO's clean-up efforts good enough

<http://mainichi.jp/english/english/perspectives/news/20130409p2a00m0na016000c.html>

In a rakugo comic monologue, "Hatena-no Chawan," the value of a cheap teacup sharply rises to 1,000 ryo (a unit of Japan's Edo-Period currency) because of rumors that an expert had held it and shook his head at the same time. However, the expert shook his head simply because water was leaking from the bowl although there were no visible cracks in it.

What is interesting about the monologue is that the rumors further boosted the teacup's perceived value, pushing up the price of the bowl. Such support could help make a cheap, leaky bowl the value of a masterpiece.

In sharp contrast, the value of a water tank at the tsunami-hit Fukushima No. 1 Nuclear Power Plant is very low. A massive amount of water contaminated with radioactive substances was leaking from an underground water tank on the premises of the atomic power station and a small amount of water was later found to have leaked from another tank. The trouble is quite serious because there are seven water tanks with the same structure at the power station.

The tanks in question hold concentrated saline water from which radioactive cesium has been removed but which still remains highly toxic. The tanks were makeshift ones created by digging the ground and laying a three-layer waterproof sheet in the area. Experts point to the possibility that the sheet's waterproof ability decreased because it was exposed to saline water.

Since workers at the power station are dealing with an accident that human beings had never experienced before, it is no wonder that they sometimes encounter unexpected developments. Still, a decline in the water level in the tank had been observed since last month and a small amount of radioactive substances had been detected around the tank. Tokyo Electric Power Co. (TEPCO), the operator of the power plant, was unable to respond to these changes apparently because of its corporate culture of underestimating risks.

In another example of recent trouble, a rat caused a power failure at the plant, showing that the plant is far from having been brought under control.

TEPCO needs an expert to judge whether the utility's work to bring the plant under control is appropriate. ("Yoroku," a front-page column in the Mainichi Shimbun)

Questions arise over whether poor workmanship or design led to leak of radioactive water

<http://mainichi.jp/english/english/newsselect/news/20130409p2a00m0na015000c.html>

Tokyo Electric Power Co. (TEPCO), operator of the Fukushima No. 1 Nuclear Power Plant, appears to be at odds with construction company Maeda Corp. over what led to leaks of radiation-tainted water from an underground reservoir at the plant.

The tank was designed by TEPCO, which says it has experience with storage reservoirs, and constructed by Maeda Corp., which argues that it would normally not design a reservoir tank in such a way. The leaks have raised the possibility of either a design error or construction flaw, and both companies are likely to come under scrutiny to determine whether they gave the project sufficient consideration. A Maeda Corp. representative said the company is investigating the content of its discussions with TEPCO on the tank's design and construction.

TEPCO maintains that the leak may have stemmed from operating the reservoir with a leak-detection pipe piercing a reservoir sheet. It is possible that the weight of water in the reservoir tank pulled the sheet down, creating a gap that allowed water to escape.

The reservoir tank is lined with three waterproof sheets: two polyethylene sheets each measuring 1.5 mm thick, and a 6.4 mm thick bentonite sheet on the outermost layer. The leak-detection pipe is pushed through the two polyethylene sheets, with the top of it above the water level.

Speaking with the Mainichi on April 8, a representative of Maeda Corp. said the construction company would normally not implement such a design. Maeda Corp. says that to prevent gaps from appearing, leak-detection pipes would not normally be allowed to pierce any sheets. A representative of the construction company added that while the same types of sheets have been used to store industrial waste, they didn't have a proven record with water storage. Water-based experiments with TEPCO officials were conducted, however, and no water leaks were confirmed during these tests.

TEPCO, however, says that similar designs are used in farm reservoirs. It plans to improve the area around the pipe and continue using its underground reservoir tanks while it investigates the cause of the leaks.

At the same time, the company announced on April 8 that that it would bring forward plans to build aboveground tanks capable of storing roughly 126,000 tons of radiation-tainted water at the Fukushima nuclear plant, though it has not yet specified a construction date.

Roughly 400 tons of contaminated underground water accumulates each day at the nuclear plant. Regular tanks and underground reservoir tanks at the plant have a capacity of roughly 331,000 tons, but as of April 2 they held about 276,000 tons of contaminated water, leaving space for only about 55,000 tons.

So far leaks have been uncovered at two storage tanks. TEPCO suspects that contaminated water leaked from near the top of the reservoir tanks, when they were nearly full. It says that if the water level is reduced to 80 percent, then leaks will not occur. However, the radiation level outside the tank where the first leak was detected stood at 57 becquerels per cubic centimeter on April 7, even though the water level

was at 65 percent of capacity. This is the same figure as before the water level dropped, suggesting that water may still be leaking. TEPCO has explained that it may take some time for readings to fall.

Meanwhile on April 8, TEPCO announced that a silt fence designed to stop radioactive material spreading in the sea had been damaged in two places, apparently due to bad weather

PROMETHEUS TRAP/ 'Shadow units' (17): SDF 'suicide mission' considered for dealing with nuclear accident

April 10, 2013

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201304100006>

By HIROYOSHI ITABASHI/ Staff Writer

Editor's note: This is the 17th part of a new series that has run in the past under the title of The Prometheus Trap. This series deals with the secret missions assigned to the "shadow units" of the Ground Self-Defense Force when the Fukushima nuclear disaster was unfolding following the Great East Japan Earthquake of 2011. The series will appear on Mondays, Wednesdays and Fridays.

About two weeks after the Great East Japan Earthquake struck, the 1st Airborne Brigade had set up one of its bases at a sports park in Iitate, Fukushima Prefecture.

In the evening, Kiichi Takahashi, 63, a local resident, showed up at the base where brigade members were planning the evacuation of residents living in a radius between 20 to 30 kilometers from the Fukushima No. 1 nuclear power plant in the event of an emergency.

"This is from everyone," Takahashi said.

With that, he presented brigade members with "amazake," a sweet, low-alcohol beverage, as well as 10 kilograms of pork.

"When all of you came dressed in a very intimidating manner, everyone here became frightened that this was not a safe place to be," Takahashi said. "Now, everyone has calmed down and are confident everything will be all right, even if we have to evacuate."

Although almost the entire village of Iitate is located outside the 30-kilometer radius, SDF members visited homes to inquire about senior citizens requiring special attention.

The members also visited Takahashi's home and after talking with them, he gradually began to understand the objective of the 1st Airborne Brigade.

It was at about that time that Maj. Gen. Tetsuro Yamanoue, the commander of the 1st Airborne Brigade, received an order from Ground Self-Defense Force Chief of Staff Yoshifumi Hibako.

"Move the base immediately. The radiation levels in the vicinity of Iitate are high."

At the end of March 2011, radiation levels in Iitate were about 10 microsieverts per hour and there were localized hot spots of high radiation levels.

Yamanoue discussed the matter with Lt. Col. Toshio Akabane, the regiment commander in charge of the base at the Iitate sports park.

"We should remain here," Akabane said strongly.

The structure for a possible evacuation had just about been put in place. If the regiment left immediately, it would needlessly heighten the concerns of residents.

At the same time, Yamanoue also realized the importance of the reason Hibako had given for leaving, namely, the members might not be of use in an emergency.

Yamanoue called Hibako. "We will move after looking at the situation," he said. "Please give me more time."

Hibako replied, "Is that so? I understand."

On March 29, Hibako made an inspection visit to the base. The reasons for leaving the village were explained to Yamanoue and Akabane.

"We are concerned about radiation doses SDF members are exposed to because we want them to continue their mission in the vicinity of the nuclear plant until the very last minute," Hibako said.

He also revealed another plan that he had in mind.

"There might be the possibility we will have to ask brigade members to parachute toward the nuclear plant and scatter boric acid to suppress a nuclear fission."

Akabane was taken aback because he couldn't believe there was **a plan for a possible suicide mission**.

After Hibako left, Yamanoue and Akabane decided to strengthen measures for managing exposure to radiation.

On April 5, brigade members left Iitate and moved their base to the Kashima district of Minami-Soma, about 30 kilometers north of the Fukushima No. 1 plant.

TEPCO apologizes for leak

April 11, 2013

TEPCO president apologizes for radioactive water leaks at Fukushima plant

<http://mainichi.jp/english/english/newsselect/news/20130411p2a00m0na014000c.html>

NARAHARA, Fukushima -- Tokyo Electric Power Co. (TEPCO) President Naomi Hirose apologized here on April 10 for a string of accidents involving underground tanks that had been found to be leaking at the crippled Fukushima No. 1 Nuclear Power Plant, vowing to do his utmost to deal with the ever-increasing radioactive water.

At a news conference held at TEPCO's Fukushima Revitalization Headquarters in Naraha, Fukushima Prefecture, Hirose bowed deeply twice after saying, "We have been causing tremendous trouble. We are very sorry."

The revelations of the leakages of radioactive water from three underground cisterns followed a power outage in March, believed to have been triggered by a rat that touched a switchboard, disabling cooling systems for spent fuel pools at the Fukushima nuclear complex. The string of such mishaps has prompted observers to question the utility's ability to bring the nuclear disaster under control.

The news conference was attended by three top TEPCO executives, including Hirose and Executive Vice President Zengo Aizawa, an engineer by background. The news conference lasted for about 90 minutes -- far longer than the 30 minutes originally scheduled.

Hirose, with a drawn face, announced that the operator of the Fukushima nuclear power station would take measures to transfer contaminated water to newly-built tanks and other facilities, and at the same time check radiation levels of underground water, among other things. Hirose was bombarded with questions from reporters such as "Is there any possibility of the construction of new tanks being delayed?" and "Will sufficient steps against leaks be taken when transferring contaminated water to the tanks?" In his reply, Hirose vaguely said, "I fully understand your concerns. We will do our best."

Asked whether it is appropriate for one company alone to carry out the unprecedented task of bringing the disaster under control, Hirose said, "Those of us who know about the power station best will carry out our responsibilities."

In a drastic shift in its policy to deal with the problem, TEPCO decided to transfer all of the contaminated water in the underground tanks to aboveground tanks. But it will take about two months to build new tanks, and therefore there will be risks of further leaks until then. Such being the case, there are no prospects at all that the problem of the contaminated water will soon be resolved. There are seven underground tanks on the premises of the troubled nuclear power station, and three of them were found to be leaking.

TEPCO, worried about a lack of space to store the contaminated water, had planned to transfer polluted water from two of the three leaking underground tanks to aboveground tanks while continuing to use other underground cisterns. But the Fukushima Prefectural Government and others were fiercely opposed to the idea of using the other underground tanks while the causes of the leakages remained unidentified.

On April 10, TEPCO announced its new plan to transfer the contaminated water from all of the underground tanks to aboveground tanks, saying that the company found a site where it could build 38 new tanks, with a capacity of 500 tons each. The utility plans to prepare auxiliary tanks but it has yet to unveil the total capacity of such tanks.

Rats, snakes and makeshift equipment

April 12, 2013

Rat, snakes, leaks betray just how frail Fukushima No. 1 is

AP

http://www.japantimes.co.jp/news/2013/04/12/national/rat-snakes-leaks-betray-just-how-frail-fukushima-no-1-is/#at_pco=cfd-1.0

A rat causing a power outage by short-circuiting a temporary switchboard. Another blackout occurring as workers install antirrat nets. Holes in the linings of huge sunken reservoirs leaking radioactive water.

Tokyo Electric Power Co.'s crippled Fukushima No. 1 nuclear power plant has run into a string of problems the past few weeks that highlight its precarious state more than two years after three of its six reactors melted down in the wake of a devastating earthquake and tsunami.

A makeshift system of pipes, tanks and power cables meant to carry cooling water into the melted reactors and spent-fuel pools inside shattered buildings remains highly vulnerable, Nuclear Regulation Authority Chairman Shunichi Tanaka acknowledged Wednesday.

"Fukushima No. 1 is still in an extremely unstable condition. There is no mistake about that," Tanaka said at a weekly meeting of the regulatory body's leaders. "We cannot rule out the possibility that similar problems might occur again. Whenever a problem occurs, it halts the plant's operations and delays the primary goal of decommissioning the plant."

The problems have raised doubts about whether the plant can stay intact through a decommissioning process that could take 40 years, prompting officials to compile risk-reduction measures and revise decommissioning plans. The regulatory watchdog said Wednesday it would add a ninth on-site inspector in order to better oversee the plant.

Just over the past three weeks, there have been at least eight accidents or problems at the plant, the NRA said.

The spate of problems started March 18, when a rat got into an outdoor switchboard — which was sitting on a pickup truck — powering the jury-rigged cooling system and several other key parts of the plant, causing a short-circuit and blackout that lasted 30 hours in some areas of the plant. Four storage pools for fuel rods lost cooling during the outage, causing Tepco to acknowledge that it had added backup power only to the reactors, despite repeated concerns raised over a pool meltdown.

The cause of the outage wasn't clear at the time, but Tepco later released a photo of the electrocuted rat, which had fallen on the bottom of the switchboard housing. The most extensive outage since the crisis started after the March 2011 disasters caused more Fukushima residents to even consider evacuation.

Two weeks later, a new water processing machine designed to remove most radioactive elements temporarily stopped after a worker pushed a wrong button. The next day, one of the fuel storage pools lost power again for several hours when part of a wire short-circuited a switchboard while an operator installed antirat nets. Tepco reported three other minor glitches on the same day, including overheating of equipment related to boron injection to the melted reactors.

Regulators acknowledge that rats and snakes are abundant at the plant, and Tepco has started to take steps to protect pipes and cables from rat gnawing. Replacement of parts and equipment to those of higher quality and long-term use is in progress.

In the latest development, three of the plant's seven sunken reservoirs are leaking. Tepco reported the first leak early Saturday, hours after the plant's second power outage. Within days, it was learned that three reservoirs were leaking, paralyzing the plant's storage plans for contaminated water.

Tepco says none of the about 120 tons of radioactive water that leaked was believed to have reached the ocean. Experts suspect the radioactive water has been leaking from the plant since early on in the crisis, citing high contamination in fish caught just off the plant.

The contaminated water is a headache for the plant, and by far the most serious of the recent problems because of its potential impact on water management and the environment.

The tanks are crucial to the management of contaminated water used to cool melted fuel rods at the plant's wrecked reactors. They have since stabilized significantly, but the melted fuel inside must be kept cool with water, which leaks out of the reactors' holes and ruptures and flows into basement areas.

"The contaminated water situation is on the verge of collapse," Tanaka said. But he said there was no choice but to keep adding water, while trying to seek ways to minimize the leaks and their risks.

To address local outrage over the recent problems and Tepco's failure to detect problems earlier, company President Naomi Hirose traveled to Fukushima and apologized Wednesday for the problems. He promised to expedite the construction of steel containers and move all the water there from the sunken reservoirs, at the request of industry minister Toshimitsu Motegi.

The reservoirs, all built by Maeda Corp., come in different sizes, including one the size of an Olympic swimming pool and similar to an industrial waste dump.

PROMETHEUS TRAP/ 'Shadow units' (18): Brigade commander faced crucial decision before reactor meltdown

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201304120005>

By HIROYOSHI ITABASHI/ Staff Writer

Editor's note: This is the 18th part of a new series that has run in the past under the title of The Prometheus Trap. This series deals with the secret missions assigned to the "shadow units" of the Ground Self-Defense Force when the Fukushima nuclear disaster was unfolding following the Great East Japan Earthquake of 2011. The series will appear on Mondays, Wednesdays and Fridays.

In addition to the Ground Self-Defense Force's Central Readiness Force, one of the "shadow units," another GSDF unit was deployed for operations in areas around the Fukushima No. 1 nuclear power plant immediately after the nuclear accident broke out at the plant.

On the day after the devastating earthquake and tsunami struck on March 11, the GSDF's 12th Brigade was hastily dispatched from Gunma Prefecture to Fukushima Prefecture for a mission to rescue disaster victims. Maj. Gen. Hidetoshi Horiguchi, 56, served as commander of the brigade in the rescue mission.

An explosion occurred in the building housing the No. 3 reactor at 11 a.m. on March 14.

The government had already issued an evacuation order for areas within 20 kilometers of the nuclear plant. But many of the residents had yet to move out of the zone. There were also reports about people left behind in hospitals and facilities for the elderly.

The headquarters of the GSDF's Camp Koriyama, where the 12th Brigade was based, was flooded with calls for help. Horiguchi responded by issuing one order after another.

"Transport patients (to hospitals)!" "Bring fuel and water (to victims)!"

Some 2,000 members of the brigade carried out his orders one by one.

The headquarters continued receiving requests for assistance well into the night. Brigade members ran around the areas, doing all kinds of tasks to help disaster victims.

Horiguchi wrote down detailed plans for operations and matters to be attended to, while looking at a map of Fukushima Prefecture spread over a table for operations planning.

"We've got to do what we've got to do," he said to himself, trying to keep his mind occupied with the task at hand.

A member of his brigade called out to Horiguchi.

"The deputy commander of the CRF wants you on the phone, sir," he said.

As soon as Horiguchi picked up the phone, the deputy commander hurriedly said to him, "There is a possibility of a meltdown in 90 minutes."

"A meltdown ...," Horiguchi repeated the words and wondered if it could really occur.

After he hung up, the brigade commander began to think about what he had just heard in silence without telling anyone.

He looked at his watch, which showed it was past 8:50 p.m. That meant an emergency situation could occur at 10:20 p.m.

A TV news program was reporting that the No. 2 reactor might have suffered a core meltdown.

A vision of the worst scenario flashed through his mind. During the 1986 Chernobyl nuclear disaster, an explosion at a reactor that spiraled out of control released tremendous amounts of radioactive materials into the air.

Horiguchi faced a critical and urgent decision: Should his brigade continue its mission or abort it?

He took another look at the map in front of him.

Within 30 kilometers of the nuclear power plant, where the power supply had been cut off, legions of SDF personnel were busily engaged in a variety of tasks, such as supplying water, transporting patients and searching for missing people.

Given the time needed to communicate an order to the personnel and evacuate residents from the areas, he had to make the decision by 9 p.m. at the latest.

Horiguchi felt his stomach churning due to extreme tension.

"I've got to make the decision. I'm in charge of Fukushima Prefecture," he thought to himself.

Horiguchi called a brigade member in charge of communications and gave him the order.

"We launch a MOPP4 operation."

PROMETHEUS TRAP/ 'Shadow units' (19): Highest alert level ordered for first time since 1995 sarin attack

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201304150001>

By HIROYOSHI ITABASHI/ Staff Writer

Editor's note: This is the 19th part of a new series that has run in the past under the title of The Prometheus Trap. This series deals with the secret missions assigned to the "shadow units" of the Ground Self-Defense Force when the Fukushima nuclear disaster was unfolding following the Great East Japan Earthquake of 2011. The series will appear on Mondays, Wednesdays and Fridays.

Japan's Self-Defense Forces use four levels of protective gear for operations in toxic environments, such as the crippled Fukushima No. 1 nuclear power plant.

Such gear is collectively called "mission oriented protective posture," or MOPP. The highest level 4 of MOPP means that maximum possible protective gear should be used to be ready for the danger posed by nuclear, biological or chemical contamination.

A little after 9 p.m. on March 14, Maj. Gen. Hidetoshi Horiguchi, who was serving as commander of the Ground Self-Defense Force's 12th Brigade, issued an order for MOPP 4 protection at Camp Koriyama in Fukushima Prefecture. The brigade was engaged in an operation to help victims of the nuclear disaster at the Fukushima No. 1 plant that had broken out three days before.

MOPP 4 required SDF personnel to wear thick protective suits over their camouflage fatigues and boots over their boots. They also had to wear protective masks.

Members of Horiguchi's brigade hastily donned all their protective gear in response to his order.

The brigade commander had been informed of the possibility of a core meltdown occurring at 10:20 p.m. He received that information from the GDSF's Central Readiness Force, which was responding to the nuclear crisis at the Fukushima No. 1 plant.

Horiguchi also ordered all brigade members to suspend their activities to help disaster victims and take refuge inside buildings. He also told them to urge local residents to get indoors.

To prevent human exposure to radiation as much as possible, Horiguchi walked around in the headquarters building, closing windows and doors.

But nothing occurred at 10:20 p.m., the time when a meltdown was expected to take place.

Horiguchi tried repeatedly to reach a director at the Nuclear and Industrial Safety Agency to find out whether the information he had received was accurate or not.

One hour later, he finally found himself speaking with the director over the phone.

While Horiguchi was drenched in sweat after working fervently in heavy protective clothing, there was no tension in the voice of the official at the other end of the phone.

"We have made no announcement of a meltdown," said the agency director. "The situation at the nuclear power plant has been improving."

"Are you telling the truth?" yelled Horiguchi. "That's not what I've heard. Give me a call after checking out the facts," he shouted as he hung up.

Half an hour later, Horiguchi received a call from the director. There had actually been danger of a meltdown, but the danger had been averted, according to the official's explanation.

Horiguchi lifted the MOPP 4 order at 12:15 a.m. on March 15, three hours after he issued it.

The actual situation, however, had been more serious than the director's explanation had suggested it to be.

Pressure within the containment vessel of the No. 2 reactor rose to a level that could trigger an explosion. Masataka Shimizu, president of Tokyo Electric Power Co., the operator of the crippled plant, had asked the prime minister's office to allow the utility to evacuate its workers from the facility.

The Fukushima plant was in the most critical situation during several hours between the night of March 14 and the wee hours of the morning on March 15. Horiguchi was not provided with detailed information about these and other developments during that period.

Horiguchi immediately restarted his brigade's rescue operation, but the three hours of suspension had caused some unwanted effects.

An angry Koriyama Mayor Masao Hara called the headquarters of the 12th Brigade at Camp Koriyama. "As you suddenly stopped the water supply operations, residents are in big trouble," Hara said. "What are you doing?"

Horiguchi explained in great detail about the unfolding chain of events to update the mayor.

The order to use MOPP 4 protection issued by Horiguchi was the only second such action taken in the history of the SDF, and the first since the Aum Shinrikyo doomsday cult launched the sarin attack on the Tokyo subway system in March 1995.

But the order was issued amid great confusion without the public's knowledge.

PROMETHEUS TRAP/ 'Shadow units' (20): TEPCO offered only a list of cellphone numbers

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201304170015>

By HIROYOSHI ITABASHI/ Staff Writer

Editor's note: This is the 20th part of a new series that has run in the past under the title of The Prometheus Trap. This series deals with the secret missions assigned to the "shadow units" of the Ground Self-Defense Force when the Fukushima nuclear disaster was unfolding following the Great East Japan Earthquake of 2011. The series will appear on Mondays, Wednesdays and Fridays.

A strong earthquake registering a lower 6 on the Japanese seismic scale of 7 rocked Fukushima Prefecture on the evening of April 11, 2011.

The temblor was reminiscent of the devastating quake that had ravaged wide areas in northeastern Japan and triggered the nuclear disaster at the Fukushima No. 1 nuclear power plant just one month before.

The Ground Self-Defense Force's Central Readiness Force (CRF), a shadow unit, was engaged in operations to deal with the nuclear crisis, using J-Village, the soccer training complex in Naraha, a town in Fukushima Prefecture, as its operational base.

As he felt the intense shaking on the April evening, Maj. Gen. Masato Taura, deputy commander of the CRF, thought this time around his unit would really have to mobilize.

Taura barked out an order to the firefighting team to immediately prepare for a mission in a louder tone of voice than usual.

As massive injections of water into the crippled reactors to cool them using concrete pump trucks had started, the Self-Defense Forces had not been engaged in water spraying operations since the end of March.

Every time an aftershock had occurred, Taura had gotten members of the unit to stand by in fire engines, but he had not actually called out the troops so far.

Immediately after the major aftershock in April, Taura talked to a young employee of Tokyo Electric Power Co., the operator of the stricken plant, who was serving as a liaison at J-Village.

“We are ready for watering operations. Are the reactors all right?” asked Taura. “I myself have no idea,” replied the TEPCO employee.

At that time, the makeshift pumps for cooling the No. 1–3 reactors at the Fukushima No. 1 nuclear plant had actually stopped, disrupting the injection of water into the reactor buildings. But no information about the situation had been conveyed to Taura.

The firefighting unit remained standing by, until, about an hour later, it received a situational report from the utility.

“The injection of water has been resumed, and there has been no other problem,” the report said.

The report came after steps to fix the problem had been taken.

Taura wondered what TEPCO had intended to do if an emergency had broken out while it had been working to fix the problem.

He remembered an incident that had occurred in late March, when TEPCO considered venting to reduce the mounting pressure within the reactors as a step to prevent hydrogen explosions.

Despite the utility saying it had decided against venting, rumors circulated that the company had taken the step.

Venting would have led to the release of radioactive materials into the atmosphere and exposed SDF personnel engaged in water-spraying operations to a health hazard.

As it turned out, TEPCO, in fact, didn’t carry out the venting. But the difficulty of gaining accurate information from TEPCO’s head office caused serious confusion at the front line of operations to deal with the nuclear crisis.

One month had passed since the nuclear crisis started, but the company was still unable effectively to cope with the situation.

Later, Taura asked a senior TEPCO executive to establish a clear chain of command for dealing with emergencies.

The only action the utility took in response to his request, however, was to send a list of the cellphone numbers of top TEPCO officials.

At that time, the Central Readiness Regiment, which belongs to the CRF, was preparing for a secret mission to rescue TEPCO employees at the Fukushima plant if the need arose.

Given the state of affairs at that time, the regiment would have to carry out the mission without accurate information about the situation at the plant. Taura decided to meet with the TEPCO official in charge of the company’s response to the crisis at the site.

On April 21, Taura called on Masao Yoshida, 57, then chief of the Fukushima No. 1 nuclear plant.

The nuclear village knows nothing about solidarity

Utility could seek 20 billion yen from TEPCO over nuclear disaster

April 24, 2013

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201304240064>

Solidarity clearly has no place in Japan's nuclear power industry.

That would seem to be the case as Tohoku Electric Power Co. prepares to seek compensation for lost business from Tokyo Electric Power Co. over the Fukushima nuclear disaster.

Sources said April 24 that Tohoku Electric could seek more than 20 billion yen (\$203 million) from TEPCO, operator of the crippled Fukushima No. 1 nuclear power plant.

The damages arise from the accident at the plant triggered by the earthquake and tsunami disaster just over two years ago.

It is extremely rare for one electric power company to seek compensation from another since all the utilities have been united in promoting nuclear energy and other issues in the past.

Tohoku Electric provides electricity in Fukushima Prefecture. The reactor meltdowns triggered a mass evacuation of residents.

The evacuation, coupled with a sharp reduction in economic activity, led to a 10-percent decrease in electricity sold in Fukushima Prefecture in fiscal 2011.

Tohoku Electric's corporate performance has been hit hard as a result of the nuclear accident. In February, it submitted an application with the central government to raise electricity rates.

Tohoku Electric, fearing it could become the target of sharp criticism from customers as well as a possible lawsuit by shareholders, apparently decided that seeking compensation from TEPCO was the way to go.

Tohoku Electric could also seek compensation for its lost investment in a proposed Namie-Odaka nuclear plant in Fukushima Prefecture.

The utility had invested 18.5 billion yen to cover the purchase of land and other costs. But in March this year the company announced it was abandoning the project because of strong opposition from local municipalities in the aftermath of the Fukushima nuclear accident.

The proposed Namie-Odaka nuclear plant would have been constructed some 10 kilometers north of the stricken Fukushima No. 1 plant.

Tohoku Electric also operated service centers in the Fukushima municipalities of Namie and Tomioka that served as bases for its engineers. However, those facilities were rendered unusable due to release of radioactive materials from the wrecked Fukushima plant.

In seeking compensation from TEPCO, Tohoku Electric will have to follow guidelines established by the central government and differentiate damages stemming from the nuclear accident from those caused by the Great East Japan Earthquake and tsunami.

TEPCO has already paid out some 2 trillion yen to local residents in compensation for the nuclear accident. The figure is expected to increase.

Sources said Tohoku Electric officials would have to give careful consideration to the timing of its compensation request so it does not conflict with compensation payments to local residents.

A high-ranking Tohoku Electric official said discussions had already begun with TEPCO on compensation.

Asked for a comment, a TEPCO public relations official told The Asahi Shimbun that the utility was not aware of such talks.

Tohoku Electric and TEPCO provide electricity to each other on a daily basis because their supply areas are adjacent to each other.

At one time, the two companies closely cooperated on other matters.

The two companies jointly constructed the No. 1 reactor at Tohoku Electric's Higashidori nuclear plant in Aomori Prefecture as well as the No. 1 reactor at TEPCO's Kashiwazaki-Kariwa nuclear plant in Niigata Prefecture.

THE ASAHI SHIMBUN

TEPCO and Environment ministry at odds over 10.5 billion yen

April 21, 2013

TEPCO rejects ministry's demand to pay 10.5 billion yen for decontamination work

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201304210011>

By FUKUKO TAKAHASHI/ Staff Writer

Tokyo Electric Power Co. refuses to pay 10.55 billion yen (\$106 million) for decontamination work around its crippled Fukushima No. 1 nuclear plant, saying it is under no legal obligation to do so.

"We don't know whether those costs are covered by the special measures law," a TEPCO official said.

The Environment Ministry disagrees. It says the money is part of the 14.9 billion yen in decontamination costs that TEPCO is required to pay under that special measures law to deal with radioactive substances from the March 2011 accident at the Fukushima plant.

The ministry has not set deadlines for the payments, meaning there will be no delinquent charges. But if it cannot get TEPCO to pay the amount, the government might be forced to cover the costs with taxpayers' money.

The government allocated 372.1 billion yen for decontamination costs in the budget for fiscal 2012, which ended last month. In the budget plan for fiscal 2013, 497.8 billion yen has been set aside for the clean-up work.

Including amounts for subsequent years, the total decontamination cost is expected to swell to several trillion yen.

Based on the special measures law, the ministry in November 2012 demanded TEPCO pay 7.6 billion yen in decontamination costs for the period until August 2012. Of that amount, 1.7 billion yen is for the central government's work in "special areas" around the Fukushima plant, as well as 2.4 billion yen in central government subsidies paid to local governments that are cleaning up their own areas.

In addition, 1.94 billion yen was spent for advance research on the number of houses subject to decontamination work and their radiation levels. The remaining amount includes 960 million yen in publicity costs for the decontamination efforts.

"We will demand payment of all additional costs," the ministry told TEPCO.

TEPCO paid 1.7 billion yen to the ministry for the decontamination work in the special areas. But it says it won't pay the remaining 5.9 billion yen.

In February, the ministry again demanded, in written form, that TEPCO cover the remaining costs.

On Feb. 7, the ministry required TEPCO to pay an additional 7.3 billion yen in decontamination costs for the period from September to November 2012.

TEPCO plans to pay 2.65 billion yen of the amount, but it refuses to pay the remaining 4.65 billion yen.

“We understand that all of those decontamination costs should be shouldered by TEPCO,” Hiroyuki Eguchi, a ministry official, said. “We are now waiting for its reply.”

TEPCO public relations office declined to comment on the issue.

A lot of money to lose

May 1, 2013

TEPCO, 7 other utilities post combined loss of 1.6 trillion yen

<http://ajw.asahi.com/article/economy/business/AJ201305010073>

THE ASAHI SHIMBUN

Eight electric power companies reported a combined loss of 1.59 trillion yen (\$16 billion) for fiscal 2012 as the aftereffects of the Fukushima nuclear disaster continued to hammer their bottom lines.

With almost all of their nuclear reactors shut down, **the companies' fuel costs soared for thermal power generation to secure a stable supply of electricity.** They also had to spend large sums for maintenance of the idle reactors as well as for new measures to protect the nuclear plants against earthquakes and tsunami.

Four of the eight utilities posted record losses.

The electric power industry, which has been highly dependent on nuclear power, is banking on the Abe administration to approve the restarts of the reactors. However, new safety regulations could further delay such decisions, force the decommissioning of certain reactors or make nuclear power plant operations economically unfeasible.

Some power companies are raising electricity rates to get through this period of uncertainty.

By April 30, the nation's 10 regional electric power companies released their financial results for the business year that ended in March.

Only Okinawa Electric Power Co., which operates no nuclear plants, and Hokuriku Electric Power Co., which runs one nuclear plant but relies mainly on thermal and hydro power generation, posted profits for fiscal 2012.

Tokyo Electric Power Co., operator of the crippled Fukushima No. 1 nuclear plant, reported the biggest loss of 685.2 billion yen.

It was the beleaguered company's third consecutive annual loss, and it was compounded by 1.16 trillion yen in compensation paid to victims of the nuclear disaster, which started in March 2011 following the Great East Japan Earthquake and tsunami.

"The difficult-to-return zone has been clearly defined, so we have raised the total amount of compensation," TEPCO President Naomi Hirose said. Evacuees will not be allowed to return to their homes in that zone near the stricken plant until at least March 2017.

Under its rehabilitation plan, TEPCO and its largest shareholder, the central government, plan to return the utility to the black for the year ending in March 2014. Creditor banks have also extended loans on the condition that TEPCO posts a profit for the current fiscal year.

But the rehabilitation plan is based on the assumption that TEPCO will be able to restart seven idle reactors at its Kashiwazaki-Kariwa nuclear plant in Niigata Prefecture beginning in April.

It is unclear when those reactors will actually be able to go online.

The eight electric power companies said their fuel costs for thermal power generation totaled about 7 trillion yen.

Such outlays have been a particularly huge drain on the four companies that reported record losses: Hokkaido Electric Power Co. (132.8 billion yen); Kansai Electric Power Co. (243.4 billion yen); Shikoku Electric Power Co. (42.8 billion yen); and Kyushu Electric Power Co. (332.4 billion yen).

They had depended on nuclear power for around 40 percent of their electricity supply.

Only two of the nation's 50 nuclear reactors are operating—at Kansai Electric's Oi plant in Fukui Prefecture.

While the 48 idle reactors are not generating profits for the utilities, expenses are piling up. The nine companies that operate nuclear plants said they spent 1.2 trillion yen in maintenance for the reactors in fiscal 2012.

Additional expenses are expected.

Under planned government-mandated safety standards, the Nuclear Regulation Authority will instruct operators to take countermeasures against natural disasters, such as building levees to block tsunami and constructing buildings for emergency power systems that can withstand powerful earthquakes.

The nine nuclear plant operators have estimated near-term costs for such safety measures at 1.2 trillion yen.

In addition, 10 of Japan's 50 nuclear reactors started operations more than 35 years ago, raising questions about the wisdom of continuing to run such aging equipment.

Some reactors are believed to be sitting directly above active faults. If these geological features are confirmed, utilities will be forced to decommission those reactors.

Electric power companies must now decide whether to maintain their nuclear plants at potentially huge and continuing costs or take a temporary yet substantial loss by decommissioning the reactors.

The utilities plan to make up for some of their losses by charging more for electricity.

TEPCO increased its household electricity rates in September. Kansai Electric and Kyushu Electric followed suit from May.

Hokkaido Electric, Tohoku Electric and Shikoku Electric have applied to the government for permission to raise their electricity rates.

Tepco suffers ¥685 billion group net loss

Kyodo

<http://www.japantimes.co.jp/news/2013/05/01/business/tepco-suffers-685-billion-group-net-loss/#.UYAGWEpsFEs>

Tokyo Electric Power Co. reported Tuesday a group net loss of ¥685.29 billion for the business year ended in March, its third straight year in the red due to the Fukushima nuclear crisis.

The utility did not release a forecast for this year amid uncertainties over its business conditions, but returning to a profit soon will be difficult under the 10-year restructuring plan authorized by the government last May.

The operator of the stricken Fukushima No. 1 nuclear plant lost less money last year after losing ¥781.64 billion in the 2011 business year.

Tepco registered an operating loss of ¥221.99 billion, compared with a loss of ¥272.51 billion the previous year.

Group sales increased 11.7 percent to ¥5.98 trillion, partly because the utility raised electricity rates for households and companies last year.

Other utilities also faced difficult business conditions amid the prolonging shutdown of many of their reactors.

Kansai Electric Power Co. posted its worst ever group net loss of ¥243.42 billion, while Kyushu Electric Power Co. also had its worst year ever, losing ¥332.47 billion.

Of Japan's 50 commercial reactors, only two operated by Kansai Electric Power are currently online.

The government's Nuclear Regulation Authority is not expected to accept applications for the resumption of any of the halted reactors until new safety requirements take effect in July.

Certainly not doing her job as a public servant

May 3, 2013

Atomic energy commissioner joined events run by power industry-backed NPO

<http://mainichi.jp/english/english/newsselect/news/20130503p2a00m0na003000c.html>

A member of the Cabinet Office's Japan Atomic Energy Commission (JAEC) has repeatedly participated in events organized by a nonprofit organization backed by the electric power industry, it has been learned.

Etsuko Akiba, 64, occasionally missed JAEC meetings and used a government car to attend events mounted by the Asca Energy Forum NPO, where she also serves as an adviser. Asca Energy Forum has received heavy financial assistance from power companies and related organizations, and the latest revelations point to continuing close ties between Akiba and the NPO.

Akiba launched Asca in 2001 to conduct awareness campaigns on energy issues and other projects, and served as president until she was appointed to the JAEC in January 2010. The NPO has received over 18 million yen in donations from the Federation of Electric Power Companies of Japan, Tokyo Electric Power Co. and other power industry players since the March 2011 Great East Japan Earthquake, tsunami and ensuing Fukushima nuclear crisis.

Chief Cabinet Secretary Yoshihide Suga told a news conference in March that there is no problem with Akiba giving advice to Asca even though she is a JAEC member.

However, Akiba has participated in at least 14 events organized by Asca since she was appointed to the JAEC, according to the commission secretariat. Moreover, she used a government car to go to Asca events held in Tokyo on March 11, 2011, Sept. 28, 2012 and March 8, 2013.

Of the 14 events, 11 were Asca workshops on radioactive waste commissioned by the Nuclear Waste Management Organization of Japan (NUMO) to win local understanding of the need to dispose of spent nuclear fuel.

Two others were social gatherings for workshop participants, and another was a study session on radiation. The JAEC secretariat said Akiba attended these events in her official capacity as a JAEC member. Akiba also moderated workshops held in three prefectures including Aichi in 2012. She furthermore looked after guest speakers and guided other attendees during an Osaka workshop in January this year. In two other workshops held in Miyagi and another area, she was tasked with inviting guest speakers.

Furthermore, Akiba skipped JAEC regular and extraordinary meetings in order to deliver a speech during a meeting organized by an Asca affiliate.

Akiba admitted that she went a little too far.

"It became necessary to urgently dispose of radioactive waste following the outbreak of the Fukushima nuclear crisis, and I was more frequently asked by NUMO for help. I worked hard to coordinate opinions between NUMO and ordinary people, but may have gone too far," she said. "However, I went through the proper procedures for being absent from a JAEC regular meeting."

Chuo University professor Shuya Nomura, who served as a member of the Diet investigative panel on the nuclear crisis, criticized Akiba for skipping JAEC meetings.

"Full-time members of the JAEC are special civil servants, and are remunerated handsomely with taxpayers' money. They should avoid any act that could be interpreted as supporting certain organizations," he said. "It's inappropriate for members to be absent from meetings simply because the meetings have achieved quorum. They should cite reasons that the public will accept."

Yakuza links put nation at added nuclear risk

by Jake Adelstein

<http://www.japantimes.co.jp/news/2013/05/05/national/yakuza-links-put-nation-at-added-nuclear-risk/#.UYYMxkpsFEs>

On April 15, two alleged terrorists in Boston killed three people, injured more than 170 others and terrified a nation — for about \$100 it cost them to modify pressure cookers into bombs. We should be glad they didn't come to Japan, where they may have been able to explode a ready-made nuclear dirty bomb, kill untold thousands, render huge swaths of the country uninhabitable — and get paid by Tokyo Electric Power Co. (Tepco) in the process.

I wish I were kidding. Japan has more than 50 gigantic nuclear “pressure cookers” ripe for exploitation by terrorists. And they wouldn't even have to lay siege to the facilities. Instead, they could just walk into a nuclear plant and leave with enough weapons-grade plutonium for a small atomic device — which later could be detonated wherever they chose.

How?

In Japan, getting access to a nuclear power plant is very simple: fill out a job application.

It is now more than two years since the start of the nuclear crisis following the Great East Japan Earthquake on March 11, 2011, and there are still no mandatory background checks for workers at its nuclear facilities.

After the three reactor meltdowns at the Fukushima No. 1 nuclear complex in March 2011, it became clear that Tepco, the plant's operator, was allowing members of Japan's organized crime groups, the yakuza, to staff the well-paid cleanup — just as they had been allowed into plants long before then.

Indeed, members and associates of the Sumiyoshi-kai (Kanto) and Kudo-kai (Kyushu) mobs have been arrested for their roles supplying labor to Tepco and its Kansai cousin, Kepco. So the dirty secret that

yakuza-linked workers and companies have long sustained Japan's nuclear industry — along with yakuza members themselves, ex-convicts, wanted criminals, and drug addicts working there — is now public knowledge.

Although many yakuza groups claim to have a protective role in society, most of their members are sociopathic felons who would commit theft, assault or murder to make a little money. And if you consider the black-market value of a little plutonium, you may feel a tad uneasy knowing such people have long had access to it — and can still get their hands on nuclear materials.

Don't worry, though: Last month the Nuclear Regulation Authority (NRA) said a panel will be set up to discuss atomic energy security issues, and it will consider introducing a system to investigate the backgrounds of workers to avoid acts of terrorism at nuclear plants.

Specifically, it seems the panel will examine ways to check whether nuclear facility employees are drug addicts or have a criminal record, among other issues, in order to screen out anyone who could potentially get involved in terrorism.

The panel will comprise NRA Commissioner Kenzo Oshima and outside experts. However, one expert who will not be on the panel is Haruki Madarame, former chief of the now-dissolved Nuclear Safety Commission. He is currently being investigated by prosecutors for alleged criminal negligence.

But hey, let's not dwell on the past. The good news is that the NRA is thinking about making nuclear plants safer in the future. They may even reach the same conclusions that the Nuclear Security Expert Commission of the Atomic Energy Commission announced ... in September 2011. Of course, why take action when you can spend more time debating about taking action?

The AEC makes recommendations for nuclear energy policy. However, that 2011 report, titled "Basic Nuclear Security Assurance," doesn't give a positive view of Japan's countermeasures.

There, the words "internal threats" appear five times in 14 pages of attached materials. And, in a section headed "Lessons of Fukushima," it notes: "It is clear there were defects in the management of those leaving and entering the site from the start of the accident. ... Licensed (nuclear facility) operators need to first strictly enforce measures to keep suspicious persons from sneaking into the facilities and strengthen countermeasures against threats from within."

The report, without irony, also notes that criminal acts such as the theft of nuclear materials to build a dirty bomb, or the destruction of facilities, "should be detected, prevented, and stopped so as to cause as little negative impact as possible to life, physical health, property, society and the environment."

It also recommends that law enforcement, regulators and the power plant operators share information to make sure that thieves, saboteurs or criminals do not have access to the plants or related facilities. But it stops short of mandating background checks.

The United States has long had a screening system in place, but Japan has delayed taking similar measures due to privacy concerns and “respect for human rights.” Meanwhile, Tepco is still unable to locate scores of workers who entered the disaster zone.

Maybe, though, we shouldn’t worry so about criminals gaining access to nuclear plants. After all, the National Diet of Japan’s Fukushima Nuclear Accident Independent Investigation Commission report in 2012 established Tepco’s responsibility for the triple meltdown. Then months later Tepco admitted it consciously ignored the threat of a tsunami-related disaster.

So perhaps the lesson to be learned is that the greatest threat of “nuclear terrorism” Japan faces is from criminally negligent power companies and a government that fails to punish them.

Come to think of it, maybe we shouldn’t worry at all about criminals gaining access to the nuclear power plants. As the Tokyo Prosecutor Office’s investigation into the top executives of Tepco for professional negligence resulting in injury and death grinds on, it seems more and more likely that criminals have been running the plants for a very long time — they just don’t all have tattoos.

When it comes to the nuclear security in Japan, the U.S. comics “swamp critter” Pogo Possum would tell you: “We have met the enemy, and he is us.” Let’s hope no other enemies decide to join the party — because if they do, Japan’s nuclear negligence may become the world’s problem as well.

CROOKED CLEANUP: Yakuza taking slice of lucrative decontamination work

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201305060062>

THE ASAHI SHIMBUN

Criminal organizations are engaging in **fraudulent practices amid a labor shortage and lax background checks by employers to pocket some of the trillions of yen from publicly funded cleanup work in nuclear disaster-stricken Fukushima Prefecture.**

On March 5, the Yamagata District Court handed down a suspended eight-month prison term to a 40-year-old former senior member of a yakuza gang.

The man, a Yamagata Prefecture resident, was charged with dispatching seven day laborers to decontamination operations in Date, Fukushima Prefecture, between November last year and January without a staffing agency license.

“The Yamagata case is just the ‘tip of the iceberg,’ ” said a Yamagata prefectural police official, asserting that the involvement of yakuza gangs in the decontamination work is widespread.

In the Yamagata case, although the court acknowledged that the convicted man's actions are a “malicious crime,” it gave him a suspended sentence on the grounds that he quit his criminal organization after the case surfaced.

When the accused was asked in court if he is aware that the decontamination work is funded by taxpayers' money, he said, “Yes, vaguely.”

According to prefectural police, the accused hit on the idea of cashing in on the extensive cleanup operations under way in Fukushima Prefecture in last November.

The central government expects to spend trillions of yen over several years to decontaminate communities that were polluted with radioactive materials after the crisis unfolded at the Fukushima No. 1 nuclear power plant in March 2011.

The accused told police that he hired the men to work for a company based in Yamagata Prefecture that, as a third subcontractor, was contracted for a project commissioned by the Date city government.

“I expected that background checks would be lax because decontamination operations require large amounts of manpower,” he said. “I attempted to expand my business (by profiting from the work).”

The man approached an acquaintance in the construction industry to line up unemployed workers eager for work.

He offered to pay 12,000 yen (\$120) a day for a “simple job,” and at least seven workers came forward.

The man received wages for the seven from the subcontractor, and paid them after siphoning off between 100,000 yen and 200,000 yen.

Prosecutors said in court that he gave a cut to the criminal gang he belonged to at the time. The yakuza group is the largest in Yamagata Prefecture, with about 40 members.

At least one of the seven workers suspected that the man had a connection with the yakuza, according to police investigators.

The president of the third subcontractor, who became acquainted with the accused more than 10 years ago, told police that he did not question the gangster about his occupation although he suspected he was a gangster.

The accused was charged with violating the worker dispatch law, which carries a maximum one-year prison term or a 1 million yen fine.

But there are many cases such as his where the convicted person receives a suspended sentence.

“The law was set without anticipating the involvement of gangsters, so sentences tend to be light,” said a senior official with the Yamagata prefectural police.

The convicted man has refused to speak to The Asahi Shimbun despite repeated requests for an interview.

INVOLVEMENT OF CRIMINAL ORGANIZATIONS WIDESPREAD

Some workers in the cleanup operations admitted that they suspected yakuza members' involvement when The Asahi Shimbun interviewed them about allegations of slipshod cleanup work and intermediary exploitation.

But they have remained silent because of fears of retribution.

In the cleanup effort in Iitate, Fukushima Prefecture, an individual working for a third subcontractor heard a senior official with a second subcontractor speaking of his background.

“I am in that line of business,” the man quoted him as saying, suggesting he had ties to the yakuza. “I go and make contributions (to the gang) every week.”

The gangster proudly spoke of his arrest record like it was a badge of honor, according to the individual.

A subcontractor in Iwaki, Fukushima Prefecture, said that an official with another company pressured him to provide jobs by pointing out his affiliation with an underground criminal organization.

In Date, a man who worked in a separate cleanup operation said that his supervisor, who identified himself as a former gangster, threatened him and told him to follow instructions.

An official with another subcontractor said it is so short-handed that it will not be able to come up with enough workers if it must check prospective workers' backgrounds.

There are tens of thousands of subcontractors involved in cleanup programs awarded to general contractors as primary contracts by the Environment Ministry and local governments.

Day laborers are obtained for their efforts through conventional hiring practices in the construction industry, where small subcontractors across the nation do the recruiting.

However, if subcontractors send their laborers to the work site in the same fashion that temporary workers are dispatched by staffing agencies, that is illegal.

Subcontractors are required to provide their own equipment and oversee the safety of their workers, in contrast to a temporary work force that comes under the supervision of a client company, like their regular employees.

Layers of subcontractors often make it more difficult for law enforcement authorities to uncover nefarious activities.

The general contractor that was awarded the primary contract in the Yamagata case refused to discuss the former gang official who dispatched the seven day laborers, saying it has nothing to do with individual contracts.

Local governments are ill-equipped to deal with the issue.

“We had no knowledge of the second and third subcontractors,” said an official with the Date city government. “The name of the third subcontractor is not familiar.”

An official wrestling with the matter at the Ministry of Health, Labor and Welfare admitted the difficulty of weeding out involvement by criminal organizations.

“What we can do to confirm the background of prospective workers is limited,” the official said. “Police should do the job.”

The official also acknowledged the lack of enthusiasm in recent months to preventing a recurrence of such illicit activities.

Tomohiko Suzuki, a freelance journalist who investigated the connection between workers at nuclear facilities and criminal organizations, said the direct hiring of workers is the key to keeping out criminal organizations.

“Even if it is getting harder for second and third subcontractors to recruit people, they must make sure all their workers are employed directly,” he said. “Otherwise, it will be impossible to keep out gang members.”

Regulators assemble behind closed doors

May 7, 2013

Nuclear regulators assemble for three-day meeting

Kyodo

<http://www.japantimes.co.jp/news/2013/05/07/national/nuclear-regulators-assemble-for-three-day-meeting/#.UYjQbUpsFEs>

Nuclear regulators from nine countries including Japan, the United States and South Korea gathered Monday in Tokyo for a three-day meeting to discuss their responses to the 2011 nuclear accident at the Fukushima Daiichi power plant.

The International Nuclear Regulators Association meeting, chaired by Shunichi Tanaka, head of Japan's Nuclear Regulation Authority, will be held **behind closed doors to enable participants to communicate candidly**, according to officials.

On Wednesday, they are scheduled to inspect work to contain the crisis at the plant in Fukushima Prefecture, northeastern Japan, they said.

During the meeting, Tanaka was expected to report on Japan's new nuclear regulations based on lessons learned from the accident triggered by the March 2011 earthquake and tsunami.

The association's meetings are held in rotation among the nine participating countries, which also include Britain, France, Germany, Canada, Spain and Sweden. Japan previously hosted the event in 2004.

About the Turkish deal

May 3, 2013

Source : Bloomberg Businessweek

<http://www.businessweek.com/news/2013-05-03/mitsubishi-areva-set-to-sign-turkish-nuclear-plant-deal-today>

Mitsubishi, Areva Sign \$22b Turkish Nuclear Plant Deal (1)

By Selcan Hacaoglu and Tara Patel

Japan's Mitsubishi Heavy Industries Ltd. (7011) and Areva SA of France signed a \$22 billion agreement today to build a nuclear power plant in Turkey, the first major order for Japan since the Fukushima disaster in 2011.

Japanese Prime Minister Shinzo Abe and his Turkish counterpart Recep Tayyip Erdogan met in Ankara to oversee the signing of the accord for the building of Turkey's second nuclear plant in Sinop province on the Black Sea coast.

"We have reached agreement on a \$22 billion investment," Erdogan said at the televised signing ceremony today. "It will be built in 10 years, but we want to bring that forward."

Abe said in a news conference before the ceremony that Japan had a responsibility to meet "high expectations" for safety after the meltdown of reactors at Fukushima, Japan in 2011 following an earthquake and tsunami.

Turkey imported more than \$60 billion in energy last year and is seeking ways to improve energy efficiency, Finance Minister Mehmet Simsek said at a conference in Istanbul last month. A single nuclear plant would reduce Turkey's current-account deficit, the third-largest in the world last year, by about \$3 billion, he said. Turkey picked Russia's Rosatom Corp. and ZAO Atomstroyexport for its first facility at a cost of \$20 billion.

GDF Suez SA (GSZ) would operate the nuclear plant in Turkey with a local partner should the deal be finalized, Chief Executive Officer Gerard Mestrallet told reporters yesterday in Paris.

Energy Dependency

The plant won't have an impact on Turkey's energy dependency for at least a decade, according to Naz Masraff, a London-based analyst at Eurasia group.

"It is unlikely that Turkey will complete the project by 2023 as planned," Masraff said in a report on May 1. "The country's increased gas dependency trajectory, therefore, is unlikely to be altered in a meaningful way in the future."

The Japanese-French group plans to build four reactors with a combined capacity of about 4,500 megawatts on Turkey's Black Sea coast, Japan's Nikkei newspaper reported on April 4, citing unidentified people familiar with the matter. The first unit is scheduled to begin operations by 2023 following the start of construction in 2017, Nikkei said.

The Turkish reactor is still "years away" from construction as the country has yet to create a nuclear safety authority that will give building permits, GDF Suez's Mestrallet said yesterday.

Over Budget

The Franco-Japanese bid is being led by Mitsubishi Heavy, which together with Areva SA (AREVA), the French reactor builder, has developed a 1,100-megawatt model called the Atmea. The unit is a smaller, less-expensive version of the EPR, which is being built by Electricite de France SA in Normandy and Areva in Finland. Both projects are behind schedule and over budget.

"We are confident in the Atmea, Mestrallet said. "We wanted to build one in France." The Atmea has never been built anywhere after a project in France was canceled.

Mestrallet declined to provide specifics about any potential Turkish partners in the project or how long the utility could take before committing to development.

GDF Suez, which operates seven nuclear reactors in Belgium through its Electrabel SA unit, has long said it wants to push ahead with new projects outside France in countries such as the U.K. and possibly Brazil. Since the meltdown of reactors after an earthquake and tsunami struck Japan two years ago, French developers of nuclear technology have failed to win any orders. "This is a positive sign" that countries are willing to keep nuclear in their future energy mix, Mestrallet said.

All but two of Japan's 50 reactors remain shut for safety checks after three meltdowns and the release of radiation at Tokyo Electric Power Co. (9501)'s Fukushima Dai-Ichi plant. Abe told lawmakers in Japan on Feb. 28 that he'll restart some nuclear reactors once new safety measures are in place.

Not so transparent

May 9, 2013

New nuclear safety standards

<http://mainichi.jp/english/english/newsselect/news/20130509p2a00m0na007000c.html>

The Nuclear Regulation Authority has made public the draft of new safety standards for nuclear power plants and plans to put them into force in mid-July. If power companies want to restart nuclear power plants now offline, they must meet the new standards. Currently only the Nos. 3 and 4 reactors of Kansai Electric Power Co.'s Oi nuclear power plant in Fukui Prefecture are in operation.

The NRA must make the process of writing the new standards transparent. It also must make the content and the application of the new standards clear-cut so that people's worries about the restart of nuclear power stations will be fully addressed.

After making public the draft, the NRA started collecting opinions from the public. The deadline for submitting opinions is Friday. It is regrettable that the public was given only a month to submit their opinions.

The draft is about 3,000 pages. It is extremely difficult for ordinary citizens to clearly understand so that they can express their opinion. Even after the deadline for accepting public comments passes, the NRA should explain important points of the draft in plain language so that ordinary citizens will understand them, and should continue open discussions with the public about the new standards.

The draft calls for such measures as installing filters to remove radioactive substances in case such substances are vented from reactor cores into the atmosphere during an emergency as well as setting up a seismically isolated emergency command center and an emergency control room to cope with emergency situations caused by a natural calamity or a terrorist attack.

It demands that each power company anticipate the highest possible tsunami and construct a seawall or a tide gate that will withstand such tsunami. It also prohibits construction of a nuclear power plant above a geological fault.

One problem with the draft is that **the work of anticipating the highest possible tsunami is left to each power company**. Another problem is that the NRA allows a **grace period of five years for installing the filter for a pressurized light water reactor** (on the grounds that the containment vessel of a pressurized light water reactor has a bigger capacity than the containment vessel of a boiling water reactor) **and for setting up an emergency control room for all types of reactors**. Tokyo Electric Power Co.'s stricken Fukushima No. 1 nuclear power plant uses boiling water reactors.

The NRA also plans to carry out a virtual preliminary review of the conditions of the Oi Nos. 3 and 4 reactors before the new safety standards take effect — raising the suspicion that the NRA is giving special treatment to the Oi plant to prevent power shortages this coming summer.

The NRA should make serious efforts to write adequate safety standards and apply them in a transparent manner to get back people's trust. Nuclear power generation should be a provisional power source. The government must set a deadline to abolish it.

Etsuko Akiba guilty of conflict of interest

May 10, 2013

Atomic commissioner's testimony reveals deeper ties between NPO, power industry

<http://mainichi.jp/english/english/newsselect/news/20130510p2a00m0na011000c.html>

Etsuko Akiba, a commissioner of the Japan Atomic Energy Commission (JAEC), acknowledged May 9 that her nonprofit, ASCA Energy Forum, had received money from power industry entities even before her appointment as its chief in January 2010.

Akiba, 64, made the remarks during a session of the House of Councillors Environment Committee, which looked into the issue of ASCA having received large amounts of money from the Federation of Electric Power Companies of Japan (FEPC), Tokyo Electric Power Co. (TEPCO) and other industry entities even after the outbreak of the nuclear crisis at TEPCO's Fukushima No. 1 nuclear plant.

Her testimony revealed that these power industry entities had extended funds to ASCA while she served as its chief and maintained close ties with her.

Akiba set up the ASCA Energy Forum in 2001 when she was a consumer advocate. She served as its head until she was appointed a JAEC commissioner in January 2010. However, she has stayed on with the NPO as an adviser.

She appeared before the upper house panel as a government witness and gave the testimony in response to questions from Kenichi Mizuno, a lawmaker of the opposition Your Party.

When asked about the more than 18 million yen ASCA, based in Tokyo's Chuo Ward, received from the 10-member FEPC, TEPCO and others after the Fukushima nuclear disaster, Akiba replied that she does not know because she has not been involved in ASCA's operations after assuming the JAEC commissioner post. But she did admit that ASCA had received an unspecified amount of financial support from power industry entities while she was at the helm of the NPO.

Akiba declined to answer how much remuneration she had received as ASCA chief, although ASCA's business reports to the Tokyo Metropolitan Government said she had received a salary as ASCA leader.

During the upper house committee session, she admitted that she participated in at least 19 events sponsored by ASCA and related groups and used chauffeured official cars even after she became a JAEC commissioner. Akiba said she has not resigned as an ASCA member and has participated in study sessions organized by the NPO. She said she used chauffeured vehicles to give lectures as part of public duties.

Akiba's testimony represented her first comment on ASCA's receipt of money from the power industry. Akira Omoto, 64, a former TEPCO executive, resigned as a JAEC commissioner in March for having accepted advisory fees from TEPCO even after the Fukushima disaster triggered by the March 11, 2011 Great East Japan Earthquake and tsunami.

Illegal dispatches of workers to Fukushima Daiichi

May 12, 2013

Nagasaki firms warned for sending workers to stricken nuke plant

Kyodo

<http://www.japantimes.co.jp/news/2013/05/12/national/nagasaki-firms-warned-for-sending-workers-to-stricken-nuke-plant/#.UY5wXUpsFEs>

NAGASAKI – The Nagasaki Labor Bureau has recently warned three local staff agencies for illegally dispatching more than 500 plumbing workers to the crisis-hit Fukushima No. 1 nuclear plant last year, it was learned Saturday.

Labor laws ban “multiple dispatches,” in which hired people end up working at places never mentioned in their initial contracts.

The three firms, Daiwa Engineering Service, Sowa Kogyo and Aguresu, all based in Nagasaki Prefecture, were involved in the illegal practice from July to August, the labor office said, adding that some workers also were paid less than they were promised.

The labor office has ordered the three firms to improve their business practices.

The case surfaced after a whistle-blower tipped off the labor office to the illegal dispatches.

Tokyo Electric Power Co., operator of the stricken plant, is struggling to secure the number of recruits needed to contain the crisis. The cumulative amount of radiation per employee is regulated by the government, and Tepco has been running out of workers.

May 11, 2013

Labor ministry disciplines 3 worker dispatch companies

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201305110061>

By TOSHIO TADA/ Staff Writer

The labor ministry warned three companies to get their act together after it emerged the firms illegally sent workers to the stricken Fukushima No. 1 nuclear power plant.

This was the first time that disciplinary measures have been handed out to companies dispatching workers to deal with the Fukushima nuclear disaster. The companies were ordered to improve their business activities.

The Nagasaki Regional Labor Bureau handed down the disciplinary measures to three companies based in Nagasaki Prefecture. They are Yamato Engineering Service and Sowa Kogyo, both of Sasebo, and Aguresu of Nagasaki city.

Between July and August 2011, Yamato sent 510 workers to install piping at the Fukushima plant, even though the dispatched workers law prohibits sending workers for such purposes.

Tokyo Electric Power Co., the operator of the Fukushima plant, contracted the work to a subsidiary of Hitachi Ltd. Some of the workers involved in the project were dispatched from more than one company, another violation of the law.

"We gave instructions to Yamato to take measures to prevent a recurrence, but it was difficult to investigate the employment conditions for subcontractors," a Hitachi official said.

Of the 510 workers, Sowa Kogyo dispatched 169 to Yamato and Aguresu sent the remaining 341. Another four companies were also involved, but they were not subject to administrative disciplinary measures apparently because they had not completed the proper paperwork required of companies that dispatch workers.

Although several thousands of people work on any given day at the Fukushima plant, only a small number are TEPCO employees. Most of the workers come from all over Japan through various subcontractors.

There are a number of subcontractors that have not complied with the law. For example, Yamato in the past was temporarily banned from taking part in public works projects because a former company executive was found to have associated with gangsters in 2009.

The latest incident came to light after a worker from Nagasaki Prefecture notified the labor ministry in July 2012 through the Labor Lawyers Association of Japan about the shady practices.

"It took close to a year for disciplinary measures to be handed down. The central government was slow in responding," said Yosuke Minaguchi, association secretary-general. "Although TEPCO also had responsibility since it commissioned the work, it was unable to resolve the issue."

This is the first time the labor ministry has released the names of companies that are being disciplined.

In December, the ministry issued instructions to eight companies to change how they were doing subcontracting work. Workers used by those companies used lead covers on dosimeters to conceal the actual levels of radiation to which they were exposed.

Unfair, says Japan Atomic Power

May 16, 2013

Japan Atomic Power calls NRA determination of active fault unfair

by Kazuaki Nagata
Staff Writer

<http://www.japantimes.co.jp/news/2013/05/16/national/japan-atomic-power-calls-nra-determination-of-active-fault-unfair/#.UZPmYkpsFEs>

Although a Nuclear Regulation Authority panel judged Wednesday that the D-1 fault running under reactor 2 at Japan Atomic Power Co.'s Tsuruga nuclear plant in Fukui Prefecture is active, that decision is premature and unacceptable, the operator's president, Yasuo Hamada, claimed the same day.

At a press conference after the panel's meeting where its decision effectively doomed any chance of restarting the reactor, Hamada slammed the NRA for not giving his firm enough opportunity to explain and discuss the matter, claiming the panel's decision was not based on objective data and facts.

He added that it was unfair that the panel did not even invite Japan Atomic Power to observe Wednesday's meeting where the five experts presented their report on their probe of the fault at the Tsuruga plant, even though it concerned the operator.

This is "really an inappropriate action taken by the regulator, which exercises public power," Hamada said.

Nuclear plant operators are not allowed to build or operate reactors and other critical safety equipment directly above active faults, which means the Tsuruga plant's reactor 2 must be decommissioned. This will deal a heavy blow to Japan Atomic Power's management.

Hamada and other Japan Atomic officials said they are confident the D-1 fault is not active and will keep stressing this point. The firm is conducting its own research and will compile a report by July, hoping to get the NRA to reverse its decision.

Reporters repeatedly asked Hamada what his company will do if the NRA stands firm. He kept saying his company still believes it can restart reactor 2 and thus has not resorted to Plan B.

Japan Atomic Power is funded by regional utilities and has three reactors, all of which are idle, mainly because of the Fukushima No. 1 nuclear plant meltdown catastrophe and looming new NRA safety requirements. The NRA has also effectively lengthened the historical span in geological time for determining whether a fault is active.

Construction began on reactor 2 in 1982 and it started operations in 1987

"Could be hit hard ... financially"

INSIGHT: NRA finding puts Japan Atomic Power on cusp of crisis

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201305160063

THE ASAHI SHIMBUN

A finding that an active fault line runs directly underneath the No. 2 reactor of the Tsuruga nuclear power plant in the western Japan prefecture of Fukui could deal a fatal blow to plant operator Japan Atomic Power Co., which may be forced to shut the facility permanently.

The conclusion, made in a report issued May 15 by an expert panel of the Nuclear Regulation Authority, could also have widespread ramifications for other major electric power companies.

This is because Japan Atomic Power is financed by the nation's nine leading utilities, which all operate nuclear power plants. If Japan Atomic Power goes bust, they, too, could be hit hard financially.

The report is expected to be approved by the NRA on May 22. This means Japan Atomic Power will almost certainly be required to decommission the No. 2 reactor, which is currently idle. It will mark the first time in Japan that the country's nuclear watchdog has refused to approve the restart of a nuclear reactor.

On the evening of May 15, Japan Atomic Power held a news conference to contest the finding.

Its president, Yasuo Hamada, expressed strong indignation on grounds that "discussions based on scientific data were not held" by the NRA's expert panel.

"It is not necessary to decommission the reactor," he added.

Japan Atomic Power intends to release the results of its own studies in early July to show that the fault under the No. 2 reactor is not active.

If the Nuclear Regulation Authority pays no heed to the report, Japan Atomic Power could file a lawsuit against the NRA.

“Even if Japan Atomic Power cannot overturn the NRA’s conclusion, it will dispute the finding, saying, ‘If we take appropriate safety measures, we can restart the No. 2 reactor,’” said an electric power industry source.

Decommissioning of the No. 2 reactor would not only endanger Japan Atomic Power’s management, but also affect the entire electric power industry.

Japan Atomic Power stands to suffer a financial loss of 100 billion yen (\$1 billion) if it is forced to decommission the No. 2 reactor.

As an asset, the reactor would have zero value. Also, the company would have to shoulder unseen costs for decommissioning in addition to the amount already reserved for that work.

Japan Atomic Power operates two other reactors: the No. 1 reactor at the Tsuruga plant and the single reactor at the Tokai No. 2 nuclear power plant in Ibaraki Prefecture.

However, Japan Atomic Power faces high hurdles in trying to restart them. The No. 1 reactor at Tsuruga has already exceeded the 40-year span for safe operations. It began operating in 1970. Also, reactivating the Tokai No. 2 plant faces strong opposition from local residents.

If these two reactors are also decommissioned, Japan Atomic Power’s losses will likely to swell to 250 billion yen, which would wipe out the company’s net assets of about 160 billion yen, including capital. The company would not be able to recover the loss even if it sold off all assets.

If the company’s deficits exceeds its assets, Japan Atomic Power’s management will become untenable. In 1957, the nation’s main electric power companies jointly established Japan Atomic Power to promote nuclear power generation. At that time, they provided the capital to start the company.

At present, 90 percent of the company’s capital--120 billion yen--is covered with funds from nine major electric power companies, except for Okinawa Electric Power Co.

If the Japan Atomic Power’s management plunges into crisis, those electric power companies will be required to offer the appropriate financial support. The huge outlays required for decommissioning could severely damage those companies’ bottom lines.

In addition to the No. 2 reactor at Tsuruga, NRA also plans to check five other sites. One of them is the No. 1 reactor at the Shika nuclear power plant in Ishikawa Prefecture, which is operated by Hokuriku Electric Power Co.

Several experts have already pointed out that an active fault likely run directly below the building housing the reactor. If the NRA concludes that the fault is indeed active, the No. 1 reactor cannot be restarted.

The other four sites are the Oi and Mihama nuclear power plants, also in Fukui Prefecture and operated by Kansai Electric Power Co.; the Monju prototype fast-breeder reactor in Fukui Prefecture, which is operated by Japan Atomic Energy Agency; and Tohoku Electric Power Co.'s Higashidori nuclear power plant in Aomori Prefecture.

Experts have also said that all four sites appear to have been built atop active faults. They, too, will remain shut down permanently if that is the case.

Of Japan's 50 reactors, 10 have been operated for more than 35 years. The NRA says that, in principle, nuclear reactors that have been operated for more than 40 years should be decommissioned.

In instances where the NRA approves an extension beyond the 40-year period, operators will be obliged to adopt stricter safety measures.

In 2012, the Ministry of Economy, Trade and Industry said that if all 50 nuclear reactors in Japan are decommissioned, electric power companies will suffer a combined loss of 4.4 trillion yen.

Of those companies, Hokkaido Electric Power Co., Tohoku Electric Power, Tokyo Electric Power Co. and Japan Atomic Power would find their deficits exceed their assets.

The nation's nuclear power plants were shut down in the aftermath of the Fukushima nuclear disaster triggered by the March 11, 2011, Great East Japan Earthquake. Currently, only two nuclear reactors are operating.

Troubled Tsuruga reactor could force utilities to shoulder enormous financial burdens

<http://mainichi.jp/english/english/newsselect/news/20130516p2a00m0na016000c.html>

The utility companies that hold major stakes in Japan Atomic Power Co. could be forced to shoulder enormous financial burdens if JAPC were to collapse due to the possible shutdown and decommissioning of the No. 2 reactor at its Tsuruga Nuclear Power Plant in Tsuruga, Fukui Prefecture.

A panel of experts appointed by the Nuclear Regulation Authority concluded on May 15 that the No. 2 reactor at the Tsuruga nuclear power station in western Japan is located right above an active fault that could undermine its safety, increasing the likelihood the unit would be shut down permanently. The power companies, major shareholders of JAPC, have already decided to extend support to JAPC until April next year, but there are no viable plans yet to restore its finances.

In the case of ordinary bankruptcies, shareholders' losses are limited to the amounts of their investments. But of all the power companies that buy electricity from JAPC, four -- Kansai Electric Power Co., Chubu Electric Power Co., Hokuriku Electric Power Co., and Tohoku Electric Power Co. -- guarantee JAPC's debts totaling about 100 billion yen. Therefore, if JAPC cannot repay its debts, the four power companies will be forced to shoulder them.

Furthermore, JAPC puts aside money for future costs to reprocess spent nuclear fuel and decommission its nuclear reactors, but if the company goes bankrupt, the accumulated funds will certainly run short. A senior government official said, "There is a possibility that the power companies will have to shoulder a total of 500 to 700 billion yen." That would further upset the power companies that have already incurred heavy losses due to higher fuel costs as a result of the shutdown of their nuclear reactors.

For this reason, "The private sector alone cannot handle the costs," said a senior power company official. Therefore, the utility companies have been negotiating with the government behind the scenes to reduce their financial burdens for decommissioning their nuclear reactors and other costs. But the government has been cautious about fresh fiscal support measures that will require the public to shoulder extra financial burdens.

As long as the utility firms' financial support helps keep JAPC running, JAPC, which insists on reactivating the No. 2 reactor at the Tsuruga plant, and the Nuclear Regulation Authority will likely continue to square off. But some utility firms say that they are barely managing their own finances. Due also in part to a backlash from users, it remains to be seen whether the power companies will be able to extend financial support to JAPC beyond April next year. In the end, the public may have to shoulder the costs of decommissioning the reactor and other expenses.

Tokyo Electric Power Co. holds a 28.23 percent stake in JAPC, while Kansai Electric has 18.54 percent, Chubu Electric 15.12 percent, Hokuriku Electric 13.05 percent, Tohoku Electric 6.12 percent, Electric Power Development Co. 5.37 percent, Kyushu Electric Power Co. 1.49 percent and Chugoku Electric Power Co. 1.25 percent.

Trading with Middle East

May 13, 2013

Source : Smart Planet

<http://www.smartplanet.com/blog/bulletin/realpolitik-japan-trades-nuclear-tech-to-middle-east-in-exchange-for-oil/19535?tag=main%3Briver>

Japan trades nuclear tech to Middle East in exchange for oil

By Mark Halper | May 13, 2013, 6:25 AM PDT

Japan has been paying enormously for importing fossil fuels to replace shuttered nuclear power plants. And its future supply of oil remains in doubt, posing possible grave economic consequences for the country.

So in a stroke of *realpolitik* - *realgeopolitik*, really - Prime Minister Shinzo Abe has returned from a tour of the Middle East where he has, you could say, bartered one form of energy for another in order to help secure a stable future for his natural resource-thin island nation.

Abe secured a deal with the United Arab Emirates earlier this month in which Japan will provide technology to help the UAE build four nuclear power plants, already under South Korean supervision. At the same time, the UAE and Prime Minister Sheikh Mohammed bin Rashid al-Maktoum "also agreed to extend an oil concession agreement with Japan's Abu Dhabi Oil Co., adding a new zone," the Japan Times reported, citing UAE's WAM news agency.

The Japanese leader hopes to negotiate a similar agreement with Saudi Arabia, where he began his visit and where China already has a nuclear foothold. Abe "is emphasizing cooperation with Japan's Middle East partners to ensure Japan will continue to receive stable deliveries of oil from the region," the Japan Times wrote.

Japan's economy has suffered following the country's decision to close almost all of its nuclear reactors after the Fukushima disaster. Nuclear had provided about 30 percent of the country's electricity. The cost of importing fossil fuels like liquefied natural gas has already hit the country hard, and the price is effectively rising amid a current weakening of Japan's currency, the yen. The expenditures recently pushed Japan's trade deficit to an all time high.

Some Japanese economists have warned that Japan could ultimately lose its supply of oil as the U.S. becomes more energy independent and potentially grows less interested in maintaining Middle East stability.

Under a push by Abe, Japan is also expected to begin restarting some of its close nuclear reactors, although the likelihood of returning to a 30 percent nuclear scenario is uncertain. By exporting nuclear technology, Japan is looking after growth in a key area of its technological expertise. Japan this month also won an agreement to help Turkey build a new nuclear power station.

NRA's mission is to ensure the safety of nuclear facilities

May 18, 2013

EDITORIAL: Kansai Electric Power should end resistance to tougher nuclear safety standards

<http://ajw.asahi.com/article/views/editorial/AJ201305180030>

Overly optimistic assumptions about the safety of nuclear power plants can result in huge damage if a disaster actually takes place. That is one of the most important lessons that should be gleaned from the devastating accident that occurred in 2011 at the Fukushima No. 1 nuclear power plant.

The Nuclear Regulation Authority (NRA), which has been created to improve the nation's nuclear safety regulations in line with the lessons learned, is completely right in demanding that nuclear power facilities be prepared for the greatest safety risks that can be assumed based on latest scientific knowledge.

But Kasai Electric Power Co. is behaving in a way that is difficult to understand because it goes against this point of view.

The utility is showing reluctance to comply with the nuclear watchdog's requests concerning the safety of the No. 3 and 4 reactors at the company's Oi nuclear plant in Fukui Prefecture. The two reactors are the only ones in Japan that are currently online.

There are two seafloor faults near the Oi plant and also an inland fault about 10 kilometers from the facility. Recent research has pointed to the possibility that the three faults can be linked within a bay located at a halfway point between them.

If linked, the three faults, which are all active, have a total length of 63 kilometers and could cause a more powerful earthquake than previously assumed.

The No. 3 and 4 reactors at the Oi plant are scheduled to remain in operation until September under provisional safety standards set after the Fukushima nuclear disaster.

The NRA, which plans to introduce tougher nuclear safety standards in July, has asked Kansai Electric Power to review the current estimates of the strength of possible quakes that could hit the Oi plant, under the assumption that an earthquake can be caused by movements occurring simultaneously along all the three faults. The utility, however, has rejected this request, which was made in line with the basic principles of the new regulatory standards.

Kansai Electric claims that its own research has shown there is little possibility of a quake involving all three faults.

But an independent expert who was consulted by the NRA said the possibility of such a quake cannot be ruled out.

Before the two reactors at the plant were restarted last year, Kansai Electric, on the instructions of the government, estimated the magnitude of a quake linked to all the faults.

The utility says the estimated magnitude was not large enough to raise concerns about a severe accident. Now that new safety standards are to be introduced, however, there is a strong case for re-evaluating the risk just to be doubly sure.

There are also safety concerns about other nuclear power plants due to possible earthquakes on multiple faults.

The safety inspection of the two reactors at the Oi plant is drawing attention of other utilities as well because it is seen as a precedent.

That only reinforces the case for strictly dealing with the issue according to the NRA's safety-first policy, which adopts the principle of erring on the side of safety. This principle should be firmly established through the safety inspection of the Oi plant.

Moreover, the decision to restart the two reactors at the Oi plant was a special measure taken in consideration of Kansai Electric's heavy dependence on nuclear power generation in ensuring a stable power supply.

At that time, the president of the utility promised to take additional steps to confirm the safety of the plant according to new safety standards when they were introduced. The company should act responsibly and make every possible effort to match words with actions.

NRA Chairman Shunichi Tanaka has indicated his intention to suspend the operation of the Oi plant if a problem that raises serious safety concerns is discovered.

Although the summer season of peak demand for electricity is approaching, the NRA should not forget that its mission is to ensure the safety of nuclear facilities.

The nuclear watchdog should carry out a rigorous safety inspection of the plant while giving thought to the efforts of Japanese people to cut power consumption.

--The Asahi Shimbun, May 18

Industry ministry's "highly questionable behavior"

Industry ministry behind private panel's push for reactor restarts

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201305190024

By SHIN MATSUURA/ Staff Writer

The government's Agency for Natural Resources and Energy engaged in highly questionable behavior by helping a private panel calling for restarts of nuclear reactors to draft recommendations that were submitted to the prime minister.

In its "urgent proposal" titled "Rebuilding of responsible, nuclear policy," the panel called on the government to bring idled reactors back online and step up reactor exports.

It was submitted to Prime Minister Shinzo Abe in February.

The 5-page proposal also blasted the Nuclear Regulation Authority, a new watchdog established after the March 2011 disaster at the Fukushima No. 1 nuclear power plant, for its emphasis on adhering to safety regulations and approach to suspected active faults running underneath nuclear sites.

"Discussion has yet to take place based on using the highest level of wisdom and information available," the proposal said in reference to the NRA.

The private panel is led by Akito Arima, a former education minister and nuclear physicist. Twenty-nine people are listed as supporters of the proposal. None of them are heads of electric utilities.

However, the list included Harufumi Mochizuki, previously the highest ranking bureaucrat in the industry ministry and now an outside director of Hitachi Ltd., a leading maker of nuclear facilities, and top officials of key players in the nuclear industry as well as trading houses.

The agency is under the jurisdiction of the Ministry of Economy, Trade and Industry, which promotes nuclear energy.

The Asahi Shimbun obtained computer files that contained the gist and draft of the proposal.

The files were produced under the name of the ministry's Information Systems and Welfare Division, which manages documents created through its computer system.

According to the ministry, all the documents created through the ministry's computers bear the name of the division.

In an interview with The Asahi Shimbun, a senior official with the agency acknowledged that bureaucrats in its Nuclear Energy Policy Planning Division produced the draft proposal.

The official also said the head of the Nuclear Energy Policy Planning Division and other agency bureaucrats attended meetings of the panel as they worked on a set of draft recommendations.

Agency officials also frequently contacted the panel secretariat through e-mail exchanges in the process of compiling the recommendations.

The panel's secretariat, with Mochizuki's help, came up with the outline late last year, according to a well-placed source who said ministry officials then produced it on the computer.

The source also said ministry officials arranged a meeting between Abe and panel members.

Mochizuki acknowledged his role, saying, "The secretariat and I put together the view espoused by supporters" of reactivating idled reactors.

An official with the General Policy Division under the ministry's Director-General's Secretariat defended the agency's involvement.

"Producing memos and providing materials for discussion itself is not a problem," the official said. Arima, who also served as president of the University of Tokyo, denied the agency played a role in drafting the proposal.

"The proposal is based on the consensus among members of the panel," he said. "It is impossible for a third party to come in and tinker with such things."

The revelation came as the Abe administration forges ahead with reactor restarts as a means of shoring up the economy, despite widespread skepticism about the safety of nuclear facilities. Of the nation's 50 reactors, only two are online.

Gov't has its priorities mixed up

May 25, 2013

Strict radiation reference levels shunned to stem Fukushima exodus

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201305250053>

By SHINICHI SEKINE/ Staff Writer

The government avoided setting stringent radiation reference levels for the return of Fukushima evacuees for fear of triggering a population drain and being hit by ballooning costs for compensation, an Asahi Shimbun investigation shows.

The revelation could rekindle debate over the government's safety standards as many evacuees prepare for their eventual return. They were displaced by the nuclear disaster more than two years ago.

In December 2011, the government led by the Democratic Party of Japan decided to lift the evacuation order for areas with residual doses of up to 20 millisieverts per year.

The government was regrouping areas in Fukushima Prefecture to pave the way for the return of some evacuees based on radiation doses as of November that year.

But minutes of ministerial meetings and accounts by meeting participants show that government officials initially sought a 5-millisievert cutoff line to ensure evacuees' safety.

The number was later eased to 20 millisieverts as some Cabinet members insisted on responding to local officials' concern that the tougher yardstick could spur population flight. They also factored in the possibility that costs of compensation for evacuees could significantly rise if they were unable to return home in the contaminated areas for a prolonged period.

The proposal for an annual radiation dose of 5 millisieverts was floated at an unofficial meeting of ministers concerned on Oct. 17, 2011, about seven months after the nuclear disaster unfolded at the Fukushima No. 1 nuclear power plant.

Goshi Hosono, the minister in charge of the nuclear disaster, insisted on that figure at the meeting. Industry minister Yukio Edano and Tatsuo Hirano, the reconstruction minister, were among other government officials present.

Hosono argued that a 5-millisievert yardstick is appropriate because there is a wide gap between 20 millisieverts, on which the government's initial evacuation order was based, and 1 millisievert, the goal the government set to declare contaminated areas safe after cleanup efforts, according to the minutes.

When the government set a planned evacuation zone outside the 20-kilometer no-entry zone around the crippled plant right after the disaster unfolded, it adopted the 20-millisievert cutoff line.

It is the toughest of the 20-100 millisieverts per year range set for the emergency phase in the 2007 recommendation by the International Commission on Radiological Protection (ICRP).

Five years after the 1986 Chernobyl accident, a dose of 5 millisieverts was used as criteria for relocating residents for safety reasons.

In Japan, a site measuring more than 5.2 millisieverts per year is designated as a radiation controlled area.

There has been a case of a Japanese worker who developed leukemia after having an equivalent dose of radiation while working at a nuclear power plant being recognized as patient of work-related illness.

With these factors in mind, the ministers agreed on setting the safety limit around 5 millisieverts at the meeting.

But at a meeting on Oct. 28, joined by Chief Cabinet Secretary Osamu Fujimura and Tatsuo Kawabata, internal affairs minister, participants appeared reluctant to approve a yardstick other than 20 millisieverts.

It apparently reflected their concern that the 5-millisievert standard could lead to a surge in evacuees as parts of the prefectural capital of Fukushima and Koriyama, a major city, come under this category.

The areas falling in the range of 5 millisieverts represented 13 percent of the land space of the prefecture.

“The prefectural government could not function with population drain under the 5-millisievert scenario,” said a state minister who attended the meeting. “In addition, there were concerns that more compensation money will be needed, with an increase in the number of evacuees.”

At the meeting on Nov. 4, the participants informally settled on the 20-millisievert proposal, saying it is difficult to draw a clear line between 1 millisievert and 20 millisieverts.

The current government is working toward the return of evacuees based on this policy.

One of the participants acknowledged that the 20-millisievert proposal was lax, while the 1-millisievert idea would result in the pullout of all the residents in the prefecture.

“So we weighed the 5-milliseivert yardstick, but we could not settle on it due to the argument that it would raise the number of evacuees,” said the official.

The DPJ government produced a report in December 2011 that the 20-millisievert cutoff line would be appropriate despite some experts’ objections to it.

Although the DPJ government emphasized safety, it did not explain that government officials arrived at the figure after giving consideration to a potential rise in the number of evacuees under the 5-millisievert scenario.

The Abe administration in March decided to release by the end of this year a set of protection measures for evacuees returning to areas with doses of up to 20 millisieverts.

The move is apparently aimed at setting the stage for return of evacuees even if decontamination operation fails to achieve the target of 1 millisievert.

In fact, many local governments admitted that cleanup efforts have yet to produce the intended results.

Fukushima Prefecture Governor Yuhei Sato has suggested the target of 1 millisievert is not realistic.

It will be difficult to attain the goal of “zero evacuees in 2020” as things stand today.

But critics say the central and local governments will come under fire for **putting priority on the return of evacuees over their safety.**

Safe, cheap and reliable or a "bottomless pit"?

May 26, 2013

Is it safe? Ruling party pushes nuclear village agenda

by Jeff Kingston

Special To The Japan Times

<http://www.japantimes.co.jp/opinion/2013/05/26/commentary/is-it-safe-ruling-party-pushes-nuclear-village-agenda/#.UaDiJ9hBpg4>

In July 2011, then Prime Minister Naoto Kan ordered stress tests on all Japan's 50 nuclear reactors to assess their safety. By May 2012, they were all idled and for the first time in 40 years the nation was not generating a single kWh from nuclear energy.

Controversially, on June 16, 2012, Kan's successor, Yoshihiko Noda, approved the restart of two reactors. This sparked mass protests that involved a million demonstrators through a summer that saw Japan's largest civil protests since the turbulent 1960s.

Noda faced strong opposition to his plans to hasten the restart of reactors due to widespread safety concerns. Haruki Madarame, chairman of the Nuclear Safety Commission, reinforced those anxieties when he announced in March 2012 that the stress tests were not sufficient to ensure the operational safety of reactors. The government then hastily cobbled together a provisional set of safety guidelines. As it turned out, the two reactors at the Oi nuclear power plant in Fukui Prefecture that had been restarted met only 20 out of the new 30 safety criteria. Furthermore, the power they generated was unnecessary even during one of the hottest summers in memory.

This April, the Nuclear Regulation Authority (NRA) began assessing whether the two Oi reactors meet new safety standards slated to go into effect in July. There are three active fault lines near the Oi plant on the Sea of Japan coast, but it will not have a remote command center ready until 2015 and its raised sea wall will not be completed until March 2014. The new safety guidelines also require that utilities equip reactors with filtered venting systems to reduce radioactive releases in the event of an emergency, but they are granted a five-year grace period before these must be in place.

Consequently, the reactors are now operating based on the hope that these countermeasures will prove unnecessary; Fukushima demonstrates the folly of wishing risk away.

The findings of three major investigations into the Fukushima accident were released in 2012, detailing the absence of a culture of safety in the nuclear industry in Japan and cozy, collusive relations between regulators and the utilities that compromised safety.

All three investigations assert that the meltdowns were preventable, and they all refuted the claims made by Tokyo Electric Power Co. (Tepco), the operator of the Fukushima No. 1 plant, that the massive tsunami was an inconceivable event that caused the three reactor meltdowns and hydrogen explosions there.

In fact, tsunami risks should have come as no surprise to Tepco, as the Tohoku coastline has been battered by major ones in 1611, 1677, 1793, 1896 and 1933. Indeed, there are tsunami stones dotting the Tohoku coastline warning future generations to heed the perils. Tepco's own researchers warned about the tsunami risk in Fukushima, and clearly the one triggered by the Great East Japan Earthquake on March 11, 2011, was no black swan, once in a 1,000-year event. But the utilities and the government ignored the risks and sited reactors in tsunami-risk zones.

The Diet investigation concludes that what's termed "regulatory capture" — regulators regulating in favor of the regulated — was at the heart of the nuclear accident, and it blasts the absence of a culture of safety. Moreover, it outlines an institutionalized culture of collusion, complacency and deceit involving regulators and utilities that explains why Fukushima in particular, and the nuclear industry in general, settled for inadequate safeguards.

Finally, in October 2012, Tepco admitted it erred in not adopting stricter safety measures and confessed that it could have prevented the nuclear crisis had it done so. Refuting its own whitewash report issued in mid-2012, Tepco now acknowledges that it downplayed tsunami risk and opposed adoption of international safety standards. It also admits that employees were not properly trained to operate emergency equipment and lacked crisis-management skills.

The utility further concedes that it did not manage risk properly because it feared that any measures to improve safety at the Fukushima plant, or to conduct evacuation drills, would stoke the anti-nuclear movement, interfere with operations, raise costs and create legal and political problems.

These mea culpas are an extraordinary development that highlights shortcomings of the so-called nuclear village — a term commonly used in Japan to refer to nuclear advocates, and beneficiaries, in the utilities, regulatory agencies, the Diet, big business, the media and academia.

Just as it appeared in mid-September 2012 that Noda's Cabinet had officially sanctioned the phasing out of nuclear energy, major business lobbies publically protested and persuaded the Cabinet to reverse course. Against steep odds, the nuclear village ensured that Fukushima did not become a game-changing event.

The election of the pro-nuclear Liberal Democratic Party to power in December 2012 was not about energy policy, but has revived prospects for the nuclear village; citizens may favor phasing out nuclear

energy, but they will not get to decide. Hitachi, Toshiba and Mitsubishi tie-ups with General Electric, Westinghouse and Areva mean that Japan stands at the nexus of the global nuclear-energy industry. The recent award of a \$22 billion contract by Turkey to a Japanese-led consortium indicates how high the stakes are, explaining why domestic firms' nuclear-policy preferences are fully reflected in government policy.

If Japan terminated nuclear power, the pain would extend beyond the utilities and vendors; lenders and investors, including Japan's major banks and insurance firms, would also face huge losses. Pulling the plug on nuclear power could also drive some of Japan's 10 utilities into insolvency. In addition, there have been strident voices from the political right calling for the retention of nuclear energy because it leaves available the nuclear-weapons option.

Washington, too, has warned Tokyo that phasing out nuclear energy would harm bilateral relations because it would raise concerns about Japan's large stockpiles of plutonium and uncomfortable questions about the consistency of U.S. nuclear non-proliferation efforts targeting Iran and North Korea.

The NRA established in September 2012 has conducted on-site inspections indicating that some reactors are sited on active fault lines, but has not made a decision about shutting them down permanently. It has, however, moved to close the problem-plagued Monju fast-breeder reactor, a non-commercial experimental facility that sits atop an active fault line.

Additionally, the NRA has signaled its intention to not approve restarting a reactor at the Tsuruga plant in Fukui, and there are several other candidates for closure; Tepco's Kashiwazaki plant with six reactors is sited near an active fault line as proven in the 2007 earthquake there, but the utility's business plan depends on restarting this facility. There are some tough calls ahead.

There has also been no conclusion declared as to whether or not seismic damage compromised cooling-system pipes at the Fukushima plant in the interval before the tsunami hit. This is an important issue because if the earthquake caused the meltdowns, all Japan's reactors would require extensive safety upgrades that would further undermine their financial viability. In any event, The Economist magazine has concluded that nuclear power is simply not economically feasible.

The NRA is set to adopt stricter safety regulations in July, but the key will be the implementation and monitoring of compliance. Problematically, there are only nine inspectors overseeing the 3,000 workers engaged in decontamination and decommissioning efforts at Fukushima, a bungled operation that has been left to the discretion of Tepco.

The utility decided against bringing in outside experts and failed to anticipate the problem of what to do with massive volumes of radioactive waste water that are accumulating at the plant. The improvised responses have proved inadequate, while the touted “solution” involves dumping the toxic water into the ocean. The Tokyo-based New York Times reporter Martin Fackler concludes that Tepco is “lurching from one problem to the next without a coherent strategy ... a cautionary tale about the continued dangers of leaving decisions about nuclear safety to industry insiders” (NYT 4/29/2013).

Despite this and other red flags on nuclear safety, the political pressures on the NRA to resume business as usual are intensifying.

Proponents of nuclear power have long argued that it is safe, cheap and reliable. The 150,000 residents who remain displaced from the vicinity of Tepco’s Fukushima plant, along with local farmers and fishermen, must wonder about that claim. So too should all Japan’s taxpayers, as the nationalization of Tepco in July 2012 means we now own its vast liabilities.

One year ago the Wall Street Journal estimated that taxpayers were already \$45 billion in the hole, and at the end of 2012 the utility requested a further ¥697 billion (ca \$8.2 billion) from the government to cover rising compensation payments.

The Fukushima plant looks to be a bottomless pit, with the tab set to grow as decontamination and decommissioning will take decades. And, how much will it cost to deal with all the radioactive waste accumulated at Japan’s 50 other reactors and where will that be stored?

Jeff Kingston is Director of Asian Studies, Temple University Japan.

Any accident should be reported

May 26, 2013

Researchers hurt at Ibaraki nuclear facility

JJI, Kyodo

<http://www.japantimes.co.jp/news/2013/05/26/national/researchers-hurt-at-ibaraki-nuclear-facility/#.UaDgIthBpg4>

At least six researchers suffered internal radiation exposure when an experiment involving elementary particles went awry and up to 24 more are feared to have been similarly exposed, the Japan Atomic Energy Agency said Saturday.

Radioactive substances leaked following the accident Thursday in the Hadron Experimental Facility of the Japan Proton Accelerator Research Complex (J-PARC) in Tokai, Ibaraki Prefecture, the government-affiliated agency reported.

Officials from the Ibaraki Prefectural Government raided the complex Saturday afternoon to investigate the delay in reporting the incident. A malfunction occurred at 11:55 a.m. Thursday during an experiment to produce elementary particles by aiming a proton beam at a target made of gold, the agency said.

An alarm went off shortly afterward and the experiment was halted. But a researcher in charge of the equipment restarted it at 12:08 p.m., despite not having pinpointed the cause of the alarm, sources familiar with the investigation said.

As a result, the proton output jumped unexpectedly, causing part of the gold to evaporate and the generation of radioactive substances that leaked out of the controlled area, according to the agency.

It said the radioactive leak has stopped, but not before at least six male researchers suffered internal radiation exposure. Four of them received doses of up to 1.6 millisieverts.

Later Saturday, the agency reported that another 24 researchers may have been similarly exposed to internal radiation. A total of 55 people were working in the facility at the time of the accident.

All work at the Hadron Experimental Facility has been suspended.

Agency officials said they initially thought there had been no leak outside the radiation-controlled area and therefore did not report the accident to the Nuclear Regulation Authority. The leak was only discovered Friday night and **the NRA was informed at 10:15 p.m.**, the officials said.

When radiation readings rose during the experiment, researchers released radioactive substances outside the facility through a fan on the assumption that they would quickly decay, the agency explained.

The level of radioactive contamination at the facility stands at as much as **40 becquerels per square centimeter**, it said.

The research complex is jointly run by the atomic energy agency and the High Energy Accelerator Research Organization.

The agency's president, Atsuyuki Suzuki, resigned earlier this month over its failure to conduct a proper inspection of its Monju prototype fast-breeder reactor in Tsuruga, Fukui Prefecture.

Science minister Hakubun Shimomura criticized the agency for its delay in reporting the accident to the prefectural and central governments, and the NRA. The delay indicates that the agency "lacks a sense of urgency and crisis," Shimomura said, stressing that **it is required to report any accident, regardless of its severity.**

May 25, 2013

Radiation leak reported day after incident at Ibaraki laboratory

<http://mainichi.jp/english/english/newsselect/news/20130525p2g00m0dm004000c.html>

TOKYO (Kyodo) -- Radioactive substances were released into the atmosphere Thursday outside the controlled area at one of the Japan Atomic Energy Agency's nuclear physics laboratories in Ibaraki Prefecture, the Nuclear Regulation Authority's secretariat said early Saturday morning.

Fifty-five researchers and others who were engaged in experiments and other work at the laboratory may have been exposed to radiation as a result of inhaling the substances, but none were taken to hospital, the government body said. Four have so far undergone checkups and the highest radiation dose detected was 1.6 millisievert.

No impact from the radiation is expected beyond the premises of the accelerator laboratory in Tokaimura.

The NRA secretariat said it received a report on the incident at the laboratory of the Nuclear Science Research Institute from the JAEA at around 9 p.m. Friday. The incident occurred at 11:55 a.m. Thursday.

Officials of the JAEA said in a press conference held early Saturday in Tokyo that it failed to report the incident to the NRA immediately because it believed the leak had been confined to the laboratory.

The Ibaraki Prefectural government said it was notified at around 9:40 p.m. Friday, adding that it will conduct an on-the-spot inspection of the facility Saturday afternoon.

The latest incident follows the resignation of the president of the state-run JAEA last week. Atsuyuki Suzuki resigned over the agency's failure to conduct a proper inspection of its Monju prototype fast-breeder reactor in Tsuruga, Fukui Prefecture.

The researchers at the lab in Ibaraki were engaged in an experiment to generate particles by applying a proton beam to gold. The equipment they were using suffered a malfunction, causing it to overheat, which resulted in the evaporation and release of radioactivated gold, the authorities said.

Contamination within the laboratory building is estimated at 40 becquerels at most, they said.

The JAEA initially thought that the leak had been confined to the lab area and that the radiation was within acceptable levels. As a result, workers switched on the ventilation fan, which eventually caused radioactive substances to escape into the outside atmosphere.

All work at the facility has been suspended, they said.

It's too easy to apologise after the event

May 25, 2013

Initial reaction to radioactive leak in question

http://www3.nhk.or.jp/nhkworld/english/news/20130525_25.html

The Japan Atomic Energy Agency says negligence in radiation checks caused a delay in reporting nuclear leakage at its laboratory in Tokai Village in Ibaraki Prefecture, northeast of Tokyo.

The accident occurred around noon on Thursday, when a piece of equipment malfunctioned while researchers were bombarding gold with proton beams to generate elementary particles.

The accident created an unexpected amount of radioactive substances. At least 6 workers, aged between 22 and 45, were exposed.

The agency became aware that the facility had been contaminated with radioactive substances around 5 PM on that day, but it only carried out simple tests to measure nuclear substances on the researchers' clothes, and allowed them go home.

It was not until Friday morning that the agency offered internal radiation checks. It has found that the 6 received internal doses of up to 1.6 millisieverts.

More people are expected to be found to have been exposed. The agency is measuring the dosages of

those who were at the facility at that time.

It is believed that the nuclear substances leaked out of the facility because exhaust fans were turned on twice after 3 PM on Thursday to lower the radiation dose that had increased in the experiment room.

However, the agency did not measure radiation levels around the facility, and it was not until after 5:30 PM on Friday that workers noticed that the level at the monitoring post next to the facility had risen.

As a result, the agency did not notify the Nuclear Regulation Authority or the prefectural government of the nuclear leakage until around 9:30 PM on Friday, or more than 30 hours after the accident.

The agency has apologized for the delay in reporting the accident to the central and local governments. It admitted that it failed to respond appropriately right after the accident, and says it will verify the problem in detail and study countermeasures.

A case of labour malpractice?

May 27, 2013

Subcontractor chided for sacking Fukushima decontamination work whistleblowers

<http://mainichi.jp/english/english/newsselect/news/20130527p2a00m0na009000c.html>

FUKUSHIMA -- The Fukushima Labor Standards Inspection Office has ordered a subcontractor engaged in the Fukushima nuclear disaster cleanup to correct its labor practices for firing three male employees without prior notice, the Mainichi Shimbun has learned.

The three men allege that they were fired by the subcontractor, based in Sapporo, after they approached the project's prime contractor and blew the whistle on alleged corner-cutting. The allegations surrounding their sacking led the labor standards office to issue a rectification order to the Sapporo firm on suspicion of violating the Labor Standards Act.

The city of Fukushima, which has contracted out decontamination work, is looking into the case, sources say.

According to the labor standards office, the prefectural capital placed an order with a joint venture formed by two local firms to conduct decontamination work in the city's Matsukawa district. But the subcontractor dismissed the three workers without prior notice on May 23.

After being contacted by the three fired workers, the labor standards office checked with the Sapporo firm which on May 24 admitted to firing the three men. The office advised the subcontractor to take corrective action and the subcontractor subsequently paid the three an average wage of about 330,000 yen each.

The Labor Standards Act stipulates that workers must be notified of dismissal more than 30 days in advance, or if an employer dismisses them effective immediately, they must be paid more than 30 days of an average wage.

Fukushima Municipal Government regulations governing the decontamination contract state that vegetation for incineration should be separated from soil to help reduce waste.

The labor standards office says the three workers were employed on May 20 and were ordered by the subcontractor to put both soil and vegetation together in bags on May 21 and 22. The three workers were fired one day after notifying the joint venture about the work procedure.

The labor standards office quoted the three as saying they were fired because they told the prime contractor about the order. The office said the subcontractor, however, maintains it fired the three because of their work behavior.

Safety can be fabricated

May 28, 2013

South Korea idles 2 nuke plants after cable tests faked

http://ajw.asahi.com/article/asia/korean_peninsula/AJ201305280117

THE ASSOCIATED PRESS

SEOUL, South Korea--South Korea has idled two nuclear power plants after finding that test results for crucial control cables were falsified in a new blow to an industry mired in a graft scandal and safety lapses.

South Korea's trade and energy ministry said on May 28 a company contracted to conduct tests fabricated the results for cables that failed to meet international standards for capacity to withstand changes in voltage and pressure. It warned that the plant shutdowns would result in summer power shortages.

The cables control valves that are responsible for cooling nuclear fuel or preventing the release of radioactive materials during an emergency. Another four nuclear reactors that were either shut down for scheduled maintenance or under construction were also using cables that had failed the tests.

"If these control cables do not operate well during an emergency, we viewed that it would not guarantee to cool nuclear fuels or to shut off radioactive materials," South Korea's Nuclear Safety and Security Commission said in a statement.

It said the cables, which were in use since December 2011, failed nine of 12 tests pertinent to their operation in a "loss of coolant accident."

Han Jinhyun, vice trade and energy minister, declined to name the company while the government's investigation is ongoing. The ministry will sue the company and also ask prosecutors to launch a probe, he told a press conference.

The revelations add to public worries about nuclear safety and power shortages during the summer when demand is at its peak. They are a new blow to South Korea's ambitions to export its nuclear technology.

With the shutdown of the Shin-Kori No. 2 and Shin-Wolsong No. 1 reactors to replace cables, a total of 10 nuclear plants are now offline.

The minister said it would take around four months to replace the cables and warned "unprecedented power shortages" are expected in coming months.

"There is no means to increase power supply in the short term, so we expect we need to lower demand considerably to weather the crisis," he said.

Last year, the South Korean nuclear industry was rocked by revelations that thousands of components used in nuclear plants had falsified quality certificates. Dozens of employees at state owned nuclear power plant operator, Korea Hydro & Nuclear Power Co., were prosecuted for taking bribes from contractors to accept substandard parts and machinery.

The investigation into the cable problems began after the nuclear safety commission received tips through a whistleblowing channel that was set up in the wake of last year's scandal.

"This incident is more serious than previous scandals because it is wrongdoing by a company that is supposed to oversee products," said Kim Ik-jung, a medical professor at Dongguk University who has become prominent as an anti-nuclear activist since the government decided to build a nuclear waste dump in Gyeongju city where he lives.

"Corruption is widespread in the nuclear industry because there is no agency that can truly regulate Korea Hydro & Nuclear Power," he said.

South Korea has 23 nuclear power plants which supply about 30 percent of its energy and plans to add another 11 reactors by 2025.

South Korea Halts Operations at Reactors Over Faked Certificates

By CHOE SANG-HUN

Published: May 28, 2013

Source : The New York Times

http://www.nytimes.com/2013/05/29/world/asia/south-korea-turns-off-nuclear-reactors.html?_r=0

SEOUL, South Korea — South Korea said on Tuesday that it was turning off two nuclear power reactors on Tuesday and delaying the scheduled start of operation at another two, after its inspectors discovered that the reactors used components whose safety certificates had been fabricated.

South Korea's nuclear power industry has been plagued by a series of forced shutdowns, corruption scandals and mechanical failures in recent years, undermining public confidence in atomic energy even as the country's dependence on it for electricity is expected to grow in coming years.

A anonymous whistle-blower led government investigators to uncover the latest problem, in which control cables had been supplied to four reactors with faked certificates even though the part had failed to pass a safety test, the country's Nuclear Safety and Security Commission said on Tuesday. The control cable is used to send electronic signals to a reactor's control system in the event of an accident.

The commission halted operations at two reactors on Tuesday so the problematic cables could be replaced. The planned start-up of two other reactors — one under a routine maintenance shutdown and the other a newly built reactor waiting for operational approval — will be delayed for the same reason.

South Korea currently has 23 reactors, and Tuesday's decision meant that 10 reactors are temporarily offline for safety concerns, maintenance and other reasons, raising the risk of power shortages in the coming summer, when electricity consumption peaks.

The two reactors shut down on Tuesday are on the southeastern coast of South Korea and each has a capacity of 1,000 megawatts. The recurring scandals have damaged the reputation of South Korea's nuclear power industry, which supplies one-third of the country's electricity needs and aspires to become a global exporter of reactors.

Despite increasing public concern, however, the government remained determined to push ahead with its aggressive nuclear power program; by 2030, the country plans to add 16 more reactors.

Last year, South Korea was forced to shut down two reactors when it was revealed that thousands of substandard parts had been supplied with fake warranties for over 10 years. The country resorted to various power-saving measures to avoid blackouts. Several nuclear power engineers and parts suppliers were later jailed for involvement in the scandal.

Japan Atomic Energy Agency under fire... again

May 28, 2013

Japan Atomic Energy Agency pressed to reform

http://www3.nhk.or.jp/nhkworld/english/news/20130528_23.html

Science Minister Hakubun Shimomura says he will soon launch a taskforce to study sweeping reforms for the trouble-hit Japan Atomic Energy Agency.

The organization co-manages a research facility north of Tokyo where a radiation leak occurred last week during a particle physics experiment. More than 30 researchers were exposed to a small amount of radiation.

The Japan Atomic Energy Agency has also come under fire for failing to inspect vital equipment at the Monju fast-breeder reactor in Tsuruga, Fukui Prefecture.

Shimomura told reporters on Tuesday that these incidents were caused by the organization's poor safety awareness.

He said the proposed taskforce will study how the Japan Atomic Energy Agency should reform its organization and operations so that it will put safety first.

The minister suggested that he will also ask the agency to urgently carry out a review of its safety measures and report the results.

Abe on nukes - A victory for a powerful lobby

May 31, 2013

Abe to intensify efforts to restart nuclear power plants

http://ajw.asahi.com/article/behind_news/politics/AJ201305310087

By TOMOYA FUJITA/ Staff Writer

Score a victory for Japan's powerful business lobby.

Despite deep-rooted public distrust of nuclear power generation in the aftermath of the Fukushima disaster in 2011, the Abe administration is set to push restarts of idled nuclear reactors as an integral engine of policy to spur economic growth.

The Asahi Shimbun obtained a copy of the government's draft growth strategy that is expected to win Cabinet approval as early as June 14.

The decision represents a marked turnaround from the previous government. There are concerns it could set off a fresh outcry from the public, which has lingering doubts about the safety of nuclear reactors following triple meltdowns at the Fukushima No. 1 nuclear power plant.

Business groups have been pressing the government to seize the nuclear initiative because of the humongous financial battering Japan has absorbed as a result of the Great East Japan Earthquake and tsunami.

The government's decision to continue to rely on nuclear power will be presented to the Industrial Competitiveness Council, a government panel tasked to draw up a growth strategy, on June 5 for formal approval.

As such, the government will put the nation on notice that a reliance on nuclear power generation will be fundamental to growth prospects on a mid- to long-term basis.

In January, Abe suggested continued reliance on nuclear power. He pledged to conduct "zero-based review" of the energy policy set by the previous administration, led by the Democratic Party of Japan, which aimed to phase out nuclear power by the end of the 2030s.

The draft underscores a need to help business circles by addressing potential shortfalls in power supply after the nuclear disaster forced all the nation's reactors, except two, to go offline.

Nuclear energy represented roughly 30 percent of overall power supply before the 2011 disaster.

The draft also stresses that an increase in electricity rates as a result of ballooning fossil fuel costs to operate more thermal power plants to make up for idled reactors should be kept in check.

The use of nuclear power, the draft says, is an answer to energy woes, along with the implementation of proposed reform of the electric power system and the introduction of highly efficient thermal power generation.

The draft also states that the government will restart reactors whose safety was cleared by the Nuclear Regulation Authority, a nuclear industry watchdog that was established after the accident.

It goes on to say that the government will "make utmost efforts" to win the understanding of and cooperation from local communities hosting nuclear power plants.

Abe's Liberal Democratic Party had pledged earlier to draw up a mid- to long-term energy policy within 10 years while cutting Japan's reliance on nuclear power as much as is deemed feasible.

However, the Abe administration made an about-face amid calls for reactor restarts from major utilities and other industries, which cited mounting fuel costs and potential risks of power shortages.

Earlier this month, 40 or so LDP lawmakers formed a group to push for restarts.

Abe reiterated his resolve on restarts at an Upper House Budget Committee session on May 15, saying, "We want to achieve (reactor restarts) at the earliest possible time."

Many members of the Industrial Competitiveness Council who are from the industrial sector strongly support nuclear energy.

"Japan should maintain a certain percentage of nuclear energy as a national strategy by bringing reactors back online soon," said Sadayuki Sakakibara, chairman of Toray Industries Inc.

Some members, such as Heizo Takenaka, a professor of economics at Keio University, called for caution but were unable to win over their colleagues.

The results of "deliberative polling," a combination of conventional public opinion polls and discussion meetings, on nuclear power last August showed that half of the participants from the public backed a phaseout of nuclear energy by 2030.

All of Japan's 50 remaining reactors were shut down by May 2012.

But two reactors at the Oi plant in Fukui Prefecture were brought online two months later.

What about peace, stability and safety?

June 1, 2013

Problematic pact with India

<http://www.japantimes.co.jp/opinion/2013/06/01/editorials/problematic-pact-with-india/#.UajWN9hBpg4>

Prime Minister Shinzo Abe and Indian Prime Minister Manmohan Singh on Wednesday agreed to accelerate talks to conclude a pact that would allow Japanese firms to export nuclear power-generation technologies and equipment to India, which is struggling to secure stable electricity supplies to sustain its economic growth. The agreement came when **the United States, France, Russia and South Korea are fiercely competing to get orders for nuclear technologies and equipment from India.**

A Japan-India nuclear cooperation pact is problematic especially in view of the fact that India is not a party to the Treaty on Non-Proliferation of Nuclear Weapons (NPT). India plans to build some 20 new nuclear power plants and to increase the share of nuclear power in total electricity supply from the current 4 percent to 25 percent by 2050. The value of India's nuclear power market is estimated at \$150 billion (about ¥15 trillion).

Mr. Abe has already signed agreements with the United Arab Emirates and Turkey to enable the export of Japan's nuclear power technologies and equipment to them. It is deplorable that he is pushing such exports to India, paying little attention to the danger of nuclear power generation and the need to prevent nuclear weapons proliferation.

Mr. Abe appears to ignore the sober fact that Japan has suffered from the crisis at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear power plant. Some 150,000 people from Fukushima Prefecture are still forced to live away from their homes in areas contaminated with radioactive substances from the plant.

India carried out nuclear explosion tests, repeated test launches of missiles that can be tipped with nuclear weapons, and is not a signatory of the NPT. India and its neighbor Pakistan, a nuclear armed nation that is not a member to the NPT, have been engaged in an arms race. These stark facts should not be forgotten.

India has no comprehensive safeguard agreement with the International Atomic Energy Agency to let the nuclear watchdog inspect nuclear-related equipment and fissile materials in a signatory nation and have the nation provide relevant data.

But in 2008, under the pressure from the U.S. Bush administration, the Nuclear Suppliers Group, including the United States, Britain, France, Germany and Japan, decided to allow exports of nuclear power technologies and equipment to India, giving it exceptional treatment. In exchange, India pledged unilateral and voluntary moratorium on nuclear weapons tests and joining a Fissile Material Cutoff Treaty to ban the further production of fissile material for nuclear weapons.

But India has called for insertion of a clause in a Japan-India nuclear pact, which ensures that the pact will not hamper India's nuclear weapons program. It also wants the right to reprocess spent nuclear fuel from Japanese nuclear power generation equipment. Japan should never accept these Indian demands.

Japan should rethink its approach to India because a Japan-India nuclear pact could trigger a further arms race between India and Pakistan, thus undermining Japan's and India's joint goal to ensure peace and stability in the whole of Asia.

S. Matsuura appointed head of Japan Atomic Energy Agency

May 31, 2013

Cabinet OKs ex-senior nuke regulator for atomic energy agency's presidency

JJI

<http://www.japantimes.co.jp/news/2013/06/01/national/cabinet-oks-ex-senior-nuke-regulator-for-atomic-energy-agencys-presidency/#.UajVethBpg4>

The Cabinet approved plans Friday to appoint **former senior nuclear regulator Shojiro Matsuura** as president of the scandal-shaken Japan Atomic Energy Agency.

Matsuura, 77, will fill the post vacated by Atsuyuki Suzuki, who quit in May to take the blame for flawed safety checks at the agency's Monju fast-breeder nuclear reactor in Tsuruga, Fukui Prefecture.

The appointment will take effect Monday.

Science and technology minister Hakubun Shimomura praised Matsuura for **his deep insight into nuclear safety regulations and his management skills.**

He is “the best person to initiate reforms at the agency, whose safety culture is found to be deteriorating,” Shimomura said.

Matsuura joined the Japan Atomic Energy Research Institute, a predecessor of the JAEA, in 1961 after graduating from Kyoto University. He was head of the institute between November 1998 and March 2000.

In April 2000, Matsuura became chairman of the now-defunct Nuclear Safety Commission, one of the entities remade into the current Nuclear Regulation Authority.

As commission head, Matsuura dealt with Tokyo Electric Power Co.’s cover-up of problems at nuclear power plants and joined work to revise design guidelines to make nuclear plants safer against earthquakes.

Matsuura in April 2011 apologized for the meltdowns at Tepco’s Fukushima No. 1 power plant the month before.

Just charge users twice for decommissioning

Reactor-dismantling cost rule may change

Kyodo

<http://www.japantimes.co.jp/news/2013/06/02/national/reactor-dismantling-cost-rule-may-change/#.Uao8cthBpg4>

The industry ministry is considering revising an accounting rule to alleviate the financial burden on electricity companies from decommissioning nuclear power plants, sources said Saturday.

The change would allow multiyear instead of single-year booking of losses resulting from dismantling atomic energy reactors, according to the sources.

The Ministry of Economy, Trade and Industry is looking to allow utilities to **pass on multiyear losses to users through higher electricity rates**, the sources said.

But as **the cost of decommissioning is already factored into electricity rates**, there could be an outcry over slapping customers with the additional financial burden.

Under the current rule, utilities are required to build reserves for decommissioning reactors over their expected lifetimes of 40 years or more. If a plant is scrapped sooner, the operator must cover any shortage of reserves.

In what may turn into an earlier-than-scheduled decommissioning case, the Nuclear Regulation Authority recently acknowledged that reactor 2 at Japan Atomic Power Co.'s Tsuruga plant in Fukui Prefecture sits atop an active fault, which is not permissible under the nuclear regulatory framework.

If the unit is dismantled, Japan Atomic Power is expected to suffer losses in the range of ¥100 billion, a huge financial blow.

METI plans to set up a panel of experts to examine the rule change with the aim of implementing a new regulation by the next-March end of the current fiscal year, the sources said.

According to a METI estimate, the nation's 10 power companies operating nuclear reactors would incur a combined ¥4.4 trillion in single-year losses if all of them were to be decommissioned.

Gov't may be filing lawsuit against TEPCO

Ministry may sue Tepco for ¥16 billion

Kyodo

<http://www.japantimes.co.jp/news/2013/06/03/national/ministry-may-sue-tepco-for-%C2%A516-billion/#.UauThdhBpg4>

June 2, 2013

Gov't eyes suing TEPCO over unpaid decontamination costs

<http://mainichi.jp/english/english/newsselect/news/20130602p2g00m0dm002000c.html>

TOKYO (Kyodo) -- The Environment Ministry is considering filing a lawsuit against Tokyo Electric Power Co., seeking payment of about 16.5 billion yen in decontamination expenses since the 2011 Fukushima nuclear disaster, sources close to the matter said.

The unpaid amount includes expenses for decontamination work by the government near the Fukushima Daiichi nuclear power plant undertaken based on a special measures law to deal with radioactive contamination, as well as government subsidies allocated to local governments which conducted decontamination work, the sources said.

Under the law, the government is supposed to cover decontamination expenses first and ask TEPCO to reimburse the sum later. Although there is no deadline for the payment, TEPCO's failure to pay the expenses means that the government continues to use taxpayer money for decontamination projects.

If the court orders TEPCO to pay the decontamination costs, the utility will also have to pay interest. Therefore, the Environment Ministry believes that TEPCO will soon agree to the payment, the sources said, adding that the ministry is now discussing the matter with the Justice Ministry.

The Environment Ministry has asked TEPCO to pay the decontamination costs every three months after finalizing the sum following the completion of decontamination projects.

Of about 21.1 billion yen that the ministry requested the utility pay, TEPCO only agreed to pay 4.4 billion yen.

TEPCO plans to soon pay an additional 250 million yen, but it remains unwilling at present to pay the remaining 16.5 billion yen, saying it takes time to confirm relevant documents.

The government has booked about 1.3 trillion yen in decontamination costs by fiscal 2013. The sum that the Environment Ministry asked TEPCO to pay is only part of the overall decontamination projects conducted in fiscal 2011.

When each local government closes its book for fiscal 2012, the sum will likely top 100 billion yen, the sources said.

TEPCO told Kyodo News that it responds appropriately in accordance with the special measures law on radioactive materials but declined to elaborate on the specific conditions of the payment.

Nukes no longer risky

June 4, 2013

Environmental government white paper removes risks of nuclear power

http://ajw.asahi.com/article/behind_news/politics/AJ201306040085

By TETSU KOBAYASHI/ Staff Writer

In line with the Abe administration's push for the restart of nuclear reactors, the 2013 government white paper on environmental issues has noticeably removed the warning on the risks of nuclear power, which was included in the 2012 report.

In the 2012 white paper, the "Annual Report on the Environment, the Sound Material-Cycle Society, and the Biodiversity in Japan," radioactive contamination is described as the "biggest environmental issue." That report followed the 2011 accident at the Fukushima No. 1 nuclear power plant.

However, such a warning disappeared from the 2013 version, which was approved by the Cabinet of Prime Minister Shinzo Abe on June 4.

Before the nuclear accident, the Environment Ministry had regarded nuclear power, which does not emit carbon dioxide, as an important means of reducing global warming. In the 2010 version of the white paper, for example, the ministry said that it would further promote the use of nuclear power.

In the 2012 version, which was compiled after the nuclear disaster, however, the white paper described the risk of the utilization of nuclear power by devoting two pages under the title "Turning Point for the Nuclear Safety Regulation."

The description partly said, "Before the Great East Japan Earthquake, the relationship between environmental concerns and nuclear disasters was rarely discussed as a political matter."

It included, "An issue for nuclear safety measures is how to define potential risks, since nuclear accidents can cause serious environmental contamination."

In the 2013 report, the white paper described the progress of the decontamination of radioactive materials that had spread due to the accident at the Fukushima No. 1 nuclear plant. It also described

measures that had been taken to alleviate the public's concerns over the possible adverse health effects from the contamination.

However, it contains no description detailing the risk of the utilization of nuclear power generation.

According to the Environment Ministry, the Nuclear Regulation Authority, which was set up as an affiliate of the ministry, is expected to use safety regulations on nuclear power generation as the main theme of its annual report. Therefore, the ministry “ceded” the cautionary note to the NRA, the ministry said.

Meanwhile, the Abe administration plans to fashion new goals to combat global warming in the autumn. The discussions for that plan will focus on the restart of the nation's idled nuclear reactors, which account for 48 of the 50 reactors.

“We don’t want to give to the discussions a (one-sided) view (that the utilization of nuclear power contains risks). It is very difficult for us to express our views in the current situation,” a high-ranking Environment Ministry official said.

Hollande's visit - cooperation on nukes between both countries

June 6, 2013

France's Hollande on Japan visit to push nuke ties

<http://mainichi.jp/english/english/newsselect/news/20130606p2g00m0dm092000c.html>

TOKYO (AP) -- French President Francois Hollande arrives in Japan on Thursday for a visit expected to focus on closer cooperation in nuclear energy technologies and on Prime Minister Shinzo Abe's economic strategies.

Hollande and Abe will hold summit talks that local media say may yield an agreement on cooperating in nuclear fuel cycle technology, next-generation reactors and decommissioning of nuclear power plants.

Japan is struggling with the cleanup from meltdowns at the Fukushima Dai-ichi plant following the March 2011 earthquake and tsunami disasters, and with the suspension of its Monju fast-breeder reactor, which is meant to process spent atomic fuel.

Abe is eager to sell Japan's nuclear technology overseas, despite the suspension of most nuclear power generation following the Fukushima disaster, and is endeavoring to show it can offer the highest safety standards. Its Mitsubishi Heavy Industries has teamed up with France's nuclear services giant Areva in building a nuclear reactor on the Black Sea coast in Turkey.

Earlier this week, Hitachi-GE Nuclear Energy, Ltd. and Areva announced they plan to work together on improving nuclear safety through filtered containment venting systems that can remove radioactive materials from the air.

Areva also has aided the crippled Fukushima plant with water treatment technology, though Tokyo Electric Power Co., its operator, soon switched to using a system designed by Toshiba after deciding the French system was not as effective as expected.

Though France is the only nation with technology for a closed nuclear fuel cycle, which reprocesses and reuses spent nuclear fuel, Hollande has announced plans to scale back its atomic power program, cutting the country's reliance on atomic power, from 75 percent to 50 percent by 2025.

On broader issues, Hollande will get a first-hand look at how Abe is fighting Japan's two-decade-old economic slump through his "Abenomics" policy mix of monetary and fiscal stimulus and reforms. Many commentators have urged European leaders to reconsider fiscal austerity imposed due to the financial crisis, pointing to Japan's emergence from recession late last year and its 3.5 percent annual economic growth rate in the last quarter as evidence that stimulus is crucial for recovery.

France has been seeking to counter its economic woes by growing its business with Asia. Hollande returned just over a month ago from a visit to China, where the two countries clinched deals on the sale of dozens of Airbus aircraft and on building a used nuclear fuel treatment and recycling facility.

It is also hoping to work with Japan on emerging technologies such as nanotechnology, information technology and robotics. The two sides also have pledged to increase student and cultural exchanges.

France's annual exports to Japan total around 7.5 billion euros (\$9.8 billion), while its imports are just over 9 billion euros. Both rank 11th as respective trade partners.

Hollande's is the first state visit to Japan this year and as such he was to be given a formal welcoming ceremony and a banquet hosted by Emperor Akihito and Empress Michiko. He and French first lady Valerie Trierweiler are due to leave Japan on Saturday.

Here comes Areva

Areva Signs Cooperation Agreements On Fukushima And Rokkasho

<http://www.nucnet.org/all-the-news/2013/06/07/areva-signs-cooperation-agreements-on-fukushima-and-rokkasho>

Research & Development

7 Jun (NucNet): French and Japanese companies have signed agreements that will see them cooperating on the rehabilitation of the Fukushima nuclear site and the start of commercial operations at the Rokkasho used fuel reprocessing facility.

A joint statement of cooperation to prepare for commercial start-up of Rokkasho was signed in Tokyo today by Japan Nuclear Fuel Limited (JNFL) president Yoshihiko Kawai and Luc Oursel, the president and chief executive officer of France's Areva group.

Areva and JNFL plan to expand their collaboration at Rokkasho, particularly on complementary safety assessments.

Areva will also contribute its technical expertise to the construction of a Japanese mixed oxide (MOX) fuel fabrication facility, whose technology is based on Areva's Melox facility in France.

Areva also signed a cooperation agreement with nuclear decontamination company Atox for dismantling and cleanup operations. The two companies will work on solutions for the rehabilitation of the Fukushima site and region.

Japan and France highly skilled in the area of safety...

June 7, 2013

Abe, Hollande reach deal to push nuclear technology

by Mizuho Aoki

Staff Writer

<http://www.japantimes.co.jp/news/2013/06/07/national/abe-hollande-reach-deal-to-push-nuclear-technology/#.UbHRVthBpg4>

French President Francois Hollande and Prime Minister Shinzo Abe agreed Friday to deepen cooperation on developing and exporting nuclear power plant technologies, and to strengthen security ties.

In a joint statement following their summit in Tokyo, the two leaders agreed to arrange talks between their foreign and defense ministers, commonly known as two-plus-two talks, to discuss joint development of defense equipment as well as exporting such items overseas.

Through such talks, Japan aims to stop France from exporting dual-use items to China that could improve the Chinese military's capabilities.

A French naval contractor sold ship-based helicopter landing systems to China, triggering concern in Japan that it will raise the potency of Chinese surveillance ships deployed around the disputed Senkaku Islands in the East China Sea.

France will be the fourth country for Japan to establish a framework of two-plus-two talks, after the United States, Australia and Russia.

During a joint news conference, Abe stressed that the proposed cooperation in nuclear power plant technologies is to enhance "safety standards" throughout the world, as **Japan and France are highly skilled in this area.**

"In that sense, I'm confident that Japan and France are the world's best partners," Abe said.

The two leaders agreed to cooperate on starting "the safe and stable operation" of the fuel reprocessing plant in the village of Rokkasho, Aomori Prefecture, which was initially due to be completed in 1997 but has been delayed by technical problems.

They also agreed to **promote joint development of a next-generation nuclear reactor as well as to support private-sector efforts to export nuclear power technologies to emerging countries.**

In early May, a Japanese-French consortium including Mitsubishi Heavy Industries Ltd. and France's Areva SA won the exclusive negotiating right for building Turkey's second nuclear plant, and both governments hope to reach similar deals elsewhere.

Cooperation in high-tech fields such as robotics and smart grids were also stipulated in the joint statement.

The European Union has maintained an arms embargo on China introduced in the wake of the 1989 Tiananmen Square crackdown. France argues that the helicopter landing equipment is not subject to the ban.

Asked about exports of dual-use items to China, Holland said, "I want to say that those (export items) are not for a military use," adding that France is abiding by the rules.

The two countries agreed to **promote ongoing negotiations for a Japan-EU free-trade agreement** so that the deal will be reached soon.

Hollande's three-day trip to Japan is the first by a French president in 17 years. The last to visit as a state guest was Jacques Chirac. Hollande is scheduled to leave Tokyo on Saturday.

Abe, Hollande agree on bilateral cooperation

http://www3.nhk.or.jp/nhkworld/english/news/20130607_25.html

Japanese Prime Minister Shinzo Abe and French President Francois Hollande have agreed that their 2 countries will cooperate in developing defense equipment and exporting nuclear power technologies.

The 2 leaders issued a joint statement at a news conference after their meeting in Tokyo on Friday.

Abe told reporters that he and Hollande confirmed that Japan and France, which share common interests, will strengthen their special partnership.

Hollande said Turkey has decided to buy a nuclear reactor jointly developed by 2 firms from France and Japan. He said France and Japan can cooperate in a range of fields as well as the energy sector.

The joint statement calls for an early foreign and defense ministerial meeting to discuss the joint development of defense equipment and export controls.

It also says the 2 countries will support the overseas sales of the ATMEA One nuclear reactor, which was jointly developed by French nuclear energy firm AREVA and Japan's Mitsubishi Heavy Industries.

Abe and Hollande also confirmed that the 2 countries will closely exchange information about the security situation in the Middle East and Africa.

Terrorists carried out an attack in January on a gas plant in Algeria and Japanese nationals were among the dead.

The statement also says the 2 countries will help accelerate talks between Japan and the European Union on an economic partnership agreement.

Diplomacy and the promotion of nukes

June 8, 2013

EDITORIAL: Abe should stop using diplomacy to promote nuclear power

<http://ajw.asahi.com/article/views/editorial/AJ201306080030>

France is the world's most nuclear-dependent country.

Under the pretext of international cooperation with this country, Prime Minister Shinzo Abe is moving fast in a direction that is exactly opposite to the promise he made during last year's Lower House election campaign to reduce Japan's dependence on nuclear power.

The only conclusion we can draw from its actions is that the Abe administration is solidly committed to promoting nuclear power.

Abe and visiting French President Francois Hollande issued a joint statement stressing the importance of nuclear power generation after their meeting on June 7.

The statement promises support for Japan's efforts to establish a nuclear fuel recycling system, including the restart of the fuel reprocessing plant in Rokkasho, Aomori Prefecture. The document also calls for bilateral cooperation in the development of fast reactor technology and in exports of nuclear technology to third countries.

Little more than two years have passed since the disaster at the Fukushima No. 1 nuclear power plant, and it is not completely over yet. Nor is the work to decontaminate areas polluted with radiation and to allow evacuees to return home yet finished.

New revelations, including the discovery of an active fault within the grounds of a nuclear plant in Fukui Prefecture, have brought to the fore afresh the risk of operating nuclear power plants in this earthquake-prone country.

The advent of the Abe administration has not decreased the desire of many Japanese to see their society wean itself from dependence on the energy released by nuclear fission.

Despite these circumstances, Japan and France jointly declared their intention to attach great importance to nuclear power.

It may make sense for Japan to receive help from France in certain areas where the European powerhouse has accumulated experience and expertise, such as reactor decommissioning and radioactive waste management.

But the other parts of the bilateral nuclear power agreement are all highly questionable.

The biggest source of concern is their deal on cooperation over Japan's stalled program to create a nuclear fuel recycling system.

Last month, Japan's Nuclear Regulation Authority imposed a ban on the restart of the Monju prototype fast-breeder reactor, which is supposed to play the central role in the program. The nuclear safety watchdog's action came after it was revealed that the Japan Atomic Energy Agency, which operates the experimental reactor, failed to carry out mandatory inspections of nearly 10,000 pieces of equipment at the plant.

Prospects for the commercial use of a fast-breeder reactor are highly doubtful from a technological viewpoint as well. The realistic decision for the Monju program would be to pull the plug on it and decommission the reactor.

The Rokkasho reprocessing plant has also been plagued by a series of troubles. Even if the plant is somehow brought online eventually, its operation will keep churning out plutonium for which there is no clear plan for use.

Japan is the only country which doesn't possess nuclear arms but has a large-scale nuclear fuel reprocessing plant.

Japan would cause immeasurable damage to the international system to prevent nuclear proliferation if it works with France, a nuclear power, in a project that would increase its production of plutonium.

This kind of cooperation between a country armed with nuclear weapons and a country that once suffered nuclear devastation could make many other non-nuclear countries think that they would be better off owning material that can also be used to produce nuclear arms.

Rather than building a nuclear fuel recycling system, Japan and France should work together in efforts to prevent nuclear proliferation.

The Abe administration has been showing increasingly clear signs that it is keen to promote nuclear power generation.

The administration has included the use of atomic energy in its strategy for economic growth. In addition to the Middle East, India and France, East Europe is also on the list of potential areas for the administration's efforts to expand Japan's nuclear cooperation with other countries. Abe is going to announce Japan's nuclear cooperation with East Europe during his visit to Poland in mid-June.

But the Abe administration has failed to offer a detailed explanation about its nuclear power policy. In taking advantage of international cooperation to gradually shift its policy toward promoting nuclear power, it is acting in a way that seriously compromises its political integrity.

Japan's nuke technology "the world's safest"?????

June 10, 2013

Editorial: Japan security cooperation with France important, but nuclear claims unfounded

<http://mainichi.jp/english/english/perspectives/news/20130610p2a00m0na003000c.html>

Following bilateral talks, Prime Minister Shinzo Abe and French President Francois Hollande released a joint statement reaffirming cooperation in nuclear power technology and security, as well as a five-year action plan.

In the field of security, the two leaders agreed on the creation of a forum to deliberate export controls of civilian items that have military applications, joint development of defense equipment, and arranging for discussions between defense and foreign ministers, known as two-plus-two talks.

Setting up a forum to discuss export management should be recognized as a forward-looking move.

Since the Tiananmen Square protests of 1989, the EU has prohibited the sale of weapons to China. What constitutes weapons, however, has been left up to the discretion of each member country.

Last year, a French defense company sold a state-of-the-art helicopter landing device to China. Japan has voiced fears to the French government that the equipment could be used by Chinese patrol boats near the Senkaku Islands, thereby improving China's performance around the disputed islands.

Hollande has consistently claimed that the sale of the copter device was not for military purposes, and for now, Japan and France have failed to see eye to eye on the issue. However, the safety of the East China and South China seas are an important matter for France, as well as to Japan, as they constitute trade routes to East Asia. Let's hope that further discussions on security, including the two-plus-two talks, can further France's understanding of the security environment, and lead to more stringent controls on exports to China.

During their talks, Abe and Hollande also reached an agreement to strengthen cooperation on nuclear technology exports, the promotion of the nuclear fuel cycle, and reactor decommissioning and decontamination following the crisis at the Fukushima No. 1 Nuclear Power Plant.

France and Japan are the world's second and third largest nuclear powers, respectively, after the U.S. The two leaders proudly declared that by bringing their nuclear power businesses together, they could raise the safety standards of nuclear technology worldwide.

We welcome bilateral cooperation on decommissioning reactors and decontamination. But working together to export nuclear reactors and promote the nuclear fuel cycle is another thing. The Fukushima nuclear disaster has yet to be brought under control, and we have not yet come to fully understand what caused it.

It is under such circumstances that Abe has outlined infrastructure export, including nuclear technology, as a pillar of the country's growth strategy. Following his tour of the Middle East in April and May, he is set to visit Eastern Europe in mid-June to market Japanese nuclear technology.

In Saudi Arabia, Abe claimed, "We can provide the world's safest nuclear technology." At a press conference following his meeting with Hollande, he declared, "Japan will meet (global) expectations for its nuclear technology to improve global safety standards. To do that, I am convinced that Japan and France are the world's best partners."

What is the basis for Abe's declaration that Japan's nuclear technology is "the world's safest?" He has failed to provide the Japanese people with a convincing explanation.

Areva, JNFL & ATOX

Areva signs nuclear power deals with Japanese firms

Source : Energy Business Review

<http://nuclear.energy-business-review.com/news/areva-signs-nuclear-power-deals-with-japanese-firms-100613>

EBR Staff Writer **Published 10 June 2013**

French nuclear firm Areva has signed **a series of strategic agreements with two Japanese firms, Japan Nuclear Fuel (JNFL) and ATOX**, for the continuation and development of the Franco-Japanese partnership in civil nuclear power.

The cooperation agreement with JNFL includes the commercial launch of the used fuel recycling plant at Rokkasho-Mura in Japan.

Both companies are also planning to expand their collaboration for the used fuel processing facilities on the Rokkasho-Mura site, especially within the field of complementary safety assessments.

In addition, Areva will provide its technical expertise to the ongoing construction of a Japanese MOX fuel fabrication plant, whose technology is based on the company's MELOX plant in France.

The second cooperation agreement with ATOX includes dismantling and clean-up operations.

As per the deal, both firms will jointly develop new solutions, primarily designed for the rehabilitation of the Fukushima nuclear site and region.

Areva said the agreement will enable both the firms to expand their partnership, which was started more than two years ago.

Areva president and CEO Luc Oursel said, "These agreements strengthen the historic links between AREVA and the Japanese nuclear industry and confirm their recognition of our expertise in the field of nuclear safety."

10 billion yen a year for idle Genkai no.1 and 2 reactors

June 11, 2013

Kyushu Electric spends 10 billion yen a year to maintain idle nuclear reactors

<http://mainichi.jp/english/english/newsselect/news/20130611p2a00m0na007000c.html>

Kyushu Electric Power Co. is continuing to spend around 10 billion yen a year to maintain the idle No. 1 and 2 reactors at the Genkai Nuclear Power Plant in Genkai, Saga Prefecture, it has been learned, even as a potential 40-year operation limit for the No. 1 reactor looms.

Multiple company executives said that they are "not thinking at all" of decommissioning the No. 1 reactor, although it will hit the 40-year-limit defined in the revised Nuclear Reactor Regulation Law in October 2015. The Nuclear Regulation Authority can grant exceptional extensions of 20 years, and company executives, who hold a strong view that nuclear power will continue to be a more cost-effective electricity source than thermal power, are hoping to be granted that exception.

According to Kyushu Electric, the price of thermal power is over 11 yen per kilowatt-hour, while the price of nuclear power is around 7.5 yen per kilowatt-hour. Even adding in the costs to meet new nuclear safety standards, the price of nuclear power would only rise about 1 yen per kilowatt-hour, so it would still be cheaper than thermal power.

Kyushu Electric also cites the problem of the cost of decommissioning the reactor. In accordance with the Electricity Business Act, the utility is setting aside funds to decommission the reactor, but at the end of fiscal 2015 it will still be 3.6 billion yen short of the estimated 35.8 billion yen needed to decommission the No. 1 reactor.

"People are telling us to dismantle the reactor, but that would be difficult if we don't receive financial assistance," says Kyushu Electric President Michiaki Uriu.

On the other hand, bringing the old reactor in line with new safety standards would require massive investments which would go to waste if it was decommissioned upon reaching the 40-year limit. Still, it seems that Kyushu Electric officials would prefer to postpone a decision on the reactor's fate for now, even if it means expending maintenance fees, until they know whether they will be able to receive an extension for the reactor and whether it will be profitable after bringing it in line with the new safety standards.

The company's consolidated balance sheet at the end of last fiscal year showed it was 332.47 billion yen in the red, its largest deficit ever. Normally, it would not be able to afford to spend 10 billion yen a year maintaining offline reactors.

"The reason they can spend large amounts of money on an inactive facility is that the current system allows them to collect power bill income to cover expenses (such as reactor maintenance) that are deemed as prime costs," says Ritsumeikan University professor of environmental economics Kenichi Oshima.

Regarding Kyushu Electric's argument for nuclear power's cost-effectiveness, Oshima raised his doubts. "Currently there is no assurance of what degree of safety measures would have to be taken at the No. 1 reactor to earn an extension, so they can't calculate the cost-effectiveness. When you also consider the costs for compensation and disaster response in the case of a nuclear disaster, you cannot call nuclear power more cost-effective than thermal power," he said.

The No. 1 reactor emerged as a problem after it was learned that its pressure vessel was in worse condition than expected. Last year, the Nuclear Regulation Authority's previous incarnation, the Nuclear and Industrial Safety Agency, said the reactor would be operational until 2033. However, the cause of the pressure vessel's deterioration remains unknown, and there is a strong opinion among experts that a non-biased research institute should analyze it. Even Hideo Kishimoto, the mayor of the town of Genkai, which hosts the plant, has expressed concern over the 20-year extension, though he is strongly calling for its reactivation.

Will Mizuno get in trouble?

June 14, 2013

Editorial: Official's tweets damage trust in disaster reconstruction efforts

<http://mainichi.jp/graph/2013/06/14/20130614p2a00m0na009000c/001.html>

A senior Reconstruction Agency official's tweets slandering legislators and a nongovernmental organization (NGO) supporting victims of the March 2011 Great East Japan Earthquake, tsunami and ensuing nuclear disaster have damaged the public's confidence in the government's reconstruction efforts.

Reconstruction Minister Takumi Nemoto apologized for the incident during a Diet session and removed the official, 45-year-old Yasuhisa Mizuno, from his post in charge of supporting Fukushima disaster victims. The government of Prime Minister Shinzo Abe should take prompt action to restore the public's trust in its reconstruction efforts.

Mizuno, a top-level bureaucrat at the Internal Affairs and Communications Ministry, was loaned to the Reconstruction Agency in August 2012. He was tasked with working out a basic policy to support the livelihoods of children and other victims of the Fukushima nuclear crisis under legislation enacted about a year ago.

Bureaucrats should be allowed to dispatch messages to the public on their private Twitter accounts, but it goes without saying that they must be responsible for the content of their tweets. Article 99 of the National Public Service Act stipulates that officials of the central government must not damage the trust in their positions or take any action that disgraces the entire bureaucracy.

Nevertheless, it has recently come to light that Mizuno slandered legislators and an NGO supporting reconstruction efforts on his private Twitter account, identifying himself as a national public servant.

After attending a rally organized by a citizens group, he tweeted, "I attended a meeting where I was intensely jeered by left-wing s---s."

Furthermore, he tweeted that an outstanding issue had been "resolved" when officials decided to leave it ambiguous, implying that he hailed procrastination on the issue.

The tweets are clearly condescending and lack a sense of responsibility for implementing measures to support the livelihoods of Fukushima victims.

The Reconstruction Agency, which says it will consider punishing Mizuno, should deal strictly with the matter. It should also examine whether his actions obstructed the performance of the agency's duties.

The government has already come under pressure to respond to revelations that a portion of public funds allocated to local governments affected by the disasters for reconstruction efforts was used outside the disaster areas.

The government tightened regulations on the use of state funds earmarked for disaster recovery following the revelations of misuse. However, it has been unable to check the use of funds provided to local bodies that are not under state control. Although the disaster recovery funding system was created by the previous government led by the Democratic Party of Japan, the Abe administration must monitor how the money is being used. The national government should promptly take concrete measures to address the misuse, such as freezing the allocation of remaining reconstruction funds.

Most government officials assigned to help restore areas affected by the disasters and support victims' livelihoods are working earnestly and enthusiastically. However, the public's trust in their efforts could be lost in an instant as a result of just one senior official's damaging words and deeds and the national government's insensitivity to the use of taxpayers' money.

To restore the public's confidence, the government has no choice but to demonstrate to society that it is steadily and patiently working on tasks to restore disaster-hit areas and support victims' livelihoods.

June 13, 2013

Reconstruction official insults citizens groups, Diet members on Twitter

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201306130069

THE ASAHI SHIMBUN

A Reconstruction Agency official in charge of supporting those affected by the 2011 nuclear disaster called a citizens group "stupid leftists" and slandered Diet members on his Twitter account.

Yasuhisa Mizuno, 45, a counselor, has admitted in the agency's questioning that he posted the comments. The agency plans to impose disciplinary measures against him shortly.

Mizuno, who is on the fast-track career course of the Ministry of Internal Affairs and Communications, was dispatched to the agency on loan in August 2012 after serving as vice mayor of Funabashi in Chiba Prefecture.

As a person in charge of the law to support children and other people affected by the accident at the Fukushima No. 1 nuclear power plant, he has often made business trips to Fukushima Prefecture.

In his Twitter account, he called himself a "central government employee." After taking part in a gathering held by a citizens group, he tweeted, "I attended a gathering in which I was repeatedly abused by stupid leftists."

Mizuno also criticized lawmakers who did not submit notices for questions they want to ask in the Diet as required.

"Because a party for workers is not submitting its notices, many (government) employees are now working late-night overtime," he tweeted.

Initially, he posted comments under his own name, but after being dispatched to the Reconstruction Agency, he began to post anonymously.

According to the agency, its employees' use of Twitter is not restricted.

Referring to Mizuno's tweets, Reconstruction Minister Takumi Nemoto said in the Lower House special committee on reconstruction on June 13: "If it is true, they are inappropriate remarks for a central government employee to make. If the tweets offended the people concerned, I want to apologize to them openly."

He added: "I am now confirming the facts of the matter. Based on the results, I intend to take appropriate (disciplinary) measures against him."

Reconstruction Agency official's tweets slander NGO, lawmakers supporting Fukushima victims

<http://mainichi.jp/english/english/newsselect/news/20130613p2a00m0na008000c.html>

A senior Reconstruction Agency official in charge of supporting Fukushima nuclear disaster victims has slandered lawmakers and an NGO on his private Twitter account in connection with their recovery efforts, prompting the agency to mull punishing him, it has been learned.

Yasuhisa Mizuno, 45, a counselor at the Reconstruction Agency, repeatedly tweeted defamatory comments on parties and issues related to his duties, calling attendants of an NGO-sponsored meeting "left-wing s---s" and hailing the procrastination of a pending issue as a "settlement."

Alerted that his tweets could raise doubts about the government's disaster recovery efforts, the Reconstruction Agency started questioning Mizuno and is mulling punishment against him, saying, "We will make a proper response based on the results confirmed." His anonymous Twitter account, in which he identified himself as a "national public servant," has since been deleted. He had earlier identified his name on the account until October last year and had tweeted at least some 600 times since assuming his current post.

During a session of the House of Representatives special committee on reconstruction from the Great East Japan Earthquake on June 13, Reconstruction Minister Takumi Nemoto bowed in apology over Mizuno's tweets, saying, "If he really made those statements, they were inappropriate as a national public servant."

I'd like to deeply apologize to the concerned parties," adding that the minister will respond to the issue properly based on the results confirmed.

Takayuki Kobayashi, a lower house member of the Liberal Democratic Party, said, "People who lost so many precious things to the quake disaster have been striving to get their lives going, and his tweets are extremely disrespectful of those who have been working so hard to support them. I urge strict responses to be taken."

Mizuno is a career bureaucrat at the Ministry of Internal Affairs and Communications, who formerly served as deputy mayor of the Chiba Prefecture city of Funabashi. He has been on loan to the Reconstruction Agency since August last year, where he is in charge of assisting nuclear disaster victims in Fukushima Prefecture. Some 150,000 residents of the prefecture are still living as evacuees after more than two years since the onset of the Fukushima No. 1 Nuclear Power Plant crisis.

Mizuno is specifically in charge of putting together a basic policy on concrete support measures based on the Act on the Protection and Support for the Children and other Victims of the TEPCO Disaster, which was enacted in June last year at the initiative of a group of suprapartisan lawmakers.

On March 7, Mizuno attended a meeting organized by a citizens group at the Members' Office Building of the House of Representatives and explained the progress of the basic policy compilation as a responsible official at the Reconstruction Agency. Later that day, he tweeted, "I attended a meeting where I was intensely jeered by left-wing s---s."

On March 8, he tweeted, "One of the pending issues was resolved today. To be precise, the concerned parties agreed to leave the matter ambiguous, without determining black or white" -- with the apparent implication that he hailed the procrastination of the issue.

The compilation of the basic policy has been delayed even though a year has passed since the enactment of the disaster support act, due in part to a delay in determining the standards for radiation doses in areas subject to support measures.

On March 15, Reconstruction Minister Nemoto announced a package of support measures for disaster victims based on the law, apart from the pending basic policy compilation. However, because the content of the package showed a setback from what had initially been anticipated, lawmakers who were involved in the enactment of the law and citizens groups criticized the measures as having been "watered down."

On his Twitter account, Mizuno slandered those lawmakers and a Cabinet minister in a way that readers could almost identify them from the context, calling one Diet member as "looking like Doraemon" and one minister as a "habitual liar."

Mizuno declined to comment on his Twitter account during an interview with the Mainichi Shimbun on the evening of June 11, only stating, "I run the account privately" and "I don't remember." He deleted his account shortly after the interview.

Independent regulators

13.06.2013_No147 / News in Brief

Regulator Says 'Organisational And Human Factors' Contributed To Fukushima
<http://www.nucnet.org/all-the-news/2013/06/13/japan-regulator-blames-organisational-and-human-factors-for-fukushima>

13 Jun (NucNet): Organisational and human factors, including the lack of an independent national nuclear regulator, contributed to the severity of the March 2011 Fukushima-Daiichi accident in Japan, a safety conference heard yesterday.

Kenzo Oshima, commissioner of the Japanese Nuclear Regulatory Authority, told the second European Nuclear Safety Regulators Group (Ensreg) Conference on Nuclear Safety in Europe in Brussels that the lack of independence of the national regulator meant little or no separation between the government and the regulatory body, resulting in a “cozy relationship” between the two. In effect, “the regulator was serving business interests”, he said.

In addition, it was left to operators to exercise their discretion when it came to the implementation of safety measures. The lack of mandatory measures made a weak framework for response to severe accidents. Any concerns voiced by the regulator resulted in the operator failing to exercise its discretion.

Mr Oshima highlighted the lack of a proper safety culture in Japan, which was dominated by a policy-culture of “nuclear infallibility”.

To resolve these issues, the Nuclear Regulation Authority was created in 2012 as an independent and transparent organisation.

Before the NRA was established, the Ministry of Economy, Trade and Industry (METI) had both promoted nuclear energy and regulated it through a branch known as the Nuclear and Industrial Safety Agency. The NRA was instead established under the Ministry of the Environment.

The main challenge for Japan according to Mr Oshima is “to regain public confidence and trust” in nuclear power and safety. Japan has to fundamentally “re-build its safety culture”.

European regulatory authorities agreed that the Fukushima-Daiichi accident has highlighted the need for independent, transparent and accountable national regulators in order to avoid organisational difficulties leading to mishandling of severe accidents.

Philip Lowe, director-general of the Directorate-General for Energy at the European Commission said “we need to maintain and strengthen the independence of national authorities”.

Decontamination - Why bother?

June 16, 2013

Government secretly backtracks on Fukushima decontamination goal

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201306160022>

THE ASAHI SHIMBUN

With the government facing difficulty in finding disposal sites, municipalities in Fukushima Prefecture are being unofficially notified that the goal for completion of radioactive decontamination work in March 2014 may not be met, sources said.

The government also informed municipalities that it will not allow decontamination work to be redone in areas where radiation levels have not declined even after decontamination efforts have been completed.

Those remarks apparently contradict the government's official stance that it will accelerate decontamination efforts for areas impacted by the accident at the Fukushima No. 1 nuclear power plant following the March 11, 2011, Great East Japan Earthquake and tsunami. Without a clear explanation, the government has begun to backtrack on its policies.

The government aims to lower radiation levels in areas to one millisievert or less a year. It plans to achieve that goal in all of the evacuation zones in 11 municipalities in the prefecture within this fiscal year, which ends in March 2014, by spending a total of 1.5 trillion yen (about \$15 billion) by the end of the year.

Prime Minister Shinzo Abe also said in March that the government will accelerate decontamination work and reconstruction activities.

However, the government is facing difficulties in securing sites to store waste contaminated with radioactive materials, due to local opposition. As a result, the government has yet to start decontamination work in five of the 11 municipalities where some or all residents were forced to evacuate due to high radiation levels.

Even in evacuation zones where the decontamination work has already begun, the progress rate of the work for houses was only 1 percent in Iitate village as of March.

In such circumstances, officials of five of the 11 municipalities said that they were told by the Environment Ministry in or after April that it would be difficult to achieve the goal within this fiscal year. Because of that, the town of Tomioka has begun to inform residents that the decontamination work will continue until the next fiscal year.

“The central government should officially admit the delay of the decontamination work and review the (decontamination) plans as early as possible,” said a Tomioka official in charge of the issue.

The ministry has also effectively rejected redoing decontamination efforts in areas where radiation levels have not declined. In a meeting with seven municipalities, held in May 27 to exchange opinions, the ministry told them, “As of now, we are not allowing the redoing of decontamination work.”

The stance is apparently contradictory to the government’s policy that redoing decontamination work could fall under the government’s fiscal measures to cover the costs. The policy was described in a document related to the government’s guidelines on decontamination work.

The contradiction is creating a backlash among municipalities because 25 municipalities have said that radiation levels have yet to decline to one millisievert in some of their areas even after decontamination work was completed.

As for decontamination plans, the Environment Ministry told The Asahi Shimbun that the policy of achieving the goal within this fiscal year is unchanged.

As for a second round of decontamination efforts, the ministry said that, currently, it has yet to target any areas. Therefore, that shows a priority being placed on areas where decontamination efforts have not been conducted at all.

“We cannot make drastic reviews until the July Upper House election,” said a high-ranking official of the ministry.

The decontamination work is apparently facing a slowdown. Though two years and three months have passed since the accident at the Fukushima No. 1 nuclear plant, decontamination work has yet to start in many areas.

In addition, additional decontamination work is not being allowed, even if radiation levels do not decline as a result of decontamination efforts. Incidents of slipshod decontamination work have also been revealed. Citizens are also having growing doubts on the cost-benefit performance of the decontamination work.

Opinions of residents are mixed. Residents, especially elderly citizens who want to return to their houses as early as possible, are placing strong hopes on the decontamination work. Meanwhile, according to a survey conducted by the village of Iitate in June 2012, more than 40 percent of the respondents replied that they don't expect to benefit from the decontamination efforts. In a Tomioka town survey, whose

results were released in February this year, 40 percent of the respondents said that they have decided not to return to their houses.

Many of the affected people are also requesting assistance for their current livelihoods rather than decontamination efforts.

Unless the government shows a clear road map for the decontamination work, residents cannot make plans for their future.

Delay of decontamination work became obvious in March when progress rates of those efforts were compiled. However, Environment Minister Nobuteru Ishihara said in the Diet in May, "There are no changes in the government's plans."

On the surface, the government is saying that it will accelerate decontamination efforts. Behind the scenes, however, it is showing an opposite stance. That means that the government is abandoning its responsibilities.

The government needs to show realistic decontamination policies to the public and make efforts to obtain their support for them.

The Fukushima prefectural government has not recorded any cases in which a second round of decontamination work has been allowed.

In the village of Yugawa in the prefecture, decontamination work was completed in fiscal 2012, which ended in March 2013. On June 5, the village asked the ministry for a second round of efforts, fearing that radiation levels could rise again due to melting snow. However, the ministry rejected the request, saying, "In principle, we cannot do them."

"The Environment Ministry's attitude toward us has always been terrible. We are not surprised at such a rejection," said an official of the village.

What can be behind rate increases

June 17, 2013

KEPCO rate hikes found to include costs for empty company housing units

<http://mainichi.jp/english/english/newsselect/news/20130617p2a00m0na009000c.html>

Customer rate increases demanded by the Osaka-based Kansai Electric Power Co. (KEPCO) beginning in May have included upkeep costs for a total of some 70 empty units within five company housing and dormitory properties, it has been revealed.

During a review previously undertaken in conjunction with the price increases, it had been revealed that fee reduction appraisals were being assessed for maintenance costs associated with housing properties with a large number of unoccupied units. However, the recent discovery made it clear that electricity fees were including the upkeep fees for completely unoccupied buildings, which is certain to draw criticism from customers.

Electricity fees are derived by calculating the necessary fees (initial costs) for providing power, as well as factoring in the ability to derive profits. In applying for a fee hike this year, KEPCO submitted documents to the Ministry of Economy, Trade and Industry calculating the costs for the approximately 250 buildings that were leased from outside companies and utilized for company housing and dormitories (totaling some 5,000 individual units) as part of initial costs. Permission from the ministry was asked for, and granted, to reflect such costs within customer fees.

The inclusion of the fees within the total cost calculations was discovered when the Mainichi obtained copies of these internal documents, and spoke with ministry officials who revealed that the number of occupants within the five buildings in question was zero in fiscal 2012, and that the projected number of occupants within the same buildings for the period up to fiscal 2015 was also zero.

Transparency

Familiar faces win ¥1.6 billion in nuclear public relations projects after Fukushima disaster

By SATOSHI OTANI/ Staff Writer

Nearly 70 percent of government spending to regain public trust in nuclear energy has landed at organizations that employ retired bureaucrats or former executives of electric power companies, The Asahi Shimbun has found.

In the two fiscal years after the accident at the Fukushima No. 1 nuclear power plant, the industry ministry awarded 49 contracts and the science ministry provided 18 for various projects worth 2.48 billion yen (\$26.2 million) to publicize and educate the public on nuclear energy.

Ten organizations with either retired bureaucrats or executives of utilities won 33 of those projects worth **1.63 billion yen**, or 66 percent of the total. The remaining projects were contracted out to advertising companies, according to documents.

The funds used in the projects come from taxes that are included in monthly electric bills.

The budget to promote nuclear energy was cut to about half of the level before the Fukushima nuclear disaster amid concerns about additional accidents and criticism against government officials who had touted the safety of nuclear energy.

The ministries' remaining programs were tailored to regain public trust by providing information on nuclear energy policy and promoting an understanding of radiation.

The cozy ties between politicians, bureaucrats, regulators and businesses in the "nuclear village" were also attacked for promoting collusion. One target of criticism was "amakudari," the practice in which retired ministry officials gain employment at companies and organizations that are overseen by those ministries.

Officials from the industry and science ministries said the hiring practices of organizations did not influence the bidding process for the projects.

"The presence of retired bureaucrats is not a standard for deciding on contract winners, and there is nothing arbitrary about the selection process," said an official with the Nuclear Fuel Cycle Industry Division within the Agency for Natural Resources and Energy under the industry ministry.

However, a number of the contracts were won by default--there were no other bidders.

The Ministry of Economy, Trade and Industry spent 1.48 billion yen in its public relations program for nuclear energy in fiscal 2011 and 2012. The program is mainly directed at citizens and municipalities hosting nuclear power plants, and much of the expenses were used to arrange lectures by nuclear energy scientists and provide workshops related to radioactive waste.

The Ministry of Education, Culture, Sports, Science and Technology used 1 billion yen in its program to support education on nuclear energy over the same period. The projects included the leasing of radiation detection equipment, seminars on radiation targeting teachers, and advertisements in newspapers and on TV.

Documents obtained from the two ministries showed that 34 private-sector companies as well as foundations and other organizations won contracts over those two years.

Six contract winners were employing retired bureaucrats from the two ministries as directors. And three of them--the Japan Science Foundation, the Radioactive Waste Management Funding and Research Center and the Tsukuba Expo '85 Memorial Foundation--had retired bureaucrats on the payroll as full-time executives.

Those three organizations were the only ones that revealed the pay of their executives. Full-time directors had annual salaries of about 16 million yen.

Four other contract-winning organizations had retired or current executives of electric power companies serving as directors or auditors.

Contracts are normally won in an open bidding process. But almost all of the public relations projects were awarded based on the commissioning body's appraisal of the bid proposal and technical skills.

Only one bid was placed for 10 of the 33 contracts won by the 10 organizations. The average winning bid was 96.8 percent of the predetermined maximum amount of the contract.

Before the Fukushima nuclear accident, between 2 billion and 3 billion yen a year was spent on public relations projects for nuclear power.

But after the triple meltdowns at the plant, those projects came under fire for spreading the false "safety myth" about nuclear power generation.

The two ministries scrapped some public relations projects that had been regular fixtures, such as poster contests and advertisements in in-flight and women's magazines.

"After the Fukushima nuclear accident, we conducted projects to meet the needs of the public in learning about radiation," said an official with the Atomic Energy Division of the science ministry. "Bidding is conducted based on established regulations, and we do not give priority to those organizations with retired bureaucrats."

However, one project in Hokkaido had a double involvement with retired officials.

In Horonobe in northern Hokkaido, a facility designed to educate the public about burying radioactive waste within an artificial barrier was built next to a larger center operated by the Japan Atomic Energy Agency (JAEA).

Construction on the facility started in fiscal 2008, and 910 million yen had been spent on the project by fiscal 2012.

The facility opened in April 2010 and will be completed this fiscal year.

Experiments at the facility are conducted jointly by the JAEA and the Radioactive Waste Management Funding and Research Center.

The research center has won contracts to build and manage the facility year after year because it has been the sole bidder.

But since there are no center employees at the Horonobe facility, the actual management work has been subcontracted to Tokyo-based Pesco Co.

Three former high-ranking officials of JAEA now work for Pesco, including the company president.

Why MOX so important is - (to Takahama)

June 17, 2013

Kepeco's MOX load to arrive June 27

by Eric Johnston

<http://www.japantimes.co.jp/news/2013/06/17/national/kepcos-mox-load-to-arrive-june-27/#.Ub8UvdhBpg4>

OSAKA – Two ships carrying uranium-plutonium oxide fuel for the Takahama nuclear power plant in Fukui Prefecture, will arrive on June 27 — the first batch of MOX to be sent to Japan since the Fukushima disaster in March 2011.

The controversial fuel is destined for reactor 3 at Kansai Electric Power Co.'s Takahama plant. But with the reactors still idle and stricter safety regulations taking effect next month, it's unclear how long the fuel might sit in storage. The Nuclear Regulation Authority still has to clear the plant before it can be restarted. The U.K.-registered Pacific Heron and Pacific Egret left France in mid-April with 20 MOX fuel assemblies. While Kepco and French nuclear firm Areva SA, which made the fuel, have not released figures, Greenpeace estimates the two ships are carrying about 10 tons of MOX, which is made with weapons-grade plutonium.

Kepco hopes to restart the units 3 and 4 after new regulatory standards take effect next month. The utility has said it won't restart them without approval from Fukui Gov. Issei Nishikawa, although it is not legally necessary.

That is not expected to be a huge political problem. Nishikawa is strongly pro-nuclear, but he has also said his judgment on giving the green light to restart reactor 3 and its new MOX fuel load will be based on the new regulatory standards.

For Takahama, the arrival of the MOX is seen as a critical step to economic recovery. About ¥4 billion, or nearly 55 percent of Takahama's fiscal 2013 budget, comes from nuclear-related subsidies provided by the central government. In past years, over 60 percent of its budget has come from such subsidies.

Over 40 local firms have contracts at the town's four nuclear power plants for a variety of goods and services. During regular inspections, which occur roughly once every 13 months, up to 2,500 of Takahama's 11,000 residents have been hired to help the inspectors, and the secondary economic impact on local stores and hotels, with their guests from Kepco and the central government, is huge.

Takahama estimates keeping just one reactor idle will cause an annual revenue loss of ¥500 million in subsidies and secondary economic benefits.

Nobody died because of Fukushima disaster

June 19, 2013

Meltdowns haven't killed anyone: LDP bigwig

by Reiji Yoshida

<http://www.japantimes.co.jp/news/2013/06/19/national/meltdowns-havent-killed-anyone-ldp-bigwig/#.UcHFXthBpg4>

Staff Writer

Liberal Democratic Party policy chief Sanae Takaichi has created a stir by saying the 2011 Fukushima meltdowns didn't kill anyone and arguing the government should restart reactors nationwide given Japan's scarce energy resources.

Delivering a speech in Kobe on Monday, Takaichi said the crisis at the Fukushima No. 1 plant "has not claimed the lives of any people," and argued the nation should "utilize nuclear power stations after securing the maximum possible safety."

No deaths have been confirmed to be directly related to the massive quantities of radioactive materials spewed from the Fukushima No. 1 plant's wrecked reactors since the March 2011 triple meltdowns.

However, hundreds of elderly people and hospitalized patients around the stricken complex were forced to evacuate because of the disaster, resulting in at least 70 deaths, according to the final report by the investigatory Diet committee on the crisis.

Takaichi's remarks were heavily covered in media reports, forcing Chief Cabinet Secretary Yoshihide Suga to try to defend her Tuesday by claiming certain parts of the speech were taken out of context.

"I saw the context, and I don't think it's a problematic remark," Suga told a news conference Tuesday. "It is true (the three meltdowns) did not kill anybody."

But when asked about the fatalities caused by the evacuation of elderly and hospitalized people, Suga admitted some of them had died and said "we recognize the vast damage."

"It's true some people died at evacuation places," Suga said.

The LDP-led government has pledged to reactivate nuclear plants across the country once their safety is confirmed, based on new regulation standards that are set to take effect in early July.

Nuclear activists have also criticized Prime Minister Shinzo Abe for helping Japanese firms to export nuclear power equipment and technologies at a time when all but two of the nation's reactors are still suspended in view of the Fukushima crisis.

Scientists, including those at the U.N., generally agree they are unlikely to find a significant statistical increase in deaths from cancers in the coming years from the nuclear crisis, given the relatively low radiation exposure of residents near Fukushima No. 1.

People's anger forces LDP policy chief to apologise

June 19, 2013

LDP's Takaichi retracts death toll comment after sparking anger in Fukushima

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201306190073>

THE ASAHI SHIMBUN

Amid calls for her resignation and growing outrage in Fukushima Prefecture, the ruling party's policy chief on June 19 apologized for saying the Fukushima nuclear disaster has not directly caused any deaths. "It was regrettable if people in Fukushima Prefecture felt bitter and were angry," Sanae Takaichi, chairwoman of the Liberal Democratic Party's Policy Research Council, told reporters at the LDP headquarters in Tokyo. "I will retract everything I said about the energy policy."

Politicians and families of people who died in the evacuation process described Takaichi's June 17 comment as insensitive, baffling and inaccurate.

Although the central government has defended Takaichi, the criticism has been so great that some members of the LDP want to limit her public appearances during the Upper House election in July.

Takaichi made the comment when she was arguing for the need to restart idle nuclear reactors during a meeting of the LDP's Hyogo prefectural chapter in Kobe.

"We are in a situation in which no one has ever been killed by an accident at a nuclear power plant (in Japan), including Tokyo Electric Power Co.'s crippled Fukushima No. 1 plant," she said.

Takaichi later said she wanted to emphasize that no one has died due to radiation exposure from the Fukushima disaster. But opposition party leaders said Takaichi was missing the point.

"Some people died due to stress during their prolonged stays at evacuation centers. It was undoubtedly caused by the nuclear accident," Goshi Hosono, secretary-general of the Democratic Party of Japan, told reporters on June 18. "Anyone who cannot accept the seriousness of such a situation has no right to manage things at the center of the government."

Mizuho Fukushima, leader of the Social Democratic Party, was more blunt.

"The LDP, which has promoted nuclear power, is most responsible for the Fukushima accident," she said. "(Takaichi's remark) was outrageous. She should resign her post as the policy chief."

And Toru Hashimoto, co-leader of the Japan Restoration Party, who himself has come under fire for his remarks about wartime "comfort women," said of Takaichi's comment, "It is wrong to judge the nuclear problem based on whether people died or not."

However, Chief Cabinet Secretary Yoshihide Suga on June 18 defended Takaichi's remark, saying, "Seen from the context, I don't think it so problematic."

Not all LDP members agreed.

The LDP's Fukushima prefectural chapter filed a protest to the party headquarters on June 19, demanding Takaichi retract her remark and apologize.

Takao Hiraide, secretary-general of the chapter, said the previous day: "With many prefectural citizens having died during the evacuation, their relatives are heartbroken. Takaichi's remark was truly regrettable."

A Lower House member who belongs to the LDP chapter was furious and bewildered. "With the central government and the LDP saying they would stay close to the pain in the disaster-stricken areas, what she said goes exactly against it."

According to Fukushima Prefecture, 1,415 residents in the prefecture have died during the forced evacuation or after they were relocated since the Great East Japan Earthquake and tsunami triggered the nuclear disaster in March 2011.

About 160,000 people in the prefecture still live in evacuation.

Forty patients at Futaba Hospital in Okuma, about 4 kilometers from the crippled plant, had died by the end of March 2011 during the chaos in the evacuation process.

"(Takaichi's) comment tramples on the feelings of people in Fukushima," said a resident whose family member was one of the Futaba patients who died. "I was unhappy about (Prime Minister Shinzo) Abe's plans to restart nuclear reactors, and I cannot stand his subordinate's remark, too."

Relatives of several patients who died in the evacuation sued TEPCO earlier this month, arguing that the deaths were caused by the accident.

In addition, some residents are still suffering from anxiety after being temporarily evacuated to an area with high radiation levels due to the government's failure to release predictions on the spread of radioactive materials immediately after the accident.

Tamotsu Baba, mayor of Namie, which was designated as a no-entry zone after the accident, said Takaichi displayed a lack of sensitivity to the continuing plight of the affected residents.

"It was an outrageous comment, given that town residents are living hard lives and were scattered in the evacuation," he said. "I am afraid that memories of the accident seem to be fading."

The LDP, currently well ahead of other parties in opinion polls, plans to include the resumption of nuclear power operations in its platform for the Upper House election.

Yoshimi Watanabe, who heads Your Party, said Takaichi's comment "showed one aspect of the LDP's intoxication caused by the high support rates."

However, many LDP members have expressed concerns that Takaichi's remark could hurt the party in the election and fuel opposition to its plan to restart nuclear reactors.

"I don't want Takaichi to make a campaign speech," a senior LDP official said.

Abe plans to visit Fukushima Prefecture on June 30 for the third time.

June 20, 2013

LDP policy chief retracts Fukushima comments

by Reiji Yoshida

Staff Writer

<http://www.japantimes.co.jp/news/2013/06/20/national/ldp-policy-chief-retracts-fukushima-comments/#.UcK2RthSb9k>

Facing flak from both the opposition — and her own party — Sanae Takaichi, policy chief for the ruling Liberal Democratic Party, retracted earlier remarks that no one was killed in the 2011 Fukushima meltdowns and that the government should restart reactors nationwide.

Takaichi told reporters Wednesday that she would retract all of the remarks she made Monday during a speech in Kobe, adding that it was up to Prime Minister Shinzo Abe to decide her fate.

Abe, who was later briefed on the matter during his diplomatic trip in Europe, said he would keep Takaichi in the position, but warned her against making remarks "that could cause misunderstandings," Chief Cabinet Secretary Yoshihide Suga said.

Abe and Suga have apparently rushed to stave off any political damage from the controversial remarks ahead of a critical Upper House election next month.

In the wake of Takaichi's comments, Suga contacted her several times to discuss the matter, a government source said.

"It's true (her words) caused misunderstanding," Suga said. "A politician should be careful not to make any remarks that could lead to misunderstandings."

No deaths have been confirmed to be directly related to the massive amount of radioactive materials spewed from the Fukushima No. 1 plant's wrecked reactors since the March 2011 triple meltdowns. However, the hasty evacuation of elderly and hospitalized patients resulted in at least 70 deaths, and many other evacuees from Fukushima Prefecture died at shelters or killed themselves after the meltdowns.

Earlier the same day, the LDP's Fukushima prefectural chapter submitted a letter of protest to party headquarters in Tokyo, saying Takaichi had ignored those victims as well as numerous Fukushima residents still unable to return to their hometowns because of dangerous levels of radiation.

Abe's Cabinet has urged party executives and Cabinet ministers in particular to avoid any gaffes that could hurt their electoral chances since his first Cabinet in 2006 and 2007 suffered political setbacks after a rash of ministerial scandals.

LDP policy chief apologizes for remarks on nuclear disaster

<http://mainichi.jp/english/english/newsselect/news/20130619p2g00m0dm094000c.html>

TOKYO (Kyodo) -- The policy chief of Prime Minister Shinzo Abe's Liberal Democratic Party apologized Wednesday over her remarks that drew criticism for making light of the 2011 Fukushima nuclear disaster.

"I retract (the remarks) and offer my apology," said Sanae Takaichi, who said on Monday that Japan should keep using atomic power while pointing out there was no death directly linked to the crisis.

The remarks sparked criticism from both ruling and opposition camps with the opposition parties urging her to resign as LDP policy chief and a lawmaker.

Takaichi told reporters at the party's headquarters that she has left the decision of whether she should resign as the LDP policy chief to "the hands of Prime Minister Shinzo Abe."

Chief Cabinet Secretary Yoshihide Suga said at a press conference that Abe wants Takaichi to stay on as policy chief, given that she has already backtracked on her remarks and apologized.

"The prime minister told me over the phone that he wanted Ms. Takaichi to be careful about what she says, and continue to soundly fulfill her role as policy chief. And I told her about that," Suga said.

The row over her remarks, however, could negatively affect Abe's position for restarting nuclear power reactors, most of which remain offline nationwide due to safety concerns.

In a speech in Kobe on Monday in which she called for the resumption of atomic power generation in Japan, Takaichi said, "No one has died" in the crisis following the March 2011 earthquake and tsunami in eastern Japan, adding, "So, we have little choice but to utilize (nuclear reactors) while ensuring maximum safety."

After facing fierce criticism, Takaichi tried to clarify her remarks Tuesday, saying, "My way of phrasing things was bad." But On Wednesday, she even faced protest from a Cabinet member.

"I'm very angry," Masako Mori, minister in charge of declining birthrate, told reporters after meeting with Takaichi. Mori, a House of Councillors member, is elected from Fukushima Prefecture.

The LDP chapter in Fukushima submitted a letter of protest to the party's leadership, saying Takaichi "is not fully aware of the current situation in Fukushima and lacks consideration" for people affected by the crisis.

The letter also noted many people remain evacuated due to radiation fears, and that more than 1,400 people have died for reasons related to the disaster, including those who committed suicide due to negative mental health.

Radiation fears forced more than 150,000 people to flee their homes in Fukushima Prefecture as of May, the government said, while seriously damaging farming and fisheries industries in surrounding areas.

LDP politician apologizes for Fukushima remarks

http://www3.nhk.or.jp/nhkworld/english/news/20130619_24.html

A high-ranking member of Japan's ruling party has apologized for remarks she made about victims of the nuclear crisis at the Fukushima Daiichi nuclear plant.

In a speech in Kobe on Monday, policy chief of Liberal Democratic Party Sanae Takaichi suggested that no one was killed by the nuclear disaster in Fukushima. She added that Japan should restart its idled nuclear plants while ensuring their safety.

The remarks caused a backlash from within the LDP. The secretary general of the party's Fukushima chapter, Takao Hiraide, visited LDP headquarters in Tokyo on Wednesday.

He said more than 1,400 people in the prefecture have been recognized as having died as a result of the disaster. They include people who died because of the stresses of evacuation and those who killed themselves due to anxiety.

Hiraide said Takaichi's remarks are inappropriate and that they lack consideration for the people of Fukushima. He submitted a letter demanding her to withdraw the remarks and apologize to residents.

Takaichi later told reporters that she retracts the remarks. She added that she regrets if her remarks caused people to suffer or feel anger. She apologized for offending residents and LDP members who are devoting themselves to reconstruction efforts.

LDP policy chief clarifies remarks on nuclear disaster

<http://mainichi.jp/english/english/newsselect/news/20130619p2g00m0dm047000c.html>

TOKYO (Kyodo) -- Sanae Takaichi, policy chief of Prime Minister Shinzo Abe's Liberal Democratic Party, on Tuesday tried to clarify her earlier remarks that drew criticism for seeming to make light of the nuclear disaster at the Fukushima Daiichi power plant in 2011.

In a speech in Kobe on Monday in which she called for the resumption of atomic power generation in Japan, where most reactors remain offline due to safety concerns, Takaichi said, "No one has died (in nuclear power plant accidents) including the Fukushima plants which suffered devastating explosions" after the March 2011 earthquake and tsunami in eastern Japan.

"So, we have little choice but to utilize (nuclear reactors) while ensuring maximum safety," she added.

Takaichi told reporters Tuesday, "If I have caused misunderstanding, it may be that my way of phrasing things was bad."

"I am aware that there are people who died due to poor health (after the disaster), even if it was not actually caused by radiation exposure, and others who killed themselves after losing their jobs and livelihood," she said.

Takaichi added she is not supporting the restart of nuclear power generation simply because there had been no deaths in the Fukushima plant disaster.

Radiation fears forced some 150,000 people to flee their homes in Fukushima Prefecture as of May, according to the government. The crisis has also seriously damaged farming and fisheries businesses in surrounding areas.

Takaichi's remarks sparked criticism from opposition parties, as well as from some lawmakers within the LDP and government.

"I believe politicians must be very careful with their own words so to avoid causing misunderstandings," Chief Cabinet Secretary Yoshihide Suga told reporters.

But the top government spokesman also defended Takaichi, saying that some media reports had played up her remarks without taking the context into account.

June 19, 2013(Mainichi Japan)

Meanwhile "the agonies of Fukushima continue"

June 19, 2013

VOX POPULI: Shameful selective memory regarding nuclear power issue

<http://ajw.asahi.com/article/views/vox/AJ201306190034>

A farmer who grew organic vegetables in Sukagawa, Fukushima Prefecture, hanged himself just 13 days after the onset of the disaster at the Fukushima No. 1 nuclear power plant.

The man left behind more than 7,500 heads of cabbage that he painstakingly grew. The nuclear disaster occurred just as the cabbages were ready for harvest.

The farmer's bereaved family demanded compensation from the plant operator, Tokyo Electric Power Co., through the nuclear damage claim dispute resolution center set up by the government. The two sides are expected to reach a settlement soon. I found the following words from the farmer's 37-year-old son, Kazuya Tarukawa, striking: "We filed a claim not because we wanted money, but because we wanted to stop (TEPCO and the government) from saying the nuclear accident caused no deaths."

I think Tarukawa spoke his true feelings.

I don't know whether she knew of the plight of the cabbage farmer or not, but on June 17, Sanae Takaichi, who chairs the Liberal Democratic Party Policy Research Council, said, "This is not a situation in which the accident caused deaths." She made the remark in connection with plans to restart nuclear power plants that have been idle since the disaster. I wonder which of the remarks can win public understanding.

The problem is not Takaichi's alone. **The Abe administration's inclination to go back to nuclear power generation is made up of the three arrows of "taking advantage of confusion," "leaving questions unanswered" and "chipping away at barriers."** With those in the business world acting as cheerleaders, the administration is moving little by little toward its goal of restarting idled nuclear reactors while hiding and giving a glimpse of its true intent. Meanwhile, the Prime Minister Shinzo **Abe is traveling overseas as the top salesman of Japanese nuclear technology.**

A newly approved white paper on energy makes no reference to the proposal made by the Democratic Party of Japan-led government last year to phase out nuclear power generation.

The white paper reflects a drastic "changing of the times." Many people will be surprised to hear that the government has not taken down its banner of "moving away from dependence on nuclear power."

Before we knew it, the focus of politics shifted to the economy, overshadowing the nuclear power issue. **But the agonies of Fukushima continue. Despite this fact, politicians are starting to speak about the continuing aftereffects of the March 11, 2011, Great East Japan Earthquake in the past tense.** The Upper House election is quickly approaching. Let us carefully examine what is going on in this current political climate.

"The problem is that (scandals) crop up one after another"

June 20, 2013

TEPCO withheld data on contaminated well water for weeks

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201306200076>

THE ASAHI SHIMBUN

After finding tritium levels higher than the safety standard in well water at the crippled Fukushima No. 1 nuclear power plant, Tokyo Electric Power Co. withheld the information from the public for nearly three weeks.

The company on June 19 disclosed that 500,000 becquerels of tritium per liter of water, eight times the legal limit, were detected. It also said that 1,000 becquerels of strontium, 30 times the legal limit, were detected.

TEPCO began taking water samples from the well on the sea side of the turbine buildings for the No. 1 and No. 2 reactors on May 24.

Analysis results about tritium were conveyed to plant officials on May 31 and shared within the company on June 14.

A TEPCO official said the announcement was not made until June 19 because additional analyses were carried out as there had been problems in past measurements.

The official also said the company waited until June 18 to see analysis results about strontium, which were due that day.

But on June 14 the utility already began considering measures to prevent water from flowing into the sea under the ground.

The well, 27 meters from the sea, is close to a water intake system of the No. 2 reactor, an area from which highly radioactive water leaked into the sea in April 2011.

TEPCO suspects that the contaminated water spread underground at the time and later flowed into the well, one of the three it dug in November and December.

The company plans to dig four wells nearby to investigate the situation and also inject an agent into the ground along the coast to prevent contaminated water leaking into the sea.

The discovery of high levels of strontium and tritium is expected to delay TEPCO's plan to pump groundwater at the plant and release it into the sea to slow an increase in radioactive water.

Kazunori Endo, of the Soma-Futaba fisheries cooperative in Fukushima Prefecture, said he was exasperated with the series of problems of contaminated water at the plant.

Members of his cooperative are opposed to the plan to dump groundwater into the sea, although TEPCO said the water contains lower levels of radioactivity than nearby rivers.

The opposition grew after June 3 when TEPCO said that radioactivity levels in the water were higher than initially reported due to a mistake in measurements.

"The problem is that (scandals) crop up one after another," Endo said. He added that TEPCO must solve the latest problem before trying to release groundwater into the sea.

Members of his cooperative have been preparing to resume full-scale operations along the prefectural coast following the March 2011 nuclear disaster.

Akio Komori, a TEPCO managing executive officer, visited the Fukushima prefectural government office on June 19 to apologize for the high levels of strontium and tritium.

Tetsuya Hasegawa, head of the living environment department, asked Komori to identify the cause of high radioactivity levels, investigate the environmental impact and prevent the spread of contaminated water.

“It was regrettable that (radioactive water was found) at a time when we are calling for all possible measures,” he said.

Fukushima Governor Yuhei Sato told senior prefectural officials on June 19 to enhance monitoring of any effects of radioactivity in the ocean.

“We have repeatedly told TEPCO to take thorough precautions against contaminated water,” Sato said. “(The latest discovery) was regrettable.”

Insincere and too smug

June 42, 2013

EDITORIAL: Kansai Electric should lose its smug attitude

<http://ajw.asahi.com/article/views/editorial/AJ201306240044>

The only nuclear reactors currently operating in Japan are at Kansai Electric Power Co.’s Oi plant in Fukui Prefecture. The Nuclear Regulation Authority (NRA) has decided to allow their continued provisional operations until September, when they are shut down for regular inspections.

The government decided on June 19 that the new safety standards for nuclear power plants will be enforced on July 8. Essentially, the operations of the two reactors at the Oi plant should be suspended before the new standards take effect. However, the NRA will likely judge that the two reactors largely meet the new safety standards.

The NRA apparently will take a realistic approach based on an examination of “whether the two reactors have problems that are big enough to suspend operations” before peak electricity consumption in summer. The nuclear watchdog seems to have made efforts to see whether the two reactors are meeting the new safety standards.

However, we disagree with the NRA’s expected approval of the continued operations because it has not reached a conclusion on experts’ indication that an active fault lies directly below an important facility of the Oi plant.

If the NRA concludes there is an active fault or faces some other serious problems, it should immediately suspend the reactor operations even before the regular inspections start.

NRA Chairman Shunichi Tanaka has clearly said as much. As a matter of course, postponed decisions on serious issues cannot be tolerated in any official examination for the Oi and other nuclear plants concerning the new safety standards.

What is more problematic than the NRA is Kansai Electric’s insincere attitude.

The NRA's evaluation report criticized Kansai Electric, saying, "(The utility) looked as if it were trying to find the lowest possible bar to clear the new safety standards by proposing safeguard measures by piecemeal."

Kansai Electric's geological surveys made little progress. As a result, no data were available to see whether the fault running below the key facility is active.

To evaluate the quake-resistance capabilities of the Oi plant, the NRA asked Kansai Electric to consider a case in which three active faults running near the plant's site move together. However, the utility resisted the request for more than one month.

Kansai Electric appeared firmly convinced from the first that it would be impossible for the NRA to halt operations of the two reactors at the Oi plant. The company does not seem to be putting a top priority on safety. **If the utility continues to take such an attitude, it is not qualified to operate nuclear power plants.**

Electric power companies have used their detailed technological knowledge to conveniently manipulate regulation authorities in certain aspects related to the safety of nuclear power generation. Kiyoshi Kurokawa, chairman of the Diet's Fukushima Nuclear Accident Independent Investigation Commission, said regulation authorities have become "captives" of electric power companies. He pointed out that supervisory functions over nuclear power plants have collapsed in Japan.

The NRA is at least trying to reflect on such a system. Electric power companies must abandon their old ways of thinking, fully cooperate with the NRA and change their attitudes to ones that secure the highest level of safety.

The public is still taking a strict view of electric power companies. Those companies should understand the realities surrounding them and reflect seriously on their attitudes.

TEPCO's staffing concerns

June 19, 2013

Tepco minutes reveal staff exodus concerns

Top executives fretted over future as pay cuts caused workers to bolt

by Tsuyoshi Inajima and Yuji Okada
Bloomberg

<http://www.japantimes.co.jp/news/2013/06/19/business/tepco-minutes-reveal-staff-exodus-concerns/#.UcCN3NhBpg4>

Tokyo Electric Power Co. executives spent dozens of meetings fretting about the utility's future as hundreds of younger employees quit over salary cuts after the Fukushima No. 1 reactor meltdowns, according to minutes obtained by Bloomberg News.

“The company could quickly deteriorate” as workers leave at “a rapidly accelerating rate,” an unidentified executive said at an Oct. 4 meeting last year of the government-backed fund designed to bail out Tepco, which faces an estimated ¥11 trillion in cleanup costs from the nuclear crisis.

The comments are in redacted proceedings of 23 meetings of the fund’s steering committee from Oct. 3, 2011, to this April 8, obtained through a freedom of information request.

Almost 1,200 employees voluntarily resigned in the two years that ended in March, Tepco Managing Executive Officer Mamoru Muramatsu said in an April 8 meeting, according to the minutes. Turnover among employees under 30 accounted for about half of all voluntary departures, Tepco President Naomi Hirose said at a Nov. 12 meeting.

“The biggest reason is money,” Hirose said, according to the minutes. “It’s difficult for us to stop them when they say they have loans and have to take care of kids and so on.”

The notes offer the first full view of the committee’s operations and talks among senior officials involved in the utility’s revival following the March 2011 meltdowns at its Fukushima No. 1 plant. The workings of the committee are contained in 227 pages, parts of which mask most attendants’ names and agenda items deemed too sensitive to be made public, according to a letter provided by the Nuclear Damage Liability Facilitation Fund to Bloomberg as part of the request.

The utility cut annual salaries by 25 percent for managers and 20 percent for workers under its turnaround plan released in May last year. The average annual salary of Tepco employees over the three years ending in March 2015 will be reduced to ¥5.9 million, the utility said in a July 25 statement.

Motivation among remaining Tepco employees may flag because of uncertainty about how much of the Fukushima cleanup costs the company will be required to shoulder, three unidentified attendants of the Oct. 4 meeting said, according to the minutes.

Tepco, which has accumulated ¥2.7 trillion in combined losses for the past three fiscal years, had a workforce of 48,757 on a consolidated basis as of March 31, down about 5,300 from the beginning of fiscal 2011, it said in a May 9 statement.

Kansai Electric Power Co. and Chubu Electric Power Co., Japan’s second- and third-biggest utilities by generating capacity, added workers in the two fiscal years to March 31, 2012, according to data compiled by Bloomberg. Kepeco’s workforce expanded 2.7 percent to 32,961, while Chubu Electric’s rose 2.3 percent to 29,774.

Tepco had around 3,000 workers at its Fukushima No. 1 plant and 1,300 at its No. 2 plant as of early June, spokeswoman Kaoru Suzuki said, adding that staffing fluctuates depending on operations.

Peak staffing after the disaster started totaled 4,000 at the Fukushima No. 1 complex and 2,250 at the No. 2 power station. Tepco has secured enough workers to continue operations at the two plants for the time being, she said.

Bullet point summaries covering the major topics discussed by the steering committee have been released previously, but not the full minutes.

Members of the state-backed damage liability fund's steering committee include Central Japan Railway Co. Chairman Yoshiyuki Kasai, former Dowa Holdings Co. Chairman Hirokazu Yoshikawa and Tadashi Maeda, a senior official at the Japan Bank for International Cooperation.

In addition to staffing concerns, discussions related to the size of the Tepco's cleanup bill for the Fukushima meltdowns arise frequently in the minutes.

Final costs associated with Fukushima are unknown because decontamination projects are at an early stage, meaning the time isn't right to request additional aid from the government, an unidentified source said during meeting last Nov. 12 of the steering committee, after the utility sought state support.

"The biggest concern is that the company will collapse if we wait until the cost is fixed," Takashi Shimada, a former senior official at the Ministry of Economy, Trade and Industry who is now an executive officer at Tepco, said in response, according to the minutes.

The government should review the structure under which Tepco must pay all decontamination costs, Shimada said at the time.

Tepco had paid ¥2.21 trillion in compensation by late April, it said in an April 30 statement. The utility asked the government's bailout fund to increase compensation aid by ¥666 billion to ¥3.79 trillion on May 31 after revising for a fourth time its estimate on compensation payments to those affected by the disaster.

The March 11, 2011, quake and tsunami shattered the Fukushima No. 1 plant, causing three of its reactors to suffer core meltdowns, forcing around 160,000 people to evacuate the ensuing radioactive fallout and leaving some areas uninhabitable for decades. The catastrophe also led to the eventual halt of all the

nation's nuclear reactors, only two of which have been restarted, effectively shutting down a critical energy source that once supplied more than a quarter of Japan's electricity.

More than ¥10 trillion will be needed to pay compensation to those affected by the nuclear crisis and to clean up areas contaminated by radioactive substances from the Fukushima No. 1 plant, Tepco estimated Nov. 7 in a two-year business plan. Decommissioning the smashed reactors of the Fukushima No. 1 facility may "far exceed" the ¥1 trillion allocated by Tepco, it said at the time.

The government should "promptly consider establishing a new support framework to handle the huge amount of financial risk that exceeds the limit under the Nuclear Damage Liability Facilitation Fund Law and the cost of decommissioning of the reactors," Tepco said at the time.

Asimo kin to probe plant

Kyodo

Tokyo Electric Power Co. said Monday it will conduct a probe at its crippled Fukushima No. 1 nuclear plant with a remote-controlled robot that uses technology originally developed for Honda Motor Co.'s Asimo humanoid robot.

The new robot, jointly developed by Honda and the National Institute of Advanced Industrial Science and Technology, will be sent into the reactor 2 building Tuesday to check the radiation level and condition of high areas on the first floor.

The robot has an arm with 11 joints and it can examine areas as high as 7 meters even in a narrow space using a zoom camera, laser range finder and dosimeter at the tip of the arm.

In developing the robot, Honda said it has applied technologies used for the Asimom, including a system that enables simultaneous control of multiple joints.

The outcome of the probe is expected to be used for the planning of cleaning the radiation-contaminated building. Tepco is also considering using the robot to check the inside of other damaged buildings.

The utility plans to decommission reactors 1 to 4 when the process can be safely accomplished. The work is expected to take decades.

TEPCO tries do dismiss US sailors lawsuit

June 23, 2013

Tepco seeks dismissal of damages suit filed in U.S.

<http://www.japantimes.co.jp/news/2013/06/23/national/tepco-seeks-dismissal-of-damages-suit-filed-in-u-s/#.UcYRUdhSb9k>

LOS ANGELES – Kyodo

Tokyo Electric Power Co. has filed to dismiss a lawsuit in which around 50 plaintiffs are seeking damages from the utility in connection with the Fukushima nuclear crisis.

The plaintiffs, including U.S. sailors dispatched to northeastern Japan for the relief operation following the March 11, 2011, earthquake and tsunami, are seeking damages without fixing the price.

They are also demanding that Tepco set up a fund worth at least \$1 billion for medical checks and treatment, arguing they faced risks of cancer and radiation exposure.

In a statement submitted Friday to the U.S. federal court in San Diego, the operator of the crippled Fukushima No. 1 power plant argued **the plaintiffs have not clarified what actually caused damage to their health and the suit should be filed in Japan**, site of the nuclear crisis.

The original group of plaintiffs sought \$110 million in damages when they filed the lawsuit Dec. 21. They changed their demands later, while the number of plaintiffs has since grown to include other U.S. military personnel and families.

The U.S. armed forces conducted the relief operation known as Operation Tomodachi in hard-hit coastal areas in coordination with the Self-Defense Forces.

Secret promises to US

June 25, 2013

Japan made secret promise with U.S. to restart pluthermal nuclear program

<http://mainichi.jp/english/english/newsselect/news/20130625p2a00m0na006000c.html>

A Japanese prime ministerial envoy secretly promised to the United States that Japan would resume its controversial "pluthermal" program, using light-water reactors to burn plutonium, according to documents obtained by the Mainichi.

The secret promise was made by Hiroshi Ogushi, then parliamentary secretary of the Cabinet Office, to Daniel Poneman, deputy secretary of the U.S. Department of Energy, during Ogushi's visit to the United States on behalf of then Prime Minister Yoshihiko Noda in September last year.

The revelation comes as Japan's pluthermal project remains suspended in the wake of the Fukushima No. 1 Nuclear Power Plant disaster due to safety concerns. The fact that a Japanese official promised to the U.S. to implement such a controversial project without a prior explanation to the Japanese public is expected to stir up controversy.

According to the official documents obtained by the Mainichi, upon being pressed to reduce the amount of plutonium in Japan that could be diverted to military use, Ogushi told Poneman that Japan would burn plutonium in plutonium-thermal (pluthermal) reactors. The then ruling Democratic Party of Japan (DPJ) was in the final stages of formulating its nuclear energy policy at the time.

Under the pluthermal plan, spent nuclear fuel generated in light-water reactors is reprocessed to extract plutonium, which is then mixed with uranium to create mixed-oxide (MOX) fuel for use in power generation. However, many experts have raised questions about the program, citing its high costs and the risks posed by the fuel's comparatively low melting point and the decreased effectiveness of control rods. The plan to burn plutonium in conventional reactors was introduced in 2009 because there were no prospects for putting the Monju prototype fast-breeder reactor into practical use.

The documents that the Mainichi obtained are a compilation of cables recording the Ogushi-Poneman talks in the U.S. on Sept. 12 last year. During the meeting, Ogushi explained that Japan would inject all available policy resources to break away from nuclear power generation in the 2030s, that it would steadfastly promote the nuclear fuel cycle program in the medium and long term, and that Japan would end research on the Monju reactor after confirming its achievements. The explanation was in accordance

with the government's Innovative Strategy for Energy and the Environment, which was finalized on Sept. 14.

The promotion of a nuclear fuel cycle implies extraction of plutonium from spent nuclear fuel at the Rokkasho Reprocessing Plant in Aomori Prefecture. But Japan's "zero nuclear power" policy and the suspension of the Monju reactor could leave the nation without a facility to burn plutonium. Poneman expressed concern that this would create a situation in which plutonium could be diverted to military use. In response, Ogushi promised the continuation of the pluthermal program to burn plutonium in light-water reactors.

During an interview with the Mainichi, Ogushi declined to reveal the details of the meeting, saying, "I can't disclose whom I met from a diplomatic standpoint." He added that he didn't remember the pluthermal issue.

The Innovative Strategy for Energy and the Environment states that "nuclear reactors whose safety has been confirmed will be utilized," but contains no reference to pluthermal plans.

Yukio Edano, a House of Representatives legislator who was serving as economy, trade and industry minister at the time, defended Ogushi, saying Japan had made no distinction between pluthermal and conventional reactors that were to be operated. There were no such micro-level talks in the Energy and Environment Council. I would have given the same answer (if I had visited the U.S.)."

The current administration led by Prime Minister Shinzo Abe also upholds a policy to resume the pluthermal program, according to documents obtained by the Mainichi that were produced by the Ministry of Economy, Trade and Industry on March 1 and submitted to minister Toshimitsu Motegi. The documents clearly state that the government will "promote the use of MOX fuel in light-water reactors (pluthermal) after reprocessing (nuclear fuel) at the Rokkasho Reprocessing Plant." Based on the content of the documents, Motegi stated at a lower house Committee on Economy, Trade and industry session on March 22, "We will steadily promote the pluthermal plans."

Despite the country not knowing which nuclear reactors will be authorized to resume operations following the July implementation of the new regulatory standards, the government has been pushing ahead with its plans to restart the controversial pluthermal program.

"It is abnormal for sure," said one official with the Agency for Natural Resources and Energy. "But it can't be helped if the Rokkasho plant is to be put into operation."

Kansai Electric chastened?

June 24, 2013

Kansai Electric responds to NRA's decision

http://www3.nhk.or.jp/nhkworld/english/news/20130624_24.html

A senior official at the operator of the Ohi plant said he felt humbled by the Nuclear Regulation Authority's decision to allow the 2 reactors to stay online.

Shigeki Otsuka from the Kansai Electric Power Company said the company would not merely meet the demands of the authority, but would go further by aiming for a world-class level of safety.

The authority had earlier criticized the utility for proposing safety measures in a piecemeal fashion, as if trying to find the minimum line to be cleared to meet new safety standards that take effect in July.

Otsuka says his company had no such intention. But he added that it would take the criticism seriously in an effort to do even better.

But TEPCO is not convinced...

June 26, 2013

Utilities unreceptive to shareholders' proposals to phase out nuclear power

<http://mainichi.jp/english/english/newsselect/news/20130626p2a00m0na008000c.html>

Proposals to phase out nuclear power were rejected at general shareholders' meetings held at nine of the country's 10 utilities on June 26.

With Japan's new nuclear standards set to take effect July 8, and the government's enthusiasm for resuming operations of idled nuclear reactors around the country, Hokkaido Electric Power Co., Kansai Electric Power Co., Shikoku Electric Power Co. and Kyushu Electric Power Co. have also voiced a willingness to restart their reactors at an early date.

As Tokyo Electric Power Co. (TEPCO) shareholders arrived at a gymnasium in Tokyo's Shibuya Ward where the shareholders' meeting for the operator of the stricken Fukushima No. 1 nuclear plant was to take place, they were welcomed by anti-nuclear activists holding placards.

"Abandonment of nuclear power is the will of the people. Since there have been changes in the (board) membership, I have some hope," said 60-year-old Yui Kimura, who heads the civic group Nuclear Phase-Out TEPCO Shareholder's Movement.

Individual stockholder Kenji Furuhashi, 34, said he took the day off of work to participate in the meeting. "I want to feel the passion of people who are against nuclear power, and listen to the voices of people from the disaster areas," he said. "I want the company to move in the direction of eliminating nuclear power."

Inside, TEPCO President Naomi Hirose opened the meeting at 10 a.m. by reiterating his intention to devote energy to bringing the disaster under control and rebuilding Fukushima Prefecture.

"We will continue to deal responsibly in compensating victims of the Fukushima No. 1 Nuclear Power Plant accident and the long-term decommissioning process of the reactors," he said.

Meanwhile, outside the site of Kansai Electric's shareholders' meeting, anti-nuclear civic groups held banners calling for "non-nuclear management," and passed out flyers to shareholders walking in demanding that Oi Nuclear Power Plant be stopped and that operations at Takahama Nuclear Power Plant remain halted.

Inside, Kansai Electric President Makoto Yagi reemphasized his plan to move toward reactivation of idle reactors, saying, "We're in a serious crunch in terms of power supply and revenue, seeing as we don't know when reactors, with the exception of Oi Nuclear Power Plant's No. 3 and No. 4, can be reactivated."

There were a record 15 proposals from shareholders at the TEPCO meeting, including proposals to abandon the Fukushima No. 2 and Kashiwazaki-Kariwa nuclear power plants. The Tokyo Metropolitan Government, a major TEPCO shareholder, proposed improving management transparency through measures such as the release of balance statements for each power plant.

With the exception of Hokuriku Electric Power Co.'s shareholders' meeting, some shareholders submitted proposals for the utilities to pull out of nuclear power and abandon reactivation. The Osaka Municipal Government, a shareholder at Kansai Electric, proposed a "swift abolition of nuclear plants." It is highly likely such proposals will be rejected, however, as utilities have already expressed objections.

Thermal power generation to compensate for the long-term halt of the country's nuclear reactors has raised fuel costs, resulting in consolidated losses for eight utilities -- the exception being Hokuriku Electric -- for the financial year ending in March 2013. The utilities, save for TEPCO and Hokkaido Electric, proposed dipping into cash reserves set aside for harsh financial situations, and of these, Tohoku Electric Power Co., Shikoku Electric, and Kyushu Electric proposed using their entire reserves.

The utilities all apologized to their shareholders for their declining performance, and sought their understanding for rising power bills and management's improvement efforts.

Protesters gathered at other meeting sites as well, including at Tohoku Electric and Hokkaido Electric, where anti-nuclear shareholders called on fellow shareholders to push for nuclear abandonment.

Shareholders also argued about the Hamaoka nuclear plant at the Chubu Electric Power Co. shareholders' meeting in Nagoya's Higashi Ward.

"If the national government were willing to offer assistance for the public to become energy self-sufficient, we could go without nuclear power," a 62-year-old woman from Nagakute, Aichi Prefecture, said.

A 76-year-old man from Nishio, Aichi Prefecture, meanwhile said, "The Hamaoka nuclear plant is still serviceable for years. It would be a waste not to use it."

Antinuke shareholders voted down

June 27, 2013

Utility shareholders reject all anti-nuke proposals

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201306270053>

THE ASAHI SHIMBUN

Shareholders of eight regional utilities voted down all anti-nuclear proposals on June 26, including those calling for the suspension or decommissioning of reactors or withdrawal from the fuel recycling program.

Nine regional utilities that operate nuclear plants held shareholders' meetings on June 26.

The 72 proposals, submitted by anti-nuclear shareholders, won support from a number of prefectural and municipal governments that own shares in the electric power companies.

But they were rejected by other shareholders, such as banks and businesses dealing with the utilities. The companies' managements were opposed to the proposals.

Support from at least two-thirds of shareholders is required for a proposal to be adopted.

At the shareholders' meeting of Tokyo Electric Power Co., operator of the crippled Fukushima No. 1 nuclear power plant, the Fukushima prefectural government for the first time supported a proposal calling for the decommissioning of the nearby Fukushima No. 2 plant.

Tohoku Electric Power Co. operates the Higashidori nuclear plant in Aomori Prefecture and the Onagawa nuclear plant in Miyagi Prefecture.

At the company's meeting of shareholders, the Aomori city government and the Misato town government in Miyagi Prefecture backed a proposal calling for the decommissioning of these plants.

The Osaka city government, the top shareholder of Kansai Electric Power Co., demanded that the company abolish nuclear reactors as soon as possible.

The Tokyo metropolitan government, which owns shares in TEPCO, called for enhanced transparency in management.

No anti-nuclear proposal was submitted at Hokuriku Electric Power Co.'s shareholders' meeting.

Executives of the nine utilities told shareholders they plan to restart idle reactors as soon as possible.

Kansai Electric, Hokkaido Electric Power Co., Shikoku Electric Power Co. and Kyushu Electric Power Co. plan to apply to the Nuclear Regulation Authority for restarting 12 reactors soon after new safety standards take effect on July 8.

The nation's 50 nuclear reactors were taken offline after the Fukushima nuclear disaster in March 2011. Only two of them have been brought back online.

Ryuichi Kino on TEPCO (concealing information)

June 26, 2013

Fight to get Tepco, state to come clean lives on

Late lawyer-journalist's right-to-know push continues

by Keiji Hirano
Kyodo

<http://www.japantimes.co.jp/news/2013/06/26/national/fight-to-get-tepco-state-to-come-clean-lives-on/#.UcqNhthSb9k>

Freelance journalist Ryuichi Kino started attending press briefings at Tokyo Electric Power Co. shortly after the nuclear crisis erupted at its Fukushima No. 1 complex in March 2011, knowing that it was an event of world significance.

"I knew I would regret it if I missed covering an incident like this making world history," he said.

It was not long, though, before he began to suspect the utility was not coming clean, a view shared by an old friend he bumped into at the briefings, Kazuo Hizumi, who operated an online news site while working as a lawyer.

Kino, 47, recalls Hizumi telling him, "We need to do something."

"I myself took offense at that time at Tepco's reluctance to properly disclose necessary information," Kino said.

Prompted by urgent concerns that people would remain uninformed amid the massive disaster, the two worked together on a book — "News Conference on the Fukushima Nuclear Disaster: What Did Tepco and the Government Conceal?" Released in January 2012, the book detailed the exchanges at press briefings in an effort to show that both the utility and the government fell short of disclosing information in the public's interest.

Five months later, on June 12, Hizumi succumbed to cancer at the age of 49.

More than a year after his death, those close to Hizumi are continuing his struggle to press for the public's right to know.

Kino, who has continued to attend Tepco news conferences, recently published a sequel to the duo's first trove.

"I know what Mr. Hizumi wanted to achieve, although he was compelled to leave unfinished business," he said.

"He must have thought he himself should continue attending the briefings to seek more detailed information. . . . I think he pushed me to write the second book," he added.

Both books were published by Iwanami Shoten Publishers in Tokyo.

In the latest book, Kino again stresses the need for adequate disclosure of information, arguing, among other things, that people need to know detailed information about workers at the crippled Fukushima plant, including what kind of work they are involved in and what levels of radiation they have been exposed to.

"It would be impossible for us, without proper information, to examine whether Tepco has followed the right path" in dealing with the crisis, he said. "And I believe each individual must be able to determine his or her fate in the face of an unexpected event by obtaining and analyzing proper information."

Kino became acquainted with Hizumi in the early 1990s when both worked for a free paper for Japanese living in Sydney, where Hizumi had moved after leaving his job as a reporter for a major daily in Japan.

After returning home, Hizumi became a certified lawyer while also serving as chief editor of the News for the People in Japan (NPJ), launched in 2008 by lawyers and freelance journalists to report issues that the mainstream media rarely covers.

As a lawyer, Hizumi was involved in lawsuits relating to information disclosure and journalistic issues.

Tokyo-based lawyer Kazuyuki Azusawa also worked with Hizumi on various occasions.

The two managed the NPJ site together, while representing around 25 plaintiffs with other lawyers in a lawsuit seeking disclosure of diplomatic documents on the 1972 reversion of Okinawa to Japan from U.S. control.

One of the plaintiffs was a former reporter at a major daily newspaper who was arrested in the 1970s for his reporting of a secret bilateral pact on the cost burden of the reversion. The reporter was ultimately convicted, raising concerns that press freedoms and the people's right to know were being infringed upon.

"Mr. Hizumi greatly contributed to building the framework of the information disclosure lawsuit," Azusawa, 60, said.

Recalling Hizumi's information disclosure push, Azusawa said: "He worked for delivering proper information to those affected by the Fukushima nuclear crisis, in the expectation that it would contribute to alleviating their sufferings — even if just a little bit — although he himself faced the burden of disease.

"He believed people could be their own rulers by having information," Azusawa added.

Hoping to promote the ideals Hizumi believed in, Azusawa and like-minded lawyers and journalists have established the Hizumi Fund for Promotion of Information Distribution by collecting public donations. "We hope we can encourage those who are campaigning for expanding information disclosure," Azusawa said.

With its first move, the fund gave a ¥300,000 award to the Access-Info Clearinghouse Japan on June 12 — the one-year anniversary of Hizumi's death.

The clearinghouse, a Tokyo-based nonprofit organization, has worked since 1980 to improve the disclosure of information and has supported those who have fought for the public's right to know.

"We are trying to secure information that can be a common basis for public debate," said Yukiko Miki, chairwoman of the NPO. "Mr. Hizumi, for his part, played an active role in promoting information disclosure for information-sharing among the public. In that sense, Mr. Hizumi and our organization are related to each other."

The NPO is now focusing on obtaining nuclear disaster-related information from the government, including health surveys of residents near the stricken plant and decontamination work.

The NPJ news site, meanwhile, has continued its own reporting on various subjects, including the debates over plans to revise the Constitution and the nation's energy policy.

Azusawa himself continues to interview key figures. "We cannot stop what Mr. Hizumi began and left behind at the risk of his life."

Chubu Electric receives part of recovery fund

June 28, 2013

Government diverts quake recovery funds to help utility with idle reactors

THE ASAHI SHIMBUN

Part of the national budget for recovery efforts from the Great East Japan Earthquake has been diverted to help a utility company burdened with extra power generation costs after being told to keep its nuclear reactors offline, The Asahi Shimbun has learned.

A fund administered by the Environmental Partnership Council paid 1.9 billion yen (\$19.2 million) in fiscal years 2011 and 2012 to Chubu Electric Power Co., which shut down all reactors at its Hamaoka nuclear plant in Shizuoka Prefecture in May 2011 at the request of the central government.

The third supplementary budget for fiscal 2011 set aside 9 billion yen as a "subsidy to facilitate thermal power generation" and 1 billion yen as a "subsidy to improve a facility using thermal effluent."

The 10 billion yen was mainly financed by post-quake recovery surtaxes, which are added on top of income taxes and other tax sources.

The thermal power generation subsidy is intended to cover the interest payments on new loans that utilities take out when they activate a thermal power plant as a replacement for idle nuclear reactors.

Although all power utilities in Japan are eligible for receiving subsidies from the fund, Chubu Electric has so far been the sole recipient.

Only two of Japan's 50 nuclear reactors have been reactivated since the March 2011 Great East Japan Earthquake after they were taken offline for regular inspections and other reasons.

The thermal effluent subsidy enables the central government to bear the burden for the Shizuoka prefectural thermal effluent utilization research center, a fish breeding facility that stopped receiving hot water from the adjacent Hamaoka nuclear plant when the latter was taken offline. The subsidy is provided via a fund administered by the prefectural government.

Chubu Electric had signed an agreement to provide hot effluent from the Hamaoka nuclear plant free of charge as part of a package of promotional measures for local communities. The prefectural fund has paid 400 million yen to cover the costs to install a new boiler for producing hot water without relying on the nuclear plant and to pay the electricity bills for generating the heat.

An industry ministry official told The Asahi Shimbun that part of the post-quake recovery budget was used in the latest cases because the Hamaoka nuclear plant was shut down at the request of the central government. The official added that the government will stop covering the interest payments for Chubu Electric beyond July, and will call for a return of the 6 billion to 7 billion yen remaining in the thermal power generation facilitation fund.

Regarding what to do with the thermal effluent fund, however, the official only said discussions were under way with relevant organizations.

The central government has yet to release information about the budget diversion. Only about 100 billion yen of the amount is expected to be returned to state coffers.

The Asahi Shimbun reported in May that more than 1 trillion yen in national post-quake recovery budget had been distributed to 20 or so funds that could be used outside the disaster zones. The revelation prompted the central government to begin reviewing those funds.

"Sickening" collusion between utilities and some local governments

June 29, 2013

EDITORIAL: Local communities should have more say in nuclear safety planning

<http://ajw.asahi.com/article/views/editorial/AJ201306290057>

A serious accident at a nuclear power plant inevitably causes damage to a very wide range of areas.

Even this most fundamental of lessons of the 2011 Fukushima nuclear disaster has yet to be absorbed effectively into the process of developing nuclear power policy in this nation.

Following the devastating accident at the Fukushima No. 1 nuclear power plant, the government widened special priority zones to a 30-kilometer radius around a nuclear power plant from 8 to 10 km. Communities within these zones must make special preparations for nuclear accidents.

The expansion increased the number of local governments within the special priority areas from 45 municipalities to 135.

If an idled nuclear reactor is restarted, it is vital to obtain the consent of all the municipal governments within the zone.

In fact, such local governments have been seeking agreements with regional electric power companies to require utilities to receive the consent of the municipalities if they want to bring a nuclear reactor back online. Similar agreements exist between utilities and the governments of cities and towns where nuclear plants are located.

But there has been little progress in the talks for such deals. Kansai Electric Power Co., which wants to restart its Takahama nuclear power plant in Fukui Prefecture as soon as possible, has been in talks with municipal governments in Kyoto and Shiga prefectures that are located within 30 km of the plant. But the utility has so far refused to grant their requests.

Some local governments that host nuclear power plants are opposed to the central government's policy of expanding areas subject to its special damage mitigation measures.

Fukui Prefecture has 14 nuclear reactors, more than any other prefecture in Japan. There are concerns that a major natural disaster could trigger accidents at many of these reactors.

But the prefectural government has postponed talks with local governments in neighboring prefectures over cooperation in responding to nuclear accidents under the pretext that the central government's evacuation criteria are vague. Fukui has developed its own response plan that limits evacuation sites to places within the prefecture.

As a result, during an evacuation drill conducted in June on the supposition of a severe accident at the Mihama nuclear power plant, residents in the town of Mihama followed the prefecture's evacuation plan. They took refuge in the town of Oi within the prefecture, home to the Oi nuclear plant, instead of a location in neighboring Shiga Prefecture, which is farther away from the nuclear plants.

Does this qualify as an evacuation plan that puts the highest priority on the safety of local residents?

Behind the Fukui prefectural government's attitude is cozy relations between the operators of nuclear power plants and the local governments concerned. These companies provide contributions to the local governments and create jobs in their communities. In return, the local governments accept dangerous nuclear facilities.

If more communities become part of the special priority zones, it will become harder for utilities to restart their idled reactors, while the local governments may find the benefits they receive by accepting nuclear plants reduced.

Such concerns appear to be affecting the actions of the nuclear plant operators and the local governments concerned. This behavior is sickening considering the nation has witnessed the harrowing consequences

of a serious nuclear accident. The collusive ties between the utilities and the local governments are unacceptable.

Nuclear plant operators should work out agreements with all local governments within a 30-km radius of their plants to establish a multilayered monitoring system. Local governments around nuclear plants should cooperate on a region-wide level to enhance their influence on issues concerning nuclear safety. They should also develop effective evacuation plans for emergencies.

Instead of mutual back scratching, both sides need to build healthy but tense relations based on the principle that the safety of residents should come first.

In addition, some reactors will not be restarted because they fail to meet the new safety standards.

Local governments that have been supporting the central government's policy of promoting nuclear power generation are in a tough situation. It is by no means easy for these governments to change their policies and start reducing their dependence on the nuclear power business.

Even Fukui Prefecture has set a goal of diversifying its energy sources. It has started to make efforts to carve out a future less dependent on nuclear energy, such as seeking a terminal for liquefied natural gas located within the prefecture.

Instead of focusing its policy efforts on winning support for restarting reactors, the administration of Prime Minister Shinzo Abe should **pour more energy into helping local communities around nuclear power plants map out a new, economically independent future for themselves.**

--The Asahi Shimbun, June 29

Don't forget the locals

July 4, 2013

TEPCO asked to seek local approval

http://www3.nhk.or.jp/nhkworld/english/news/20130704_43.html

The governor of Niigata, which hosts Japan's largest nuclear plant, has demanded the operator seek the prefecture's approval as it prepares to restart the facility.

Hirohiko Izumida made the request Thursday to Tokyo Electric Power Company. The utility operates the Kashiwazaki Kariwa nuclear plant, with 7 reactors, on the Sea of Japan coast.

TEPCO officials decided Tuesday to ask Japan's nuclear regulator to conduct safety checks of the reactors. The checks are needed to gain approval for restarting them.

TEPCO officials plan to make their request on or after Monday, when the regulator puts new safety standards into effect. The standards are aimed at ensuring that nuclear plants can withstand severe accidents like the one in Fukushima.

Niigata's governor told TEPCO officials on Thursday that before they apply to the regulator, they should get his approval for a new safety device called a "filter vent."

The device is designed to release pressure in the containment vessel of a reactor while limiting emissions of radioactive substances.

A safety agreement between TEPCO and municipalities stipulates that the utility must gain local authorities' consent before setting up any new facilities at a nuclear plant.

The governor of Niigata has expressed concern about the filter vent. He said the device reduces emissions, but still allows radioactive substances to escape.

The governor will meet with TEPCO President Naomi Hirose on Friday to convey his request.

TEPCO officials say they will take the request into consideration.

Safety?

July 5, 2013

Japan utility hires nuclear safety advocate

Lady Barbara Judge smiles during an interview with The Associated Press in Tokyo on July 5, 2013. (AP Photo/Itsuo Inouye)

<http://mainichi.jp/english/english/newsselect/news/20130705p2g00m0dm070000c.html>

TOKYO (AP) -- The Japanese utility still battling leaks of radiated water and rat-caused power outages at a nuclear plant, sent into multiple meltdowns, thinks it has found the perfect person to oversee its safety campaign -- a foreign woman.

Lady Barbara Judge -- a British-American, who has worked as a lawyer, banker and U.S. Securities and Exchange Commissioner -- says that Tokyo Electric Power Co., the utility behind the 2011 Fukushima nuclear catastrophe, has changed enough, under a new president, to begin restarting its reactors.

Still, she did not mince words about the past practices of the utility linked to the worst nuclear disaster since Chernobyl.

"There was a culture of efficiency, not a culture of safety," Judge told The Associated Press on Friday, during a trip to Tokyo for meetings at TEPCO. "There was no safety culture. There was an assumption of safety."

Judge, honorary chairman at the U.K. Atomic Energy Authority, says she is exactly the kind of person Japan's insular and male-dominated atomic industry needs to keep it in rein.

She also says nuclear power remains the best option for a resource-poor nation like Japan and vows that under her guidance the utility will adhere to world-class safety standards.

TEPCO, which hired her for its nuclear reform committee in September, is eager to restart its Kashiwazaki-Kariwa plant, northeast of Tokyo.

New government safety rules are set to kick in next week, signaling a possible go-ahead for some of the 50 idled reactors to get back online.

Having undergone a public bailout, TEPCO is bleeding money, facing compensation demands from the thousands of people evacuated from around the plant, as well as importing costly oil, coal and gas to keep power going

All its reactors are either defunct, including the four being decommissioned at Fukushima Dai-ichi, or shut down for safety tests after the disaster. And nuclear plants that can't restart are a liability, looking terrible on a company's books.

But Japanese protesters oppose restarting the plants, and public opinion surveys show a majority want an end to atomic power. The ruling party is pro-nuclear, but every other political party is demanding a phase-out.

Chikako Fujii, an aromatherapist who has taken to the streets opposing nuclear power, said she had believed in the superiority of Japanese technology -- until Fukushima.

"This nation is definitely moving ahead to have nuclear plants back up again. But I am really against that," she said.

Decades are likely needed to decommission Fukushima Dai-ichi. A dead rat recently caused a massive blackout, temporarily shutting down the system to keep reactor-cores cool.

Tons of contaminated water continue to leak. Experienced workers are growing harder to find as they reach radiation-exposure limits.

Judge's answer to such skeptics: TEPCO should do more outreach to answer people's questions and show how nuclear is the superior choice.

She has advised TEPCO to "apologize profusely" for the accident and asserts that under her initiative, TEPCO is bringing together the toughest standards and safest practices in the world.

Judge served as chairman of the U.K. Atomic Energy Authority from 2004 to 2010.

She insists that the safety-oversight section she is bringing together at TEPCO, instead of being ignored as they were in the past, will be respected, a place for "the best and the brightest."

She said the standards her team is putting together would be ready "within months."

After all, the Fukushima accident was set off because backup generators were in the basement when the tsunami struck in March 2011, not a failure of fancy science, she noted.

She pointed to Germany as seeing costly energy imports, worsening carbon emissions and higher electricity prices, while it's buying nuclear power from France, after opting for a nuclear phase-out.

"It's a mess," said Judge. "Life without nuclear is the Emperor's new clothes, as far as I'm concerned."

Some people are happy with nukes

Mountain regions pull for linear collider project

<http://mainichi.jp/english/english/newsselect/news/20130708p2a00m0na009000c.html>

Two mountainous regions, one in northeast Japan and one in the southwest, are now competing to host the construction of a major supercollider -- even as the national government shows little interest in the project.

The initiative, known as the International Linear Collider (ILC) project, involves a giant particle accelerator that would be used to help uncover the mysteries surrounding the birth of the universe.

The two competing areas -- the Kitakami mountain region lying within Iwate and Miyagi Prefectures, and the Sefuri mountain region straddling Saga and Fukuoka prefectures -- are both hoping to entice the facility to their respective locations.

The collider is set to become the successor to the European Organization for Nuclear Research (CERN)'s Large Hadron Collider (LHC), which was used to discover a new particle believed to be the Higgs boson. The machine will accelerate electrons and positrons (positive electrons) to nearly the speed of light, colliding them in a straight accelerator around 30 kilometers long, and then analyzing the various particles created in the collision.

While the LHC can only make a Higgs Boson once every trillion collisions, the ILC will be able to produce them once every hundred collisions. This has created hopes regarding the potential discovery of new particles that make up dark matter, as well as results that may be utilized toward cancer treatment and semiconductor processing.

A thick book of schematics for the project was completed in June, totaling 1,240 pages. Building the collider will come with a heavy price tag of at least 830 billion yen, with the host country expected to pay half the total. Around 10,000 residents including researchers and their families are expected to live around the collider facility, which is likely to employ a few thousand people every year.

Saga and Fukuoka prefectures are working with local business groups to advertise themselves as potential sites. The governors of both prefectures visited Europe in May, touting their areas as featuring excellent transportation services and other city functions. Both regions have also hung banners at train stations and convenience stores in an effort to drum up local support.

Iwate Prefecture is positioning the project as one that will bring economic health back to the tsunami-stricken area, and has set up a committee to promote the project. An official says, "We are close to related research facilities in Ibaraki Prefecture, and with our bullet train line and expressways, our transport infrastructure is not inferior (to the Sefuri mountain region)." The promotion committee has also invited Professor Takehiko Saito of Germany's Johannes Gutenberg University of Mainz to talk to elementary and junior high students in the area about topics including the makeup of the universe, and research on elementary particles.

Not all opinions are in favor of the project, however, with no country having officially come forward as a host candidate so far due to its heavy cost. The Japanese government has similarly shown little interest, giving the project the lowest possible priority rating during its large project reviews in 2010 and 2012. An evaluation committee with the Science Council of Japan that opened in June was also unenthusiastic. "The project would cost a lot of tax money, so if the reasons for building it are not further explained, the people won't go along with it," one member commented.

A radiation leak incident at a particle accelerator in Tokai, Ibaraki Prefecture that occurred in May has also lowered opinions regarding the project. Still, however, the two local sites remain locked in a PR tug-of-war, driven by an estimate released by the Japan Productivity Center that the linear collider would create an international research city and bring 45 trillion yen in profit to domestic industries over a 30-year period.

An evaluation committee is expected to recommend a single candidate location to the national government in August.

July 08, 2013(Mainichi Japan)

NRA must learn to listen/talk to people

July 8, 2013

New challenge for Japan's nuclear regulators

http://www3.nhk.or.jp/nhkworld/english/news/20130708_15.html

Japan's nuclear regulators are facing a tough challenge as new safety regulations take effect on Monday.

The new rules make plant operators legally responsible for the first time for taking steps to prevent severe accidents.

The expertise of 80 people charged with examining power companies' applications to restart reactors is on the line.

Most of the examiners were employed by the now-defunct Nuclear and Industrial Safety Agency. The

former regulator was criticized for its lack of expertise in nuclear plant operations.

Some people even called it "a slave" of the power companies it was meant to supervise. The current Nuclear Regulation Authority must assess the safety of each reactor under the new regulations. This includes measures taken by operators to prevent severe accidents.

The NRA is also required to explain to the public the review process and its outcomes in plain language that people can understand.

The NRA in May confirmed the existence of an active fault under the No. 2 reactor at the Tsuruga nuclear plant in Fukui Prefecture. The authority concluded the reactor is vulnerable to an earthquake and cannot be allowed to operate.

But local communities complained about a **lack of transparency** in the way the authority handled the matter.

Experts say the NRA needs to establish a mechanism for hearing public opinion about the review process and responding to questions.

The problem of fuel costs

July 7, 2013

Power companies suffer from higher fuel costs

http://www3.nhk.or.jp/nhkworld/english/news/20130708_04.html

Japanese power utilities are losing money by having to pay more for the fuel used in operating their thermal power plants.

All of Japan's nuclear power plants-- except one plant on the Japan Sea coast-- are off-line following the accident in Fukushima in 2011.

Nine Japanese power companies posted combined fuel cost of 7 trillion yen, or about 70 billion dollars, in the business year that ended in March. This is about double what they paid 2 years ago.

Due to the increased fuel cost, 4 companies, including Kansai Electric and Kyushu Electric, posted their largest-ever losses in the business year ended in March.

Hokuriku Electric was the only utility that did not post losses.

Some utilities have decided to raise electric bills to cover their losses.

Experts say a restart of operations at one nuclear plant would slash fuel costs by as much as 60 to 100 million dollars per month.

Power company officials say they want to resume operations as soon as possible to improve their finances and to ensure stable power supplies.

The influence of Twitter

July 9, 2013

Retweeting of nuclear power-related posts help boost their online presence

<http://mainichi.jp/english/english/newsselect/news/20130709p2a00m0na006000c.html>

The forwarding and quoting of tweets about "nuclear power" by specific Twitter users are playing a major part in boosting the number of such tweets among policy-related words over the Twittersphere, analysis by the Mainichi Shimbun and a Ritsumeikan University associate professor has shown.

The analysis, which was jointly conducted by the Mainichi and Ritsumeikan's Ryosuke Nishida as part of collaborative research into online campaigning for the July 21 House of Councillors election, sought the reasons behind the high number of tweets about the nuclear power issue, using the analysis software "BuzzFinder" developed by NTTCom Online Marketing Solutions Corp.

When tweets posted on July 4, the day the upper house election was officially announced, were collected and analyzed, it was found that the diffusion of tweets about nuclear power were expanded by specific Twitter users who were intensively retweeting them.

There were 55,100 tweets that included the term "nuclear power" on July 4, of which 18,600 were original tweets posted by 9,100 users. Those tweets were retweeted 36,500 times by 16,500 users. Many of the original tweets are believed to represent writers' own opinions, with an average of two tweets posted per person that day. Nearly twice the number of those who posted original tweets retweeted at least two tweets each on average. Because the same person may have posted original tweets and also retweeted others' tweets, it can be said that specific individuals and groups concerned with the nuclear power issue repeatedly retweeted relevant posts, tripling the number of tweets from that of those original tweets.

According to a nationwide telephone survey by the Mainichi Shimbun covering some 30,000 voters on July 4 and 5 over which points of contention they weigh the most in their voting decisions for the upper house election, 28 percent cited "pension, health care, nursing care and child-rearing" and another 28 percent cited "economic measures." Only 8 percent cited "nuclear power and energy policy." As for those in their 20s to 30s -- many of whom are believed to be Internet-users --- the trends were almost the same, with those who cited "nuclear power and energy policy" accounting for just 5 percent.

There were 19,800 tweets about "pension and child-rearing" on July 4, of which 10,000 were original tweets posted by 7,400 people and the remaining 9,800 were retweets by 6,400 people. Compared to tweets about nuclear power, original tweets about "pension and child-rearing" were fewer in number and were not retweeted as frequently. As such, the gap between the total number of tweets is greater than the gap between the number of original tweets on the respective topics.

Celebrities and others who have over 100,000 followers each have actively tweeted their views on the pros and cons of nuclear power, contributing to the diffusion of such tweets. The protests against reactor

restarts in front of the Prime Minister's Office also expanded via Twitter. Ties nurtured among those specific users are believed to have made it easier to diffuse such tweets via retweeting.

"Topics on Twitter tend to be focused on policy issues that encompass diverse points of contention and are hard to resolve unambiguously, such as the nuclear power issue," Nishida said.

"It should be said that communications among specific Internet users have been made visible (on Twitter), and that the number of tweets itself does not reflect public opinion.

"The number of those who posted their original tweets wasn't so many, considering the total number of Twitter users. The idea of exploring public opinion on the Internet by analyzing topics frequently discussed on Twitter may be inappropriate in itself," he added.

Strict, swift and...convincing

July 8, 2013

Governors seek strict nuclear plant screening

http://www3.nhk.or.jp/nhkworld/english/news/20130708_42.html

Prefectural Governors in Japan have requested strict screening procedures before restarting nuclear power plants under the new safety guidelines.

The heads of 47 prefectures began two days of meetings on Monday in Matsuyama City, western Japan. They discussed the new safety guidelines that were officially decided by the Nuclear Regulation Authority.

The guidelines require nuclear plant operators to take concrete steps when handling serious accidents. They took effect on the same day.

Ehime Prefecture Governor Tokihiro Nakamura called for setting up a system where the central government assumes final responsibility for allowing nuclear plants to restart.

Nakamura made the request in reference to the Ikata nuclear plant operator's application to restart its number 3 reactor under the new guidelines.

Tottori Prefecture Governor Shinji Hirai said the central government has to decide whether to restart nuclear plants based on the opinions of local governments.

The prefectural leaders agreed on proposals that call on the nuclear authority to implement strict and swift screenings under the new guidelines.

They also proposed that when deciding to restart a nuclear plant, the central government must hold public hearings to gain the understanding of locals living nearby.

A very pro-nuclear government and administration

July 9, 2013

Utilities seeking restarts have support of pro-nuclear government

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201307090073>

THE ASAHI SHIMBUN

With a pro-nuclear administration chomping at the bit, Japan is expected to bring at least one nuclear reactor back online as early as winter, after the two already running are shut down in autumn.

Four electric power companies on July 8 applied to the Nuclear Regulation Authority for restarting 10 reactors at five plants based on the new safety standards incorporating lessons from the 2011 Fukushima nuclear disaster.

The No. 3 reactor at Shikoku Electric Power Co.'s Ikata plant in Ehime Prefecture is expected to be the first to get restarted. Key equipment items have been constructed, and there is a low risk of the plant being swamped by a massive tsunami.

The No. 1 and No. 2 reactors at Kyushu Electric Power Co.'s Sendai plant in Kagoshima Prefecture also face few hurdles.

The NRA will confirm whether reactors satisfy the new standards through a safety screening, whose conclusion is expected in six months or so.

Electric power companies also need to obtain consent from local governments that host nuclear plants and approval from the central government before restarting reactors. However, approval from local governments for restarting these 10 reactors is believed to be relatively easy for the four utilities to gain.

The pro-nuclear Abe administration plans to bring idle reactors back online as soon as NRA safety screenings are over.

"We are responsible for supplying energy at low cost and in a stable manner," Prime Minister Shinzo Abe said on a TV program on July 5. "We want to restart those reactors the NRA judged as safe."

The ruling Liberal Democratic Party stands equally committed.

"If we are to be responsible for Japan's economy, we have no other choice but to restart reactors whose safety has been confirmed," Secretary-General Shigeru Ishiba told reporters on July 8. "We will never avoid that responsibility."

Japan's 50 reactors, except for two, have all remained offline after the Fukushima No. 1 nuclear plant was crippled by the March 2011 Great East Japan Earthquake and tsunami.

The No. 3 and No. 4 reactors at Kansai Electric Power Co.'s Oi plant in Fukui Prefecture were reactivated last June based on provisional procedures. They are among the 10 reactors because they will be shut down in September for regular inspections.

The four utilities—Kansai, Shikoku, Kyushu and Hokkaido Electric Power Co.—are desperate to restart reactors to turn around their operations because they depended on nuclear energy for more than 40 percent of their electricity supply.

In the fiscal year ended in March, eight regional utilities, including these four, incurred a combined loss of 1.6 trillion yen (\$15.80 billion) due mainly to fuel costs for thermal power generation that made up for lost capacity at nuclear plants.

Kansai Electric and Kyushu Electric raised household electricity rates in May, and Shikoku Electric and Hokkaido Electric have applied for increases.

"The reactivation of reactors is necessary not to inconvenience our customers with higher electricity rates," said Toru Yoshizako, executive vice president of Kyushu Electric.

Opposition parties have criticized the Abe administration for rushing headlong to restart idle reactors.

"The LDP is trying to promote nuclear energy without any debate," said Goshi Hosono, secretary-general of the Democratic Party of Japan.

Hosono was trying to set the DPJ apart from the LDP ahead of the crucial July 21 Upper House election.

The government plans to postpone discussions on a percentage of electricity supplied by nuclear power for 10 years, without specifying a figure in a basic energy plan to be compiled at the end of the year.

The DPJ, which was in power when the accident started at the Fukushima No. 1 plant, also supports restarting reactors whose safety has been confirmed by the NRA. The DPJ government approved the reactivation of the Oi reactors last year.

But the party has continued to call for halting operations of nuclear plants by the 2030s, a goal set before it was ousted from power by the LDP in a Lower House election in December.

The Japan Restoration Party, whose campaign promise is phasing out nuclear energy by the 2030s, said it is premature to restart reactors now.

"We must tide ourselves over with other energy sources until the safety standards are met," Ichiro Matsui, the party secretary-general, said.

The Japanese Communist Party is dead set against restarting reactors.

A telephone survey conducted by The Asahi Shimbun on July 6-7 found that 48 percent of respondents opposed the LDP's stance backing the reopening of nuclear plants, compared with 34 percent who support the party's stance.

Seventy percent of respondents said they will consider the issue of nuclear plants either "greatly" or "to some extent" when they vote in the Upper House poll.

The LDP has refrained from turning nuclear policy into a key campaign issue for the election. A senior party official in charge of policy issues said nuclear policy cannot be translated into votes.

As the four utilities turn to local governments for approval for restarting the reactors at the five plants, they face mixed reactions from residents.

One of the plants is Kansai Electric's Takahama plant in Takahama, Fukui Prefecture.

"Young people in this district are engaged in work related to the nuclear plant. I want to see the plant restarted soon," said a 66-year-old Takahama resident.

"There will not be a limit if we think about what would happen beyond expectations," he said of safety measures. "The plant was safe until now. They can consider (safety measures) after the plant is restarted."

The operator of a grocery store 2 kilometers from Kyushu Electric's Sendai plant said the area would have been virtually deserted without the nuclear plant.

His store derived half of its sales from vegetables and fish sold to hotels and inns. But orders halved after regular inspections for the nuclear plant were suspended following the Fukushima accident.

Local governments are trying to attract solar and wind power generation companies to help take the place of nuclear power.

But the grocery operator, 52, said, "With wind or solar power, people will not come. Roughly 2,000 workers come for a regular inspection of the nuclear plant."

A 35-year-old homemaker in Satsuma-Sendai, where the Sendai plant is located, said she did not pay any special attention to the nuclear plant but the Fukushima nuclear disaster changed her way of thinking. "I will be concerned as long as the plant is in operation even if it passes a safety screening," she said. "I hope Japan will become a society that can meet electricity requirements without nuclear plants, with people saving energy."

Has M. Yoshida left a record of the disaster?

July 10, 2013

Mixed reviews over deceased ex-Fukushima plant chief's handling of nuclear crisis

<http://mainichi.jp/english/english/newsselect/news/20130710p2a00m0na012000c.html>

Masao Yoshida, who had spearheaded the daunting on-site task of handling the crisis at the Fukushima No. 1 Nuclear Power Plant, died of esophageal cancer at the age of 58 on July 9.

While receiving high marks for such actions as continuing to inject seawater into one of the troubled reactors at his own discretion in defiance of instructions from his bosses at the headquarters of Tokyo Electric Power Co. (TEPCO), Yoshida is also known to have failed to implement measures against tsunami ahead of the March 2011 disaster. His 58 years of life reflect the light and dark sides of Japan with heavy dependence on nuclear power.

Yoshida told his friend, a medical doctor, last year, "I am thinking of writing a record of the accident, but I can't make much progress in my writing." He was considering publishing a memoir and contributing the royalties to disaster victims. But his health condition failed to stabilize because of treatment for esophagus cancer, and therefore he apparently tended to stop writing.

Yoshida emerged from Tokyo Institute of Technology's graduate school in 1979. He joined TEPCO after turning down a job offer from the then Ministry of International Trade and Industry (MITI), which is currently the Ministry of Economy, Trade and Industry (METI). He had consistently served in technology-related positions in the company. He won the confidence of workers at the nuclear station for being a "big-brother type" and "service-minded." Apparently he was also respected by workers from other companies who had little connection to TEPCO headquarters. He became the head of the Fukushima No. 1 Nuclear Power Plant in June 2010, his fourth assignment to the nuclear station.

According to the government's accident analysis (interim) report released in December 2011, when Yoshida was the head of TEPCO's nuclear facility department in 2008, he compiled results of his own preliminary calculation which said tsunami of up to 15.7 meters -- far greater than what had previously been assumed -- could hit the nuclear plant. But it has emerged that he actually postponed the implementation of anti-tsunami measures such as the construction of levees, saying, "It is nothing but a preliminary calculation based on the severest hypothesis."

In November 2011, eight months after the outbreak of the nuclear crisis, Yoshida apologized for the accident and told the media at the nuclear power station, "Some of the assumptions were too optimistic. It is necessary for other nuclear power plants to make improvements in light of that."

Yoshida also said, "The hydrogen explosion at the No. 3 reactor (on March 14, 2011) had the biggest impact. We were in a situation where we wouldn't have been surprised if we died. I thought about 10 people could have died." Yoshida had seldom talked about the accident in public. But in August 2012, he sent a message to a public symposium in which he looked back on the disaster.

"It is our most important duty to stabilize the nuclear reactors. I want to do my best to help workers at the site when I get my strength back," he said in the video message. While showing fatigue from his battle against cancer, he expressed his willingness to make a comeback to the task of bringing the crippled nuclear power station under control.

However, in late July 2012 after recording his video message, he suffered bleeding to the brain. A source close to the government's accident investigation panel described Yoshida as "the person who knows the most about the process of the accident." But Yoshida's life ended without fully revealing the truth behind the nuclear disaster. An official of TEPCO's public relations department said, "We have not confirmed whether he left a note or he wrote private papers on the accident."

Democratic Party of Japan (DPJ) lawmaker Naoto Kan, who was the prime minister when the crisis broke out, said on June 9, "We are largely indebted to Mr. Yoshida for preventing the accident from further expanding. I was thinking of talking to him when he recovered. I really regret that I couldn't do that."

DPJ Secretary General Goshi Hosono, who had served as the state minister in charge of the nuclear accident, posted a video message on Facebook, saying, "Without Mr. Yoshida's leadership and fighting spirit, we would not have been able to overcome that situation."

Interview with Kyoto governor

Kyoto gov. says gov't should clarify its responsibility for nuclear power policy

<http://mainichi.jp/english/english/newsselect/news/20130711p2a00m0na013000c.html>

KYOTO -- Kyoto Gov. Keiji Yamada pointed out that **there are problems that need to be addressed before the national government approves the restart of idled nuclear reactors, such as safety measures for residents of areas hosting nuclear plants in case of an accident.**

In an exclusive interview with the Mainichi Shimbun, the 59-year-old governor also **urged the central government to clarify its responsibility for Japan's nuclear power policy.**

Excerpts of the interview follow:

Question: Kyoto Prefecture neighbors the Fukui Prefecture city of Oi that hosts Kansai Electric Power Co.'s Oi Nuclear Power Plant. As heads of local governments neighboring nuclear plants, you and the governor of Shiga Prefecture jointly recommended that the national government ensure transparency of its nuclear power policy. Do you think your recommendation has been sufficiently reflected in the new safety regulations enforced recently by the Nuclear Regulation Authority (NRA)?

Answer: Members of the general public are worried that the central government has failed to sufficiently clarify the cause of the crisis at the tsunami-hit Fukushima No. 1 Nuclear Power Plant run by Tokyo Electric Power Co. And it remains to be seen how far the new safety regulations will dispel the public's concern. It's hard to understand why electric power companies have been given a grace period to implement safety measures under the new regulations. Moreover, the regulations don't provide for sufficient measures to respond to an accident, such as how to ensure the safety of residents around nuclear plants. There remain tasks that must be addressed before restarting idled nuclear reactors.

Q: There are calls within industries urging that the government approve reactivation of nuclear power stations to ensure stable supply of less expensive electric power. How would you react to such calls?

A: As a member of the Union of Kansai Governments, Kyoto Prefecture left a final decision on whether to reactivate the Oi power station to the national government because we feared that a power shortage in summer could pose a threat to the lives and safety of prefectural residents. However, the Kyoto Prefectural Government's basic position is to create a society that needs to rely on as little nuclear power as possible. If the national government intends to promote the restart of nuclear plants, it should show responsible measures to decommission aging reactors and deal with spent nuclear fuel.

Q: Power suppliers warn that they wouldn't be able to balance their budgets and would be forced to raise their electricity charges unless they were allowed to restart their nuclear plants. What do you think about such a view?

A: An energy strategy is the core of basic national policy along with diplomacy and security. I doubt that it should be dealt with as a matter of one company's profitability or utility charges. The lesson of the Fukushima nuclear crisis is that nuclear plants (which could cause serious damage in case of an accident) can't be considered simply from the viewpoint of private companies' management. The government should further clarify its own responsibility for Japan's nuclear power policy.

Q: The national government is looking for a site for a final disposal facility for spent nuclear fuel, isn't it?

A: The central government has asked the National Governors' Association to hold talks about the issue. Because nuclear plants had been in operation for many years, spent nuclear fuel had continued to accumulate. The government can't work out an energy strategy without addressing the issue. Moreover, there will be no solution to the problem if local bodies continue to say, 'We need energy but don't want a disposal facility.' The issue of building a final disposal facility is what the whole nation should decide. I wonder what conditions the national government will offer to ask a local community to host a final disposal facility and how to win understanding of local residents. I think the national government's ability to deal with the matter is being tested.

Why such a rush?

July 10, 2013

Rushing to restart reactors

<http://www.japantimes.co.jp/opinion/2013/07/10/editorials/rushing-to-restart-reactors/#.Ud6jD6xSb9k>

Four power companies on Monday asked the Nuclear Regulation Authority to assess the safety of 10 reactors at five nuclear power plants under the NRA's new safety regulations, which went into force the same day.

The Abe administration and the ruling Liberal Democratic Party have presented no clear long-term policy related to nuclear power. They should be criticized for trying to bring nuclear power plants back online by *fait accomplis* even before the causes of the Fukushima nuclear disaster are established. In addition, the

regulations include a five-year grace period for an important safety measure, so once again the nuclear industry would be gambling that a disaster won't strike in the interim.

While the Democratic Party of Japan was in power, it carried out deliberative polls across the country to find out people's views on nuclear power. In that process, a majority of people called for eventually ending Japan's reliance on nuclear power.

According to a Kyodo News poll whose results were made public on May 19, 54.3 percent of those polled opposed the restart of reactors even if they passed the NRA's safety assessment while 37.2 percent supported it. The Abe administration and the LDP should make a sincere effort to listen to people's opinions by organizing public discussions in a transparent manner.

The government, political parties and people should not be swayed by short-term economic factors such as rises in electricity charges in the absence of nuclear power. In addition to safety concerns over their operation, which grow riskier as they age, spent nuclear fuel and radioactive waste will continue to accumulate but there is no established technology for safely storing it.

One wonders whether the Abe administration and the LDP are aware of these factors. They have yet to present clear-cut programs to deal with a large-scale nuclear disaster or to dispose of accumulating spent nuclear fuel and radioactive waste.

The government should present a clearly defined plan to eventually end Japan's reliance on nuclear power, to encourage the development of renewable energy sources and to end the major power companies' regional monopolies.

The NRA's new regulations require power companies to take measures to cope with severe accidents, including construction of sea walls to protect individual nuclear power plants from the largest possible tsunami and the installation of filters to prevent radioactive substances from escaping into the atmosphere in the event of an emergency. The NRA's new regulations are an improvement, however they are far from perfect. A grace period of five years is allowed for the installation of filters in the 10 reactors that the four power companies want assessed, because they are pressurized light-water reactors, in which hydrogen explosions are said to be unlikely. For example, the new safety measures do not require construction of a hard structure to protect a reactor core against a terrorist attack involving missiles, bombs or 9/11-style aircraft strikes. They also do not mandate the installation of emergency cooling-water storage facilities inside reactor containment structures to help prevent core meltdowns.

The NRA should carry out its reactor assessments in a thorough and transparent manner, and resist any pressure from vested "nuclear village" interests, so that the public can readily understand and trust its conclusions.

Don't mention it

Pro-nuke LDP's candidate quiet on Ehime reactor restart bid

by Eric Johnston
Staff Writer

IKATA, EHIME PREF. – On the far western edge of Shikoku, Ehime’s Sada Misaki Peninsula juts out into the Seto Inland Sea. It’s a long sliver of land home to several species of hawk and several varieties of the prefecture’s famous “mikan” oranges.

It’s also **home to the Ikata nuclear plant**, whose reactor 3 might be the first to be turned back on under new regulations that came into effect Monday. That’s a decision, local opponents say, that has more to do with municipal, and national, Liberal Democratic Party politics than with any need for the power the plant would provide.

“Much of the electricity Ikata generates can be sold to Kansai Electric Power Co., money that Shikoku Electric Power Co. needs. Unlike the Kansai region, **large commercial enterprises in Shikoku often have their own generators and are, in fact, selling their excess power to Shikoku Electric,**” said Junko Saima, an Ikata resident who has opposed the plant for decades.

Noboru Hiroo, a Shikoku Electric official, said the utility expects peak summertime electricity demand to reach 5.62 million kw. While most of the supply will come from fossil fuel plants, some will be bought from those generating their own electricity.

“We have contracts with eight companies and expect them to provide 140,000 kw,” he said.

As the July 21 Upper House election looms, utilities nationwide are rushing to apply for restarting their nuclear power stations, which have been shut down since the March 11, 2011, earthquake, tsunami and Fukushima meltdowns. With the ruling LDP expected to win big, at least a dozen reactors, including Ikata’s reactor 3, could be rebooted by next year if they clear the safety assessment by the Nuclear Regulation Authority.

Less than 2½ years since those tragic events, the heavily pro-nuclear LDP and its allies in the utilities, local governments and business community are striking back, as concerns about electricity shortages and rising electric bills clash with safety fears.

Of the 10 major political parties, only the LDP rejects the idea of eliminating atomic energy entirely. Its platform calls for gaining the trust of local residents to reactivate reactors.

“We will not restart reactors that do not meet NRA standards. At the same time, we have a responsibility to provide safe electricity,” Prime Minister Shinzo Abe told reporters at the Japan National Press Club earlier this month

New Komeito, the LDP's ruling bloc junior partner, is campaigning on a goal to make Japan nuclear-power-free "as soon as possible." Despite strong support from pro-nuclear utility worker unions, the Democratic Party of Japan, the main opposition force and the ruling party when the Fukushima meltdowns occurred, says it wants all atomic plants offline by the 2030s.

Among other opposition groups, Your Party promises to have no nuclear power plants operating by the end of the 2020s, while Nippon Ishin no Kai (Japan Restoration Party) promises to phase out all nuclear energy by the 2030s. The Japanese Communist Party has pledged to keep idle all reactors shut down at present. Only two reactors are currently operational nationwide, at Kepco's Oi plant in Fukui Prefecture.

While the restart of reactor 3 at the three-reactor Ikata plant is making local headlines, bread-and-butter issues like economic revitalization, employment and care for children and the elderly are just, if not more, prominent.

In Ehime, LDP Upper House candidate Takumi Ihara, who in media polls is leading the race, makes no mention on his website of restarting the Ikata reactor. While JCP hopeful Masakatsu Ueki calls for decommissioning the plant, Your Party candidate Kayoko Fujioka says little about it, choosing instead to emphasize child care issues.

For the town of Ikata and Shikoku Electric, the restart of reactor 3 is of paramount importance. The town of over 10,000 inhabitants relies on both nuclear power-related subsidies, including government and private subsidies, while local service industries count on plant-related business, especially during inspection periods, to keep them going.

But the idling of the Ikata plant has also finally given local politicians a chance to speak about a nuclear-free future.

"I feel strongly the need to revise our economic revitalization policy, which relies on the presence of nuclear power," Ikata Mayor Kazuhiko Yamashita said in mid-June, although he added he was not seeking a permanent shutdown of the Ikata plant.

For Shikoku Electric, keeping the facility offline has forced the utility to import more fuel for its thermal plants, prompting it to hike electricity rates.

"With the reactors at Ikata shut down, there's no change in the tough situation we face with regard to electricity supply," Shikoku Electric President Akira Chiba said at a shareholders' meeting in June.

The House of Councilors election is about short-term politics, and whether Japan's remaining reactors will be fired up within months or years. But regardless of the result, politicians of all stripes will be forced to tackle fundamental long-term problems regarding atomic energy, especially what to do with aging reactors and the shortage of storage space for spent nuclear fuel.

Of the nation's 50 commercial reactors, three are more than 40 years old. By 2020, another 11 will have hit the 40-year limit, including all of those operated by Kansai Electric, while reactors 5 and 6 at Tokyo Electric Power Co.'s wrecked Fukushima No. 1 plant are unlikely to be restarted due to political opposition.

Reactors are supposed to be decommissioned after 40 years of service, and utilities can apply to extend their operations for up to two decades. But while not legally obliged to do so, the units are unlikely to continue operating beyond 40 years without local consent.

Towns and villages hosting atomic plants are sure to raise safety concerns. This means the central government and the utilities will likely find themselves bargaining with local officials over how much taxpayer money and private donations should be pumped in initially to secure local permission to keep the nuclear plants online.

That's just the first problem.

Assuming reactors are restarted and run at pre-3/11 levels, media reports estimate that 33 of the 50 reactors will see their on-site spent-fuel pools max out their capacity within six years. They include all seven Tepco reactors at the Kashiwazaki-Kariwa plant in Niigata Prefecture and some of Kepco's Takahama and Oi reactors in Fukui. The pools of another 14 reactors would likely be filled to the brim within a dozen years.

Only three reactors, including Ikata's unit 3, have enough space left to continue storing spent fuel after 12 years.

About 14,200 tons of spent nuclear fuel was sitting in pools next to Japan's reactors as of September 2011 — around 70 percent of the total capacity.

The government says the three options for dealing with this stockpile, and future spent fuel, are to ship it to Rokkasho, Aomori Prefecture, for reprocessing, build medium-term storage facilities or send it overseas for direct reprocessing.

The problem with Rokkasho is that its planned reprocessing facility is decades behind schedule and will not open anytime soon. Rokkasho's storage pools for spent fuel sent by utilities around the nation over the years are about 98 percent full.

The problem with new medium-term storage facilities is that, despite central government and utility cash incentives, few local governments have expressed any interest in building such facilities in their backyard. Even if a few were approved somewhere soon, they aren't likely to be built before spent-fuel pools at some reactors are full.

That leaves overseas reprocessing, an effort that, critics say, hides the true cost of nuclear power and creates a host of international safety and proliferation concerns.

Although restarting the plants, and the future of atomic power, is an important campaign issue, **the headline-grabbing antinuclear protests seen a year ago were absent as the campaign kicked off.**

A recent rally in Matsuyama, Ehime Prefecture, for Greens Japan candidate Uiko Hasegawa drew only a couple dozen people. Conceding the level of public demonstrations has faded since last July, Hasegawa nevertheless said events since the March 11, 2011, disasters have created a new reality.

"Think about the situation before then, when Japanese society almost considered you a criminal if you opposed nuclear power. Today, everybody is talking about whether it's necessary. There's a much better awareness of the problems," she said.

In Ikata, meanwhile, Saimu, whose husband led lawsuits nearly four decades ago to stop the plant from being built, continues to oppose the restart of Ikata's reactor 3. But she admits it's a tough job.

"It takes pretty much all of our effort just to oppose the Ikata plant. **The Fukushima meltdowns shattered the nuclear power safety myth. But now we have to translate that into political action,** and that can be quite hard," she said.

What to think of M. Yoshida?

June 11, 2013

Did late No. 1 plant head avert or facilitate nuclear crisis?

by Reiji Yoshida

Staff Writer

<http://www.japantimes.co.jp/news/2013/07/11/national/did-late-no-1-plant-head-avert-or-facilitate-nuclear-plan-crisis/#.Ud-oNqxSb9k>

When Masao Yoshida met reporters from major media outlets for the first time on Dec. 12, 2011, the then-chief manager of the Fukushima No. 1 plant left a strange impression on those present.

Yoshida remained calm and quiet throughout the joint interview, although he was known for exerting impassioned leadership that barely spared the nuclear plant from suffering the same explosive fate as Chernobyl, and thus mitigated the level of radioactive fallout in the Tohoku region.

“I apologize from the bottom of my heart. That’s the first thing I will say,” Yoshida told the reporters, saying the triple meltdowns had caused great trouble to everyone in Japan but especially those in Fukushima Prefecture.

Three days later, he left the plant and Tokyo Electric Power Co. later announced he had esophagus cancer. When Yoshida, 58, died of the cancer Tuesday after a long fight, the news made big headlines across the country.

A Tepco spokesman said the utility is not sure if he was aware of the disease at the time of his only news conference.

Many Japanese have praised his bravery in continuing to battle the crisis as well as the bureaucratic tendencies of Tepco’s top management.

Yet while not much spotlighted, Yoshida may have been partly responsible for ignoring the dangers of potentially giant tsunami and for not taking enough measures to bolster the plant against major damage, even though expert advisers in 2008 had warned Tepco about the threat.

Yoshida was known for a strong leadership style that kept united plant workers fighting the meltdown crisis that broke out in March 2011, triggered by the quake-tsunami disasters.

He became a national hero for containing the crisis. He even defied unreasonable instructions from senior management at Tepco's head office in managing the disaster, which only added to his reputation as a decisive leader who cared about his employees.

During a March 12, 2011, teleconference, Tepco executive Ichiro Takekuro ordered Yoshida to stop the critical injection of seawater into the wrecked reactor 1 despite the acute need for more coolant to prevent a catastrophic explosion.

Yoshida loudly told his staff to stop the injection, as ordered by Takekuro, but at the same time whispered to them that they should never actually do so. Experts later said Yoshida's judgment was spot on.

"The possibility was high that without him, the (Fukushima) crisis would have escalated further," former Prime Minister Naoto Kan wrote on his blog Wednesday, after learning of Yoshida's death.

"Whatever I asked, staff who came to the prime minister's office from Tepco's head office didn't give any organized answers. Yoshida clearly explained the situation. . . . I strongly felt you can trust this guy," Kan wrote.

But Yoshida was also a Tepco executive and may have been partly to blame for not preventing the disaster in the first place, as indicated in a 2011 interim report by an expert investigatory panel set up by the government.

According to the report, a panel of experts had pointed out to Tepco in February 2008 that the plant was vulnerable to a possible mega-quake and monster tsunami. Yoshida was then the head of Tepco's nuclear equipment management department.

Based on this warning, Tepco conducted a simulation and concluded that tsunami in excess of 10 meters could hit the Fukushima No. 1 power plant.

Yoshida and Sakae Muto, a fellow Tepco executive, were briefed about the simulation but they didn't take any effective measures, believing the projection was based only on a worst-case scenario and was thus unrealistic, the report showed.

Investigation into discharge of radioactive water in river used for irrigation

July 12, 2013

Probe launched after contractor JDC dumped radioactive water into river for irrigation in Fukushima

Kyodo

<http://www.japantimes.co.jp/news/2013/07/12/national/probe-launched-after-contractor-jdc-dumped-radioactive-water-into-river-for-irrigation-in-fukushima/#.Ud75HqxSb9k>

JDC Corp., a midsize general contractor, **discharged 340 tons of radioactive water into the Iizaki River, which is tapped for irrigation in Minamisoma**, Fukushima Prefecture, during government-sponsored decontamination work it was involved in, company sources said Thursday.

Local government officials claimed they were never informed of the action. But JDC sources said the dumping occurred after it received assurances from the Japan Atomic Energy Agency, which contracted it to carry out the decontamination work, that the state body had informed the local governments about the discharge in advance and no problem was anticipated.

The company had not been aware that water from the river would be used for agricultural purposes, the sources added.

A Minamisoma official said the city never received any explanation about the dumping, nor had Fukushima Prefecture, according to a prefectural official.

The Japan Atomic Energy Agency claimed it had verbally notified the city and prefecture, but had not established an agreement in writing.

The Environment Ministry is investigating, suspecting information was not properly conveyed in accordance with law.

The radioactive water was accumulated during agency-sponsored decontamination projects JDC was involved in between December 2011 and February 2012.

JDC engaged in radiation decontamination work in and around Kanabusa elementary school in Minamisoma and accumulated 609 tons of tainted water, according to JDC data made available to Kyodo News.

Of that amount, 269 tons was treated by specialists and the remaining 340 tons was discharged into the Iizaki River, which is used to irrigate rice paddies.

The discharged water included 60 tons with radiation levels at 100 to 121 becquerels per liter, exceeding the agency's maximum allowable standard of 90 becquerels, the company data indicate. Radioactive substances in the discharged water totaled 16 million becquerels.

The agency approved a JDC plan to transport radiation-contaminated water to a certain collection center in December 2011 and submitted the plan to the Minamisoma Municipal Government.

The city said that at the time, it had expected the tainted water to be taken away.

Gov't money allotted to decontamination work not used

June 12, 2013

State withholds more than 60% of Fukushima cleanup budget

<http://ajw.asahi.com/article/0311disaster/recovery/AJ201307120080>

THE ASAHI SHIMBUN

The central government held back more than 60 percent of the 255 billion yen (\$2.57 billion) recovery budget earmarked in fiscal 2012 for radioactive cleanup efforts overseen by municipal governments in Fukushima Prefecture.

The central government is directly overseeing cleanup efforts in the vicinity of the stricken Fukushima No. 1 nuclear power plant.

The central government has also set aside separate amounts to cover the expenses of decontamination work overseen by 36 municipal governments in Fukushima Prefecture. The cash has been deposited in a fund administered by the prefectural government.

It pays for the work initially, but later sends corresponding bills to Tokyo Electric Power Co., the plant operator.

The thriftiness is apparently partly due to consideration for TEPCO, which eventually has to cover the expenses of the cleanup. Rigorous restrictions apply.

The finding by The Asahi Shimbun raises questions over the consistency of the practice, given the Abe administration's official pledge to speed up the decontamination work.

It emerges that 158 billion yen in leftovers from the budget earmarked for the decontamination of radioactive fallout triggered by reactor meltdowns at the Fukushima plant following the 2011 earthquake and tsunami disaster was carried forward into the current fiscal year, which started in April.

Documents disclosed by the prefectural government showed that only 97 billion yen, or less than 40 percent of the allocated budget, was used in fiscal 2012. Thirty-two municipal governments carried over residual amounts into the current fiscal year, with 17 of them not even spending half of their allocations.

Nevertheless, the central government has set aside an additional 204.7 billion yen in the fiscal 2013 budget for cleanup work, including new cash injections into the prefectural fund.

Officials in municipal governments have pointed out that cleanup methods proposed by their governments are often rejected by the Environment Ministry, which strictly adheres to its rigorous decontamination guidelines. That comes on top of delays in securing land plots for hosting temporary waste storage depots and a shortage of cleanup workers.

The Environment Ministry holds meetings with municipal governments to decide on the applicability of decontamination methods in the absence of clear-cut standards. The ministry has so far refused to approve the replacement of drain spouts and the use of other costly cleanup methods.

An official with the ministry's Fukushima Office for Environmental Restoration told The Asahi Shimbun that **decisions are being made with TEPCO's opinions factored in.**

"We cannot approve methods that TEPCO does not approve," the official said.

A senior official with a different central government body expressed sympathy with the Environment Ministry's stance.

"It's only natural to negotiate matters so that TEPCO would not refuse payments," the senior official said.

So far, TEPCO has refused to pay 15.9 billion yen of the 21.2 billion yen in central government bills, citing ambiguities in the decontamination standards. **The central government is likely to end up paying the bills that TEPCO has refused to pay.**

Talks were held on 284 cleanup issues in fiscal 2012. **It can take up to six months before a conclusion is reached.**

"The cleanup processes will speed up only if the municipal governments are given the authority to make decisions," said an official with the Fukushima city government.

Ironically, the budget for decontamination processes, which the central government has pledged to promote on its own responsibility, has remained noticeably underused at a time when the national budget earmarked for other post-quake recovery efforts are found to have been diverted to apparently irrelevant purposes.

There is a strong sense of distrust among officials in municipal governments, who believe the central government is citing meticulous rules as a pretext to curb the use of the cleanup budget.

"We are discussing the cleanup processes with the Environment Ministry but we cannot disclose the details," a TEPCO representative said.

(This article was written by Shinichi Sekine and Eiji Zakoda.)

Japan Atomic Power Co challenges Tsuruga ban

July 16,2013-

**Utility seeks to overturn reactor ban
NRA judgment of active fault at Tsuruga plant challenged**
Kyodo, JJI

- <http://www.japantimes.co.jp/news/2013/07/16/national/utility-seeks-to-overturn-reactor-ban/#.UeZUfW1U2vM>

Japan Atomic Power Co. filed a petition Tuesday seeking to revoke the Nuclear Regulation Authority's instruction issued in May to assess how spent-fuel assemblies would be affected by movement in a fault that runs under one of its reactors at the Tsuruga nuclear plant in Fukui Prefecture.

The move by Japan Atomic Power, which is angling to restart the Tsuruga reactors, is aimed at countering NRA's conclusion that the fault is active.

This is the first protest filed by a power firm based on the administrative appeal law against the NRA since the regulatory body debuted last September.

A team of experts under the NRA compiled a report in May concluding that a crush zone under reactor 2 at the Tsuruga plant is an active fault requiring attention under seismic-resistant design guidelines for nuclear plants.

The NRA authorized the report and instructed the power company to submit an assessment by the end of July of how spent-fuel assemblies stored in a pool in the building housing reactor 2 could be affected by a quake.

In its objection, Japan Atomic Power requested the cancellation of the instruction, arguing that providing such an assessment would be tantamount to concluding the fault is active, which the firm denies.

The company argues that the NRA's conclusion about the fault is mistaken and therefore the instruction based on it is illegal.

At the same time, the company said it will submit an evaluation report later this month as instructed because it can't risk being penalized for not complying.

Last Thursday, Japan Atomic Power submitted a report to the NRA insisting that the fault shows no trace of movement during the past 120,000 to 130,000 years and therefore does not meet the definition of an active fault.

The NRA is now looking into that report.

Under the seismic-resistant design guidelines, no important structure in a nuclear facility can be built above an active fault.

Separately Tuesday, the NRA held its first meetings with power utilities to check whether their reactors satisfy the new safety requirements introduced following the 2011 Fukushima reactor meltdowns.

Four utilities have so far applied for the NRA's safety assessments on a total of 12 reactors for which restarts are being sought.

The new requirements, introduced July 8, oblige utilities to put in place for the first time specific countermeasures against possible severe calamities, like reactor core meltdowns, as well as against huge tsunami — the direct cause of the catastrophe at Tokyo Electric Power Co.'s Fukushima No. 1 complex.

Naoto Kan sues Abe for libel

July 17, 2013

Ex-prime minister sues Abe for libel over Fukushima comments

http://ajw.asahi.com/article/behind_news/politics/AJ201307170007

REUTERS

Japan's prime minister at the time of the 2011 Fukushima nuclear disaster said on July 16 he has sued the current premier, Shinzo Abe, for defamation over an article criticizing the emergency operation he supervised during the crisis.

Naoto Kan, a lawmaker for the opposition Democratic Party of Japan, took the highly unusual step only a few days before an Upper House election on July 21, in which nuclear power is one of the most hotly debated issues.

Kan has become a vocal opponent of nuclear power in the wake of the disaster, while Abe's ruling Liberal Democratic Party wants atomic energy to help pull the economy out of stagnation.

About two-thirds of the public opposes nuclear power.

Kan headed the government when an earthquake and tsunami killed nearly 20,000 people and set off the world's worst nuclear crisis in 25 years when the Fukushima No. 1 nuclear plant was destroyed, leaking radiation into the sea and air.

In an article from May 20, 2011, still visible on Abe's website, Abe criticized Kan for taking credit for the decision to cool the melting nuclear reactors with seawater. He said Kan had not been aware of the operation at first, then stopped it only to finally restart it after consulting experts.

“The content is based on totally false information. The article has severely damaged my honor,” Kan told a news conference at parliament, adding that he had asked Abe to remove the article several times.

Kan demanded that Abe immediately delete the story, apologize and pay 11 million yen (\$110,100) in compensation.

Kan has been credited with playing an important role in stopping the crisis from getting worse by preventing the operator of the crippled plant, Tokyo Electric Power Co., from abandoning the plant and pulling out its workers.

Cooling the nuclear reactors with seawater was seen as key to preventing the situation at the crippled plant from getting completely out of control.

All of Japan’s 50 nuclear reactors were shut down after the disaster.

A decision by the previous government to restart two of them last year was met with the biggest protests in decades and contributed to the government’s defeat in a December Lower House election.

Still, opinion polls show strong support for the LDP, buoyed by hopes that Abe’s hyper-easy monetary policy, public spending and structural reform will bolster growth and jolt Japan out of years of stagnation.

TEPCO trying to stop brain drain

July 20, 2013

TEPCO makes lump-sum bonus payment to managers to stop brain-drain

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201307200041>

By MARI FUJISAKI/ Staff Writer

Managers at Tokyo Electric Power Co. will receive a one-time payment of 100,000 yen (\$997) each, in a bid to boost morale and keep them from abandoning the embattled utility and operator of the crippled Fukushima No. 1 nuclear power plant.

Naomi Hirose, the corporate president, formally announced the plan during a news conference July 19, where he tried to allay possible complaints about the payment amid the protracted efforts to keep the situation at the crippled nuclear plant under control.

"The cleanup work, the decommissioning processes for the nuclear reactors, the making of damage payments, these all take workers and personnel to accomplish," Hirose said. "We have decided on the payment, despite its extremely unusual nature, to boost spirits and motivate the managers to do their jobs."

The lump-sum payment is scheduled to be made July 22. Only section chiefs and managers higher up are eligible for the payments because quite a number of them are currently being compensated less than the rank-and-file.

That's because the annual wages received by managers have fallen by as much as 30 percent since the onset of the Fukushima nuclear disaster in March 2011. Non-managerial employees have had their salaries cut by 20 percent. However, they are entitled to overtime pay, TEPCO officials said.

About 5,000 individuals are eligible for the one-time payments, which will cost TEPCO 500 million yen (\$4.9 million). **The payment has been made possible due to the 500 billion yen in cost cuts achieved in fiscal 2012**, which was 150 billion yen more than TEPCO had initially envisioned, officials added.

Customers are also bearing part of the burden due to electricity rate hikes by TEPCO.

From the onset of the nuclear crisis and until the end of June 2013, a total of 1,286 employees left TEPCO of their own volition. Fifty-one of those were section chiefs or higher, with many playing central roles in the Corporate Planning Department, which is responsible for mapping out the utility's post-crisis business recovery efforts, and the departments in charge of damage payments.

Blocking the brain-drain of core personnel has emerged as a major management challenge for TEPCO.

How reliable are WHO's data?

July 20, 2013

Question about the credibility of WHO data

Posted by **Mochizuki** on July 20th, 2013 ·

<http://fukushima-diary.com/2013/07/column-question-about-the-credibility-of-who-data/>

Last week, Tepco revised their own medical report.

The report is about the exposure dose of Fukushima workers. It was already submitted to WHO one year ago.

In the revised report, Tepco states about 2000 workers had significant thyroid exposure. It's 11 times much number as originally reported to WHO.

Why did they report 1/11 times smaller number in the beginning ?

As the reason, Tepco comments they were on the assumption that "some" workers took radioactive Iodine-131 in the middle of their working term in Fukushima nuclear plant instead of from the beginning of their working term.

"Some" workers mean FEMALE workers and supporting workers from other plants.

Half of Iodine-131 decays in 8 days. By assuming those workers didn't take it from the beginning, they can downplay the effect.

Women are more sensitive for radiation exposure. If Tepco admits they were significantly exposed, Tepco has to pay their medical care. Tepco has a lot of benefits from underestimating the actual exposure.

So far, Tepco hasn't announced they re-submitted the correct report to WHO.

If they don't, WHO would take another underestimated data of a nuclear accident.

There is a possibility that WHO collects data like this from around the world.

The fake science based on the countless lies is given the brand of "WHO".

We need to investigate the data collecting process of WHO.

Why so late?

July 22, 2013

TEPCO admits radioactive water leaked to sea

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201307220093>

THE ASSOCIATED PRESS

Tokyo Electric Power Co. has said its crippled Fukushima nuclear plant is likely to have leaked contaminated water into sea, acknowledging for the first time a problem long suspected by experts.

Experts have suspected a continuous leak since the Fukushima No. 1 plant was ravaged by the March 2011 earthquake and tsunami.

TEPCO had previously denied contaminated water reached the sea, despite spikes in radiation levels in underground and sea water samples taken at the plant.

Japan's nuclear watchdog said two weeks ago a leak was highly suspected, ordering the utility to examine the problem.

The company said July 22 that the leak has stayed near the plant inside the bay.

TEPCO is struggling to manage leaks of water used to cool the wrecked reactors, a risk hampering the plant's decommissioning efforts.

Tepco now admits radioactive water entering the sea at Fukushima No. 1

Fisheries exec shocked by utility's flip-flop on groundwater's flow

AFP-JIJI

<http://www.japantimes.co.jp/news/2013/07/22/national/tepcu-now-admits-radioactive-water-entering-the-sea-at-fukushima-no-1/#.Ue1bV6xSb9k>

Fukushima nuclear plant operator Tepco on Monday **admitted for the first time** that radioactive groundwater is flowing into the sea, fueling fears that marine life is being poisoned.

The admission came a day after voters handed the largely pro-nuclear Liberal Democratic Party of Prime Minister Shinzo Abe — and ally New Komeito — a handsome majority in the Upper House.

Earlier this month, Tokyo Electric Power Co. said groundwater samples taken at the battered plant showed that levels of cesium-134 had shot up more than 110 times in a few days.

Although unable to explain the increased readings, Tepco had nevertheless maintained the toxic groundwater was likely being contained, largely by concrete foundations and steel sheets.

"But now we believe that contaminated water has flowed out to the sea," a Tepco spokesman said Monday.

However, the spokesman insisted the impact of the radioactive water on the ocean would be limited. "Seawater data have shown no abnormal rise in the levels of radioactivity."

Tetsu Nozaki, chairman of Fukushima Prefectural Federation of Fisheries Co-operative Associations, voiced deep concern.

"It was quite shocking," he told NHK. "(Tepco's) explanation is totally different from the one in the past."

Fishing around the Fukushima plant was halted shortly after the crisis, and production of beef, milk, mushrooms and vegetables was banned in surrounding areas, crippling the prefecture's thriving fishing and agriculture industries.

Tepco, which is surviving thanks to a massive infusion of public funds, said it would step up efforts to reduce underground water by consolidating soil near its harbor.

Radioactive substances released by the reactor core meltdowns at the aging plant following the huge quake and tsunami of March 2011 have been leaking from damaged buildings and mingling with the ground water, which usually flows out to sea.

Environmental experts warn that the festering radioactive sore could contaminate the food chain by tainting marine life and ultimately, the humans who eat it.

Tepco said earlier this year that a fish found with radiation more than 2,500 times the legal limit had been caught in a port on Fukushima No. 1's premises. It also said last week that around 2,000 people who worked at the plant now face a heightened risk of thyroid cancer.

This is 10 times more than Tepco's previous estimate for potential thyroid cancer victims and came after the beleaguered utility was told its figures were too conservative.

Gov't : TEPCO always "one step behind the problems"

Jul. 23, 2013

Suga: TEPCO must stop leak quickly

http://www3.nhk.or.jp/nhkworld/english/news/20130723_27.html

Chief Cabinet Secretary Yoshihide Suga says the government will instruct the operator of Fukushima Daiichi to do a quick and secure job in preventing further leaks of radiation-tainted groundwater into the sea.

Tokyo Electric Power Company admitted for the first time on Monday that tainted water is seeping into the sea from the plant site, based on its analysis of water levels underground and in the adjacent sea.

High levels of groundwater contamination have been identified since May at the plant's monitoring wells.

Suga told reporters after the Cabinet meeting on Tuesday that the government views this as a grave matter.

He said the government will urge TEPCO to take necessary measures immediately and appropriately.

Suga said TEPCO had submitted some data to the Nuclear Regulation Authority last Thursday, but they were still not sufficient proof of leakage at that point.

He said the government believes that data should be made open to the public immediately, and that it will have the economy and industry ministry instruct the utility on transparency.

Economy and industry minister Toshimitsu Motegi criticized TEPCO, saying its release of data was too slow.

Jul. 23, 2013 - Updated 05:16 UTC

Industry ministry official slams TEPCO

http://www3.nhk.or.jp/nhkworld/english/news/20130723_05.html

A senior Japanese government official has criticized the operator of the crippled Fukushima Daiichi nuclear plant for failing to stop radioactive water leaking into the ocean.

Tokyo Electric Power Company officials announced on Monday that new findings suggest tainted water has been leaking into the ocean since April.

Officials from the Industry Ministry inspected the plant later on Monday. Senior vice minister Kazuyoshi Akaba says the situation is deplorable.

He says **TEPCO always seems to be one step behind the problems.**

TEPCO says the contamination has not spread beyond an area near the plant.

Workers are using chemicals to solidify the ground around the wells and the coastal area to stop further leakage.

BUt hasTEPCO any trust to damage?

July 23, 2013

TEPCO loses trust over leak of radioactive water into sea

<http://mainichi.jp/english/english/newsselect/news/20130723p2a00m0na011000c.html>

Tokyo Electric Power Co. (TEPCO) finally admitted on July 22 that radiation-tainted water has been seeping from the crippled Fukushima No. 1 nuclear plant into the sea.

Highly contaminated water was first found in an existing observation well at the nuclear plant on June 3. On numerous occasions since then, an increase in radiation levels had been measured in the sea and high concentrations of radioactive materials were detected in a new observation well, raising suspicions of leaks. But in an opinion on the cause of the increased levels, TEPCO had previously explained, "When contaminated water leaked from the vicinity of an intake of the No. 2 reactor in April 2011, right after the outbreak of the nuclear accident, some of it remained in the ground. We haven't seen any significant impact on the environment."

Contaminated water has continued to accumulate at a rate of 400 metric tons per day as a result of groundwater entering damaged reactor buildings at the Fukushima plant. As of July 16, roughly 75,000 tons of water had accumulated in the No. 1-4 reactor buildings. To reduce the amount of water building up, TEPCO initially planned to release groundwater that had not yet been contaminated into the sea, thereby limiting the amount of groundwater entering the reactor buildings.

However, small amounts of radioactive materials were detected in the groundwater, and local fisheries cooperatives objected to the plan due to fears it would spark harmful rumors about local marine resources. In the end the plan was derailed. Now, having admitted to a leak of contaminated water, the fishing industry's trust in TEPCO could diminish further.

The Nuclear Regulation Authority (NRA) pointed out this month that there were strong suspicions contaminated water had seeped into the sea. NRA Chairman Shunichi Tanaka stated, "Contamination of the sea, to a greater or lesser extent, is continuing," suggesting it was possible that contaminated water that had leaked from reactor buildings had mixed with groundwater and was flowing toward the sea.

On July 22, TEPCO finally released its analysis of data on the sea level and the water level in a buried observation well near the sea. This overturned previous views on the situation. The company had reported the data to the NRA on July 18.

Seiji Abe, a Kansai University professor familiar with public utilities, criticized TEPCO's handling of the situation.

"Its response damaged trust that urgently needed to be restored, and its actions were extremely problematic," he said. "The company still probably hasn't come to the realization that the monopoly it has had has created a wide gap between its reasoning and the public's demands."

The government has been involved in creating a roadmap to decommission the damaged reactors at the Fukushima plant. However, it has not had a direct hand in any onsite work.

"TEPCO is the one that's working on the scene," an official from the Ministry of Economy, Trade and Industry commented.

On the evening of July 22, Takeshi Takahashi, chief of the Fukushima No. 1 nuclear plant stabilization center, visited officials at the Fukushima Prefectural Government headquarters including Tetsuya Hasegawa, head of the living environment department, and explained the leaks.

"We apologize for causing concern. We'll take measures to prevent further leaks into the sea," Takahashi said.

Hasegawa responded with a demand that TEPCO take proper measures to stop radioactive materials leaking into the sea and identify the cause of the leak.

July 23, 2013(Mainichi Japan)

Fishermen in Fukushima angry at TEPCO over leak

http://www3.nhk.or.jp/nhkworld/english/news/20130723_42.html

Fishermen in Fukushima have expressed anger at Tokyo Electric Power Company's acknowledgement on Monday that contaminated underground water is seeping into the ocean.

About 100 fishermen attended a private briefing session on Tuesday by the operator of the crippled Fukushima Daiichi nuclear plant.

Officials from the utility reportedly said the contaminated water hasn't spread much. They also explained their plan to build walls along the coast to prevent tainted water from leaking into the ocean.

Some fishermen reportedly said Tokyo Electric Power Company officials may have deliberately concealed the information. Others said they cannot trust the firm.

Fishermen are also worried about the impact of the announcement on their plan to resume fishing on a trial basis in September.

The head of a local fisheries cooperative said they will not be able to reassure consumers by drawing a line in the sea to separate safe and contaminated areas.

He said TEPCO's announcement has dealt a serious blow to their plan to resume fishing.

Jul. 23, 2013 - Updated 10:36 UTC

TEPCO criticized for belated admission of radioactive leaks into the sea

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201307230066>

THE ASAHI SHIMBUN

FUKUSHIMA--Fukushima prefectural officials blasted Tokyo Electric Power Co.'s belated admission that radioactive water was leaking into the ocean from the damaged Fukushima No. 1 nuclear plant, even though the utility knew in January that water from a contaminated well had a direct channel to the sea.

TEPCO publicly admitted July 22 for the first time since suspicions emerged in June that radioactive substances from the reactors had likely leaked into the ocean.

The admission came after the utility announced June 19 that it had detected increased levels of radioactive substances in monitoring wells on the ocean side of the hobbled plant--a discovery it had sat on since May 31. It also knew months earlier before the confirmation that the wells where the radioactivity was detected were fluctuating in sync with tide levels.

TEPCO's Fukushima Revitalization Headquarters blamed the delay on announcing its findings on insufficient in-house communication.

"Our civil engineering department had confirmed water level variations in monitoring wells as early as in January," an official of the Revitalization Headquarters told the news conference on July 22, referring to the fact that such variations indicated that groundwater was likely mixing with seawater. That means contaminated groundwater had access to the sea. "But that information was not shared by our department responsible for monitoring radioactive levels."

The Fukushima prefectural government July 22 summoned TEPCO representatives to its offices to lodge a protest.

"It is truly regrettable that the insufficient sharing of in-house information resulted in a delay in safety measures being taken," the director-general of the prefectural government's Living and Environment Department, Tetsuya Hasegawa, told Takeshi Takahashi, head of the Fukushima No. 1 nuclear plant stabilization center, and other TEPCO representatives.

Hasegawa also called on TEPCO to take measures to prevent further leaks and to strengthen its monitoring operations.

"The people of Fukushima become more anxious every time they hear of more safety failures," he told the TEPCO representatives. "Please put that thought at the very center of your mind as you try to fix this situation."

Tetsu Nozaki, who heads the Fukushima Prefectural Federation of Fisheries Cooperative Associations, also voiced a renewed sense of distrust in the power company.

"Never have I felt so shocked since we first learned during the early phases of the nuclear disaster that radioactive water was leaking into the ocean," he said.

Nozaki said the fishermen's union had held discussions with TEPCO on measures to stop radioactive water from contaminating the ocean before the most recent admission.

"That premise is gone, and we now face a totally different situation," he said. "Before anything else, I want them to make every effort to stop the leaks as soon as possible."

Will the "pain" of pursuing nuke policy be more tolerable?

July 23, 2013

LDP executive: Abandoning nuclear energy would cause 'intolerable pain'

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201307230037>

THE ASAHI SHIMBUN

Terminating nuclear energy now because of the Fukushima nuclear disaster would inflict unbearable suffering on future generations in Japan, an executive of the ruling Liberal Democratic Party said.

"The world trend is to advance nuclear power generation," Hiroyuki Hosoda, the LDP's executive acting secretary-general, said on a TV program on July 22. "The argument that we should abandon everything because of the misfortune--the accident at the Fukushima No. 1 nuclear power plant operated by Tokyo Electric Power Co.--will cause future Japanese nationals intolerable pain."

Hosoda was elected from Shimane Prefecture, which is home to a nuclear power plant.

Although he was apparently trying to express the feelings of residents in Shimane Prefecture, his remark may spark criticism that he is being insensitive to the disaster victims in Fukushima Prefecture.

The LDP's policy chief, Sanae Takaichi, came under heavy fire last month for saying the Fukushima nuclear accident has not directly caused any deaths in her arguments for restarting nuclear reactors.

More than two years since the March 2011 earthquake and tsunami struck northeastern Japan and led to meltdowns at the Fukushima plant, about 150,000 residents of the prefecture are still living as evacuees.

Fishermen very angry with TEPCO

July 24, 2013

Fishermen slam tardy admission of radioactive flow into sea, of well levels in sync with tides

Tepco held back groundwater news

<http://www.japantimes.co.jp/news/2013/07/24/national/tepcO-held-back-groundwater-news/#.UfAFUaxSb9k>

Kyodo

Tokyo Electric Power Co.'s admission Monday that radioactive groundwater from under the disaster-struck Fukushima No. 1 nuclear plant has reached the Pacific Ocean came about a month after the problem was confirmed.

Tepco had been taking groundwater samples from wells near the shore at the crippled plant to test for radioactive substances. It claims it only recently realized the water levels in the wells rose when the ocean tides did.

Tepco's slow action and tardy revelation, coupled with an apparent lack of coordination within the utility in sharing crucial data about the case, is making local fishermen increasingly distrustful of the utility.

At a Tuesday briefing for fishermen in Iwaki, Fukushima Prefecture, the day after the groundwater leak was admitted, participants expressed anger at the utility, with one calling for someone to take responsibility.

Following the March 2011 nuclear meltdowns triggered by the massive quake and tsunami, fishermen in the prefecture voluntarily suspended operations.

Finally in June last year, they began trial fishing in a limited area in the north targeting selected types of fish.

Fisheries officials were also considering launching limited operations in waters off Iwaki in the south from September. Then came Tepco's admission.

"This will pose a significant hurdle to the trial operation. Even if we can catch fish, will we be able to tell consumers with confidence that they can eat them?" said Masakazu Yabuki, 76, head of the Iwaki fisheries cooperative.

The utility announced in mid-June that high concentrations of radioactive materials were detected in groundwater observation wells located by the sea. It kept downplaying its possible impact on the sea, saying it did not detect any changes in concentration levels in nearby seawater.

The utility's cautious attitude about announcing the radioactive groundwater flow seems to stem from its urgent need to take measures against the ever-increasing amount of nuclear contaminated water.

At the Fukushima No. 1 plant, a huge amount of water has been pumped into the three reactors that suffered meltdowns. The water was tainted with radioactive materials and recycled for cooling the reactors after removing radioactive cesium and salt content.

Also, about 400 tons of groundwater flows into its reactor building basements daily and gets mixed with the water used to cool the reactors, creating a new contamination problem.

As of July 2, about 400,000 tons of contaminated water was stored in tanks.

The utility had planned to pump out the groundwater and release it into the sea before it enters the ground under the buildings. But it has yet to carry out the plan because of opposition from local fishermen.

The fishermen's distrust grew further after a series of problems surfaced, including an error in the way Tepco checked the radiation levels of the groundwater it seeks to release into the sea.

Tetsu Nozaki, 58, chairman of the fisheries co-op association of the prefecture, said, "It has become emotionally difficult to accept (Tepco's groundwater release plan) due to the leakage of contaminated water (into the sea)."

The utility acknowledged the contaminated groundwater was reaching the sea after realizing that the water levels in the wells rose when the tides came up.

The data had been collected since January by Tepco's civil engineering department working to design a sunken wall to prevent the spread of radioactive materials in the local harbor but had not been shared within the company.

The department overseeing contaminated water became aware of the existence of the data around July 17, sources said.

Tepco informed the Nuclear Regulation Authority of the data the following day, but did not make a public disclosure until the following week, considering the impact it would have on the upcoming briefing, they said.

Fishermen exasperated

July 26, 2013

Fishermen lambaste TEPCO over radioactive water leaks

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201307260041>

THE ASAHI SHIMBUN

Representatives of Japan's national fishermen's federation visited Tokyo Electric Power Co. headquarters on July 25 to hand in a letter of protest over the recent leakage of radioactive water from the crippled Fukushima No. 1 nuclear plant into the sea.

"We are exasperated at the development, which is an act of treason to all fishing industry workers and to all members of the public in Japan," read part of the letter addressed to Naomi Hirose, the corporate president.

Hiroshi Kishi, head of the National Federation of Fisheries Cooperative Associations, and his fellow representatives also called on TEPCO to take every precaution to stop the leaks and monitor seaborne contamination more closely.

Tetsu Nozaki, head of the Fukushima Prefectural Federation of Fisheries Cooperative Associations, also attended the meeting.

Nozaki told reporters the latest development was the biggest scandal since the onset of the nuclear disaster, which was triggered by the March 2011 earthquake and tsunami.

"We will take prompt measures to stop the leaks into the ocean," Hirose told reporters after the meeting.

He also defended TEPCO's belated admission that radioactive water was leaking into the sea.

"We were cautious and collected more data, because the announcement was expected to have significant ramifications," Hirose explained.

TEPCO announced on June 19 that it had detected increased levels of radioactive substances in a monitoring well on the ocean side of the hobbled plant. TEPCO workers had obtained the analysis results on May 31.

It took TEPCO another month before it officially admitted on July 22 that the radioactive water was also likely leaking into the ocean.

July 25, 2013

Fishermen file protest against TEPCO over leaks

http://www3.nhk.or.jp/nhkworld/english/news/20130725_22.html

The head of a national federation of fisheries cooperatives has lodged a protest against the operator of the crippled Fukushima nuclear power plant after revelations that contaminated groundwater has leaked into the sea.

Federation chief Hiroshi Kishi visited the headquarters of Tokyo Electric Power Company on Thursday.

Kishi handed a letter of protest to TEPCO president Naomi Hirose. He said the federation has repeatedly asked the utility to ensure that no radioactive water reaches the sea. He accused TEPCO of betraying fishermen's trust.

Kishi demanded that TEPCO outline how it will contain tainted water accumulating in the complex. He said TEPCO must take immediate measures to stop the water leaking into the sea.

He also urged the power company to increase its monitoring for radioactive substances in waters near the plant.

Hirose said he would work to comply with the requests.

A representative of a fisheries cooperative in Fukushima accompanied Kishi. He said he wants TEPCO to know that the leaks of radioactive water are the worst mistake since the nuclear accident.

High concentrations of radioactive substances have been detected in monitoring wells near the shore at the plant as well as in adjacent waters. TEPCO admitted the leaks on Monday.

68% of firms handling decontamination in Fukushima violated labor laws

<http://mainichi.jp/english/english/newsselect/news/20130726p2a00m0na008000c.html>

FUKUSHIMA -- Sixty-eight percent of firms engaged in decontamination work in Fukushima Prefecture in the wake of the prefecture's nuclear disaster were found to have violated labor-related laws during a recent survey, the Fukushima Labor Bureau said.

The bureau announced July 24 that it has already instructed those companies to rectify their conduct. The bureau investigated 388 Fukushima workplaces between January and June this year, mainly through snap inspections, and confirmed a total of 684 violations at 264 offices, officials said.

Seventy percent of the misconduct involved violations of the Labor Standards Act, including 108 cases of unpaid overtime, 90 cases of undocumented payrolls and 82 cases of failure to present working conditions.

The remaining 30 percent involved violations of the Industrial Safety and Health Act. Failure to conduct research on radiation dosages prior to decontamination work was reported in 20 cases, followed by 16 cases of failure to provide workers with proper education on radiation and 14 cases of failure to monitor radioactive contamination levels after decontamination work had finished.

In addition, the bureau discovered 12 cases in which the special daily allowance for decontamination work (around 10,000 yen) had not been paid, and reported these cases to the Ministry of the Environment.

The bureau conducted a similar investigation between April and December last year, targeting 242 firms, and discovered that 45 percent were violating the laws. Officials attributed the large increase this time to the fact that more items had been added to the inspection list.

July 25, 2013

Rampant violations of labor-related laws in decontamination work

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201307250073>

THE ASAHI SHIMBUN

FUKUSHIMA--Nearly 70 percent of companies engaged in decontamination work in Fukushima Prefecture were found to be in violation of job-related laws, according to the Fukushima Labor Bureau. Of 388 companies, 264 firms, or 68 percent, had breached the Labor Standards Law or the Industrial Safety and Health Law in a total of 684 cases, the bureau said July 24.

The firms have been instructed to clean up their act, it added.

In on-the-spot inspections from January to June, the bureau uncovered 473 cases that violated the Labor Standards Law and 211 cases that breached the Industrial Safety and Health Law.

The Labor Standards Law violations included not clearly explaining the labor conditions, such as wages including the hazard allowance, and not paying wages.

The Industrial Safety and Health Law violations included not spending the required time for special safety education.

In March it was revealed by The Asahi Shimbun that some companies were not paying hazard allowances to decontamination workers and were instructing them not to talk about the non-payment to government inspectors.

When the labor standards inspection offices mount on-the-spot inspections, they have to implement them without giving advance notification to companies.

However, the Tomioka Labor Standards Inspection Office notified a company in advance. As a result, workers were instructed to lie to inspectors by saying they were receiving hazard allowance.

"In cases in which companies have to prepare related documents for our inspections, we notify companies of our inspections in advance," said Yasufumi Kikuchi, director of the bureau's labor standards department, on July 24.

"Because of that, the Tomioka case does not correspond to leakage of inspection-related information by staff of the inspection office," he said. "But the advance notification led to an undesirable practice (of instructing workers to lie to inspectors). So we have to review the advance notification system."

TEPCO "dodging responsibility"

Editorial: Time for TEPCO to stop dodging responsibility for radioactive water leak

<http://mainichi.jp/english/english/perspectives/news/20130724p2a00m0na001000c.html>

Tokyo Electric Power Co. (TEPCO), operator of the stricken Fukushima No. 1 nuclear plant, has admitted there is ground water contaminated with highly radioactive substances from the plant leaking into the Pacific Ocean. TEPCO officials said the leak "will have no effect on the coast," but it may very well cause yet greater economic damage to northeastern Japan by feeding public worries about local products.

The central and local governments plus TEPCO must step up off-shore radiation monitoring and make the results public. TEPCO must also move fast to stop the contaminated water from reaching the sea by installing barriers and improving the nuclear plant buildings' foundations.

TEPCO noticed the ground water problem after the water level in an observation well on the No. 1 plant grounds was seen rising and falling with the tides, leading utility officials to conclude that ground and sea water were mixing below the plant. As tritium makes up much of the leaking radioactive substances, TEPCO believes that polluted water in a service tunnel built on the seaward side of the plant is the source of the contamination.

The power company revealed all this on July 22. Severe contamination of the observation well, however, was confirmed all the way back on June 3. In the following days, TEPCO also confirmed that the concentration of radioactive substances in the local seawater was rising, and measured the concentrations

in the well water. During this time, the Nuclear Regulation Authority (NRA) also stated that it "strongly suspected" radioactive material was seeping into the ocean. Even so, TEPCO continued to insist that the elevated radiation levels were caused by "water that leaked near the No. 2 reactor intake port on April 2, 2011, some of which remained in the ground."

TEPCO was also late reporting a radioactive water leak from an underground storage tank in April this year -- yet another in a string of incidents that show the utility is treating fluctuations in radiation data too lightly, and is responding to these incidents too late as a result. TEPCO's predisposition to try and cover up problems has not changed at all, and we might go so far as to say the company lacks even the ability to take responsibility for the entire situation.

A portion of the data TEPCO finally revealed on July 22 was submitted to the NRA on July 18, and we have to wonder if the utility deliberately delayed releasing the full story so that it wouldn't impact the outcome of the July 21 House of Councillors election. TEPCO denies any such intention, but we remain doubtful.

Japan came in for harsh international criticism some two years ago -- soon after the March 2011 meltdowns -- for dumping contaminated water into the ocean. This time around, the NRA has said it plans to quickly establish a working group to investigate the seeping ground water. There are still many unknowns in the case, including how much contaminated water has made it to the ocean and exactly how it got there. We hope and expect that authorities will get a good grasp of the entire situation, evaluate the risks and take appropriate countermeasures.

However, even if the seepage is stopped, this case shows that the current plan to deal with radioactive water is on the brink of failure.

Even now, the flow of ground water beneath the No. 1 plant is increasing the volume of contaminated water at the rate of 400 metric tons per day. Meanwhile, a plan to redirect groundwater into the ocean before its contaminated has failed to gain the support of local fishing cooperatives. Another plan to freeze soil into a subterranean dam to keep ground water away from the plant isn't expected to be completed until fiscal 2015.

Dealing with the ground water problem is not part of the government's schedule for dismantling the shattered No. 1 plant reactors, and work on-site has yet to address the seepage directly. Contaminated ground water measures are, however, an essential part of any plan to decommission the reactors. We call on the government to do its utmost to address this problem, including explaining the reality of the situation to local residents and drawing up a budget estimate to deal with the issue.

Just didn't want to worry the public

July 27, 2013

TEPCO says was reluctant to worry public over leak

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201307270024>

THE ASSOCIATED PRESS

The operator of Japan's crippled nuclear plant said July 26 that it delayed acknowledging that the plant was leaking contaminated water into the sea because it did not want to worry the public until it was certain there was a problem.

Tokyo Electric Power Co. acknowledged for the first time this week that its Fukushima No. 1 plant was leaking contaminated underground water into the ocean, a problem many experts had suspected since shortly after the crisis unfolded more than two years ago.

The plant suffered multiple meltdowns after the March 2011 earthquake and tsunami destroyed its power and cooling systems.

After a major leak of contaminated water in April of that year, TEPCO said it had contained the problem, and denied there were any further underground leaks into the ocean until July 22.

TEPCO has repeatedly been criticized for delayed disclosures of problems and mishaps at the plant, which still runs on makeshift equipment and has been plagued with problems, including recent blackouts and minor water leaks from storage tanks.

TEPCO President Naomi Hirose said July 26 that the company delayed acknowledging contaminated water was leaking into the sea even though obvious signs of leaks were detected in May because officials were waiting until they were certain there was a problem before making such a "major announcement."

Hirose apologized for the delay and said that he and TEPCO executive vice president Zengo Aizawa would take a 10 percent salary cut for one month over the matter.

"Rather than proactively inform the public of potential risks, we retreated to negative thinking and tried to gather more data to ensure there was a problem because it was going to be a major announcement," Hirose said. "We've been trying to reform, but we repeated the same mistake. Obviously, our effort is not enough. We are really sorry."

TEPCO's quarterly meeting of its reform monitoring committee, which comprises four outside experts, was dominated by discussion of the water leaks on July 26.

The head of the reform committee, Dale Klein, said he was disappointed and frustrated by TEPCO's handling of the disclosure of the leaks.

"These actions indicate that you do not know what you're doing, and that you do not have a plan, and you're not doing all you can to protect the environment and people," Klein, former chairman of the U.S. Nuclear Regulatory Commission, said at the meeting.

On July 25, the chief of Japan's national federation of fisheries, Hiroshi Kishi, said TEPCO had betrayed the public by denying the leaks for more than two years and demanded the company take steps to stop the leaks immediately and step up monitoring of radioactivity in seawater near the plant.

TEPCO last detected spikes in radiation levels in underground and seawater samples taken at the plant in May. The company says the contamination is limited to just near the plant, but the extent of the contamination is unknown.

Most fish and seafood from along the Fukushima coast are barred from domestic markets and exports.

So what's new?

July 26, 2013

TEPCO provides conflicting accounts on toxic water leak

<http://mainichi.jp/english/english/newsselect/news/20130726p2a00m0na014000c.html>

Tokyo Electric Power Co. (TEPCO) was aware of a leak of contaminated water from the Fukushima No. 1 Nuclear Power Plant prior to its official announcement of the leak on July 22, the head of TEPCO's reconstruction headquarters in Fukushima Prefecture has suggested.

Headquarters chief Yoshiyuki Ishizaki said at a news conference on July 25 that he received an email from the utility's headquarters in Tokyo saying that TEPCO had no choice but to announce that radiation-tainted water from its crippled nuclear power plant had leaked into the Pacific Ocean.

While TEPCO had submitted data on the leak to the secretariat of the Nuclear Regulation Authority on July 18, the utility had thus far insisted that it couldn't explain the data until July 22.

After Ishizaki's news conference on July 25, TEPCO's public relations office said that it had no means to answer which email Ishizaki referred to. It said the office had heard TEPCO finished collecting data on July 21.

Ishizaki said he couldn't remember who sent him the email. He said the Tokyo headquarters' nuclear power division and the Fukushima No. 1 power station team determined that contaminated water was spilling out into the sea. The Fukushima reconstruction head office was not involved in determining the situation, he added.

When asked by reporters if TEPCO had delayed the announcement due to a possible impact on the House of Councillors election on July 21, the public relations office denied it.

Is it "just" fear?

July 28, 2013

Fukushima: evolving fear into fact

by David Roberts and Ted Lazo

http://www.japantimes.co.jp/opinion/2013/07/28/commentary/fukushima-evolving-fear-into-fact-2/#.UfZk_KxSb9k

BANGKOK – Masao Yoshida had been the chief manager of Japan’s Fukushima Daiichi (No. 1) nuclear power plant for just nine months when, on March 11, 2011, a massive earthquake and tsunami triggered a triple nuclear reactor meltdown. The plant spewed radioactive material into the air and water, terrifying the Japanese public and much of the world.

Yoshida’s death last week from cancer under the pall of that nuclear disaster brings to mind how vulnerable facts can be to distortion.

In the accident’s wake, a lack of trustworthy information — and an abundance of misinformation — fueled fear among the public, both in Japan and abroad. As we learned from the Three Mile Island (United States) and Chernobyl (Ukraine) accidents, stress can be at least as harmful as the radiation exposure itself. Thus, a veracity rating in the same spirit as The Washington Post’s Fact Checker, which rates the reliability of politicians’ statements in “Pinocchio” units, may help to save lives in future public health crises.

A fearful public quickly lost confidence in official communications channels after repeated failures. People looked instead to the news media for information, but the media could not be relied on fully, either, with even the most respected outlets unnecessarily feeding public anxiety.

Accurate information was understandably difficult to obtain in the weeks immediately following the accident, but misinformation persisted even when scientific data on radiation levels and reactor stability had become more readily available. Even The New York Times, which provided some truly excellent on-the-ground reporting, contributed at times to public alarm during the recovery, owing to misleading — and sometimes incorrect — statements. Three examples of reporting that was clearly flawed at the time, not just in hindsight, demonstrate the point:

(1) In October 2011, the *Times* compared radiation levels in “hot spots” in Tokyo to “some contaminated areas around Chernobyl.” The information was technically accurate, but the menacing impression of pockets of radioactive apocalypse was not.

The article uses the reference point of “37,000 becquerels per square meter, the level at which zones were considered contaminated at Chernobyl,” but fails to mention that this boundary is for the most peripheral of the Chernobyl-contaminated zones and is considered habitable.

The associated potential “dosage of more than one millisievert per year” could more comprehensibly (and much less frighteningly) be likened to the approximate difference in additional annual radiation exposure that the average U.S. resident experiences compared to the average Japanese due to natural background

radiation. Even this non-Chernobyl comparison overstates the real dose, as it is analogous to a large contamination zone rather than a localized “hot spot.”

(2) Likewise, the following January, the Times reported that Japan’s government would soon impose stricter food-safety radiation regulations, “bringing Japan in line with most developed countries.” This statement, made in passing, wrongly implied that Japan’s regulations at the time were notably lax, heightening the paranoia about what were already some of the world’s most strictly radionuclide-regulated food supplies (even before restrictions were further tightened).

(3) Two months later, in an ominously titled article, “Japan Nuclear Plant May Be Worse Off Than Thought,” the Times called into question the stability of one of the reactors. After citing test results showing that water levels in fuel-containment vessels were lower than expected, the article described worst-case scenarios, such as overheating and leakage of contaminated water into the ground or ocean. But the Times neglected to mention that tests of the water’s temperature conducted simultaneously actually suggested that the situation was stabilizing.

Fearful communities are deeply affected by this type of reporting. While enormous amounts of time and resources have been dedicated to learning the technical lessons of the Fukushima accident (and rightly so), not enough have been spent on trying to understand and address the damage to public health caused by misinformation.

Ideally, trusted experts would regularly be on hand to inform a more scientifically literate public and press.

What could be done now to improve post-crisis reporting would be to introduce a sort of scientific ombudsman — someone with strong credentials, access to the world’s leading experts, and a talent for communicating technical concepts to the general public effectively.

International news sources could employ such a person expressly to assess statements issued by governments, journalists, and commentators on large-scale public health crises such as nuclear accidents, epidemics, and oil spills.

In the wake of the Fukushima meltdown, a **trusted expert** [?] handing out veracity scores, or “Pinocchios,” in a respected newspaper would have given the public a greater sense of certainty in an atmosphere of fear and mistrust. That would certainly have been extremely popular among a public desperate for reliable information.

One hopes that, during the next major public health crisis, when people are foundering in a sea of unverified, often-alarming information, such a system will be in place to help keep everyone afloat.

David Roberts is former science adviser to the U.S. ambassador to Japan. Ted Lazo is deputy division head for radiation protection at the OECD Nuclear Energy Agency. © 2013 Project Syndicate (www.project-syndicate.org)

Fukushima: An emergency to be treated as such

July 31, 2013

EDITORIAL: Incompetent TEPCO should never be allowed to handle nuclear energy

<http://ajw.asahi.com/article/views/editorial/AJ201307310031>

Has Tokyo Electric Power Co. learned nothing over the past two years and four months since the nuclear disaster started at the Fukushima No. 1 power plant?

We cannot help but ask this question in light of the utility's appallingly shoddy handling of radioactive water that is leaking from the crippled plant into the sea. We must also note that the Nuclear Regulation Authority and the Agency for Natural Resources and Energy of the Ministry of Economy, Trade and Industry, which are responsible for overseeing TEPCO's operations, can hardly be said to be living up to their responsibilities.

Water is still being pumped into the plant's crippled reactors to cool them. Some of the water that became polluted upon contact with radioactive materials has seeped into the ground and leaked into the sea. At the No. 3 reactor, highly radioactive "mystery steam" has been spotted.

The fact that radioactive substances are still being released into the ground, the sea and the air is irrefutable proof that the nuclear disaster of March 2011 is not over. The responsible parties must take this situation gravely and treat it no differently from **an emergency**.

When dealing with an accident or a disaster, the most important thing is to assess the situation accurately and disclose the findings as soon as possible. If the overall picture remains elusive, educated guesses must be made to anticipate the outcome and minimize potential damage.

How has TEPCO acted? After radioactive substances were detected in late May in well water on the coastal side of the reactor buildings, it took the company quite some time to finally admit the possibility that contaminated water was leaking into the sea. And although there was information that the level of the well water was linked to the ocean tide, this vital information was not shared among TEPCO staff.

TEPCO confirmed on July 18 that the leak into the sea had occurred, and President Naomi Hirose on July 19 ordered that directives be issued to the local fisheries community and others. Yet, no official announcement of the leak was made until a regular news conference on the evening of July 22.

The utility's glaring ineptitude with crisis management was noted right from the start of the Fukushima disaster. How and why could TEPCO have kept repeating the same blunders over and over? Did the utility even bother to examine its missteps? Or did it simply fail to learn from them?

The news conference in question took place **the day after the July 21 Upper House election. TEPCO insists this was mere coincidence, but it is only natural to suspect that the announcement was perhaps delayed intentionally to avoid influencing the voters.**

TEPCO intends to restart the Kashiwazaki-Kariwa nuclear power plant in Niigata Prefecture, but we have zero faith in the utility's reliability as an operator of any nuclear power plant. In fact, allowing the company to handle nuclear energy is simply out of the question.

The entire company now needs to be focused on preventing radioactive substances from escaping into the environment.

Questions are also being raised about the competence of the nation's nuclear watchdogs in handling nuclear mishaps.

The NRA, for instance, should now be directing every aspect of the Fukushima disaster cleanup work, even if it means putting on hold the screening of applications from other utilities to restart their nuclear power plants.

Are the new safety regulations adequate enough to prevent radioactive water from flowing into the sea in the event of a major nuclear accident? We call on the NRA take a good, hard look at this matter upon thorough examination of the Fukushima leakage case.

--The Asahi Shimbun, July 29

TEPCO controls all information

July 31, 2013

Yet more Tepco incompetence

<http://www.japantimes.co.jp/opinion/2013/07/31/editorials/yet-more-tepco-incompetence/#.UfoWMqxSb9k>

Tokyo Electric Power Co. on July 22 finally admitted that radioactive water is leaking from its stricken Fukushima No. 1 nuclear power plant into the Pacific Ocean. The admission came more than 50 days after the company detected a high concentration of tritium on May 31 in a ground water sample taken 25 meters from the sea. Tepco had long refused to admit such a leak although experts stressed the possibility.

Tepco's belated admission shows that it lacks the ability to prevent the leakage of radioactive substances into the environment and does not have a proper sense of its responsibility to protect the environment from radioactive contamination.

On June 19 a high concentration of radioactive strontium was detected again in the same groundwater. Although Tepco made its findings public, it said it did not think that the contaminated groundwater was flowing into the sea. On June 24, Tepco said a high concentration of tritium was found in seawater near the plant. On June 29, a high concentration of radioactive substances was detected in a well about four meters from the sea.

On July 10, the Nuclear Regulation Authority (NRA) officially announced that radioactively contaminated water was seeping into the ground and flowing into the sea. But Tepco said that it "could not make a definitive answer" because it lacked relevant data.

It wasn't until July 17/18 that Tepco said that it discovered that data did exist in the company that showed a correlation between the groundwater level and the sea tide level. Tepco then finally admitted that the radioactive groundwater was leaking into the sea. It is deplorable that various Tepco departments failed to share critical data with one another.

Tepco has been postponing taking drastic measures to prevent the leakage of radioactive groundwater into the sea, and because **it controls all information**, it is very difficult for outside groups to know what is going on and to ensure the crisis is being managed correctly. Tepco's monopoly of data and its unilateral decisions on what to do with it must come to an end.

Every day about 400 tons of groundwater flowing into the plant buildings becomes radioactive as it mixes with water that has been used to cool the reactor cores. But Tepco has not worked out a way to prevent this. On July 27, Tepco announced that it had detected 2.35 billion becquerels of radioactive cesium and 750 million becquerels of other, unnamed radioactive substances per liter in water from a cable trench as close as 50 meters to the sea.

If **outside experts** had been able to examine Tepco's data and worked with the company to prevent the leakage of contaminated groundwater, the current situation could have been avoided. **A system for the NRA and other experts, both Japanese and foreign, as well as the government to not only oversee Tepco's handling of the nuclear crisis but actively participate in the process, must be established.** The latest development underlines the need to thoroughly discuss whether Tepco has the ability to properly operate nuclear power plants.

TEPCO's 2-year inaction - Sealing work too difficult

August 1, 2013

TEPCO did nothing about radioactive water leak for 2 years

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201308010053>

THE ASAHI SHIMBUN

The operator of the crippled Fukushima No. 1 nuclear power plant sat on its hands for more than two years despite having pledged to seal a leaking hole in a turbine building, The Asahi Shimbun has learned.

Tokyo Electric Power Co. said in April 2011, just one month after the Great East Japan Earthquake and tsunami triggered the Fukushima nuclear disaster, that it would block the connection between a turbine building and an underground pit to prevent radioactive water from leaking into the sea. However, the utility only began preparing for shielding tests this summer, after contaminated water was found to be leaking into the sea.

TEPCO's inaction is likely responsible for the spread of radiation.

During the early phases of the nuclear meltdowns, water, used to cool the overheating reactors, filled the reactor and turbine buildings as well as adjacent underground pits.

On March 27, 2011, TEPCO workers found that radioactive water, measuring more than 1,000 millisieverts per hour, lay in an underground pit adjacent to the turbine building for No. 2 reactor. The following day, at a news conference to announce the findings, TEPCO officials explained that the tsunami had likely broken open a barrier between the underground pit and the basement level of the turbine building, thereby creating a water channel.

One TEPCO official, answering a question from an Asahi Shimbun reporter on that occasion, acknowledged the possibility that radioactive water could seep from pit joints out into the ground and eventually reach the sea.

Radioactive water was found leaking into the sea near a water intake for the No. 2 reactor on April 2, 2011. The leak was plugged four days later.

On April 17, 2011, TEPCO released a road map toward bringing the nuclear crisis under control. To illustrate the measures it had "considered" or "taken" to prevent a recurrence of the leak from the No. 2 reactor, the utility released a public announcement that explicitly mentioned "shielding the connection between the pit and the turbine building," alongside two other measures it had already taken.

TEPCO, in fact, had yet to seal that connection, and left it unattended afterward. Officials of the utility apparently believed that stopgap measures, which consisted of using concrete and crushed stone to seal the seaward end of the pit, were sufficient.

TEPCO said in June this year it had detected high levels of radioactive substances in groundwater sampled from a well on the ocean side of the turbine buildings. The utility, which acknowledged July 22 that radioactive water was leaking into the sea, came under fire when it was uncovered that its officials had reached that conclusion on July 19.

Experts believe some of the radioactive water lying in pits likely seeped out into the ground and eventually reached the ocean.

TEPCO officials have said the turbine building remains connected with the pit, which means highly radioactive water may still be leaking.

In response to questions from The Asahi Shimbun, TEPCO officials insisted that the act of sealing the seaward end of the pit constituted "shielding the connection between the pit and the turbine building" as stated in the announcement material.

The utility did consider plugging up the leak hole in the turbine building after it put together a set of "reliability enhancement measures" in May 2012 at the behest of the government, but **the sealing work "has not been done to this day because of the (technical) difficulties involved,"** the officials added.

(This article was written by Senior Staff Writer Toshihiro Okuyama and Toshio Tada.)

Nuclear victims cost too much

August 1, 2013

Gov't agencies secretly agreed to put off nuke disaster victim relief until after election

<http://mainichi.jp/english/english/newsselect/news/20130801p2a00m0na011000c.html>

The Reconstruction Agency secretly agreed with other government agencies to postpone assistance to nuclear disaster victims until after the July 21 House of Councillors election, sources close to the government have revealed.

According to the sources, the Reconstruction Agency and other relevant ministries and agencies agreed in March to put off until after the upper house poll a decision over which organ would lead consideration into radiation dose standards, a crucial step for formulating concrete support measures for nuclear disaster victims under the Act on the Protection and Support for the Children and other Victims of TEPCO Disaster. The law, which is designed to assist residents in areas whose radiation doses surpass certain criteria, is overseen by the Reconstruction Agency.

Such a behind-the-curtain move comes in disregard of nuclear victims' repeated calls for swiftly drawing up support measures, in the face of the prolonged indecision over the radiation dose criteria since the law's enactment on June 21 last year.

The secret agreement had apparently been mentioned in a controversial Twitter comment by a former senior Reconstruction Agency official, who tweeted on March 8, "One of the pending issues was resolved today. To be precise, the concerned parties agreed to leave the matter ambiguous, without determining black or white." The former official, who was in charge of the law for supporting Fukushima victims, was later punished for repeatedly slandering lawmakers and an NGO on his private Twitter account in connection with their recovery efforts.

Because any decision on the dose criteria, based on which the government's medical and life support for children and other residents was to be determined, could draw criticism, the government agencies apparently weighed the possible effects that the decision could have on the upper house race. Almost five months after the secret agreement, examination of the dose criteria has yet to begin.

According to the government sources, the Reconstruction Agency in February sounded out the Nuclear Regulation Authority (NRA) on its intention to draw up dose criteria for the disaster support law, but the

NRA lashed back, saying, "It's not an issue to be decided from a scientific perspective." The NRA oversees the Radiation Council, which is tasked with deliberating radiation exposure standards.

Despite nearly a month of discussions by the Reconstruction Agency, the NRA and the Cabinet Office's Support Team for Residents Affected by Nuclear Incidents, no conclusion was made over which organization would take on the formulation of the dose criteria. The Cabinet Office's support team is in charge of residents' return to areas affected by the nuclear disaster.

Since February, the meetings of section chiefs and counselors of those government bodies were held at the initiative of the Reconstruction Agency, where a decision to postpone consideration on the dose criteria until after the upper house election was eventually made.

Among the attendants of the meetings was a Reconstruction Agency counselor belonging to its "Fukushima team" -- to which the former counselor who was reprimanded for his defamatory tweets also belonged. The meeting was indeed held on March 8, the day the punished counselor tweeted that "One of the pending issues was resolved today." The meeting has since been held about twice a month, joined also by the Ministry of the Environment, which is in charge of decontaminating radioactive materials emanating from the Fukushima nuclear disaster.

While the national standard dictates that the limit of annual accumulated radiation exposure doses for general members of the public be up to 1 millisievert, the government raised the criteria to 20 millisieverts in demarcating evacuation areas for Fukushima disaster victims. Meanwhile, the abovementioned disaster relief law stipulates that residents who voluntarily evacuated from areas not designated as evacuation zones are also covered by support measures if the radiation doses in those areas exceed certain criteria. While citizens groups supporting nuclear disaster victims claim that the dose criteria should be set at 1 millisievert per year, **the government maintains reservations about the decision because extending the areas covered by government support could inflict heavy financial burden on the government.** Consideration of the dose criteria also involves a political decision, while disaster victims are expected to react with a backlash depending on the results of the move.

On March 7, Reconstruction Minister Takumi Nemoto stopped short of specifying the deadline for determining the dose criteria at the Nuclear Emergency Response Headquarters, saying, "It is necessary to obtain public understanding based on objective evidence." Nemoto added that the headquarters was to present a view by the end of the year on measures to reduce radiation exposure in preparation for residents returning to their hometown.

In response to an inquiry by the Mainichi, the Reconstruction Agency's public relations section stated, "We'd like to withhold from comments on the content of measures (mentioned in the March 8 tweet). Since March 7, officials including section chiefs and counselors of concerned ministries and agencies have held meetings on an irregular basis, but the former counselor (who was punished for his Twitter slanders) did not take part in those meetings."

Slow restart bothers some

August 2, 2013

Slow reactor restart process rattles energy markets as uranium piles up

<http://www.japantimes.co.jp/news/2013/08/02/business/slow-reactor-restart-process-rattles-energy-markets-as-uranium-piles-up/#.UfvaX6xSab0>

Bloomberg

MELBOURNE – Uranium prices are showing little sign of recovery after sinking to their lowest levels in more than seven years amid a glut of the radioactive metal and speculation Japan will delay restarting its reactors.

Prices may average \$42.82 a pound (.45 kg) this year, according to Morgan Stanley, while Bank of America Corp. is predicting \$43.80.

BMO Capital Markets, which cut its price estimate by 10 percent in July, forecasts \$43 a pound. Uranium has averaged \$40.94 so far in 2013 after sliding to \$34.50 in July, the lowest price since November 2005.

While Japanese power producers including Tokyo Electric Power Co. are seeking to restart reactors as soon as possible as the cost of other fuels escalates, operations may not resume until next year, according to Deutsche Bank AG.

That's threatening to delay a rebound in demand for uranium, hurting miners such as Australia's Paladin Energy Ltd. as supplies outstrip demand. **There is about 60 million pounds of surplus uranium around the world**, according to Cantor Fitzgerald LP.

"The process for restarts is clearly going to take some time," said Jonathan Hinze, a senior vice president at Ux, which provides research on the nuclear industry. "Japanese utilities are unlikely to require any new fuel until 2014 at the earliest. There is a realization that the uranium demand from Japan is unlikely to dramatically change anytime soon, especially this year."

Uranium for immediate delivery has dropped as much as 21 percent this year, extending a 17 percent decline in 2012, according to data from Ux. Prices slumped 12 percent in July, the biggest monthly loss since March 2011. They climbed as high as \$152 in June 2007.

"The weakness in uranium prices is partially attributable to uncertainty surrounding the timetable for reactor restarts in Japan," John Borshoff, the chief executive officer of Australia-based Paladin Energy, said in the company's quarterly production report July 16.

The Nuclear Regulation Authority, which assesses the safety of reactors, began receiving applications for restarts on July 8. Tepco will seek permission to resume operations at its Kashiwazaki-Kariwa atomic plant in Niigata Prefecture as soon as possible, it said July 2.

Five reactors may be restarted this year, according to the median estimate of 13 analysts and producers compiled by Bloomberg in June. As many as 10 restarts were predicted in the survey.

"Restarts in Japan and any indication serving to confirm that most of the country's reactors will again be operating should provide comfort to the market that the country's record-high uranium inventories will not be dumped," said David Sadowski, an analyst at Raymond James Ltd. who predicts prices may increase to more than \$50 a pound in 2014. "This should spur other buyers, many of whom have been sitting on the sidelines."

All but two of Japan's 50 reactors remain idle due to the Fukushima disaster and must meet stricter safety standards set by the NRA before they can be restarted. Four utilities have applied to restart 12 idled reactors. That will probably happen early next year, Bank of America said in a July 16 report.

"The timing of restarts appears slower than our estimates," Peta Arnott, a research analyst at Bank of America in Sydney, said in the report, predicting six reactors will resume operations in the second half of this year. This may be a "negative near-term drag on uranium spot pricing," Arnott said.

The reactor review process is likely to take six months for each one, Deutsche Bank said in a July 15 note, citing NRA Chairman Shunichi Tanaka. An evaluation of all of Japan's reactors may take more than three years and the first units may be restarted in February, Deutsche said.

Conspicuous indeed

August 1, 2013

35% of reconstruction budget unused as decontamination and other key projects stalled

<http://mainichi.jp/english/english/newsselect/news/20130801p2a00m0na009000c.html>

About 35.2 percent of the 9.74 trillion yen fiscal 2012 budget for reconstruction of areas hit by the Great East Japan Earthquake has gone unused, as key projects such as decontamination of soil in Fukushima Prefecture were not carried out as smoothly as originally planned.

Of the total money unused, 2.2 trillion yen was reallocated for reconstruction work to be done in fiscal 2013, while the remaining 1.2 trillion yen was transferred to the Special Account for Reconstruction from the Great East Japan Earthquake as disused funds. Because the special account for reconstruction is largely based on special tax increases for reconstruction and other revenues, it should be used effectively and efficiently. Although Prime Minister Shinzo Abe's government vowed to "speed up reconstruction," it seems to be easier said than done.

About 64.8 percent of the reconstruction budget for fiscal 2012 was used, slightly higher than 60.6 percent in fiscal 2011. Chief Cabinet Secretary Yoshihide Suga said at a news conference on July 31, "We have been taking all necessary measures" to use reconstruction budgets. But he also said, "It is difficult to do so, as there are projects for which agreements with local residents are prioritized."

In addition to the need to secure agreements with local residents, Reconstruction Minister Takumi Nemoto said, "Problems such as shortages of staff and materials emerge at the time of implementation (of projects)." The Reconstruction Agency says the budget was not fully used partly because it had secured extra funds for the reconstruction budget in order to prevent necessary projects from being left out due to a lack of funding.

The agency says it has already decided how to use the reallocated funds in fiscal 2013 and thereafter. Therefore, it says, "The ratio of budget execution becomes higher if it is calculated based on contracts." Unused funds can be reallocated only twice.

The disused funds that emerged after projects were cancelled were transferred back to the special account for reconstruction before possibly being used again for reconstruction projects by fiscal 2014. The unnecessary funds include: 221.5 billion yen for reconstruction of facilities for the agriculture, forestry and fisheries industries; 185.8 billion yen for reconstruction of public works facilities; 140.1 billion yen to help disaster-stricken people rebuild their livelihoods; 101.1 billion yen for decontamination of soil and the like. The agency says the reconstruction work has stalled because it has spent much time coordinating with local residents and local governments.

Conspicuously, 32.1 percent of the budget for decontamination work was unused in fiscal 2012. The budget is supposed to be used for decontamination in 11 municipalities in Fukushima Prefecture that were designated as evacuation zones and were subject to decontamination work to be done by the central government as well as in 101 municipalities outside evacuation zones that were designated as "priority areas" for decontamination. But the decontamination work has not been carried out as fast as originally scheduled.

Behind uranium prices

August 2, 2013

Slow reactor restart process rattles energy markets as uranium piles up

<http://www.japantimes.co.jp/news/2013/08/02/business/slow-reactor-restart-process-rattles-energy-markets-as-uranium-piles-up/#.UfvaX6xSab0>

Bloomberg

MELBOURNE – Uranium prices are showing little sign of recovery after sinking to their lowest levels in more than seven years amid a glut of the radioactive metal and speculation Japan will delay restarting its reactors.

Prices may average \$42.82 a pound (.45 kg) this year, according to Morgan Stanley, while Bank of America Corp. is predicting \$43.80.

BMO Capital Markets, which cut its price estimate by 10 percent in July, forecasts \$43 a pound. Uranium has averaged \$40.94 so far in 2013 after sliding to \$34.50 in July, the lowest price since November 2005.

While Japanese power producers including Tokyo Electric Power Co. are seeking to restart reactors as soon as possible as the cost of other fuels escalates, operations may not resume until next year, according to Deutsche Bank AG.

That's threatening to delay a rebound in demand for uranium, hurting miners such as Australia's Paladin Energy Ltd. as supplies outstrip demand. **There is about 60 million pounds of surplus uranium around the world**, according to Cantor Fitzgerald LP.

"The process for restarts is clearly going to take some time," said Jonathan Hinze, a senior vice president at Ux, which provides research on the nuclear industry. "Japanese utilities are unlikely to require any new fuel until 2014 at the earliest. There is a realization that the uranium demand from Japan is unlikely to dramatically change anytime soon, especially this year."

Uranium for immediate delivery has dropped as much as 21 percent this year, extending a 17 percent decline in 2012, according to data from Ux. Prices slumped 12 percent in July, the biggest monthly loss since March 2011. They climbed as high as \$152 in June 2007.

"The weakness in uranium prices is partially attributable to uncertainty surrounding the timetable for reactor restarts in Japan," John Borshoff, the chief executive officer of Australia-based Paladin Energy, said in the company's quarterly production report July 16.

The Nuclear Regulation Authority, which assesses the safety of reactors, began receiving applications for restarts on July 8. Tepco will seek permission to resume operations at its Kashiwazaki-Kariwa atomic plant in Niigata Prefecture as soon as possible, it said July 2.

Five reactors may be restarted this year, according to the median estimate of 13 analysts and producers compiled by Bloomberg in June. As many as 10 restarts were predicted in the survey.

"Restarts in Japan and any indication serving to confirm that most of the country's reactors will again be operating should provide comfort to the market that the country's record-high uranium inventories will not be dumped," said David Sadowski, an analyst at Raymond James Ltd. who predicts prices may increase to more than \$50 a pound in 2014. "This should spur other buyers, many of whom have been sitting on the sidelines."

Four utilities have applied to restart 12 idled reactors. That will probably happen early next year, Bank of America said in a July 16 report.

"The timing of restarts appears slower than our estimates," Peta Arnott, a research analyst at Bank of America in Sydney, said in the report, predicting six reactors will resume operations in the second half of this year. This may be a "negative near-term drag on uranium spot pricing," Arnott said.

The reactor review process is likely to take six months for each one, Deutsche Bank said in a July 15 note, citing NRA Chairman Shunichi Tanaka. An evaluation of all of Japan's reactors may take more than three years and the first units may be restarted in February, Deutsche said.

NRMC urges TEPCO on safety

August 5, 2013

05.08.2013_No193 / News in Brief

Committee Criticises Tepco On Safety Reforms And Communications

<http://www.nucnet.org/all-the-news/2013/08/05/committee-criticises-tepco-on-safety-reforms-and-communications>

Security & Safety

5 Aug (NucNet): A committee headed by the former head of the US Nuclear Regulatory Commission has urged Tokyo Electric Power Corporation (Tepco) to speed up nuclear safety reforms and has criticised the company's attitude towards disclosing information.

Dale Klein, chairman of the Nuclear Reform Monitoring Committee (NRMC), urged Tepco to speed up its efforts under a nuclear safety reform plan, and to solve issues at the Fukushima-Daiichi nuclear plant such as contaminated water leaking from storage tanks.

Mr Klein criticised Tepco's attitude towards information disclosure, saying, "This lack of an effective communication programme diminishes the hard work a lot of people have been doing for Tepco."

Mr Klein is chairman of the NRMC, which includes nuclear experts from both Japan and abroad. The third-party committee was set up in September 2012 to oversee the reform of Tepco's nuclear power division with an eye towards restarting reactors that have been offline since the March 2011 Fukushima-Daiichi accident.

The Japan Atomic Industrial Forum (Jaif) said the NRMC reports to Tepco's board of directors.

Jaif said the NRMC has finalised a report on its monitoring of Tepco's progress with safety reforms originally announced by Tepco in March 2013. The report has been submitted to the utility's board of directors, Jaif said.

Gov't to take much bigger (financial) role in clean-up

August 7, 2013

Government to step in, provide funding for Fukushima clean-up

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201308070044>

REUTERS

The Japanese government will take a significantly bigger role in the massive clean-up at the crippled Fukushima nuclear plant and **may spend taxpayer money to contain the build-up of radioactive water**, officials said on Aug. 7.

The move comes as operator Tokyo Electric Power Co. struggles to contain toxic water flowing into the ocean from the plant.

Chief Cabinet Secretary Yoshihide Suga said the buildup of the radioactive water was a very serious issue and that Prime Minister Shinzo Abe would order the Ministry of Economy, Trade and Industry, which regulates power utilities, to step in.

The ministry is considering requesting public funds for the cleanup, Suga told reporters.

"The government must take a step forward and get involved in achieving this (coping with the contaminated water)," Suga told a regular news conference.

"I understand that METI is considering the budget. The prime minister will instruct the METI minister to quickly take measures," Suga said.

The government moves appear to be in response to warnings by industry experts that TEPCO's failure to address the problem questioned its ability to safely decommission the Fukushima No. 1 plant, 220 km northeast of Tokyo.

The utility has been widely castigated for its failure to prepare for the massive 2011 tsunami and earthquake that devastated the plant and led to the worst nuclear disaster in the world since Chernobyl.

It has also been criticized for its inept response to the disaster and covering up shortcomings.

TEPCO's handling of the clean-up has also complicated Japan's efforts to restart its 50 nuclear power plants, almost all of which have been shut since the disaster because of safety concerns.

That has made Japan dependent on expensive imported fuels for virtually all its energy.

CREATING EMERGENCY

An official from the country's nuclear watchdog told Reuters on Aug. 5 that the highly radioactive water seeping into the ocean from the Fukushima plant was creating an "emergency" that TEPCO was not successfully containing on its own.

The utility pumps out some 400 tons a day of groundwater flowing from the hills above the nuclear plant into the basements of the destroyed buildings, which mixes with highly irradiated water that is used to cool the reactors.

TEPCO is trying to prevent groundwater from reaching the plant by building a "bypass," but recent spikes of radioactive elements in sea water has prompted the utility to reverse months of denials and finally admit that tainted water is reaching the sea.

One more measure both TEPCO and METI have been working on since May is freezing the soil to prevent groundwater from leaking into the reactor buildings. Similar technology is used in preventing groundwater flooding in subway construction.

The technology was originally proposed by one of Japan's largest construction companies, Kajima Corp. that is already heavily involved in the clean-up.

Experts say, however, that maintaining the ground temperatures for months, if not years, would be costly. "Right now there are no details (of the project yet). There's no blueprint, no nothing yet, so there's no way we can scrutinize it," said Shinji Kinjo, head of a Nuclear Regulatory Authority (NRA) task force set up to deal with the Fukushima water issue.

METI has requested a budget allocation to help address the water problem, an official told Reuters on condition of anonymity.

"It is incredibly difficult to completely block the groundwater like this. It would be better if they could pump clean water before it reaches the plant," said Kotaro Ohga, research fellow at Hokkaido University and groundwater expert.

Gov't mulls providing funds to block toxic water at Fukushima plant

<http://mainichi.jp/english/english/newsselect/news/20130807p2g00m0dm077000c.html>

TOKYO (Kyodo) -- The government must step in to financially assist Tokyo Electric Power Co.'s efforts to prevent further accumulation of radioactive water at its crippled Fukushima Daiichi nuclear plant by freezing the soil around the reactor buildings, the top government spokesman said Wednesday.

"There is no precedent in the world to create a water-shielding wall with frozen soil on such a large scale (as planned now at the Fukushima complex). To build that, I think the state has to move a step further to support its realization," Chief Cabinet Secretary Yoshihide Suga told a press conference.

The Economy, Trade and Industry Ministry is considering including the costs in the fiscal 2014 budget request. If the request is approved, it will be the first government funding to help the plant operator tackle the problem of groundwater seeping to mix with contaminated water in the reactor buildings.

The government has so far allocated taxpayer money for research and development related to reactor decommissioning at the Fukushima plant, which suffered meltdowns in the aftermath of the massive earthquake and tsunami in March 2011.

To create frozen soil, pipes to run coolant will be inserted around the Nos. 1 to 4 reactor buildings, three of which house meltdown reactors. **The wall is expected to be 1.4 kilometers long, possibly costing tens of billions of yen.**

About 400 tons of groundwater seep into the reactor buildings every day and get mixed with toxic water that has been used to cool the crippled reactors. This means that the total volume of contaminated water is increasing by the same amount daily.

Dealing with the massive accumulation of radioactive water at the plant has remained a concern for TEPCO since the nuclear crisis.

Most recently, the utility admitted that toxic water is escaping into the adjacent Pacific Ocean from the plant's site and it is trying to prevent the spread of contamination.

Public cash for TEPCO

August 7, 2013

Tepco needs public cash to dig deep wall

Radioactive flow to sea 300 tons daily; Suga says utility can't halt it

<http://www.japantimes.co.jp/news/2013/08/07/national/tepcu-needs-public-cash-to-dig-deep-wall/#.UgMwbqxSab0>

Kyodo

The public must help fund Tokyo Electric Power Co.'s effort to freeze the soil around the reactor buildings at its Fukushima No. 1 nuclear plant, creating a barrier to prevent more groundwater from becoming radioactive, Chief Cabinet Secretary Yoshihide Suga said Wednesday.

It was revealed the same day that 300 tons of tainted water is flowing to the Pacific daily from the stricken plant.

"There is no precedent in the world to create a water-shielding wall with frozen soil on such a large scale (as planned now at the Fukushima complex). To build that, I think the state has to move a step further to support its realization," Suga told reporters.

The Ministry of Economy, Trade and Industry is considering including the costs in the fiscal 2014 budget request. If approved, it will be the first time the government has provided money to Tepco to help it contain the groundwater mixing with radioactive water in the reactor buildings.

The government has so far allocated taxpayer money for research and development related to reactor decommissioning at the Fukushima plant, which suffered three meltdowns in the aftermath of the massive earthquake and tsunami in March 2011.

A 1.4-km barrier of frozen soil will be created by sinking pipes around the buildings housing reactors 1 to 4 and then running coolant through them. According to major contractor Kajima Corp., which proposed the project, construction is expected to cost ¥30 billion to ¥40 billion.

At the end of May, a government panel adopted the project as the best way to reduce radioactive groundwater at the plant. METI Minister Toshimitsu Motegi instructed Tepco to go ahead with the project.

About 400 tons of groundwater seep into the reactor buildings every day and mix with toxic water that has been used to cool the crippled reactors.

On Wednesday, the Natural Resources and Energy Agency said about 300 tons of radioactive water per day is flowing out to the sea.

Dealing with the massive accumulation of radioactive water at the plant has remained a concern for Tepco since the nuclear crisis began.

Most recently, the utility admitted highly radioactive water is escaping into the Pacific from the plant and it is trying to prevent the spread of contamination.

Meanwhile on Wednesday, a fisheries cooperative in Iwaki, Fukushima Prefecture, decided to postpone a plan to resume test fishing from September due to the radioactive flow into the sea.

Masakazu Yabuki, head of the co-op, said delaying the operation ensures consumers won't be sold unsafe marine products.

August 7, 2013

Govt. to help TEPCO handle nuclear water leak

http://www3.nhk.or.jp/nhkworld/english/news/20130807_35.html

Prime Minister Shinzo Abe has instructed the industry ministry to take immediate action to prevent further leakage of radiation-tainted water into the sea from the crippled Fukushima Daiichi nuclear power plant.

Abe gave the order to Industry Minister Toshimitsu Motegi at a meeting of government officials on the nuclear disaster.

Abe told the officials that people are extremely concerned about the leaks and that it's an urgent problem that must be dealt with.

He said the government will not leave the issue entirely up to the plant's operator, Tokyo Electric Power Company, and that officials must take steps to help the utility.

Abe told Motegi that he wants him to instruct the utility to promptly take all possible measures to deal with the leaking water.

On Thursday, the industry ministry will discuss details of a project to build a large underground wall for damming groundwater by freezing the soil at the plant.

The ministry will also examine the possibility of using government funds to pay for the wall-construction project.

Aug. 7, 2013 - Updated 09:20 UTC

Govt. considers financing nuclear water-leak work

http://www3.nhk.or.jp/nhkworld/english/news/20130807_22.html

The Japanese government is considering a plan to fund efforts being made by the operator of the Fukushima Daiichi nuclear plant to contain radioactive groundwater from leaking into the sea.

Chief Cabinet Secretary Yoshihide Suga said on Wednesday that the government should support the efforts being made by Tokyo Electric Power Company.

TEPCO has been trying to prevent contaminated water from leaking into the sea by solidifying an embankment on the grounds of the plant.

But the utility discovered last week that water was likely spilling over the top of the hardened soil.

Suga said TEPCO has now decided to create an underground wall that surrounds the crippled reactors and prevents contaminated groundwater from leaking.

He added the government needs to think about helping the company pay for the project, as building such a large underground wall for damming water is unprecedented.

The walls will be made by freezing the soil around the reactor buildings.

Suga said the industry ministry is studying the costs of the project. He said Prime Minister Shinzo Abe will instruct industry minister Toshimitsu Motegi to quickly deal with the matter at a meeting of government officials on the nuclear disaster.

Aug. 7, 2013 - Updated 06:24 UTC

New rules for utilities deciding to scrap their nuclear reactors?

August 7, 2013

Panel drafts accounting rule revision for reactor decommissioning

<http://mainichi.jp/english/english/newsselect/news/20130807p2g00m0dm042000c.html>

TOKYO (Kyodo) -- An industry ministry panel on Tuesday drafted changes in accounting rules for electric power companies to prevent their business from deteriorating sharply if they decide to scrap nuclear reactors earlier than planned.

Utilities are currently required to set aside reserves for decommissioning each of their reactors while the facility is in service. The draft allows them to continue to set aside the funds for 10 years beyond the end of a reactor's operation.

The rule change, expected to be finalized later in the year, would enable a utility to avoid booking a large extraordinary charge in a single year to cover a shortfall in decommissioning funds.

The revision would also include measures to prevent a utility from facing a sudden drop in the asset value of the nuclear facility.

The review comes as Japan introduced new safety requirements for reactors in early July, which could lead utilities to give up restarting some of their reactors rather than invest in costly safety measures to meet the new regulations compiled in the wake of the 2011 Fukushima Daiichi complex disaster.

The draft, compiled by the panel, will be finalized after soliciting public comments.

Taxpayers to foot the bill?

August 8, 2013

ANALYSIS: Taxpayers hit as framework to resolve Fukushima crisis hits wall

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201308080051>

THE ASAHI SHIMBUN

Tokyo Electric Power Co.'s continuing futility in resolving the Fukushima nuclear crisis is threatening to unravel the government's framework for dealing with the disaster.

Radioactive water continues to spill into the ocean from the site of the Fukushima No. 1 nuclear plant, and the government is now being forced to change course and inject public funds to help deal with the water problem.

However, with no end in sight to the Fukushima nuclear crisis and with costs piling up, taxpayers could end up footing the enormous bill for the entire decommissioning process.

After the disaster started in March 2011, the government created a framework under which TEPCO pays for compensating disaster victims, decontaminating affected areas and decommissioning the crippled reactors. The government's stance holds the utility responsible for resolving the accident—without the use of taxpayer money.

That framework is now running into the wall.

TEPCO says the company is doing everything within its power at the nuclear plant site. But it has been able to take only stopgap measures to contain the ever-increasing amount of radioactive water.

At a meeting of the Nuclear Emergency Response Headquarters on Aug. 7, Prime Minister Shinzo Abe instructed industry minister Toshimitsu Motegi to speed up steps to contain the radioactive water at the Fukushima plant.

The government plans to shoulder part of the estimated tens of billions of yen required to surround the reactor and turbine buildings with an underground wall of frozen soil to prevent groundwater from flowing into the facilities.

The industry ministry will include the costs in a fiscal 2014 budget request, without specifying an amount. The funding--technically--will not break away from the existing framework.

"We cannot disburse money that will support TEPCO," a senior industry ministry official said. "We have no other choice but to make a request in the name of research and development."

Under the framework, TEPCO mainly uses revenue from electricity charges for the decommissioning work, including disposal of radioactive water.

For compensation and decontamination, the utility can borrow up to 5 trillion yen (\$52 billion) from the government-backed Nuclear Damage Liability Facilitation Fund. But it must pay back the amount.

The costs for compensation and decontamination are estimated to total 10 trillion yen, double the credit line from the state-backed fund.

In a meeting with Abe in April, TEPCO Chairman Kazuhiko Shimokobe and other executives asked for greater state involvement.

"The government wants to take a step forward and work with TEPCO on the challenges the company faces and for the reconstruction and rehabilitation of Fukushima," Abe said.

But the government has remained cautious about injecting taxpayer money.

"We cannot bear the costs for decommissioning," a senior Finance Ministry official said. "We will closely examine whether a line is drawn."

It remains unclear if the government will create a new framework under which it will take responsibility for decommissioning the plant, compensation and decontamination by spending taxpayer money.

If the current framework is maintained, the government may raise the amount of loans available from the state-backed fund and allow TEPCO to further increase electricity rates to secure more funds.

The nuclear crisis will not be brought under control if makeshift measures continue without deciding who will shoulder the costs for dealing with the accident.

No guidelines for exporting nukes

August 7, 2013

Japan gov't failing to keep promises on nuclear tech exports

<http://mainichi.jp/english/english/newsselect/news/20130807p2a00m0na018000c.html>

Amid Japan's ongoing push to export nuclear power technology, the Mainichi Shimbun has discovered that **the Japanese government has failed to sufficiently evaluate client nations' nuclear regulatory regimes as well as awareness of nuclear safety issues among the public of those nations.**

In 2008, the administration of then Prime Minister Taro Aso pledged to create guidelines that would block Japanese financing for nuclear exports if residents of the importing nation were not properly aware of safety issues related to nuclear power.

The Aso administration made the promise in a written response to a query from then Social Democratic Party lawmaker Masamichi Kondo. The response stated that it would create guidelines directing the Japan Bank for International Cooperation (JBIC) "not to provide financing" for nuclear power technology exports if the public in the importing nation "has not been appropriately informed of" the guaranteed safety level, measures to be taken in the event of a nuclear accident, and how nuclear waste including spent fuel would be handled.

No tangible progress was made, however, on creating the guidelines. In December 2010, seven non-governmental organizations including the environmental NGO FoE Japan addressed the 2008 promise during a regular meeting with the Ministry of Finance, the parent ministry of the JBIC. An official from the ministry's international section stated that "the JBIC has said the content of the guidelines and when they'll be finalized are both being considered with the utmost gravity." Asked by the NGOs what the ministry's position was on the issue, the official apparently replied that the ministry was "in full agreement with the written reply to House of Councillors member Masamichi Kondo" from two years before.

Three years later, with a nuclear technology deal in place with Turkey and another possible with Jordan, those guidelines have yet to be completed.

In a related development, information obtained by the Mainichi has furthermore shown that the Ministry of Economy, Trade and Industry is considering action to deal with the inability to conduct checks on importing nations' nuclear regulatory and safety apparatus -- previously conducted by the now defunct Nuclear and Industrial Safety Agency (NISA) -- which apparently became even more slipshod beginning in September last year. This is because **the Nuclear Regulation Authority set up following the Fukushima**

nuclear disaster has refused to take over the duty from the NISA on the grounds that it could not ensure its independence as a regulatory body if it were involved in the export of nuclear plant technology.

The JBIC and the Finance Ministry admitted to the Mainichi that the public information guidelines remain undecided, but that they would be "drawn up in line with the trade ministry's response to the safety regime evaluation issue."

FoE Director Kanna Mitsuta poured cold water on the JBIC and Finance Ministry comments, saying, "That's not a real answer. Government checks of an importing nation's nuclear safety apparatus and confirming the people of that country have access to the information they need about nuclear power are completely different issues."

The JBIC will finance purchases of Japanese nuclear reactors -- just one of which costs hundreds of billions of yen -- by developing nations unable to pay the hefty price tag up-front in a single payment.

"If the (public information) guidelines are not in place, then the JBIC cannot provide financing, and nuclear technology exports become impossible," a senior trade ministry official told the Mainichi.

TEPCO overwhelmed - What is Gov't waiting for?

August 9, 2013

EDITORIAL: Total overhaul needed of way TEPCO operates

<http://ajw.asahi.com/article/views/editorial/AJ201308090054>

The central government has decided to use public funds to contain the problem of radioactive water flowing into the ocean from the crippled Fukushima No. 1 nuclear power plant operated by Tokyo Electric Power Co.

According to the government, there is a possibility that 300 tons of contaminated water is flowing into the ocean daily. From the way TEPCO has kept falling behind in its measures to effectively deal with the problem, it is clear that the company is incapable of dealing with the situation.

Thus, it is quite natural for the government to step in. Still, the decision should have been made much earlier.

This is not to say that the problem will now be sorted out merely because the government is taking the lead. **This type of project has never been attempted before and all sorts of difficulties could arise.**

The authorities need to avail themselves of all conceivable wisdom and technology to stop the situation from getting any worse.

Thus, it is absolutely vital that a system be established that enables all parties concerned to promptly share information gathered on site.

Instead of leaving the actual work to TEPCO alone, the government must create a process by which it can always monitor and assess the situation, and make whatever decisions necessary, while keeping in close contact with related organizations and local governments.

There is another problem that must be dealt with promptly. TEPCO's corporate rehabilitation plan must be subject to a fundamental review.

While the government decided to include expenses for measures to deal with the contaminated water problem in the fiscal 2014 budget, the amount makes up only a small fraction of huge expenses to be borne by TEPCO and is no more than a stopgap remedy.

Under the existing framework, TEPCO must single-handedly shoulder all expenses--costs to deal with the accident, compensation and financial support for those affected by the disaster, and expenses for decontamination work and future decommissioning of the crippled reactors. The process has long been in deadlock.

TEPCO is planning to seek permission to restart its Kashiwazaki-Kariwa nuclear power plant in Niigata Prefecture in accordance with the existing rehabilitation plan. This is an outrageous idea, given what is happening in Fukushima. It beggars belief that TEPCO is even considering it.

TEPCO's responsibility must not be alleviated in any way.

That said, TEPCO is confronted by massive burdens that far exceed its capability. If the situation is left unattended, it could have a negative effect on the reconstruction of stricken areas and the power supply to the Tokyo metropolitan area.

What part of the existing setup is unreasonable? How much money will be needed in the future? Who should shoulder the expenses and how? It is time for the government to squarely face reality and discuss these issues. At the same time, it must scrupulously disclose every scrap of information on the issue.

Whatever happens, an additional injection of taxpayers' money will be unavoidable. That being the case, the government needs to go back to the starting point of the debate on liquidating insolvent TEPCO and seeking to impose financial burdens on its creditors.

Once again, we realize the huge impact of the Fukushima disaster on the lives of citizens. In the face of hard facts, it is clear how the Abe administration must deal with the situation.

It must abandon its stance of promoting nuclear power generation and clearly show how Japan can reduce its dependence on nuclear power plants.

8 highschoools stored radioactive materials on shelves

August 8, 2013

Schools stored radioactive materials without permission

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201308080060>

By YUSUKE YAMADA/ Staff Writer

Eight high schools in the central Japan prefecture of Nagano stocked radioactive materials for their physics labs without government permission, the Nuclear Regulation Authority and other sources said Aug. 7.

This surprising finding emerged in a checkup requested by the Nagano Prefectural Board of Education.

The board reported the matter to the NRA on June 20, but did not make it public.

The schools are all operated by the prefectural government.

The schools kept uranyl nitrate, uranium oxide, uranium acetate and americium, the sources said.

They are legally obliged to notify the central government if they are storing those substances.

It appeared likely that some substances were used in lab experiments years ago and before the schools were required to seek permission from the government to keep such stocks.

The schools in question are: **Nagano Technical High School; Komoro Business High School; Iida High School; Shimo-Ina Agriculture Senior High School; Kiso Seiho High School; Matsumoto Fukushima High School; Minami-Azumi Agricultural High School; and Hakuba High School.**

The materials were kept in glass vials and other containers on shelves in physics preparation rooms or related facilities. The measurements ranged from 10 grams or so to 180 grams.

Due to the small amounts, there was no risk to health or the environment, the sources said.

It remains unclear how the schools obtained the radioactive materials. They have since applied to the government for a permit to store the substances.

Atomic Energy Commission "just a rubber stamp"

August 8, 2013

Panel chief: Nuclear safeguard work just formality

http://www3.nhk.or.jp/nhkworld/english/news/20130809_06.html

The head of a government panel on nuclear energy has revealed the truth about its work. He said the commission's task to verify the peaceful use of nuclear power is just a formality.

The head of the Atomic Energy Commission, Shunsuke Kondo, made the remark on Thursday at a meeting of experts reviewing its organization and operations.

The commission is tasked with ensuring that nuclear facilities be built only for peaceful aims and not for the development of nuclear weapons.

Kondo said there is little point in making judgments based on the words "for peaceful purposes" written on documents submitted by nuclear facility operators.

His comment indicates that his commission is just a rubber stamp for such documents.

Kondo also touched on measures to prevent nuclear materials at facilities from falling into the hands of terrorists. He said his commission has not even heard from regulatory offices on whether internationally accepted standards are in place.

An expert group overhauling the commission's structure plans to reach conclusions by the end of the year.

Gov't + TEPCO + taxpayers

August 8, 2013

Japan to use public funds to deal with radioactive water in Fukushima

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201308080053>

August 08, 2013

THE ASAHI SHIMBUN

The central government is going ahead with a plan to use public funds in an attempt to stop radioactive water at the crippled Fukushima No. 1 nuclear power plant from flowing into the ocean, as operator Tokyo Electric Power Co. is seen as incapable of coping with the problem on its own.

"The problem of contaminated water is the most pressing. Rather than leave it up to TEPCO, the central government will come up with the measures to deal with it. The industry minister will instruct TEPCO in order to implement swift and multilayered measures," Prime Minister Shinzo Abe told a meeting of the Nuclear Emergency Response Headquarters on Aug. 7.

The Agency for Natural Resources and Energy released the results of a study that estimated about 1,000 tons of groundwater was flowing daily from nearby mountains to the ocean in the vicinity of the Fukushima No. 1 plant. Of that amount, about 400 tons is being contaminated with radiation after flowing into reactor buildings and other facilities at the plant site.

Of the remaining 600 tons of groundwater, about half was coming into contact with soil contaminated by radioactive materials around the reactor buildings and flowing into the ocean, according to the report.

Those involved in the study have been unable to determine when the contaminated water began flowing into the ocean. The possibility that contaminated water has been flowing into the ocean from the outset of the disaster cannot be denied.

The remaining 300 tons of groundwater is believed to be flowing into the ocean without being contaminated and poses no risk.

TEPCO plans to begin pumping up contaminated groundwater from wells on the plant site from Aug. 9. While about 100 tons will be pumped up daily at first, plans also call for digging more wells. The contaminated water will be stored in tanks on site.

According to TEPCO officials, tanks that have already been installed can hold about 380,000 tons. They are at the 320,000-ton mark now.

Plans call for installing tanks to increase the capacity to 700,000 tons by 2015 and 800,000 tons by fiscal 2016.

TEPCO officials hope to reduce the volume of contaminated groundwater to 60 tons a day and store that water in the tanks. One measure being considered for that reduction is to solidify contaminated soil with chemicals to construct a wall that would block out groundwater.

However, TEPCO plans do not take into consideration the possibility that contaminated water may leak from the reactor buildings.

Moreover, while the concentration of radioactive materials in the water is being measured at the wells, the results have fluctuated depending on the timing and location for the collection of the water samples. That makes it difficult to determine the level of radioactive materials in the water.

TEPCO officials have also been unable to determine where the water is leaking from, nor the extent of the area that has been contaminated.

Such uncertainty will likely force the utility to undertake a comprehensive review of measures that have been implemented until now to deal with the problem.

TEPCO also has an untested plan to freeze soil around the Fukushima No. 1 plant to block the flow of groundwater into the reactor and turbine buildings. However, because the project would cost several tens of billions of yen, TEPCO alone will be unable to finance it. The central government will cover part of the costs.

The Ministry of Economy, Trade and Industry plans to ask for funds in the fiscal 2014 budget for research purposes for the soil freezing project without specifying how much it wants.

The central government and TEPCO finalized the plan in May and are planning to complete the project by the first half of fiscal 2015.

Under the proposal, the wall of frozen soil will be built by inserting cooling pipes into the ground at intervals of about one meter around the buildings. The pipes would be inserted as deep as 30 meters into the ground. Coolant of about minus 50 degrees would be circulated through the pipes to freeze the surrounding soil.

Compared to constructing walls using clay or concrete, the frozen soil wall would better block the water and the time needed for completing the project would also be shorter.

TEPCO officials are confident they can surround all the buildings reasonably quickly.

One problem is that a huge amount of funds would be needed to continuously circulate the coolant.

In the meantime, TEPCO has other plans to construct a wall to block out water by injecting chemicals into the foundation near the levee to prevent contaminated water from flowing into the ocean. The utility will also pump up contaminated water.

However, those measures would not completely stop the flow of water into the ocean. An additional problem is where to store the pumped water.

If the water can be blocked from flowing into the reactor buildings, the contaminated water now accumulated in the basement of the buildings could be extracted to allow for the decommissioning of the

reactors. However, the extraction of that water will likely be a difficult task because workers are unable to approach the buildings because of high levels of radiation.

No indictment for officials

August 9, 2013

Charges not expected for TEPCO, Kan over Fukushima nuclear disaster

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201308090084>

THE ASAHI SHIMBUN

Although 15,000 people have filed criminal complaints, **prosecutors will likely not indict any official of the government or Tokyo Electric Power Co. for the disaster at the Fukushima No. 1 nuclear plant**, sources said.

Investigators could not find sufficient evidence to prove criminal responsibility for Japan's worst-ever nuclear accident, the sources said Aug. 8.

Despite reports to the contrary, including TEPCO's own studies, prosecutors concluded that the strength of the magnitude-9.0 Great East Japan Earthquake and the height of the tsunami that caused the nuclear disaster in 2011 were unforeseeable, they said.

An official decision on the criminal complaints, accepted by prosecutors in Tokyo and Fukushima last August, is expected this month.

Individuals and residents' groups are demanding that the officials be indicted on charges of professional negligence resulting in death, referring to the hundreds of people who died during the frantic forced evacuation from areas around the stricken plant, as well as those who have died in evacuation centers.

Others accuse officials of professional negligence resulting in injuries related to radiation exposure from the nuclear plant.

Those named in the criminal complaints include people who held key posts in government and at TEPCO when the nuclear disaster was set in motion on March 11, 2011.

The politicians and government officials include former Prime Minister Naoto Kan, Haruki Madarame, former chairman of the Nuclear Safety Commission of Japan, former Chief Cabinet Secretary Yukio Edano, and Banri Kaieda, who was industry minister.

The TEPCO officials named include former Chairman Tsunehisa Katsumata and former President Masataka Shimizu.

Prosecutors have requested an interview with Kan to ask about his response to the accident, the sources said. But Kan, who has said his actions prevented the nuclear disaster from spreading, is expected to deny any criminal responsibility.

The quake and tsunami knocked out all power to the Fukushima No. 1 nuclear plant, causing the cooling systems to shut down and resulting in the meltdowns of three reactors.

Prosecutors decided they could not recognize injuries resulting from radiation exposure at this stage, the sources said.

However, they concluded that a causal link between the nuclear accident and the deaths of evacuees "cannot be ruled out."

But to prove that professional negligence was involved, they needed evidence to show that the officials were able to foresee a tsunami of that scale and with the potential to cause a loss of all power sources at the nuclear plant.

They also looked into whether officials took safety precautions that reflected the maximum size of a natural disaster that they believed could strike.

Prosecutors determined that before the accident, few experts had predicted an earthquake or tsunami of that scale, the sources said.

The criminal complaints also accused officials of negligence for the delays in easing pressure within reactor buildings that led to a series of hydrogen explosions.

Prosecutors, however, concluded that high radiation levels and the lack of electricity caused the delay in work to vent the reactor containment vessels.

A senior official with the prosecution authorities said although indictments may not be coming, the government and utility should take the investigation as a serious warning.

“If a similar accident takes place again, they cannot argue that it was triggered by a disaster that was beyond the scale they could foresee,” the official said. “Those concerned should take necessary precautions, rather than admitting that the measures put in place turned out to be insufficient.”

The tsunami was 15.5 meters at the highest point and inundated the reactor buildings that were located 10 meters above sea level.

Prosecutors interviewed government and TEPCO officials, as well as dozens of experts on earthquakes and tsunami, to determine if the utility was well prepared for natural disasters.

They found that before the 2011 disaster, the prevailing view among experts was that the maximum magnitude of an earthquake in that area would be 8.3.

They also concluded that only a few specialists had explicitly warned of the need to take measures to prepare for a catastrophic tsunami.

Some experts had, in fact, repeatedly pointed out the likelihood of a huge tsunami hitting northern Japan.

Even a TEPCO study in 2008 estimated that a tsunami could reach as high as 15.7 meters at the plant, based on expert research.

The Diet’s Fukushima Nuclear Accident Independent Investigation Commission noted TEPCO’s earlier estimate and other factors in its report on the causes of the nuclear crisis. It held TEPCO and nuclear industry regulators responsible for “the profoundly man-made disaster that could and should have been foreseen and prevented.”

The commission’s report stated that the officials had a chance to draw up measures to prepare for such a disaster, but TEPCO and the regulation authorities deliberately put them off.

Prosecutors, however, said experts in 2008 were divided over the research on which TEPCO based its prediction for possible tsunami to hit the Fukushima No. 1 plant.

Officials of the utility told prosecuting authorities that despite that estimate, they decided not to put safeguard measures in place after concluding that a tsunami of that scale was unlikely in reality.

Prosecutors concluded that although TEPCO was insufficiently prepared for a huge tsunami, it would be difficult to pursue the officials' criminal responsibility and establish a case against them.

According to the Reconstruction Agency, 92,770 people in Fukushima Prefecture were still displaced from their homes as of July 4. The Fukushima prefectural government said 53,277 residents were still living outside the prefecture because of the series of disasters.

TEPCO is still struggling to resolve the crisis at the nuclear plant.

Doubts about clean-up of unprecedented scale

August 15, 2013

INSIGHT: Japan's nuclear clean-up costly, complex and at risk of failing

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201308150021>

REUTERS

KAWAUCHI, Fukushima Prefecture--The most ambitious radiation clean-up ever attempted has proved costly, complex and time-consuming since the Japanese government began it more than two years ago in the wake of the Fukushima nuclear meltdown. It may also fail.

Doubts are mounting that the effort to decontaminate hotspots in an area the size of Connecticut will succeed in its ultimate aim - luring more than 100,000 nuclear evacuees back home.

If thousands of former residents cannot or will not return, parts of the farming and fishing region could remain an abandoned wilderness for decades.

In many areas, radiation remains well above targeted levels because of bureaucratic delays and ineffective work on the ground. As a result, **some experts fears the \$15 billion allocated to the scheme so far will be largely squandered.**

The deep-seated problems facing the clean-up are **both economic and operational**, according to a Reuters review of decontamination contracts and interviews with dozens of workers, managers and officials involved.

In Kawauchi, a heavily forested village in Fukushima Prefecture, decontamination crews have finished cleaning up houses, but few of their former inhabitants are prepared to move back. Just over 500 of the

3,000 people who once lived here have returned since the March 2011 meltdown at the Fukushima nuclear plant 25 kilometers (15 miles) to the east.

Even after being deemed safe enough for people to return, Kawauchi has no functioning hospital or high school.

The mushrooms that used to provide a livelihood for foragers are now steeped in dangerous levels of cesium. The only jobs on offer in town are menial. Some houses are so mildewed after three summers of abandonment that they need to be torn down.

The village has not only shrunk; its population has also aged. While the elderly used to make up a third of the town, they now account for 70 percent of residents.

The same pattern has played out across Fukushima as the nuclear accident turned the slow drip of urban flight by younger residents into a torrent, creating a demographic skew that decontamination is unlikely to reverse.

Kawauchi is one of the 11 townships that were most heavily contaminated after the accident, when rain and snow showered radioactive particles onto the verdant hills here as the plume from the plant passed overhead. Half of it lies in the still-evacuated area where the national government has assumed control of the clean-up.

"There is no comprehensive plan on how to rebuild the village," said Yasutsugu Igari, 34, who works in the reconstruction department at Kawauchi's village office. "It's the government that destroyed it, but now it's doing very little to help us re-create our lives."

UNPRECEDENTED SCALE

Masayoshi Yokota, who is in charge of decontamination, says he has heard that frustration before.

"First they said they wouldn't come back unless we decontaminated. So we did that and told them they could come back," he said. "But then it was about jobs or that they didn't want to come back because they have children."

Japan's plan to scrub clean the area around Fukushima and remove radioactive debris was beset by difficulties from the beginning.

Nothing on the same scale had ever been attempted before. After the Chernobyl accident in 1986, highly contaminated houses were entombed in concrete and the surrounding area was abandoned.

By contrast, Japan's government is attempting to bring background radiation levels in the most highly contaminated evacuation zone to an average of 1 millisievert per year once all the work is completed.

That would be twice the background radiation level in Denver, or a sixth of the annual dose for the average American when all sources of radiation are taken into account.

Japanese nuclear workers are limited to an accumulative exposure of 100 millisieverts over five years. Although radiation health experts assume that any incremental exposure to radiation increases risks for later cancers, the International Atomic Energy Agency says a statistically significant correlation only shows up at doses over that higher threshold.

The Japanese government decided to allow people to move back to areas with an average annual dose of less than 20 millisieverts in December 2011.

In an attempt to reach the tougher radiation target, thousands of temporary workers have been put to work scrubbing houses and roads, digging up topsoil and stripping trees of leaves into which invisible cesium particles have wormed.

Few of the hundreds of companies and small firms involved have any experience with radiation. Some workers have said they have been told to flush contaminated leaves away in rivers by supervisors to speed the job up and reduce waste, since storage remains a problem.

On a recent Saturday, a crew of 10 workers in jumpsuits, hardhats and surgical masks were clearing a roadside outside Kawauchi, picking up leaves and trimming weeds. The lower half of nearby forest slopes were stripped of saplings and shrubbery.

"That's lovely," Yokota told a visitor. "They've got it nice and clean."

Some experts are doubtful about the payback of that effort. First, there is a risk that radioactive isotopes can return to decontaminated areas via wind and rain. Officials in the village of Yugawa found snowfall earlier this year caused radiation levels to spike.

At the same time, the protocols for how to complete the same job vary depending on location. For example, Fukushima city has banned the use of high-pressure water hoses for fear that they simply scatter radioactive particles rather than remove them. Other areas have allowed the hoses to be used, but filtering the collected water produces highly radioactive residue.

"The truth of the matter is that from the European experience (after Chernobyl), remediation factors are disappointing," said David Sanderson, a professor of environmental science at the University of Glasgow and an expert in radiation who has made numerous trips to Fukushima to map the fallout.

"And it's very expensive. I fear there's a chance the experience in Japan might be pointing to the same conclusion. Unless it succeeds in putting people back in their homes, the benefit is difficult to see."

Tokyo has budgeted \$15 billion for the effort over the past three years, but only a quarter of the \$6.5 billion of that provided to the Ministry of the Environment has been spent, according to data provided to Reuters. The target is to finish the project by the end of 2016, although the government of Prime Minister Shinzo Abe has pledged to go faster.

NOT COMING BACK

There is also the **problem of storage**. Most of the contaminated soil and leaves remain piled up in driveways and empty lots because of fierce opposition from local communities to storing it in one place until the Ministry of Environment secures a central site that could hold it for the longer term.

Residents of Tamura, a village in the evacuated zone, were encouraged recently to begin preparing to return to their decontaminated houses--armed with Geiger counters. Some areas still show radiation at twice the target level.

"Decontamination in the true sense of the word is not being carried out," said Tomoya Yamauchi, a professor of radiation physics at Kobe University. Yamauchi said he found that some decontaminated road surfaces in Fukushima had readings 18 times the target level because cesium had accumulated in cracks in the asphalt.

"I think the government recognizes that Fukushima cannot be returned to how it was."

Many have given up hope of ever returning to live in the shadow of the Fukushima nuclear plant. A survey in June showed that a third of the former residents of Iitate, a lush village famed for its fresh produce before the disaster, never want to move back. Half of those said they would prefer to be compensated enough to move elsewhere in Japan to farm.

Nuclear evacuees currently receive a living allowance from plant operator Tokyo Electric Power Co. (TEPCO), which is cut off when the government decides they are able to move home again.

"I feel like some people don't want to go back because they're happy living off the compensation money from TEPCO and they don't want that to end," said Hiroaki Inoue, an official from the Ministry of Economy, Trade and Industry spending a year working at the Kawauchi village office to monitor the spending of the reconstruction budget.

But some evacuees say it is unfair to cut off financial support when their previous homes and villages remain unlivable.

"There's no jobs, no shops open, nothing. It's become an incredibly difficult place to live and yet they're saying 'You can go home now'," said a single mother evacuated from near Kawauchi, who declined to be named for fear of retribution from the authorities.

"It's so unfair to say that. It's not that simple."

In Tomioka, a coastal ghost town north of the Fukushima plant, ambient radiation remains at 10 times the government's target. Wild boar wander the streets.

"This could be fixed," said Yokota on a recent visit. "They could get these levels right down. But the thing is, people didn't come back quickly enough. That's fatal."

Kan denies liability for Fukushima disaster

August 15, 2013

Ex-PM Kan denies criminal liability for Fukushima disaster

<http://mainichi.jp/english/english/newsselect/news/20130815p2g00m0dm038000c.html>

TOKYO (Kyodo) -- Former Prime Minister Naoto Kan, who led the government's response to the Fukushima nuclear disaster in March 2011, denied Wednesday he is criminally responsible for the crisis, sources close to the issue said.

While residents groups across Japan, mainly in Fukushima Prefecture, filed complaints against 40 people including Kan and his Cabinet members on suspicion of professional negligence resulting in injuries, Kan said in a document submitted to prosecutors through his lawyers that "there was no problem" with his immediate response to the crisis triggered, the sources said.

In their criminal complaints, the residents accused Kan and two of his ministers of failing to take prompt venting measures to lessen the pressure within the reactor containers before it caused hydrogen explosions and injured workers at the Fukushima Daiichi plant operated by Tokyo Electric Power Co.

The two ministers are then Economy, Trade and Industry Minister Banri Kaieda, who now heads the opposition Democratic Party of Japan, and then Chief Cabinet Secretary Yukio Edano. Kan served as prime minister from June 2010 through September 2011.

Kan's visit to the plant on the morning of March 12, 2011, the day after it was crippled by a massive earthquake and tsunami, has been criticized for supposedly distracting the attention of its workers who should have been focusing on containing the crisis.

In the document, the former premier said he had given the green light to venting operations requested by TEPCO before visiting the plant and that his trip to the facility did not cause any problem.

A government-appointed panel investigating the nuclear disaster concluded in July last year that Kan could have dispatched other officials for on-site inspection, but that his visit did not affect venting operations at the facility.

After receiving claims by Kaieda and Edano, the prosecutors are expected to wrap up their investigations launched in August last year on their suspected negligence without indicting any of the 40 people, according to the sources.

They also include Tsunehisa Katsumata and Masataka Shimizu -- then chairman and president of TEPCO - - and Haruki Madarame, then chairman of the now-defunct Nuclear Safety Commission.

The prosecutors have decided, based on the testimony of tsunami experts, that the government and TEPCO could not have expected such a large tsunami due to the lack of unified knowledge on the height of tsunami.

If the prosecutors refrain from indicting them, the residents plan to ask an 11-member independent panel to seek indictments against the government and TEPCO officials.

August 13, 2013

Kan denies criminal liability for Fukushima crisis

http://www3.nhk.or.jp/nhkworld/english/news/20130814_27.html

Former Japanese Prime Minister Naoto Kan has denied criminal responsibility in the government's response to the 2011 Fukushima nuclear crisis.

Kan gave a written statement to Tokyo prosecutors on Wednesday. He denied he was negligent in dealing with the accident at the Fukushima Daiichi plant.

Prosecutors have been investigating the case for more than a year following complaints from residents of Fukushima Prefecture and others.

The residents accused Kan of professional negligence that resulted in injuries to workers at the plant and radiation exposure among local residents.

Some workers were injured in a hydrogen explosion at the plant's No.1 reactor building at 3 PM on March 12th.

That's one day after the quake and tsunami damaged the plant.

The complaints say Kan's visit to the plant that morning hindered plant workers' efforts to contain the crisis. They say the resulting delay in a venting operation to ease pressure in the reactor containment vessel led to the explosion.

Sources close to the former prime minister say Kan insists in his statement that the workers could have conducted the operation early in the morning but did not.

Kan reportedly says he visited the plant to press for a quick response, not to delay it.

Criminal complaints have also been filed against former executives of the plant's operator, Tokyo Electric Power Company, and officials at Japan's former nuclear regulatory agency.

The prosecutors are expected to make a final decision as early as this month on whether to press charges.

What reform for JAEA?

August 15, 2013

Editorial: Plan to reform Japan Atomic Energy Agency a major challenge

<http://mainichi.jp/english/english/perspectives/news/20130814p2a00m0na017000c.html>

The Education, Culture, Sports, Science and Technology Ministry has drawn up a plan to reform the Japan Atomic Energy Agency (JAEA), the operator of the trouble-plagued "Monju" prototype fast-breeder nuclear reactor in Fukui Prefecture.

The ministry emphasizes that the plan would fundamentally overhaul the entity following revelations that the JAEA had failed to inspect about 10,000 parts of the reactor. However, the plan is nothing but superficial reform centering on partially downsizing the organization. The ministry should go ahead with the reform of the JAEA after thoroughly discussing the role of the nuclear fuel cycle project in Japan's future energy policy.

As such, the plan, which has been worked out on the premise that the Monju reactor will be retained, represents a serious challenge to the public.

The JAEA is a huge organization with an annual budget of some 180 billion yen and about 3,900 employees.

The reform plan calls for a split of the nuclear fusion research and other divisions from the JAEA while prioritizing the nuclear fuel cycle project centering on Monju, a response to the crisis at the tsunami-hit Fukushima No. 1 Nuclear Power Plant, atomic power safety research and human resource development. The reform would reduce the number of its employees by around 500.

Monju would be transformed into the "Monju power station" under the direct control of the JAEA president as an organization only responsible for operating and maintaining the reactor. However, as the plan calls for the establishment of a separate organization responsible for public relations on Monju, the number of workers assigned to the fast-breeder project would rather increase. Those who have served as top officials of private power stations would be appointed as JAEA board members in charge of safety measures. Moreover, mid-ranking JAEA staffers would be dispatched to railway companies or airlines to learn how they can operate JAEA facilities while placing top priority on human lives.

The reform is aimed at using private-sector funds to drastically restructure the organization. However, such an idea is what has been called for whenever a technical problem occurred in the past and is nothing new.

The Nuclear Regulation Authority (NRA) pointed out in May this year that the JAEA's safety culture had deteriorated following revelations that the agency omitted examinations of approximately 10,000 parts of Monju, and banned the body from making preparations to restart the reactor.

The JAEA can in no way nurture its own safety culture even if it asks the private sector for cooperation without scrutinizing why it had previously failed to carry out its own reform. **The Education, Culture, Sports, Science and Technology Ministry is responsible for the JAEA's deteriorating safety culture as its government regulator.**

It's easy to see that the government's nuclear fuel cycle policy has already failed. More than 1 trillion yen in taxpayers' money has been invested in Monju, which would have been the core facility in the project, but there is no prospect that fast-breeder reactors will be put into practical use in the foreseeable future. There are suspicions that an active fault is situated just below the reactor. The facility costs about 20 billion yen a year although its operations have been suspended. Most other developed countries have abandoned developing fast-breeder reactors.

The completion of a spent nuclear fuel reprocessing plant under construction in Aomori Prefecture, which is another core facility in the project, has repeatedly been postponed.

Nearly 2 1/2 years have passed since the outbreak of the Fukushima nuclear crisis. Some 150,000 residents of Fukushima Prefecture are still taking shelter within or outside the prefecture, while workers at the crippled nuclear plant are struggling to deal with radioactive water accumulating on the premises of the power station.

Instead of sticking to the continuation of the Monju project, it would be better for Japan in the long run to let the JAEA concentrate on its response to the nuclear disaster and decommissioning the disaster-hit reactors, while conducting research on nuclear safety.

Japan's "nightmare"

Two recent articles by William Pesek . (Bloomberg)

William Pesek is based in Tokyo and writes on economics, markets and politics throughout the Asia-Pacific region.

August 12, 2013

Abe's Japan Is Blind to Scary Nuclear Reality

<http://www.bloomberg.com/news/2013-08-12/abe-s-japan-is-blind-to-scary-nuclear-reality.html>

By William Pesek *Aug 12, 2013 11:00 PM GMT+0200*

Forget Abenomics. Ignore Shinzo Abe's efforts to rejuvenate Japan's diplomatic and military clout. Look past the quest to rewrite the constitution. History will judge this prime minister by one thing alone: what he did, or didn't do, to end the worst nuclear crisis since Chernobyl.

It's mind-boggling how disengaged Japan's leaders have been since their "BP moment" -- the March 2011 near-meltdown at the Fukushima Dai-Ichi nuclear plant. Abe's predecessors Naoto Kan and Yoshihiko Noda virtually ignored the radiation leaks and spent fuel rods sitting 135 miles (217 kilometers) from Tokyo. In December, Abe became the third prime minister to pretend all was well at Fukushima after a devastating earthquake and tsunami that flooded the plant.

The official line on Fukushima is depressingly familiar: The folks at Greenpeace International are trouble makers bent on scaring Japanese; the alarmists at the World Health Organization should mind their own business; the international news media needs to discover decaffeinated coffee. Nuclear power is clean, safe and -- most important, now that a weakened yen has driven up energy bills -- cheap.

Reality made an inconvenient reappearance last week. Mounting evidence that radioactive groundwater is gushing into the Pacific Ocean forced Abe to admit that plant owner Tokyo Electric Power Co. Inc. isn't up to the task of containing the disaster. Under international pressure, he pledged the government would "make sure there is a swift and multifaceted approach in place" to stop the leak.

Abe's Seriousness

Pardon me for doubting Abe's seriousness. It's not just the sketchiness of the suggested remedy: freezing the ground around Fukushima, a tactic scientists fear will prove inadequate. It's not the fact that nuclear regulators remain more focused on restarting reactors than on neutralizing the one that's polluting North Asia. It's not that no one at Tepco has gone to jail or been shamed. (BP Plc's former chief executive officer,

Tony Hayward, was fired and sued over the 2010 oil spill in the Gulf of Mexico.) Tepco is leaking something far worse and lying through its teeth. Yet it hasn't been nationalized, and its executives remain in their offices.

No, my real worry is that official Japan is still stuck on "how" Fukushima become synonymous with Chernobyl, not "why" it happened or "what" it means for the world.

The "how" is the stuff of the gods, according to conventional wisdom. The event Japanese call 3/11 was an act of the heavens that no one could have foreseen. There was no way to plan for it, no way Tepco could have known not to place all of its backup generators in the same place underground, just steps away from the sea in a tsunami-prone nation.

This storyline ignores the "why." Fukushima was a preventable, man-made disaster stemming from the worst conformist tendencies of Japan Inc. Look, if executives got together globally and created a Hall of Shame for the greedy, corrupt and clueless along them, Tepco would deserve its own wing. All Enron Corp. and Bernie Madoff did was manufacture fake profits. Tepco fudged its safety record and put the lives of tens of millions of people at risk.

But it takes a village to breed such a corrupt and dangerous system. Tepco got away with its negligence for years because of the cozy ties between power companies and the regulators, bureaucrats and researchers that champion the industry -- the "nuclear village." Backed by its connections, money and control of the media, Tepco has brazenly continued to cook its radiation data for the last two and a half years. It matters little that the government is finally commandeering Tepco's cleanup: The government is Tepco.

Dollar Signs

Abe's Liberal Democratic Party is blinded by dollar signs. In May, Abe visited Turkey to help close a \$22 billion deal for Japan to build nuclear power plants in that seismically active nation. That kind of cash makes power companies virtually untouchable. And it raises doubts about Tepco's admission that 300 tons of water laced with strontium and other particles is pouring into the Pacific each day. One can't help but wonder if the leak is of a much greater magnitude.

It's time for the government to face reality and do six things: decommission Fukushima; invite independent auditors from overseas to assess the magnitude of the damage; admit the surrounding area might not be safe for inhabitants, fishing or farming for decades; scour the world for innovative solutions; break up the nuclear village; and level with the Japanese about cleanup costs that will be in the hundreds of billions of dollars.

That brings us to the "what." Fukushima is a growing embarrassment for Japan on the international stage. Oceans don't have boundaries. Radioactive traces have been found in bluefin tuna -- not to mention on secondhand cars and auto parts imported by Russia from Japan. Another earthquake -- a live possibility -- could damage Fukushima anew or take out another reactor between now and the 2020 Summer Olympics that Tokyo hopes to host. The world won't give Japan a pass twice on what would have been a perfectly preventable disaster.

Analysts are rating Abe on his success in cleaning up Japan's finances. Posterity will judge him on whether he cleaned up the mess Tepco and the nuclear village have created.

Japan's Nuclear Nightmare

<http://www.bloomberg.com/news/2013-08-07/japan-s-nuclear-nightmare.html>

By William Pesek *Aug 7, 2013 3:12 PM GMT+0200*

I had a terrible dream last night. I imagined it had been 29 months since a giant earthquake and tsunami wrecked the Fukushima Dai-Ichi nuclear plant, the reactor continued to spew radiation into the sea just 135 miles away from my home in Tokyo -- and the Japanese government was standing by and doing nothing. Wait! Sadly, until earlier today, that was reality.

The real nightmare for me and the 126 million people who reside in Japan was that it took Prime Minister Shinzo Abe this long to step in to help Tokyo Electric Power -- the plant's owner -- to deal with tons of radioactive groundwater spilling into the Pacific Ocean. Stopping the leakage could cost tens of millions of dollars; Tepco, which continues to insist that the contamination is minor, would clearly not have been eager to pony up.

Really, a little government intervention would have been even nicer two years ago, when Naoto Kan occupied Abe's office. Back then, scientists and academics urged Japan to nationalize Tepco and decommission that plants it ran with such abandon and arrogance.

Intervention would have been more helpful even one year ago, when Yoshihiko Noda was prime minister. Experts tried to get Noda to take seriously evidence that radioactive discharge from Fukushima was exceeding legal limits. They nudged him to hold someone, anyone, at Tepco accountable. Prosecutors had arrested and charged Olympus Corp. executives for cooking the accounting books. Why not the folks at Tepco, whose flouting of safety rules almost cooked Tokyo? Literally -- most people still have no idea how close we came to losing the world's biggest city in March 2011.

It also would have been great if Abe himself had cared more about nuclear safety than dollars when he assumed the premiership in December. His focus was on restarting the 52 reactors taken offline out of an abundance of caution after the earthquake. Never mind that most Japanese want them to remain mothballed. Japan's potent "nuclear village," the nexus of power companies and pro-nuclear regulators, bureaucrats and researchers, packs way too much political firepower. This nuclear-industrial complex is one of the nation's biggest advertisers, which keeps the Japanese media in line. That's partly why

international campaigners like Greenpeace received so few column inches as they presented report after report showing radiation levels far above what Tepco would admit. (Tepco was eventually forced to come clean.)

So, is Abe's sudden interest in Fukushima's radiation mess for real? Well, it has to be at this point. Aside from the risk to his approval ratings, Tokyo is actively vying for the 2020 Summer Olympics. International Olympic Committee officials might find the threat of protests in Istanbul preferable to jokes about Tokyo hosting the Chernobyl Games.

The first thing Abe must do is shift the Nuclear Regulation Authority's focus away from evaluating the safety of atomic plants for restart, back to the fast-growing crisis of toxic sludge flowing into the sea around Fukushima. Really folks, first things first. Let's first make sure children living within a 100 mile radius won't develop cancer 10 years from now.

Abe also should nationalize the Fukushima site. Yes it will be messy, sure it will cause a tempest in financial circles when investors and creditors fight over money and indeed it will put Japan's government into uncharted territory. But Tepco isn't up to the task of managing life-and-death matters in what's arguably the world's most seismically-active nation. Each time I read quotes by one of their executives explaining how the company learned from its mistakes and is being reborn, I check and make sure I'm not reading TheOnion.com.

Sometimes comedy is the only reasonable default at times like this. Tepco's logo, after all, looks suspiciously like Mickey Mouse (no joke). So I'll ask: Who put Homer Simpson in charge of Japan's nuclear safety? For such a rules-based, technologically proficient nation, Japan's nuclear safety record these last 15 years seems no sounder than that of the fictional Springfield Nuclear Power Plant, where Homer is head of safety. Only, this is no laughing matter.

So better late than never, Mr. Prime Minister. We Tokyoites are glad you are finally on the case. But please excuse us for having our doubts that a year from today, things in Fukushima will be any safer. Welcome to our nightmare.

New providers for Tokyo metro government

August 16, 2013

Chubu Electric affiliate to power some TMG facilities instead of Tepco

Kyodo

<http://www.japantimes.co.jp/news/2013/08/16/business/chubu-electric-affiliate-to-power-some-tmg-facilities-instead-of-tepco/#.Ug5wN6xSab0>

The Tokyo Metropolitan Government said Friday that a Chubu Electric Power Co.-affiliated firm will supply power to 48 of its facilities instead of Tokyo Electric Power Co.

The metro government contracted with **Diamond Power Corp.**, based in Tokyo, in which Nagoya-based Chubu Electric plans to take an 80 percent stake soon, to supply a total of 9,850 kw to the 48 facilities, including vocational skills development centers, from Oct. 1.

Before the March 2011 earthquake and tsunami disaster devastated the Tohoku region and led to three reactor meltdowns at Tepco's Fukushima No. 1 atomic plant and the effective shutdown of the nation's overall nuclear energy system, the metro government had relied on Tepco to supply most of 1 million kw for about 1,200 facilities, including the main government buildings in the Shinjuku area.

The metro government plans to set up new power supply contracts for a total of 271 facilities with **four new energy providers, including Diamond Power, from October.**

As power supply by new providers is expected to increase from 40,000 kw in April to 96,000 kw, the metro government is anticipating yearly savings of about ¥300 million in power costs.

TEPCO replies to Asahi's attack

Announcements

(Aug 01,2013)

Regarding the Asahi Shimbun article "TEPCO did nothing about radioactive water leak for 2 years" on August 1, 2013

http://www.tepco.co.jp/en/announcements/2013/1229541_5502.html

The Asahi Shimbun reported in its front page on August 1, 2013 that: TEPCO did nothing for more than two years despite having pledged to seal a leaking hole between a turbine building (the leakage source) and an underground pit (a trench) in April 2011 when water contaminated with radioactive materials from Fukushima Daiichi Nuclear Power Station was found to have leaked into the ocean; and the company

only began preparing for shielding tests this summer after contaminated water was found to be leaking into the sea this time. However, the facts regarding this issue are as follows:

- In "Roadmap towards Restoration from the Accident" we released on April 17, 2011, we included "blockage between trenches and buildings" (corresponding to "shielding the connection between the trench and the turbine building" in the article) among the measures that we had "considered" or "taken" to prevent a recurrence of the leakage of highly radioactive contaminated water from Fukushima Daiichi Nuclear Power Station Unit 2. On April 30, however, we announced that we encountered technical difficulties in blocking a vertical shaft at the connection between the turbine building and the trench, and planned instead to block a vertical shaft located between the turbine building and the sea. Accordingly, we completed blocking of the latter vertical shaft in early May 2011.

- Further, on May 12, 2012, we disclosed "Implementation Plan on Reliability Improvement Measures at Fukushima Daiichi Nuclear Power Station", where we clearly stated our plan to study construction techniques for shutting off water at the connection between the turbine building and the trench within FY2012 and then spend several years implementing measures to shut off, collect, and apply treatment to water accumulated in such locations as trenches. Although technical difficulties and a severe work environment should be overcome in implementing this plan, we adopted the plan in order to further reduce the risk of having outflow of contaminated water beyond the trench.

- Since then, we have been bringing forward consideration according to this plan. In our report submitted at a meeting of the committee on countermeasures for contaminated water treatment on May 30, 2013, we disclosed, as one step to implement a concrete measure to remove water from the trench, our plan to conduct a verification test for removing water from the trench after blocking water flow by freezing the connection between the turbine building and the trench and complete evaluation of this measure by the end of December 2013.

- The above facts conflict with the claim in the article that TEPCO completely neglected advancing the consideration and making preparations for more than two years while leaving a leaking hole at the turbine building unsealed.

With regards to the current contaminated water leakage into the port, we deeply apologize to the society for concern and anxiety caused not only by the fact that the leakage occurred, but also by our attitude toward publication about the leakage. We are committed to making further progress in the effort to cleanse contaminated water inside the trench, and to accelerating and devoting ourselves to such efforts as to remove contaminated water from the trench by blocking the connection between the turbine building and the trench.

Gov't should clearly define responsibilities

August 17, 2013

EDITORIAL: Clearer government role needed for Fukushima cleanup

<http://ajw.asahi.com/article/views/editorial/AJ201308170027>

The crisis at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear power plant is far from over. The government has yet to call off the state of nuclear emergency it declared on March 11, 2011, when the catastrophic earthquake and tsunami set off the nuclear accident.

Water contaminated with radioactive materials keeps leaking from the crippled plant, polluting underground soil and the sea in the area.

This fact clearly shows that the nuclear disaster is still going on.

Last week, Prime Minister Shinzo Abe said the continued leakage of contaminated water is "a pressing problem."

"The government will take effective measures to tackle the problem instead of leaving it entirely to Tokyo Electric Power," he said.

Abe made these remarks at a meeting of the Nuclear Emergency Response Headquarters, set up in line with the government's declaration of the state of nuclear emergency. Abe is head of the task force.

By clearly defining the respective responsibilities of the utility and the government organizations involved in responding to the situation, the government needs to make flat-out efforts to contain radiation and resolve the crisis.

The government has made a big mistake by leaving it entirely to TEPCO. As a result, measures to stop leaks of radioactive water have been ineffective, allowing environmental pollution to escalate. The government's move to step in and get involved in the efforts to sort out the problem came far too late.

Abe told industry minister Toshimitsu Motegi to give appropriate instructions to TEPCO as soon as possible. He also called on Shunichi Tanaka, chairman of the Nuclear Regulation Authority, to ensure that the nuclear regulatory body will direct all its efforts toward identifying the causes of the problem and take effective steps to secure safety.

Although TEPCO will remain in charge of cleanup work at the site, the government said it will now take concrete actions to support the efforts. The industry ministry has indicated it will cover part of the costs of implementing a plan to freeze soil around the nuclear facilities to prevent groundwater from flowing into the contaminated areas of the plant.

But the ministry will provide the money to partly finance the measure as research expenses. Given the urgency of the situation, the ministry's commitment to tackling the situation is far too weak.

The NRA is not showing an all-out commitment to the challenge, either.

"TEPCO and the Agency for Natural Resources and Energy are playing a central role (in dealing with the problem)," Tanaka said. "Our role is to provide advice (for the efforts) as an observer."

It would be shameful if TEPCO, the industry ministry, which has been a champion of nuclear power generation, and the NRA, the nuclear regulator, try to shuffle off responsibility onto one another or make their responsibility vague, thereby causing delays in the implementation of necessary measures.

The NRA's role is crucial.

Ahead of receiving the request from Abe, the nuclear watchdog set up a task force to discuss measures to stop leaks of contaminated water.

The group has shown a willingness to provide guidance for TEPCO's efforts to deal with the situation by raising some specific questions that need to be answered, such as: "How effective will it be to pump up groundwater?" "How far has polluted water spread in power cable ducts?"

The NRA should demonstrate a stronger commitment to the challenge and offer useful ideas by using all its expertise and other intellectual resources.

The chief of the now defunct Nuclear Safety Commission was not even a member of the Nuclear Emergency Response Headquarters, but the NRA chairman is deputy chief of the headquarters. The entity should make the most of the powers vested in it according to lessons learned from the disaster.

No gauge?

August 21, 2013

Leaking tank at Fukushima plant has no water gauge

http://www3.nhk.or.jp/nhkworld/english/news/20130821_30.html

The operator of Fukushima Daiichi nuclear plant says it may have failed to find a leak of radioactive wastewater from a tank because it lacks a water gauge.

Tokyo Electric Power Company, or TEPCO, on Monday found a massive leak of highly contaminated wastewater from a tank near the No.4 reactor. Water had seeped outside the barrier around the tank.

The tank is 11 meters high and can store up to 1,000 tons of wastewater. TEPCO said the tank's water level had dropped nearly three meters. That means more than 300 tons had been lost.

The utility says the tank has no water gauge, so workers at the plant did not notice the leak until they saw water outside the barrier.

The tank is one of about 350 at the plant made from steel plates and bolts. Four cases of leaks have been reported so far.

TEPCO officials say workers conduct patrols twice a day to check the tanks for possible leaks.

Tokyo Electric is trying to find the cause and location of the current leak. It will carry out emergency inspections on other tanks, and determine whether other tanks have water gauges.

Nuclear power chief should be on site

August 21, 2013

TEPCO nuclear chief to be stationed in Fukushima

http://www3.nhk.or.jp/nhkworld/english/news/20130821_35.html

The operator of the Fukushima Daiichi nuclear plant says it will station its nuclear power chief near the facility to oversee its decommissioning process, particularly handling of radioactive water.

Tokyo Electric Power Company revealed last month that contaminated groundwater at the plant is seeping into the sea. This week, it said more than 300 tons of wastewater had leaked from a storage tank there.

On Wednesday, the utility said it will send Vice President Zengo Aizawa, who heads the firm's nuclear power division, to Fukushima Prefecture to take direct command of decommissioning efforts. It said the

move is aimed at clarifying the chain of command and facilitating information sharing among TEPCO officials in charge.

In a news conference on Wednesday, Aizawa apologized for the utility's continuing to cause so much trouble and concern nearly 2 and a half years after the accident at the plant. He said he will tackle the water leaks as an issue of the highest priority.

"The biggest management crisis"

August 22, 2013

TEPCO faces 'biggest management crisis' after toxic water leak from Fukushima tank

<http://mainichi.jp/english/english/newsselect/news/20130822p2a00m0na014000c.html>

Tokyo Electric Power Co. (TEPCO)'s ambitious scheme to deal with contaminated water at the crippled Fukushima No. 1 Nuclear Power Plant is on the verge of collapsing, as the safety of storage tanks built on the complex has been called into question after highly radioactive water leaked from one of the aboveground storage tanks.

TEPCO, the operator of the badly-damaged nuclear power station, has been building one tank after another in a "shoestring operation" to store ever-increasing highly contaminated water. The Nuclear Regulation Authority (NRA) said the severity of the leakage of highly radioactive water is on par with a level-3 (serious incident) on the International Nuclear and Radiological Event Scale. But because the nuclear crisis has remained unresolved with no end in sight, the current situation cannot be assessed easily by conventional yardsticks.

TEPCO Executive Vice President Zengo Aizawa exhibited a sense of crisis, saying at a news conference on Aug. 21, "This is the biggest management crisis. Taking it as a pressing matter of the highest priority, we want to respond to this problem." He made the comment because about 300 metric tons of highly contaminated water leaked from one of the aboveground storage tanks. The leakage of the contaminated water from the tank set off alarm bells about TEPCO's scheme to store radioactive water.

Contaminated water continues to increase over time because about 400 tons of groundwater flows into damaged reactor buildings each day and comes into contact with melted nuclear fuel, turning itself into highly radioactive water. This process started immediately after the outbreak of the nuclear crisis at the Fukushima plant. There is also water contaminated with relatively low levels of radioactive substances that are produced after highly radioactive water has been treated by purification equipment.

If contaminated water, regardless of the levels of radiation, flows out of the complex, it will contaminate the environment. Therefore, TEPCO has been storing such water in tanks and other containers on the premises of the nuclear complex. As of Aug. 20, the total volume of such water stood at about 430,000 tons.

Initially, TEPCO had built seven underground storage tanks (for a total of 58,000 tons of water) that could store a lot more water at once than aboveground storage tanks that cannot be built easily and quickly. But contaminated water was found to be leaking from underground storage tanks in April this year. Thus, far more than 20,000 tons of contaminated water was hastily transferred from the underground tanks to aboveground tanks that were hurriedly built. The situation worsened to a level so bad at one time that experts predicted that only 3,600 tons of additional water could be stored in the aboveground tanks.

TEPCO aims for full-scale operations of its water decontamination system, called the Multi-nuclide Removal Equipment (ALPS), which could remove up to 62 kinds of radioactive substances from up to 500 tons of water each day. TEPCO also worked out a plan to build an "underground water bypass" system to pump up uncontaminated water before flowing it into the damaged reactor buildings and release it outside. On Aug. 7, Prime Minister Shinzo Abe said, "Instead of leaving it to TEPCO, the government will take measures." The government then started to extend financial assistance for a project to build walls of frozen soil to reduce the amount of groundwater flowing into reactor buildings.

The government and TEPCO had believed that if such measures worked to stop water from being contaminated with radioactive substances, they would be able to deal with the problem of the contaminated water under the current plan by increasing the total volume of storage tanks to about 800,000 tons of water by fiscal 2016.

But the ALPS system that began to run on a trial basis at the end of March this year was forced to shut down after it was found to have been leaking water in June. Furthermore, the device is not technically capable of removing radioactive tritium. The underground bypass system has not been built yet because of opposition from local fisheries cooperative associations that are concerned about harmful rumors about radioactive contamination.

There has been no successful case elsewhere in the world of a large-scale project to build walls of frozen soil, and therefore it remains unclear whether the project under consideration will actually be effective. The life span of the storage tank in question is five years, and therefore the tanks should be regularly replaced with new ones. The cause of the leakage of the radioactive water has yet to be found, and **TEPCO is faced with another task of checking more than 1,000 small and large tanks on the premises of the nuclear complex.**

At a working-group meeting of the NRA held on the evening of Aug. 21, some of the participants proposed that water-level gauges should be installed in the same type of storage tanks that leaked contaminated water. Other participants also urged TEPCO to transfer contaminated water to different types of tanks. But it is not easy to obtain such storage tanks.

NRA Chairman Shunichi Tanaka said, "We fear a situation in which we have no control unless (contaminated water) is dumped into the ocean as the number of tanks keeps increasing rapidly." He stressed that it is necessary to release water into the ocean after treating it with the ALPS system. But the consent of local residents and communities is needed to do so. It has become even harder for TEPCO, therefore, to secure the understanding of local residents and communities to release water into the ocean because of revelations in July of contaminated underground water flowing into the ocean and the "level 3" leakage of radioactive water from the aboveground storage tanks.

Yuzo Onishi, chairman of the government committee on contaminated water treatment countermeasures, said, **"Unless drastic measures are taken promptly, the Fukushima No. 1 Nuclear Power Plant will collapse at some point."** (By Shinpei Torii and Motofumi Fujino, Tokyo Science and Environment News Department)

Gov't not playing its role

August 22, 2013

Editorial: Gov't lacks sense of responsibility over Fukushima radioactive water leak

<http://mainichi.jp/english/english/perspectives/news/20130822p2a00m0na008000c.html>

Revelations that about 300 tons of water contaminated with radioactive substances has leaked from an above-ground tank at the tsunami-hit Fukushima No. 1 Nuclear Power Plant have demonstrated that the nuclear crisis has not yet been brought under control.

It was the largest amount of radioactive water that has leaked from a tank on the premises of the power station, and the Nuclear Regulation Authority (NRA) is considering rating the accident as Level 3, or a serious incident, on the International Nuclear and Radiological Event Scale.

Prime Minister Shinzo Abe said the government will take countermeasures against the leakage of contaminated water. Actually, however, the government has failed to play a key role in efforts to bring the crisis under control while basically leaving the daily response to the crisis to plant operator Tokyo Electric Power Co. (TEPCO). The government should have a sense of responsibility and play a more active role in responding to the crisis.

Radioactive water has leaked from a cylindrical tank with a capacity of 1,000 tons, which was assembled by joining steel plates with bolts. The tank contained water used to cool down nuclear reactors, from which radioactive cesium was removed.

Of some 1,000 tanks at the crippled plant containing radioactive water, about 350 were built by joining steel plates with bolts and the rest of them were built by welding steel plates.

It's quicker to assemble tanks by joining steel plates with bolts, but water can leak from joint areas more easily than welded tanks. Water leakage from such tanks had previously occurred four times. In the latest case, it remains to be seen from which part radioactive water leaked, and the possibility cannot be ruled out that further water leakages will occur.

Following the latest revelations, TEPCO began to examine tanks with bolts and is set to increase the frequency of daily inspections on such tanks from two to three times a day. The utility needs to clarify the cause of the leakage and the reason why it was slow to detect the problem, and fundamentally review the

way it inspects and maintains the tanks. It must also confirm if radioactive water has leaked from the tank into the sea and whether the tainted water contaminated underground water in the area.

TEPCO is supposed to treat radioactive water in multi-nuclide removal equipment after radioactive cesium is removed from it. However, the equipment remains stalled after it developed trouble during its trial operations. To reduce the risk the contaminated water poses to the environment, TEPCO should quickly repair and reactivate the equipment.

TEPCO is considering what it calls an underground water bypass system as an emergency countermeasure against the influx of underground water onto the premises of the power station, which is the primary cause of an increase in the amount of contaminated water. In the system, a well will be drilled into the plant's mountainside area to allow underground water to be pumped up before being contaminated with radioactive substances and discharged into the sea. However, the plan still cannot win consent from the local communities hosting the power station for fear that it could fuel harmful rumors about local agricultural and fisheries products.

It came to light in April this year that tainted water was leaking from an underground water tank at the plant. It then surfaced last month that underground water on the premises of the power station got mixed with highly contaminated water and was leaking into the ocean. As the leakage of radioactive water is drawing worldwide attention, it could adversely affect the international community's confidence in Japan.

The NRA has set up a panel to study the impact that radioactive water on the premises of the crippled nuclear plant has on the sea. The panel should objectively analyze relevant data that can provide a basis for judging whether the water is posing a threat to the environment, and actively dispatch such information to the world.

If TEPCO goes ahead with the creation of the underground water bypass system, the national government must do its best to convince local communities as well as the general public of the entire plan, **including a response to possible contamination that could occur as a result of the system's operation.**

Abe's political leadership sorely tested

August 22, 2013

EDITORIAL: Abe needs to step up and lead crisis response at Fukushima plant

<http://ajw.asahi.com/article/views/editorial/AJ201308220040>

The crisis at the stricken Fukushima No. 1 nuclear power plant has taken another turn. As much as 300 tons of highly radioactive water has leaked from a surface storage tank.

On Aug. 21, the Nuclear Regulation Authority said the leak is the equivalent of Level 3 on the eight-level International Nuclear and Radiological Event Scale. That means it is a “serious incident.”

Radioactive materials have to be kept in secure storage. The fact that a huge amount was released into the environment is a very alarming situation.

There is growing international concern over the leak.

This is a crisis that is threatening not just the safety of surrounding areas, but also international confidence in Japan. Prime Minister Shinzo Abe should take charge of the situation by making a swift and effective response.

The Fukushima nuclear disaster has been rated as a “Level 7,” or “major accident,” the highest severity level on the international nuclear event scale. The only other Level-7 nuclear accident was the Chernobyl disaster in 1986.

Work to deal with the consequences of the Level-7 accident at the Fukushima nuclear plant is far from over. The environment is still being contaminated by radioactive materials from the plant.

Because the leak of polluted water from a storage tank occurred during the process of dealing with the aftermath of the nuclear disaster, some people dispute the appropriateness of declaring it to be a new Level-3 incident.

But the question that must be asked is why the leak couldn't be prevented.

The tank in question is one of 350 or so lower-quality containers among the 1,000 tanks installed to store contaminated water. These makeshift tanks have a useful life span of only five years.

From the outset, experts have warned there is a possibility of leakage from these tanks.

The massive leak of radioactive water is clearly the result of a poor response to the problem. The task of dealing with accumulating contaminated water has been left to Tokyo Electric Power Co., the embattled utility that operated the Fukushima No. 1 plant. Consequently, only insufficient, stopgap measures have been taken to cope with the situation.

In an Aug. 7 meeting of the Nuclear Emergency Response Headquarters, Abe said, “The government will take effective measures to tackle the problem (of continued leakage of polluted water) instead of leaving it entirely to Tokyo Electric Power.” His remarks have finally made ministries and agencies willing to cooperate with one another to tackle this formidable challenge, according to administration officials.

Plans to deal with contaminated water have been developed by the task force for decommissioning reactors under the Nuclear Emergency Response Headquarters. TEPCO and the Ministry of Economy, Trade and Industry have been playing the central role in working out the plans. This approach has proved misguided.

Tackling the problem entails a range of tasks that all require swift and all-out efforts by the entire government. These efforts cannot be hampered by the walls between ministries and agencies. They include assessing the current situation accurately, explaining the situation to the general public at home and abroad, gaining cooperation from other countries in efforts to fix the situation and securing and allocating necessary funds.

The challenge sorely tests Abe's political leadership.

The government should improve its preparedness for new developments to levels close to those required for responding to a full-fledged nuclear accident. It should, for instance, make sure that all information related to the situation at the Fukushima plant be reported to the deputy chief Cabinet secretary for crisis

management to ensure proper sharing of information so that the appropriate ministries and agencies can make a coordinated response.

The NRA is also responsible for the leak because it has endorsed the flawed framework for efforts to deal with the problem by TEPCO alone. The NRA has provided nothing more than weak oversight.

Its role is to keep sounding the alarm about the worst that could happen while guarding itself against unwarranted optimism.

The nuclear regulatory body should act swiftly to come up with specific measures to cope with the situation based on the latest knowledge and cutting-edge expertise available at home and abroad. It should, for instance, ensure that more than one alternative plan be prepared for preventing additional leaks and start rigorous monitoring of environmental pollution.

--The Asahi Shimbun, Aug. 22

Gov't cannot wash its hands of Fukushima disaster

VOX POPULI: Government cannot wash away its responsibility for Fukushima disaster

<http://ajw.asahi.com/article/views/vox/AJ201308220050>

Vox Populi, Vox Dei is a daily column that runs on Page 1 of the vernacular Asahi Shimbun.

Apparently because Japan is blessed with abundant water, the Japanese language is rich in metaphorical expressions that use water, writes tanka poet Akiko Baba, who is also an editor for The Asahi Shimbun's tanka column. Indeed, anyone can cite many examples, such as "mizu mo shitataru" (dripping with water), which means good-looking, or "mizu o mukeru" (to direct water), an expression that means to try to draw information from someone.

But now, the phrase "mizu mo morasanu" (watertight) sounds hollow. It became clear that highly radioactive water has leaked from a tank at the crippled Fukushima No. 1 nuclear power plant. Much of the 300 tons of contaminated water, equivalent to what can be held in 1,500 drums, is believed to have seeped into the ground. High levels of radiation have been detected near the tank.

The Nuclear Regulation Authority determined that the leak represents "a serious incident," equivalent to a Level 3 on the eight-level International Nuclear and Radiological Event Scale. The March 2011 nuclear disaster was so serious that it's hard to grasp the implications of the leak. But if it had happened in ordinary times, such an incident would have set off an uproar. The cause of the leak remains unknown.

Be that as it may, serious situations that have to do with water have developed one after another. It was just the other day that the government released an estimate that said about 300 tons of contaminated water is leaking into the ocean daily. It's always one thing or another. Tokyo Electric Power Co., which operates the plant, is like a boxer who is having trouble staying on his feet and about to be knocked down.

There is no way we can leave a single company, which can barely stand itself, to deal with the aftermath of the accident on its own. In order to expedite restarts of idle nuclear reactors and exports of nuclear technology, it seems the government wants to leave TEPCO to the enormous task of dismantling the stricken nuclear reactors and bring the situation under control while shrugging off its own responsibilities.

"Mizu ni nagasu," or to let water carry something away, means to pretend the whole thing never happened. Maybe the government is letting water carry it away, to use a water-related idiom. It is said that behind this is also the idea of performing ablutions or purifying oneself with water. Performing ablutions is a specialty of politicians, but still, it is impossible to wipe away the fact that the government has promoted nuclear power generation as a national policy. Am I being too suspicious about the government's intentions? The Fukushima nuclear disaster is still going on.

--The Asahi Shimbun, Aug. 22

* * *

Vox Populi, Vox Dei is a popular daily column that takes up a wide range of topics, including culture, arts and social trends and developments. Written by veteran Asahi Shimbun writers, the column provides useful perspectives on and insights into contemporary Japan and its culture.

Strange priorities

August 23, 2013

OLYMPICS/ Tokyo governor says nuclear crisis won't affect Games bid

<http://ajw.asahi.com/article/sports/topics/AJ201308230094>

REUTERS

Radiation levels in Tokyo are no different from those of other major world cities and the worsening crisis at Fukushima nuclear plant should have no impact on the city's bid to host the 2020 Olympics, Tokyo's governor said on Aug. 23.

The nuclear crisis escalated this week to its worst level since a massive earthquake and tsunami crippled the plant more than two years ago, with a tank holding highly contaminated water leaking 300 tons of radioactive liquid.

But Tokyo governor Naoki Inose told a news conference roughly two weeks before the decision is due that he was confident the problem would be resolved, citing promises from Prime Minister Shinzo Abe that the government as a whole will take a proactive role.

"Our food and water are totally safe and all the data is published on our home page. Right now, there's absolutely no difference between the radiation levels in Tokyo, London, New York and Paris," Inose said.

"As a result, the Fukushima issue is one that must be solved swiftly, but I think there is no direct connection to the hosting of the Tokyo Olympic and Paralympic Games."

Tokyo is competing with Istanbul and Madrid to host the 2020 Games, with the final decision set for Sept. 7 in Buenos Aires. Tokyo hosted the Summer Olympics in 1964 and Japan has twice hosted the Winter Olympics.

Anybody in charge?

August 24, 2013

Column] Is Tepco in charge or JP Gov ? -Gov intentionally making it unclear not to pay compensation

<http://fukushima-diary.com/2013/08/column-is-tepco-in-charge-or-jp-gov-gov-intentionally-making-it-unclear-not-to-pay-compensation/>

Japan is going to have to pay astronomical value of compensation for the world.

This is why Japan is making it unclear who is in charge of Fukushima, -Tepco ? or Japanese government ? Due to the series of recent leakage, media coverage came back to Fukushima again. Fukushima has actually been in the spot light for long compared to other industrial accidents. but we will not see the end of the media coverage.

What media wants to know is who is responsible for the leakage, and also the whole decommissioning project of Fukushima plant.

Now nobody thinks Tepco is capable of doing it. It looks strange for the government to leave just one company in charge.

In this emergency, Japanese Prime Minister doesn't even make an official announcement.

He doesn't even mention the leakage.

It's possibly because if he steps to Fukushima, it would look like Japanese government is finally going to take over the decommissioning project for the international world.

The bottom line is there is no technology to settle it down whoever becomes responsible.

However, the difference of when Tepco takes responsibility and when Japanese government takes responsibility is the solvency.

On 8/23/2013, China Central TV attended Tepco's press conference and asked about the international effect of the unstoppable leakage.

International world is becoming seriously worried about the endless contamination of the Pacific.

In short, they are wanting to know if they can be properly compensated.

It has been anticipated since day 0 that Japan is going to have to pay astronomical amount of compensation.

Japanese government is gaining time by having Tepco the scapegoat.

However, it's only the matter of time.

Japanese people may need the compensation for medical care in a few years, but it would be paid from their own savings.

Fukushima nuclear plant accident was a little bit too big for one government to pay for.

Iori Mochizuki

TEPCO's "inept management"

August 24, 2013

Strong oversight of Tepco needed

<http://www.japantimes.co.jp/opinion/2013/08/24/commentary/strong-oversight-of-tepco-needed/#.Uhmkgn9Sab0>

The discovery last week that about 300 tons of highly radioactive water leaked from a tank at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear power plant has reminded both people in Japan and around the world that the nation's nuclear crisis is far from over and that radioactive substances are continuing to be released into the environment.

The Nuclear Regulation Authority proposed raising the severity level of the leak from the earlier level 1 on the International Nuclear and Radiological Event Scale (INES) of 8 to level 3. The nuclear catastrophe at the plant, as a whole, is rated as level 7.

The massive water leak is only the latest in a serious of accidents that have plagued the plant since the disaster started on March 11, 2011. It highlights the inability of Tepco to manage the crisis — which in large part was caused by Tepco's inept management of the nuclear plant.

It is suspected that up to 300 tons of the water leaked into the ocean. Prime Minister Shinzo Abe and other government leaders must realize that the ongoing leakage, which is polluting the Pacific Ocean — a shared resource — is undermining Japan's trustworthiness in the international community.

The government must acknowledge that Tepco cannot manage the crisis by itself and take a commanding role to ensure that it is handled in the most competent manner possible.

The latest leak occurred in a tank that is a temporary structure. It is made of steel sheets bolted together with their seams sealed with rubber packing. Some 1,000 tanks are being used at the plant site to store radioactive water that had been used to cool the three reactors that suffered core meltdowns. Of those tanks, about 350 are of the temporary type and the remaining are more reliable welded tanks. The service life of the temporary tanks is said to be five years.

It should have been clear to Tepco from the beginning that storing radioactive water in such tanks is inappropriate. It is likely that more leaks will occur. Tepco estimates that 10 tons of contaminated water leaked daily from the tank in question for the past month. One wonders why the leak was not detected sooner.

Tepco also estimates that water containing as much as 10 trillion becquerels of radioactive strontium and 20 trillion becquerels of radioactive cesium-137 from the Fukushima No. 1 power plant has flowed into the Pacific Ocean since May 2011. It must be pointed out that the crippled nuclear plant has only a makeshift system to contain radioactive water.

The sloppiness of Tepco and other parties is clear. For example, Tepco had to abandon tests of equipment, scheduled to start early this month, for removing 62 kinds of radioactive nuclides from contaminated water when leaks from the equipment were detected.

The government must end its “hands off” attitude regarding the management of the nuclear crisis and take on an active role drawing on all available resources. Its first step should be to mobilize the NRA, Tepco, corporations and nuclear experts to stop the outflow of toxic water into the Pacific Ocean.

Brain drain at TEPCO's

Plugging Tepco's brain drain

<http://www.japantimes.co.jp/opinion/2013/08/26/commentary/plugging-tepcos-brain-drain/#.Uhtkc9Sab0>

On July 22, Tokyo Electric Power Co. paid a uniform ¥100,000 special summer bonus to each of its some 5,000 employees in managerial positions.

Tepco President Naomi Hirose told reporters that the company wanted to express its appreciation for their hard work although he conceded some may doubt if this small sum would serve that purpose.

Needless to say, boosting the morale of employees in managerial posts was not the only reason for paying the bonus. Another obvious reason was to put the brakes on a recent sharp rise in the number of employees who are resigning.

Having faced a managerial crisis due to the severe accident at its Fukushima No. 1 nuclear power plant in March 2011, Tepco carried out salary cuts of 20 percent for ordinary employees and 25 percent for those in managerial posts in fiscal 2011 (April 2011 through March 2012). As the company's balance sheet deteriorated further as the costs of importing fuels soared due to the declining value of the yen currency, the pay cut rate for managers rose to 31 percent in fiscal 2012.

These measures did serve to reduce total personnel costs by ¥177.9 billion annually. But the downside of the measures is the emergence of cases in which lower-ranking employees who are paid for overtime work earn more than some of employees in managerial posts. This has lowered the morale of employees in the managerial class, accelerating a move among them to leave Tepco and look for other jobs.

In fiscal 2011, 465 managerial and nonmanagerial employees voluntarily quit Tepco. The number shot up by more than 50 percent to 712 in fiscal 2012, which was 5.3 times the corresponding figure in the pre-disaster fiscal 2010. This is quite serious for Tepco, as one company insider pointed out that of those who voluntarily quit, 40 percent were “core employees” who were either already holding managerial posts or about to be promoted to such posts.

This trend shows no sign of ending. From April to the end of June 2013, 109 employees voluntarily quit. A high-ranking official of the Tepco group said the drain of human resources is accelerating among employees close to the hub of Tepco management.

An official of the trade and industry ministry said that Tepco may well already be in a state of “imminent brain death.”

The company’s financial straits stem from mounting expenditures to deal with the Fukushima nuclear crisis: (1) compensation paid to victims of the nuclear accident, (2) decontamination of soil and buildings contaminated by radioactive substances and (3) dismantling of the damaged reactors.

Compensation to victims will be paid out of up to ¥5 trillion to be provided by the government-funded Nuclear Damage Liability Facilitation Fund (NDLFF) in aid. Tepco will have to pay the money back from future profits. The sum committed by the NDLFF had already reached ¥3.909 trillion as of June 25. The scope of the compensation will further grow as compensation covers citizens originally excluded from coverage, such as those who voluntarily evacuated. Soon the total amount of compensation will reach the ¥5 trillion ceiling in aid from the NDLFF.

Decontamination of polluted areas and decommissioning of the reactors are also serious problems for the company because it has to bear all the costs by itself. The cost needed to reduce the annual radiation dose to the targeted 1 millisievert is estimated to be at least ¥5 trillion. A Tepco official says the sum could reach ¥10 trillion.

For decommissioning the damaged reactors, Tepco has set aside nearly ¥1 trillion. But ¥300 billion has already been spent to cope with 400 tons of underground water flowing into the reactor buildings every day, even before any concrete action for decommissioning has been taken.

The entire process of decommissioning is expected to take 30 to 40 years. No decision has been made on where to bury high-level radioactive wastes. A reactor manufacturing industry insider has said ¥5 trillion will be required to dispose of such wastes and turn the nuclear power station site into raw land.

Another headache for Tepco is the delay in restarting the operation of its Kashiwazaki-Kariwa nuclear power plant in Niigata Prefecture. The company hopes to restart it in order to avoid high costs of purchasing imported fuels to run thermal power plants.

In an effort to get consent for its plan to restart the Nos. 6 and 7 reactors at the plant from the Niigata prefectural government, Tepco President Hirose visited Niigata on July 5 only to encounter staunch opposition from Gov. Hirohiko Izumida. The governor repeatedly asked, “Why do you hurry to restart the plant?”

It is estimated that if one reactor is stopped for a year, incremental fuel costs and other factors will reduce the company’s profit by ¥96 billion to ¥132 billion. This means a failure of Tepco’s “comprehensive special business plan” to achieve a current account surplus in fiscal 2013.

For fiscal 2012, Tepco reported a consolidated current account deficit of ¥326.9 billion despite raising electricity rates for business enterprises as well as private consumers and reducing labor, materials and other costs by ¥496.9 billion — 40 percent more than the original cost reduction goal of ¥351.8 billion.

A current account deficit for fiscal 2013 would mean losses for three straight years. This would make it extremely difficult for Tepco to secure new bank loans.

As of the end of March, Tepco’s long-term debts of more than ¥3.5 trillion were owed to 77 financial institutions. Over ¥1 trillion becomes due during fiscal 2013, including redemption of corporate bonds worth more than ¥580 billion.

Tepco hopes to straighten out the situation by raising electricity fees and by obtaining additional funds from the NDLEF with the support of the Liberal Democratic Party on the strength of its overwhelming victory in the Upper House election in July.

But a banking source says that in order to turn the company’s balance sheet into the black, Tepco will have to raise electricity fees by nearly 20 percent. The fees have already been raised since March and the average household fees in August are ¥705 higher than in February. Meanwhile, the consumption tax rate is scheduled to go up April 2014. Enterprises and consumers will not accept such an additional fee increase of nearly 20 percent.

It will not be easy either to win general public support for funneling more taxpayer money through the NDLEF if creditors — such as shareholders, bondholders and banks — continue to remain protected.

According to a government insider, there is mounting opinion within the trade and industry ministry that Tepco should be placed under legal liquidation. Specifically, most of its operations for compensation payments and part of its operations for decontamination and reactor decommissioning would be placed under government control and the rest would undergo legal liquidation. Its electricity generating and supplying operations would be sold to other power companies.

An official of the ministry said if such a scheme is adopted, an increase in taxpayers' burden may be accepted by the public. But at this point, how to divide Tepco's assets and liabilities is unclear.

A major bank official said if banks were asked to forgive a large portion of Tepco's debts in order to reduce burdens on taxpayers, the scheme would "disintegrate in midair." This is because banks have long assured their shareholders that loans to Tepco will be safe and paid back.

The drain on human resources from Tepco in the form of employees in managerial positions running away from it all represents a "funeral march" for its organizational collapse.

This is an abridged translation of an article from the August issue of Sentaku, a monthly magazine covering Japanese political, social and economic scenes.

Motegi promises to act

August 26, 2013

Trade minister vows help in resolving nuke crisis

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201308260117>

THE ASSOCIATED PRESS

IWAKI, Fukushima Prefecture--Trade Minister Toshimitsu Motegi pledged on Aug. 26 an urgent government action to curb leaks of radioactive water from the crippled Fukushima No. 1 nuclear power plant.

Motegi told reporters that lax maintenance by the plant's operator was largely to blame for the series of leaks from storage tanks at the plant, which was damaged by a massive earthquake and tsunami in 2011. "The urgency of the situation is very high," Motegi said. "From here on the government will take charge."

The leaks have shaken confidence in the reliability of about 1,000 tanks that are crucial for storing water that has been pumped into three damaged reactors to keep their radioactive fuel cool.

At least five of the tanks at the plant on Japan's northeastern coast have leaked.

Last week, Tokyo Electric Power Co., said 300 tons of highly contaminated water had flowed from one tank, in the worst leak so far.

Most of the water is thought to have seeped into the ground, but some may have entered the sea through a rainwater gutter, it said.

The tanks contain nearly 300,000 tons of partially treated radioactive water.

Motegi, who toured the plant on Aug. 26, said inspections of the tanks would be doubled to four times a day. "Water control is a very important issue. We have to prevent contaminated water from reaching the sea," he said.

TEPCO President Naomi Hirose, who accompanied Motegi, apologized for the leaks. He said the company is setting up a new taskforce to better deal with the problem of radioactive water and will step up efforts to assess the extent of underground water contamination and prevent leakage into the sea.

TEPCO plans to build more tanks to store another 800,000 tons of water, which combined with plans to pump out uncontaminated underground water should prevent the situation from becoming dire for another three to four years.

"But we cannot keep making tanks endlessly," Hirose said.

The chief of Japan's nuclear watchdog, Toyoshi Fuketa, who inspected the plant last Friday, also criticized the plant's management of the tanks, some of which have hoses running directly on the ground.

TEPCO spokesman Noriyuki Imaizumi said Aug. 24 that a two-person team has been inspecting the 1,000 tanks during twice-daily "patrols," which regulators have criticized as just a walk. He acknowledged that the workers usually did not carry dosimeters to measure radioactivity, and did not keep full inspection records unless there were notable irregularities such as major rust spots or leaks.

Chief Cabinet Secretary Yoshihide Suga said the recent major leak was "extremely regrettable," though he said it arose "largely because of sloppy valve operation and patrols," apparently trying to calm deepening fears of additional leaks.

"Our position is to do everything we can to help resolve the problem as quickly as possible," he said.

Motegi is expected to compile a support plan, and the ruling coalition will set up a taskforce to handle the water problem, Suga said.

As the crisis drags on, costs are mounting.

TEPCO's stock price plunged nearly 6.9 percent on Monday following the release over the weekend of further details of the crisis.

Fishermen working from a port in the nearby city of Iwaki had hoped to resume test catches next month after sampling showed a decline in radioactivity over the past two years.

But those plans were scrapped, and fisheries operations in Fukushima remained suspended indefinitely, after news of the latest leak from the plant.

It remains unclear what the environmental impact from the contamination will be on sea life, but the frustrations of those who rely on the fisheries industry for their livelihood is evident.

"The operators (of the plant) are reacting too late every time in whatever they do," said Fumio Suzuki, whose boat has been part of the sampling trips since the 2011 disaster.

"People in the fishing business have no choice but to give up. There are many (fishermen) who have mostly given up already," Suzuki added.

Still, fisherman and researchers continue to survey the sea life.

Sampling results from over 170 types of fish showed 40 percent of fish with signs of contamination.

Nobuyuki Hatta, director of the Fukushima Prefecture Fisheries Research Center, said the trend had been positive before the latest leaks, with fewer fish found exceeding radiation limits.

More official promises

Suga: Govt. to rein in radioactive water problems

http://www3.nhk.or.jp/nhkworld/english/news/20130826_24.html

Japan's Chief Cabinet Secretary says the government will do more to help contain radioactive water leaks at the troubled Fukushima Daiichi nuclear plant.

Yoshihide Suga said on Monday that it's unacceptable to have contaminated water leak from the plant's storage tank and flow into the ocean.

He pointed to poor management as a likely cause. He said this case is different from the contaminated groundwater now seeping from the plant into the ocean.

Suga said the government needs to play a more active role in taking countermeasures.

He said industry minister Toshimitsu Motegi was instructed several weeks ago to involve the government in solving this problem. This includes earmarking public money to tackle the storage tank leak.

Suga dismissed the idea that the leakage will negatively impact Japan's bid for the 2020 Olympics and Paralympics. He said the foreign ministry should be providing proper information on the matter.

Let's use reserve funds

August 26, 2013

Japan may dip into budget reserves to fight Fukushima toxic water

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201308260090>

REUTERS

Japan may use emergency reserve funds from this year's budget to help Tokyo Electric Power Co., the operator of the crippled Fukushima nuclear plant, deal with escalating radioactive water problems at the site.

TEPCO acknowledged last week that hundreds of tons of highly radioactive water had leaked from a tank, one of around 350 assembled quickly after the 2011 earthquake and tsunami that triggered nuclear meltdowns at the site.

The tanks are used to store water pumped through the reactors to keep fuel in the melted cores from overheating.

The latest revelation is the most serious problem in a series of recent mishaps, including power outages, contaminated workers and other leaks.

TEPCO also said last month--after repeated denials--that the Fukushima plant was leaking contaminated water into the Pacific Ocean from trenches between the reactor buildings and the shoreline.

"It's deplorable," Chief Cabinet Secretary Yoshihide Suga told a news conference on Aug. 26. "It is necessary for the country to step forward and offer support to solve the problem as well as prevent a recurrence."

Suga said trade and industry minister Toshimitsu Motegi had been instructed to come up with measures, including the possible use of reserve funds from the state budget for the year ending March 2014.

Japan put aside a total of 350 billion yen (\$3.55 billion) in reserves for natural disasters and other emergencies in the budget.

Motegi and TEPCO President Naomi Hirose will visit the Fukushima site later on Aug. 26.

Japan is under increasing pressure to contain the toxic water problem at the plant.

The new crisis comes as Prime Minister Shinzo Abe is pitching the country's nuclear technology abroad to countries like Turkey, promising that its nuclear reactor makers have learned vital safety lessons from the disaster.

TEPCO shares fell as much as 10 percent on Aug. 26 to their lowest in 12 weeks.

On Aug. 25, Chinese government said it was paying close attention to developments at Fukushima, noting it has the right to request entry into waters near the facility to conduct checks and assess the impact of the nuclear accident on the Western Pacific.

The country's State Oceanic Administration said it hadn't found any evidence of a "direct impact" from radiation on Chinese waters, but will closely monitor developments.

Reserve funds may be used on Fukushima plant

http://www3.nhk.or.jp/nhkworld/english/news/20130826_39.html

Japan's industry minister says the government may use public funds to prevent further leakage of radioactive groundwater from the Fukushima Daiichi nuclear plant into the sea.

Toshimitsu Motegi spoke to reporters on Monday after inspecting the crippled plant.

He visited the area where contaminated groundwater is being pumped out to prevent it from seeping into the ocean.

He also viewed the site where about 300 tons of highly radioactive water leaked from one of the plant's storage tanks.

Motegi instructed plant operator Tokyo Electric Power Company to take several measures. These include enhanced monitoring of the tanks and installing more welded tanks. The storage tank that leaked was made of steel plates attached by bolts rather than by welding.

Motegi told reporters that so far the government has let the operator deal with the situation each time a problem has come up. But he said that from now on, the government will take full charge.

Motegi said the government will also consult with fiscal authorities on the possibility of using this year's reserve funds to build an underground frozen soil wall to stop contaminated groundwater from leaking into the ocean.

Mismanaged' leaks to require reserve funds

Jiji, AP, Kyodo

<http://www.japantimes.co.jp/news/2013/08/26/national/mismanaged-leaks-to-require-reserve-funds/#.Uhtje39Sab0>

The government is considering using reserves from the fiscal 2013 budget to deal with the leaks of radioactive water at Tokyo Electric Power Co.'s Fukushima No. 1 power plant, Chief Cabinet Secretary Yoshihide Suga said Monday.

Suga said he has instructed industry minister Toshimitsu Motegi to pursue all possible measures to deal with the leaks, including the money.

Motegi, who visited the plant Monday for an inspection, said Tepco's lax maintenance was largely to blame for the leaking storage tanks surrounding the poorly protected 40-year-old plant hit by the earthquake and tsunami in March 2011.

He said the government would be taking charge and stepping up patrols of the tanks to prevent more problems.

Suga said the big problem is that Tepco has failed to properly manage tanks for storing contaminated water, unlike the structural factors behind the contamination of groundwater at the plant.

The building crisis involving leaks of radioactive water from the crippled plant will not hamper Japan's bid to host the 2020 Summer Olympics, Suga also said at the same press conference.

He acknowledged that Japanese diplomats have been briefing other countries on the escalating crisis at the plant, but added, "I believe this will not influence" the Olympics bid.

Prime Minister Shinzo Abe is scheduled to join a general meeting of the International Olympic Committee on Sept. 7 in Buenos Aires and make a final presentation for Tokyo's bid to host the games, which Madrid and Istanbul are also seeking to host.

91% of Japanese want Gov't intervention - Mainichi poll

August 26, 2013

91 percent of Japanese want gov't to step in at Fukushima nuke plant: Mainichi poll

<http://mainichi.jp/english/english/newsselect/news/20130826p2a00m0na004000c.html>

Some 91 percent of Japanese believe that the national government should play a larger role in dealing with the contaminated water leaks at the Fukushima No. 1 nuclear plant, a Mainichi poll has found.

The government has already announced plans to commit funds to dealing with the massive leaks, in which hundreds of metric tons of radioactive substance-contaminated water are thought to have leaked into the ground and seeped into the ocean. The Aug. 24-25 nationwide poll shows, however, that many people across Japan do not trust plant operator Tokyo Electric Power Co. (TEPCO) to competently carry out leak countermeasures and other cleanup operations on its own.

Public doubts have emerged after repeated signs of TEPCO mismanagement at the Fukushima plant, including using recycled tanks to hold toxic water. At least one of those tanks is thought to have leaked some 300 tons of contaminated water.

On other major issues, 68 percent of respondents told the Mainichi that they thought Prime Minister Shinzo Abe's decision to forgo a visit to the controversial Yasukuni Shrine on Aug. 15 -- the 68th anniversary of the end of World War II -- was appropriate. Just 25 percent of respondents disagreed with Abe's decision. Even among respondents who said they actively support the Abe Cabinet, 73 percent said

they believed Abe was right not to visit the shrine where Class A war criminals are enshrined along with Japan's war dead -- virtually identical to the 74 percent of respondents who said they did not support the Cabinet.

Meanwhile, on Deputy Prime Minister Taro Aso's July comments referencing Nazi Germany in connection with Japan's current constitutional reform debate, 54 percent of respondents said the gaffe had "worsened" Japan's image in the world, while 1 percent said it had actually bettered Japan's image.

When asked what Japan's opposition parties should focus on with the governing Liberal Democratic Party and New Komeito now in firm control of both houses of the Diet, 42 percent of respondents said they should "concentrate on rebuilding," while 25 percent said they should "get themselves in order to create a powerful opposition force." In fact, some opposition parties are now attempting to reorganize to better oppose the LDP. The poll numbers suggest, however, that most voters would rather see them steady their own footing before going after the governing parties.

Among respondents backing the Democratic Party of Japan (DPJ) -- which lost a staggering number of seats in both the last House of Representatives and House of Councillors elections -- about half said the party should focus on rebuilding, as against some 30 percent who wanted the DPJ to join hands with other opposition parties to go on the political offensive.

DPJ wants Diet to debate leakage

Diet debates on Fukushima tank leak asked

http://www3.nhk.or.jp/nhkworld/english/news/20130826_40.html

Japan's main opposition Democratic Party wants the Diet to debate the leakage of radioactive water from a storage tank at the Fukushima Daiichi nuclear plant.

Senior DPJ officials met on Monday to discuss the crisis in which contaminated water may have leaked into the ocean.

Some expressed concern that the government's response has been too slow despite the seriousness of the problem.

Others said the government must investigate the leaks immediately and take necessary measures.

The lawmakers decided to call on other opposition parties to jointly demand the government take up the matter in the Diet, even though the Diet is in a closed session.

They will also dispatch their own inspection team led by former foreign minister Koichiro Gemba. He heads the DPJ's task force on the nuclear crisis.

Party President Banri Kaieda told reporters that the government has failed to acknowledge the seriousness of the problem.

He urged the government to actively work to maintain its credibility in the international community.

So money is no problem

Industry minister eyes reserve fund use for plant

http://www3.nhk.or.jp/nhkworld/english/news/20130827_33.html

Japan's industry minister has pledged to work quickly on allocating public funds to prevent more radioactive water from leaking into the sea.

Toshimitsu Motegi said officials will study the possibility of using this year's reserve funds to deal with the crisis at the Fukushima Daiichi nuclear plant.

Motegi made the comments on Tuesday, the day after visiting the plant. Proposed measures include building an underground frozen soil wall to stop contaminated groundwater from leaking into the ocean.

Motegi called the issue urgent and said the government wants to tackle it quickly. He said officials will discuss the scale and other details of the budget with fiscal authorities so that the measures will not be delayed.

Motegi said the plant operator, Tokyo Electric Power Company, should do what it can to try to stop further leakage. But he said the government is taking full charge to move things forward in handling the leaks.

The blind leading the blind?

August 27, 2013

Abe offers Kuwait support in nuclear crisis

http://www3.nhk.or.jp/nhkworld/english/news/20130827_15.html

Prime Minister Shinzo Abe says Japan will help Kuwait respond to a nuclear disaster in its neighboring countries.

Abe met Kuwaiti Prime Minister Jaber Mubarak Al-Hamad Al-Sabah on Monday, on the second leg of his 4-nation Middle East and African tour.

Abe first thanked Kuwait for donating 5 million barrels of oil following Japan's 2011 earthquake and tsunami.

He said he hoped both countries will deepen ties to build a comprehensive partnership, not only in the energy sector but also in politics and security.

Abe is being accompanied by a delegation of Japanese business leaders. Jaber said the delegation represents Japan's eagerness to contribute to Kuwait's development.

The two agreed to strengthen bilateral ties to ensure a stable supply of oil to Japan, which has been hit by higher fuel costs caused by a weaker yen.

They also agreed that senior officials in charge of defense and foreign policies will hold security talks.

Abe pledged Japan's commitment to helping Kuwait build sewage, subways and other basic infrastructure.

Abe also offered support to Kuwait in the event of a nuclear disaster in a neighboring country, such as Iran. He said Japan would help with decontamination, based on its experience with the Fukushima nuclear disaster.

The 2 ministers shared grave concern about the alleged use of chemical weapons in Syria, and expressed hope that a UN inspection team will determine what happened in the ongoing civil war.

Stop TEPCO's "whack-a-mole" game & let Gov't step in

August 27, 2013

Fukushima water leaks overwhelming utility

'Whack-a-mole' Tepco can't cut it, so state steps in

Bloomberg

<http://www.japantimes.co.jp/news/2013/08/27/national/tepcos-whack-a-mole-prompts-government-take-over-in-fukushima/#.Uhyftn9Sb9k>

The government will lead “emergency measures” to combat the radioactive water leaks at the wrecked Fukushima No. 1 nuclear plant, wresting control of the disaster recovery from the besieged Tokyo Electric Power Co.

“We’ve allowed Tepco to deal with the contaminated water situation on its own and they’ve essentially turned it into a game of ‘whack-a-mole,’ ” Industry minister Toshimitsu Motegi told reporters Monday night in Fukushima. “From now on, the government will move to the forefront.”

The Ministry of Economy, Trade and Industry, which is led by Motegi, “is working to draw up, sometime in September, both emergency measures and more fundamental steps to eliminate the roots of the contaminated water problem, as well as measures to be carried out going forward,” the prime minister’s office said in a response to written questions.

More than two years after the March 2011 nuclear disaster started, Tepco’s recovery effort has taken a turn for the worse.

The Nuclear Regulation Authority last week questioned the utility’s ability to deal with the crisis, echoing comments earlier in the month by Prime Minister Shinzo Abe.

Motegi’s visit to the plant comes a week after a storage tank leaked 300 tons of highly radioactive water, which the NRA labeled a “serious incident” in its worst assessment of the problems at Fukushima since the earthquake and tsunami of 2011 caused three reactor meltdowns.

It’s now up to the government to manage the radioactive water building up in tanks at the plant at a rate of 400 tons a day, and leaking from underground tunnels into the ocean, Motegi said.

He told Tepco to monitor its storage tanks more frequently and replace the type that leaked.

“Mr. Motegi said that this leak was caused by human error,” Tepco President Naomi Hirose said in a separate news conference Monday night in Fukushima. “We are very grateful that we are getting government support.”

In its response to questions, the prime minister’s office said METI will pump more “liquid glass” or sodium silicate into the ground as one measure to block radioactive groundwater from spreading and reaching the sea.

In addition to the leaky tank, Tepco has admitted that radioactive groundwater is flowing into the Pacific. The government estimates the flow at 300 tons a day.

Other steps listed under the government's emergency measures include using a subterranean bypass to stop groundwater from reaching the reactor building basements, according to the prime minister's office.

Measures under consideration for the next one to two years include fencing off the reactor building basements with what would be the world's longest underground "ice walls."

These comprise coolant pipes, sunk as deep as 40 meters underground, to turn soil into permafrost. One wall would prevent water flowing from nearby mountains from coming into contact with radioactive coolant water leaking into the basements of the buildings housing the three melted reactors, the other would block radioactive water from reaching the ocean. The government is still working out how much this would cost, according to the prime minister's office.

Tepco initially floated the sunken wall system.

Motegi also gave Tepco until mid-September to restart the advanced liquid processing system to filter radioactive isotopes out of the coolant water. ALPS was taken offline Aug. 8 due to corrosion. The loss of ALPS, one of two systems for filtering water used to cool the reactors, adds to the contamination levels of water in the plant's storage tanks. ALPS is designed to strip out radiation such as strontium, which has been linked to bone cancer.

The tank that leaked had levels of beta radiation of 80 million becquerels per liter, including strontium, Tepco said Aug. 20. That's 8 million times the limit for drinking water under health ministry guidelines.

There are about 350 tanks of similar design to the one that leaked. The NRA has called the danger of other tanks leaking the biggest concern at the site.

Leak likely unnoticed for at least a month

August 28, 2013

Fukushima water leak likely went undetected for more than a month

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201308280059>

THE ASAHI SHIMBUN

The leakage of about 300 tons of highly radioactive water from a surface tank at the crippled Fukushima No. 1 nuclear power plant **may have gone unnoticed for more than a month before it was discovered on Aug. 19**, according to **a spike in workers' beta-ray exposure levels**.

A representative of Tokyo Electric Power Co., the plant operator, told a meeting of a working subcommittee of the Nuclear Regulation Authority on Aug. 27 that the leak had likely already begun by July. He said that inference is based on a study of beta-ray doses in workers who each spent about 2.5 hours a day at a radio relay station, some 20 meters from the storage tank where the leak occurred.

He said the worker dosage readings began to rise some time around mid-July, adding that **TEPCO had yet to investigate the data taken before July**.

TEPCO officials said they believe the leak initially involved only tiny amounts of contaminated water but gradually gained strength. They said rainfall of up to 30 millimeters was recorded on some days in mid-July and later, and **the rainwater likely spread the radioactive water and helped it seep into the ground**.

The NRA on Aug. 27 called on TEPCO not only to investigate the cause of the leak, but also dig wells in an area surrounding the leak site to gauge the spread of radioactive substances. TEPCO has admitted that the leaking water may have reached the ocean.

The leaking tank, which utilizes steel sheets connected by bolts, entered service in October 2011. It used to hold highly radioactive water, one liter of which contained 136,000 becquerels of radioactive cesium in addition to 200 million becquerels of beta-ray source materials, which include radioactive strontium. Of the 1,000 surface tanks in use at the Fukushima plant, about 350 are of a similar design.

Government will take the initiative

August 29, 2013

Abe: Government will take charge of Fukushima radioactive water leak

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201308290044>

Prime Minister Shinzo Abe said his government will take the initiative in dealing with the leak of radioactive water from a storage tank at the crippled Fukushima No. 1 nuclear power plant.

"The government will work as one to do its utmost," Abe said at an Aug. 28 news conference in Qatar, a stop on his tour of Middle East nations. "The government will deal with the situation responsibly, and will keep both domestic and foreign audiences well informed."

Abe also emphasized that the Fukushima nuclear disaster should not be left for Tokyo Electric Power Co., the plant operator, to handle alone, but that the government should also engage in earnest efforts to tackle the situation, including how to deal with the growing stockpile of radioactive water.

Meantime, industry minister Toshimitsu Motegi said Aug. 28 that he will consider using taxpayer money to expand the Alps, a device designed to remove radioactive substances from contaminated water at the Fukushima No. 1 plant.

"The central government will take it upon itself to install more channels if there is a need to do so," Motegi told Yuhei Sato, the governor of Fukushima Prefecture.

The Alps device, which currently has three channels, has yet to finish trial runs prior to becoming fully operational.

The Nuclear Regulation Authority said Aug. 28 that it has formally raised the severity evaluation of the leak of 300 tons of highly radioactive water from a surface tank to Level 3 (serious incident) on the eight-level International Nuclear and Radiological Event Scale (INES). The leak was discovered Aug. 19.

The crisis at the Fukushima No. 1 nuclear power plant caused by the 2011 Great East Japan Earthquake and tsunami, which involved triple reactor meltdowns and hydrogen explosions, was evaluated as a "major accident," the highest on the INES scale at Level 7.

Fukushima Pref asks for Gov't help

August 28, 2013

Fukushima governor urges govt. to address leakage

http://www3.nhk.or.jp/nhkworld/english/news/20130828_44.html

The governor of Fukushima Prefecture has asked the central government to take the lead in dealing with the seemingly endless problems of water leakage at the Fukushima Daiichi nuclear plant.

Highly radioactive groundwater has been found to be seeping out to sea from the plant. This month, more than 300 tons of contaminated wastewater was revealed to have leaked from a storage tank. Some of it may have reached the ocean.

Governor Yuhei Sato visited the Nuclear Regulation Authority in Tokyo on Wednesday.

Sato told the authority's chairman Shunichi Tanaka that the situation can no longer be handled solely by the plant's operator, Tokyo Electric Power Company.

He asked the government to regard the problem as a national emergency and step up monitoring of the plant and guidance of the firm.

Tanaka promised quick action in dealing with the leaks.

Nuclear regulators had ordered TEPCO to swiftly determine the cause of the tank leak and take preventive measures for about 300 other tanks that hold highly radioactive wastewater.

Sato also visited Economy, Trade and Industry Minister Toshimitsu Motegi and handed him a letter outlining similar requests.

Motegi said the government hopes to draw up by early next month measures for dealing with groundwater contamination.

Abe: government will resolve tainted water crisis

http://www3.nhk.or.jp/nhkworld/english/news/20130829_09.html

Prime Minister Shinzo Abe says he intends to spearhead efforts to contain leakage of highly radioactive water at the crippled Fukushima Daiichi nuclear power plant.

Abe met with reporters in Qatar, the last leg of his 4-nation tour in the Middle East and Africa, on Wednesday.

He acknowledged the need for the state to deal with the crisis at the plant, hit by a nuclear disaster in March 2011. He said it cannot leave it up to its operator, Tokyo Electric Power Company.

Abe disclosed that he had instructed the industry minister and the head of the state's Nuclear Regulation Authority to look into why massive amounts of contaminated water had leaked from a storage tank earlier this month.

Some of the water may have seeped into the Pacific Ocean.

Abe also said the industry minister has begun drawing up responses to deal with the contaminated water.

The prime minister pledged to be open about its plans both domestically and abroad.

In regards to his overseas tour, Abe said the lives of Japanese nationals would not be the same if it were not for the Middle East. He said Japan must contribute to the advancement of Middle East nations, and not only through energy alone.

Abe said he came to an agreement with the leaders of Bahrain, Kuwait, Qatar and Djibouti for closer cooperation in politics, security and the economy.

Abe says gov't to take charge of toxic water leak at Fukushima plant

<http://mainichi.jp/english/english/newsselect/news/20130829p2g00m0dm002000c.html>

DOHA (Kyodo) -- Japanese Prime Minister Shinzo Abe said Wednesday his government will take charge of efforts to contain the nuclear disaster in northeastern Japan following a recent toxic water leak at the crippled Fukushima Daiichi power plant.

"There is a need for the state to address the issue with a sense of urgency and not just leave it all up to Tokyo Electric Power Co.," Abe said at a press conference.

Abe's remarks came after the plant's operator, known as TEPCO, recently said the leak of highly radioactive water from a huge steel storage tank was estimated at 300 tons, some of which could have flowed into the adjacent Pacific Ocean. It was the worst leak from the containers at the complex.

Abe, who is in Qatar on the last leg of his trip to the Middle East and Africa, said the government will thoroughly disseminate to people in Japan and abroad information about efforts to contain the disaster at the Fukushima plant.

Japan's Nuclear Regulation Authority decided the same day to raise its assessment of the severity of the leak to level 3, which is defined as a "serious incident," on an eight-point international scale.

The Fukushima nuclear accident, triggered by the huge earthquake and tsunami in March 2011, was rated at the maximum level 7, on a par with the 1986 Chernobyl disaster.

TEPCO's sloppiness can be counted on

August 29, 2013

TEPCO's sloppy oversight of radioactive water tanks continued even after advice

<http://mainichi.jp/english/english/newsselect/news/20130829p2a00m0na006000c.html>

Tokyo Electric Power Co. (TEPCO) continued conducting sloppy oversight of tanks containing highly radioactive water at the Fukushima No. 1 Nuclear Power Plant even after advice was offered by the Nuclear Regulation Authority's secretariat from around a year ago, it has been learned.

Had TEPCO improved its oversight according to the secretariat's advice, it may have been able to reduce the severity of the massive leak of contaminated water at the plant.

According to the secretariat, TEPCO has been conducting twice daily patrols of around 930 tanks holding radioactive water, sending two of nine workers at a time to carry out the inspections. Each worker checks over 450 tanks over the course of two to three hours, and the secretariat is worried that these patrols are insufficient for promptly discovering if one of the tanks is leaking.

From July 2012 to June this year, secretariat officials on site made recommendations or issued instructions around 10 times to beef up patrols and to install more observation cameras and water gauges, among other measures.

TEPCO replied to the secretariat that it had made improvements, but it only upped its patrols from an original once a day to twice a day, without stationing more personnel, and installed more cameras, while still leaving blind spots.

There was also an instance in which a secretariat inspection found a crack in a barrier that was meant to stop contaminated water that had leaked from the tanks from escaping outside the plant.

The leak of radioactive water from the tanks is thought to have started in early July, but it took time to be noticed and as much as around 300 tons of contaminated water escaped.

This month, the Nuclear Regulation Authority also instructed TEPCO to make improvements at the plant. The utility has indicated it will increase its patrol staff by 50 people, boost the number of daily patrols to four and install water gauges in the tanks.

A TEPCO official declined to comment on the matter, saying they did not know enough about the secretariat's instructions.

Don't worry, says Gov't

August 29, 2013

Abe: government will resolve tainted water crisis

Japan's Nuclear Regulation Authority decided the same day to raise its assessment of the severity of the leak to level 3, which is defined as a "serious incident," on an eight-point international scale.

The Fukushima nuclear accident, triggered by the huge earthquake and tsunami in March 2011, was rated at the maximum level 7, on a par with the 1986 Chernobyl disaster.

"The tanks were built in a rush and we couldn't handle all the work"

August 28, 2013

TEPCO didn't take measurements of problem tank after ground sank

<http://mainichi.jp/english/english/newsselect/news/20130828p2a00m0na010000c.html>

Tokyo Electric Power Co. (TEPCO) performed only one check to make sure new storage tanks that were built to hold highly radioactive water at its Fukushima No. 1 Nuclear Power Plant were in the right position and weren't on a lean, it has been learned.

The finding comes after 300 tons of highly radioactive water leaked from one of the tanks in what the Nuclear Regulation Authority deemed to be on par with a Level 3 (serious incident) on the International Nuclear and Radiological Event Scale.

It is believed that the leak occurred as a result of the ground beneath the tank sinking, warping its steel body, but TEPCO didn't take any new measurements after this -- a fact highlighting the sloppy management of contaminated water at the plant.

In July 2011, TEPCO noticed that the concrete base for new tanks that were being tested had sunk about 20 centimeters into the ground. The utility disassembled the tanks and moved them to another location, but this month one tank was found to be leaking.

In a probe after the leak was detected, TEPCO learned that the leaking tank was built about one month before the ground was found to be sinking. However, detailed measurements including those to check whether the tank was leaning even slightly were conducted only once, before it was put into use. It also

emerged that the reason TEPCO realized the ground was sinking was because there was a visible crack in the concrete base.

There are currently about 1,000 tanks on the premises of the crippled nuclear plant, including 350 of the same type as the one which leaked, but measurements were taken only once for each tank.

TEPCO is aware that the ground at the nuclear plant sank as a result of the March 2011 earthquake. When asked why the company was not more thorough when it came to checks, a representative explained, "**The tanks were built in a rush and we couldn't handle all the work.**" In light of the possibility of similar problems occurring with other tanks, TEPCO set up a headquarters handling measures on contaminated water and storage tanks on Aug. 26, and will consider how to approach the situation.

Yuzo Onishi, a member of the government committee managing contaminated water who is versed in civil engineering work, said that when handling highly contaminated water, it is advisable to take measurements regularly to reduce risks.

At a Nuclear Regulation Authority (NRA) working group meeting on Aug. 27, TEPCO expressed the view that the radioactively contaminated water began leaking from the tank in early July, as radiation dosages of workers near the tanks started rising around July 9. Furthermore, based on the rate at which water was leaking, it had been previously calculated that the water started leaking about one month before the leak was detected on Aug. 19.

The NRA has cited the possibility of the leaking section being located at the bottom of the tank, and had instructed TEPCO to conduct a focused inspection. It says that if TEPCO does not adopt an appropriate response, it will consider issuing an order to TEPCO to take action.

But we'll need money

Industry ministry to demand funds to tackle radioactive water leaks

<http://mainichi.jp/english/english/newsselect/news/20130828p2a00m0na011000c.html>

The Economy, Trade and Industry Ministry is set to demand a non-specific budget appropriation amount next fiscal year for measures to prevent leaks of radioactive water at the Fukushima No. 1 nuclear plant, ministry sources said.

The ministry will stop short of specifying the amount as the cost to implement measures to prevent contaminated water from accumulating on the grounds of the nuclear plant is not yet known.

In a related development, ministry officials had said on Aug. 26 that it will disburse money from the 350 billion yen reserve fund for fiscal 2013 to deal with the radioactive water.

With these decisions, the national government has demonstrated to the public that it will work hard to respond to the problem. Moreover, the ministry is poised to demand 12.5 billion yen from the fiscal 2014 state budget to encourage power companies to decommission aging nuclear reactors, up 44 percent from the current fiscal year.

The ministry presented the latest proposal at a meeting of the economy, trade and industry division of the ruling Liberal Democratic Party (LDP) on Aug. 27.

To prevent contaminated water on the Fukushima plant property from increasing further, the ministry is mainly considering freezing soil around the reactor buildings to block underground water from flowing into their basements. However, the durability of such a method remains unknown as there is no precedent for using it over an extended period.

Citing the tremendous amount of public funds required, some LDP legislators underscore the need to examine the effectiveness of the technique before committing to it.

The central government had previously insisted that plant operator Tokyo Electric Power Co. (TEPCO), primarily responsible for the nuclear disaster, foot the entire cost of decommissioning crippled reactors and dealing with radioactive water. Moreover, funds allocated to decommissioning the Fukushima reactors are regarded as "research and development funds" for developing a robot capable of extracting melted fuel from the reactors.

Behind such prudence is the fact that the government is wary that the unlimited use of a massive amount of taxpayers' money to bring the nuclear crisis under control could be seen by a critical public as a government bailout for TEPCO.

However, as Economy, Trade and Industry Minister Toshimitsu Motegi says, the government "cannot just leave the crisis response entirely to TEPCO," as the international community views the leak of contaminated water as the most serious crisis at the plant since the meltdowns triggered by the March 2011 quake and tsunami.

However, neither the ministry nor TEPCO have worked out the details of their response to accumulating radioactive water. The ministry intends to only demand funds be allocated for dealing with contaminated water without specifying the amount because TEPCO is still calculating how much it will cost to freeze soil around reactor buildings and operate the system.

Gov't takeover can't be put off any longer

Government must take over Fukushima nuclear cleanup

by Andrew Dewit and Christopher Hobson
Special To The Japan Times

<http://www.japantimes.co.jp/opinion/2013/08/29/commentary/government-must-take-over-fukushima-nuclear-cleanup/#.UiBF39Sb9k>

Recent weeks have seen increasingly concerned calls, from within and without Japan, for the Japanese government to take a direct role in managing the multifaceted crisis at the Fukushima No. 1 nuclear power plant. The most recent opinion poll shows 91 percent of the Japanese public wants the government to intervene.

The Economist calls Fukushima a “nightmare,” and the editors of Bloomberg deem it “ground zero” for the Abe government. Tepco’s handling of the stricken plant continues to be a litany of negligence and error, raising grave doubts over whether the company is up to the incredibly difficult and important task of decommissioning the plant. While it may be politically inconvenient for Prime Minister Shinzo Abe to accept, it is time to intervene and take over the plant before it is too late.

Understandably, most commentary on the Fukushima plant focuses on the multiple leaks of water laced with high- and low-level radiation. An estimated 300 tons of highly toxic water, including Strontium-90, has leaked from a hastily constructed tank. This became a level-3 crisis on Aug. 21, “serious” on the United Nation’s 7-point International Nuclear and Radiological Event Scale, and represents the most urgent reported problem at the plant since the initial meltdowns.

The leaks closely follow Tepco’s admission that contaminated water has been flowing into the ocean since the accident took place in on March 11, 2011. Crises have been arising with such frequency that NRA Chairman Shunichi Tanaka has described the plant as being like a “haunted house” in which “mishaps keep happening one after the other.”

Yet Japan has been very lucky that nothing worse has occurred at the plant. But luck eventually runs out. The longer Tepco stays in charge of the decommissioning process, the worse the odds become. Without downplaying the seriousness of leaks and the other setbacks at the plant, it is important to recognize that things could very quickly get much worse.

In November, Tepco plans to begin the delicate operation of removing spent fuel from Reactor No. 4. There are 1,300 used fuel rod assemblies in a pool above the reactor. They weigh a total of 400 tons, and contain radiation equivalent to 14,000 times the amount released by the Hiroshima atomic bomb. The spent-fuel pool, standing 18 meters above ground, was damaged by the earthquake and tsunami and is in a deteriorating condition. It remains vulnerable to any further shocks, and is also at risk from ground liquefaction. Removing its spent fuel, which contains deadly plutonium, is an urgent task.

Even under ordinary circumstances spent-fuel removal is a difficult task, normally requiring the aid of computers. But due to the damage, removal of spent fuel from Reactor No. 4 and the five other reactors will have to be done manually. This work will be undertaken in arduous conditions, increasing the risk of yet another mishap.

And if something does go wrong, the consequences could be far more severe than any nuclear accident the world has ever seen. If a fuel rod is dropped, breaks or becomes entangled while being removed, possible worst case scenarios include a big explosion, a meltdown in the pool, or a large fire. Any of these situations could lead to massive releases of deadly radionuclides into the atmosphere, putting much of Japan — including Tokyo and Yokohama — and even neighboring countries at serious risk.

When the stakes are this high, who do you want to bet on? Tepco's abysmal track record is characterized by repeated blunders. Even now there are few signs that Tepco fully understands the magnitude of the situation they — and we — collectively face. It is therefore vital, literally a matter of national security, that Fukushima No. 1's decommissioning be taken over by the government with the assistance of an international task force of experts.

Regarding the contaminated water problem, industry minister Toshimitsu Motegi announced on Monday that, "from now on, the government will move to the forefront." This is a start, but not enough. Tepco must be relieved of control of the whole decommissioning process.

One of the key findings of the independent commissions that studied the accident at Fukushima No. 1 was that it was a "manmade disaster" because the risks and warning signs were repeatedly down-played or ignored. These kinds of warnings have been streaming from the plant since the crisis began. How many more alarm bells does Abe need before he recognizes the gravity of the problem and intervenes?

It is understandable why Abe and his backers do not want to directly take on this toxic job. They risk being tarred with responsibility for further mishaps. But this crisis is too big for Tepco, and the public wants decisive intervention. So the buck stops at the prime minister's desk.

Moreover, many of Abe's key aims as leader — including restoring Japan's economy and national pride — are dependent on successfully managing the precarious situation at Fukushima No. 1. Even his pro-nuclear agenda is reliant upon what happens there: With each new problem or revelation, public skepticism towards nuclear power deepens. Ultimately this is what Abe's prime ministership will be judged on, whether he likes it or not. Now is the time for action, before it is too late.

TEPCO busy launching joint venture with Toshiba

BIZ BRIEF: Toshiba, TEPCO to form global power transmission business venture

http://ajw.asahi.com/article/economy/biz_briefs/AJ201308290062

THE ASAHI SHIMBUN

Toshiba Corp. and Tokyo Electric Power Co. announced Aug. 29 that they have agreed to establish a joint venture that will undertake the engineering support, operation and service business of power transmission and distribution systems in overseas markets.

The new company, T.T. Network Infrastructure Japan Corp., will be established in Tokyo on Sept. 2 and be capitalized at 100 million yen (\$1 million). Toshiba will hold a 85.1-percent stake, while TEPCO will have the remaining 14.9 percent.

T.T. Network Infrastructure Japan will integrate Toshiba's technologies in power transformation and power grid solutions with TEPCO's know-how in grid planning, system design, operation and maintenance.

The company will provide engineering support for overseas transmission and distribution infrastructure projects, initially those promoted by Toshiba. The company will also develop a new, community-based business model, **offering solutions proposals from consulting and system supply through to construction, operation and maintenance.**

Gov't under fire for tepid response

August 30, 2013

Government under fire for slow response to Fukushima leak

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201308300066>

THE ASAHI SHIMBUN

Prime Minister Shinzo Abe has been forced to vow to take all-out efforts to contain the Fukushima nuclear crisis as his administration is roundly criticized for its tepid response to the recent leak of 300 tons of highly radioactive water.

“It should not be left entirely in the hands of Tokyo Electric Power Co. to deal with the accident,” Abe said in Qatar on Aug. 28, citing the plant’s operator. “The government should face up to the situation with a sense of urgency, including the problem of radioactive water.”

The government has come under fire from overseas media organizations, ruling party politicians and fishermen worried about radioactive water contaminating the ocean.

In a meeting at the ruling Liberal Democratic Party headquarters on Aug. 29, party lawmaker Yasuhisa Shiozaki lashed out at the Abe administration’s “lack of a sense of crisis,” singling out Chief Cabinet Secretary Yoshihide Suga.

“The issue of radioactive water is increasingly seen as an international problem, and lawsuits may be filed overseas,” said Shiozaki, acting chairman of the LDP Policy Research Council and a former chief Cabinet secretary.

Shiozaki’s anger can be seen as the first explicit criticism of the government from the ruling party since the LDP returned to power in December.

Later in the day, Suga received a visit from Hiroshi Kishi, head of the National Federation of Fisheries Cooperative Associations, and Tetsu Nozaki, head of the Fukushima Prefectural Federation of Fisheries Cooperative Associations, at the prime minister’s office.

“We must say that TEPCO’s system of handling radioactive water has broken down,” Kishi said. “We want the government to take the initiative in dealing with the situation immediately.”

South Koreans are also worried about the contamination of seawater.

In a statement released on Aug. 26, an environmental protection group based in Seoul called for an outright ban on seafood imports from Japan.

The Chosun Ilbo newspaper said the same day, "The South Korean government should take preventive actions based on a worst-case scenario, without relying only on information from the Japanese government and TEPCO."

Shunichi Tanaka, chairman of the Nuclear Regulation Authority, said Aug. 29 Japan should provide information to foreign countries to dispel growing concerns over the leak.

In Qatar, Abe, in the midst of a four-nation swing through the Middle East and Africa, also said, "The government will deal with the situation responsibly, and will keep both domestic and overseas audiences well informed."

When TEPCO discovered that 300 tons of radioactive water escaped a surface tank in mid-August, many administration officials did not take the leakage seriously.

"It is not a big issue," a senior government official said at the time. "All they should do is to patrol the area carefully and stop the spill."

Successive administrations following the accident at the Fukushima No. 1 nuclear power plant that stemmed from the March 11, 2011, Great East Japan Earthquake and tsunami argued that TEPCO is responsible for bringing the crisis under control. They were reluctant to spend taxpayers' money, fearing criticism that the government was bailing out the embattled utility.

The Abe administration has been forced to break with the traditional approach because TEPCO has failed to hold the ever-increasing radioactive water in check.

However, government officials are still lagging behind the deteriorating situation at the Fukushima plant.

An estimated 400 tons of groundwater flow into the reactor and turbine buildings daily and mix with radioactive water generated in reactor cooling operations.

TEPCO and the government plan to freeze the soil and create a wall to keep some of the groundwater from flowing into the buildings, possibly from the first half of fiscal 2015.

In early August, the industry ministry decided to include part of the costs in the fiscal 2014 budget following a leak of radioactive water into the ocean. The fiscal year starts in April.

But the ministry had to decide to tap into reserve funds under the fiscal 2013 budget and move up the schedule after the disclosure of radioactive water leaking from the storage tank.

"We know complaining will not help, but we feel as if we are playing whack-a-mole because (new problems crop up one after another as) the abnormal situation continues," a government source said.

Just "a ploy to avoid negative publicity" before the Olympics bid?

August 31, 2013

Fishermen ponder whether Olympic bid, not safety is priority for Diet

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201308310042>

THE ASAHI SHIMBUN

A Diet committee has decided to push back a session on the problem of water contaminated with radiation from the Fukushima nuclear accident, ostensibly to wait to see what measures the Abe administration comes up with first.

But fishermen and others directly affected by the hundreds of tons of contaminated water flowing into the sea are skeptical, and believe the stalling tactic is simply **a ploy to avoid negative publicity ahead of a Sept. 7 vote by the International Olympic Committee** to decide the host city for the 2020 Summer Games, of which Tokyo is a leading candidate.

"If they think it is all right to delay dealing with the contaminated water, that shows an extremely low sense of what the problem is," said Masakazu Yabuki, head of the Iwaki city fisheries cooperative in Fukushima Prefecture. "I have gone beyond angry to being completely astounded."

Although the Diet is currently not in session, there are provisions that allow for the holding of committee sessions on urgent matters. For the fishermen and others in Fukushima, it is a highly urgent matter and they want swift action to deal with the problem.

The Nuclear Regulation Authority has classified the water leak as a "serious incident," a Level 3 event on the eight-level International Nuclear and Radiological Event Scale (INES), and the leakage of radioactive materials into the Pacific Ocean has now garnered international attention.

But directors of the Lower House Economy, Trade and Industry Committee met on Aug. 30 and decided to hold off on a session on the problem until mid-September or later. Among the reasons given for that decision was a desire to first look at what the central government was putting together in terms of measures to deal with the leaking contaminated water.

The Ministry of Economy, Trade and Industry said that it would present such measures next week.

Some committee members also proposed visiting the Fukushima site to check on the leakage before holding a committee session.

The Abe administration plans to announce specific measures to deal with the leaking problem ahead of the IOC vote in order to placate international concerns about radiation in Tokyo.

At the same time, the decision by the Diet committee to wait to see what the government plans to do will likely raise criticism that lawmakers were more concerned about bringing the Olympics to Tokyo than dealing with a problem that has already hurt the fishing industry in Fukushima Prefecture.

The Iwaki fisheries cooperative postponed its initial plan to begin test fishing in September. It has submitted a request to the central government asking that it deal with the leaking water as quickly as possible.

IAEA demands "appropriate communication" plan from Japan

August 28, 2013

IAEA Document Reveals Concerns Over Fukushima Communications

<http://www.nucnet.org/all-the-news/2013/08/28/iaea-document-reveals-concerns-over-fukushima-communications>

Security & Safety

28 Aug (NucNet): The International Atomic Energy Agency (IAEA) has told Japan to consider producing an “appropriate communications” plan to explain the safety significance of incidents at the Fukushima-Daiichi nuclear plant and to avoid sending “possibly confusing” messages to the media and the public.

In a document responding to questions from Japan’s permanent mission to the Vienna-based agency, the IAEA says that with “clear content and appropriate frequency of messages” such a plan would be “highly effective” and would avoid sending confusing messages on a possibly long series of low-level International Nuclear and Radiological Event Scale (INES) incidents throughout the recovery operation at the plant.

The document, posted online by Japan’s Nuclear Regulation Authority (NRA), was a response to questions from Japan about whether or not it should apply an INES rating in the case of a leak earlier this month of contaminated water from a tank.

The leak was first reported on 19 August 2013 when water was discovered inside and outside a dike surrounding the water tank. On 21 August the NRA revised its initial rating of the leak from a Level 1 to a provisional Level 3 on INES.

The IAEA document notes that the leak was the latest in a number of similar events that were not given an INES rating.

It says the application of an INES rating is a national responsibility, but whatever communications strategy is adopted, it is important that the information needed to properly determine an INES rating is collated and that “a defensible” rating is determined.

“Frequent changes of rating will not help to communicate the actual situation in a clear manner,” the document says.

The document is online: www.nsr.go.jp/activity/bousai/trouble/data/20130828-1.pdf

- Japan NRA Revises Classification Of Water Tank Leak To INES Level 3 (News in Brief No.206, 21 August 2013)

"All the tanks are makeshift"

September 2, 2013

No. 1 worker knew spill risk in '11

Tanks said built in haste, bound to leak

Kyodo, AFP-Jiji

<http://www.japantimes.co.jp/news/2013/09/02/national/leaks-feared-when-fukushima-no-1-water-tanks-constructed/#.UiR2aH9Sb9k>

FUKUSHIMA – A subcontractor who was involved in building water storage tanks at the damaged Fukushima No. 1 nuclear plant said late last month that concerns about leaks emerged after workers were told to build the vessels as quickly as possible.

As feared, one of the tanks at the plant leaked 300 tons of highly radioactive water last month, Tokyo Electric Power Co. recently disclosed.

“We were required to build the tanks in quick succession,” the man said, recalling his experience building a group of tanks in the H4 area of the plant two years ago. **“We were told to put priority on making the tanks, rather than quality control.** There were fears that toxic water may leak.”

With some 400 tons of the radioactive coolant accumulating at the plant after the three reactor core meltdowns, workers rushed to slap together a 1,000-ton tank every three days, he said. The water, highly radioactive, was stored after being used to cool the melted fuel in the three reactors.

The tanks were flange-type units, which are less watertight than those with welded seams because they have many bolted parts that spring leaks.

The man said the workers were ordered by Tepco and its subcontractor to meet a deadline for the tanks because the amount of coolant water was rising and needed to be stored.

He said management of the tanks' construction was poor, with necessary materials sometimes not delivered on time and rusty bolts found among the materials.

The tank that was confirmed to have leaked was originally constructed in the H1 area of the plant in June 2011, around three months after the Great East Japan Earthquake and tsunami helped trigger the three

meltdowns. After terrain instability was detected in H1, the tank was dismantled and later reassembled in H4, he said.

He said he was involved in sealing the bolted parts and in waterproofing the insides of the tanks to prevent leaks. Currently, the work of waterproofing the insides is done by a company specialized in the field.

He also said the workers checked for cracks and leaks by injecting water.

“We never cut any corners in constructing the tanks and we used the latest technology,” he said. That said, the man noted the average life span of the water tanks is only five years.

“All of the tanks are makeshift. So more toxic water may leak as they deteriorate,” he said.

There are around 350 such water tanks at the plant.

Speaking on Tepco’s current efforts to deal with the huge volume of radioactive water accumulating daily, the man said, “Everyone is working so hard, but I don’t know whether this method is the right answer.”

On Monday, Shunichi Tanaka, chairman of the Nuclear Regulation Authority, said Tepco cannot store huge amounts of coolant water at the plant indefinitely.

“I’m afraid that it is unavoidable to dump or release the water into the sea” after it is purified to levels recognized as safe under international standards, Tanaka told a news conference.

Other officials said the government will present a set of emergency measures Tuesday to deal with the radioactive water problem. It’s not clear if the steps are also meant to curb the roughly 300 tons of highly radioactive groundwater that is believed flowing toward the Pacific Ocean daily, after running under the plant and possibly mixing with water in the basements of the stricken reactor buildings.

The measures to address the buildup of contaminated water, possibly including steps financed by the state budget, will be presented at a ministerial meeting headed by Prime Minister Shinzo Abe.

Fukushima plant worker says leaks were feared when water tanks constructed

<http://mainichi.jp/english/english/newsselect/news/20130902p2g00m0dm002000c.html>

FUKUSHIMA (Kyodo) -- The water storage tanks at the crippled Fukushima Daiichi nuclear power plant were built hastily and it was feared at the time that toxic water could leak from them, a male utility worker involved in their construction told Kyodo News recently.

As feared, one of the tanks was found last month to have leaked 300 tons of highly radioactive water, according to Tokyo Electric Power Co., the operator of the plant.

"We were required to build the tanks in succession," the male worker said, recalling his experience of constructing the group of tanks in the "H4" area two years ago. "We gave priority to making the tanks, rather than quality control. There were fears that toxic water may leak."

With contaminated water accumulating at the plant that suffered a triple meltdown, workers constructed one 1,000-ton tank every three days, he said.

The procurement of materials was not managed well, with necessary materials sometimes not delivered on time.

The tank confirmed to have leaked was built in June 2011, around three months after the plant was damaged by a huge earthquake and tsunami, but it was dismantled after sinking into the ground and later reassembled in the H4 area, he said.

He said the workers made utmost efforts to prevent leakage by waterproofing the inner sides of the tanks and checking for cracks and leaks by injecting water.

"We never cut corners in constructing the tanks and we used the latest technology," he said.

Given that the life span of the tanks is only around 5 years, he said, "All of the tanks are makeshift. More toxic water may leak as they deteriorate."

There are around 350 such tanks at the plant.

Mycle Schneider - the scale of Fukushima disaster

August 30, 2013

<http://globalpublicsquare.blogs.cnn.com/2013/08/30/why-fukushima-is-worse-than-you-think/>

Why Fukushima is worse than you think

By **Mycle Schneider**, Special to CNN

Editor's note: Mycle Schneider is an independent international consultant on energy and nuclear policy based in Paris. He is the coordinator and lead author of the World Nuclear Industry Status Report. The views expressed are his own.

“Careless” was how Toyoshi Fuketa, commissioner of the Japanese Nuclear Regulation Authority, reportedly described the inspection quality of hundreds of water tanks at the crippled Fukushima plant following the recent discovery of a serious radioactive spill. China’s Foreign Ministry went further, saying it was “shocking” that radioactive water was still leaking into the Pacific Ocean two years after the Fukushima incident.

Both comments are to the point, and although many inside and outside Japan surely did not realize how bad the March 11, 2011 disaster was – and how bad it could get – it seems clear now that we have been misled about the scale of the problem confronting Japan. The country needs international help – and quickly.

While the amount of radioactivity released into the environment in March 2011 has been estimated as between 10 percent and 50 percent of the fallout from the Chernobyl accident, the 400,000 tons of contaminated water stored on the Fukushima site contain more than 2.5 times the amount of radioactive cesium dispersed during the 1986 catastrophe in Ukraine.

So, where has this huge amount of highly contaminated water – enough to fill 160 Olympic-size swimming pools – come from? In the aftermath of the 2011 earthquake and tsunami, the reactor cores of units 1, 2 and 3 melted through the reactor vessels into the concrete. Nobody knows how far the molten fuel went through the containment – radiation levels in the reactor buildings are lethal, while robots got stuck in the rubble and some never came back out.

More from CNN: What Japanese leaders can learn

The molten fuel still needs to be cooled constantly and the operator, Tokyo Electric Power Company (TEPCO), injects about 400 tons of water into the perforated reactor vessels *every day*. That water washes out radioactive elements and runs straight through into the basements that were flooded during the tsunami. By 2015, over 600,000 tons of highly radioactive liquid are expected to have accumulated in temporary tanks, some underground, many bolted rather than welded together, and none ever conceived to hold this kind of liquid over the long term. The dangerous fluid is pumped around in four kilometer long makeshift tubes, many of them made of vinyl rather than steel, and plagued with numerous leaks in the winter when the above ground lines get hit by frost.

TEPCO’s account of the discovery this month of the leak of 300 tons of highly radioactive water showed a frightening level of amateurism:

“We found water spread at the bottom level of tanks near the tank No.5... Therefore, we checked the water level of this tank, and... confirmed that the current water level is lower by approximately 3 meters than the normal level.”

TEPCO reportedly admitted that only 60 of 350 tanks in that area are equipped with volume gauges. “Inspection” is done visually by a worker with a radiation detector. Meanwhile, the soil around the leaking tank delivered a dose per hour equivalent to the legal limit for nuclear workers for five *years*. No remote radiation measuring devices, no remote handling.

The tank leak is just the latest in a long list of signs that things are going fundamentally wrong at the site of what could still turn out to be the most serious radiological event in history. And the situation could still get a lot worse. A massive spent fuel fire would likely dwarf the current dimensions of the catastrophe and could exceed the radioactivity releases of Chernobyl dozens of times. First, the pool walls could leak beyond the capacity to deliver cooling water or a reactor building could collapse following one of the hundreds of aftershocks. Then, the fuel cladding could ignite spontaneously releasing its entire radioactive inventory.

More from CNN: Japan ponders freezing ground

TEPCO’s inability to stabilize the site, and the dramatic failure of the Japanese government, now majority owner of TEPCO, should come as no surprise. Indeed, so far, the Nuclear Regulation Authority has seemed too busy trying to help restart the country’s stranded reactors to put adequate attention on stabilizing the Fukushima site.

The fact is that the Fukushima Daiichi site represents challenges of unprecedented complexity. Maintaining the cooling of three molten reactor cores and five spent fuel pools in a disaster zone is a job of titanic proportions. That is why two weeks after the crisis first erupted I suggested the creation of an International Task Force Fukushima (ITFF) that would pull together the world’s experts in key areas of concern: nuclear physics and engineering, core cooling, water management, spent fuel and radioactive waste storage, building integrity and radiation protection.

Two and a half years on, the need for such a taskforce has only grown.

An ITFF would need to be established for at least two years to be effective, and could have two co-chairpersons – one Japanese, one from abroad. A core group of about a dozen experts would work full-time on the project and could draw at will on the expertise of several dozen corresponding experts that are carefully selected by the core group. A significant share of the core group should be independent experts (i.e. with no link to corporate or state interests). In addition, the ITFF would work in an open expert network, free to draw on any expertise in any field that it judges pertinent. It could openly invite feedback to its recommendations and would do its utmost to assess comments and suggestions.

Of course, such a taskforce would not “supervise” or “control” – the responsibility for this would remain with the Japanese government and the regulator. But the ITFF could provide recommendations on short-, medium- and long-term strategies for site stabilization.

Will the call for such a taskforce gain any traction? I have presented the basic concept to safety authorities of several countries, acting and former ambassadors, ministers and the European Commission. But while some officials have pointed to some ongoing limited bilateral assistance, so far, the main stumbling block appears to be the “pattern of denial” in Japan, a problem that has affected not only TEPCO, but apparently the Japanese government and the safety authorities as well.

Thankfully, there have been some small signs in official declarations by TEPCO and the Japanese government in recent days that offer hope for a change in attitudes. And Japan’s image in the world – and the Japanese people’s trust in their institutions – would greatly profit from an explicit and concrete international project. The question is whether members of the international community can muster the will to put their own interests aside, and help Japan conquer the denial that is risking catastrophe.

47 billion yen to tackle water crisis

September 3, 2013

Japan to spend ¥47 billion to deal with water crisis at Fukushima No. 1

AFP-JJI, Kyodo

<http://www.japantimes.co.jp/news/2013/09/03/national/japan-to-spend-47-billion-to-deal-with-water-crisis-at-fukushima-no-1/#.UiWsE39Sb9k>

The government will spend ¥47 billion in public funds to fight the radioactive water leaks at the Fukushima No. 1 nuclear plant, officials said Tuesday, as the state has vowed to take the lead in the cleanup.

Prime Minister Shinzo Abe gathered members of his nuclear disaster response team to decide on the government response to stop radioactive water from flowing into the Pacific from the crippled plant, officials said. The toxic water is coming from not only leaking coolant water storage tankage, but on a daily basis, some 300 tons of toxic groundwater is also reaching the sea from under the complex.

The government plan will total ¥50 billion, including the costs to be shouldered by Tokyo Electric Power Co. The measures include an untested project to freeze the soil well below the water table around four reactor buildings, three of whose units suffered core meltdowns, to stop groundwater from entering and mixing with water being pumped into the leaking reactor cores to keep the melted fuel cool.

Water from nearby mountains flows under the plant and mixes with radioactive water that has already seeped into the ground, resulting in mildly radioactive water also reaching the sea.

Scientists want to circulate a special refrigerant through pipes in the soil to create a “frozen wall” that will stem the inflow of groundwater into the basements of the reactor buildings.

The government will also finance a project to upgrade nuclear decontamination systems at Fukushima. Of the planned spending, ¥21 billion is expected to be covered by emergency funds in the current fiscal year’s budget.

It was not immediately clear where the rest of the money would come from.

At a meeting of ruling party lawmakers Monday, Abe said: “The nation will stand at the forefront and carry out necessary measures without leaving the contamination water problems to Tepco.

“It is necessary to take radical measures, not a haphazard response,” he said.

Tepco has long struggled to deal with the huge amounts of water used to cool the three reactors that went into meltdown after the March 11, 2011, Great East Japan Earthquake and tsunami.

The Nuclear Regulation Authority said Monday that ultimately some radioactive water would have to be released into the sea because it could not be stored in the temporary tanks at Fukushima permanently.

Neighboring countries and local fishermen have expressed concern at the mooted release from the plant, where vast amounts of radioactive water has already escaped into sea.

The cleanup at the plant has been hit by a series of mishaps that have cast doubt on the utility’s ability to contain the world’s worst atomic disaster since Chernobyl in 1986.

Gov't to spend 47 bil. yen to fight Fukushima toxic water

<http://mainichi.jp/english/english/newsselect/news/20130903p2g00m0dm055000c.html>

TOKYO (Kyodo) -- The government said Tuesday it will use about 47 billion yen to tackle a massive buildup of radioactive water at the crippled Fukushima Daiichi nuclear power plant, in the latest sign that the government is stepping in to address the issue that has heightened concerns in and outside Japan.

As part of a basic policy on the toxic water problem adopted the same day, the government pledged to finance measures involving technical difficulties such as a plan to freeze the soil around reactor buildings to stop groundwater from seeping into the buildings and getting mixed with contaminated water.

The government also said it will hold a meeting of ministers concerned and set up an office near the nuclear complex where government officials will stay. But the list of measures presented to prevent the situation from worsening was otherwise mostly what had been announced earlier.

There has been speculation the government wants to avoid any negative impact from the issue on Tokyo's bid to host the 2020 Summer Olympics. Prime Minister Shinzo Abe is scheduled to make Japan's final presentation to the International Olympic Committee's general meeting in Buenos Aires on Saturday, after which the IOC will vote to choose the host city.

Plant operator Tokyo Electric Power Co. has tried to manage the accumulation of radioactive water at the plant since the nuclear crisis began more than two years ago. But it recently admitted that 300 tons of highly toxic water had leaked from a storage tank, some of which could have flowed into the adjacent Pacific Ocean.

Around 400 tons of groundwater seeps into the basement of reactor buildings every day and becomes contaminated as it mixes with highly toxic water that is used to cool the crippled reactors. Water is pumped out from the buildings and stored in tanks.

The plan to freeze a stretch up to 1.4 kilometers long of soil around the Nos. 1 to 4 reactor buildings is seen as a key measure to halt the further increase of radioactive water.

Economy, Trade and Industry Minister Toshimitsu Motegi said that about 32 billion yen in state funds will be used to build the ice wall, including 14 billion yen coming from reserve funds under the fiscal 2013 budget.

The government aims to put the wall in service by the end of March 2015 and a feasibility study is currently being carried out on the unprecedented plan, officials said.

About 15 billion yen, including 7 billion yen from reserve funds, will also be set aside for an experimental project to build a facility that can more efficiently reduce the radiation level of toxic water stored at the plant.

Govt. sets policy to tackle Fukushima leak

http://www3.nhk.or.jp/nhkworld/english/news/20130903_25.html

The Japanese government has decided to spend public funds of about 47 billion yen, or 470 million dollars, to deal with the massive buildup of radioactive water at the crippled Fukushima Daiichi nuclear power plant.

Prime Minister Shinzo Abe, Industry Minister Toshimitsu Motegi and other members of the government's nuclear disaster taskforce approved the basic plan at a meeting on Tuesday.

They agreed the government should take the initiative in tackling technically challenging problems instead of leaving them for plant operator Tokyo Electric Power Company to deal with.

The money will be used to freeze soil to create an underground wall around the 4 damaged reactors.

The aim is to prevent groundwater from seeping through and becoming contaminated.

The government will also foot the bill for decontaminating radioactive water.

Of the funds, 210 million dollars will be financed with reserve funds from the fiscal 2013 budget.

Chief Cabinet Secretary Yoshihide Suga will head a new ministerial panel to address the radioactive water issue.

The government will also set up two liaison bodies so officials can coordinate with workers at the Daiichi plant and officials at TEPCO's head office.

Abe said the measures are intended to achieve a fundamental solution to the radioactive water problem instead of dealing with it in an ad hoc manner.

He said the government will work in a coordinated way, as the world is closely watching whether Japan can successfully resolve problems at the plant and decommission the reactors.

NRA chief Tanaka on TEPCO

September 3, 2013

NRA chief comments on TEPCO

http://www3.nhk.or.jp/nhkworld/english/news/20130903_33.html

Japan's nuclear regulator chief has pledged to give stricter instructions to the operator of the Fukushima Daiichi nuclear plant as the utility struggles to contain radioactive wastewater leaks.

In a news conference on Monday, Nuclear Regulation Authority chairman Shunichi Tanaka criticized Tokyo Electric Power Company for making only quick, patchwork fixes to a series of radioactive water leaks.

He said the agency has given spoken and written instructions to TEPCO for improving the situation, but the operator has obviously failed to follow them.

Tanaka stressed that the regulator will use its enforcing power, if needed, to make the company take the proper procedures.

The regulator's chief commented on the leak of 300 tons of radioactive wastewater from a tank last month and said reports on what caused it, how it happened, and how much leaked are still only estimates.

As for wastewater leaks at other tanks, he said they have been feared and suspected, but any signs of seeping water are too small to be classed as coming out of the tanks.

He also referred to the detection of 1,800 millisieverts per hour of beta-ray radiation at a joint on one of tanks. He said beta-rays are not as penetrating as gamma rays, and will not go through leather shoes, for example.

The chief also reiterated that some of the wastewater may have to be released into the ocean after radioactive substances in it are filtered to within the safety limit.

He said the release of water within safety limits is carried out by nuclear power plants around the world. But Tanaka added that **if Japan is to release the wastewater, the government will still have to explain what it's doing to the international community.**

We don't want another Guadalcanal

September 2, 2013

Don't let Fukushima nuke disaster devolve into another Battle of Guadalcanal

<http://mainichi.jp/english/english/perspectives/news/20130902p2a00m0na021000c.html>

Things are going badly. There's radioactive water leaking, and it can't be controlled.

The minister of economy, trade and industry has said that the central government will now "man the front lines" in the war to tame the Fukushima nuclear crisis, but if the workers on-site do not consent to join battle, if they cannot muster the courage to keep up the fight, then we cannot expect real progress. At least, that's the impression I got after talking with one of those workers, an employee of Fukushima No. 1 nuclear plant operator Tokyo Electric Power Co. (TEPCO).

"The managers don't go outside to the work sites," the worker told me last week. "There are a lot of managers who get almost no radiation exposure, and then they just quit. There's some unhappiness about that where I work. Some people actually tell the managers, 'Go out to the site!' and do the inspections or the maintenance. But in the (plant decommissioning) plan, it actually says that operations have to be 'directed from indoors.' The managers use that as an excuse."

I cannot write the worker's name, or age, or job description here. But I can say that he is not an agitator or loose cannon, stirring up dissatisfaction. Rather, he is a completely average employee, laboring in an environment plagued by a chronic lack of information, beset by haphazard orders, and hampered by poor communication.

"Now, at the plant, they're talking about how to assign people to the contaminated water tank patrols," the worker continued. "The (TEPCO) vice president went ahead and told a news conference that we'd do 'four checks a day,' didn't he? But we're not getting any extra staff. The management says 'do this' and 'do that,' but I don't think they really consider the workers' radiation exposure doses at all.

"Recently, some government minister came here (to the plant) and ran his mouth, right? When I see stuff like that, I think, 'Gimme a break! What the hell do you know about anything?'"

Some radioactive water was seen flowing into the ocean back in April 2011, soon after the three-reactor meltdowns. Sumio Mabuchi, a former minister of land, infrastructure, transport and tourism and an aide to then Prime Minister Naoto Kan, called immediately for an underground earthen wall to stop the flow of ground water beneath the plant grounds. TEPCO ignored him. After long and meandering discussions, that subterranean barrier plan is finally being implemented, but in this as in all else, TEPCO remains passive and reluctant to take action.

The contaminated water issue jumped back to the top of the priority list in April this year, when an underground storage tank for contaminated water sprang a leak. TEPCO had intended to begin dumping water detoxified with the Toshiba Corp.-built Advanced Liquid Processing System (ALPS) into the ocean after gaining the consent of local fisheries cooperatives. The ALPS equipment, however, broke down in June. Then in August, an aboveground storage tank erected to deal with the excess water also sprang a leak and yet more radioactively contaminated water flowed into the Pacific, spreading panic with it.

The government official overseeing the situation called the leak "incompetent management. It's just not acceptable." With matters coming to a head, the prime minister and the industry minister finally began saying the government would assume responsibility.

I've heard the officer in charge of the Self-Defense Forces efforts at the Fukushima plant describe the situation as being "the same as war." In fact, the chaos that has erupted because of the toxic water leaks reminds me of the Imperial Japanese Army's planning in World War II's Battle of Guadalcanal.

Almost 20,000 Japanese officers and men died of starvation on that southern Pacific island because they were not properly resupplied. This logistical failure was due to overconfidence and a critical underestimation of the American enemy. Japanese strategy in the battle lost view of the broader situation, and the operations ordered from on-high stank of grandstanding. Those at the top of the command structure, looking at their maps in Tokyo, could not grasp the realities of the hard-fought battle.

All this bears a striking similarity to the Fukushima nuclear crisis. Leadership has underestimated the contaminated water problem, put too much confidence in storage tanks and ALPS, and put the plant workers under ever greater strain as miscalculation is piled upon mistake.

We cannot let Fukushima devolve into another Guadalcanal. The government's real intentions, whether it really is willing to "man the front lines," will be revealed in the monies and personnel it commits to the nuclear disaster. On Aug. 27, the industry ministry named Director-General for Policy Planning and Coordination Toshihide Kasutani, 52, to lead the "contaminated water special policy secretariat," which will also be given a budget. I'd like to believe that this marks the end of putting lowered costs over safety.

The workers at the Fukushima plant deeply distrust those in Tokyo, and this must be wiped away. The waters next to the plant have been subject to unprecedented nuclear contamination, and this must be halted. Diet discussions must be put to practical use, to strengthen the distribution of information both domestically and internationally. After so much continuous failure, we must repair the damage done to Japan's international reputation. (By Takao Yamada, Expert Senior Writer)

Japan's crisis management ability under question

September 3, 2013

Editorial: Radioactive water leaks call Japan's crisis management capability into question

<http://mainichi.jp/english/english/perspectives/news/20130903p2a00m0na013000c.html>

Contaminated water at the Fukushima No. 1 nuclear plant operated by Tokyo Electric Power Co. (TEPCO) is becoming an increasingly serious problem. High levels of radiation were found near storage tanks similar to a tank where some 300 tons of radiation-tainted water was previously found to have leaked. Meanwhile, contaminated water continues to flow into the ocean.

Overseas media have reported the recent developments as the most serious crisis since the outbreak of the disaster two and a half years ago. Not only have we failed to bring the disaster under control, we are facing an extremely dire situation -- one in which the country's crisis management ability is being brought into question.

Addressing the water issue, Prime Minister Shinzo Abe previously said, "There is a need for the state to address the issue with a sense of urgency and not just leave it all up to Tokyo Electric Power Co." Thus far, however, we've seen little of Abe in the countermeasures that have been taken.

Since the beginning of his second stint as prime minister in December 2012, Abe has pushed for the resumed operation of nuclear reactors in Japan, while championing sales of Japanese nuclear reactors overseas as a component of his economic growth strategy.

However, bringing the disaster at the Fukushima nuclear plant under control and implementing measures against radioactive water leaks should be his top priority. **Without solving the problem of contaminated water in Fukushima, any talk of the safety of Japanese nuclear technology will lack all credibility.** It is the prime minister's duty to lead us to a solution as the head of the Nuclear Emergency Response Headquarters.

The volume of contaminated water continues to grow, because some 400 tons of groundwater flows into the plant's damaged reactor buildings every day, where it comes into contact with melted nuclear fuel. TEPCO removes cesium from this highly radioactive water, after which the water is stored in tanks on the plant grounds. Over 400,000 tons of water, including water with low levels of radiation, are now stored in these tanks. Meanwhile, part of the contaminated groundwater continues to leak into the ocean.

TEPCO plans to process the cesium-free water with ALPS, a multi-nuclide removal system that can eliminate 62 types of nuclear substances. ALPS operations have been put off, however, since water leaks were detected in a test run of the system. Meanwhile, our stopgap strategy of setting up more tanks as contaminated water continues to accumulate is near collapse.

Since the radioactive water leaks came to light, the Ministry of Economy, Trade and Industry (METI) established a new director-level post dedicated to handling the contaminated water, and announced it would increase the number of resident staff at the Fukushima No. 1 plant. TEPCO, meanwhile, set up a contaminated water task force directly under the jurisdiction of the company president's office, to which the utility says it will invite experts from Japan and abroad. Such structural reinforcement is likely to have a certain level of impact, but they remain stopgap measures. Water contamination leaks and other crises are sure to arise again in the future.

In the coming days, the government is to announce a comprehensive strategy for the water crisis. Some of the challenges it faces include installing additional ALPS filtration systems and carrying out its underground water bypass plan, which would pump groundwater and release it into the ocean before it comes into contact with contaminated reactor buildings. The government says it will allocate supplemental budgets to the construction of an underground dam made from a wall of frozen soil around the reactor buildings to block groundwater leakage.

Experts have pointed out the necessity of an underground dam since soon after the nuclear disaster broke out. **Any delays in resolving the radioactive water crisis citing lack of funds or human resources are unacceptable.** The government, having effectively nationalized TEPCO, must take control of the chain of command, recognizing that merely handing down orders to TEPCO to implement countermeasures will not solve the problem. METI, the Nuclear Regulation Authority (NRA) and other related agencies must work closely to confront the crisis we now face.

We also urge the government, in lieu of TEPCO, to explain the leakage of contaminated water into the ocean, which has caused concern in both Japan and overseas. TEPCO's handling of the disaster has shown that its tendency for cover-ups has not changed; any social credibility it may have had has been lost.

Similarly, the Diet, in its passivity, has shown that it still lacks awareness that the current situation is directly linked to the nation's crisis management capabilities.

Postponing discussion of the ongoing state of affairs until the extraordinary session of the Diet begins in October is out of the question. Lawmakers in both the ruling and opposition parties should be prepared to dedicate the next session to contaminated water, and consider convening the session earlier than scheduled.

Opposition lawmakers submitted a request for an assessment by the Lower House Committee on Economy, Trade and Industry -- attended by ministers and agency leaders -- while the Diet is not in session. In a response that strikingly indicated a lacking sense of crisis, members said they would go on an inspection tour of the Fukushima plant in the near future, without setting a specific date.

Diet discussions serve to force the government into becoming a centrally invested party in the issues that are debated, and particularly with the nuclear disaster, to release important information to the public. The development of an oversight and inspection framework that takes into consideration the contaminated water leaks, and what is required for a fundamental resolution, must be thoroughly debated as soon as possible. For example, an underground water bypass is a plan that must undergo a multifaceted assessment before politicians make a final decision on it.

What's especially disturbing is the sense that the political world is holding back on any discussion of the crisis out of concern that such talk could affect Tokyo's chances of winning the bid for the 2020 Olympics, a campaign that will end with the International Olympic Committee's announcement of the host on Sept. 7. Politicians, should, instead, realize that withholding an explanation on the crisis has the potential to further deepen the world's distrust toward Japan.

The ordinary session of the Diet earlier this year ended in June without any extensions due to the scheduling of the subsequent House of Councillors election, which makes it highly possible for the country to go without parliamentary debate for a very long time. As such, prompt discussion is crucial.

Opposition parties must avoid dedicating their energy into pointing out the faults of the ruling parties and emphasizing the differences between themselves and other opposition parties. Rather, what we need is for opposition parties to find common ground with each other in order to offer constructive counterproposals to the ruling coalition. Political parties' competence is being put to the test.

On Sept. 15, the No. 4 reactor at Oi Nuclear Power Plant operated by Kansai Electric Power Co. will be halted for a routine inspection. It will be the first time since July 2012 that no nuclear reactors will be running in all of Japan. In quake-prone Japan, we cannot return to an energy policy that depends on nuclear reactors. The latest contaminated water crisis is a reminder of this reality.

Gov't with the Olympic bid in mind

September 4, 2013

Prime minister's office rushes to address Fukushima contamination as Olympic vote nears

<http://mainichi.jp/english/english/newsselect/news/20130904p2a00m0na010000c.html>

The prime minister's office and the Ministry of Economy, Trade and Industry (METI) began considering the use of reserve funds from this fiscal year's budget to fight a buildup of radioactive water at the crippled Fukushima No. 1 Nuclear Power Plant without consulting the Ministry of Finance, it has been learned.

The prime minister's office and METI considered using the funds in mid-August as part of the 47 billion yen allocation approved by the government's Nuclear Emergency Response Headquarters to tackle radioactive contamination at the plant, which is operated by the Tokyo Electric Power Co. (TEPCO).

The officials envisaged using 21 billion yen in reserve funds to increase and improve facilities to deal with contaminated water, and to construct a wall of frozen soil to stop groundwater from flowing into the nuclear reactor buildings.

It is believed that the prime minister's office and ministry moved quickly to address the contamination amid growing international concerns, which they feared could negatively affect the nation's bid to host the 2020 Olympic Games.

"The world is watching to see whether decommissioning of the Fukushima No. 1 Nuclear Power Plant can be achieved, including the handling of contaminated water. The government will unite to solve this," Prime Minister Shinzo Abe commented at response headquarters on Sept. 3.

The flow of contaminated water into the sea had emerged as an issue during a meeting held at headquarters on Aug. 7, and it was learned on Aug. 19 that a storage tank had been leaking. Overseas

media organizations, mainly in Europe, were critical of the situation -- with the BBC quoting a nuclear expert as saying that the leaking was "much worse than we have been led to believe."

About 40 percent of the International Olympic Committee members are from Europe. During a news conference held Aug. 26, opposition Democratic Party of Japan (DPJ) leader Banri Kaieda commented, "Not only neighboring countries such as South Korea and Russia, but Europe, too, is keenly interested in the issue. There is a possibility that it could affect the Olympic bid."

Concern also arose within the government, with one source from the prime minister's office commenting, "The issue of the Olympic bid is at hand. We can't leave things unattended to forever."

In a separate news conference on Aug. 26, Chief Cabinet Secretary Yoshihide Suga commented, "We have instructed the economy, trade and industry minister to do all he can, including utilizing reserve funds." Suga said that the instruction had been given to the minister "two weeks earlier."

Until that time, the Ministry of Finance had been left "out of the loop," and the perplexed Finance Ministry was left asking what the reserved funds would be used for. It appears that the prime minister's office adopted the view that if the government brought forward its plans to use a portion METI's "decommissioning research funds" from the 2014 budget to build a wall of frozen soil at the crisis-hit Fukushima plant, it would then be able to override the Ministry of Finance.

In another news conference on Sept. 3, Suga said, "Urgency over the issue of contaminated water is increasing day by day. The latest move shows the government's intention to stand at the fore to reach a solution without leaving everything up to TEPCO."

However, the government does not envisage boosting financial assistance to TEPCO beyond that earmarked for the handling of contaminated water.

"If the premise that TEPCO is responsible for cleaning up after the accident collapses, then there will be no limits," one government source said, stressing that the latest declaration of government assistance was an exception.

Masashi Waki, secretary-general for the ruling Liberal Democratic Party (LDP) in the House of Councillors, stated that there had also been "big problems" under the previous DPJ-led administration, and then added, "The measures have come a little too late."

For the time being, however, the LDP does not intend to comply with requests from the opposition parties to conduct reviews of the situation while the Diet session is not in progress. It is apparent that the party wants to avoid having the contaminated water issue turn into material that could be used to criticize the Abe administration.

On Sept. 4, Abe heads to a G20 summit in Russia, followed by an International Olympic Committee meeting in Argentina, where the host of the 2020 Olympic Games will be chosen. Several government officials commented that the government had been running at full speed to address the contamination issue, and that they could not deny that the government had the Olympic bid in mind.

Japan in contact with US experts

September 4, 2013

Trade minister says Japan in contact with U.S., others on Fukushima water crisis

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201309040092>

REUTERS

Japan is in touch with experts in the United States and elsewhere on ways to control the spread of irradiated water at the wrecked Fukushima nuclear plant, trade and economics minister Toshimitsu Motegi told Reuters.

"We will be looking for the best knowledge, technology and information with regard to how to manage the contaminated water at the plant and how to decommission the complex," Motegi said in an interview on Sept. 4.

Japan was criticized for being slow to seek overseas help in the early stages of the response to the Fukushima disaster two and a half years ago.

Despite a pledge to tap global expertise to decommission crippled reactors, nuclear contractors in the United States and Europe have been largely shut out of the project.

Japan's government this week pledged nearly \$500 million to contain leaks and decontaminate radioactive water at the coastal Fukushima plant, which was hit by a massive earthquake and tsunami in March 2011 that triggered reactor meltdowns in the worst nuclear disaster since Chernobyl.

The steps come as the International Olympic Committee decides on Sept. 7 whether Tokyo--some 230 km from the stricken plant--will host the 2020 Olympic Games.

Prime Minister Shinzo Abe has helped lead the campaign to win the bid to host the Games and officials have been eager to show the crisis is under control, even as radiation levels at parts of the Fukushima plant have spiked to record highs.

Motegi, who has been sharply critical of the plant operator, Tokyo Electric Power Co.--he has likened its response to an escalating problem with irradiated water to a game of "whack-a-mole"--said Japan has been in touch with a national research facility in the United States for ideas on how to deal with the contaminated water, as well as other overseas experts. He did not provide details.

A spokesman for the Ministry of Economy, Trade and Industry said no decision had been made on whether to use the technology suggested by overseas experts and declined to provide specifics on those exchanges.

DECOMMISSIONING AGENCY?

Motegi said it was too soon for Japan to consider a legal framework that would give the government sole oversight for scrapping the Fukushima reactors.

Yasuhisa Shiozaki, acting policy chief of the ruling Liberal Democratic Party, has proposed creating an agency similar to Britain's National Decommissioning Authority, a public body charged with dismantling Britain's atomic power stations.

"This will take thinking through questions like our overall energy policy and taking a big-picture view of the situation," Motegi said. "To create a new agency with a single mission would not necessarily accelerate the work that needs to be done."

Japan's nuclear industry, which once provided a third of the nation's power, has nearly ground to a halt since the Fukushima disaster.

TEPCO has been pumping water over the reactors to keep them cool and storing the radioactive wastewater in above-ground tanks.

The utility said last month that at least one of those hastily built tanks was leaking.

It has also found high radiation levels just above the ground near other tanks, suggesting widespread structural problems.

Those revelations spurred the government intervention. Under the new steps, Tokyo will fund a \$400 million project spearheaded by Kajima Corp. to ring the area around four reactors with a wall of frozen earth to keep groundwater from seeping towards them and becoming contaminated.

More money will be used to build a water treatment facility that can remove all radioactive particles from water except tritium, considered the least harmful to humans.

Motegi said the Advanced Liquid Processing System (ALPS), developed by Toshiba Corp and Utah-based EnergySolutions but which has been stalled for months due to safety problems, would begin running this month.

Japan should swallow its pride, says Akio Matsumura

<http://akiomatsumura.com/2013/09/japan-swallow-your-pride-and-ask-for-help.html>

Japan, Swallow Your Pride and Ask for Help

September 3, 2013

A Choice for Japan. Prime Minister Abe and the Pacific Ocean.

Japan is an island nation, connected to the rest of the world through the Pacific Ocean's currents. For thousands of years those waterways have carried Japanese sailors to distant shores. Now they carry radioactivity to our coasts. Japan's reluctance to ask for international help in managing Fukushima's cleanup would be one thing if it put only its own people at risk. But with the rest of the world facing health risks, Japan's mismanagement of its nuclear crisis is irresponsible and should not be accepted by other governments, especially the United States, whose food supply stands to be contaminated.

The contaminated water is the result of a process that cools the spent fuel rods at the site. TEPCO is storing the water in almost 1000 tanks on the site. About one-third of these tanks are more vulnerable to leaks because their steel walls are bolted together rather than welded. TEPCO will have to continue to build several hundred more each year. And with the decommissioning of the power plant taking 40 years, where will the new water tanks go?

TEPCO is already having a tough time keeping up with the growing variety of problems that storing the water has caused. The Chairman of the Nuclear Regulation Authority described the plant to the Japan Times as being like a "haunted house" in which "mishaps keep happening one after the other." The Guardian reports reports that extremely high levels of radiation are coming from one tank. TEPCO does not know why the radiation levels spiked.

Through the summer, after TEPCO revealed contaminated water has leaked into the Pacific Ocean since the accident and proved its inability to handle the accident, Prime Minister Abe instructed the Nuclear Regulation Authority to take a more active role in decommissioning the plants. Its Chairman, Shunichi Tanaka, said: 'We cannot fully stop contaminated water leaks right away. That's the reality. The water is still leaking into the sea, and we should better assess its environment impact.'"

The irradiated water will continue to leak into the ocean. And with no room for new tanks, Japan will have to dump the irradiated water its holding now as well.

The effects this will have on the ocean is largely unknown. We must remember that the Pacific Ocean connects most of the world, reaching the shores of both Americas, the long coasts and islands of Asia, and the barrier reefs of Australia. The web of life it contains is complex and rich.

Still, it is our use of its resources that concerns us most. Salmon swim east to Alaska, tuna swim off the coast of Japan. For now, fisheries around Fukushima have been closed. Ken Buesseler, leader of a radiochemistry research team that just finished work off the coast of Fukushima, makes clear that we still know little about the accidents' effects on the marine ecosystem, but the increasing flow of irradiated water into the ocean is worrisome.

The Japanese formed a unique bond to the sea over thousands of years. In the last two years we have changed the legacy of that relationship forever. We cannot properly conceive of the effects on a network of life we know little about in the first place. As tenants of the planet, the Japanese and human beings have no right to pollute as we have.

The water crisis is just one thing that has gone wrong, and just one of many more that could go wrong but haven't yet. Many scientists have explained the worst case scenario for Fukushima: four nuclear reactors were damaged by the 2011 tsunami and earthquake. Of these, three reactors have not been repaired at all due to the high radiation and the fourth contains ten times the radioactivity of what Chernobyl released. If one of the reactors collapses, it will cause a global catastrophe. Earthquakes and structural damage contribute to this event's likelihood.

Crisis. Catastrophe. The words I choose are those of alarm.

But a quick look at Prime Minister Abe's agenda makes it clear that business continues as usual in Japan. Although he has come under recent criticism for mishandling the crisis (some have protested that Tokyo should not be a finalist for the 2020 Olympic Games), his strong position has let him carry on, his political course unchanged.

Instead, Prime Minister Abe should use his hard-won political independence to stave off a crisis. He has the opportunity to overcome Japan's incapacitating national pride and ask for the best technical support and expertise the world can offer. The world would no doubt quickly come to Japan's aid. Asking for assistance should be his first governing priority. Besides, it is good politics. How can he build a strong Japanese economy if a top export is radioactivity?

In fact, I find it hard to believe that preventing further disaster — a leaking water tank, a power failure to a cooling pool, another mega earthquake — is not his greatest concern. I believe he has grasped the huge challenge and the potential catastrophe, but with no clear solution to handle the damaged nuclear plants and underground contaminated water in ten years, Prime Minister Abe wishes to shift the public attention to the 2020 Tokyo Olympic Game. With this strategy he can only hope that the next crisis will not take place during his term.

The threshold for government action is foolishly high. Especially in the United States. Leaders say that the science is uncertain, that we need more definitive evidence. This is negligent. Government has the unique ability to convene resources and intervene early to take precautionary action for public good. While Germany, Russia, France, and England could certainly help, the United States is home to some of the best technology and experts in science, engineering, and health. Japan needs to ask for their help in stemming the flow of water and stabilizing the four damaged power plants. American and Japanese leaders should realize that the irreversible nature of a large crisis will leave us with radiation and other health risks for a minimum of several hundred years.

While a politician can skip out on his responsibility thanks to terms of office, we the people cannot avoid whatever health risks ensue. We as Japanese do not want to carry the legacy as those who irreparably harmed the Pacific Ocean and we as Americans do not want to be affected by this crisis. We as humans do not want to see the Pacific Ocean polluted. But by letting Prime Minister Abe choose wealth over health, we are cementing our joint roles in the history books.

Japan must swallow its national pride and ask the best minds and technology from abroad to save Japan and the world.

Asahi receives award for scoops on decontamination

September 4, 2013

Asahi Shimbun wins award for scoops on shoddy decontamination work

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201309040084

THE ASAHI SHIMBUN

The Asahi Shimbun on Sept. 4 won a Japan Newspaper Publishers and Editors Association award for a series of scoops revealing the scope of slipshod work done by general contractors to decontaminate areas around the stricken Fukushima No. 1 nuclear power plant.

Four Asahi Shimbun reporters camped out a total of 130 hours in areas around the plant where decontamination work was under way. They photographed workers dumping tainted grass and water, instead of collecting them for proper disposal, at 11 sites. Interviewing workers, they wrote a series of stories that showed the corners being cut on the central government-commissioned cleanup efforts.

The series prompted the Environment Ministry to launch an investigation, which resulted in three general contractors being ordered to take corrective action.

The honor from the newspaper association, the Japanese equivalent to the Pulitzer Prize, followed last year's award to The Asahi Shimbun for a long-running series under the title "The Prometheus Trap." The articles detailed the fast-spreading Fukushima nuclear crisis from various angles after it was triggered by the Great East Japan Earthquake and tsunami on March 11, 2011.

The articles on the shoddy decontamination work that contributed to the winning of the award are available at:

- (1): Radioactive waste dumped into rivers during decontamination work in Fukushima
- (2): Some decontamination workers sorry for following orders
- (3): Reporters document extent of shoddy decontamination practices
- (4): Government mishandled complaints about shoddy cleanup work
- (5): Government to investigate Fukushima decontamination
- (6): Ministry questions decontamination contractors; workers express hopelessness
- (7): Decontamination workers say cutting corners came naturally
- (8): Environment Ministry failed to act on Asahi tip-off
- (9): Fukushima city not sticking to plan to decontaminate homes
- (10): Ministry to investigate after companies admit only 3 violations in Fukushima
- (11): Photos, videos show contractors lied in decontamination reports
- (12): Government confirms 5 cases of shoddy decontamination work
- (13): Workers break silence to allege boss ordered corner-cutting
- (14): Yakuza taking slice of lucrative decontamination work

Olympics vs Fukushima crisis

September 5, 2013

Leader of Tokyo bid for Olympics dodges reporters' radiation questions

by Dave Hueston

Kyodo

<http://www.japantimes.co.jp/news/2013/09/05/national/leader-of-tokyo-bid-for-olympics-dodges-reporters-radiation-questions/#.UigvUH9Sb9k>

BUENOS AIRES – What should have been a resounding kickoff for the Tokyo 2020 bid with the International Olympic Committee's vote coming Saturday turned into **a fencing match as bid chief Tsunekazu Takeda tried to parry questions from the media about the Fukushima nuclear crisis.**

Takeda, who is president of the Japanese Olympic Committee, and Fujio Cho, president of the Japan Sports Association and honorary chairman of Toyota Motor Corp., held a media event Wednesday in Buenos Aires to pitch Tokyo's proposed marketing program and emphasize the capital's certainty to deliver the games in first-class style.

A space-aged, 34-cm robot called Mirata, was brought on stage as a symbol of Japan's technological excellence. It demonstrated exercises, stretches and fencing maneuvers with Yuki Ota, winner of two Olympic silver medals in fencing and a delegate for Tokyo 2020.

But it was Takeda, who spoke in English for most of the news conference, who appeared to be doing a robot act as he repeatedly delivered the same talking points. Four of the six questions asked by reporters were about Fukushima.

Takeda sent a letter to IOC members on Aug. 27, reassuring them that Tokyo is "completely unaffected" by the problem of radiation-contaminated water at Fukushima No. 1.

Asked whether he is more concerned privately than he is letting on publicly, Takeda said, "I sent a letter to IOC members, I think last week, and I mentioned Fukushima. Now, Tokyo is very safe. The water, the seafood and also the radiation is absolutely safe. Our prime minister, Mr. (Shinzo) Abe, officially announced the government's response for this problem and already started the project."

Takeda was referring to the government's announcement to provide ¥47 billion for measures to deal with the huge volume of radioactive water accumulating at the plant, but he failed to answer the question of how it might influence the vote. Abe is scheduled to give an explanation to IOC members on the day of the vote.

"The radiation level in Tokyo is the same as London, New York and Paris, like the major cities in the world. It's absolutely safe," Takeda said. "There are 35 million people living there in very normal conditions with no worries about this problem."

Asked whether worries from IOC members could weigh against the bid, Takeda again said: "I already explained the radiation level in the water or food is absolutely safe. Same as here (in Buenos Aires). We're not concerned about this problem in Tokyo and also 2020 Tokyo."

Finally, he was asked whether IOC members, who will vote Saturday on the host city, are questioning him about the crisis, irrespective of the safety of radiation levels, and he answered in Japanese.

"The prime minister will explain in a way that reassures people in the presentation," he said. "The water and food is absolutely safe. The radiation levels are the same as in London, Paris, New York or here."

He added that Fukushima is more than 200 km from the capital and in that sense there is no reason for alarm.

"They're not dealing with the issue," said Duncan Mackay, founder and publisher of *insidethegames*, a publication that features in-depth analyses of all things Olympic. "The issue isn't whether the (radiation) situation is the same as London, New York or Paris. London, Paris and New York aren't bidding for the games. Tokyo is. The perception internationally and among some IOC members is that Fukushima is an issue."

Fukushima was so much of a distraction that Tokyo's real agenda became almost an afterthought. Cho said Toyota is ready to become a sponsor of the 2020 Games if Tokyo, which is competing against Madrid and Istanbul, is selected as the host.

"Of course, if the Olympics come to Tokyo, Toyota plans to be a sponsor," he said. "We have already been helping the bid. You can be sure that Japanese companies will be lining up to become business partners of the 2020 Games."

Japan fends off Fukushima concern in Olympic bid

http://www3.nhk.or.jp/nhkworld/english/news/20130905_21.html

Japan's top government spokesman tried to fend off concerns about the leakage of radioactive water at the Fukushima Daiichi nuclear plant ahead of the vote to choose the host of the 2020 Olympics.

Reporters from overseas media raised concerns about the leakage in a news conference by members of Japan's Olympic bid committee in Buenos Aires on Wednesday.

Chief Cabinet Secretary Yoshihide Suga said in Tokyo on Thursday that the Japanese government has already made clear that it will lead the efforts to resolve the water leakage as soon as possible.

He said Japan will work to gather technology and expertise to tackle the issue.

The International Olympic Committee will choose the host city for the summer games on Saturday in the Argentine capital from 3 contenders -- Tokyo, Istanbul and Madrid.

NRA promises full disclosure of radioactivity data

September 6, 2013

Japan's NRA to fully disclose tainted water data

http://www3.nhk.or.jp/nhkworld/english/news/20130906_42.html

A senior official from Japan's nuclear power regulator says it will fully disclose information on radioactive substances leaked into the sea from the stricken Fukushima Daiichi nuclear power plant.

Hideka Morimoto, the deputy secretary general at the secretariat of the Nuclear Regulation Authority, made the remarks at a news conference on Friday.

He offered no comment on the possible adverse effect the water leaks could have on Tokyo's bid to host the 2020 Summer Olympic Games.

He did not speak on South Korea's decision to ban imports of marine products from some parts of Japan either.

Morimoto said disclosing accurate information is important and the reporting provided by the regulator thus far has been insufficient.

He said how the tainted water is affecting the sea in particular is crucial and the NRA will fully disclose data about radioactive materials in that regard.

The NRA says the concentrations of radioactive substances at 1.3 kilometers south of the water outlet for the Number 1 reactor at the plant have fallen to below detectable levels. It adds that water contamination has not spread outside the port for the plant.

On Friday, the NRA uploaded data about water leaks and radioactive materials in the sea in English on its website. It also plans to send the data to foreign correspondents and embassies in Japan.

Lawmakers very timid in tackling the situation

September 6, 2013

Lawmakers wary of dealing with nuclear plant contaminated water leaks

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201309060056>

THE ASAHI SHIMBUN

Even as global concern increases over the radioactive water leaks from the Fukushima No. 1 nuclear power plant, Japanese lawmakers are not aggressively tackling the problem.

The international focus comes only days before the International Olympic Committee selects the host for the 2020 Summer Olympics on Sept. 7. Tokyo is one of three cities in the running.

About the only lawmakers who have taken action is a small multi-partisan group calling for the elimination of all nuclear plants in Japan.

Tomoko Abe, a Lower House member in the group, said, "Now is not the time to be saying to the IOC, 'Japan is all right.' The Abe administration and the Diet lack a sense of crisis in dealing with the problem."

On Sept. 5, seven members of the group visited the Fukushima No. 1 plant for a close-up look at the tanks that have been the source of leaking contaminated water.

Wearing protective gear, the lawmakers spent about three hours at the plant, checking on the storage tanks, as well as the wells that have been dug to pump out groundwater that flows under the Fukushima plant site.

But despite the seriousness of the situation, other Diet members do not appear to be in a rush to deal with the problem.

While the Diet is currently not in session, members of the Lower House Economy, Trade and Industry Committee had decided to visit the Fukushima plant site. However, a definite schedule could not be put together because committee chairman Shigeyuki Tomita had an overseas business trip planned.

As a result, the group of no-nukes lawmakers was the first to visit the plant site, even though Tokyo Electric Power Co., the plant operator, was at first reluctant to allow the visit because of the group's stance on nuclear energy.

No decision has yet been made on when committee sessions would be held to discuss what was learned from the plant site visit scheduled for Sep. 12.

Both the ruling Liberal Democratic Party and opposition Democratic Party of Japan have their own reasons for taking a cautious approach.

A joint session was held on Sept. 4 of the LDP research commission on natural resources and energy strategy as well as the economy, trade and industry policy division. Members welcomed the central government's involvement in handling the leaking water problem.

"There can be no closure on the nuclear accident unless something is done about the contaminated water," one participant said. "It is very encouraging to see the central government playing a leading role in dealing with the problem."

LDP lawmakers, though, were less eager to review the comprehensive plans to deal with the nuclear accident.

Tadamori Oshima, who heads the project team jointly set up by the LDP and New Komeito to deal with the contaminated water problem, said it would not be a simple matter to decide what legislative steps need to be taken to resolve the issue.

There are also concerns that if the central government has to provide public funds whenever there is a new development, there would be no end in sight for government involvement.

The DPJ is also treading lightly in dealing with the contaminated water problem.

A number of lawmakers, including Teruhiko Mashiko, an Upper House member representing Fukushima Prefecture, visited the plant site on Aug. 14. On Aug. 22, the party set up a headquarters to respond to the contaminated water problem.

In a Sept. 5 meeting, DPJ lawmakers decided to seek committee sessions in the Upper House while the Diet is not in session.

However, DPJ members are also aware of the strong criticism being voiced by LDP officials, who blame the DPJ government for leaving the contaminated water problem up to TEPCO.

Some DPJ lawmakers, therefore, are hesitant to criticize how the Abe administration deals with the problem, since the situation might not have become as serious as it is now if the DPJ government had dealt with it more aggressively when it was in power.

Why countries support the Olympic Games

September 6, 2013

Tokyo Olympic bid committee on the defensive over radioactive water at Fukushima nuke plant

<http://mainichi.jp/english/english/newsselect/news/20130906p2a00m0na027000c.html>

BUENOS AIRES -- Tokyo's Olympic bid committee remains on the defensive over how radioactive water accumulating at the tsunami-ravaged Fukushima nuclear power plant should be dealt with.

The bid committee of Tokyo and the two other candidate cities, Madrid and Istanbul, are all stepping up efforts to convince International Olympic Committee (IOC) members to support their bids in anticipation of the IOC vote on Sept. 7 to pick a host city.

The three bid committees are holding news conferences on a daily basis to convince the IOC -- as well as the international community -- that their respective cities are most suited to host the 2020 Games. The IOC is scheduled to announce the host city at 5 p.m. on Sept. 7 local time, which is 5 a.m. on Sept. 8 Japan time.

Of the 103 IOC members, 97 will cast their ballots, excluding President Jacques Rogge and members representing the candidate cities. If nobody abstains, a candidate city must garner at least 49 votes to be elected host city in the first round of voting.

It was widely viewed that Tokyo and Madrid were running in a dead heat, while Istanbul was on the back foot because of the chaotic situation in neighboring Syria. As the voting day draws near, however, the competition is now more complex.

In the vote four years ago to pick a city to host the 2016 Summer Olympics, Japan captured 22 votes in the initial round and 20 in the second round. A senior member of the bid committee said they believe that Tokyo will garner around 30 votes in the first round, judging from IOC members' reactions to the committee's campaigning. Still, this falls below the winning line.

Support from IOC members representing Japan's Asian neighbors is far from firm because of tensions in Japan's relations with China and South Korea.

Meanwhile, the Tokyo bid committee is presently undertaking efforts to win support from prominent figures in the international sports world. During his tour of the Middle East and Africa in late August, Prime Minister Shinzo Abe held talks with Olympic Council of Asia president Sheikh Ahmad Al-Fahad Al-Sabah, who has a huge influence on Middle East and African countries. Abe is also scheduled to attend the upcoming IOC general meeting.

Tokyo's plan to host the Olympics and ability to organize the games have won high appreciation worldwide, with a number of British bookmakers rating Tokyo as No. 1. The contaminated water accumulating on the premises of the Fukushima No. 1 Nuclear Power Plant is drawing increasing attention from the international community as the voting day draws near, however -- putting Tokyo on the defensive.

A source familiar with the IOC has told the Mainichi Shimbun that "Madrid has an edge even though the competition is close."

Madrid is believed to have gained the upper hand when Prince Felipe of Asturias, who participated in the 1992 Barcelona Olympics' yachting event, delivered an emotional speech during a presentation held in Lausanne, Switzerland in July behind closed doors.

Spain's capital has won firm support from IOC members representing Spanish-speaking countries in Central and South America. The city got 31 votes for its bid to host the 2012 Summer Olympics, and also won 32 votes in the runoff election to pick a city to host the 2016 Games -- although it ended up losing to Rio de Janeiro by a narrow margin.

Campaigning by Madrid's bid committee, which includes IOC member Juan Antonio Samaranch Jr. -- the son of a former IOC president -- and two other IOC members, has been intense. Major Spanish newspaper El Mundo predicted that Madrid would score an overwhelming victory, saying, "It'll certainly win at least 40 votes, and may even garner a majority in the first round of voting."

Bid committee head Alejandro Blanco Bravo is warning against such optimism, however. "We can't tell you about our prediction of how many votes we'll garner," he said. "We'll continue to lobby IOC members until the last minute to secure a majority."

Istanbul, which has aspired to become the first city in the Muslim world to host the Olympics, was initially in keen competition with its rivals. Its campaign later lost momentum, however, after a minority group's protest of a plan to redevelop the city center escalated into nationwide anti-government demonstrations. Tensions have also heightened in neighboring Syria, where the United States is considering a military intervention.

During voting to pick a host city for the 2008 Olympics, Istanbul garnered 17 votes in the first round -- and only nine in the second round.

Istanbul bid team leader Hasan Arat commented, "We'll bring back the gold medal." Observations are widespread, however, that the city's chances of being selected are slim.

Final presentations by representatives of the three candidate cities will largely determine whether they win the competition to host the Games.

Dick Pound, an IOC member representing Canada, pointed out that most members decide which city they will vote based not only on the quality of candidate cities' bidding plans -- but also on their own personal preferences.

Daily news conferences held in Buenos Aires by the three cities' bid committees serve as practice for their final presentations.

Istanbul's bid team has failed to make clear-cut assertions on their positions because of difficult problems both at home and overseas.

Fujio Cho, president of the Japan Sports Association and honorary chairman of Toyota Motor Corp., attended the Tokyo bid committee's first news conference in Buenos Aires on Sept. 4 to emphasize Japan's economic capacity.

However, four of the six questions posed to the committee officials focused on radioactive contamination and the leak of contaminated water at the crippled Fukushima nuclear plant.

Tsunekazu Takeda, head of the bid committee and president of the Japanese Olympic Committee, was desperate to dispel the concerns of the international community regarding the dangers that the nuclear crisis could pose to Tokyo.

"Tokyo is absolutely safe. It is 250 kilometers away from Fukushima, and the kind of danger that you imagine does not exist there," he told the news conference.

Tokyo must convince IOC members that radioactive water would not pose any threat to athletes and Olympics organizers in Tokyo in order to get the upper hand in its final presentation.

The bid team intends to emphasize that a disaster could occur anywhere in the world, and that sports have given encouragement to those affected by the March 2011 quake, tsunami and nuclear disaster.

During the final presentation, Princess Takamado will express appreciation to the international community for supporting areas hit by the disasters. IOC members have a respect for the Japanese Imperial Family because many are themselves from royal families. Moreover, the significance of Japan hosting the Olympics to support the restoration of disaster-hit areas is likely to win sympathy from many IOC members.

There is room for Japan to dispel the concerns of the international community regarding radioactive water at the nuclear plant if Prime Minister Shinzo Abe sincerely explains the situation during the final presentation.

At a Sept. 3 news conference, Istanbul's bid committee was bombarded with questions about the Syrian situation.

The following day, the team showed a promotion video emphasizing its efforts to serve as a bridge between the East and West by hosting the 2020 Games. Half of the questions posed to them, however, focused on a mass doping scandal involving many Turkish track-and-field athletes.

During a recent news conference, Madrid emphasized its recent opinion poll -- which showed that 91 percent of the public support the city's bid to host the 2020 Olympics.

In response to a question about its economic uncertainty, such as the high unemployment rate, Mayor Ana Botella said, "That's why we're bidding to host the Olympics: to vitalize the economy."

What to make of IOC's choice

September 8, 2013

UPDATE/ OLYMPICS: Tokyo emerges triumphant in race for 2020 Summer Games

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201309080027

THE ASAHI SHIMBUN AND WIRE REPORTS

The International Olympic Committee chose Tokyo as the host city for the 2020 Summer Olympics at the 125th session of the general assembly in Buenos Aires on Sept. 7, beating out other finalists Istanbul and Madrid.

With Japanese Prime Minister Shinzo Abe reassuring IOC members that the Fukushima nuclear crisis is under control and poses no health threat, Tokyo handily defeated Istanbul 60-36 in the final round of secret voting. Madrid was eliminated in an earlier round after an initial tie with Istanbul.

Tokyo will host the Games for the second time, having been the site of the Summer Olympics in 1964. It will also mark the first time in 12 years that an Asian city will host the Summer Games, following Beijing in 2008.

Tokyo won the bid emphasizing its solid fiscal foundation, urban infrastructure and capability of hosting a successful Games.

Tokyo officials had feared that the accident at the Fukushima No. 1 nuclear power plant, and particularly the recent disclosure that radioactive water had leaked into the sea, would influence the IOC's decision.

In an effort to address the concerns, Abe flew to Buenos Aires to lead the Japanese delegation, cutting short his attendance at the Group of 20 summit in St. Petersburg, Russia.

In the final presentation before the vote, Abe assured the IOC that the Fukushima leak was not a threat to Tokyo and took personal responsibility for keeping the Games safe.

"Let me assure you the situation is under control," Abe said. "It has never done and will never do any damage to Tokyo."

Abe gave further assurances when pressed on the issue by Norwegian IOC member Gerhard Heiberg.

"It poses no problem whatsoever," Abe said in Japanese, adding that the contamination was limited to a small area and had been "completely blocked."

"There are no health-related problems until now, nor will there be in the future," he said. "I make the statement to you in the most emphatic and unequivocal way."

IOC members said Abe's answers were crucial and helped dispel any doubts.

"People wanted to hear it and needed to hear it," Canadian member Dick Pound said. "And he delivered on that. I think that was a real knockout answer."

Tokyo Electric Power Co., operator of the Fukushima No. 1 nuclear plant, has acknowledged that tons of radioactive water has been seeping into the Pacific from the plant for more than two years after the March 2011 earthquake and tsunami led to meltdowns at three of its reactors. Recent leaks from tanks storing radioactive water used to cool the reactors have added to fears that the amount of contaminated water is getting out of hand.

Tokyo's bid benefited from Japan's large economy and link to Olympic sponsors. Asia offers a huge market for the IOC.

"There are a lot of commercial advantages for the IOC going to a country with the third-biggest GDP," Australian member John Coates said. "And then compare that to the economic uncertainty facing Spain and the political unrest that Istanbul experienced a few months ago and more particularly the unrest at the Middle East at the moment."

"The IOC, we've taken the safe bet."

Tokyo delegates in the hall screamed with joy, jumped in the air, hugged and waved small flags after IOC President Jacques Rogge opened a sealed envelope and read the words: "The International Olympic Committee has the honor of announcing that the games of the 32nd Olympiad in 2020 are awarded to the city of Tokyo."

The three candidate cities bidding to host the 2020 Olympic Games made their final presentations to the session before the vote, which was conducted via a secret ballot through electronic voting.

The site receiving the lowest number of votes was eliminated in the voting, continuing until a city garnered a majority of votes.

OLYMPICS/ ANALYSIS: IOC chooses Tokyo for 2020 Games for its solid hand

- Previous Article PHOTO: Tokyoites erupt with joy on successful bid to host 2020 Olympics

September 08, 2013

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201309080039

By ATSUSHI AKUTSU/ Staff Writer

BUENOS AIRES--Tokyo earned the blessing of the International Olympic Committee to hold the 2020 Games in the capital with its promise to offer "peace of mind, safety and stability" amid concerns about the Fukushima nuclear crisis.

All three finalists bidding for the Summer Games had their weaknesses.

Madrid has been embroiled in an economic crisis, while Istanbul has been rocked by anti-government demonstrations as well as civil war in Syria, Turkey's neighbor.

Tokyo's candidacy was overshadowed by a series of leaks of radioactive water at the crippled Fukushima No. 1 nuclear power plant in recent months.

Four years ago, Tokyo lost out in a bid to host the 2016 Games, which went to Rio de Janeiro. While Tokyo decided to compete in the race for the 2020 Games, the city failed to present a clear rationale for wanting to organize them.

When the magnitude-9.0 Great East Japan Earthquake and tsunami devastated northeastern Japan on March 11, 2011, former Tokyo Governor Shintaro Ishihara and other officials began arguing that the Olympics held in the Japanese capital would contribute to post-quake reconstruction.

After all, the IOC was seeking "solidity" for the 2020 Games.

In a speech immediately before a vote at an IOC general meeting on Sept. 7, Princess Hisako thanked the IOC for its support in post-quake reconstruction.

Prime Minister Shinzo Abe also said, "There is not a problem (with leaks of radioactive water)."

That is the assurance that IOC members wanted to hear.

In the first round of voting, Tokyo led with 42 votes, followed by Istanbul and Madrid with 26 each. After Istanbul edged out Madrid in a tie-breaking vote, Tokyo defeated Istanbul 60-36 in the final round.

Tokyo will be hosting the Summer Olympics for the second time following the 1964 Games.

September 8, 2013

Factors behind Tokyo's selection

http://www3.nhk.or.jp/nhkworld/english/news/20130908_12.html

Observers say IOC members likely selected Tokyo to host the 2020 Summer Olympics for its ability to operate the world sporting event safely and soundly.

Tokyo emphasized its stable fiscal base and well-known safety. Financial uncertainty still looms over Madrid and Istanbul has been hit with anti-government rallies and athlete doping issues.

IOC members had voiced concern over radioactive waste water leaks at the crippled Fukushima Daiichi nuclear plant in Japan, which attracted attention in the past few months.

But Prime Minister Shinzo Abe's speech during the final presentation helped to ease that concern. He gave assurances that the situation at the plant is under control.

He explained that the radioactive water affects only 0.3 square kilometers inside the plant's port and the government will take responsibility for countermeasures.

Brisk lobbying activities headed by Japanese Olympic Committee President Tsunekazu Takeda also helped win support of members. Takeda was elected as an IOC member last year.

The country picked up support from IOC members from Asia and Africa. And Japan was very successful in gaining support from Europe, which has the most IOC members of all the continents. Japan won more votes from European IOC members than its two rivals.

Japan promotes sports as part of the national strategy with a law in place since two years ago. The second Olympic Games in Tokyo are now strongly supported by the government and private business.

The IOC survey showed a surge in support among the people of Tokyo to 70 percent for the 2020 bid, compared to 56 percent in the 2016 bid which Japan lost.

Experts proposal on Gov't role ignored... in December 2011

September 7, 2013

Former DPJ-led gov't neglected expert proposal on contaminated water

<http://mainichi.jp/english/english/newsselect/news/20130907p2a00m0na014000c.html>

An expert panel's proposal that the government adopt a major role in dealing with radioactively contaminated water at the crippled Fukushima No. 1 Nuclear Power Plant was left unaddressed by the former Democratic Party of Japan (DPJ)-led government, it has been learned.

An expert panel to the Cabinet Office's Japan Atomic Energy Commission (JAEC) made the proposal in December 2011, advising that the government take the initiative in preventing water leaks and safe storage and treating of contaminated water at the plant. However, it was revealed Sept. 6 that the government at the time left the proposal virtually untouched. The panel also recommended setting up a third-party body to monitor measures taken by plant operator Tokyo Electric Power Co. (TEPCO) and to seek dialogue with local bodies, but this suggestion has yet to be implemented.

"We were severely criticized for having promoted nuclear power, and we compiled the proposal thinking that we, too, had a responsibility to ensure safe decommissioning of the Fukushima reactors," said a senior JAEC official.

A former official in the DPJ-led administration commented, "TEPCO was playing a major role in addressing the nuclear disaster. ... There was no reason the government had to act in accordance with the proposal." The comment serves as an admission that the government at the time was not placing much emphasis on the JAEC proposal, which was filed on Dec. 13, 2011, about nine months after the onset of the nuclear crisis.

If the previous administration had paid more attention to the recommendation, problems relating to contaminated water might not have been as severe. Even after the current administration led by Prime Minister Shinzo Abe spelled out on Sept. 3 this year basic government policies such as injecting public funds to deal with contaminated water and stepping up the monitoring of TEPCO's work, some in the ruling Liberal Democratic Party (LDP) still point out that the government's involvement in the issue remains ambiguous.

The JAEC proposal analyzed the U.S. government's response to the Three Mile Island (TMI) nuclear accident in March 1979 and estimated that the amount of contaminated water generated at the Fukushima No. 1 nuclear plant -- where multiple reactors were damaged -- was likely to climb to around 20 times that at Three Mile Island. The proposal noted that Washington didn't leave the handling of the TMI accident solely to the power company but established a system to share the responsibilities among the Department of Energy and the Nuclear Regulatory Commission. It praised such measures as leading to longtime and safe management and disposal of radioactive waste including contaminated water.

On the financial front, the JAEC proposal pointed out that the U.S. government injected public funds into the development of technology and equipment to decommission the TMI reactor at the center of the accident -- including measures against contaminated water -- on the grounds of protecting "national interests," while having the power company perform a key role. The JAEC proposal emphasized the importance of the Japanese government becoming aware of its responsibility and getting involved in the issues at the Fukushima No. 1 nuclear plant.

With regard to measures to be taken to deal with contaminated water, the JAEC paper expressed concern that it might not be possible to detect the locations of water leaks using cameras or dosage measurements alone. It also urged the construction of impermeable walls and the utilization of both domestic and foreign expertise in the development of technology and equipment as part of measures to safely store and process contaminated water over a long period of time.

More meetins related to nukes (Reconstruction Agency) kept secret

September 6, 2013

Gov't agency kept meetings on nuke disaster support off-record, withheld documents

<http://www.mainichi.jp/english/english/newsselect/news/20130906p2a00m0na026000c.html>

Inter-agency meetings on the extent of government support for people affected by the Fukushima nuclear disaster were never recorded, and their proceedings were kept effectively secret from the public, the Mainichi has learned through a freedom of information request.

The Reconstruction Agency held a number of high-level meetings with other agencies and ministries concerned with the nuclear disaster support law, but chose not to release any information about the meetings so as not to "invite public misunderstanding or unwarranted speculation," an agency official stated. In fact, details suggest that the agency chose not to reveal that the meetings were even happening.

The Reconstruction Agency released its basic support plan on Aug. 30, which covered 33 municipalities in Fukushima Prefecture. The agency was originally going to determine eligibility for government support based on a set standard for local radiation. The agency chose to select municipalities eligible for government support without drawing up such a standard, however -- which has drawn criticism that the area covered by the plan is "unfairly narrow."

Reconstruction Minister Takumi Nemoto has stated that this support plan "was arrived at in consultation with related ministries and agencies," hinting at pivotal meetings that took place among division directors and policy counselors as the plan took shape.

The Mainichi filed a freedom of information request for the minutes of these meetings in early July, more than a month before the basic support plan was released by the Reconstruction Agency.

The agency responded on Sept. 4 with eight pages of documents detailing the times, places and attendees at four meetings in April through June. The Mainichi was told, however, that minutes of these conferences "do not exist." Furthermore, the agency refused to release some 120 pages of documents presented by related government offices for consideration during the meetings, stating that the material was "of a preliminary nature and would invite public misunderstanding and unwarranted speculation."

According to the agendas and other sources, the meetings were convened at the behest of the Reconstruction Agency, and included division directors and policy counselors from the Environment Ministry, the Cabinet Office's disaster victim support team, and the Nuclear Regulation Authority (NRA). The director-general for the Reconstruction Agency and the NRA's vice-chief were also on hand during at least one occasion.

The nuclear disaster victim support law guarantees that victims' opinions will be taken into account, and that all discussions will be made transparent. Furthermore, the government has been in hot water before for keeping meetings related to the nuclear crisis secret, after it was found at the beginning of last year that proceedings of the Cabinet Office's nuclear disaster response headquarters had also gone unrecorded. The government's public document management committee, meanwhile, demanded in April 2012 that minutes be kept of all meetings related to the March 2011 Great East Japan Earthquake.

The Reconstruction Agency has failed to heed this call, however -- at least in the case of its inter-agency meetings over the nuclear disaster support law. On its failure to record minutes of the meetings and its refusal to release related documents, the agency told the Mainichi, "the law on public document management does not require meeting minutes and other documents to all be recorded in the same way. The meetings in question were not held to make final decisions, but were simply information exchanges."

The Cabinet is set to formally adopt the basic nuclear disaster victim support plan after the public comment period ends on Sept. 13. The Reconstruction Agency is scheduled to hold public information sessions on the plan in the city of Fukushima on Sept. 11.

More Fukushima people supposed to have died of stress than from direct effects of disaster

September 9, 2013

Stress-induced deaths in Fukushima top those from 2011 natural disasters

<http://mainichi.jp/english/english/newsselect/news/20130909p2a00m0na009000c.html>

The number of deaths in Fukushima Prefecture caused mainly by stress from the nuclear disaster reached 1,539 at the end of August, almost equaling the 1,599 fatalities due directly to the 2011 Great East Japan Earthquake and tsunami, the Mainichi Shimbun has learned.

In addition, bereaved families have filed condolence money applications for at least 109 victims who they say died due to fatigue, stress and aggravated health conditions while living in evacuation shelters and temporary housing. If this number is added, deaths attributable to post-disaster conditions surpass the number of those killed directly by the March 11, 2011 quake and tsunami.

There have been cases of Fukushima residents whose health conditions worsened due to extended periods living as evacuees, as well as those who were driven to suicide.

The Reconstruction Agency had put the total number of these deaths at 1,383 at the end of March this year. According to a Mainichi survey of 25 cities, towns and villages in Fukushima that have certified disaster aftermath-related fatalities, a further 156 people passed away from such causes from April through August.

The city of Minamisoma led the tally at 431, followed by the town of Namie at 291, and the town of Tomioka at 190.

But many municipalities declined to specify the causes of those disaster aftermath-related deaths, saying they would affect future screenings of applications for condolence money.

The Reconstruction Agency's investigations into the causes of 734 deaths in Fukushima Prefecture based on data at the end of March last year show that 33.7 percent died from fatigue due to life in evacuation centers, 29.5 percent died from exhaustion due to relocation to evacuation centers or other locations, and 14.5 percent died of worsening illnesses after hospitals treating them stopped functioning. Nine people took their own lives.

As of the end of August this year, such aftermath-related deaths totaled 869 in Miyagi Prefecture and 413 in Iwate Prefecture.

Get on with the task force

September 9, 20123

Govt., TEPCO meet to discuss Fukushima leaks

http://www3.nhk.or.jp/nhkworld/english/news/20130909_41.html

Officials from the government and the operator of the Fukushima Daiichi nuclear plant have met for the first time as part of a task force to discuss radioactive waste water leaks at the plant.

They agreed to boost measures to stop the waste water from flowing into the Pacific Ocean.

About 20 officials, including senior vice industry minister Kazuyoshi Akaba, attended the task force meeting in Naraha town near the plant on Monday.

The government-led task force was established on September 3rd as the problem of contaminated water at the plant was getting more serious.

They talked about radioactive waste water leakage from storage tanks. Tokyo Electric Power Company workers last month discovered that about 300 tons of the water had leaked from one of tanks. Some of water may have flowed into the ocean.

They decided to build higher barriers around the tanks and seal a ditch leading to the ocean so that waste water will not enter it.

They also asked the plant operator to draw up a plan to change the storage tanks for more reliable welded types by the next meeting in October.

The hundreds of tanks being used, including the one that leaked waste water, are made of steel plates fastened together with bolts.

The task force will also address groundwater contamination in the plant.

Nobody held responsible

September 9, 2013

Prosecutors decide not to indict anyone related to Fukushima nuclear accident

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201309090099>

THE ASAHI SHIMBUN

Prosecutors on Sept. 9 decided not to indict any of the 40 or so individuals who had been targeted in criminal complaints and accusations for their role in the Fukushima nuclear accident of 2011.

Residents of Fukushima Prefecture and citizens groups had filed the accusations in Tokyo and Fukushima district public prosecutors offices. Among those targeted were Tsunehisa Katsumata, who was chairman of Tokyo Electric Power Co. when the accident occurred at the utility's Fukushima No. 1 nuclear power plant, and Naoto Kan, who was the prime minister at the time.

The assertions suggested the individuals bore responsibility for hospitalized patients dying as they were evacuated in the immediate aftermath of the Fukushima nuclear disaster as well as causing residents to become exposed to radiation.

Prosecutors concluded it would be difficult to prove criminal responsibility in relation to the lack of adequate measures to deal with the tsunami on the part of TEPCO because experts had not predicted an earthquake and tsunami on the scale that struck on March 11, 2011.

Prosecutors also concluded that individuals could not be held criminally responsible for the manner in which they dealt with the crisis.

Those who submitted the criminal complaints and accusations plan to submit their cases to prosecution inquest panels made up of ordinary citizens in an effort to override the decision by prosecutors not to indict anyone.

Kan, Tepco execs avoid charges over nuclear disaster

Kyodo

<http://www.japantimes.co.jp/news/2013/09/09/national/kan-tepco-execs-avoid-charges-over-nuclear-disaster/#.Ui7C8n9Sb9k>

Prosecutors on Monday decided not to indict former Prime Minister Naoto Kan or any officials from Tokyo Electric Power Co. over the nuclear disaster at the Fukushima No. 1 plant because of the lack of criminal responsibility.

"It was difficult to foresee the scale of the earthquake and tsunami," the Tokyo District Public Prosecutor's Office said of the government's response to the natural disasters in Tohoku that triggered the man-made meltdowns in Fukushima Prefecture in March 2011.

About 14,700 people from groups across Japan, but mainly in Fukushima Prefecture, filed complaints against Kan and 41 other individuals for alleged professional negligence resulting in death and injury in connection with the nuclear disaster, which was triggered when the poorly protected power station lost all power after being hit by the quake and subsequent tsunami.

Kan, who was prime minister from June 2010 to September 2011, called the prosecutors' decision "a natural outcome."

But residents dissatisfied with the ruling will request that an 11-member independent inquest panel review the case. The groups said they are now planning to take their case to the Committee for the Inquest of Prosecution in Tokyo, where the investigation was handled.

In addition to Kan, the accused included Tsunehisa Katsumata and Masataka Shimizu, who were chairman and president of Tepco at the time, and Haruki Madarame, then chairman of the now-defunct Nuclear Safety Commission.

The focus was on whether prosecutors could find enough evidence to prove that the government and Tepco failed to take sufficient measures at the 40-year-old power plant after being notified of the risk of earthquakes and tsunami.

The government and Tepco were also accused of delaying the evacuation of residents around the plant, causing many to be exposed to radiation and leading to the deaths of many bedridden hospital patients. Asked about the prosecutors' decision, Chief Cabinet Secretary Yoshihide Suga said at a news conference that he would not comment on the conclusions of investigations conducted in individual cases.

September 8, 2013

TEPCO executives spared from indictment

http://www3.nhk.or.jp/nhkworld/english/news/20130909_39.html

Japanese prosecutors have decided not to indict former TEPCO executives for insufficient precautions against a massive tsunami, and their handling of the 2011 disaster at the Fukushima Daiichi nuclear plant.

Fukushima residents and others filed criminal complaints against Tokyo Electric Power Company and more than 40 people.

They include former TEPCO chairman Tsunehisa Katsumata and other top management, former Nuclear Safety Commission head Haruki Madarame and former Prime Minister Naoto Kan.

Prosecutors said on Monday that TEPCO, its former executives and others cannot be held criminally responsible.

They say the accused could not predict the real dangers of such a massive earthquake and tsunami.

They say TEPCO's failure to carry out countermeasure construction after it projected in 2008 a scenario of a huge tsunami of more than 15 meters, cannot be considered socially irresponsible behavior.

The plaintiffs say they do not accept the conclusions of the ruling. They plan to take the issue to a prosecution inquest panel made up of randomly selected citizens.

Sep. 9, 2013 - Updated 11:37 UTC

Kan, Tepco execs avoid charges over nuclear disaster

Kyodo

<http://www.japantimes.co.jp/news/2013/09/09/national/kan-tepco-exec-avoid-charges-over-nuclear-disaster/#.Ui4HeX9Sb9k>

Prosecutors on Monday decided not to indict former Prime Minister Naoto Kan or any officials from Tokyo Electric Power Co. over the nuclear disaster at the Fukushima No. 1 plant because of the lack of criminal responsibility.

“It was difficult to foresee the scale of the earthquake and tsunami,” the Tokyo District Public Prosecutor’s Office said of the government’s response to the natural disasters in Tohoku that triggered the man-made meltdowns in Fukushima Prefecture in March 2011.

About 14,700 people from groups across Japan, but mainly in Fukushima Prefecture, filed complaints against Kan and 41 other individuals for alleged professional negligence resulting in death and injury in connection with the nuclear disaster, which was triggered when the poorly protected power station lost all power after being hit by the quake and subsequent tsunami.

Kan, who was prime minister from June 2010 to September 2011, called the prosecutors’ decision “a natural outcome.”

But residents dissatisfied with the ruling will request that an 11-member independent inquest panel review the case. The groups said they are now planning to take their case to the Committee for the Inquest of Prosecution in Tokyo, where the investigation was handled.

In addition to Kan, the accused included Tsunehisa Katsumata and Masataka Shimizu, who were chairman and president of Tepco at the time, and Haruki Madarame, then chairman of the now-defunct Nuclear Safety Commission.

The focus was on whether prosecutors could find enough evidence to prove that the government and Tepco failed to take sufficient measures at the 40-year-old power plant after being notified of the risk of earthquakes and tsunami.

The government and Tepco were also accused of delaying the evacuation of residents around the plant, causing many to be exposed to radiation and leading to the deaths of many bedridden hospital patients.

Asked about the prosecutors’ decision, Chief Cabinet Secretary Yoshihide Suga said at a news conference that he would not comment on the conclusions of investigations conducted in individual cases.

Case against TEPCO, Kan likely to be dropped

http://www3.nhk.or.jp/nhkworld/english/news/20130909_02.html

Prosecutors are not likely to press criminal charges against former TEPCO executives and others, including a former prime minister, for their handling of the 2011 nuclear crisis at the Fukushima Daiichi plant.

Fukushima residents had filed criminal complaints against more than 40 people from Tokyo Electric Power Company and the government.

Those included former TEPCO chairman Tsunehisa Katsumata and former Prime Minister Naoto Kan.

Over the past year, prosecutors have been investigating whether these officials and executives were able to predict such a massive earthquake and tsunami in advance.

The prosecutors also sought out the opinions of earthquake and tsunami experts.

They concluded that these people cannot be held responsible because they were not able to predict the real dangers of such a massive quake and tsunami.

The prosecutors have also concluded that they will not press criminal charges for the actions of the utility and the government in the aftermath of the nuclear crisis.

Fukushima residents say they will immediately take the matter to a prosecution inquest panel. The decision on whether or not these people should be indicted will be decided by randomly-selected citizens.

Sounds familiar

September 9, 2013

Quake reconstruction budget still used for unrelated projects

<http://ajw.asahi.com/article/0311disaster/recovery/AJ201309090083>

THE ASAHI SHIMBUN

Money from a post-quake reconstruction budget is still being used on unrelated projects handled by the industry ministry for promoting power meters and storage batteries despite a government order to return the funds.

In July, the Abe administration decided to have funds operated by public-interest corporations and local governments return unused money from a budget to help reconstruction from the 2011 Great East Japan Earthquake.

The decision came after it was found that 1.2 trillion yen (\$12 billion) from the reconstruction budget had been allocated to about 20 funds for projects unrelated to the disaster. About 100 billion yen was still unused as of July.

However, Sustainable Open Innovation Initiative, a Tokyo-based organization that operates a fund for the industry ministry's two energy-related projects, is accepting new applications for subsidies through January.

The projects promote power-saving meters, which show the amount of electricity used, and storage batteries by paying subsidies to households and companies that install them.

It is said they would lower the nation's electricity usage and prevent a possible power shortage from disrupting reconstruction of disaster areas.

A combined 51 billion yen was allocated for the projects from the reconstruction budget in November 2011, and 3.4 billion of that money was used by the end of March.

However, when the Abe administration demanded money in the funds be returned, excluding the amount that had been "effectively used," the industry ministry only returned 10.6 billion yen to state coffers. Officials said how the remaining 37 billion yen would be used had already been decided.

According to Sustainable Open Innovation Initiative and companies that sell the equipment, however, the amount also included the value of equipment in inventory that they ordered, relying on subsidies, and plan to sell in the future.

The companies are telling prospective customers that subsidies are still available.

"We do not know about equipment in inventory," said an official at the Agency for Natural Resources and Energy, part of the industry ministry. "We heard (from companies) figures for equipment already ordered and equipment in a stage immediately before contracts are signed."

Hiroshi Arikawa, a professor at Nihon University, said the industry ministry cannot gain the understanding of taxpayers who think the budget will be spent on post-quake reconstruction.

"The ministry has continued the projects apparently to prevent disruption of industry," said Arikawa, a former official of the Board of Audit of Japan. "But the budget should be routed to disaster areas as much as possible, even down to a single yen."

We promise

September 10, 2013

Japanese govt. vows to IAEA to solve nuclear issue

http://www3.nhk.or.jp/nhkworld/english/news/20130910_17.html

The Japanese government has vowed to take the initiative in dealing with the massive buildup of radioactive water at the crippled Fukushima Daiichi nuclear plant.

Ambassador Toshiro Ozawa of Japan's diplomatic mission made that pledge on Monday at a regular board meeting of the International Atomic Energy Agency in Vienna. He outlined the government's plan to solve the problem of contaminated water leaking from the plant.

Ozawa said the buildup of radioactive water is the most urgent problem caused by the 2011 nuclear accident. He stressed the government's determination to solve it as soon as possible.

Ozawa told reporters after the meeting that other countries, especially Japan's neighbors, hope Japan will be able to successfully cope with the situation.

The ambassador said those countries want Japan to provide more information.

At the IAEA board meeting, the Japanese mission provided English translations of the government's basic plan to deal with the buildup of radioactive water. The government approved the plan last week.

The mission also plans to hold a briefing at the general meeting of the IAEA next week about the current situation at the Fukushima plant.

Pursuing legal responsibility for Fukushima disaster

September 9, 2013

Accusers denounce prosecutors decision

http://www3.nhk.or.jp/nhkworld/english/news/20130909_44.html

A group of Fukushima residents has denounced the prosecutors' decision to not indict former TEPCO executives for the nuclear crisis.

The group's representative, lawyer Hiroyuki Kawai, told reporters that **the prosecutors had failed to respond to the voice of local residents.** He said it is a matter of course that they did not indict anyone as the investigation was based on data provided on a voluntary basis and on experts' opinions.

Kawai said he intends to take the issue to an inquest panel and file a criminal complaint with the Fukushima prefectural police.

He said he wants people and police officers in Fukushima who are struggling and are still angry following the nuclear disaster to make their judgment.

September 10, 2013

POINT OF VIEW/ Keiji Takeuchi: Pursuing responsibility for Fukushima disaster of utmost importance

<http://ajw.asahi.com/article/views/opinion/AJ201309100038>

THE ASAHI SHIMBUN

The Sept. 9 decision by prosecutors to not indict anyone connected to the Fukushima nuclear accident only concluded that **it is technically difficult to pursue legal responsibility of individuals for the disaster.** The Diet's Fukushima Nuclear Accident Independent Investigation Commission pointed out that the crisis at the Fukushima No. 1 nuclear power plant was "a man-made disaster."

More than two years have passed since the reactor meltdowns at the site, but no progress has been made to determine who played what role in that disaster. That, in turn, led to ambiguities about who was responsible.

In his pitch in Buenos Aires for Tokyo to host the 2020 Summer Olympics, Prime Minister Shinzo Abe said that the situation at the Fukushima plant is under control and there are no health concerns.

The reality, however, is that no work can begin on decommissioning the reactors at the Fukushima No. 1 nuclear power plant. There is also the problem of the continuing leak of water contaminated with radiation from the plant.

Given the gap between the confused situation at the Fukushima plant and the decision by prosecutors to not indict anyone, it is difficult to be convinced by the decision.

Primary responsibility for the accident must lie with Tokyo Electric Power Co., operator of the plant. But since the central government worked closely with the electric power industry to promote nuclear energy as a "national policy managed by the private sector," it also bears major responsibility.

None of the high-ranking government officials or executives of TEPCO who were deeply involved in promoting nuclear energy or who were in important posts at the time of the nuclear accident have truly apologized for their role and taken responsibility.

In the absence of apologies or even reflection, there are now growing calls to resume operations at other nuclear plants and to export nuclear energy technology.

If criminal cases had proceeded in court rooms, the roles played by individuals would have come under the spotlight.

Even though that has not happened, something must be done so society can make clear where the responsibility resides.

The only way to take responsibility on behalf of future generations is for people in various positions to hold discussions in order to question who was responsible for the accident and to change policy.

Abe's assurance questioned

September 10, 2013

Doubt cast on Abe's assurance to IOC about Fukushima leaks

THE ASAHI SHIMBUN

The operator of the crippled Fukushima No. 1 nuclear power plant, as well as local fishermen barred from going to sea since the accident, questioned Prime Minister Shinzo Abe's assurance to the International Olympic Committee that the problem of radioactive water is "under control."

In a speech before the IOC picked Tokyo as host of the 2020 Games, Abe said the situation is under control, referring to the contaminated water issue, and that Japan will never allow it to cause damage to Tokyo.

In response to a question, Abe also told the IOC general meeting in Buenos Aires on Sept. 7 that radioactive water has been "completely blocked" within a 0.3-square-kilometer area in the harbor of the Fukushima No. 1 plant.
