Abe's remarks are credited with helping dispel concerns about radioactive water at the plant and securing the Games for Tokyo. Denis Oswald, an IOC member from Switzerland, said Abe's speech on Fukushima was convincing.

However, sources at plant operator Tokyo Electric Power Co. acknowledged that it has not been able to keep radioactive materials from flowing into the ocean completely.

No radioactive cesium has been detected in many places outside the harbor, but the government estimates that 300 tons of radioactive water are flowing into the harbor daily.

Radioactive materials have been contained by silt fences, or curtain-like undersea partitions, set up near seawater intakes for nuclear reactors and within the harbor.

However, 68 becquerels of tritium were detected per liter of seawater sampled at the entrance of the harbor on Aug. 19, suggesting that radioactive materials may have been spreading outside the harbor.

An estimated 300 tons of highly radioactive water that escaped a storage tank may also have directly flowed into the ocean through a ditch.

Meanwhile, a survey of fish samples taken in waters within a 20-kilometer radius of the plant has shown that amounts of radioactive cesium in marine products have fallen.

However, amounts exceeding safety standards for consumption were detected from slime flounder and other samples taken in July.

The Fukushima No. 1 nuclear power plant was crippled by the Great East Japan Earthquake and tsunami of March 11, 2011. Water containing extremely high concentrations of radioactivity leaked into the ocean the following April and May, prompting TEPCO to install silt fences.

The concentrations are believed to have been diluted as the contaminated water spread, but radioactive materials have accumulated at the bottom of the sea.

Radioactive cesium detected in fish samples apparently derive from such accumulations.

Toshimitsu Konno, a fisherman in Soma, Fukushima Prefecture, is angry at Abe's remarks at the IOC general meeting.

"He must be kidding," the 54-year-old said. "We have been tormented by radioactive water precisely because the nuclear plant has not been brought under control."

The Soma-Futaba fishing cooperative association, to which he belongs, decided to postpone the resumption of test fishing operations scheduled this month following a series of leaks of contaminated water.

"He (Abe) can say, '(Radioactive water has been) completely blocked,' because he does not know what is going on at the site," Konno said.

“He said it is safe when he was abroad, but he will not tell us the same thing. Can Abe take responsibility for his own words? If he can, I urge him to act on what he said.”

Chinese and South Korean media also called Abe’s sweeping statements into question.

A China Central Television program said, “Although Japan emphasized that the situation is under control, people’s concerns have not been completely dispelled.”

South Korea’s Munhwa Ilbo newspaper took issue with Abe’s remark that there is no problem about the radioactive water issue, citing the view of a Japanese expert that the vow is groundless.

Abe told the IOC gathering, “I will take responsibility for deciding on a program to resolve the (radioactive water) issue once and for all.”

Fukushima Governor Yuhei Sato said the prime minister must make good on his words.

“Abe made an international promise that the government will be responsible for ensuring safety,” Sato said Sept. 9. “I want him to stand by that promise.”

Abe’s assurance to IOC on nuclear plant called into question

by Reiji Yoshida

Staff Writer

<http://www.japantimes.co.jp/news/2013/09/10/national/abes-nuke-assurance-to-ioc-questioned/#.Ui9jkX9Sb9k>

One question that emerged among the public immediately after Tokyo won the right to host the 2020 Olympics was whether Prime Minister Shinzo Abe made an incorrect statement, or told an outright lie, about the contaminated water issue at the Fukushima No. 1 nuclear plant.

During the Tokyo bid delegation’s final presentation before the International Olympic Committee in Buenos Aires on Saturday, Abe stressed that the “effects from the contaminated water have been perfectly blocked within the (artificial) bay” of the wrecked nuclear complex, and said “the situation is under control.”

Experts have long pointed out that irradiated water from the plant has kept gushing into the Pacific far beyond the man-made bay, although the government continues to claim that most radioactive materials have been contained within a silt fence that forms a barrier directly in front of reactor units 1 through 4. Reactors 1, 2 and 3 suffered core meltdowns in March 2011.

The silt fence was deliberately set up with many openings so it can withstand waves and tidal movements.

When disclosing the results of a simulation last month, Tokyo Electric Power Co. admitted that a lot of water — and probably radioactive materials — was penetrating the fence and pouring into the wider ocean. The simulation assumed that 50 percent of the water inside the fence becomes mixed with seawater daily due to tides and other factors.

Tepco, based on the findings, concluded that a maximum of 10 trillion becquerels of radioactive strontium-90 and a further 20 trillion becquerels of cesium-137 may have reached the ocean.

At a news conference Tuesday, Chief Cabinet Secretary Yoshihide Suga admitted that contaminated water has escaped through the silt fence. But at the same time, he stressed that surveys have shown that the levels of radioactive materials in coastal waters around the nation, including off Fukushima Prefecture, are far lower than international safety thresholds.

“Even at the maximum, the density of (radioactive) cesium is less than one-five hundredth of the World Health Organization standards for drinking water, which poses no (health) problems at all,” Suga said.

“So (based on this, Abe) said (in Buenos Aires that) the effect has been totally blocked” within the bay of Fukushima No. 1, Suga said.

However, Suga did not answer repeated questions on the possibility that the density readings might be lower simply because tainted water is being diluted with massive amounts of seawater, and not because Tepco or the government has the situation “under control” as Abe claimed.

Jota Kanda, a professor at Tokyo University of Marine Science and Technology, pointed out that densities of radioactive materials within the artificial bay have stopped falling recently, despite the huge amounts of seawater that flow in and out every day.

This indicates a certain amount of new radioactive materials are flowing nonstop from the plant's wrecked reactor buildings into the sea, he said.

Kanda, however, also noted that the total amount of radioactive materials detected in contaminated water samples has been so low that it is unlikely to pose any danger to human health.

Surveys of fish caught around Japan's shores have shown no alarming concentrations of radioactive materials in recent months.

What now?

September 10, 2013

Now Japan must deliver

<http://www.japantimes.co.jp/opinion/2013/09/10/editorials/now-japan-must-deliver/#.Ui9khn9Sb9k>

The International Olympic Committee has chosen Tokyo as the host of the 2020 Summer Olympics and Paralympics. It is hoped that Tokyo's hosting of the once-in-four-year global games will help dispel the "locked in" feeling prevalent in Japanese society — which has been primarily attributed to difficult economic conditions — and help to enhance the level of sports in Japan. But government leaders must realize that their promise to end the leaks of radioactive water from Tokyo Electric Power Co.'s stricken Fukushima No. 1 nuclear power plant has now become an international pledge.

The government must mobilize all available resources to quickly solve the leak problem so that not only people in and around Fukushima Prefecture but also participants in the Olympic and Paralympic Games will not have to worry about radiation problems. It will be especially important for the government and Tokyo Electric Power Co. to tackle the problem in a transparent manner so that people both in Japan and abroad can have ready access to accurate information on the situation.

Madrid, Istanbul and Tokyo, the candidate cities to host the 2020 Summer Olympics and Paralympics, all had strong and weak points. Madrid, which sought to hold the games in a less extravagant way, is suffering from Spain's serious economic problems. Istanbul, which could have become the first city in the Islamic world to host the games, had its image tarnished by clashes between government forces and demonstrators earlier this year. Tokyo, whose marketing campaign stressed, "You're in safe hands with Tokyo," had the festering radiation problem.

It appears that Prime Minister Shinzo Abe's speech in Buenos Aires, the venue of the IOC's convention — in which he stated that the situation at Fukushima No. 1 is under control and that the "effect" of contaminated water is fully contained within the 0.3 sq. meter harbor adjacent to the nuclear power plant — helped to convince the IOC to award the games to Tokyo.

But Tepco estimates that some 50 percent of the water inside the harbor flows into the outer ocean every day. It is suspected that 300 tons of contaminated water leaked into the ocean in August. Because groundwater is flowing into the basements of the damaged reactor buildings every day and becoming contaminated, 400 more tons of radioactive water are being added to the on-site storage tanks on a daily basis. But it is impossible to increase the number of tanks ad infinitum. The government and Tepco must solve the water leakage problem as quickly as possible.

Japan's campaign to win the right to host the games had a very regrettable aspect to it. Princess Takamado gave a speech at the outset of Tokyo's presentation in Buenos Aires, in which she thanked the international community for the help it extended to Japan in the aftermath of the 3/11 disasters. This smacks of the use of an Imperial Family member for a political purpose, and even the Imperial Household Agency expressed its discomfort. The Diet should question the government on this point and ask it to refrain from similar actions in the future.

Ms. Mami Sato, a Paralympian from Kesenuma, Miyagi Prefecture, gave a powerful speech stressing the power of sports to restore people's confidence based on her experience in the 3/11 disasters. Japan needs to make serious efforts to nurture more athletes who embody the ideals stated by Ms. Sato.

Invitation of US expert Lake H. Barrett

September 10, 2013

Press Releases 2013

Press Release (Sep 10,2013) Invitation of an External Professional, to the Contaminated Water and Tank Countermeasures Headquarters

http://www.tepco.co.jp/en/press/corp-com/release/2013/1230443_5130.html

On August 26 this year, we set up the "Contaminated Water and Tank Countermeasures Headquarters." Today, we have determined to invite Mr. Lake H. Barrett (former US Nuclear Regulatory Commission, and former US Department of Energy), an overseas expert familiar with clean-up and decontamination technology, as an outside expert to the "Contaminated Water and Tank Countermeasures Headquarters."

Based on his international knowledge and **experience, acquired by engaging in control of the Three Mile Island accident** at the US Nuclear Regulatory Commission, he will participate in the meetings of the Contaminated Water and Tank

Countermeasures Headquarters and each project team, and will provide advice regarding decontamination issues such as contaminated water countermeasures at the request of TEPCO.

We recognize that bringing the contaminated water under control is the most urgent and serious issue that we must address. Supported by the Japanese government, and **utilizing the immense amount of expertise provided by professionals around the world**, all of us at TEPCO will strive relentlessly to rectify this issue.

What happened to the levees?

September 11, 2013

Work not begun at 57% of levees in disaster zone

NHK has learned that only 17 percent of levees planned along the Pacific coast of eastern Japan have been completed, and that work hasn't begun on 57 percent of them.

The central and local governments plan to build levees totaling about 410 kilometers along the Pacific coast from Aomori to Chiba prefectures, which suffered tsunami damage in March 2011.

Of the 574 planned levees, 99 were completed as of the end of August, but 330 were still in the planning stage.

In the hardest-hit prefectures of Miyagi, Iwate and Fukushima, only 4 percent of the planned levees were completed and 67 percent had yet to be started.

Most of the planned new levees are higher than previous ones in anticipation of massive tsunami that strike once every several decades or centuries.

The central and local governments are having trouble winning the approval of local residents, many of whom are opposed to such high levees, saying they are unsightly and would hamper coastal jobs.

TEPCO feels "relieved" - Tritium contamination on the increase

September 11, 2013

No. 1 chief pleased with Olympics bid; tritium reading doubles

by Kazuaki Nagata

Staff Writer

<http://www.japantimes.co.jp/news/2013/09/11/national/no-1-chief-pleased-with-olympics-bid-tritium-reading-doubles/#.UjDI3H9Sb9k>

The head of the Fukushima No. 1 nuclear plant said Wednesday night that it was a relief to see Tokyo win the bid for the 2020 Summer Olympics as yet another leap in groundwater radiation was disclosed at the site.

"Honestly, **I felt relieved,**" said Akira Ono, current chief of the crippled power plant run by Tokyo Electric Power Co. "**I never imagined that the contaminated water issue would actually affect the bid,**" he said at the news conference in Fukushima.

Officials from Tepco, as the company is known, said tritium in a groundwater sample from a monitoring well near the suspect tank that lost 300 tons of tainted water last month in a level 3 incident was exhibiting 64,000 becquerels per liter of radioactivity.

The energy of the tritium in Tuesday's sample is more than double Monday's sample, which was giving off 29,000 becquerels per liter, and dwarfs the 4,200-becquerel sample from Sunday.

The disclosure is **yet another signal backing suspicions that the tons of water that vanished from the tank has sunk into the ground and may be spreading, turning the storage area into a radioactive swamp.**

The legal limit for dumping tritium into the sea is 60,000 becquerels per liter. Tepco, again, said it was "investigating."

The tainted water problem heated up over the summer after Tepco belatedly admitted — the day after the Liberal Democratic Party won the Upper House election and after months of denials — that radioactive water from the plant was pouring into the Pacific.

Attention grew last month when the highly radioactive 300-ton water leak prompted the Nuclear Regulation Authority to classify it as level 3, or “serious incident,” on the International Nuclear and Radiological Event Scale, which tops out at 7.
And several more leaks preceded that one.

Ahead of the International Olympic Committee’s announcement early Sunday, foreign media outlets repeatedly asked the Tokyo 2020 Bid Committee whether the Fukushima plant was really safe. **The question was artfully dodged with empty guarantees and statistics on where some of the radioactive material in the ocean had settled, rather than what kind of sea life may have consumed it before migrating along the coast.**

“There was no doubt we were under pressure,” said Ono, adding that the first thing many plant workers said Monday was that they were glad Tokyo’s bid prevailed.

TEPCO too big for bankruptcy?

September 11, 2013

INSIGHT: Japan ponders Fukushima options, but TEPCO too big to fail**

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201309110090>

REUTERS

Fukushima nuclear plant operator TEPCO Electric’s response to the world’s worst atomic disaster in a quarter century has been called ad hoc and more concerned with cost than safety, but 30 months later, the utility is still in charge.

Prime Minister Shinzo Abe, in the centerpiece of Tokyo’s successful bid to host the 2020 Olympics, said he would be personally responsible for a plan to cope with the legacy of the March 2011 disaster in which a massive earthquake and tsunami caused triple meltdowns, spewing radiation and forcing some 160,000 residents to flee their homes.

A crisis over radiation-contaminated water at the plant has revived calls to put Tokyo Electric Power Co. (TEPCO) into bankruptcy as a prelude to nationalizing the clean-up and shut-down of the reactors, but there is little political support for the idea given its potential fallout for financial markets, TEPCO’s creditors and other nuclear utilities.

With concerns over TEPCO’s ability to cope, policymakers are pondering ways to take the Fukushima shut-down off the utility’s hands, perhaps through an agency along the lines of Britain’s Nuclear

Decommissioning Authority. Even that, though, faces hurdles, including the likely need for new legislation, clarity on the size of the bill for taxpayers and government liability, and working out the implications for Japan's other utilities.

That means, at least for now, the government may just end up pouring in more money, leaving TEPCO in charge while stepping up official oversight.

"They haven't come up with any good idea yet," said one former government official, although he said various options were being discussed. "Abe is not shy about providing government support, but I don't think he's thinking about any radical change of the structure of this company," he said, referring to calls to put TEPCO through bankruptcy procedures.

ON LIFE SUPPORT

Abe's government last week said it would spend nearly half a billion dollars to contain the leaks and decontaminate water at the facility. That's on top of a 1 trillion yen (\$10 billion) injection of public funds last year and a 5 trillion yen government credit line for compensating disaster victims.

"Clearly the government is using state funds to extend TEPCO's life, so the only way forward is to legally bankrupt the firm and make clear who is responsible, including past directors, financial institutions and shareholders," said Kazuyoshi Sato, an assembly member in Iwaki City just outside the 30 km (18.5 mile) exclusion zone around the Fukushima plant.

Few in Tokyo support that view.

"I don't think it's right to put in taxpayers' money without TEPCO going down," said ruling Liberal Democratic Party lawmaker Taro Kono, who has long been at odds with his party over nuclear energy. But he added: "It seems I'm the only one, or one of just a few, being noisy about liquidation."

TEPCO's admission in July that contaminated water had flowed into the Pacific Ocean and news that highly contaminated water was leaking from a tank storing water used to cool the melted reactor cores prompted Abe's pledge to take the lead and bolster government oversight.

Several ruling party politicians, however, said TEPCO's bankruptcy--considered but rejected in the months after the disaster because authorities decided the utility was too big to fail--was not on the table now.

"TEPCO is, in reality, bankrupt," said LDP lawmaker Taku Yamamoto, head of the party's panel on natural resources and energy strategy. "But under the law ... it cannot be put through bankruptcy. It must fulfill its role."

FOOTING THE BILL

TEPCO, which has racked up net losses of \$27.4 billion since the disaster, has cut its costs and raised its prices, but its long-term sustainability remains in doubt. It has yet to win local support to restart its Kashiwazaki Kariwa nuclear plant on Japan's northwest coast, some 200 km from Fukushima--which could save it about \$1 billion a month in fuel costs.

Under the scheme crafted to keep TEPCO afloat after the 2011 disaster, the company is liable for compensation, decontamination of affected areas and decommissioning the reactors. It is supposed to use

electricity revenues to pay for decommissioning, while, for compensation and decontamination, it can borrow up to 5 trillion yen from the state-backed Nuclear Damage Liability Facilitation Corporation.

"Our company would like to fulfill our social responsibility by properly compensating those affected by the disaster and decommissioning the reactors," TEPCO said in response to Reuters queries for this article.

"If the option of corporate bankruptcy or other court-led restructuring were chosen, there is concern that those affected by the nuclear incident would not be properly compensated and there might be a large impact on financial markets," it said.

With cost estimates for compensation and decontamination at least double the 5 trillion yen credit line, and projections of the cost of decommissioning starting at 1 trillion yen, critics have long said Japanese citizens would end up paying the bill.

But putting TEPCO into bankruptcy would make that inconvenient truth all too clear.

"Who would take over the clean-up and paying the people of Fukushima?" said the LDP's Yamamoto. "It would be the government. It would be tax money. And we don't know how much that will cost."

'ECONOMIC INCENTIVE'

TEPCO's bankruptcy could also trigger potential chaos in the corporate bond market, a key source of funds for power firms, though the utility's short-dated bonds due this year trade near par for now, reflecting investor confidence they will be paid.

"At the end of the day ... the government has a social need to keep TEPCO running," said CV Ramachandran, head of Asian business for restructuring specialist AlixPartners. "If it wanted to wind-down and replace TEPCO with another entity, that would have a major impact on TEPCO bonds and potentially the Japanese bond markets. But this scenario is not likely."

Rating agencies, too, said the government was unlikely to risk market upheaval by pushing TEPCO to the wall.

"With over 4 trillion yen (\$40.2 billion) in (TEPCO) bonds outstanding, the Japanese bond market would suffer a negative impact if TEPCO were to default on its payments; we believe the government has an economic incentive to avoid such a scenario," said Standard & Poor's analyst Hiroki Shibata.

TEPCO shares have more than doubled this year to 512 yen each, but are still just a quarter of what they were worth before the 2011 disaster.

A TEPCO bankruptcy would also require clarifying the future shape of Japan's electricity sector, now controlled by 10 regional monopolies, but set to be liberalized under a law the government aims to pass this year. That would create a national power grid by 2015, and split the regional utilities into generation and transmission firms by 2020. Key details have yet to be worked out, making it hard to value TEPCO's good assets.

The government is also re-doing its basic energy plan, setting out the role of nuclear and other energy sources even as it tries to restart some of Japan's 50 reactors--which used to provide almost a third of the nation's electricity but are nearly all now off-line--in the face of public safety concerns.

"The government would immediately need to present an overall plan for Japan's energy future, which would be almost as difficult to do today as it was in 2011," said Martin Schulz, a senior research fellow at Fujitsu Research Institute.

Still, the growing criticism of TEPCO has bureaucrats and politicians searching for some solution. "We must avoid a situation in which TEPCO fails, so ultimately the government will have to step in and take on the burden," said Koichi Hagiuda, an LDP lawmaker close to Abe.

Splitting off the Fukushima project without forcing the Japanese mega-banks that hold its bonds and have extended loans to take a hit, however, would be politically touchy.

"No one will accept putting a huge chunk of money into TEPCO just so bondholders and pensioners get a soft-landing," said Jun Okumura, a former industry ministry official and now a senior adviser for Eurasia Group.

All of which suggests the government may shy away from drastic change, and continue to drip-feed in more funds.

"On the surface, the government says it will 'take responsibility', but this is just a temporary expedient of using tax money," said Shigeaki Koga, a former trade and industry ministry official who proposed putting TEPCO through bankruptcy in 2011. "They probably don't really intend to take responsibility."

Abe's promises to the world

September 10, 2013

EDITORIAL: Abe needs to deliver on his nuclear safety promises to the world**

<http://ajw.asahi.com/article/views/editorial/AJ201309100026>

Cleaning up the consequences of the disaster at the Fukushima No. 1 nuclear power plant is a challenge the government must tackle irrespective of the fact that Japan has won its bid to host the 2020 Summer Olympics.

In the selection process leading to the International Olympic Committee's decision to choose Tokyo as the host city for the Games, it became clear again that the world is taking a critical view of the way Japan is grappling with the challenge.

In the final presentation before the IOC vote, Prime Minister Shinzo Abe vowed to take responsibility for solving the problem of radioactive water accumulating at the crippled nuclear plant. In a news conference, he also pledged to reduce the share of nuclear power in Japan's overall energy mix and accelerate as much as possible the policy efforts to promote renewable energy sources and slash the nation's energy consumption in the next three years.

Abe made these promises to the international community. He needs to deliver on them if he doesn't want them to be seen both at home and abroad as a mere expedient for winning the right to host the Olympics. We are eager to see Abe get down to dealing with this serious problem as a top policy priority.

Speaking in Tokyo's final presentation to the IOC, Abe said, "Let me assure you the situation is under control." Responding to a question from an IOC member later, he said the effects of contaminated water are "completely blocked" within the harbor of the nuclear plant. Both his speech and answers to questions at the IOC session in Buenos Aires were clear and articulate.

Abe's remarks went down well with IOC members, who are not necessarily well versed in issues related to nuclear accidents, and helped win their votes for Tokyo.

But Abe's words probably sounded hollow to the ears of people who have witnessed the government's confused responses in the face of the grave damage caused by radiation.

To be sure, the Abe administration has established a system in which the government will take the initiative in dealing with the problem of polluted water. But it remains to be seen whether the system will work effectively and stem the spread of contamination.

Already, many tough technological challenges facing the government have been pointed out. Data has emerged to indicate the possibility that contaminated water has reached underground water. Some other unexpected problems may be in store for the government.

Even if the government manages to solve the polluted water crisis, it will then face an even more formidable challenge: decommissioning the reactors at the plant.

It would be totally unacceptable for the government to try to cover up the seriousness of the situation in its eagerness to stress safety and security. Nor must the government hesitate to take necessary measures out of fear of criticism.

The government must not forget that in order to win the trust of the international community, it needs to disclose all information about the situation and the actions it is taking. It must also humbly seek help and advice from other countries in taking measures to solve the situation.

As for the new energy policy, Abe, since he took office last December, has repeatedly made remarks that indicate his desire to revive nuclear power generation while offering no clear long-term policy vision.

Almost two and a half years have passed since the nuclear disaster at the Fukushima plant. How does the government intend to lower the nation's dependence on atomic energy? What kind of measures will it adopt to promote renewable energy and energy conservation? Abe has a duty to talk about his vision for the energy future of the nation and offer concrete plans to achieve policy goals.

We can truly celebrate Tokyo's successful bid to host the Olympics only if it gives a boost to the government's efforts to guide the nation in the right direction.

--The Asahi Shimbun, Sept. 10

DPJ challenges Abe's safety claims

September 13, 2013

Opposition DPJ takes aim at Abe's contaminated water comments at IOC meet

<http://mainichi.jp/english/english/newsselect/news/20130913p2a00m0na017000c.html>

The opposition Democratic Party of Japan (DPJ) is challenging Prime Minister Shinzo Abe over his Sept. 7 claim in front of the International Olympic Committee (IOC) that the contaminated water leaks at the Fukushima No. 1 nuclear plant are "under control."

DPJ Secretary General Akihiro Ohata, head of his party's contaminated water policy headquarters, stated at a Sept. 12 news conference that he will hold a meeting with his counterparts from the other opposition parties as early as next week. He added that he intends to demand that the ruling Liberal Democratic

Party (LDP) and New Komeito launch an inquiry into Abe's claims before the beginning of an upcoming extraordinary Diet session.

The DPJ's contaminated water headquarters members are scheduled to meet in Koriyama, Fukushima Prefecture, on Sept. 13.

"The prime minister must back up his claim that the (radioactive water) problem is under control," Ohata said on Sept. 12. "The government has a responsibility to explain this statement to the people of Fukushima Prefecture and indeed the entire country." If the ruling parties do not investigate during the current Diet recess, Ohata said that the DPJ would push to accelerate the opening of the extraordinary Diet session, currently scheduled for October.

The DPJ created its contaminated water policy headquarters in late August this year. Since then, over the course of three hearings, the HQ has questioned officials from Fukushima plant operator Tokyo Electric Power Co. (TEPCO) and government agencies related to the water issue. Ohata said that witnesses have broken with the official line on the problem on a number of occasions, including stating that the planned wall of frozen soil to prevent the inflow of groundwater onto the plant site is "technically very difficult."

One attendee apparently also told the HQ, "The prime minister suggested that the effects (of the radioactive water) were being stopped completely, but there are still significant risks."

Despite these doubts, however, Ohata said on Sept. 12, "Now that the government has decided on the ice wall plan, we'd like to see it implemented so we can get at least some results."

The DPJ was also involved with the contaminated water problem when the party was in power, making the party fearful of attacking the ruling coalition on the issue. After what party executives called Abe's "unfounded" statements before the IOC, however, sentiment within the DPJ shifted in favor of challenging the prime minister.

"Even if we take flak from the ruling parties because of our own involvement, we will put up a fight," one senior DPJ executive told the Mainichi."

Meanwhile, an ex-advisor to former Prime Minister Naoto Kan who organized plans for an underground water barrier in 2011 told an Aug. 30 meeting of the DPJ contaminated water HQ that the technique is not likely to succeed.

"If the contamination is widespread, then the (frozen soil) method cannot be used," said former prime ministerial advisor Sumio Mabuchi.

Mabuchi first included an underground barrier plan in a June 2011 nuclear disaster resolution work schedule under the heading, "mid-term issues for consideration." According to Mabuchi, by that point he had already worked with TEPCO staff to fine-tune clay barrier plans, including drawing up diagrams. Originally, there were four techniques considered for the subterranean barrier, including the ice wall, but Mabuchi and TEPCO staff eventually settled on a clay solution.

The plan was never actually announced because TEPCO was worried of its possible impact on the markets. However, when Mabuchi met with then TEPCO Vice President Sakae Muto on June 13, 2011, both men agreed the barrier should be given the go-ahead "without delay." According to Mabuchi, it was understood at the time that widespread radioactive contamination would make an ice barrier impossible to execute.

Diet finally meeting on leak (end of Sept)

September 13, 2013

Diet committee to hold radioactive water leak meeting by month's end

THE ASAHI SHIMBUN

IWAKI, Fukushima Prefecture--The Diet's Lower House Economy, Trade and Industry Committee has decided to call a special meeting by the end of this month over the radioactive water leaks at the crippled Fukushima No. 1 nuclear power plant.

The committee, which discusses budget issues over the cleanup effort, decided to hold the special session as early as Sept. 27 after conducting an on-site inspection of the Fukushima No. 1 plant on Sept. 12, and after it met with local fishermen and their representatives.

"We have already started working to hold the meeting by the end of this month ... at all costs," said Shigeyuki Tomita, the Diet committee's chairman and a lawmaker for New Komeito. He also indicated he will call on industry minister Toshimitsu Motegi as well as Naomi Hirose, president of Tokyo Electric Power Co., operator of the damaged plant, to attend the planned session.

Tomita also told reporters on Sept. 12, "I am satisfied with the schedule and timing on conducting the inspection."

The Diet committee plans to set an exact date for the meeting after Tomita returns from an overseas trip. Although the Diet is currently not in session, there are mechanisms in place that allow for the holding of committee sessions on matters of urgency.

The committee on Aug. 30 first started considering holding a special session on the radioactive leak issue. But it decided to push back the meeting in an apparent bid to avoid negative publicity ahead of the Sept. 7 vote by the International Olympic Committee on which city would host the 2020 Summer Games.

The same day as the on-site inspection, members of the Lower House Committee also attended a meeting with officials from the Fukushima Prefectural Federation of Fisheries Cooperative Associations.

Tetsu Nozaki, head of the federation, demanded the Diet committee make the radiation leak issue top priority.

"We are aware that you have a lot to discuss, such as securing energy sources for the nation, but we call on you to find countermeasures against the Fukushima nuclear accident," Nozaki said at the meeting.

Another federation official said, "We understand the 2020 Tokyo Olympics is one of the most important projects for Japan, but if the Diet delays dealing with these issues afflicting Fukushima Prefecture, the prefecture will suffer." He then added, "Whether we will be able to survive or not depends on how you, our lawmakers, deal with the problem."

Fisheries cooperatives in Fukushima Prefecture earlier postponed their initial plans to start in early September test fishing operations due to the radioactive water that continues to leak into the ocean from the stricken nuclear facility. The Soma-Futaba fisheries cooperative association decided on Sept. 12 to resume test fishing operations off the prefecture by the end of this month.

"The radioactive water leak issue is reported in newspapers and TV day after day," a third fisheries federation official told the members of the Lower House Committee. "We hope you will discuss measures on how to convince consumers that our fisheries products are safe."

The committee chairman, Tomita, said he accepted their words with sincerity.

(This article was written by Yuki Nikaido and Shinya Sugizaki.)

Leakage is not under control

September 13, 2013

TEPCO official denies Abe's claim that nuclear crisis is 'under control'

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201309130063>

THE ASAHI SHIMBUN

A senior official of the operator of the crippled Fukushima No. 1 nuclear power plant on Sept. 13 disputed Prime Minister Shinzo Abe's assertion to International Olympic Committee members that the Fukushima crisis is under control, which helped Tokyo land the 2020 Summer Games.

"We regard the current situation as not being under control," Kazuhiko Yamashita, an executive officer of Tokyo Electric Power Co., told a meeting in Koriyama, Fukushima Prefecture. The meeting was held by the opposition Democratic Party of Japan's task force on radioactive water issues.

The comment contradicts the well-publicized assurance that Abe gave at an IOC general meeting in Buenos Aires on Sept. 7, before Tokyo was selected as the host city for the 2020 Games.

"Let me assure you the situation is under control," Abe told the IOC.

Hironori Nakanishi, director-general for Energy and Technological Policy at the Agency for Natural Resources and Energy, attended the meeting in Koriyama on Sept. 13 and promised he will make his best efforts to resolve the Fukushima nuclear crisis.

"From now on, we will work hard to control the situation," Nakanishi said.

THE ASAHI SHIMBUN

TEPCO official: Leakage 'not under control'

http://www3.nhk.or.jp/nhkworld/english/news/20130913_36.html

A senior official from the Tokyo Electric Power Company has acknowledged that the radioactive water leakage at the crippled Fukushima Daiichi plant is not under control.

The government's top spokesman later said the assessment does not contradict Prime Minister Shinzo Abe's statement, delivered internationally, that the situation in Fukushima is under control.

TEPCO official Kazuhiko Yamashita was speaking at a hearing on Friday in Koriyama City, Fukushima Prefecture. The session was organized by the opposition Democratic Party, with officials from the government and TEPCO taking part.

Yamashita apologized for the radioactive water leaks, saying that what's happening now goes beyond TEPCO's assumptions.

A lawmaker asked if Yamashita agrees with Abe's statement made last Saturday at a general meeting of the International Olympic Committee in Buenos Aires.

Yamashita replied that he believes the current situation is not under control.

Chief Cabinet Secretary Yoshihide Suga later told a news conference that he heard Yamashita made the comment after being pressed several times for an answer.

Suga said government officials have confirmed with TEPCO that Yamashita was speaking in reference to independent incidents, including a leak of radioactive wastewater from a storage tank at the plant.

Suga said that even if such independent incidents take place, multi-layered steps will be taken to prevent the radioactive water from contaminating the ocean.

Suga said it is true that tainted water has leaked from a tank. But he said workers' patrols of storage tanks have been increased from once to 4 times per day, as part of all-out efforts to urgently deal with the problem.

TEPCO: Leaks not under control

G0v't tries downplaying Abe's assurance

September 14, 2013

Government denies TEPCO adviser contradicted Abe's radioactive water remark

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201309140065>

The government downplayed a potentially damaging remark that contradicted Prime Minister Shinzo Abe's assurance to an international audience that the radioactive water problem at the Fukushima No. 1 nuclear plant is under control.

Chief Cabinet Secretary Yoshihide Suga on Sept. 13 denied there were discrepancies between the words of Abe and Kazuhiko Yamashita, a technology adviser to Tokyo Electric Power Co., operator of the stricken Fukushima plant.

“The effects of radioactive materials are confined within the plant’s harbor,” Suga told a news conference. “Abe said the situation is under control, meaning that steps will be taken to prevent the radioactive water from affecting the ocean.”

Suga was responding to the remarks that Yamashita made at a meeting of the opposition Democratic Party of Japan in Koriyama, Fukushima Prefecture, earlier in the day.

“Predictable risks are under control, but what cannot be predicted is happening,” Yamashita said. “We believe that the current conditions show that (the radioactive water problem) is not under control.”

In a speech at an International Olympic Committee meeting in Buenos Aires on Sept. 7 before members picked Tokyo to host the 2020 Games, Abe said, “The situation is under control,” referring to the problem of radioactive water at the Fukushima No. 1 plant.

The prime minister also said the effects of radioactive water have been “completely blocked” within a 0.3-square-kilometer area in the plant’s harbor.

Suga said Yamashita was speaking about individual incidents, such as a recent leak from a storage tank, not the overall issue of radioactive water.

In August, TEPCO workers discovered a leak of an estimated 300 tons of radioactive water from a storage tank. Part of the water is believed to have flowed into the ocean through a ditch, while the remainder appears to have seeped into the ground and contaminated soil and groundwater.

The government also estimates that 300 tons of radioactive water flow into the ocean daily. TEPCO says few radioactive materials have been detected outside the harbor, but that is apparently because they have been diluted.

TEPCO followed the line of the prime minister’s office.

“The prime minister spoke to the effect that contamination is confined within the harbor and that no rise in (radioactive) concentrations has been detected in the sea near the plant,” Masayuki Ono, acting general manager of the utility’s Nuclear Power and Plant Siting Division, told a news conference Sept. 13. “We have the same perception as the prime minister.”

TEPCO carried a statement on its website, saying that the company shares Abe's view.

The company said Yamashita meant that the leak from the storage tank and other issues are not under control.

But confidence in Abe's assurance could be undermined because Yamashita effectively refuted it by using the same words. Yamashita's remarks also showed that the government and TEPCO are not necessarily united in their assessment of the situation at the plant.

Concerns about the radioactive water leaks at the Fukushima No. 1 plant were overshadowing Tokyo's bid to host the 2020 Games, prompting Abe to give his speech at the IOC meeting to dispel such fears.

But according to sources, even Abe wondered whether saying "under control" could backfire on him until shortly before the speech. He decided to use the phrase because he believed that strong language was necessary to emphasize safety.

Only a few aides decided on the expression, leaving no time to consult with TEPCO in advance, the sources said.

The DPJ plans to go on the offensive in the Diet against Abe, who also told the IOC meeting, "I will take responsibility for deciding on a program to resolve the (radioactive water) issue once and for all."

"This calls the prime minister's responsibility into question," DPJ Secretary-General Akihiro Ohata told reporters Sept. 13. "We will demand clear explanations."

A senior DPJ official also said, "We want to turn the extraordinary Diet session into one focusing on the problem of radioactive water."

Lower House member Sumio Mabuchi, who has worked on the issue, is expected to spearhead the party's efforts to pursue the government's responsibility.

Abe has started preparations to visit the Fukushima No. 1 nuclear power plant on Sept. 19.

Japan criticised at IAEA meeting

September 17, 2013

Experts at IAEA meet criticize Japan for ongoing problems at Fukushima

Kyodo, JIJ

<http://www.japantimes.co.jp/news/2013/09/17/national/experts-at-iaea-meet-criticize-japan-for-ongoing-problems-at-fukushima/#.UjhfYj95ivM>

VIENNA – The government Monday came under criticism from some nuclear experts at a briefing held on the sidelines of the U.N. nuclear watchdog's annual assembly over its attempt to stem the leak of radioactive water at the Fukushima No. 1 nuclear power plant.

At the meeting called by the government, a Slovenian expert said all Japan has been doing for a long period of time was storing contaminated water in tanks, questioning whether it has found a solution to the problem.

A French expert highlighted that the government sometimes did not immediately disclose information about leakage cases. The expert said Japan could have publicized information promptly and accurately through avenues such as Twitter.

Japanese officials said it takes time to identify locations of leaks and to block them. They also said that the government has considered releasing groundwater from mountains to the sea in order to reduce water flowing into reactor buildings, but has faced oppositions from fishermen concerned about radioactive contamination.

Japan has sought to enhance transparency in order to win the trust of the international community, the officials said.

The briefing was held on the fringe of the annual general conference of the International Atomic Energy Agency that opened Monday in Vienna.

At the power plant crippled by the March 2011 earthquake and tsunami disaster in Fukushima Prefecture, about 400 tons of groundwater has been flowing into reactor buildings every day, creating a new source of pollution.

At the conference Ichita Yamamoto, Japan's science and technology policy minister, tried to ease international concerns about continued leaks of radioactive water, assuring Tokyo's full commitment to contain the tainted water crisis.

Yamamoto also pledged to redouble efforts to provide the international community with accurate information on the problem at the plant.

In his speech on the first day of the five-day annual gathering, Yamamoto said the Japanese government regards tackling the water crisis as its "most urgent task" and intends to spend ¥47 billion on necessary measures.

He also stressed Japanese water and food are safe to eat and drink thanks to stringent safety standards adopted after the nuclear accident. Effects of the water leaks are limited to a 0.3-sq. km area inside the Fukushima plant's port, Yamamoto said in line with the government's official view, pointing out radiation levels in seawater outside the port are lower than safety limits for drinking water set by the World Health Organization.

The minister called for the international community's cooperation with Japan in sorting out the water problem and decommissioning tsunami-ravaged nuclear power reactors.

It is necessary to establish a global cooperation system that brings together technology and expertise from all over the world because the work to end the water crisis and the reactor decommissioning project needs to overcome unprecedented challenges, he said.

At the meeting, IAEA Director-General Yukiya Amano expressed the organization's readiness to extend assistance to Japan, saying the water leak problem is "a matter of high priority that needs to be addressed urgently."

Japanese too have doubts

September 16, 2013

66% of Japanese doubtful about PM's 'under control' comment on Fukushima plant: Mainichi survey**

<http://mainichi.jp/english/english/newsselect/news/20130916p2a00m0na006000c.html>

Sixty-six percent of people surveyed by the Mainichi Shimbun say they don't believe Prime Minister Shinzo Abe's Sept. 7 claim before the International Olympic Committee (IOC) that the situation of radioactive water accumulating at the Fukushima No. 1 nuclear plant is under control.

The poll conducted Sept. 14-15 showed ongoing public concern over the radioactively contaminated water leaking from the Fukushima No. 1 plant, despite the government's insistence on the legitimacy of Chief Cabinet Secretary Yoshihide Suga's claim that the toxic water and its impacts are being held "inside the plant's port."

Only 8 percent of respondents said they believe Abe's Sept. 7 comments that radioactive water is "completely blocked," while 24 percent answered they're not sure.

Even among those who support the Abe Cabinet, only 11 percent believe prime minister's remarks, while 58 percent said they don't think the situation at the Fukushima plant is under control.

On Sept. 13, a senior official of plant operator Tokyo Electric Power Co. (TEPCO) admitted during a meeting with opposition Democratic Party of Japan (DPJ) lawmakers that the massive radioactive water buildup at the plant is "not under control." The DPJ's Acting Secretary-General Akira Nagatsuma criticized the prime minister in an NHK program on Sept. 15 for sending a false message to the world by saying the situation is under control.

Meanwhile, 86 percent of pollees said the government should take all actions necessary to contain the contaminated water, regardless of the cost.

Asked about the consumption tax hike from the current 5 percent to 8 percent scheduled for April 2014, 30 percent of respondents believe it should be raised as planned, while 25 percent want the hike phased in a point at a time, followed by 19 percent who believe the sales tax "should be raised, but the timing should be delayed." Some 22 percent were opposed to the sales tax hike, saying it should "remain at the current 5 percent."

Meanwhile, 72 percent favored a reduced tax rate on everyday necessities, up 3 percentage points from last month -- as against 23 percent who oppose such a move.

Responsibility

Fukushima and the right to responsible government

Colin P. A. Jones argues that everyone must act to fix the ongoing nuclear crisis

by Colin P.A. Jones

<http://www.japantimes.co.jp/community/2013/09/16/issues/fukushima-and-the-right-to-responsible-government/#.Ujf-0z95ivM>

Reprinted dozens of times since it was first published in 1967, “The Legal Consciousness of the Japanese People” by the late Takeyoshi Kawashima is arguably the most influential book on Japanese law ever written.

One of Kawashima’s theories is that traditional Japanese society lacked a strong consciousness of rights. After the Meiji Restoration of 1868, when the government started translating Western legal codes to use for Japanese laws, there wasn’t even a Japanese term that could be used to express the concept of a “right,” so a new one had to be invented. With this cultural foundation, notwithstanding the introduction of Western-style courts and legal codes, the notion of using the former to assert rights under the latter never really took root.

Non-litigiousness remains an integral part of the “Japan is different” canon that Japanese people recount to foreigners and each other. While Kawashima’s explanation has been influential and merits attention, it is due some skepticism as well. I consider it noteworthy that just a few years after the Meiji Restoration, the new government created a statute of limitations. This suggests that whether or not the average Japanese person thought about asserting their rights, from a very early stage the nation’s leaders saw a need to restrict their ability to do so.

Interestingly, a subject that Kawashima barely mentions is that of responsibility. This is odd, since to recognize a right also implies a responsibility — on the part of a court or other government actor — to define and enforce that right. Kawashima posited that because of a culture of “wa” (harmony), Japanese people avoid “black and white” resolutions to disputes, preferring mediated compromises. From the standpoint of the court or other government authorities charged with resolving a dispute, mediated results have the benefit of leaving them free of responsibility for the substantive outcome. Cultural notions of wa can thus be recast as a mechanism by which government officials can exercise authority while minimizing the responsibility associated with doing so.

This is perfectly rational behavior: Most people, given the choice, would probably maximize their authority while minimizing their responsibility for its exercise, particularly if the rewards for taking more responsibility than necessary and succeeding were nil while the punishments for failure were significant.

Japanese bureaucratic organizations are said to base their personnel evaluations on a system of “gentenshugi,” meaning that advancement in the civil service is generally done in lock-step, with officials losing points for failures rather than gaining them for successes. Full marks are given for doing nothing wrong, or perhaps doing nothing at all.

In the Japan of yore, responsibility could hurt — seppuku is the traditional archetype of atonement for official failure. The first national penal code enacted by the Meiji government was based on models taken

from Imperial China and derived from Confucian legal principles (the current penal code is based on German models but was not adopted until 1907). Under these early laws a judge who sentenced someone improperly was subject to the same punishment as they had wrongly meted out, including execution! There quickly developed a practice of judges pre-clearing their judgments with the central government so that somebody else could share responsibility.

Avoiding and obfuscating responsibility seems to have become a very basic feature of Japanese governance. Given that bureaucrats actually draft most of the laws that they end up administering, it is unsurprising that the resulting rules often make it hard to pin down who is actually responsible for anything. And while the Constitution vests in the Japanese people the power to remove public servants, the laws governing the public service make it almost impossible to do so in practice.

This fuzziness extends to the top of government. Even when the locus of responsibility seems clear, practices have developed that either obfuscate it or render it symbolic. We could start with the Emperor, who promulgates laws and performs other official acts but only in a symbolic capacity, and always in accordance with the advice and consent of the Cabinet, which in turn theoretically always acts based on unanimous decisions. Even laws empowering the prime minister to act alone have been interpreted as requiring Cabinet approval. Elected politicians circulate through Cabinet posts like plates of cheap sushi, rarely staying long enough to accomplish let alone be responsible for anything. Most legislation is drafted by bureaucrats, submitted by the Cabinet and passed by the Diet. Who is responsible for the end product? Good question!

In any event, it is almost impossible to challenge the laws or hold the people who make and administer them to account since the courts are exceptionally deferential to the legislative and executive branches. Judges are kept safely anonymous through frequent transfers in the lower courts and frequent turnover at the Supreme Court. Most elite bureaucrats are also transferred among posts so often that they are almost impossible to link to any particular policy or project.

Yet it would be wrong to just brand Japanese government institutions as completely irresponsible. Rather, the means of holding a member responsible for bad judgments are internalized as part of the rules and discipline governing the hierarchy to which they belong, with mechanisms for outsiders to assert responsibility — to assert rights — being minimized and neutralized whenever possible. For example, the constitution provides for the impeachment of judges, but most of the few impeachments that have occurred were cases in which a complaint was brought by ... the Supreme Court.

This brings us to Tokyo Electric Company (Tepco).

When reporting on events at the stricken Fukushima No. 1 nuclear plant, the Japanese media dutifully refers to it as a Tepco facility, reinforcing the notion that only the troubled utility is to blame. But any

normal company in the same situation would have been rendered insolvent ages ago, leaving the whole mess for the government to fix. This would have been a perfectly logical result — Tepco was merely operating the plant in accordance with the government’s energy strategy and supposedly rigorous set of safety regulations.

Whether Tepco was ever a normal company, it certainly isn’t now that it is majority-owned by the **Nuclear Damage Liability Facilitation Fund**, a quasi-governmental entity created shortly after the Great East Japan Earthquake, ostensibly to help resolve damage claims arising from the Fukushima meltdown. It has done so by propping up Tepco financially, with critics suggesting that this Fund’s real agenda is to limit claims — the corporate form does, after all, exist for the specific purpose of limiting liability. And this is the Tepco whose lawyers famously argued in court that since it did not own the radioactive fallout strewn across people’s land, it was not responsible for the resulting damages. Although the Fund is supposed to act as an additional source of compensation funding, the arrangement still puts a buffer between the disaster and the public purse.

Compensation is “just” a matter of money. However, considering that it is also the Fund’s statutory mandate, its controlling interest in Tepco does not bode well for the prospects of Tepco being managed in a way that prioritizes actually fixing the stricken Fukushima plant — as opposed to being kept alive in a zombie-like state as an entity whose ability to compensate anyone will necessarily be limited by its cash flow. Perhaps that is convenient, too — kept alive, Tepco provides a useful, non-governmental blame nexus for everything bad that has happened to date and may happen in the all-too-near future.

If anything called for a nation’s government to quickly intervene actively on a massive scale and assume direct responsibility for a situation, it would be the crisis that continues to unfold 200 km from Tokyo. That a financially crippled, demoralized company bleeding talented employees is clearly not up to the task of remediating what could still prove to be the worst nuclear disaster in history should by now be obvious. Could anyone in a position of authority ever have responsibly expected otherwise?

Yet here we are 2½ years later, learning highly radioactive water has been leaking into the groundwater and the ocean and that storage tanks full of even more radioactive water are starting to fail. Surely it is a basic fact of life in nuclear power that fuel rods need to be kept cool whether sitting in a containment pool or melted through the reactor floor? The accumulation of radioactive water at the Fukushima plant was an utterly predictable problem almost from the day things first started to explode.

Tepco gets a failing grade here for sure, but what about the people expecting a single company to deal with a problem of such unprecedented magnitude in the first place? If there is still money for things such as bullet trains, and now — Olympic swimming pools. Surely fixing Fukushima would be an infrastructure project of similar magnitude worthy of pursuing as a matter of national urgency.

Recently the government finally announced that it will intervene directly in resolving the water problem, supposedly by turning the earth near the plant into a giant popsicle (and where will the power needed to keep the ground frozen come from again?). Such assertiveness on Fukushima by the government is long overdue, yet the amounts involved seem small given the scope and potential impact of the disaster — the yen equivalent of just a few hundred-million dollars. Furthermore, the government probably had to act because the leakage had clearly become a crisis, one ranked a 3 by the International Atomic Energy Agency on its 1-7 scale — just as the International Olympic Committee was making its decision on the 2020 Games.

While almost nobody looks forward to crises, they do have the merits of both requiring action and restricting options in a way that naturally limits responsibility for the results, because “what else could we do? It was an emergency.” Of course, few likely think this way in advance, but a crisis like water leakage at Fukushima certainly smacks of being a byproduct of the prolonged avoidance of responsible decision-making.

Don't be surprised if Tepco continues to remain the primary scapegoat for most of what happens at Fukushima and if the further crises develop, despite seeming predictable in hindsight.

For example, does Japan have an endless supply of workers willing to toil in dangerous conditions, and who have not already received the maximum dosage of radiation permitted by law? Chernobyl was contained by a Soviet leadership that drafted vast numbers of people — pilots, soldiers, engineers, miners — as part of a concentrated national response. Is it realistic to expect Tepco to fix Fukushima armed only with employment contracts and a powerful incentive to sacrifice compliance with those agreements and worker safety?

A great irony of the current political situation may be that fixing Fukushima is a concrete example of a crisis where many Japanese people might actually agree that the government should be able to exercise broad emergency powers of the type the Liberal Democratic Party wants to enshrine in a new constitution. Indeed, the absence of such powers may be one reason why the government seems so frustratingly passive.

However, to recognize Fukushima as a greater threat would entail admitting responsibility for the failed nuclear policies of the past, and make it that much harder to bring other plants back online, not to mention sully Tokyo's winning Olympic bid. So while Tepco keeps trying to patch radioactive holes that render parts of the Japanese mainland uninhabitable, Prime Minister Shinzo Abe seeks support for his authoritarian new constitution by emphasizing territorial disputes involving islands that were never inhabited in the first place.

It will probably take an imminent crisis for the government to resolve any of the serious problems facing the nation today — not just Fukushima, but the national debt, declining global competitiveness, the shrinking population and growing demographic imbalance.

Unfortunately, the historical precedents are not great. It took a double atom-bombing and (by some accounts) two separate admonitions by Emperor Hirohito for Japan's "leaders" to finally accept the Potsdam Declaration and end World War II. Of course, being constitutionally "sacred and inviolable," the Emperor could not be held responsible for anything.

We can't expect similar Deus ex Machina resolutions to Fukushima or anything else. Japan is supposedly a democracy, so in theory a responsibility-shirking government is ultimately the people's problem — and responsibility — just as much as the nuclear disaster and all the nation's other problems. Fortunately the people have a plentiful supply of other targets to blame until enough of them come to that realization.

Information on nukes as national secret or not ?

September 19, 2013

Anti-leak bill to exclude nuclear plants

http://www3.nhk.or.jp/nhkworld/english/news/20130919_13.html

A senior Japanese official says the government will not designate information on the country's nuclear power plants as national secrets that require strict confidentiality.

An advisor to Prime Minister Shinzo Abe, Yosuke Isozaki, appeared on a TV program on Wednesday. He explained a government plan for a legislation to protect classified information.

The bill says information that could gravely compromise national security will be designated as special secrets.

Public officials who leak them will face prison terms of up to 10 years.

The government aims to enact the bill at the extraordinary session of the Diet later this year.

Isozaki pledged that the government will never designate information related to nuclear plants as special secrets, even if there is concern that the information may fall into the hands of terrorists.

Some members of Japan's junior coalition partner, the New Komeito party, are requesting that the bill stipulate the guarantee of the freedom of the press and the people's right to know.

Civic groups are voicing concern that information the government considers inconvenient will not be made public.

Abe visits Fukushima Daiichi

Abe visits Fukushima nuclear plant amid toxic water problem

<http://mainichi.jp/english/english/newsselect/news/20130919p2g00m0dm080000c.html>

OKUMA, Japan (Kyodo) -- Prime Minister Shinzo Abe visited the severely damaged Fukushima Daiichi nuclear power plant Thursday in northeastern Japan to inspect efforts to contain the leaks of radioactive water accumulating on the premises amid global concerns about the problem.

It was Abe's first visit to the plant in Fukushima Prefecture since a trip last December shortly after he took office. The inspection is designed to demonstrate his desire to take the lead in handling the crisis, officials said.

Clad in protective gear, the premier is expected to view the area where leaks of toxic water have been confirmed. He will also hear explanations from plant operator Tokyo Electric Power Co., which has been struggling to deal with the problem.

The contaminated water has been increasing daily as a result of continuing water injections into the three reactors that suffered meltdowns in the wake of the March 2011 earthquake and tsunami.

Abe has said the government will play a major role in tackling the problem, including budgetary spending on necessary measures, and will not leave the issue to Tokyo Electric alone.

He is apparently hoping to show the government is actively involved in handling the crisis especially after Tokyo recently won the right to host the 2020 Summer Olympics. The capital is some 250 kilometers southwest of the plant.

In a presentation as part of the capital's bid before the International Olympic Committee earlier this month, Abe said of the toxic water problem that "the situation is under control" and offered assurances that there "will never be health problems."

But the remark raised the eyebrows of critics, who consider the government has been slow in handling the problem.

Water shielding plan dates June 2011

September 18, 2013

Made in Japan: Workers prepare to take apart a flange-type water tank at the Fukushima No. 1 plant Friday. Several of the tanks, which are prone to leaks, will be disassembled as part of the beleaguered utility's probe into the mysterious disappearance of 300 tons of radioactive water from one of its more than 1,000 storage tanks this summer. | TEPCO/AFP-JIJI

Tepco ditched soil-freezing solution in '11

Fears of stirring up stock market killed water plan early in crisis

Jiji, Kyodo

Tokyo Electric Power Co. initially put off a plan to create frozen-soil groundwater shields at the Fukushima No. 1 nuclear plant after being cowed by the cost, a former senior government official revealed Wednesday.

Earlier this month, the government vowed to spend ¥32 billion on building underground walls by freezing soil around the reactor buildings to prevent groundwater from seeping into the basement levels.

Tepco was initially scheduled to announce the water shielding plan on June 14, 2011, about three months after the nuclear crisis started, Sumio Mabuchi, a senior member of the Democratic Party of Japan, said at a party meeting.

As an aide to Naoto Kan, prime minister during the early stages of the unprecedented emergency, Mabuchi was put in charge of the water shielding plan at the time.

Tepco asked then industry minister Banri Kaieda, currently leader of the DPJ, to postpone the announcement as the utility was concerned about how the stocks market would react to the ¥100 billion or so in funds it would require, Mabuchi said.

The government agreed to put off the announcement to avoid disrupting the market, Mabuchi explained. Mabuchi said he obtained then-Tepco Executive Vice President Sakae Muto's confirmation that the utility would proceed with the water shielding plan without delay.

At the DPJ meeting Wednesday, however, Junichi Matsumoto, a senior Tepco official, denied there was confirmation by Muto.

At the end of May, a government panel adopted the project as the best way to reduce radioactive groundwater at the plant. Industry minister Toshimitsu Motegi told Tepco to go ahead with the project, which involves building a 1.4-km barrier of frozen soil by sinking cooling pipes around reactor buildings 1 to 4.

It will be the first state funds injection aimed at helping Tepco prevent the groundwater from mixing with radioactive water leaking from the reactor buildings.

Water problem could have been tackled two years ago

September 18, 2013

TEPCO failed to meet promise on water barriers

http://www3.nhk.or.jp/nhkworld/english/news/20130918_28.html

A onetime advisor to former Prime Minister Naoto Kan has revealed that the operator of the crippled Fukushima Daiichi nuclear plant promised 2 years ago to build fences to block radioactive water leaks at the plant, but failed to deliver on the promise.

Democratic Party of Japan executive member Sumio Mabuchi told a party meeting on Wednesday that Tokyo Electric Power Company agreed with the DPJ-led government in June 2011 to build shields around the reactor buildings.

Soon after the crisis at the plant began in March 2011, Mabuchi was helping the government respond to the situation as an advisor to the prime minister.

Mabuchi says TEPCO asked the government not to announce the agreement about building the fences, saying that the company was worried the 1 billion dollar construction cost would add to its debt and lead to market confusion.

He says the government agreed not to publicize the deal.

Mabuchi says TEPCO then promised it would honor the agreement by building the fences immediately, but it did not carry out the work.

TEPCO delayed tackling radioactive water in 2011 due to bankruptcy fears

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201309180063>

THE ASAHI SHIMBUN

Tokyo Electric Power Co. put off dealing with radiation-contaminated water at its crippled nuclear power plant more than two years ago because it feared the cost of fixing the problem could bankrupt the utility.

While TEPCO has grudgingly admitted it was concerned about facing bankruptcy, two lawmakers have told The Asahi Shimbun that the utility feared it would go under if it went ahead with the project.

The decision taken at the time apparently led to a delay in dealing with the radioactive water issue that has now reached crisis proportions.

The two Democratic Party of Japan lawmakers were closely involved in dealing with the disaster at the Fukushima No. 1 nuclear power plant triggered by the 2011 Great East Japan Earthquake and tsunami.

One of them is Banri Kaieda, who became DPJ president in 2012. At the time he served as minister of economy, trade and industry and was in charge of nuclear energy policy. The other lawmaker was Sumio Mabuchi who served as special adviser to Naoto Kan, who was then prime minister. Mabuchi was in charge of dealing with the nuclear accident

He said he became aware early on that steps had to be taken to deal with radiation-contaminated water.

In May 2011, just two months after the nuclear disaster unfolded, TEPCO realized that groundwater was becoming contaminated after flowing into reactor buildings. To prevent the contaminated water from leaking outside of the buildings, Mabuchi put together a report that called for constructing an impermeable steel wall sunk into the ground surrounding the structures.

However, TEPCO the following month came up with an estimate that 100 billion yen (\$1 billion) would be needed to do that.

According to the lawmakers, a top TEPCO executive around that time said, "If we included the 100 billion yen construction cost as a liability, the market would consider us a company in danger of bankruptcy."

He also noted that the company was to hold a shareholders' meeting at the end of the month.

The executive asked Kaieda to be vague at a news conference about when construction on the impermeable wall would start or how much it would cost.

The DPJ government was taking the position that TEPCO bore full responsibility for the nuclear accident and it did not make a decision to inject public funds for the project.

However, Kaieda eventually concluded that if TEPCO went bankrupt it would delay payment of compensation to evacuees. He was also concerned about the payment of salaries to workers at the nuclear plant site.

He told TEPCO he would announce at a news conference that construction of the wall would be a medium- to long-term objective that would be seriously considered only from the following year.

Mabuchi said he accepted Kaieda's decision because of a verbal pledge made by Sakae Muto, then a TEPCO executive vice president, that work on the wall would proceed without delay.

A group of plaintiffs who had been seeking criminal responsibility on the part of former TEPCO executives publicized an internal company document that said: "There is a big possibility that the market would hand down the appraisal that we were heading in the direction of excess liabilities. That is something that we must definitely avoid."

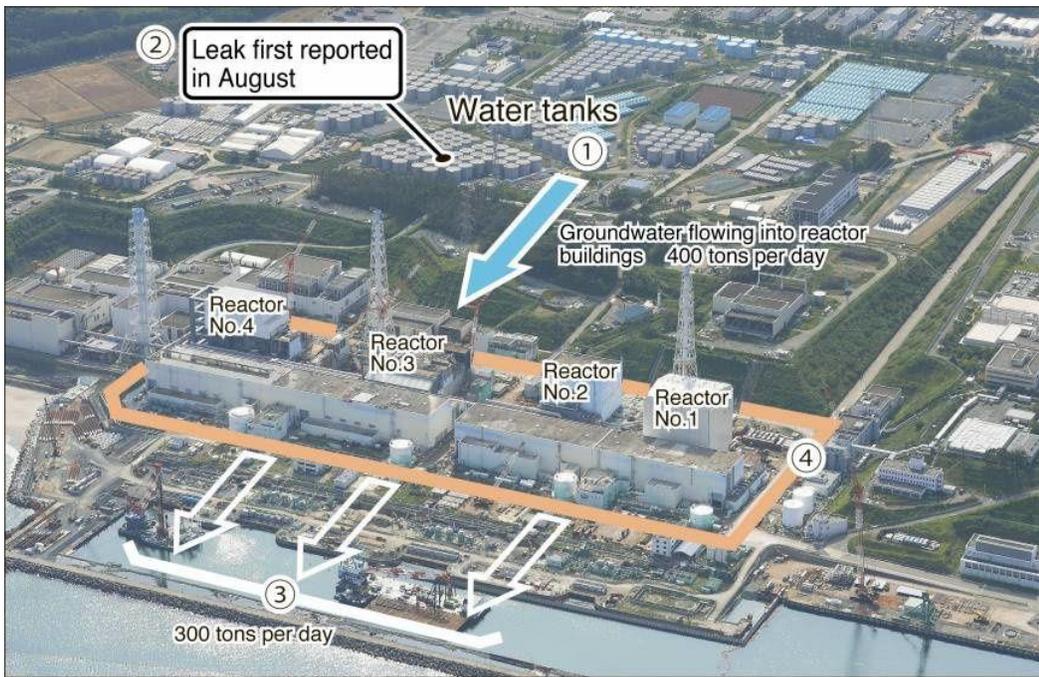

TEPCO officials have also admitted to the compilation of that document.

In response to a question from The Asahi Shimbun, a TEPCO official said on Sept. 17: "The reason construction was not started did not pertain to costs, but because it was unclear whether it was feasible due to the many technical issues that arose related to the impermeable wall. There were concerns about including costs for such a project as a liability."

What is Gov't going to do about the water crisis?

September 19, 2013

1) Tepco estimates 1,000 tons of groundwater enters the area around reactors 1 to 4 at Fukushima No. 1 each day; 400 tons is believed to reach the reactor building basement levels. 2) On Aug. 19, Tepco found 300 tons had leaked from a tank in this area. Of about 1,060 water tanks there, 350 are similar flange-type tanks, which are less durable than welded ones. 3) Tepco believes a maximum of 300 tons of tainted water is seeping into the sea every day. 4) Tepco plans to create a wall of frozen soil around the reactors by March 2015 to keep the groundwater out. | KYODO

Abe mum on plan for contaminated water crisis

Tepco president sets fiscal 2014 deadline for filtering stored coolant

by Reiji Yoshida

Staff Writer

<http://www.japantimes.co.jp/news/2013/09/19/national/abe-mum-on-plan-for-water-crisis/#.Ujs6QVNSb9k>

OKUMA, FUKUSHIMA PREF. – Wearing a protective suit to guard against radioactive contamination, Prime Minister Shinzo Abe entered the wrecked Fukushima No. 1 nuclear plant Thursday to inspect the desperate effort to stop tainted water from entering the soil and the Pacific.

Abe visited the site in an apparent publicity stunt to demonstrate his determination to get the water crisis under control. An estimated 300 tons of contaminated groundwater is believed to be flowing into the ocean every day, and experts say the more than 1,000 storage tanks overlooking the site pose an even greater hazard.

During his two-hour visit to the facility, Abe viewed a storage tank that recently lost a sizable amount of highly contaminated water. At least five of the plant's 350 flange-type water tanks have sprung leaks.

In the plant's reinforced headquarters, Abe thanked about 200 plant workers for "working under severe conditions" to address the water crisis.

"I have renewed my determination that the government should stand on the front line to carry out our responsibilities," he said.

Abe's visit followed controversial remarks he made on the water situation at Fukushima No. 1 during Tokyo's bid to win the 2020 Summer Olympic Games in Buenos Aires. During Tokyo's final pitch to the International Olympic Committee on Sept. 7, Abe declared that "the situation (at the Fukushima plant) is under control" and "effects from the contaminated water have been perfectly blocked within the (artificial) bay" next to the wrecked nuclear complex.

On Thursday, as he faced reporters after addressing the workers, Abe repeated the controversial remarks almost word for word, saying the "effects from the contaminated water have been perfectly blocked within the bay."

"By stating this clearly, I want to bring an end to harmful rumors about Fukushima," he asserted.

Despite Abe's assurances, Tepco has not been able to control the contaminated groundwater seeping into the sea nor the storage tank leaks that have cropped up in the past two months since the election.

"During the presentation for the Olympic Games, Prime Minister Abe told a lie," Teruhiko Mashiko, an Upper House member and vice president of the Democratic Party of Japan, said during a recent interview in Tokyo.

"This is a big problem. The government should invest more people, money and technologies to turn their lies into truths," Mashiko, who represents Fukushima Prefecture, said in an interview with The Japan Times.

Other government officials have parroted Abe's claims, citing tests showing that levels of radioactive materials in the artificial bay have stayed well within safety margins. But experts say the levels are probably low because the contaminants are being diluted and carried away by new seawater entering the bay, not because of measures being taken by Tepco or the government.

On Thursday, Abe said he asked Tepco President Naomi Hirose to set a deadline for finishing filtering all the tainted water stored in tanks. He also urged Tepco to formally decide to decommission reactors 5 and

6 to free up their resources for the decommissioning of the entire plant. He did not elaborate on the request.

In response, Hirose promised to finish the filtering by the end of fiscal 2014 and make a decision on the two undamaged reactors by the end of the year, according to Abe. Unlike three of the older reactors, units 5 and 6 did not suffer core meltdowns but have been suspended since March 2011.

DPJ's Mashiko was long been concerned with the reliability of the holding tanks. Of the approximately 1,060 water tanks, around 350 are of the less durable flange type, rather than the sturdier welded type, including all five that sprung leaks.

Mashiko claimed that last spring that a local tank manufacturer warned that the tanks were of very bad quality and could suffer leaks within two years of construction.

According to Mashiko, the manufacturer was asked to build six low-cost tanks and take no more than a month to do it.

"The company turned down the offer because they only would have ended up constructing low-quality tanks under (bad) contract conditions," Mashiko said.

At recent news conferences in Tokyo, Tepco executive and spokesman Masayuki Ono has repeatedly refused to comment on Mashiko's account or reveal details of the contracts with construction companies to build the Fukushima water tanks. Ono would only say that Tepco won't disclose information on "contracts between private companies."

But many industry sources suspect that Tepco, short on money, may have bought low-quality tanks to reduce the ballooning costs of trying to clean up the shattered facility.

Mashiko said residents of Fukushima, in particular those in the fishery industry, have developed a deep distrust of Tepco, which has made it even harder for the utility to handle the crisis.

To reduce the tainted water, Tepco plans to drain groundwater from the hillside above before it mixes with the tainted water in the basement floors of the damaged reactor buildings. It then plans to discharge the water into the sea after confirming the density of radioactive materials is lower than safety standards.

However, the local fishing industry is staunchly opposed to the idea, fearing it would further damage perception of its seafood. Others say they can't even trust Tepco to release accurate information, Mashiko said.

For his part, Mashiko believes Tepco will eventually have to discharge the water into the sea to save the plant from the water crisis, as other experts say. But before that, the utility must first regain public trust, he said.

Abe's team has also drawn fire for not fully committing to solving the water problem. Earlier this month, his team decided to throw ¥47 billion at the water crisis to create an experimental wall of frozen soil around the reactor buildings within about two years to isolate them from the groundwater. What is not clear is how the giant refrigerator would be powered, or for how long.

But Abe's team has yet to provide money for other urgent tasks, such as bolstering or replacing the water tanks, perhaps out of fear of a voter backlash. People are already frustrated over hikes in electricity prices brought on by the nuclear shutdown, and Tepco is widely regarded as the main culprit behind the triple meltdown crisis and ensuing water problems.

A high-ranking official said the Abe Cabinet will maintain a certain distance from Tepco, saying the public has not yet developed a consensus on helping Tepco with taxpayer money.

What "frontline efforts"?

September 16, 2013

Be careful, or payback for nuclear disaster will be twice as grim

<http://mainichi.jp/english/english/perspectives/news/20130916p2a00m0na002000c.html>

Radiation-contaminated water from the stricken Fukushima No. 1 nuclear plant is not "under control," as Prime Minister Shinzo Abe has declared. No matter how you look at it, that phrase does not accurately represent the current state of affairs.

Because of the prime minister's distorted characterization of the situation, however, the Olympics are coming to Tokyo. This bitter truth is something that Tokyo, the country's biggest consumer of energy, must recognize.

There's no hope for success in the 2020 Olympic Games if we remain impervious to the injustice of relegating the handling of radioactive water to the disaster areas, while the Tokyo metropolitan area counts its Olympic business chickens before they've even hatched.

Injecting a mere 47 billion yen from the national budget toward tackling toxic water in Fukushima does not constitute the "front-line efforts" promised by the government. According to some estimates, Fukushima plant operator Tokyo Electric Power Co. (TEPCO)'s underlying debt is expected to come out to some 15 trillion to 20 trillion yen -- levels exceeding what a private company can handle.

Despite this knowledge, the government has failed to take over because it continues to adhere to its unreasonable public position that power companies are liable for damages stemming from a disaster. The result has been a massive moral hazard. The situation surrounding radiation decontamination is a prime example.

Under law, decontamination is technically a responsibility of the national government. However, that same law stipulates that the utility will "make efforts to pay for any costs" from bills or claims for compensation that it receives. This has effectively given administrative bodies free reign to commission decontamination work excessively, while sending the bills to TEPCO.

Decontamination workers are eligible for extra danger pay, which makes the job popular among subcontractors. Organized crime groups have gotten in on the action, too, seeking kickbacks.

The quagmire of compensation, decontamination, decommissioning and radioactive water appears interminable. There are no prospects for payments to be completed. Workers are exhausted and demoralized. **"It is eternal hell,"** says a TEPCO executive, likening the situation to the eighth and most painful circle of Buddhist hells.

Critics say that TEPCO should follow in the footsteps of Japan Airlines Co. (JAL) and file for bankruptcy protection. They say that determining the responsibility of TEPCO's management, megabanks' lender liability, and the responsibility of government are a priority. And they are right.

However, the public funds necessary in the case of TEPCO are an order of magnitude greater than those for JAL. While JAL required 350 billion yen, TEPCO will need at least 5 trillion yen. The utility is in a bottomless pit of debt. Moreover, it is difficult to find the manpower, know-how and systems necessary to bring the disaster under control from sources outside of TEPCO.

Two and a half years have passed since the outbreak of the nuclear crisis, with the government neither shutting down nor buoying TEPCO, pumping a lot of but still not enough money into the utility. It has all been a stopgap measure that is now coming apart at the seams.

When Japan began developing nuclear technology half a century ago, it already knew that a nuclear disaster was not something a private corporation could handle on its own. In the U.S. and other industrialized countries, it is a given that the national government will provide compensation in the event of a crisis.

Japan, too, had planned on following this rule, until the then Ministry of Finance objected. As a result, the power companies were made liable.

What does it mean for the national government to make "front-line" efforts? First, it means that the government must acknowledge that the nuclear power plant is not under control. It must then let the public know point-blank that bringing the plant under control will take massive amounts of money.

If the government takes over responsibility for compensation, there will inevitably be an increased financial burden on the public. Distribution of financial burdens that will rectify the unfair burdens already shouldered by the disaster areas compared to areas of major power consumption will also have to

be considered. And more than anything, we must refrain from feeding into the simplistic notion that all will turn out fine if the Olympics stimulates the economy.

In the hit television series "Hanzawa Naoki," the protagonist, Naoki Hanzawa, a maverick banker during Japan's economic bubble, fights against his boss's corruption, scapegoating, and a culture of choosing peace at any cost. Under his policy of "doubling the payback if your enemies hurt you," he goes on to change the unjust realities of life.

If Japan lets its successful 2020 Olympics bid go to its head and continues to shrug off its responsibilities for the Fukushima plant, payback will be a truth twice as grim. (By Takao Yamada, Expert Senior Writer)

Has Abe dispelled speculation and concern?

September 20, 2013

Inose: Tainted water not necessarily under control

http://www3.nhk.or.jp/nhkworld/english/news/20130920_35.html

Tokyo Governor Naoki Inose says that the problem of radioactive water leaking from the crippled Fukushima Daiichi nuclear plant isn't necessarily under control.

Earlier this month, Prime Minister Shinzo Abe declared at the general assembly of the International Olympic Committee in Buenos Aires that the situation at Fukushima is under control.

The IOC chose Tokyo as the host city for the 2020 summer Olympics and Paralympics.

At a news conference on Friday, **Inose said the most important thing is that Abe expressed his determination to bring the situation under control.**

The governor praised Abe for dispelling widely spread speculation and concern about the leakage problem.

Inose added that he expects the central government to do all it can to solve the problem.

What will Gov't involvement mean?

September 20, 2013

INSIGHT: Abe takes political risk by stressing government in charge of Fukushima plant

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201309200051>

Prime Minister Shinzo Abe has raised the stakes in his gamble concerning the Fukushima nuclear disaster.

His visit to the Fukushima No. 1 nuclear power plant on Sept. 19 was designed to reinforce the impression that the central government was taking charge of the situation. But by bringing greater attention to the accident, Abe has opened himself up to potential criticism if problems and setbacks continue to emerge in a cleanup process that has so far been anything but smooth.

Abe told workers at the plant site, "While the work you are doing is difficult, the future of Japan rests on your shoulders."

The fate of the Abe administration could also depend on the work there.

The prime minister made headlines by telling an International Olympic Committee meeting earlier in September that the problem of radiation-contaminated water at the Fukushima nuclear plant was under control.

After his reassuring words helped Tokyo win its bid to host the 2020 Summer Olympics, a technological adviser to the plant's operator, Tokyo Electric Power Co., contradicted Abe's claim.

During his visit to the plant, Abe focused on efforts to prevent the contaminated water from leaking into the ocean. He was shown tanks that have been leaking radioactive water as well as the Alps multi-nuclide removal equipment, which can eliminate 62 radioactive substances from contaminated water.

He also observed the silt fences that were installed to stem the flow of water inside the harbor at the Fukushima plant site.

TEPCO officials explained that radioactive materials were often below detectable levels in waters outside of the harbor.

Abe asked the officials what constituted a range of 0.3 square kilometers in the harbor. He had cited that figure when he told IOC members that Tokyo would not be affected by the contaminated water problem.

After his visit to the nuclear plant, Abe again used that figure to emphasize that his understanding of the problem had not changed.

"The effects of contaminated water have been completely blocked within a range of 0.3 square kilometers within the harbor," he told reporters.

Although Abe used the term "blocked," the silt fences in the harbor cannot prevent all water from flowing out into the ocean. Radioactive materials pass through the silt fences and mix with the ocean, becoming so diluted that they are difficult to detect.

Even Chief Cabinet Secretary Yoshihide Suga, the top government spokesman, said the measures at the Fukushima site are not stopping all of the water within the harbor.

Abe explained that his visit to Fukushima had been in the works for some time and was not added to his schedule because of the increased international attention to the situation.

During the visit, Abe instructed TEPCO President Naomi Hirose to decommission the No. 5 and 6 reactors of the plant and purify the contaminated water being stored in tanks at the site.

"We will secure an additional 1 trillion yen (\$10 billion) for decommissioning and complete purifying the contaminated water by the end of fiscal 2014," Hirose told Abe.

Some officials say the central government will inevitably have to pump in more public funds to deal with the Fukushima crisis now that it has put itself in charge of ending the contaminated water problem.

"The situation will likely arise in which the central government will also have to deal with decontaminating areas in Fukushima polluted by radioactive materials as well as constructing the interim storage facility for the removed soil," a source close to Abe said.

A former Cabinet minister said measures to address the various problems related to the Fukushima nuclear accident will have a major effect on the nation's fiscal condition.

Opposition parties plan to question how the government is handling the Fukushima situation.

"One thing we will have to think about in the future is what to do should the problem become drawn out," a high-ranking government official said.

Officials protest against Abe's "under control" comment

September 21, 2013

Namie town assembly protests PM Abe's 'under control' comment

<http://mainichi.jp/english/english/newsselect/news/20130921p2a00m0na008000c.html>

The town assembly of nuclear disaster-hit Namie, Fukushima Prefecture, passed a protest resolution against Prime Minister Shinzo Abe on Sept. 20 for declaring the situation surrounding the radioactively contaminated water leaks at the Fukushima No. 1 nuclear plant "under control."

The prime minister made the controversial comments during Tokyo's final presentation at the International Olympic Committee (IOC)'s general meeting in Buenos Aires on Sept. 7, saying, "Some may have concerns about Fukushima. Let me assure you, the situation is under control." He also said the effect of the water leak has been "completely blocked" within the 0.3 square kilometers of the plant's harbor.

The Namie Town Assembly unanimously passed the Sept. 20 protest resolution stating that there is a "serious problem" with Abe's remarks as they "contradict reality." The protest also calls the situation at the plant, where some 300 metric tons of radioactively contaminated water is leaking into the ocean every day, "serious."

"The situation has never been 'under control,' nor is the contaminated water 'completely blocked,'" the protest read.

Regarding Abe's claim that "there are no health-related problems until now, nor will there be in the future," the Namie resolution pointed out that there had been 1,459 deaths related to the triple disasters in Fukushima Prefecture thus far.

"We can't help but feel resentment against the government and plant operator Tokyo Electric Power Co., both of which are disregarding Fukushima Prefecture," the protest stated.

The entire town of Namie has been designated as an evacuation zone since the outbreak of the Fukushima nuclear disaster.

Local leaders criticize Abe for saying radioactive water leaks 'under control'

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201309210057>

THE ASAHI SHIMBUN

The governor of Tokyo and a local town assembly severely affected by the Fukushima disaster took issue with Prime Minister Shinzo Abe's assurance to International Olympic Committee members earlier this month that the Fukushima nuclear crisis is "under control."

"We strongly protest (Abe's) irresponsible comment," the town assembly of Namie, Fukushima Prefecture, said in an unanimously adopted opinion on Sept. 20 protesting Abe's assertion.

Before Tokyo was awarded the 2020 Olympics, and with growing international concern over the leakage of tons of radioactive contaminated water from the plant into the sea, Abe told the International Olympic Committee in Buenos Aires on Sept. 7, "Let me assure you, the situation is under control."

Although the IOC appears to have bought it, Abe's statement has raised criticism back home.

Abe's statement has "grave problems that fly in the face of the fact," added the opinion adopted by the Namie town assembly.

Two and a half years after the onset of the nuclear accident caused by the Great East Japan Earthquake and tsunami, all residents of Namie are still evacuees.

The opinion said the daily flow of 300 tons of polluted groundwater from the plant into the Pacific Ocean constitutes an "emergency."

It called on the central government to resolve the situation by retracting the government's declaration in December 2011 that the crisis is under control.

Prime Minister Yoshihiko Noda had cited the state of cold shutdown of the reactors.

The opinion also stated that more than 290 people from the town have died as a result of the evacuations. "If Abe does not have an idea how stifling it is for people to be forced to evacuate, he should sincerely listen to what evacuees have to say," the opinion said.

In Tokyo, Governor Naoki Inose also countered Abe's claim that things are under control.

"(The leakage of contaminated water is) not under control necessarily at this stage," Inose told reporters Sept. 20 at a regular news conference. "It was very important for the central government to demonstrate its resolve to get things done right by providing funds for it (at the IOC committee). Officials should strive toward resolving it."

Split TEPCO?

September 21, 2013

LDP bigwig pushes Tepco split to speed up Fukushima No. 1 decommissioning

Kyodo

http://www.japantimes.co.jp/news/2013/09/21/national/ldp-bigwig-pushes-tepco-split-to-speed-up-fukushima-no-1-decommissioning/#.Uj3os1M0_9k

A senior official of the ruling Liberal Democratic Party has proposed to Prime Minister Shinzo Abe that **Tepco be split up and a new company created to take charge of decommissioning the Fukushima No. 1 plant**, a party official said Saturday.

The plan, floated Wednesday by **Tadamori Oshima, head of the LDP committee on Tohoku's recovery from the 2011 disasters**, could speed up decommissioning work while allowing Tokyo Electric Power Co. to focus on compensating those affected by the nuclear crisis and on its primary business, the official said.

Of the six reactors at Fukushima No. 1, Tepco is moving to dismantle No. 1 through 4, which were crippled by core meltdowns or hydrogen explosions in March 2011. Abe on Thursday urged Tepco to also scrap the No. 5 and 6 units, which didn't suffer any major structural damage.

Under the plan proposed by Oshima, a former vice president of the LDP, Tepco employees engaged in cleanup efforts and decommissioning work at Fukushima No. 1 would be transferred to the new entity, which would be primarily funded by the government.

Observers, however, say the idea may face resistance from some quarters for its potential to confuse the responsibilities of Tepco and the government over the plant's decommissioning.

The LDP committee is expected to compile a formal proposal based on Oshima's plan in the near future. But it may also include other options, such as setting up a new government agency or an independent administrative body for the dismantling of Fukushima No. 1, the official said.

Abe - and most media - ignore the seriousness of the problem

September 20, 2013

EDITORIAL: Abe should confront the reality of Fukushima radiation leaks

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201309200051>

In the wee hours of Sept. 20, a strong earthquake measuring a 5-plus on the Japanese seismic scale struck Fukushima Prefecture. Its epicenter was in the Hamadori area in the eastern part of the prefecture, where the wrecked Fukushima No. 1 nuclear power plant is located.

Even though it caused no damage to the some 1,000 storage tanks within the plant that are filled with radioactive water, the quake must have given many people a chill.

On the previous day, Prime Minister Shinzo Abe visited the crippled plant and reiterated his view about the effects of contaminated water, saying they had been "completely blocked" within a certain range.

But he is overoptimistic if he really believes what he said about the problem.

He needs to appreciate the seriousness of the situation and make an all-out effort to prevent unforeseen disasters like massive leaks of contaminated water.

Symbolical of Abe's unwarranted optimism about what is going on at the plant is his claim that the situation is "under control."

He made the remark earlier this month in his presentation at a session of the International Olympics Committee, which helped Tokyo to be chosen as the host city for the 2020 Summer Games. After his statement was reported around the world, however, a senior executive of Tokyo Electric Power Co. (TEPCO), the operator of the Fukushima plant, rebutted his argument, saying the situation was not under control.

During the International Atomic Energy Agency's annual general conference meeting held on Sept. 16-20 in Vienna, representatives of many countries raised questions about Abe's statement. China, for instance, voiced strong concerns about how things stand at the Fukushima complex.

Mindful of the international perceptions, Ichita Yamamoto, minister of science and technology policy, didn't use the phrase "under control" in his official speech at the IAEA meeting.

We are not demanding that the prime minister describe the situation with complete accuracy.

We are concerned that he may be confusing the goal with the reality. Efforts are certainly under way to put the radiation crisis "under control" and "completely block" the effects of polluted water. But that doesn't mean the situation is actually "under control" or that the effects are "completely blocked."

At the moment, how much radioactive water is flowing into the sea and what underground route it is taking to reach the sea can only be guessed. That means the situation is far from being "under control."

The prime minister's words carry great weight. If he voices an overoptimistic view about the current situation concerning leaks of contaminated water, the efforts to deal with the problem could be prematurely relaxed.

One big mistake concerning the problem was made by the previous administration of Prime Minister Yoshihiko Noda. In December 2011, the Noda administration declared that the Fukushima nuclear crisis had been resolved.

But, in fact, only a stopgap system to pour water continuously onto melted reactor cores had been established.

As a result, the problem of polluted water accumulating at the plant dropped from the list of important topics of political debate and lost the attention of the general public.

News media should also do soul-searching over their failure to communicate the seriousness of the problem sufficiently to the public.

At the IAEA meeting, one inevitable question was raised. The problem of radioactive water accumulating at the Fukushima plant has been recognized from the beginning. Why is it that no serious effort has been made to find a solution for as long as two years?

British science magazine Nature takes a dim view of how the Japanese government, which has announced a plan to take over the cleanup, will cope with the crisis. "Given the government's past actions and information policies, one might doubt whether it would be any more competent than TEPCO at managing the situation and communicating it to the public," it commented in a recent issue.

The current situation of the crisis warrants no optimism. The Abe administration needs to honestly acknowledge the enormity of the challenge, and communicate its view and related information to audiences both at home and abroad. Then it should start taking steps to gain necessary knowledge and support from all over the world to tackle the challenge effectively.

--The Asahi Shimbun, Sept. 21

Nature magazine : Nuclear error

Nuclear error

Japan should bring in international help to study and mitigate the Fukushima crisis.

03 September 2013

<http://www.nature.com/news/nuclear-error-1.13667>

The radioactive water leaking from the site of the wrecked Fukushima Daiichi nuclear power plant in Japan is a stern reminder that we have not seen the end of the world's largest nuclear crisis since the Chernobyl meltdown in Ukraine in 1986. After an earthquake and tsunami crippled the Fukushima plant in March 2011, it became clear that efforts to decontaminate the area would be long-lasting, technically challenging and vastly expensive. Now it turns out that the task has been too big for the owner of the plant, the Tokyo Electric Power Company (TEPCO). The Japanese government on 3 September announced a plan to take over the clean-up, but its intervention is overdue.

In the two and a half years since the accident, TEPCO has repeatedly failed to acknowledge the nature and seriousness of problems with safeguarding nuclear fuels in the three destroyed reactors at Fukushima. Each day, some 400,000 litres of water are being funnelled into the reactor cores to prevent the rods from overheating. Only in recent months has TEPCO admitted that some contaminated water is leaking into the reactor basement and, through cracks in the concrete, into the groundwater and the adjacent sea. Few independent measurements of radiation exposure are available, and it is worryingly unclear how these leaks might affect human health, the environment and food safety. But the problems do not stop there. There are now almost 1,000 storage tanks holding the used cooling water, which, despite treatment at a purification system, contains tritium and other harmful radionuclides. The leaks make clear that this system is a laxly guarded time bomb.

It is no secret that pipes and storage tanks sealed with rubber seams have a habit of leaking. TEPCO's reliance on routine patrols to detect any leaks has been careless, if not irresponsible. That the company, in response to the latest incidents, intends to refit the tanks with sensors and extra safety controls just underlines the makeshift way in which the storage facilities were set up in the first place. Meanwhile, the fate of the constantly amassing polluted water is undecided. Proposals earlier this year to dump it into the sea understandably met with fierce opposition from local fisheries.

“An international alliance on research and clean-up would help to restore shattered public trust.”

Given the government's past actions and information policies, one might doubt whether it would be any more competent than TEPCO at managing the situation and communicating it to the public. Over the weekend, it turned out that radiation doses near the leaking tanks are 18 times larger than first reported: leakage that started as a mere 'anomaly' has turned into a genuine crisis. Japan should start consulting

international experts for help. The United States, Russia, France and the United Kingdom — to name but a few — all have know-how in nuclear engineering, clean-up and radiation health that would serve Japan well. An international alliance on research and clean-up would help to restore shattered public trust in the usefulness and effectiveness of monitoring and crisis-mitigation.

The most important impacts of the leaks will be those on the sea off Fukushima and the larger Pacific Ocean, which must be closely monitored. After assessments by US and Japanese scientists in 2011 and 2012, two major questions remain unanswered. How much radioactivity is still entering the sea? And, given the high levels of radioactivity that have been measured in some species long after the accident, when will fish and seafood from the region be safe to consume? The leaks make it more urgent to find answers to these questions.

To make reliable assessments of any environmental effects, scientists need to be able to collect data on contamination of marine food webs with all long-lived radionuclides, and particularly with caesium-137, strontium-90 and plutonium-239. They also need to know the sources of contamination, and to study the transport of radionuclides in groundwater, sediments and ocean currents. Current Japanese Prime Minister Shinzo Abe and his government have promised to boost science; they should encourage and support researchers from around the world in collecting and sharing information. Chernobyl was a missed opportunity for post-accident research — in that sense at least, Fukushima could do much better.

Let the world help at Fukushima No. 1

http://www.japantimes.co.jp/community/2013/09/23/voices/let-the-world-help-at-fukushima-no-1/#.UkB-BVM0_9k

Re: "Fukushima and the right to responsible government" by Colin P.A. Jones (The Foreign Element, Sept. 17):

It would be useful if the government of Japan would avail themselves of the assistance and technology that could be provided by foreign corporations with experience in the decommissioning of nuclear plants.

The United States successfully cleaned and decommissioned nuclear facilities at Hanford, Washington, Rocky Flats, Colorado, and Portsmouth, Ohio. Other projects are currently under way in both the U.S. and U.K.

Yet, American firms who have offered to help with issues at Fukushima have been repeatedly turned down by Tepco and the Ministry of Economy, Trade and Industry.

Recently, a METI official told me that Japan could not use American technology that was used to decommission Hanford because these were military reactors used in weapons programs. Fukushima is a civilian power reactor and, hence, the technology would not be appropriate.

Fuel rods inside the core of a nuclear reactor do not know if they will be reprocessed or put into a spent fuel pool.

This type of thinking harkens back to the fallacious argument that Japanese cannot eat American beef because their intestines are different.

The cleanup of any nuclear reactor will use the same technology, regardless of what the reactor has been used for.

The consequences of the continued delay in addressing the real challenges at Fukushima have international consequences.

So, why not allow the international nuclear community the opportunity to help?

Diet committee to meet on water crisis on Friday

September 24, 2013

Lower House panel to discuss wastewater on Friday

http://www3.nhk.or.jp/nhkworld/english/news/20130924_35.html

Japan's ruling and opposition parties have agreed to examine the problem of radioactive wastewater at the Fukushima Daiichi nuclear plant in a Lower House committee meeting on Friday.

Directors of the Lower House Committee on Economy, Trade and Industry on Tuesday discussed when to meet on the matter, **as the Diet is currently not in session.**

They agreed to summon President Naomi Hirose of the plant's operator, Tokyo Electric Power Company, as an unsworn witness on Friday to ask how the utility has been coping with the wastewater problem.

Members of the committee inspected wastewater tanks and leakage sites at the plant this month.

The directors also decided to summon Economy, Trade and Industry Minister Toshimitsu Motegi and Nuclear Regulation Authority Chairman Shunichi Tanaka next Monday.

Committees of the Diet rarely hold sessions when it is closed. Opposition parties demanded that the committee open a session on the radioactive water, but the members of the group failed to agree on the matter until Tuesday.

Why doesn't TEPCO accept Rusatom's help?

September 25, 2013

Rusatom hopes to help TEPCO resolve Fukushima nuclear disaster

<http://mainichi.jp/english/english/newsselect/news/20130925p2g00m0dm036000c.html>

VLADIVOSTOK (Kyodo) -- Russian state-run nuclear power company Rusatom hopes to cooperate with Japan's Tokyo Electric Power Co. in resolving the March 2011 Fukushima Daiichi nuclear plant disaster, the head of a Rusatom unit said Tuesday.

Rusatom could take advantage of its experiences with the 1986 Chernobyl nuclear plant accident to help TEPCO resolve the problems at its crippled plant, Rosatom Overseas General Director Djomart Aliyev said in an interview with Kyodo News.

Noting TEPCO has been negative about cooperating with the Russian company, Aliyev urged the Japanese utility to accept Russian help.

"As TEPCO has not made all the information open, we cannot find solutions immediately," Aliyev said. "If we cooperate, however, we may produce good results."

Rusatom has formed a special team to analyze the Fukushima situation and proposed lists of support tools including radiation-resistant cameras and agents for clumping radioactive materials, but the Japanese side has failed to accept any of its proposals, he said.

He also said Russia and Japan may cooperate in training nuclear plant operators in Vietnam and Turkey where they are competing for nuclear plant contracts.

Questioned on reported doubts about the safety of the Bushehr nuclear plant that Rusatom helped Iran construct, Aliyev said Rusatom has taken much time to test the plant and sees no safety problems.

Iran's reported plan to use domestically developed nuclear fuel at the plant would be effectively impossible, he said.

Interview with Industry minister Motegi about TEPCO's liquidation

September 25, 2013

FUKUSHIMA WATER CRISIS: Liquidating TEPCO not the answer, says industry minister

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201309250053>

THE ASAHI SHIMBUN

Industry minister Toshimitsu Motegi expressed opposition to suggestions that Tokyo Electric Power Co. should be liquidated if taxpayers money is used to deal with the radioactive water problem at the Fukushima No. 1 nuclear power plant.

Doing so could jeopardize compensation payments to victims of the nuclear accident and also adversely affect the electricity supply, he told The Asahi Shimbun in a recent interview.

Motegi pledged that the government will actively tackle the contaminated water problem. He added that the government would spare no effort to promote technological innovations in areas where current expertise is insufficient.

Motegi, 57, heads the government's task force set up this month to take charge of the problem concerning contaminated water as well as decommission the plant's crippled reactors.

The Ministry of Economy, Trade and Industry estimates that 300 tons of water contaminated with radioactive materials are leaking from the site into the sea each day.

In an effort to plug the leakage, the government is taking or plans to take several measures, including freezing the soil around reactor and turbine buildings to prevent groundwater from flowing into the structures. Excerpts from the interview follow.

Question: There is growing confusion about the leakage of contaminated water. What are your thoughts on the issue?

Motegi: Until the Liberal Democratic Party regained power last December, we did not have detailed information. From the immediate aftermath of the nuclear accident, the government (led by the Democratic Party of Japan) was always slow in taking measures to deal with the disaster. In particular, the government left it to TEPCO to solve the problem of contaminated water at the plant. TEPCO continued to take stopgap measures like a whack-a-mole game.

Q: Earlier this month, the government announced measures to deal with the problem of contaminated water. Will those measures be sufficient to solve the problem?

A: We had many discussions with experts. As a result, we worked out preventive and multilayered measures. We don't think that those measures are insufficient.

We will also gather ideas from Japan and abroad to deal with potential risks. In two months, we will work out measures to cope with the risks. If those measures are insufficient, we will take additional measures at the earliest moment.

Q: Do you mean that the government has no intention of leaving it entirely to TEPCO to solve the problem of contaminated water?

A: We will shift from the policy of leaving it entirely to TEPCO to come up with a solution. There is no hesitation on the part of this government in doing what it has to do.

Q: But the costs for the government's measures will be covered by taxpayers' money. To what extent will the government be responsible for those measures?

A: Decommissioning of the reactors will be done by TEPCO. But technologies developed for that purpose could be used throughout the world in the future. The government will be in charge of the development of those technologies. As for contaminated water, the government will be involved in the fields where solutions are technically difficult and could be delayed.

Q: Do you think that the measures taken by the DPJ-led government were insufficient?

A: Recalling those days, I must say “Yes.” But the top priority now is not to place blame, but for the ruling and opposition parties to cooperate to solve the problem of contaminated water.

Q: Some lawmakers are demanding in the Diet that legislation must be drawn up to clarify the roles of the government and those of TEPCO (in order to prevent the government, which means taxpayers, from shouldering a huge financial burden in efforts to solve the problem of contaminated water and other issues).

A: Various considerations must be taken into account. But it is not simply an issue of costs. It is an issue that should be considered in comprehensive discussions, including those on the payment of compensation, decontamination work and the position of nuclear power in overall energy policy.

Q: Some people say that if the government uses taxpayers’ money, TEPCO should be liquidated.

A: If TEPCO is liquidated, there is a possibility that the right of victims of the nuclear accident to receive compensation will not be met and that companies engaged in the solution of the various problems resulting from the disaster will not be able to receive payment for their work. There would be big adverse effects. Besides, the supply of electricity could become unstable.

Q: In the presentation held before the International Olympic Committee’s vote to choose the host country of the 2020 Summer Olympics, Prime Minister Shinzo Abe said, “Let me assure you the situation (of contaminated water at the plant) is under control.” But a senior TEPCO official took issue with the remark.

A: The TEPCO official’s remark pointed to individual events, such as the leakage of contaminated water from a storage tank. We should not confuse it with the entire situation. As the prime minister said, the effects of contaminated water are limited to nearly 0.3 square kilometer (of sea water) within the port (at the plant), and is under control as a whole.

(This article was written by Mari Fujisaki and Daisuke Fukuma.)

New levees below height standards

September 26, 2013

Rebuilt coastal levees in disaster-hit prefectures below recommended height

<http://mainichi.jp/english/english/newsselect/news/20130926p2a00m0na012000c.html>

Some coastal levees in Iwate, Miyagi and Fukushima prefectures that were destroyed by tsunami triggered by the March 2011 Great East Japan Earthquake are being rebuilt below designated height standards, the Mainichi Shimbun has discovered.

In many cases, local residents have requested that the levees be lowered due to interference with their ability to enjoy scenic views, as well as concern that the levees could negatively impact the fishing industry. Such requests have been complied with in a total of 14 districts in Iwate Prefecture. No local government in Miyagi Prefecture has accepted such requests, and discussions remain underway between residents and officials in several localities.

According to prefectural and municipal government officials, the levees are slated to be rebuilt in a total of 101 districts in Iwate Prefecture, 254 districts in Miyagi Prefecture, and 65 districts in Fukushima Prefecture. While these figures include levees used to prevent cliff erosion, they do not take into account offshore levees used to protect beaches.

The three prefectures decided the height of the levees for each existing bay during the autumn of 2011, in response to advice from the Ministry of Land, Infrastructure, Transport and Tourism that they take into account previously existing data indicating that tsunamis occur "once every few dozen or few hundred years."

In Iwate Prefecture, the proposed height of the levees was lowered in a total of 20 districts. Among these, the adjustments in 14 districts took place after residents specified that the higher levees "were unnecessary, as they would be building their houses on higher ground." In the other cases, the lowered heights were presented by local officials, and consented to by local residents.

While the height of the levees is due to be lowered in a total of 99 districts within Miyagi Prefecture, prefectural officials indicated that they would be rebuilding the levees at their original height in areas where houses and roads were destroyed. In some areas, including districts within the cities of Kesenuma and Ishinomaki, residents have asked that the height of the levees be lowered. Discussions are presently ongoing in at least 30 separate districts in this regard.

In Fukushima Prefecture, officials have adjusted the height of the levee in one district.

September 26, 2013(Mainichi Japan)

And the Band Played On...

And the Band Played On...

September 25, 2013 Japan, Nuclear

<http://akiomatsumura.com/>

Scott Jones, Ph.D.

There is historical evidence that the Titanic's orchestra heroically continued to play until the ship made its final plunge to the bottom of the Atlantic Ocean. There is some temptation to compare that snippet of history to what is playing out in Japan following the decision of the Olympic Committee to award the 2020 Summer Olympic Games to Tokyo. The theatrical command that, "The show must go on," may be an appropriate observation, but there are monumental differences in the situations.

The human loss of life on the Titanic was indeed shocking, partially so because the Titanic was professionally declared to be unsinkable. The music from Fukushima is decidedly unnerving. It is the sounds from the seriously damaged reactor building number four as its tilt increases in its agonizing slow

collapse. That collapse will trigger a one-hundred foot fall of the spent fuel rod cooling tank, exposing the fuel rod assemblies and creating a nuclear disaster more than a thousand times greater than Hiroshima.

Japan will be well remembered by those who survive the global consequences of the resulting radiation hell. The memories will be starkly mixed. Sympathy will soften the memories of the thousands of innocent civilians killed in Hiroshima and Nagasaki as the result of wartime attack of nuclear weapons. There will be no sympathy for the refusal of Japan to immediately request international assistance to determine what could be done to stem the cascade of increasing risks following the March 2011 earthquake and tsunami.

Hopefully, there will be international memories of lessons learned from the tragedy of Fukushima. Profit controlled critical decisions. Regulatory capture assured that warnings of unsafe practices and conditions could be ignored or action deferred.

We will never know if the inevitable outcome could have been avoided if the world's most experienced nuclear crises engineers and scientists had been involved at Fukushima.

The 2020 Summer Olympic Games will not take place in Tokyo. Nature has others plans for Tokyo and the world.

Sadly, the issue is no longer, "what can be done?" The terminal issue is a brutally honest international assessment that must be made about Fukushima and the nuclear power industry. This is owed to future generations who will pay dearly for our incautious dance with technology we could not handle.

Dr. Scott Jones was a career naval officer with extensive nuclear weapon experience. He was a qualified nuclear weapons delivery pilot, and in intelligence assignments, a Nuclear Weapons Deployment Officer, and created Nuclear Weapon Target Annexes for U.S. European Command War Plans. Following this he became special assistant to Senator Claiborne Pell.

Behind TEPCO's (and Gov't) decisions and judgments

September 25, 2013

FUKUSHIMA WATER CRISIS: TEPCO should face bankruptcy if taxpayer money used, says DPJ lawmaker

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201309250060>

By AKINORI ONO/ Staff Writer

If taxpayer money is used to deal with the contaminated water problem at the Fukushima No. 1 nuclear power plant, the government should consider having Tokyo Electric Power Co., the plant's operator, go bankrupt or nationalizing it, Sumio Mabuchi, who served as an aide to the prime minister on the Fukushima nuclear accident in 2011, told The Asahi Shimbun in a recent interview.

Mabuchi, 53, is a lawmaker of the opposition Democratic Party of Japan, which was in power when the nuclear accident unfolded in March 2011 following the Great East Japan Earthquake and tsunami.

The leakage of water contaminated with radioactive materials at the crippled Fukushima plant is becoming serious. To solve the problem, the government, now led by the Liberal Democratic Party, is considering measures with TEPCO, including a costly project of constructing a frozen soil wall around reactor and turbine buildings to prevent groundwater from flowing into them. Excerpts from the interview follow:

* * *

Question: About two weeks after the nuclear disaster occurred at the Fukushima plant, you assumed the post of special adviser in charge of the accident to then Prime Minister Naoto Kan. Immediately after that, you said contaminated water would become a serious problem.

Mabuchi: In the compound of the Fukushima No. 1 nuclear plant, TEPCO constructed buildings on sites lower than the groundwater table by lopping off a cliff. Therefore, it was natural to consider the possibility that groundwater could flow into the buildings and be contaminated by radioactive materials. But TEPCO denied the possibility, saying, "There are no effects (of groundwater) at all."

Then, I checked the data for the years starting in 1971 when the nuclear plant started operations. As a result, I found the fact that groundwater repeatedly flowed into the buildings of the No. 1 to No. 4 reactors, and TEPCO conducted work to stop the inflow. I felt that the buildings were standing in the path of the groundwater flow. I studied four kinds of impermeable walls, and adopted one in which four sides of the area of the buildings are dug to the clay layer at a depth of 30 meters, and walls made of clay-like materials will be constructed to that depth, like a (huge) square bathtub.

Q: But the idea never materialized?

A: As the project will cost about 100 million yen (\$1 million), Kan and then Minister of Economy, Trade and Industry Banri Kaieda agreed to make it a governmental project. But a day before the project was to be announced on June 14, 2011, TEPCO “overturned” the planned announcement.

Q: Why did TEPCO do so?

A: At that time, TEPCO was in a period of being audited on its financial statements ahead of its June 28 shareholders’ meeting. The reason for overturning the plan was that if people felt that TEPCO had a new debt of 100 million yen (for the construction of the wall) and, as a result, the utility’s liabilities could exceed its assets, the market would be plunged into turmoil.

Sakae Muto, then TEPCO executive vice president, told Kaieda, “Please allow us to announce that we will implement (only) research on the impermeable wall.” I accepted Muto’s proposal because he promised that TEPCO would implement (construction of the impermeable wall) without delay.

Q: Did the DPJ-led government make a mistake in its judgment?

A: No, it didn’t. It is one view that if TEPCO’s liabilities exceed its assets, the market will be plunged into turmoil. The problem is that though we decided to implement the construction of the wall, the decision was later overturned. I don’t know the reason as I was dismissed as a special adviser on June 27. But I deeply regret (that the decision was overturned).

Q: How should the government deal with the contaminated water problem?

A: Prime Minister Abe says that he will deal with the problem under the government’s responsibility. But if the government will use taxpayers’ money, it should consider having TEPCO go bankrupt or nationalizing it. As for the frozen soil wall now being considered by the government, I doubt whether the wall can be constructed uniformly in the ground and can prevent inflows of groundwater. I think that an impermeable wall made of clay-like materials is best.

Q: In the presentation held before the International Olympic Committee’s vote to choose the host country of the 2020 Summer Olympics, Prime Minister Shinzo Abe said, “Let me assure you the situation (of the contaminated water at the crippled Fukushima nuclear plant) is under control.”

A: Even if he wanted to win the vote to choose the host country of the 2020 Summer Olympics, he made a mistake in stating the actual condition of the plant. The international community will ask Japan, “Is it

really under control?" I think that people around Abe advised him to say so. What judgments politicians should make responsibly when facing such a big issue is a permanent challenge.

IAEA says TEPCO can't do it alone

September 27, 2013

IAEA: Japan's radioactive water survey inadequate

http://www3.nhk.or.jp/nhkworld/english/news/20130927_10.html

The head of the International Atomic Energy Agency has suggested Japan should not monitor radioactivity unilaterally in the seawater around the Fukushima Daiichi nuclear power plant. He pushed for international efforts in regard to the testing.

IAEA Director General Yukiya Amano spoke to the Japanese media in Vienna on Thursday about the leakage of radioactive water at the plant. The interview was held ahead of his scheduled visit to Japan next month.

Amano said that it is not sufficient for Japan to monitor levels of seawater radioactivity around the crippled nuclear plant alone as there are a variety of ways to conduct the testing.

He stressed cooperation with international bodies is crucial for Japan from the planning stage in order to gain trust from the international community.

The IAEA plans to send inspectors to Japan this autumn. The agency is considering including seawater analysis specialists on the mission.

TEPCO aware of possible leakage at an early stage

September 27, 2013

TEPCO admits to putting shield walls on hold

http://www3.nhk.or.jp/nhkworld/english/news/20130927_42.html

The operator of the Fukushima Daiichi plant says it has had to delay constructing underground walls to block the leakage of contaminated water because other work was more urgent.

Tokyo Electric Power Company President Naomi Hirose testified on Friday at a Lower House committee meeting.

The committee was convened to discuss the massive groundwater contamination at the plant.

Hirose admitted that TEPCO was aware of the possible leakage of radioactive water into the sea at an early stage.

Three months after the nuclear accident, the utility decided to build underground walls around the reactor buildings.

Asked why TEPCO did not pursue the plan, Hirose said it had to deal with many "hot spots" of radiation, as well as contaminated debris.

He said it was first decided by the government and TEPCO to build underground walls near the sea, instead of around the reactor buildings.

The seaside walls were built by solidifying an embankment with chemicals. The current plan calls for walls surrounding the reactors to be built by freezing the soil, which is unprecedented in scale and cost.

The president was also asked about Prime Minister Shinzo Abe's remark at the general assembly of the International Olympic Committee earlier this month. Abe claimed situation is under control.

Hirose says Abe seemed to have meant that the impact of the contaminated water has been contained within the plant's port and that in that sense he agrees with the prime minister.

TEPCO: Ten more billion dollars for cleanup

September 27, 2013

World Briefing | Asia

Japan: \$10 Billion More for Cleanup of Fukushima Nuclear Plant

By REUTERS

http://www.nytimes.com/2013/09/28/world/asia/japan-10-billion-more-for-cleanup-of-fukushima-nuclear-plant.html?_r=0

Published: September 27, 2013

The Tokyo Electric Power Company, the operator of the wrecked Fukushima nuclear plant, said Friday that it would revise its business turnaround plan to allocate an additional \$10 billion for the plant's cleanup. Tokyo Electric, also known as Tepco, is trying to contain radioactive water at the Fukushima plant, which was hit by meltdowns and hydrogen explosions after a massive earthquake and tsunami in March 2011.

TEPCO obtains 80 billion yens of refinancing loans

September 29, 2013

Improvement of TEPCO's financing in sight: Motegi

<http://mainichi.jp/english/english/newsselect/news/20130929p2a00m0na009000c.html>

TOKYO (Kyodo) -- The financing situation of Tokyo Electric Power Co., operator of the crisis-hit Fukushima Daiichi nuclear plant, is stabilizing, industry minister Toshimitsu Motegi said Sunday. "Financial institutions will continue extending loans to the utility," Motegi said on an NHK program. "Improvement of its balance of payments is now in sight."

TEPCO is negotiating with Sumitomo Mitsui Banking Corp. and others over loan refinancing after filing for state safety assessments of two reactors at the Kashiwazaki-Kariwa plant in Niigata Prefecture in a bid to reactivate them and improve its business position.

Motegi also said the utility will scrap the Nos. 5 and 6 reactors of the crippled Fukushima Daiichi plant in Fukushima Prefecture as urged by Prime Minister Shinzo Abe.

"Tokyo Electric is likely to accept Prime Minister Abe's request and decide (on decommissioning) at an early stage," Motegi said.

Of the plant's six reactors, TEPCO is already moving ahead with decommissioning the Nos. 1 to 4 units, all of which suffered meltdowns or hydrogen explosions in the early days of the crisis triggered by a huge earthquake and tsunami on March 11, 2011.

Abe urged TEPCO in September to scrap the remaining Nos. 5 and 6 reactors as well, even though they suffered no major structural damage.

September 28, 2013

Banks agree to give ¥80 billion in refinancing loans to TEPCO

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201309280044>

THE ASAHI SHIMBUN

A group of banks agreed Sept. 27 to extend 80 billion yen (\$800 million) in loans to Tokyo Electric Power Co. for refinancing after the struggling utility moved toward restarting two nuclear reactors, bank executives said.

The money will go to repayments due at the end of October on loans of the same amount that were extended to TEPCO before the March 2011 Great East Japan Earthquake and tsunami triggered the accident at its Fukushima No. 1 nuclear power plant.

In the coming days, about 30 banks of the group will decide how much of the 80 billion yen each will contribute. They will convey their decision to TEPCO and the government's Nuclear Damage Liability Facilitation Fund by mid-October.

Some of the 30 financial institutions, especially local banks based in areas affected by the March 2011 disaster, remain cautious about lending to TEPCO. If those local banks balk during the discussions, some major banks said they will make up the difference, several bank executives told The Asahi Shimbun.

The decision to grant the new loans came the same day TEPCO applied to the Nuclear Regulation Authority for safety screenings of the No. 6 and No. 7 reactors at its Kashiwazaki-Kariwa nuclear power plant in Niigata Prefecture. The screening process is required before the reactors can be restarted.

The financial institutions extending the loans, including three megabanks, viewed TEPCO's screening application as a step toward generating nuclear energy and improving its financial and business operations.

TEPCO desperately needs to lift its business performance to receive loans from the banks. The utility posted pretax losses for two straight years after the nuclear accident, due largely to increased fuel costs for thermal power generation to make up for lost capacity at its idle nuclear plants.

On Sept. 27, TEPCO President Naomi Hirose said his company is also preparing to apply to the NRA for safety screenings at other reactors to bring them back online.

But even after TEPCO receives the 80 billion yen in loans, the utility still faces hurdles; loans worth 200 billion yen come due in December, and the company is seeking to borrow 300 billion yen in additional loans.

Hirose on Sept. 27 asked for further government support in a Diet hearing called to discuss the problem of contaminated water leaking at the Fukushima plant.

"If the government embarks on a full-fledged effort to solve the problems that resulted from the nuclear accident, it would be a blessing for us," said an executive of a major bank.

However, many insist that TEPCO's creditors and shareholders should shoulder more of the responsibilities.

"It is illogical that taxpayers' money is used to solve problems resulting from the nuclear accident," Tetsuya Shiokawa, a lawmaker from the Japanese Communist Party, said in the Diet hearing. "There are other things that should be done before taxpayers' money is spent."

Tepco to keep receiving ¥77 billion in bank loans after repayment deadline

Kyodo, JJI

http://www.japantimes.co.jp/news/2013/09/28/national/tepco-to-keep-receiving-%C2%A577-billion-in-bank-loans-after-repayment-deadline/#.UkgSu1M0_9k

Twenty-eight financial institutions will continue to extend ¥77 billion in loans to struggling Tokyo Electric Power Co. beyond the October repayment deadline, sources said Saturday.

The refinancing is expected to stabilize Tepco's management and advance its cleanup efforts at the crippled Fukushima No. 1 facility.

It follows Tepco's application Friday for state safety inspections of two reactors at its Kashiwazaki-Kariwa nuclear plant in Niigata Prefecture, joining four other utilities seeking to reactivate atomic power stations idled because of the Fukushima crisis. Power companies have been bleeding money to cover the costs of thermal power generation since the March 2011 meltdowns at Fukushima No. 1.

The 28 institutions include Sumitomo Mitsui Banking Corp. and regional lenders. In August, Tepco presented its creditor banks with an income and expenditure plan that stated its aim of moving into the black in fiscal 2013 by reactivating idled reactors or hiking electricity rates.

Although the refinancing means Tepco in October will be able to clear the most pressing financial hurdle, the utility still needs to secure ¥300 billion in fresh loans and to refinance ¥200 billion worth of existing loans in December.

Tepco intends to seek further support from its creditor banks for those moves after revising its special management plan approved by the government in May 2012, the sources said.

Hirose supports Abe's "blocked" statement

September 28, 2013

TEPCO president agrees with Abe that radioactive water is 'blocked'

<http://mainichi.jp/graph/2013/09/28/20130928p2a00m0na002000c/001.html>

The president of Tokyo Electric Power Co. (TEPCO), Naomi Hirose, told a Diet panel on Sept. 27 that he shared Prime Minister Shinzo Abe's view that the leaking radioactive water at the Fukushima No. 1 Nuclear Power Plant is contained within the bay there.

During Tokyo's final presentation in its bid for the 2020 summer Olympics, Abe said at the International Olympic Committee general assembly meeting in Buenos Aires that the radioactive water situation is under control, with the water completely "blocked" from exiting a 0.3 square kilometer area in the bay.

Hirose said at a session of the House of Representatives Economy, Trade and Industry Committee that he "completely agreed," and that "from the view of preventing leaking into the outside ocean, I think the situation is firmly under control." Hirose also apologized for causing concerns due to the leak.

However, on Sept. 13, TEPCO executive-level fellow Kazuhiko Yamashita said, "I don't believe (the radioactive water situation) is under control," showing a conflict in opinions coming from the company.

TEPCO should get its priorities right

September 28, 2013

Editorial: TEPCO should prioritize bringing Fukushima nuclear crisis under control

<http://mainichi.jp/english/english/perspectives/news/20130928p2a00m0na008000c.html>

Tokyo Electric Power Co. (TEPCO) has applied with the nuclear power regulator for a safety inspection of two reactors at its Kashiwazaki-Kariwa Nuclear Power Plant in Niigata Prefecture in preparation to reactivate them. The move is in response to Niigata Gov. Hirohiko Izumida's agreement to such an application.

However, TEPCO is the operator of the crippled Fukushima No. 1 Nuclear Power Plant. It therefore must establish a method for dealing with radioactive water accumulating on the power station's premises and take other measures to bring the nuclear crisis under control in order to restore the public's confidence in it as a precondition for restarting the idled No. 6 and 7 reactors at the Kashiwazaki-Kariwa plant.

Gov. Izumida attached some conditions to his agreement to TEPCO's application for a safety inspection. Specifically, he demanded that TEPCO not use a vent equipped with a filter -- a device that exhausts air out

of a nuclear reactor after removing as much radioactive material as possible in order to prevent damage to the reactor -- without consent from the local governments of areas hosting the power plant. Moreover, he required the power company to change the content of the application if such a measure becomes necessary as a result of its consultations with the prefectural government.

The governor's demands reflect the local communities' sense of deep distrust in TEPCO. The company decided in July this year to go ahead with the application without consulting the concerned local bodies. TEPCO's disrespect for local communities' opinions only served to deepen the distrust in the firm. It took the utility three months to finally file the application. However, even if the power plant passes the safety inspection, TEPCO must gain the prefectural government's consent to actually resume operations at the No. 6 and 7 reactors. As such, TEPCO should hold thorough consultations with the concerned local bodies over a disaster prevention plan to prevent local residents from being exposed to radiation in the event of a nuclear accident at the power station.

At the same time, it is difficult to understand why Gov. Izumida agreed to TEPCO's application for a safety inspection of the reactors after he bitterly criticized such a move. He should provide a detailed explanation on his about-face since it is a matter closely related to the safety of prefectural residents.

TEPCO must overcome a high hurdle before restarting any of its nuclear reactors. The Fukushima nuclear disaster has negated the so-called myth of nuclear plants' infallible safety. TEPCO must regain the public's trust in itself by convincing local residents that the utility will protect the safety of local residents by taking appropriate measures in the event of a nuclear accident in order to gain consent from the local communities for reactivation of nuclear plants.

However, it is still fresh in people's memory that TEPCO was too slow to respond to the Fukushima nuclear disaster and led to the crippled power station releasing a massive amount of radioactive substances. It then continued to deal with the accident in an inappropriate manner, causing underground water that flowed onto the premises of the plant to get contaminated with radioactive substances before leaking into the sea. Moreover, the highly radioactive water also leaked from storage tanks holding such contaminated water. TEPCO has still failed to block underground water from flowing onto the power station's premises. As a result, a massive amount of contaminated water is piling up at the plant day by day.

TEPCO must try its utmost to bring the Fukushima crisis under control before reactivating the No. 6 and 7 reactors at the Kashiwazaki-Kariwa nuclear plant. It cannot win understanding for its reactivation unless it restores the public's trust in itself which has been badly damaged by the disaster.

TEPCO is desperate to restart idled nuclear plants because it is being forced to review its business plan, which is a prerequisite for obtaining bank loans indispensable for its business activities. To avoid a deficit

for a third consecutive year, the utility must either resume operations at idled nuclear power stations or raise its electricity charges.

However, even if the Nuclear Regulation Authority gives the green light to reactivation of the Kashiwazaki-Kariwa plant, the utility will likely continue to manage itself on a tightrope. Even so, the company should not simply weigh up the safety of its nuclear plants and its profitability. The national government, which has placed TEPCO under its control, also needs to seriously consider a future vision for the troubled power company.

September 28, 2013

TEPCO & cost-cutting

September 29, 2013

TEPCO head expects return to the black through cost cutting

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201309290115>

THE ASAHI SHIMBUN

The president of Tokyo Electric Power Co. predicted that the embattled utility can return to profitability for the current fiscal year by cutting costs even without restarting a third nuclear power plant or raising electricity rates.

Naomi Hirose told The Asahi Shimbun in Tokyo's Chiyoda Ward on Sept. 28 that expenses for fiscal 2013 can be reduced by delaying part of planned repairs of its power generation and transmission equipment to fiscal 2014.

The prospect for posting a profit for the fiscal year ending in March means that TEPCO will be eligible to secure new loans from financial institutions, including three megabanks.

Securing a pre-tax profit is a condition for TEPCO to be extended new financing.

The utility's business outlook improved with the possibility of bringing two reactors at the Kashiwazaki-Kariwa nuclear power plant in Niigata Prefecture online in fiscal 2014.

TEPCO on Sept. 27 applied for checks of reactors No. 6 and No. 7 by the Nuclear Regulation Authority, which assesses if a nuclear facility meets the new safety standards before its reactors can be restarted. The move came after Niigata Governor Hirohiko Izumida finally gave consent to the company's plan to proceed with the application after months of refusal.

"There is the possibility that we can resume operations during the next fiscal year," Hirose said, referring to the two reactors at its Kashiwazaki-Kariwa plant.

TEPCO owns three nuclear power plants--the Fukushima No. 1 and No. 2 nuclear power plants in Fukushima Prefecture, both of which were damaged by the Great East Japan Earthquake and tsunami on March 11, 2011, and the Kashiwazaki-Kariwa plant on the Japan Sea coast. The latter has seven reactors.

Although the company sought to log a profit for the current fiscal year by delaying part of repairs of equipment to the next fiscal year, financial institutions were not sold on the plan.

They were concerned that the move to push back capital expenditures could imperil the financial standing of TEPCO in fiscal 2014.

However, with the possibility of the two reactors going back online in the next fiscal year, Hirose said the financial institutions' concerns over the utility's financial troubles eased.

TEPCO trimmed costs by 500 billion yen (\$5.09 billion) for fiscal 2012 through reducing repair and personnel expenses.

"Additional cost cutting will help the company to return to profitability for the current fiscal year," Hirose said.

After logging pre-tax losses in fiscal 2011 and 2012, the company also posted 29.4 billion yen in pre-tax losses for the first half of fiscal 2013.

The utility estimated that restarting a single reactor at the Kashiwazaki-Kariwa nuclear power plant will result in an increase of more than 100 billion yen in profits.

Hirose also said that the company will not consider a hike in electricity rates for the time being to increase earnings for the current fiscal year.

The rate hike was regarded as a key step to improving the company's financial standing, along with bringing an idled reactor online. But the TEPCO president did not completely rule out the possibility of raising electricity rates.

He cited fluctuations in currency markets and crude oil prices as well as the safety checks, which could take longer than the expected six months or so.

(This article was written by Takashi Ebuchi and Mari Fujisaki.)

* * *

Excerpts of the interview follow:

Question: Why did it take TEPCO nearly three months after its board decided to actually apply to make a request for safety checks of the Kashiwazaki-Kariwa nuclear power plant (by the Nuclear Regulation Authority)?

Answer: The board made the decision on July 2, and three days later we visited the Niigata prefectural government to gain understanding for our decision. But our move was described as “abrupt” or “disregard for local governments.” After experiencing the Fukushima nuclear disaster, we made a fresh start as a new TEPCO. But due to the accident, we had to get involved with people in Fukushima Prefecture more than the residents of Niigata Prefecture. To the eyes of the people in Niigata Prefecture, it was like TEPCO came out of nowhere just to push ahead with our application for a safety clearance. We should reflect on our actions.

But applying for a safety screening led to more communications with local governments (in Niigata Prefecture). We began briefings in Kashiwazaki and Kariwa (the two municipalities that host the plant). The three months we had to wait until actually filing the application, I believe, was time needed to gain understanding to our position.

Q: Many people are critical of TEPCO for taking steps toward restarting the nuclear power plant despite the fact the accident at the Fukushima No. 1 nuclear power plant has not been resolved yet, as was manifested by continuing leaks of contaminated water.

A: I truly believe that we should apply for safety checks. We should put in place safeguard measures such as the construction of a breakwater to prepare for possible quake and tsunami. Safety checks are meant to determine that our precautions are appropriate and we are not being self-complacent, by an expert third party. We will need to overhaul safeguard measures in line with the conclusion (of the NRA).

Q: Still, applying for safety inspections is a process based on the premise of restarting a nuclear reactor.

A: Restarting a reactor is not something for the immediate future. I am not going to deny that it is a step leading to restarts, but we don't know if the reactors can clear safety checks. Even if they can, it is not as if they will go online the next day. We cannot leave idled reactors as they are now. We want them to be examined for safety.

Q: TEPCO pledged to secure funding of 1 trillion yen over 10 years to deal with the contaminated water problem at the Fukushima No. 1 nuclear power plant. How are you going to make that happen amid your company's financial difficulties?

A: We have yet to come up with specific steps to achieve it in 10 years' time. Admittedly, it will be difficult to secure that amount of money through regular cost-cutting efforts alone. **We should whittle away investments as well.** We will consider cutting back piecemeal the proportion of our investments in such projects as natural gas ventures overseas as well as rebuilding thermal power plants.

Q: The government decided to inject 47 billion yen in public funds to cope with the problem of radioactive water. But some critics pointed out that a line has not been drawn to clarify the responsibility between the government and TEPCO. What is your view?

A: There is room for discussion on such issues as the establishment of an entity to make it easier for public funds to be injected. But TEPCO is the one that actually carries out the task of dealing with contaminated water. Even if the responsibility now comes under the banner of the government and TEPCO, it does not instantly stop the flow of contaminated water and make everyone happy. We also face challenges such as the cleanup and compensation for people who were affected by the nuclear disaster. We are continuing to cope with such difficult tasks because of our determination to take responsibility for the accident we caused.

Q: In addition to compensation for victims, costs for cleanup and decommissioning the reactors are ballooning. Are you going to seek assistance from the government in this regard?

A: It is utterly impossible for us to pay those costs. Considering the liberalization of the electricity market, we will not be able to compete with huge debts on our shoulders. The issue will be the focus of our discussion to review the restructuring plan.

Is TEPCO actually aware of its situation?

September 30, 2013

EDITORIAL: Cash-hungry TEPCO mixes up its priorities

<http://ajw.asahi.com/article/views/editorial/AJ201309300056>

The public is probably wondering if Tokyo Electric Power Co. is actually aware of the situation it is in.

TEPCO on Sept. 27 asked the Nuclear Regulation Authority to conduct safety screenings of the No. 6 and No. 7 reactors at the Kashiwazaki-Kariwa nuclear power plant in Niigata Prefecture to confirm they meet the NRA's new safety standards.

The screenings are a hurdle the utility must clear to bring its idled reactors back online.

Naomi Hirose, president of TEPCO, expressed his intention to prepare for the restart of other reactors at the plant as well.

TEPCO's move toward resuming reactor operations is totally unacceptable.

The utility runs the Fukushima No. 1 nuclear power plant, which has been crippled by an accident that is far from over. TEPCO should be focusing all of its efforts on the Fukushima disaster, including the new challenge of dealing with contaminated water leaks.

Under the current circumstances, the company certainly cannot afford to send its staff members to another nuclear power plant.

TEPCO's push to restart its reactors is driven purely by financial reasons. If reactor operations are not resumed soon, the company's turnaround plan will collapse.

If the reactors remain offline, the company will likely end up posting a loss for fiscal 2013 for the third straight year due mainly to ballooning costs for fossil fuel used at its thermal power plants.

Another dismal financial performance by TEPCO could prompt financial institutions to stop lending to the embattled utility.

Even if TEPCO receives approval, it will take time before the reactors at the Kashiwazaki-Kariwa plant are actually restarted. The company apparently believes that as long as it takes steps toward the restarts, it will be able to secure loans.

In fact, starting the process for a resumption of reactor operations was included in TEPCO's rebuilding plan, which was drawn up last year with the government.

However, it is already obvious that the turnaround plan is untenable. It was drawn up on the premise that TEPCO would foot the bill for everything resulting from the nuclear accident, including compensation for victims, decontamination work and the decommissioning of the Fukushima reactors.

It is clear that the rebuilding plan should be reviewed. The utility must not hastily pursue reactor restarts.

One problem is the attitude of the Abe administration.

The government, a major shareholder of TEPCO, decided to take charge of the contaminated water issue at the plant. But there has been little progress in the debate over the management of TEPCO.

Overhauling TEPCO's revival plan may raise criticism from the public. If the plan is reconsidered, taxpayer money and an electricity rate hike will likely be required to shoulder the sum needed to settle issues related to the Fukushima accident that TEPCO cannot cover by itself.

The government is also preparing to raise the consumption tax rate in April. It is not difficult to feel that Abe and his aides would rather put the TEPCO question on the back burner to prevent the situation from marring his popular economic policy.

If that is the case, the government's announcement that it is taking over the battle against contaminated water leaks at the Fukushima plant lacks luster.

The Fukushima accident resulted from short-sighted economic calculations and a fixation on past practices that hindered information sharing and necessary safeguard measures.

In the end, promoting nuclear power itself became the primary objective.

The situation will be exacerbated if TEPCO and the government make the same mistake and stick to the hollow revival plan.

The grave lesson from the Fukushima accident is that the traditional culture surrounding nuclear energy must be remedied.

--The Asahi Shimbun, Sept. 28

South Korea calls Japan "immoral"

September 30, 2013

S.Korea fisheries minister calls Japan immoral

http://www3.nhk.or.jp/nhkworld/english/news/20130930_42.html

South Korea's fisheries minister has called Japan "immoral" because it allowed radioactive wastewater to leak into the sea from the Fukushima Daiichi plant without prior notification.

Yoon Jin-sook was speaking to reporters on Monday. She said Japan has the responsibility to inform her country and others, but let the contaminated water flow out freely. She called such behavior absurd.

The South Korean government has placed an import ban on all fishery products from Fukushima and 7 other Japanese prefectures.

Yoon said she doubted whether the South Korean government had to care about such immoral people under diplomatic protocols, so she promptly ordered the import ban.

Yoon's remark comes as South Korean fishermen are in a tight spot. **Consumers are becoming increasingly concerned about the safety of fishery products as a whole, not just those from Japan.**

The Diet will need explanations

September 30, 2013

Editorial: Abe must elaborate on Fukushima's water contamination

<http://mainichi.jp/english/english/perspectives/news/20130930p2a00m0na008000c.html>

The House of Representatives Committee on Economy, Trade and Industry has finally begun to examine Tokyo Electric Power Co. (TEPCO) and the government's response to radioactively contaminated water accumulating at the utility's tsunami-hit Fukushima No. 1 Nuclear Power Plant. Yet the Diet is not in session now, and the move comes too late.

The Diet has neglected to deal with the problem since the House of Councillors election in July, and the ruling and opposition parties are still battling a sterile tug-of-war over the timing of an extraordinary session of the Diet.

Lawmakers need to supply an avenue for Prime Minister Shinzo Abe to provide an explanation on the issue as soon as possible.

On Sept. 27, legislators including Sumio Mabuchi of the Democratic Party of Japan (DPJ), who dealt with the contaminated water issue as an adviser to the prime minister when the DPJ was in power, posed questions to TEPCO President Naomi Hirose.

Mabuchi explained that the DPJ-led government had planned to announce in June 2011 that it would create underground walls made of clay around the crippled reactors to prevent water from leaking outside. But he admitted that the DPJ-led government abandoned the plan after TEPCO expressed concerns that such a measure would raise speculation in markets that the utility faced a capital deficit. Hirose officially admitted that the company had worked out the basic specifications for such walls.

Mabuchi told legislators in a panel that a DPJ probe on the construction of water-shielding underground walls was shelved after he stepped down from his post. He also provided details on the DPJ-led administration's response to the problem. The DPJ needs to go beyond grilling the government to clarify its own responsibility in dealing with the matter during its time in power.

The panel is scheduled to convene for a total of 30 days. However, the prime minister has not been given the opportunity to provide any explanations since it surfaced that problems involving radioactive water were far more serious than generally believed.

In his 2020 Olympic bid speech at a general meeting of the International Olympic Committee in Buenos Aires, Abe stressed that the situation regarding radioactive water at the Fukushima plant was "under control." However, a senior TEPCO official later said he did not think the situation was under control. On Sept. 27, Hirose told the Diet that he completely agreed with the prime minister over the matter. The prime minister must explain his understanding of the situation to the Diet and elaborate on how to deal with the problem from a long-term perspective.

Prime Minister Abe's remark that contaminated water was completely blocked from exiting a 0.3 square kilometer area in the bay near the nuclear power station has also sparked wide controversy. The government has explained it hasn't seen any increases in levels of radioactive cesium during its monitoring of seawater around the power plant, yet one cannot help but wonder what the prime minister meant by saying the effects of radioactively tainted water were "completely blocked."

Opposition parties have gathered signatures from 92 legislators to demand that the Diet be convened at an early date. The Constitution stipulates that the Cabinet must convene a Diet session if requested by at least a quarter of all of legislators in either chamber. However, the supreme law stops short of providing for the timing of convening a session, and the ruling coalition appears to have no intention of bringing forward the start of a planned extraordinary session from Oct. 15.

There is no guarantee that current measures to block radioactive water from leaking from the crippled power plant will always work properly -- as highlighted by the temporary halt of an advanced liquid processing system (ALPS) due to technical problems. The possibility that an unforeseen accident will occur cannot be ruled out. The government has drawn up additional countermeasures against contaminated water while taking potential risks into account, but no one knows whether these measures are feasible.

Since the government is now playing a leading role in countermeasures against radioactive water accumulating at the nuclear plant, the prime minister should provide a specific explanation at the Diet of how to deal with the matter.

Is the NRA up to the job?

October 1, 2013

Nuclear regulator criticized for 'red tape' job

http://www3.nhk.or.jp/nhkworld/english/news/20131001_12.html

Japan's nuclear regulator is coming under fire from intellectuals. They're being criticized for bureaucratic behavior.

The Nuclear Regulation Authority fielded comments on Monday from 6 experts who are studying the crisis in Fukushima. The discussion was a review of the NRA's first year of operation.

Shuya Nomura is a lawyer who served on a Diet panel that investigated the accident at the Fukushima Daiichi nuclear plant.

Nomura criticized the NRA for its handling of the radioactive water leaks. He said NRA members should go to the plant, instead of demanding explanations from its operator's executives.

Journalist Yoichi Funabashi said **drafting rules and standards isn't enough to win public trust**. He described the plant as a battleground and urged regulators to take a more proactive stance in dealing with the crisis.

Others pressed for reforms at the NRA Secretariat. It's staffed mostly by personnel from the previous regulator which was under a government umbrella that promoted nuclear power.

NRA chief Shunichi Tanaka said he feels the organization has been given a mandate that's bigger than its capacity, but that members will try to improve.

Japan should work with the international community, says IAEA

October 1, 2013

FUKUSHIMA WATER CRISIS: Japan should request international collaboration, IAEA chief says

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201310010075>

By TAKASHI KIDA/ Correspondent

VIENNA--Japan should stop working alone and seek international collaboration in dealing with the problem of radiation-contaminated water at the Fukushima No. 1 nuclear plant, Yukiya Amano, director-general of the International Atomic Energy Agency, said.

In an interview with The Asahi Shimbun, Amano said his agency was prepared to include an expert on marine pollution in the review team that is scheduled to be sent to Japan in autumn.

He also said **other experts around the world can help alleviate the crisis at the Fukushima site; they're just waiting for a request from Japan.**

A former Foreign Ministry official, Amano, 66, was reappointed to his post at the September IAEA general conference.

Excerpts of the interview follow.

Question: The problem of radiation-contaminated water at the Fukushima No. 1 nuclear power plant arose despite a warning by the IAEA review team dispatched in April about the importance of implementing measures. How do you view the situation?

Amano: While the objective of that review team was decommissioning the reactors in general, it also touched upon the importance of dealing with the contaminated water problem and recommended that Tokyo Electric Power Co. compile an overall plan.

I believe the (water) accident occurred while consideration was being given toward such a plan after the Japanese side accepted the recommendation.

Q: What would be the purpose of sending a second review team in autumn?

A: In addition to technical matters in dealing with the contaminated water, other important issues include strengthening monitoring, making efforts to minimize the effects should a leak occur and communicating with local residents.

We want to provide advice (to Japan) from an overall perspective so it can put together comprehensive measures.

During the September general conference, I spoke about the importance of maritime monitoring with (Ichita) Yamamoto, state minister in charge of science and technology, and (Shunichi) Tanaka, chairman of the Nuclear Regulation Authority, who attended the conference.

Q: But isn't Japan already conducting marine monitoring?

A: There are different ways to conduct monitoring, including the selection of test locations and depths. However, if the methods are inconsistent, it will be impossible to compare data. There is a need to conduct monitoring in line with international standards.

Because there is also the problem of negative publicity, it is insufficient for Japan to only say we conducted monitoring and will inform the world about the results.

I believe **it is important to work together with international agencies from the planning stage and in accordance with international standards, and to also involve the international community in the transmission of information.**

The style of the review team is to exchange views with IAEA specialists, international specialists and Japanese specialists in order to learn from each other. The IAEA's Environment Laboratories in Monaco has long experience working on the marine environment as well as an extensive network with various nations. If Japan should make a request, we could include researchers from that lab (to the next research team).

Q: During the general conference, you made the evaluation that the Japanese government's response had made an important step forward. Why was such an appraisal made?

A: It was an important first step for the government to announce its policy that the contaminated water problem was a very important one. But, I also believe there are still many details that must be worked out in the specific measures to be implemented.

Q: How do you view the criticism among experts of various nations who believe that measures were not implemented even though the importance of the contaminated water problem was known immediately after the nuclear accident two and a half years ago?

A: Other nations have two general attitudes toward the Fukushima nuclear accident. One is of wanting to cooperate while the other is dissatisfaction at the insufficient response to proposals for cooperation.

Rather than simply have Japan inform the world about what it is doing, it should take the position of wanting to work together with the international community and transmitting information along with the international community.

Japan's "irresponsible" attitude

October 1, 2013

S. Korean minister accuses 'irresponsible' Japan of hiding radioactive water leaks

http://ajw.asahi.com/article/asia/korean_peninsula/AJ201310010059

By AKIHIKO KAISE/ Correspondent

SEOUL--South Korea's fisheries minister Sept. 30 hurled criticism and insults at Japan, saying its secrecy behind the radioactive water leaks from the Fukushima No. 1 nuclear plant is "irresponsible."

"Although Japan has the responsibility to immediately make all information available (to neighboring countries when such accidents occur), it chose to discharge (radioactive materials) into the sea without informing us," Yoon Jin-sook, minister of oceans and fisheries, said at a gathering of South Korean reporters.

Special Diet session to discuss water crisis

October 1

October 1, 2013

Responsibilities in tackling tainted water at Fukushima plant under scrutiny

<http://mainichi.jp/english/english/newsselect/news/20131001p2a00m0na016000c.html>

A special Diet session was convened on Sept. 30 to discuss how to deal with contaminated water accumulating at the crippled Fukushima No. 1 Nuclear Power Plant, but it remains unclear which party -- the government or Tokyo Electric Power Co. (TEPCO) -- should take the lead in tackling the difficult problem.

The special session, convened while the Diet was out of session, focused on the roles to be played by the government and TEPCO in handling radioactively tainted water at the Fukushima nuclear complex, as the government earlier said it would "come to the fore" to deal with the problem. However, Economy, Trade and Industry Minister Toshimitsu Motegi, who attended the special session for the first time, reiterated the government's conventional stance, saying, among other things, that TEPCO should bear "primary responsibility" for the problem.

The level of technical difficulty serving as the basis for the government's coverage of a project to deal with the contaminated water remained unclear, obscuring where the overall responsibility for the Fukushima nuclear crisis lies.

The government decided last month to use about 47 billion yen to tackle the radioactive water, vowing to finance measures involving technical challenges such as a plan to freeze the soil around reactor buildings to stop groundwater from seeping in and becoming contaminated. Motegi commented during the special Diet session, "We want TEPCO as the key entity which built the reactors itself to fulfill the primary

responsibility in executing (the project)," while adding that the government would take responsibility in the removal of radioactive substances in areas requiring high levels of technical ability.

On the various levels of technical difficulty serving as criteria for government action, Motegi said, "If we were to classify one thing or other as difficult, we could say everything is difficult. The current handling of the accident, decommissioning of reactors and taking measures against contaminated water -- these are unprecedented tasks, and TEPCO, the installer of the reactors, is carrying them out." On measures to deal with potential risks involved in the operation, Motegi only said, "We would like to sort out what should be done by TEPCO and the government."

On a plan to install an impermeable wall to prevent groundwater from seeping into the reactor buildings, Sumio Mabuchi, former assistant to the prime minister from the main opposition Democratic Party of Japan, proposed to take an emergency step to install steel sheet piles. In his response, Motegi said, "We want to unwaveringly consider measures including what you proposed."

Prime Minister Shinzo Abe told an International Olympic Committee general meeting in September that the situation at the Fukushima nuclear power plant was "under control" and that the "influence of the contaminated water is completely blocked within the 0.3-square-kilometer area of the plant's bay." On Abe's remarks, Motegi said, "The prime minister commented responsibly on the current situation. It is precisely under control." However, Nuclear Regulation Authority Chairman Shunichi Tanaka stated, "It is difficult to scientifically define whether it is under control or not. We will do our best to prevent it from affecting the environment."

Motegi ruled out the possibility of liquidating TEPCO, saying, "If the Corporate Reorganization Act is applied, its utility bonds will be prioritized for redemption. There is a possibility that damages as well as receivables held by subcontractors operating on the spot (at the crippled nuclear power plant) will not be paid."

What is behind Koizumi's stand on nuclear power?

October 2, 2013

Koizumi's call for nuclear-free Japan raises speculation about his intent

http://ajw.asahi.com/article/behind_news/politics/AJ201310020073

By TSUYOSHI SUZUKI/ ASAHI SHIMBUN WEEKLY AERA

Junichiro Koizumi's huge popularity as prime minister stemmed from views that he was a straight talker unafraid to carry out his policies, even if they created potentially dangerous political enemies.

Despite defections from the Liberal Democratic Party and the rise of "rebels" against him, Koizumi pushed through postal privatization and led the LDP to a sweeping victory in the 2005 Lower House election.

Now, the retired politician has returned to the spotlight by railing against nuclear power and urging Prime Minister Shinzo Abe to move Japan away from its reliance on atomic energy.

Some political sources say Koizumi is simply expressing his true feelings about nuclear power. But others point to a political motive behind this anti-nuclear stance. They say Koizumi may be trying to protect, albeit indirectly, the Abe administration and even the party he once famously vowed to "destroy."

Abe, who was groomed to be prime minister during the days of the Koizumi administration, appears to be listening.

Koizumi, who was prime minister from 2001 to 2006, stunned an audience on Sept. 24 during a forum in Tokyo's Roppongi Hills commercial complex commemorating the 50th anniversary of the publication of the business magazine *President*.

"Since retiring (from politics), I have had more opportunities recently to speak with business leaders rather than Diet members. During such discussions, I often hear comments that Japan cannot grow without any nuclear power plants or that calling for zero nuclear power plants is irresponsible," Koizumi, 71, said in a speech. "However, I studied what experts have said until now about nuclear energy being safe, clean and inexpensive, and I harbored doubts.

"I wonder if human beings can really control nuclear energy. I have now become an advocate calling for zero nuclear plants and urge politicians to make that decision as quickly as possible."

A major catalyst for Koizumi's no-nuclear power stance was a visit to Finland in August, a trip he decided to make after watching a TV documentary immediately after the 2011 Great East Japan Earthquake and tsunami triggered the Fukushima nuclear crisis.

The TV program featured various issues related to the final repository in Finland for spent nuclear fuel that would be durable for 100,000 years, the first such facility in the world.

Koizumi began doubting the argument that nuclear energy was safe and inexpensive after learning about the very long time period.

The main objective of his Finland trip was to inspect the Onkalo spent fuel repository, a facility designed to completely seal off highly radioactive waste by digging 400 meters deep into the foundation.

The radioactive materials would become harmless over 100,000 years.

However, it is unclear if the facility can actually withstand such a long passage of time. There is also the question of how to inform people in the distant future about the dangers that lie within the facility.

After listening to the explanation given by experts at the facility site, Koizumi said he became more convinced that Japan should move away from nuclear power generation.

“One cannot fathom a time 100,000 years in the future. Can such a facility ever be built in Japan? I thought it would be impossible,” Koizumi said in his Sept. 24 forum speech. “The first reason why I thought it would be better to have zero nuclear plants is because there is no final repository in Japan. Some people may say it is irresponsible to call for zero nuclear plants, but I think it is even more irresponsible not to have a disposal site for the waste or even any prospect of constructing such a facility.”

The former prime minister also said that Japan, unlike Finland, is frequently hit by earthquakes and tsunami. He said the dangers of natural disasters in Japan fueled his concerns about the nation’s dependence on nuclear energy.

“The Japanese have never knuckled under to natural disasters but have always overcome them to further develop the nation. We are now at a major turning point for creating a recyclable society through energy sources based on natural resources. Opportunity lies in a pinch. That is how we should be looking at the situation,” he said.

A source in the political world who is close to Koizumi said his anti-nuclear stance is not something new.

“During private conversations, Koizumi has for a long time called for a radical move toward no nuclear plants. The Onkalo visit strengthened that conviction,” the source said. “The engineers from nuclear plant manufacturers who accompanied him on the trip initially thought they could convince him with their views. However, after returning to Japan, Koizumi said, ‘I strongly argued for the need to move away from nuclear energy.’”

Although the Finland visit may have been important, Koizumi had indeed made comments about moving away from nuclear energy from shortly after the March 2011 disaster.

In a speech in May 2011, Koizumi called for reducing the nation's dependence on nuclear energy, saying, "It was wrong for Japan to have spoken up after placing its trust in the safety of nuclear plants."

Last December, Koizumi, speaking on behalf of an LDP candidate before the Lower House election, said, "Efforts should be made to reduce the number of nuclear plants to zero as much as possible."

But it was a column that appeared in the Aug. 26 edition of the Mainichi Shimbun that sent shock waves through the political world.

In responding to a senior staff writer, Koizumi said: "If I were to return to being an active politician, I would not have the confidence to convince undecided Diet members about the necessity of nuclear energy. After making various observations, I feel I would be able to convince lawmakers to move in the direction of zero nuclear plants."

Koizumi continued: "Unless the decision is made now to have zero nuclear plants, it will become more difficult to move toward zero nuclear plants in the future. All the opposition parties now favor zero nuclear plants. This could be done as long as the prime minister made the decision."

Although four years have passed since he retired from politics, Koizumi maintains high popularity and his comments still have influence.

The source close to Koizumi said: "His comments against nuclear energy are likely due to dissatisfaction at the Abe administration. I believe he wants to strongly lodge a protest against the sharp turn by the administration toward resuming operations at nuclear plants."

Those in the Abe administration are trying to determine Koizumi's motives.

"After the Mainichi Shimbun column appeared, we were paying attention to whether others would follow in his footsteps, including his son, Shinjiro, a Lower House member," a source close to the Cabinet Intelligence and Research Office said. "He does, after all, have an outstanding sense for how the political world operates."

There are signs that Abe was the one who responded most aggressively to the comments made by Koizumi.

The Abe administration has been pushing for the restarts of nuclear reactors that were shut down after the meltdowns at the Fukushima No. 1 nuclear power plant. The prime minister also declared the Fukushima nuclear accident was “under control” at a meeting of the International Olympic Committee in Buenos Aires last month.

But after the IOC awarded Tokyo the 2020 Summer Games, Abe told a news conference on Sept. 7: “We will lower the ratio of nuclear energy. Over the course of about three years, we will make every effort to accelerate the spread of renewable energy sources and promote energy conservation.”

Abe did refer to renewable energy and energy conservation as key issues in his policy address at the Diet in February. But his statements at the news conference about resuming operations at nuclear plants were substantially toned down from his earlier remarks.

An LDP source said: “Koizumi is making those comments while being very aware of their effects. However, rather than trip up Abe, I believe he is only trying to restrain the Abe administration that is moving in the direction (of resuming nuclear plant operations).

“The message Koizumi is sending is that moving too strongly in that direction could hurt the administration, even though it may have high support ratings now. The comments by Koizumi can also serve as a coastal levee of sorts for Abe who faces pressure from lawmakers with close ties to the electric power industry. I believe Abe understands what is happening.”

In any event, Koizumi is not backing away from his no-nukes stance.

“If the government and LDP now came out with a policy of zero nuclear plants, the nation could come together in the creation of a recyclable society unseen in the world,” he said in a speech in Nagoya on Oct. 1. “A large majority of the population now understands that nuclear energy is the most expensive form of power generation.”

TEPCO still paying pro-nuclear Rokkasho

October 4, 2013

As Fukushima compensation stalls, TEPCO continues to pay pro-nuclear village

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201310040060>

By SATOSHI OTANI/ Staff Writer

Tokyo Electric Power Co. “donated” tens of millions of yen to a pro-nuclear village government in August despite promising to abolish such payouts to accelerate compensation for victims of the Fukushima nuclear disaster.

TEPCO, operator of the crippled Fukushima No. 1 nuclear plant, and Tohoku Electric Power Co. paid a combined 200 million yen (\$2 million) to Rokkasho, Aomori Prefecture, which hosts facilities related to spent nuclear fuel reprocessing, sources said.

The two regional utilities have raised electricity rates, citing financial difficulties due to the accident at the Fukushima No. 1 plant. The government has also decided to use taxpayer money to deal with the radioactive water problem that TEPCO seems unable to control at the plant.

TEPCO said the payment to Rokkasho was based on a promise made before the Great East Japan Earthquake and tsunami caused the meltdowns at the Fukushima No. 1 plant in March 2011.

“The payment is associated with construction of a nuclear plant, and we believe it is different from a donation,” a TEPCO official said. “But we will refrain from commenting on a specific case.”

The industry ministry, however, said the payment to Rokkasho is “close to a donation.”

Masaru Kaneko, a professor of public finance at Keio University, said the government should do something to end such actions by TEPCO, which has been effectively brought under state control.

“The provision of this sort of money is abnormal, given that compensation for nuclear disaster victims and containment of contaminated water have stalled and that further hikes in electricity rates have been mentioned,” Kaneko said.

The payment to the village has been made since fiscal 2010 in the name of promoting fisheries business around Higashidori, a village north of Rokkasho, where TEPCO is planning to build a nuclear plant and Tohoku Electric already operates another.

The two companies agreed to pay 200 million yen annually for five years. TEPCO and Tohoku Electric paid 133.4 million yen and 66.6 million yen, respectively, until fiscal 2012.

In May 2012, when the government decided to inject taxpayer money into TEPCO, the utility said it would stop making donations to local governments.

According to documents obtained by The Asahi Shimbun and sources in the Rokkasho village government, this year's payment was initially expected around May or June.

TEPCO, citing financial difficulties, proposed an installment plan. Eventually, TEPCO and Tohoku Electric completed payments on Aug. 30 and Aug. 26, respectively. The breakdown was the same as in past years.

When TEPCO applied to increase its electricity rates in 2012, the company included the payment to Rokkasho--as part of construction expenses for the Higashidori nuclear plant--into power generation and other costs used as a basis for calculating the rates.

However, the industry ministry refused to include the payment in such costs, saying "it is not essential to supply electricity and is, therefore, close to a donation."

The ministry noted that compensation was separately paid to fishermen over the construction of the Higashidori plant.

Rokkasho officials said they spend the money from the utilities on squid-fishing boats and farms for kelp and sea urchins.

A Rokkasho official in charge of agricultural, forestry and fisheries business said the village expects to receive the payment next year, too.

"We know that TEPCO and Tohoku Electric are in difficult times, but village programs are planned based on the assumption that the payment will be made," the official said.

Tohoku Electric began operating a reactor at its Higashidori nuclear power plant in 2005, and TEPCO began building one at its plant in January 2011. The two companies each plan to build an additional reactor.

Tohoku Electric said the company is shouldering its fair share of the expenses for fisheries industry promotion in line with a pre-quake promise, adding that it is necessary to continue to make the payment.

TEPCO, Tohoku Electric continue donations to village building nuke fuel processing plant

<http://mainichi.jp/english/english/newsselect/news/20131004p2a00m0na008000c.html>

Tokyo Electric Power Co. (TEPCO) and Tohoku Electric Power Co. have continued to extend donations to the Aomori Prefecture village of Rokkasho, where a nuclear fuel reprocessing plant is under construction, even after the Fukushima nuclear accident, it has been learned.

This is despite the fact that electricity charges have been raised because the utilities have to rely more on thermal power stations and that the national government has provided a massive amount of taxpayers' money to finance countermeasures against radioactive water accumulating at the Fukushima plant.

TEPCO and Tohoku Electric donated 133.4 million yen and 66.6 million yen, respectively, to Rokkasho in August this year as funds to help vitalize the local fishing industry, according to the municipal government.

The two companies contributed the same amount to the village in 2011 and 2012 following the outbreak of the nuclear disaster in March 2011. The municipal government is set to also demand donations from the two companies next fiscal year.

The donations are based on a 2009 agreement signed prior to the outbreak of the disaster, under which the two utilities would extend donations to the village over a five-year period from fiscal 2010. The village is supposed to use the money to provide subsidies to a local fisheries cooperative to help its members build and improve facilities to farm fish and maintain fishing boats.

The utilities are supposed to extend the donations to the village in May, but provided the funds in August this year after cash-strapped TEPCO asked for a delay.

TEPCO announced in May 2012 that it would discontinue any donations. The utility denies that the funds provided to the Rokkasho Municipal Government are donations, explaining that the money comes from funds set aside to build a nuclear power station in the neighboring village of Higashidori. The official denied that the cost is added to electricity charges.

Utilities still paying village for planned reactors

Kyodo

http://www.japantimes.co.jp/news/2013/10/04/national/utilities-still-paying-village-for-planned-reactors/#.Uk7pFIM0_9k

Tokyo Electric Power Co. and Tohoku Electric Power Co. are continuing to make payments to the municipal government in Rokkasho, Aomori Prefecture, over plans to build additional nuclear reactors in a nearby village, the municipal office said Friday.

Rokkasho, located south of the village of Higashidori on the Pacific coast, received ¥133.4 million from Tepco for fiscal 2013 on Aug. 30 and ¥66.6 million from Tohoku Electric on Aug. 26, the office said.

Tepco, which has received government funding to deal with the radioactive water leaks at the Fukushima No. 1 power plant, says its payments to Rokkasho are not included in its costs for power generation, which form the basis for its electricity rates.

Tepco plans to build two reactors in Higashidori, while Tohoku Electric, which already has one reactor in the village, plans to build another. The two utilities began making payments to Rokkasho, itself home to nuclear fuel-recycling facilities, in fiscal 2010 to back the local fishing industry.

Rokkasho has used the funds to assist the purchase of squid-fishing vessels and gear, and improving fishing grounds. The village hopes the utilities will continue with the payments in line with a promise made before the 2011 Fukushima disaster, a municipal official said.

Tepco started to construct a 1.38 million kw reactor in Higashidori in January 2011, but work was suspended after the Fukushima crisis started. The utility plans to continue with construction and build an additional reactor there.

In 2005, Tohoku Electric began running its Higashidori plant with a 1.10 million kw reactor on land adjacent to Tepco's and plans to build another reactor, but the existing reactor remains shut down along with all other reactors in Japan.

NRA orders TEPCO to fix mess

October 4, 2013

NRA to Tepco: Fix water mess, even add workers

Kyodo

http://www.japantimes.co.jp/news/2013/10/04/national/nra-to-tepco-fix-water-mess-even-add-workers/#.Uk7paFM0_9k

The Nuclear Regulation Authority on Friday ordered Tokyo Electric Power Co. to bring under control the massive amount of radioactive water gushing from the Fukushima No. 1 nuclear complex, including by boosting worker numbers on-site.

Summoning Tepco President Naomi Hirose after a series of recent spills at the crippled power plant, Katsuhiko Ikeda, head of the NRA secretariat, tore into the utility for “rudimentary mistakes” that caused the toxic water problem and said its management in the field was “significantly deteriorating.”

“I want you to implement on-site management appropriately even if it requires bringing workers from Tepco’s other nuclear power plants,” Ikeda warned Hirose.

With concerns growing over the toxic water problem at Fukushima No. 1, Ikeda also urged Tepco to report whether it can ensure the safety of its Kashiwazaki-Kariwa atomic plant in Niigata Prefecture, two of whose seven reactors the utility seeks to restart.

Hirose, in turn, said he will “devote all the company’s resources” to managing the toxic water problem. Tepco will also undertake all necessary procedures for restarting reactors 6 and 7 at Kashiwazaki-Kariwa, he told reporters afterward.

Later Friday, Ikeda said he expects Tepco to submit a report on how it plans to deal with the water fiasco in about a week.

Radioactive water continues to build daily at Fukushima No. 1 because groundwater is seeping into the reactor buildings and mixing with water being used to cool the three crippled reactors. Contaminated water is stored in around 1,000 tanks at the complex, and Tepco is struggling to plug leaks.

On Thursday, Tepco said some 430 liters of radioactive water had poured out of one tank the day before, and some of it flowed into the Pacific. The leak was caused when workers tried to inject water into the tank, which was nearly at full capacity. The tank was not equipped with a water-level indicator and had not been set up on level ground, issues Tepco was fully aware of.

ALPS halted again

FUKUSHIMA

Kyodo

Tokyo Electric Power Co. said Friday it had to again suspend the water treatment system at the wrecked Fukushima No. 1 power plant after an alarm was triggered at 6:40 a.m.

No leakage of contaminated water has been detected so far, the utility reported.

Following a previous suspension Sept. 27, Tepco resumed operation Monday of the advanced liquid processing system (ALPS) after determining that a rubber sheet left in a nearby water tank had obstructed a drain outlet.

TEPCO urged to prevent contaminated water leaks

http://www3.nhk.or.jp/nhkworld/english/news/20131004_27.html

The Secretariat of Japan's Nuclear Regulation Authority has criticized the president of Tokyo Electric Power Company for repeated errors that caused radioactive water to leak from the Fukushima Daiichi nuclear plant.

NRA Secretary-General Katsuhiko Ikeda summoned TEPCO President Naomi Hirose on Friday, and demanded that the utility immediately come up with plans to prevent such problems.

Ikeda said it is regrettable that the leakage was caused by human error. He said the company's on-site management is extremely poor.

Highly radioactive water was found to be overflowing from a storage tank at the plant on Wednesday. Workers had continued to pump water into the tank located on a slope.

Ikeda added that he wants TEPCO to send personnel from other power plants to help with the work at Fukushima Daiichi.

Ikeda also asked TEPCO to show whether safety measures are in place at the Kashiwazaki-Kariya nuclear plant in Niigata Prefecture.

The utility applied to the Nuclear Regulation Authority last month for the safety screening needed to restart 2 of the idle reactors at the Niigata plant.

Hirose apologized for the problems at Fukushima Daiichi, saying the company had recently changed its system for processing contaminated wastewater, and workers are not used to the new procedures. He said TEPCO will use all possible resources to deal with the problem.

Regulators order TEPCO to improve radioactive water management

<http://mainichi.jp/english/english/newsselect/news/20131004p2g00m0dm071000c.html>

TOKYO (Kyodo) -- Nuclear regulators on Friday ordered Tokyo Electric Power Co. to improve its management of a massive amount of radioactive water at its crippled Fukushima Daiichi nuclear complex without hesitating to deploy workers from other power plants.

Summoning TEPCO President Naomi Hirose following recent leaks at the Fukushima plant, Katsuhiko Ikeda, the head of the NRA secretariat, criticized the utility for "rudimentary mistakes" that resulted in the trouble and said its field management ability was "significantly deteriorating."

"I want you to implement on-site management appropriately even if it requires bringing a workforce from TEPCO's other power generation plants," Ikeda told Hirose.

With concerns growing over the situation at the Fukushima plant, Ikeda also urged the utility to report whether it can ensure the safety of the Kashiwazaki-Kariwa nuclear power station in Niigata Prefecture, which the company is seeking to restart.

Hirose said he will "devote all the company's resources" to managing the toxic water problem. The company will also undergo necessary procedures toward resuming two idled reactors at the Kashiwazaki-Kariwa plant, he told reporters.

Ikeda told reporters later that he expects TEPCO to submit a report on how it will deal with the issue in about a week.

Radioactive water is increasing daily at the Fukushima plant, hit by a huge earthquake and tsunami in March 2011, because groundwater is seeping into reactor buildings and mixing with water that is used to cool the three crippled reactors.

Such contaminated water is kept in about 1,000 tanks set up at the site, and TEPCO is struggling to prevent leaks from the storage tanks. The current typhoon season is adding to the difficulty because the utility also has to deal with rainwater that accumulates inside leak-protection barriers around the tanks.

On Thursday, the utility said about 430 liters of radioactive water leaked from one tank the previous day, and some of that water flowed into the Pacific Ocean.

The leak occurred because water spilled after workers tried to inject more water into the nearly full tank. The tank was not equipped with a water-level indicator and was set up on unlevel ground, which TEPCO was aware of.

Just before the incident, TEPCO also allowed 5 tons of tainted rainwater to overflow from another tank because a worker erroneously connected a hose to the tank.

The International Atomic Energy Agency, meanwhile, announced that it will send a team of experts on decontaminating areas affected by the nuclear crisis at the request of the Japanese government.

The mission, to take place between Oct. 14 and 21, is a follow-up to a previous mission conducted in October 2011.

The IAEA said that the 16-member team plans to submit a report on the last day of the mission summarizing its findings and advice to the Japanese government.

Abe promises again

October 4, 2013

Abe pledges to tackle radioactive water issue

http://www3.nhk.or.jp/nhkworld/english/news/20131004_37.html

Prime Minister Shinzo Abe says his government will do all it can to deal with the massive buildup of radioactive water at the disabled Fukushima nuclear plant.

Abe on Friday met Seiichiro Murakami, a lower house member of the main governing Liberal Democratic Party who heads a LDP panel on the Fukushima nuclear accident.

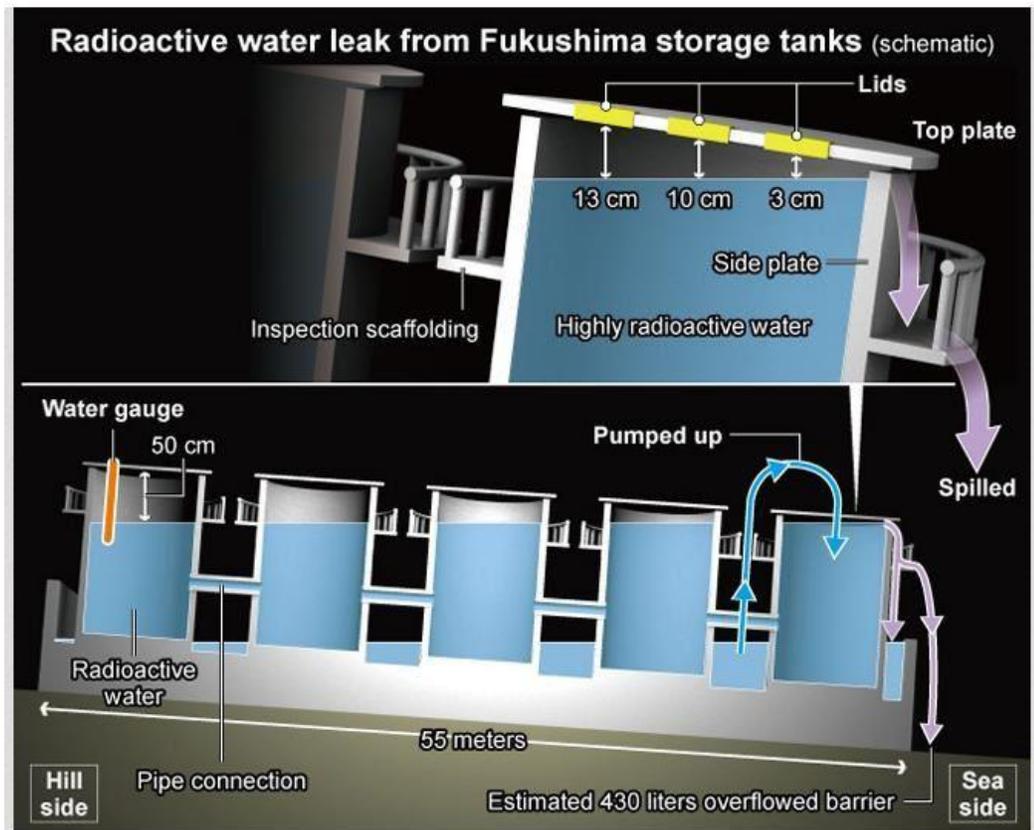

Murakami said uncovering the cause of the accident and containing the problem of contaminated water are pressing matters, as Japan reconsiders its energy policy.

Abe said the radioactive water issue will be a major topic of debate in the upcoming Diet session. He said the Abe administration will do all it can to tackle the problem.

A series of blunders

October 4, 2013

FUKUSHIMA WATER CRISIS: Combination of TEPCO errors led to latest radioactive water leak

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201310040068>

THE ASAHI SHIMBUN

Patience is wearing thin over Tokyo Electric Power Co.'s continuing series of blunders at the stricken Fukushima No. 1 nuclear plant, the latest one allowing more radioactive water to spill into the ocean.

Katsuhiko Ikeda, secretary-general of the Nuclear Regulation Authority, summoned TEPCO President Naomi Hirose on Oct. 4 and demanded a plan to deal with the contaminated water problem at the plant. Ikeda said effective measures must be taken, even if it involves bringing in personnel from TEPCO's other nuclear plants, including the one it plans to restart in Niigata Prefecture.

"Problems have been caused by basic mistakes," Ikeda said. "They will recur unless appropriate site control measures are taken."

Hirose said his utility will do its best to deal with the issue.

The Fukushima prefectural government on Oct. 3 asked Yoshiyuki Ishizaki, head of TEPCO's Fukushima Revitalization Headquarters, to ensure that no more radioactive water escapes from the hundreds of storage tanks at the site.

Ishizaki apologized and admitted to TEPCO errors in its assumptions and flaws in its control measures.

The latest leak of radioactive water into the ocean was caused by a combination of problems: an overpumping of rainwater into a storage tank due to a mistake in properly monitoring water levels, and an ill-arranged measure to ensure early discovery of radioactive water leaks.

The leak occurred on Oct. 2 as rainwater from an approaching typhoon threatened to fill and breach a barrier surrounding five storage tanks connected by pipes in the B-South area of the plant.

Workers decided to transfer the rainwater into the tanks, each with a capacity of 450 tons, until they were 98 percent full.

The ground where the five tanks sit is inclined toward the sea.

The only water gauge was mounted on the highest tank on the hill side.

The workers used that water gauge to monitor the water levels in the other lower tanks. It took them a while before they realized that water had reached the top of the tank at the lowest level on the sea side.

"We believed it was a narrowly safe level," Masayuki Ono, acting general manager of TEPCO's Nuclear Power and Plant Siting Division, told a news conference on Oct. 3.

They were wrong.

The water reached the top of the sea-side tank and spilled out as the rainwater continued to be pumped in.

TEPCO said it had never expected to fill the storage tanks near their capacity and thought it was safe to build such tanks as long as the ground incline did not exceed 1 percent.

The water in the tanks contained 580,000 becquerels of beta ray sources, such as radioactive strontium, per liter. The water pooling inside the barrier showed 200,000 becquerels per liter when TEPCO made the measurement on the afternoon of Oct. 2.

These figures indicate considerable amounts of radioactive water leaked from the tank into the interior of the barrier.

TEPCO officials said the leak may have started immediately after the pumping began and continued for up to 12 hours.

Radioactive water also dripped outside the barrier by way of scaffolding mounted on the tank. Part of that water likely entered a drainage ditch and flowed into the sea, TEPCO officials said.

Rainwater accumulated in the barrier because of a measure TEPCO took following the August discovery that 300 tons of highly radioactive water had leaked from a tank and breached a barrier in a separate area on the site. Some of that water eventually reached the ocean.

Until August, TEPCO workers kept the drainage valves on barriers permanently open to prevent rainwater from forming pools around tanks and making it difficult to immediately spot radioactive water leaks.

Because of that precaution, highly radioactive water that escaped the tank did leak unnoticed via drainage valves to the exterior of a barrier.

The NRA ordered TEPCO to keep the drainage valves shut and to pump water pooling inside barriers into the storage tanks.

But with the valves closed, TEPCO was forced to do something with the rainwater filling the barrier. The rainwater is supposed to be kept under control as potentially radioactive water.

TEPCO calculated that water would overflow barriers during a rainfall of 120 millimeters or more, a downpour that it believed occurs once or so a year, company officials explained.

When another typhoon approached on Sept. 15, water overflowed the barrier surrounding the B-South area--the site of the Oct. 2 leak. TEPCO workers collected 1,400 tons of water during that typhoon.

TEPCO hopes to check the radioactive levels of the rainwater once it has been transferred into temporary storage tanks, and release it into the sea if its levels are low. But the NRA has yet to approve that plan, citing flaws in TEPCO's measurement methods and standards for discharging waste into the environment.

The company said it plans to heighten the barriers to cope with the water situation, adding that the work will be completed at the end of this year.

TEPCO's Ishizaki told the prefectural government that the utility will install water gauges before the end of November on all storage tanks that are of the same type as the source of the latest leak.

Japan explains itself at WTO

October 5, 2013

Japan to explain contaminated water issue at WTO

http://www3.nhk.or.jp/nhkworld/english/news/20131005_11.html

Japanese government officials plan to take up the issue of leaks of contaminated water at the Fukushima Daiichi nuclear plant at the World Trade Organization. **They want to address the concern of South Korea over radioactive contamination of seawater around the plant.**

The South Korean government last month banned imports of marine products from 8 eastern Japanese prefectures, including Fukushima, citing consumer concern about radioactive contamination.

The Japanese government has called for lifting the blanket embargo swiftly. But earlier this week, South Korea's fisheries minister called Japan "immoral" because it allowed radioactive wastewater to leak into the sea from the crippled nuclear plant without prior notification.

This week, fish samples showing radioactive contamination exceeding the government standard were confirmed by the Japanese government in some waters off the coast of Fukushima and Ibaraki prefectures.

The officials want to convey Japan's position on the issue at a WTO panel meeting, scheduled to be held later this month.

Japan's delegates are expected to explain that Japanese marine products are approved for shipping after inspection based on strict standards.

The officials will also seek understanding from the international community for Japan's assertion that the South Korean embargo impedes its exports.

More foreign help needed, Abe says

October 6, 2013

Abe seeks more foreign help in containing Fukushima crisis

<http://mainichi.jp/english/english/newsselect/news/20131006p2g00m0fp020000c.html>

KYOTO (Kyodo) -- Prime Minister Shinzo Abe on Sunday sought more foreign assistance in containing the crisis at the crippled Fukushima Daiichi nuclear power plant, where decommissioning work that will go on for decades has been plagued by a series of contaminated water leaks.

"My country needs your knowledge and expertise" in coping with the aftermath of the nuclear accident triggered by the March 2011 earthquake and tsunami, Abe said in a speech in English at an international science conference hosted by the city and the prefecture of Kyoto.

"We are wide open to receive the most advanced knowledge from overseas to contain the problem," he said.

Abe also said the Japanese government plans to start hosting a separate annual forum on technologies to reduce greenhouse gas emission from next year.

The first such forum will be held on Oct. 7 and 8 next year in Tokyo.

Abe: Japan wants advice on water leaks

http://www3.nhk.or.jp/nhkworld/english/news/20131006_18.html

Prime Minister Shinzo Abe says Japan wants to obtain advanced knowledge from other countries for use in preventing leaks of contaminated water at the crippled Fukushima Daiichi nuclear plant.

Abe made the remark at the opening ceremony of the 10th annual meeting of the Science and Technology in Society forum in Kyoto on Sunday.

Abe called the Fukushima Daiichi accident a "bitter lesson". He called on participants at the forum to contribute in their most advanced knowledge for use in coping with problems at the plant, including radioactive water leaks.

The prime minister also referred to reducing emissions of greenhouse gases. He said Japan can contribute its carbon fiber technology to help achieve the goal of cutting the world's greenhouse gas emissions in half by 2050.

Carbon fibers are light and strong and can reduce the weight of cars and aircraft to save on gas.

More than 1,000 researchers and politicians from about 100 countries and regions are taking part in the 3-day conference.

Discussions focus on the theme "The Lights and Shadows of Science and Technology". Topics include climate change and energy issues.

Wonderful news...from TEPCO

October 7, 2013

TEPCO aims to eliminate human error

http://www3.nhk.or.jp/nhkworld/english/news/20131007_31.html

The president of Tokyo Electric Power Company says the utility will take steps to prevent problems caused by human error at its Fukushima Daiichi nuclear power plant.

Naomi Hirose was speaking before an Upper House panel on Monday. Industry minister Toshimitsu Motegi and Nuclear Regulation Authority Chairman Shunichi Tanaka were also in attendance.

Hirose acknowledged the need to improve the working environment at the plant following a series of problems caused by human error. He said workers should not be allowed to become exhausted and that his company plans to increase the workforce and open more employee lounges.

Tanaka touched on the utility's application for safety screenings for the idled Kashiwazaki-Kariwa nuclear plant in Niigata Prefecture.

He said regulators will carefully consider how to proceed with the screenings. He said the situation at Fukushima Daiichi has not been sufficiently stabilized to reassure the public about nuclear safety.

Tanaka added that the Authority is asking the utility for a report on safety management at Kashiwazaki-Kariwa by the end of the week.

Motegi expressed caution about the concept of liquidating Tokyo Electric Power Company.

He said that if the utility goes bankrupt under current laws, administrators would use its assets to pay institutional investors before compensating Fukushima residents or paying subcontractors at Fukushima

Daiichi.

He said that if this happens, efforts to deal with the massive amounts of contaminated wastewater would be delayed.

Motegi suggested that the government consider how to support the company by taking into account future energy policies and progress being made on compensation.

The panel was convened to discuss the massive wastewater problem at the plant while the Diet is not in session.

TEPCO's generous handouts

October 8, 2013

TEPCO paid 500 million yen to open Fukushima branch of Russian museum

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201310080064

THE ASAHI SHIMBUN

Lavish payments doled out by Tokyo Electric Power Co. to gain local support for nuclear power projects included 500 million yen (\$5 million) for an aborted attempt to open a branch of Russia's State Hermitage Museum, The Asahi Shimbun has learned.

The 500 million yen was paid during the 1990s for opening the facility by Lake Inawashiroko in Fukushima Prefecture, as a way to win local approval for adding the No. 7 and No. 8 reactors to the Fukushima No. 1 nuclear power plant, the sources said.

TEPCO failed to retrieve the payment, funded by the electricity rates paid by customers, even after the project went nowhere, sources said.

In 1994, TEPCO offered to build the J-Village soccer facility in Fukushima Prefecture at a cost of 13 billion yen when it approached the Fukushima prefectural government with plans to expand the Fukushima No. 1 plant.

"The museum project started after (then) President Hiroshi Araki showed enthusiasm for it," a senior TEPCO source said. "We donated 500 million yen (for the project)."

Isao Mizutani, former chairman of Mizutani Construction Co., said he took part in the project. He said Shiro Shirakawa, chairman of a security service provider, a senior TEPCO official who was in charge of plant site planning, and other individuals were also involved.

Mizutani, 68, said he temporarily paid 500 million yen on behalf of TEPCO as a construction deposit to the Russian museum.

“I paid (the money) because (the senior TEPCO official) said he would guarantee (repayment),” he told The Asahi Shimbun in Kuwana, Mie Prefecture. “He said (at the time) it would take some time before TEPCO could come up with the 500 million yen and that the advance payment was necessary.”

He said he did TEPCO a favor in hopes of winning contracts for the two reactors. The midsize general contractor had opened a branch in Fukushima Prefecture in 1993.

The expansion project came to naught after the Fukushima No. 1 plant was crippled by the 2011 Great East Japan Earthquake and tsunami.

Shirakawa, for his part, was known as “TEPCO’s ghost” for acting as a liaison with local communities for the utility’s nuclear plant affairs.

A preparatory office to organize the museum’s construction was set up in a building in Tokyo’s Minato Ward that houses Shirakawa’s company.

According to sources close to the Tokyo Regional Taxation Bureau, 500 million yen was paid by Mizutani Construction into the organization’s account and was later withdrawn.

Later, 500 million yen was paid by TEPCO into the same account and was transferred to Mizutani Construction’s account, the sources said.

A TEPCO spokesman said the company was “not aware of” the museum project or the donation.

In a statement, the State Hermitage Museum said the museum and Russia’s culture ministry have more than once discussed ways to cooperate with various Japanese organizations since the 1990s. However, it declined to discuss specific cases.

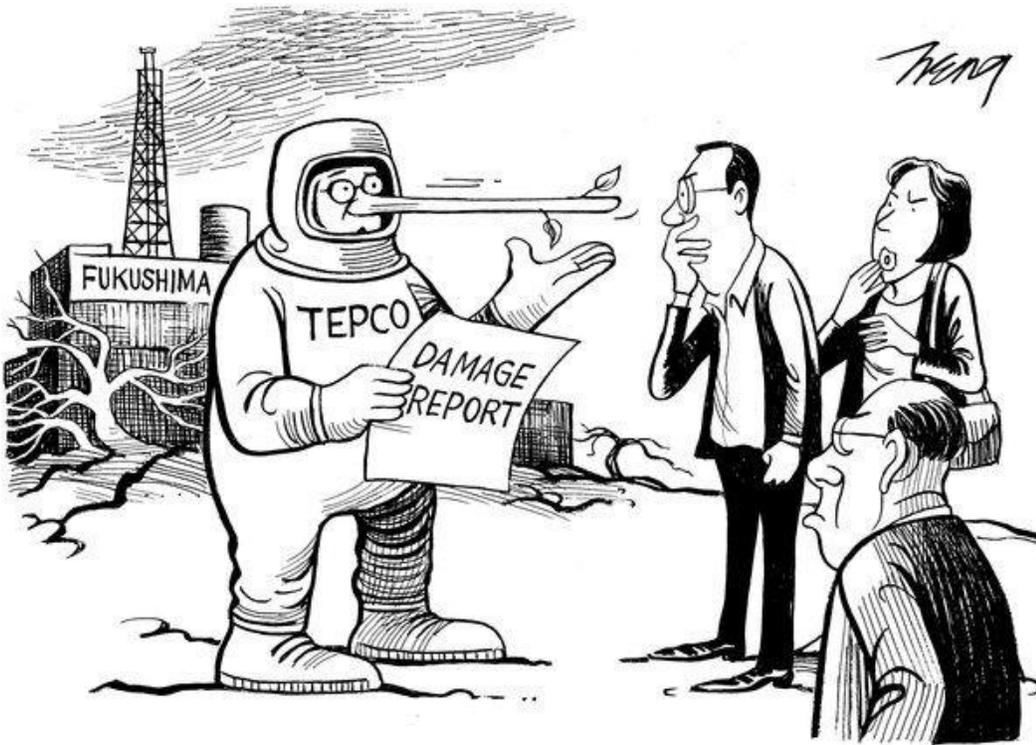

Mizutani Construction once amassed a large slush fund for winning public-works projects, according to prosecutors. The company allegedly paid 100 million yen off the books to a former aide of political heavyweight Ichiro Ozawa.

IAEA promises to help

October 9, 2013

Japan to work with IAEA on radioactive wastewater

http://www3.nhk.or.jp/nhkworld/english/news/20131009_41.html

Japan and the UN's nuclear watchdog have agreed to **work together to dispel global fears over radioactive wastewater** at the Fukushima Daiichi nuclear plant.

Japan's Economy, Trade and Industry Minister Toshimitsu Motegi met in Tokyo on Wednesday with International Atomic Energy Agency Director General Yukiya Amano.

Motegi stressed the **importance of highly reliable monitoring of radioactive substances in the wastewater, as well as quick public disclosure of accurate information.**

He sought help from the IAEA in these areas.

Amano said he believes the crippled plant is generally in stable condition, and promised to cooperate with Japan in monitoring the wastewater.

IAEA promises to help (2)

October 11, 2013

Japan and IAEA to jointly monitor seawater contamination off Fukushima plant

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201310110046>

THE ASAHI SHIMBUN

Japan and the International Atomic Energy Agency will jointly monitor waters off the crippled Fukushima No. 1 nuclear power plant to gauge radioactive contamination in the sea, a step aimed to bolster the credibility of checks in response to international concerns.

Shunichi Tanaka, chairman of the Nuclear Regulation Authority, and Yukiya Amano, director-general of the Vienna-based IAEA, met in Tokyo on Oct. 10 to affirm a policy of mutual cooperation in the monitoring of radiation levels in seawater off the plant and nearby areas.

Amano has been calling for checks that comply with international standards in terms of selecting observation sites and other criteria as well as releasing the results and relevant information to the global community.

Currently, the task is primarily conducted by Tokyo Electric Power Co., which owns and operates the plant, and the government's nuclear regulation agency.

The IAEA is expected to send a team of inspectors to Fukushima Prefecture in November to determine if the sites to sample seawater and the method to gauge pollution levels are appropriate.

Based on the outcome, officials with the NRA and the IAEA will discuss in detail how they can work together in monitoring and releasing information.

October 10, 2013

IAEA to vet Pacific radiation checks

Kyodo

http://www.japantimes.co.jp/news/2013/10/10/national/iaea-to-vet-pacific-radiation-checks/#.UlfqNIM0_9k

Experts from the International Atomic Energy Agency will arrive in Japan in late November to undertake joint radiation monitoring of the sea around the Fukushima No. 1 plant, the Nuclear Regulation Authority said Thursday.

The decision was conveyed during talks between the NRA's commissioners and visiting IAEA Director General Yukiya Amano in Tokyo. The U.N. watchdog's experts are expected to study the monitoring activities of domestic authorities and Tokyo Electric Power Co., an NRA official said.

Concerns remain among neighboring countries about the impact of radioactive materials that continue to spill from Fukushima No. 1, which suffered three core meltdowns from the quake-tsunami disaster in March 2011. Most recently, these fears have centered on the 300 of tons of contaminated groundwater spewing into the Pacific every day.

"Sea monitoring is very important. The IAEA will very much like to cooperate," Amano told NRA Chairman Shunichi Tanaka at the outset of the meeting.

The Vienna-based watchdog's participation is expected to help increase, somewhat, the credibility of data released by the Japanese government and Tepco about the nuclear disaster.

A massive amount of toxic water is stored in tanks at the No. 1 plant, but leaks have occurred repeatedly. The government earlier said radioactive contamination of the sea has only been observed within the facility's harbor, an area less than 0.3 sq. km.

October 9, 2013

IAEA to join Japan's regulator to monitor seawater

http://www3.nhk.or.jp/nhkworld/english/news/20131010_37.html

The International Atomic Energy Agency is to join Japan's nuclear regulator in monitoring radioactivity in seawater near the Fukushima Daiichi nuclear plant.

IAEA Director-General Yukiya Amano offered to cooperate when he met Japan's Nuclear Regulation Authority chief Shunichi Tanaka on Thursday.

Tanaka accepted, saying that working together would help alleviate concerns among neighboring countries.

Seawater monitoring by the authority has shown that radioactivity levels in most examined sea areas are under detection limits.

But concerns about seawater contamination have been growing at home and abroad because of a series of radioactive water leaks at the plant.

South Korea recently banned imports of marine products from Fukushima Prefecture and elsewhere in Japan.

IAEA officials say figures obtained and released by Japan alone would not convince international society that the country's seafood is safe.

The IAEA plans to send a team of specialists to Japan in mid-November to study how to carry out joint monitoring.

LDP on splitting TEPCO

October 9, 2013

INTERVIEW: LDP's Oshima says TEPCO breakup an option

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201310090079>

REUTERS

The ruling Liberal Democratic Party will make proposals this month on how to handle the embattled operator of the crippled Fukushima nuclear plant, including the possible break-up of the giant utility, a senior party policymaker said on Oct. 9.

Tadamori Oshima, head of LDP's task force on reconstruction after the 2011 earthquake and tsunami that wrecked the reactors at the Fukushima plant, told Reuters the government needs to do more in dealing with floods of contaminated water at the plant and decommissioning the facility.

He declined to express a clear opinion on the controversial question of whether to break up Tokyo Electric Power Co., but said: "It's time for us to make a decision, not in order to save TEPCO, but to pave the way toward reconstruction."

The current set-up is not working, Oshima said in an interview, as progress is hindered by TEPCO remaining in charge of all the work.

TEPCO has lost \$27 billion since the disaster at its Fukushima No. 1 nuclear plant and faces massive liabilities as it decommissions the facility, compensates tens of thousands of evacuees and pays for decontamination of an area nearly the size of Connecticut.

Prime Minister Shinzo Abe has promised that the government would take primary responsibility for containing the contaminated water at Fukushima, telling the world the "situation is under control."

At the Fukushima plant, some 800 tons of groundwater flow into the basements of the wrecked reactor buildings every day, mixing with highly radioactive water used to cool melted fuel rods.

After months of denials, TEPCO in July admitted contaminated water was flowing into the nearby Pacific Ocean.

It also since found that 300 tons of highly radioactive water had leaked from one of hundreds of hastily-built storage tanks.

Last week, TEPCO said another 430 liters of water overflowed from another tank.

In the latest mishap, six Fukushima workers were exposed to a leak of highly radioactive water after one of them mistakenly detached a pipe.

HEATED DEBATE

The government effectively nationalized TEPCO last year with a taxpayer-funded rescue.

But there is heated debate over direct government involvement in the company and whether to split it up, such as by spinning off the Fukushima clean-up and letting the remainder of TEPCO focus on its traditional business of generating electricity for millions of homes and businesses in the Tokyo area.

Oshima, a former LDP vice president, reportedly last month proposed breaking off the function of decommissioning the wrecked Fukushima plant--a process that is expected to take at least 30 years and cost more than \$100 billion.

He declined to comment on what he proposed, saying it was a private letter to Abe that wasn't meant to be disclosed.

There is a push to enact a "special measures law" that would let the government take a more direct role, as it is now authorized only to participate in research and development on the water issue.

Oshima said careful negotiations are under way with a wide variety of parties, including government ministries and the LDP's junior coalition partner, New Komeito, on such issues as stronger government involvement and potential reorganization.

TEPCO has said it is not in a position to comment on its future structure, and aims to return to profitability this financial year.

The bureaucracy is pushing back, government officials say. The Finance Ministry fears that breaking up TEPCO would hand another large bill to taxpayers, while the Ministry of Economy, Trade and Industry, which regulates electric utilities, worries a break-up could have ripple effects through the industry.

Industry minister Toshimitsu Motegi said this week that a special measures law was not needed as the current legal framework allows the government to be more involved in TEPCO.

Blame the workers!

October 9, 2013

Chairman of Japanese nuclear regulator blames declining worker morale for Fukushima leaks and problems

<http://enformable.com/2013/10/chairman-japanese-nuclear-regulator-blames-declining-working-moral-fukushima-leaks-problems/>

On Wednesday, Shunichi Tanaka, Chairman of Japan's Nuclear Regulation Authority, suggested that one of the causes of radioactive leaks and other problems at Fukushima Daiichi is due to a decline in worker

moral. Tanaka said that the problems would be prevented if the workers had strong morale in a positive work environment.

The majority of the workers on-site at Fukushima Daiichi are subcontracted and have no tenure or authority amongst circles of TEPCO workers. Why are the subcontracted workers there? Because TEPCO does not want to unnecessarily expose their key on-site personnel, who have the most knowledge and experience with the Fukushima Daiichi site, while stuck in the current feed and bleed doldrums with no obvious path forward. The workers who worked at the plant before the March 11th disaster have the most intimate knowledge of the site and the reactor buildings. They fill in the gaps where the blueprints leave off. Right now, human beings cannot even enter the reactor buildings, due to high radiation levels, so the intricate knowledge of the buildings is not as helpful as will be down the road. So, currently TEPCO is stuck in a holding pattern, and using **expendable** (red-shirt for all the Trekkie fans) **subcontracted workers; who are paid minimal amounts, sent in to do the most dangerous work, and now get blamed for all the mistakes.**

This week, TEPCO confirmed that the reason why radioactive water leaked from storage tanks, is because TEPCO decided to purchase storage tanks which were not welded, rather bolted, in order to save time and money. This was not a decision in any way affected by the subcontracted help at Fukushima Daiichi, it was a cost-effective decision made by TEPCO.

Tokyo Electric, not subcontracted workers, broke their promise made in June, 2011 to the Japanese government to build fences to block radioactive water from leaking directly into the Pacific Ocean. The utility asked the government not to announce they had committed to a \$1 billion construction project, due to fears of the financial fall-out that would ensue, then – did not even move forward with the work that they had promised to complete.

Personally, I resent the very idea submitted by the Chairman. I think that Tokyo Electric, the utility in charge of the power plant before and after the disaster is the main reason for the additional ongoing problems at Fukushima Daiichi.

I spoke to Dave Lochbaum with the Union of Concerned Scientists, to see if maybe I was missing the point. Dave also shared these concerns. He added, “Let us hypothetically suppose, that even if the problems at Fukushima Daiichi were caused by the poor moral of a single worker, then maybe we could advocate that TEPCO deserved to be cut some slack; but it is clear to me what when a large portion of the workforce becomes demoralized – TEPCO is definitely the one to blame. Each worker may be responsible for their own morale, but **TEPCO is responsible for the moral of the work force.** Additionally, if even the workers who are risking their lives are demoralized and have no trust in TEPCO wanting to do – or being capable of doing the right things, why should the Japanese citizens or international public at large have any confidence in the Japanese government or TEPCO?”

Maximum demand for TEPCO power

October 12, 2013

Tepco power demand hits highest level of year

JJI

http://www.japantimes.co.jp/news/2013/10/12/business/tepco-power-demand-hits-highest-level-of-year/#.UlmN21M0_9k

Maximum electricity demand in Tokyo Electric Power Co.'s Kanto service area reached 95 percent of total supply capacity Friday, the highest level so far this year.

Power demand in and around Tokyo surged to 39.7 million kw between 2 p.m. and 3 p.m. Friday, Tepco officials said.

It is the first time the rate has climbed to that level since Nov. 28 last year, when it hit 96 percent.

The officials attributed the high reading to people turning on air conditioners amid unseasonably hot weather, and the suspension of a 600,000-kw unit due to a glitch at Tepco's thermal power plant in Fukushima Prefecture.

The previous peak seen this year was 94 percent, in January and February, according to the officials.

LNG arrives from Angola

bloomberg

Tepco on Saturday received the nation's first spot cargo of liquefied natural gas from Angola, ship-tracking data show.

The Lobito, with a capacity of 155,000 cu. meters, docked at Tokyo Electric Power Co.'s Futtsu terminal in Chiba Prefecture, according to transmissions by IHS Fairplay.

It had been scheduled to arrive Friday.

The ship loaded the supercooled gas in Angola at a Chevron Corp.-led LNG plant in the city of Soyo and departed Aug. 11, the data show.

Japan, the world's largest importer of LNG, does not have any long-term contracts with Angola, according to Bloomberg data.

The Futtsu terminal has a capacity of 20.2 million tons per year and receives term shipments from Indonesia, Malaysia, Qatar, Australia, Oman, Abu Dhabi, Brunei and Russia. The Lobito's cargo was the third shipment loaded at the Angola LNG plant since June, when the facility became operational.

Hydrogeologists, gov't monitoring, better system to reuse water & constant attention

October 14, 2013

FUKUSHIMA WATER CRISIS: Water recycling system urgently needed, ex-chairman of U.S. nuclear watchdog says

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201310140011>

By SHIRO NAMEKATA/ Correspondent

WASHINGTON--Japan urgently needs an effective system that reuses radiation-contaminated water to cool down the crippled reactors at the Fukushima No. 1 nuclear plant, said Gregory Jaczko, former chairman of the U.S. Nuclear Regulatory Commission.

In an interview with The Asahi Shimbun, the nuclear expert said failure to handle the contaminated water problem at the site will damage Japan's credibility.

Excerpts from the interview follow.

Question: As an outside expert, how do you view the serious problem of contaminated water leaks at the Fukushima nuclear power plant?

Jaczko: There is a long-term challenge in Japan with the clean-up from the Fukushima nuclear accident, which is going to take decades to resolve, and this is just one of the first incidents to show that it needs **continuous focus and attention.**

What I saw was somewhat surprising: the lack of monitoring of the tanks. That seems to be something that is more straightforward and easier to do--to ensure that there are not spills, or when there are spills, they are identified readily and quickly addressed and remediated.

But it did not appear that they had any type of instrumentation, monitoring, for those tanks; it was done as "walk-arounds" and identified by workers. They demonstrate a weakness in the safety system, in the oversight and the management of the project, and I think what is needed is corrections for those elements.

Q: Critics say that Tokyo Electric Power Co., the plant's operator, has already lost control of the situation. What do you think?

A: It is unfortunate that TEPCO has not done more to address the situation. It has continued to raise concerns about their ability to do that, but it is also not an easy task to replace TEPCO because there are a number of workers who are involved in this effort. You cannot simply replace all those workers. Fundamentally, this issue comes down more to management and safety focus than anything else.

What is really needed is an effective, rigorous system of accountability and management at the site. And ultimately, that has to come from the bulk of the workers and the people who are there every day.

But there needs to be continued government oversight. The regulator should continue to play a strong role in ensuring that the activities that go on at the site are safe, that they are consistent with the requirements.

There should be experts within the regulator who understand hydrogeology and the groundwater issues. Whenever you are designing, siting and licensing nuclear power plants, you have to prepare for spills and other ways that the groundwater can be contaminated.

So, again, if the regulator does not have those experts, it would be important to hire them so that it could continue to provide effective oversight of TEPCO's activities.

Q: If you were responsible for the situation, how would you manage it?

A: As a long-term program of management of the wastewater, what needs to be done is a more effective system of reuse of the water, the existing water.

In a normal operating reactor, water is continuously reused and used for cooling purposes, periodically cleaned, and it is those systems that are not working effectively right now in Japan.

In the long term, a program to release the water would be very damaging for the credibility of the Japanese.

There may be certain amounts that are allowed to be released within acceptable regulatory limits, and that is certainly a practice at an operating reactor. Some of it has low levels of contamination, and that is a practice that happens.

If it is within acceptable limits, then that is something that could be done.

Q: Is it possible to use lessons learned from the Three Mile Island accident and from the handling of old nuclear facilities, such as the Hanford Site?

A: The normal methods for reactor cooling, for filtering, for reusing water, those systems are not fully functioning at all with the reactors at the Fukushima plant. As a result, there is this need to continue to inject large quantities of water and then store the wastewater as it comes out.

I don't believe that was the situation at Three Mile Island because there was not the damage to all of the water circulation systems.

Hanford and many other sites in the United States have more lessons because there were, perhaps, more similar issues with radioactive materials being put into tanks.

While it was a slightly different type of material, and liquid material, nonetheless, there were some very important lessons, like when you build tanks very quickly, those tanks may not be robust and last for a long period of time.

The other issue that is really relevant from those sites is just understanding the hydrogeology of the site, understanding how groundwater moves, what the impact from groundwater would be, how radionuclides will move through the groundwater, and ultimately how those processes work.

There is more to be learned from what happened at Hanford than the Three Mile Island accident at this point.

The Three Mile Island accident will become much more relevant when they get to the point of beginning to actually extract the fuel from the reactor vessels--or wherever it is--in the reactors.

The Hanford situation is a little bit different as a model because the activities that went on were government activities as part of the nuclear weapons program.

The issue of the water and the water contamination at the Fukushima plant is a very unique situation, and it does not offer any immediate examples of challenges.

Q: Many Japanese are opposed to the nation's dependence on nuclear power plants. What do you think about the future of nuclear energy?

A: The current generation and type of reactors will always suffer from this fundamental challenge--the possibility of having some type of very catastrophic accident.

For a country like Japan, that is even more significant because of the small size of the country. When you have an accident, it has the potential to contaminate, as a percentage, a significant portion of Japan.

For the long term, it is beneficial to look for alternative ways to generate electricity.

As we look 30 to 40 to 50 years down the road, one would hope that we are generating electricity in ways that are more efficient and effective than the current generation of nuclear reactors.

And then, there is the potential for these catastrophic accidents. If I were advising the Japanese industry, I would look to put effort and focus on new technologies and new industries to generate electricity.

40% of exported nuke material never checked for safety

October 14, 2013

40% of Japan nuclear tech exported over past decade failed to go through safety check

<http://mainichi.jp/english/english/newsselect/news/20131014p2a00m0na015000c.html>

About 40 percent of Japanese nuclear plant equipment exported over the past decade -- worth some 51.1 billion yen -- failed to go through national government safety inspections, the Mainichi Shimbun has learned.

The government conducts safety inspections on nuclear plant equipment that is to be exported only if manufacturers receive loans from the government-affiliated Japan Bank for International Cooperation (JBIC), or take out insurance policies from Nippon Export and Investment Insurance, an independent administrative agency. This is in sharp contrast to the requirement that all devices for domestic nuclear power stations be subject to strict government safety inspections.

An expert involved in the Japan Atomic Energy Commission's compilation of a new nuclear power policy outline said the finding highlights insufficiencies in the government's system to examine nuclear plant equipment for export.

"It came as a surprise to me that many exported nuclear plant-related devices failed to undergo safety inspections," said Keio University professor Masaru Kaneko. "Prime Minister Shinzo Abe claimed in a speech overseas that Japan can provide the world's safest atomic power technology, but how can Japan guarantee the safety of nuclear plant equipment Japanese firms export without a proper system to examine it?"

Japanese manufacturers exported some 124.8 billion yen worth of nuclear plant equipment to 23 countries and territories from 2003 to 2012, according to the Finance Ministry's trade statistics.

Of that, some 73.7 billion yen worth sold to five countries -- China, the United States, France, Belgium and Finland -- received prior government safety inspections, according to documents that the Mainichi has obtained from the Agency for Natural Resources and Energy under the freedom of information system. **The remainder, worth approximately 51.1 billion yen, failed to go through such checks.**

Devices exported without going through safety inspections include those for the installation at Taiwan's fourth atomic power station, and repair works in Sweden and Brazil, according to manufacturer officials and the Japan Electrical Manufacturers' Association's internal documents.

Three major manufacturers of nuclear plants -- **Hitachi, Ltd., Toshiba Corp. and Mitsubishi Heavy Industries, Ltd.** are among the manufacturers that exported relevant equipment without safety inspections. Among the items exported without inspection are key components such as nuclear reactor pressure vessels, their lids and control rod driving systems.

Since many sections of the documents released by the Agency for Natural Resources and Energy had been redacted, it remains unclear whether all the 73.7 billion yen worth of devices underwent full government safety checks.

Japanese manufacturers must pay heavy compensation if nuclear plant devices they have exported fail.

Plenty to be depressed about

October 14, 2013

FUKUSHIMA WATER CRISIS: Declining worker morale at Fukushima plant may be behind recent mishaps

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201310140095>

THE ASAHI SHIMBUN

A series of recent mishaps at the Fukushima No. 1 nuclear power plant may be symptomatic of declining worker morale.

A major reason for this disturbing trend is the health concerns held by workers who still face high levels of radiation every time they enter the plant.

Workers receive what looks like a receipt at the end of each shift, which shows their level of radiation exposure. **Some workers are exposed to nearly 2 millisieverts over the course of a day, which is close to double the annual exposure limit for the general population.**

There are many locations within the plant site around the reactor buildings where radiation levels continue to exceed 100 millisieverts per hour.

Although work schedules are made while considering the amount of radiation a worker will be exposed to, those who have accumulated levels that exceed the annual 50-millisievert limit will not be allowed to enter the plant site for the rest of that year.

"If we exceed our radiation exposure limits, we will simply be disposed of as workers," said a man in his 30s who has worked at the Fukushima No. 1 and other nuclear plants for more than 10 years.

Before the Fukushima nuclear accident, the man was responsible for leading a team that worked within the reactor building. Immediately after the accident, he volunteered to return to work at the plant from where he had evacuated. One task he performed was to carry a hose to the reactor building so water could be pumped into the reactor. Dose levels exceeded 10 millisieverts per hour.

"I thought I would die," the man said.

Media reports about Fukushima tend to focus on the problems that have arisen, and **the voices of workers at the plant site are rarely reported**. Whenever celebrities visit the disaster site to encourage victims, they never meet with any plant workers.

"Right now, I do not feel that our efforts are being recognized by society," the man said. "My motivation to work is gradually disappearing."

Among the recent blunders at the plant have been storing too much contaminated water in storage tanks, leading to leaks. In another instance, workers were showered with contaminated water after piping was inadvertently removed.

At the building workers must pass through to enter and leave the plant site, another male worker feels with the increase in problems related to radiation-contaminated water this summer, there has also been an increase in workers whose skin or underwear has become contaminated with radiation.

Although workers are required to wear protective clothing and full face masks, some workers touch the back of their necks with their contaminated gloves when removing their masks.

"The workers brought in by the construction companies after the accident do not have much work experience or knowledge," the male worker said. "They cannot even skillfully remove their protective clothing."

Moreover, unlike other nuclear plants, the landscape of the Fukushima No. 1 plant is constantly changing with the removal of rubble and the installing of storage tanks to hold the massive volume of contaminated water left over after cooling the reactors. There are some areas of the plant where work experience from before the accident is of no use at all.

A worker in his 20s feels that more people are choosing to become involved in the decontamination efforts. One reason may be that those who do decontamination work receive an additional 10,000 yen (\$102) a day in the form of hazard pay, which comes from public funds. In 2011, when the accident occurred, the man received close to 30,000 yen a day in wages, but now he receives under 20,000 yen. That means there is almost no difference in pay with those doing decontamination work.

"The dose levels workers at the Fukushima plant can be exposed to are several hundred times that for those doing decontamination work," the man said. "I feel more workers have come to think it is not worth it."

Although such factors make it difficult to find good workers, there are some from the local community who continue to return to the Fukushima plant.

A man in his 30s was scolded by his mother for his decision to continue working at the Fukushima plant. He has with him a tablet computer on which he keeps an image of a person who died after being exposed to a large dose of radiation during the 1999 criticality accident at the JCO Co. plant in Ibaraki Prefecture.

"I work while thinking that is how I might end up," the man said.

One reason for the low worker morale is because a large percentage are employed by subcontractors. **Only 10 percent of those working at the plant site are employees of Tokyo Electric Power Co.**, the plant operator.

The central government and TEPCO estimate that **about 12,000 workers are needed over the course of a year**. However, workers who exceed their annual radiation exposure limit cannot continue to work, meaning **new workers have to continually be found**.

Inexperienced workers are recruited from around Japan, many by the subcontractors. The multi-layered structure of the companies involved in the work at the Fukushima plant means there is ambiguity about who is actually the employer, and that has left open the possibility of illegal hiring practices.

Shunichi Tanaka, chairman of the Nuclear Regulation Authority, raised concerns about TEPCO's tendency to leave things up to subcontractors.

"Efforts must be made to maintain the morale of each and every worker at the plant," Tanaka said on Oct. 9. "Careless errors cannot be corrected simply through regulations."

At an Oct. 11 news conference, Masayuki Ono, acting general manager of TEPCO's Nuclear Power and Plant Siting Division, said, "We will improve the situation after determining whether it is a structural problem or simply a careless error."

(This article was written by Takuro Negishi, Tetsuya Kasai, Susumu Okamoto and Toshio Tada.)

TEPCO promises more workers and better equipment

October 15, 2013

TEPCO vows to increase workers at Fukushima plant, improve water management

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201310150104>

REUTERS

The operator of Japan's wrecked Fukushima nuclear plant, under fire to put right repeated contamination mishaps, promised on Oct. 15 to draft in extra workers and improve equipment as part of plans to make the site safe and keep the company solvent.

Tokyo Electric Power Company has been reprimanded twice in as many months by Japan's nuclear regulator for mismanagement in a cleanup operation more than 2 1/2 years after the Fukushima No. 1 plant was struck by an earthquake and tsunami.

Though the company has posted more than \$27 billion in net losses since the disaster, it has received pledges of financing from banks totaling \$5.9 billion.

Much of that, however, is contingent on TEPCO securing the regulator's approval to restart two of seven reactors at another of its plants, the world's largest nuclear plant.

"We will increase the workforce at Fukushima No. 1 nuclear power plant and make sure we have an accurate grasp of the situation, follow procedures, introduce proper communications and instructions needed to carry out competent management of the site," TEPCO said in a statement after submitting a report to the regulator.

The increase, it said, would bring to 200 the number of workers drafted in since September to deal with contaminated water.

The cleanup of the disaster, the worst nuclear crisis since Chernobyl in 1986, is expected to take decades. TEPCO has been battling the rising contaminated water at Fukushima, 220 km northeast of Tokyo, that is leaking into the adjacent Pacific Ocean.

After months of denials, the utility acknowledged in July that the water was flowing into the sea from the wrecked reactor buildings.

Last week, it said radiation levels in nearby seawater had soared to the highest level in two years.

WITHOUT NUCLEAR POWER

Japan shut down all 50 of its reactors for safety checks in response to a wave of public revulsion after three meltdowns at Fukushima caused mass contamination and evacuations in the aftermath of the 2011 tsunami.

Two reactors restarted last year, but are now off line for maintenance, leaving the country without power generated from nuclear plants for only the third time in more than 40 years.

The chairman of Japan's new Nuclear Regulatory Agency has said TEPCO must prove its cleanup operations at Fukushima are in order before its plan to fire up two reactors at the giant Kashiwazaki-Kariwa plant on Japan's west coast can be approved.

NRA Chairman Shunichi Tanaka said last month it had to be determined whether TEPCO "has the technological ability to operate a nuclear power plant".

In its submission on Oct. 15, TEPCO said it had taken steps to improve safety at Kashiwazaki-Kariwa based on lessons learned from the 2011 disaster.

But an early restart of the two new reactors is unlikely. A delay in TEPCO's plan to have them running by the end of the month has already prompted the company to revise its reorganization plan to cut costs and restore its finances.

Prime Minister Shinzo Abe, making a successful pitch last month to stage the 2020 Olympic Games, declared the plant stable. But he has also ordered TEPCO to set deadlines for stopping leaks.

The government, which controls TEPCO after a capital injection last year, will "respect" any decision by the NRA on a restart, an official familiar with the issues told Reuters.

30 years to recoup compensation fund

October 16, 2013

Taxpayers take note: State may need 31 years to recoup ¥5 trillion in Tepco redress aid

Kyodo

http://www.japantimes.co.jp/news/2013/10/16/national/taxpayers-take-note-state-may-need-31-years-to-recoup-%C2%A55-trillion-in-tepco-redress-aid/#.Ul69EFM0_9k

It will take up to 31 years for the government to recover the ¥5 trillion in aid it may provide, just through this fiscal year, to Tokyo Electric Power Co. for compensation related to the Fukushima No. 1 nuclear plant disaster that started in 2011, a government agency said Wednesday.

Relevant interest payments to financial institutions through fiscal 2044 will cost the government an estimated ¥79.4 billion and will be effectively shouldered by taxpayers, the Board of Audit of Japan said.

The board's findings marked the first time an estimate has been released on how long it will take for the government to recover the money provided through a state-backed bailout fund as well as the financial burden taxpayers will face in the process.

The auditing was conducted at the request of the Diet in August 2012, after cash-strapped Tepco fell under effective state control after receiving a ¥1 trillion capital injection.

Apart from the ¥1 trillion in public funds, Tepco has received assistance from the Nuclear Damage Liability Facilitation Fund to ensure swift compensation payments to people affected by the world's worst nuclear crisis since the 1986 Chernobyl disaster.

The fund entails allocated government bonds that can be redeemed when necessary for assistance to Tepco, with the ceiling set at ¥5 trillion. The government borrows money from financial institutions to redeem the bonds and pays the relevant interest.

The fund has so far provided Tepco with about ¥3.05 trillion, including ¥2.91 trillion already paid to people affected by the disaster.

But compensation payments are still ongoing and the assistance Tepco will need, including costs to clean areas contaminated by radioactive fallout from the Fukushima No. 1 plant, may eventually exceed the fund's ceiling.

Under the current scheme, the fund recovers the money provided to Tepco through annual contributions from 11 Japanese electricity firms that own nuclear plants, including Tepco.

Tepco is also required to pay what is called a “special contribution” to the fund once its financial conditions have improved.

The Board of Audit conducted its report on the assumption that ¥5 trillion will be provided to Tepco by the end of the current fiscal year through March.

If Tepco pays no more than the annual contribution, the Board of Audit’s estimate showed that the government will take 31 years to recover the aid.

If Tepco pays the annual contribution and the special contribution, however, the period will be shortened to 14 years, with interest payments totaling ¥37.4 billion.

The estimate also showed that Tepco will face ¥1.09 trillion in additional costs for failing to restart its idled nuclear reactors at the Kashiwazaki-Kariwa plant in Niigata Prefecture in fiscal 2015 and fiscal 2016.

The additional costs represent the consumption of fossil fuel required to make up for the loss of nuclear power generation.

Nuclear compensation fund recovery to take decades

http://www3.nhk.or.jp/nhkworld/english/news/20131016_40.html

Japan's Board of Audit says it could take more than 30 years for the government to recover funds it has invested to help compensate victims of the Fukushima Daiichi nuclear accident.

The government has issued bonds worth 5 trillion yen, or 50 billion dollars, to help the plant's operator Tokyo Electric Power Company pay compensation. It is for people who've had to evacuate, and farmers and fishermen who've lost their livelihood.

The government plans to recover the funds through an annual pay-back by TEPCO and contributions from other nuclear power companies.

But the Board of Audit says if TEPCO does not go into the black, recovery would not end until 2044. Even if the utility's profits improve, the funds would not be fully recovered until 2030.

The Board of Audit expects the need for government assistance to balloon further as demands for decontamination and real estate compensation increase.

The board wants TEPCO to quickly balance its finances, because the longer it takes for recovery, the heavier the burden on the national budget and taxpayers.

The board is also urging the utility to sell off its property assets and subsidiaries to minimize the burden on the public.

Abe lacks sense of crisis over water leaks

October 16, 2013

Editorial: Abe's policy speech shows lack of sense of crisis over radioactive water leaks

<http://mainichi.jp/english/english/perspectives/news/20131016p2a00m0na021000c.html>

A policy speech that Prime Minister Shinzo Abe delivered on Oct. 15 at the outset of the extraordinary Diet session highlighted his lack of a sense of crisis over radioactively contaminated water accumulating at the tsunami-hit Fukushima nuclear plant.

Unless the government solves this problem, it cannot go ahead with the implementation of a growth strategy as the prime minister has pledged.

His policy speech was partially a counter-argument against public criticism of a remark he made at an International Olympic Committee (IOC) general meeting in September to the effect that the situation concerning radioactive water is "under control." Moreover, Prime Minister Abe mentioned harmful rumors about the contaminated water's effects on locally made food and other products and said, "The impact on foodstuffs and water is far below the legally permissible limit."

However, the problem is not limited to harmful rumors on locally produced goods. Since the IOC meeting, serious problems involving leaks of radioactive water have surfaced almost daily, and there is no prospect that the crisis will be brought under control in the foreseeable future. If the current situation continues, it will become impossible to decommission and dismantle crippled reactors at the Fukushima No. 1 Nuclear Power Plant. The current response to the situation is only amplifying public concerns about the crisis.

The prime minister emphasized that the government will play a leading role in bringing the crisis under control and thereby fulfill its responsibility. However, he fell short of elaborating on the response to the crisis, such as specifically how the government and plant operator Tokyo Electric Power Co. (TEPCO) will divide their responsibilities from a mid- to long-term perspective.

Naturally, efforts to bring the nuclear crisis under control will be a major issue during the current Diet session. There are calls within the ruling Liberal Democratic Party (LDP) urging TEPCO be split into multiple companies and that an organization specializing in treating radioactive water and decommissioning the reactors be set up. Both the ruling and opposition blocs should seriously cooperate in working out specific measures to end the crisis before it is too late.

Prime Minister Abe also expressed optimism about Japan's future in his speech saying, "Japan can grow powerfully again" and "We can open the way for growth if we have willpower." These remarks apparently

reflect the self-confidence that he has gained as more than nine months have passed since he returned as head of the government. We have no objection to the prime minister's words, "Japan should restore a society filled with entrepreneurship and where young people can play an active role and women can shine."

However, "the actual feeling of economic recovery has not yet spread throughout the country," just as the prime minister acknowledged in his policy speech.

As part of the growth strategy, Abe unveiled a plan to ease regulations for companies that are actively developing new technologies as a preferential measure, among other plans. He said the most important thing is "deeds," and went on to say "simply writing an essay is meaningless." Now, whether the Abe government will achieve its goal of increasing wages for workers through the growth strategy is being tested.

Reform of the social security system is also an urgent task. The prime minister said financial resources to cover snowballing social security spending will be secured by raising the consumption tax rate from the current 5 percent to 8 percent in April 2014 and increasing the tax revenue by achieving economic recovery, while reforming the system into one in which benefits and burdens are well balanced. Abe should show the clear direction for his government's social security system reform to prove that it is not just an "essay."

Needless to say, there are numerous other challenges. Legislators from both the ruling and opposition parties should hold in-depth and thorough discussions on various pressing issues to make up for their long "summer vacation" as Diet members had not met since the end of June.

Abe's "flippant" remarks on water crisis raise concern

October 16, 2013

Abe claims Fukushima radioactive water woes are 'under control'

Kyodo

http://www.japantimes.co.jp/news/2013/10/16/national/abe-claims-fukushima-radioactive-water-woes-are-under-control/#.U17mYFM0_9k

Prime Minister Shinzo Abe said Wednesday the impact from accumulating radioactive water at the crippled Fukushima No. 1 nuclear plant has been "under control."

The government will "continue efforts to address the problem with multiple preventive measures," using the world's wisdom, Abe told a plenary session of the House of Representatives.

"The situation has been under control as a whole," Abe reckoned, answering questions from Banri Kaieda, head of the Democratic Party of Japan, about the policy speech Abe delivered Tuesday when the Diet

convened an extraordinary session. The DPJ was in power when the Fukushima nuclear crisis started in 2011.

Abe's repeated no-cause-for-alarm assessments of the situation at the Fukushima plant, which suffered three reactor-core meltdowns shortly after it was hit by the March 2011 Great East Japan Earthquake and monster tsunami, are raising the eyebrows of critics who regard the condition as worrying and warn of possible negative fallout on the environment and industries.

Critics also lashed out when Abe made similar assertions last month when he made a presentation to the International Olympic Committee in Buenos Aires for Tokyo's bid to host the 2020 Olympics. The city won the bid by beating Istanbul and Madrid, but at the same time repeated reports on the radioactive water spills plaguing the Tokyo Electric Power Co. nuclear plant were circulating, causing an international stir.

Kaieda said Wednesday that Abe should be more careful about assessing the situation at the plant, criticizing his remarks as being "extremely flippant."

Radioactive water is increasing daily at the plant as groundwater flows into reactor buildings and mixes with water used to cool the three crippled reactors.

Some of the contaminated water is kept in around 1,000 tanks set up at the site, and Tepco is struggling to prevent spills from the storage tanks, as well as to curb the daily flow, reportedly amounting to hundreds of tons, of radioactive groundwater into the Pacific Ocean from the plant.

Abe also reiterated in the Lower House that the government will play a major role in addressing the water problem, not leaving the task to the utility alone. The government has unveiled a basic policy to handle the situation, including potential financial assistance for the utility.

"Little effect has been seen", says NRA

October 16, 2013

Tepco's toxic water failures pitiful: NRA

JJI

http://www.japantimes.co.jp/news/2013/10/16/national/tepcos-toxic-water-failures-pitiful-nra/#.U17nfVM0_9k

Tokyo Electric Power Co.'s efforts to keep radioactive water at its stricken Fukushima No. 1 power station from spilling into the sea have been ineffective, according to the Nuclear Regulation Authority.

"Our conclusion is that little effect has been seen" in Tepco's measures, NRA Commissioner Toyoshi Fuketa said at an NRA panel meeting Tuesday, citing an increase in the levels of radioactive materials in some seawater samples collected near the plant.

Tepco is pumping up groundwater and has injected a water-stopping agent into the ground near the plant's port in order to curb the flow of radioactive groundwater into the sea.

Despite such efforts, the levels of cesium-137 in seawater samples collected between the water intakes for reactors 1 and 2 inside the port rose to around 100 becquerels per liter this month from around 10 becquerels between late June and early July.

"It is reasonable to assume that the total amount of radioactive materials flowing into the sea has risen," said Masaya Yasui, an emergency response official at the NRA secretariat.

Radioactive water from the damaged reactors "may be leaking directly into the sea instead of mixing with groundwater before making its way into the sea," Fuketa said.

Last week, Tepco said the cesium level was 1.4 becquerels per liter of seawater sampled on Oct. 8 at a point 1 km from the seawall of the power plant, far below the safety limit of 10 becquerels for drinking water set by the World Health Organization.

But radioactive cesium was detected at the point for the first time since the firm started radioactivity checks there in mid-August.

The industry ministry now plans to introduce a system to examine the advisability of what nuclear experts call the "final" disposal method for highly radioactive waste from spent nuclear fuel every five years, a ministry official said Tuesday.

The ministry showed the drafted five-year review plan for the permanent underground disposal program to an expert panel the same day, hoping for the plan to facilitate finding of a municipality to host the final disposal facility.

Under the existing program, geological surveys and construction of a final disposal facility will be carried out for 30 years after a municipality agrees to host the facility. The facility will continue work to bring in and bury nuclear waste deep underground till it is shut down more than 40 years later. After the shutdown, the waste will be stored there for tens of thousands of years before it becomes no longer toxic to humans.

The ministry wants to revise the program to allow underground disposal to be replaced by safer disposal, if such a method is found in the more than 70 years till the facility's closure.

The draft plan also clarifies the stance of putting priority on the host municipality's preference on when to start operation of the disposal facility and shutter it.

The ministry aims to reflect the new plan in the final disposal program, which is now under review by the government, as well as the government's basic energy policy.

Spent fuel at the nation's atomic plants, all of which are currently offline, has been stored on-site at the facilities, but the storage pools are believed to be near capacity.

Meanwhile, no community has volunteered to host the "final" storage site.

Abe good at overlooking problems

October 16, 2013

Policy speech overlooks key issues

http://www.japantimes.co.jp/opinion/2013/10/16/editorials/policy-speech-overlooks-key-issues/#.UJ_WL1M0_9k

An extraordinary Diet session started Tuesday to discuss important issues such as the leaks of contaminated water from the crippled Fukushima No. 1 nuclear power plant, the reconstruction of areas devastated by the 3/11 disasters and Japan's strategy for the Trans-Pacific Partnership talks.

The session began 3½ months after the regular Diet session ended. During this period, there has been no substantive discussion on urgent matters. It's time for the government and the Diet to get serious about helping Japan overcome the problems that are having the biggest impact on people's lives.

Prime Minister Shinzo Abe devoted about one-third of his policy speech to his economic growth strategy, which he said is aimed at increasing employment and wages for "young people and women." He said the effective ratio of job offers to applicants increased from 0.83 in late 2012 to 0.95 in August. But what he failed to do is mention the quality of employment. Businesses are adding irregular employees, whose wages are lower and who can be fired at any time.

According to the internal affairs ministry, the number of irregularly employed workers hit a record 18.81 million in the April-June period, while the number of regular workers declined by 530,000 from the same period of 2012 to 33.17 million.

Regarding the nuclear disaster, Mr. Abe said that in general contamination of food and water with radioactive substances from the Fukushima plant measures much lower than safety standards require. Cases are being reported of fish being caught off Fukushima that exceed permissible contamination standards. Contaminated water continues to leak, but Mr. Abe failed to give a detailed outline on how the government plans to contain it. Regarding the fact that little progress is being made in efforts to decontaminate areas around the plant, Mr. Abe only said that he will accelerate cleanup efforts as well as restore infrastructure.

Mr. Abe stated that efforts to resettle 3/11 disasters victims in highland areas have entered a stage of acquiring land and preparing sites. But he failed to mention that his policy of pushing public works projects nationwide is draining workers and equipment from disaster areas, thus slowing reconstruction.

As for the TPP, Mr. Abe did not mention people's worries about food safety, access to public health insurance and a lower national food self-sufficiency rate. He said only that he will take the initiative where necessary and defend what he must defend.

Mr. Abe stressed the importance of "proactive pacifism" as a way of contributing to world peace and stability. He neglected to mention his goal of allowing Japan to exercise the right to collective self-defense by changing the government's traditional interpretation of the Constitution's war-renouncing Article 9. Nor did he mention his plan to submit a bill that will not only impose up to 10 years' imprisonment for national public servants and up to five years' imprisonment for Diet members who leak "special secrets" in the fields of security and diplomacy but also punish reporters who investigate such secrets. The bill will undermine two pillars of democracy: Freedom of the press and the people's right to know.

Mr. Abe's speech shows that he ignores issues that don't mesh with his agenda, even if people are deeply concerned by them. If this continues, people will increasingly question his sincerity.

Abe talks of Fukushima plant, economic measures

http://www3.nhk.or.jp/nhkworld/english/news/20131016_42.html

Japan's Prime Minister Shinzo Abe says radioactive water leakage at the Fukushima Daiichi nuclear plant is under control.

Abe made the remark in a lower house session on Wednesday in response to a question from an opposition leader about Abe's policy speech on the previous day.

The questioner asked whether Abe adheres to his remark that the situation at Fukushima Daiichi is under control. The lawmaker argued that a senior official of the plant operator said he cannot confirm that this is the case.

Abe said leaks still occur, but that the radioactive water is affecting a limited area inside the plant's port.

He stressed that the government will keep working to address the problem with preventive measures based on knowhow from around the world.

Abe also referred to a wage hike and expansion of employment, answering a question from a member of his governing party.

Abe said Japan's economy is picking up smoothly. He said his government has launched a meeting with business and labor leaders to nurture common understanding to create a positive growth cycle with a wage hike and job creation.

Abe also referred to a plan to scrap a reconstruction tax imposed on businesses after the 2011 earthquake and tsunami one year earlier than initially planned.

He stressed that the plan was expected to help realize a pay raise for workers

"There is nobody who has solutions"

Radioactivity level spikes 6,500 times at Fukushima well

Published time: October 18, 2013 02:08

Edited time: October 18, 2013 12:23

Irina Galushko, Japan, Nuclear, Thabang Motsei

Radioactivity levels in a well near a storage tank at the Fukushima nuclear power plant in Japan have risen immensely on Thursday, the plant's operator has reported.

Officials of the Tokyo Electric Power Company (TEPCO) said on Friday they detected 400,000 becquerels per liter of beta ray-emitting radioactive substances - including strontium - at the site, a level 6,500 times higher than readings taken on Wednesday, NHK World reported.

The storage tank leaked over 300 tons of contaminated water in August, some of which is believed to have found its way into the sea through a ditch.

The well in question is about 10 meters from the tank and was dug to gauge leakage.

TEPCO said the findings show that radioactive substances like strontium have reached the groundwater. High levels of tritium, which transfers much easier in water than strontium, had already been detected.

Officials at TEPCO said they will remove any contaminated soil around the storage tank in an effort to monitor radioactivity levels of the water around the well.

The news comes after it has been reported a powerful typhoon which swept through Japan led to highly radioactive water near the crippled nuclear power plant being released into a nearby drainage ditch, increasing the risk of it flowing into the sea.

On Wednesday TEPCO said it had detected high levels of radiation in a ditch leading to the Pacific Ocean, and that it suspected heavy rains had lifted contaminated soil.

‘Decades-long problems being faced at Fukushima’

Robert Jacobs, a professor at Hiroshima Peace University, told RT the compounding problems at Fukushima Daiichi underscore one critical reality: no one really knows what to do.

“Nobody really knows how to solve the problems at Fukushima. There is nobody who has solutions.

The problems at Fukushima are unprecedented, so even bringing in outside expertise, all that they can try to do is problem solve. There is no solution that other countries have that they can come in and fix the reactors, or rather, shut down the contamination, shut down the leaks.”

Prime Minister Shinzo Abe’s open request for advanced knowledge from overseas is a welcome step, as this will bring a higher degree of professionalism than Tepco has demonstrated since the crisis first erupted, Jacobs says. But even though, those experts will be at a loss to solve the immense problems they’ll be facing for decades at Fukushima.

Even in the one area where Japan could potentially help contain the disaster, the authorities have wavered, Konstantin Simonov from the Moscow-based Fund for Energy Security told RT.

“Fukushima should be treated just like Chernobyl – as a wreck that must be retired and put in a sarcophagus, with radioactive waste slowly and thoroughly utilized. Why does the problem persist at Fukushima? Because they can’t decide whether they want to close it or to keep it going.”

Tokyo Electric Power Company in fact seems reluctant to shut down Fukushima for good. Tepco is in fact pushing to reopen its Kashiwazaki Kariwa facility – the world’s largest nuclear power station – which itself was shut down in 2007 following reports of radioactive leaks in the wake of an earthquake.

In September, Japan announced its only operating nuclear reactor had been closed for maintenance, leaving the country with no nuclear power supply for only the second time in four decades.

Atomic power accounted for 30 percent of Japan’s energy needs prior to the Fukushima disaster, and the country was forced to increase fossil fuel imports to make up for the deficit.

As a result, Japan become the world’s largest importer of liquefied natural gas (LNG), prompting the world’s third-largest-economy to post its first trade deficit since the second oil shock 31 years ago.

Under these circumstances, the crisis gripping Fukushima will not be the only factor in deciding the fate of the country’s nuclear industry.

Interview with Robert Jacobs

'Fukushima might make 2020 Tokyo Olympics impossible'

Published time: October 08, 2013 13:46

<http://rt.com/op-edge/fukushima-impossible-tokyo-olympics-2020-895/>

There is no reason to believe that radiation leaks at Fukushima will be contained by 2020, so the Tokyo Olympics can become impossible, nuclear technology historian Robert Jacobs told RT.

Last August Tokyo Electric Power Company (TEPCO) for the first time requested international help in its increasingly desperate fight to contain the leaks at the crippled nuclear plant. Historian of social and cultural aspects of nuclear technology and Associate Professor at Hiroshima Peace University, Robert Jacobs believes this means the problem is catastrophically large.

RT: *What does this SOS call tell us about the scale of the leaks at the plant?*

Robert Jacobs: The main thing it tells us is that they are so significant and so large that the Japanese government and Japanese nuclear industry is at a loss at how to deal with them. Now remember Japan has over 50 nuclear power plants, so there's a lot of expertise and a lot of experience in Japan. If these leaks are so significant that the Japanese nuclear industry and government are at a loss of how to deal with them then they are catastrophically large. So this is a very, very big problem and it's not an easy problem to solve.

RT: *Japan's Prime Minister says his country, and I quote, 'needs your knowledge and expertise' - which countries do you think could be most useful in this situation?*

RJ: Clearly the countries that would be the most useful are the countries with the largest and oldest groups of power-plants, so this would be the United States, Russia and also the United Kingdom or rather France. These are the countries with the largest amount of nuclear power plants in the world and the longest amount of experience, so these are countries that have both expertise and experience. However, given that nobody really knows how to solve the problems at Fukushima, there is nobody who has solutions to this. The problems of Fukushima are unprecedented, so even bringing in outside expertise all that they can do is to try to problem solve, there is no solution that other countries have that they can come in and fix the reactors or rather shut down the contamination, shut down the leaks. Even other countries coming in and bringing their expertise will hopefully bring more professionalism than TEPCO has shown in the last two and a half years, but even those experts would be at a loss at how to solve the immense problems that we'll be facing for decades in Fukushima.

RT: *What about Russia's experience in cleaning up such problems?*

RJ: Russia's experience is instructive, but as many people I'm sure know the nuclear fuel at Chernobyl is still melting, and it's still needing to be contained, and there's new containment being built at Chernobyl even this long after the event. So part of the expertise that Russia has shown in dealing with Chernobyl is to evacuate a much larger area and move people further away from the contamination. This is not being done in Japan. But this won't solve the problems of the leaks and this won't solve the problems of the contamination.

RT: *What is it going to take to get the situation at the plant under control?*

RJ: Nobody knows that. And this is the terrifying part is that the situation when there's a large nuclear disaster like this the situation is so unprecedented that there is no solution. Right now there are so many problems at the Fukushima plant. You have over a thousand tanks of water with highly contaminated radioactive water inside these tanks, because of the ground water that is also flowing through there and the water that's being poured on every day in order to keep the melting cores cool, in order to keep them from heating up the level of water saturating that ground is incredibly high. And then you have over 1000 tanks and more tanks being built every few days to store thousands of tons of water - this is all on ground saturated with water. So how they are going to be able to keep that water in place without these tanks all leaking is anybody's guess. How they are going to be able to find where underneath these reactors the nuclear fuel is and limit and contain them so that they stop leaching radiation into the environment is likely to take decades even with all expertise in the world.

RT: *How could all this affect the 2020 Tokyo Olympics?*

RJ: It could be very devastating for the Tokyo Olympics. Right now there is still all throughout northern Japan caesium being found in the urine of children there which means that the exposure and contamination is ongoing, they have not gone down for children in these areas, they are still being exposed to radiation. So two and a half years later it has yet to be contained. There is no reason to believe that it will be contained even by 2020. What's more, there's likelihood of a potentially more catastrophic happening in Fukushima. If there was another large earthquake, if there was a large typhoon there could easily be more destruction there. As we know there is a spent fuel pool in the number 4 reactor that holds an immense amount of spent nuclear fuel rods and the building has been damaged and is leaning. This spent fuel pool is several floors up, so if this building were to collapse which could happen it would spill these spent nuclear fuel rods all over the ground which would make the 2020 Tokyo Olympics impossible and could threaten all kinds of health problems throughout northern Japan and Tokyo itself. So it's a wish that Tokyo Olympics will not be affected by this, but there's no doubt that the radioactive leakage will be continuing at that time.

RT: *The Fukushima tragedy has got a massive anti-nuclear movement rolling - is the world ready to abandon this energy source for good?*

RJ: It has to for the well-being of the population of the world and the eco-system. The benefits from nuclear power last one or two generations but the burden of taking care of the spent fuel from those two generations of power last over a thousand generations. That's an incredible burden to ask thousand generations to take care of our garbage so that we could have energy for one or two generations. When you are creating toxins that are the most dangerous toxins in the world and some of them will remain dangerous toxins for 20 thousand or a 100 thousand years. Once those toxins are manufactured, plutonium is manufactured, it doesn't exist in nature, once these manufactured elements enter into the ecosystem they will be something that has to be dealt with by human beings by tens of thousands or hundreds of thousands years. So to continue to create more of these poisons for the purpose of having easier electricity is unsustainable that's putting a burden on our future, that's too much to bear. The world cannot continue with nuclear power. The way forward are not with limited fuels or contaminating fuels, the way forward over the course of hundreds maybe thousands of years if we are able to sustain human civilization is through renewable and sustainable energy sources that do not pollute or contaminate our ecosystem. What's happening in Fukushima is a catastrophic problem that is not finished, will not be finished any time soon, and remains a dire threat to the people of Japan as well as for people all around the world as long as it continues to spill radiation into the ocean and into the ecosystem.

77 % of decontamination budget unused

Ministry fails to use 77% of Fukushima decontamination budget; TEPCO refuses to pay

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201310170058>

By TAKUYA KITAZAWA/ Staff Writer

The Environment Ministry has failed to use 76.6 percent, or 247.2 billion yen, of its budget to decontaminate radioactive areas around the Fukushima No. 1 nuclear plant, the Board of Audit said.

Progress has been slow because opposition from local residents is making it difficult for the ministry to secure places to temporarily store the contaminated soil and debris collected in the work.

The ministry faces another problem: Tokyo Electric Power Co., the operator of the stricken Fukushima plant, refuses to cover all the costs of the decontamination work as required under law.

The Board of Audit investigated the ministry's budget of about 322.8 billion yen (\$3.2 billion) for decontamination work for the period until March 2013, the end of fiscal 2012.

The results were released on Oct. 16.

In September, the Environment Ministry withdrew its plan to complete the decontamination work within fiscal 2013. The slow use of the budget made it clear that the goal was overly optimistic.

“We will make efforts for smooth progress of the decontamination work by obtaining the consent of local residents,” a ministry official said.

The ministry has been decontaminating areas known as “hinan-shiji kuiki,” from where residents were ordered to evacuate immediately after the March 2011 accident at the nuclear plant. The areas are located in 11 municipalities in Fukushima Prefecture.

By the end of July this year, only three of the municipalities-- Tamura, Naraha and Kawauchi--had obtained sufficient storage space for radioactive debris gathered in the decontamination process.

Seven municipalities have secured less than 50 percent of the necessary storage space, including Iitate at 15.2 percent and Minami-Soma at 18.0 percent.

Namie has not acquired any storage place.

By fiscal 2013, the central government had earmarked 1.287 trillion yen for decontamination work. The amount needed is expected to increase.

Under the special measures law to deal with contamination caused by radioactive materials, TEPCO must shoulder all costs of decontamination work conducted by the central government and local governments. The law also stipulates that TEPCO must make efforts to quickly make the payments.

For the work that has been completed so far, the ministry sent TEPCO a bill for about 40.4 billion yen. However, the utility has paid only about 6.7 billion yen, or 16.7 percent.

According to the Board of Audit, TEPCO refuses to cover much of the costs.

The utility has raised doubts over whether certain contamination work was carried out appropriately. It also questioned if such requests for payment are within the limit stipulated under the special measures law, according to the board.

“We are paying the costs we were able to agree on,” a TEPCO official told The Asahi Shimbun. “We cannot comment on the details because we have to discuss them with the Environment Ministry.”

TEPCO promises new business plan in November

Tepco vows new rehab plan next month reflecting cost cuts, restarts

Jiji

http://www.japantimes.co.jp/news/2013/10/17/business/tepco-vows-new-rehab-plan-next-month-reflecting-cost-cuts-restarts/#.UmDTolM0_9k

Tokyo Electric Power Co. plans to map out a new business reconstruction plan in late November, Jiji Press has learned.

The utility briefed creditor banks about the plan, sources said. Tepco’s present plan calls on it to return to profitability in the current business year to next March.

In the new plan, Tepco will increase the size of its cost cuts and show when it aims to restart reactors 6 and 7 at the Kashiwazaki-Kariwa nuclear plant in Niigata Prefecture, the sources said.

Tepco has asked the Nuclear Regulation Authority for safety checks of the reactors under new regulatory safety standards.

Tepco plans to obtain fresh loans worth some ¥300 billion and refinance loans worth some ¥200 billion possibly in December. Banks are expected to accept additional loans after examining the new business plan, a step to ease concerns over the company's financing.

For its reconstruction, Tepco has to assess how much it should bear in costs for decontamination and other measures in dealing with the meltdown disaster that started in 2011 at its Fukushima No. 1 plant.

The current business plan endorsed by the government in May 2012 does not state Tepco's share of such costs, which may exceed ¥10 trillion, with the company unable to draw any concrete road map for its reconstruction.

Tepco is thus expected to accelerate negotiations with the government in order to show a certain course in the new plan, the sources said.

LNG project financing

Japan Petroleum Exploration Co. may seek some project financing for its \$10 billion liquefied natural gas project in Canada from Japan Bank for International Cooperation, according to an official from the producer.

Japan's second-biggest oil and gas explorer, known as Japex, acquired a stake in April in the Pacific Northwest Project, which plans to build an LNG plant in Prince Rupert, British Columbia, with a production capacity of 12 million metric tons a year.

"Given our 10 percent equity in the project, our investment could reach ¥100 billion or more," Koichi Shimomura, who advises the president of Japex's Americas and Russia project division, said at the World Energy Congress in Daegu, South Korea, Thursday. "As much as 50 percent of the total could be covered with the project finance."

Japex purchased its stake in Pacific Northwest from Malaysian state-owned Petroliam Nasional Bhd., known as Petronas. It also bought 10 percent of a shale-gas field in the North Montney area of British Columbia in the same month.

Japex and Kuala Lumpur-based Petronas plan to complete a front-end engineering design study in early 2014 and reach a final investment decision by the end of that year, Shimomura said.

“Our priority is on the Pacific Northwest LNG Project,” he said at a briefing.

Japex is part of a Japanese consortium comprising Inpex Corp., Itochu Corp., and Marubeni Corp. that signed a memorandum of understanding with Russian state-owned Gazprom OAO in June to market in Japan LNG supplies from a project in Vladivostok.

Energy policy committee: Only 2 anti nuclear out of 15 members

October 18, 2013

Pro-nuclear voices dominate energy policy committee

http://ajw.asahi.com/article/behind_news/politics/AJ201310180073

THE ASAHI SHIMBUN

Kikuko Tatsumi has found herself increasingly isolated on a government panel discussing the nation's energy policy.

As one of only two anti-nuclear people on the 15-member subcommittee, Tatsumi's words were largely brushed aside at a two-and-a-half-hour meeting on Oct. 16.

“The important voices expressed in last year's nationwide discussions are not being reflected here,” Tatsumi, an adviser to the Nippon Association of Consumer Specialists, said.

Tatsumi was referring to the public hearings and deliberative polling that prompted the Democratic Party of Japan-led government in September last year to adopt a policy of steering the nation away from nuclear energy.

But since the Liberal Democratic Party ousted the DPJ and regained control of government in December 2012, the anti-nuclear voices have waned in talks about energy policy.

The subcommittee of the Advisory Committee for Natural Resources and Energy is expected to work out the state's middle- and long-term energy policies within this year for Cabinet approval.

Based on the views expressed on Oct. 16, it is clear which direction the subcommittee is taking.

"Given the time needed to secure alternative energy sources, it is dangerous to sharply lower the dependence on nuclear power," said Hajimu Yamana, professor of engineering at Kyoto University.

Masakazu Toyoda, chairman of the Institute of Energy Economics, Japan, who used to be a bureaucrat at the Ministry of Economy, Trade and Industry, also expressed his pro-nuclear view.

"I want the government to put in the basic energy plan a message that makes it possible to construct new nuclear reactors to secure a certain scale of nuclear power generation," he said.

In light of the accident at the Fukushima No. 1 nuclear plant, the DPJ-led government's policy was to abolish all nuclear reactors by the end of the 2030s and withhold approval of construction of new nuclear reactors.

The DPJ-led administration also set up a committee on basic issues, with about one-third of the members considered anti-nuclear.

However, the LDP-led government nullified the previous administration's policies. It also changed the basic issues committee into the predominantly pro-nuclear policy subcommittee, which started discussions in March this year.

The subcommittee is headed by Akio Mimura, an adviser to Nippon Steel & Sumitomo Metal Corp.

Prime Minister Shinzo Abe has said the government will reduce Japan's dependence on nuclear power generation as much as possible.

But the Ministry of Economy, Trade and Industry has no intention of setting a future ratio of energy sources in the basic energy plan because of the current difficulties in predicting how many idled nuclear reactors can be restarted.

Unless the ratio and a time frame are clarified, however, companies will be unable to decide on how much importance they should place on solar power and other renewables.

Electric power companies will also have difficulties in determining the size of their investment in plant and equipment for each energy source.

In addition, the government faces problems on whether to approve the reconstruction or new construction of reactors and where to store the spent nuclear fuel.

Anti-nuclear sentiment is again rising following a series of mishaps and leaks of radioactive water at the Fukushima No. 1 nuclear plant.

A high-ranking industry ministry official doubted the basic energy plan will include government approval of the construction of new reactors under the current circumstances.

A different senior ministry official said, "We want to wait until we can discuss the issue in a calm manner." The government could also postpone a decision on how it will address potential safety problems if the existing nuclear reactors are maintained.

Can the situation be "under control" for the Olympics?

October 19, 2013

Fukushima 2020: Will Japan be able to keep the nuclear situation under control?

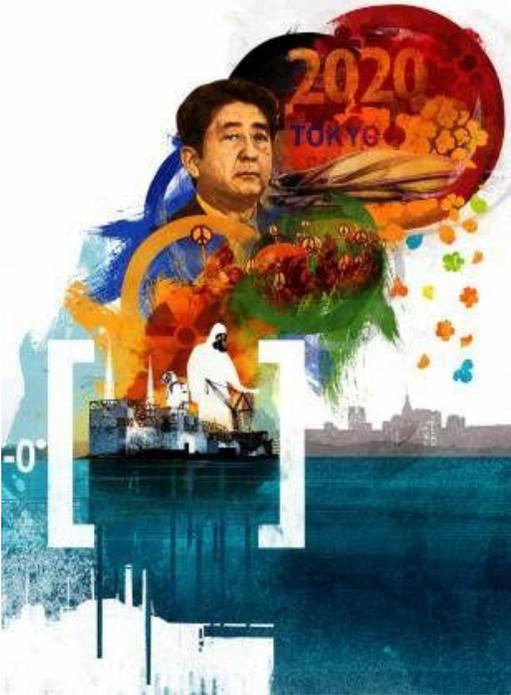

by Jun Hongo

Staff Writer

http://www.japantimes.co.jp/news/2013/10/19/national/fukushima-2020-will-japan-be-able-to-keep-the-nuclear-situation-under-control/#.UmN5I1M0_9k

Thirty seconds into what may ultimately be regarded as one of the defining speeches of his career, Prime Minister Shinzo Abe slowly raised his hands chest high, then spread them out sideways in a gesture of confidence.

| IAN DODDS ILLUSTRATION

“Let me assure you,” he said, addressing members of the International Olympic Committee on Sept. 7. “The situation is under control.”

The prime minister was attempting to convince his audience in Buenos Aires that the multiple meltdowns at the Fukushima No. 1 nuclear power plant, initiated by tsunami triggered by the Great East Japan Earthquake on March 11, 2011, should not be a cause of concern for Tokyo hosting the Summer Olympic Games in 2020.

The nuclear accident, he said, “has never done and will never do any damage to Tokyo.”

However, cleaning up the crippled nuclear power plant certainly won’t be plain sailing, with decommissioning plans believed to include the removal of spent nuclear fuel rods from a cooling pool littered with debris, the creation of a permafrost wall around the four damaged reactors in order to prevent the spread of radioactive isotopes and the discovery of the precise location of the melted nuclear fuel in the highly toxic containment vessels.

“On a scale of zero to 10, I’d say the decommissioning process has advanced by about 0.1 (since the nuclear accident),” said Michio Ishikawa, president of the Association for Nuclear Decommissioning Study.

“I think the prime minister was right in saying that things are under control now,” Ishikawa said, but “predicting what the situation will be in 2020 is still very difficult.”

According to the latest road map released by the government and the Tokyo Electric Power Co. in June, decommissioning Fukushima’s four damaged nuclear reactors is expected to take up to 40 years to complete. The first — and most pressing — item on Tepco’s to-do list is stem the flow of contaminated water leaks from the on-site facilities.

The government has earmarked roughly ¥30 billion on an unprecedented project to freeze the ground around the reactors to prevent groundwater from leaking into the plant. Under a plan proposed by Kajima Corp. in April and endorsed by the Ministry of Economy, Trade and Industry on Oct. 9, a frozen wall spanning 1.4 km will be formed by coolant tubes drilled into the ground at 1-meter intervals around the plant. The government expects to finish the project by the end of the country’s fiscal 2014.

The annual running cost of the permafrost wall hasn’t officially been revealed yet. However, several critics have suggested that it could total up to ¥3 billion annually based on current estimates. Critics have also expressed concern that the system will require an abundant electricity supply around the clock, despite the nationwide shortages that have continued since the country’s nuclear reactors have been taken offline for maintenance in the wake of the Fukushima catastrophe.

In addition to the proposed permafrost wall, Tepco hopes to remove most radioactive materials from contaminated water on the site by employing the Advanced Liquid Processing System at full capacity soon.

However, creating an artificial permafrost of this scale has never been attempted before, while the filtration system that commenced trial operations in June has already been suspended three times after malfunctions were detected.

Despite the ongoing setbacks, the government only officially reached out to nuclear experts worldwide in September for advice on how to handle the contaminated water issue. The government has been notably slow to act on several occasions, which has even left pro-nuclear advocates scratching their heads in bewilderment.

“It isn’t completely clear that freezing the soil will contain the radioactive water,” University of Tokyo professor Satoru Tanaka said.

In June 2011, Tanaka was named head of the Atomic Energy Society of Japan, which boasts a membership of 7,000 nuclear experts nationwide. He was involved in designing the Fukushima No. 1 nuclear power plant, and issued apologies after the crisis for not being able to handle the calamity better.

When asked about the ongoing problems hampering the cleanup, Tanaka noted that none of the proposed solutions had ever been successfully implemented anywhere else in the world on such a massive scale. “The whole process will be trial and error, and then fixing the error and trying again. It’s the only way things will move forward,” Tanaka said. “It is crucial that everyone involved anticipate what may go wrong and be ready to implement countermeasures quickly.”

Presuming Tepco is able to control the spread of contamination beyond 2015, it would still have only scratched the surface of the issue. The mammoth task of removing the melted nuclear fuel and debris from the reactors lies ahead.

In mid-November, the embattled utility is preparing to remove 400 tons of spent fuel from the damaged reactor 4, 2½ years after a hydrogen explosion damaged the structure’s exterior.

According to the Nuclear Regulation Authority, there are 1,533 spent and unused fuel rod bundles in the cooling pool that contain radiation equivalent to 14,000 times the amount released in the atomic bomb attack on Hiroshima in 1945.

To remove the rods, Tepco has erected a 273-ton mobile crane above the building that will be operated remotely from a separate room.

Up to 22 spent fuel rods will be pulled from the racks they are stored in and inserted one by one into a heavy steel chamber while the assemblies are still under water. Once the chamber is removed from the pool and lowered to the ground, it will be transported to another pool in an undamaged building on the site for storage.

Under normal circumstances, such an operation would take little more than three months, but Tepco is hoping to complete the complicated task within fiscal 2014.

The plan has received mixed reviews regarding its safety from nuclear experts. Removing the fuel rods is a task usually assisted by computers that know their exact location down to the nearest millimeter. Working virtually blind in a highly radioactive environment, there is a risk the crane could drop or damage one of the rods — an accident that would heap even more misery onto the Tohoku region. The more alarmist critics out there have even argued that residents in Tokyo, located more than 200 km away, could be forced to evacuate if another earthquake flattened the reactor 4 building.

Others, meanwhile, say the reactor 4 building is more straightforward to work with than those housing other reactors since the pressure vessel didn't contain fuel rods at the time of the earthquake and tsunami. The cooling pool has also been made substantially stronger than it was before the accident, with Tepco saying that reinforced concrete measuring up to 18.5 cm is structurally sound on all sides, and the entire pool is shielded by a 6-mm stainless steel sheet.

While successfully removing the spent fuel rods from the reactor 4 cooling pool will probably go some way to allaying the fears of those living in Tohoku, it merely puts Tepco and the government on a collision course with the hitherto great unknown: finding the melted nuclear fuel in the remaining three reactors.

Tepco is planning to submerge the entire pressure vessel of each reactor in water in order to reduce radiation levels. Exactly how the utility is going to fill the 32-meter-high light-bulb-shaped containment vessel — in addition to sealing any cracks or holes it stumbles across along the way — is expected to be decided within fiscal 2016.

Subsequent steps regarding the pressure vessels are not expected to be decided until fiscal 2018, paving the way for the actual removal of the fuel in the remaining three reactors in the first half of fiscal 2020 — about the same time the Olympic torch is being relayed across the country.

Bearing all of this in mind, it's extremely hard to predict exactly how far along the decommissioning schedule the Fukushima plant will have come by 2020.

Ishikawa, whose career has also included stints at the International Atomic Energy Agency, is one of the few people who can claim to have an insight into the process.

"First, I would like to explain that decommissioning a nuclear power plant is not as complicated as it sounds," the 79-year-old told The Japan Times On Sunday. "It's all about removing the nuclear fuel, which contains 99.9 percent of the radioactive material. After that, it's basically the same as deconstructing any other building."

Employed at the Japan Atomic Energy Research Institute, Ishikawa was involved in designing Japan's first nuclear reactor. And then, toward the end of his career, he was tasked with creating technology in the 1980s to decommission the first nuclear plant in Japan.

"The first time, it was strenuous," Ishikawa said. "We needed ways to operate machines remotely and we had to build them from scratch."

He said he was excited by the prospect of creating a brand new form of technology to clean up nuclear waste.

But the Fukushima No. 1 cleanup remains a different story, even in his eyes. Nuclear fuel inside reactors 1, 2 and 3 is believed to have breached the inner containment vessels and accumulated in the outer steel containment vessels — what experts describe as a “melt-through.”

Assuming the reactor pressure vessels are submerged before the Olympics, as Tepco plans, still won't help much in figuring out where the nuclear fuel is located.

“It could be mixed with other metal, it could be as hard as iron or as breakable as a concrete block,” Ishikawa said. “There is no way to know such factors and, without them, removal isn't a possibility.”

Ishikawa believes that designing a specialized robot to locate the melted fuel is probably going to be required. If that doesn't work, easing the upper limit of radiation exposure for decontamination workers at the Fukushima No. 1 power plant is going to be essential, as laborers would need to work in close proximity to the vessels.

“If a sample of the nuclear fuel lying at the bottom of a vessel is extracted for study within the next four to five years, I'd call it a success,” Ishikawa said.

Forecasting the cleanup timetable in the aftermath of a nuclear crisis is also complex because there are few precedents that can provide an accurate guidance.

The Chernobyl disaster in 1986, which along with Fukushima remains the only level 7 incident to occur since the International Nuclear Event Scale was created, is very much an ongoing effort as of 2013.

Nine years after the plant exploded and caught fire, the World Health Organization linked nearly 700 cases of thyroid cancer among children and adolescents in the region to the accident. Some believe that radioactive iodine released in the calamity was deposited in pastures and eaten by cows who then concentrated it in their milk — a favorite source of nourishment for young children.

The Russian government is still in the process of strengthening Chernobyl's containment structure, and reports say that more than 95 percent of the nuclear fuel that sat in the pressure vessel at the time of the accident remain under the sarcophagus today. A new containment shelter over what's left of the devastated power plant in the Ukraine is scheduled to be completed in 2015.

By comparison, workers cleaning up the site of Three Mile Island were in the middle of shipping critical debris components to an off-site storage facility using specialized chambers and rail carriages nine years after America's worst nuclear accident. The debris shipments began in 1986 and continued until 1990.

The accident, however, was substantially easier to mop up compared to Fukushima or Chernobyl, as it was only a level 5 incident on the International Nuclear Event Scale.

Ishikawa does not believe the reactors at Fukushima No. 1 will be in a state that would worry the International Olympic Committee seven years from now in 2020.

While several radioactive materials that were released following the 2011 accident have half lives that will render much of the surrounding countryside unusable for many decades, there is no reason to believe that Fukushima will become an issue in hosting the Olympics, he said.

Tanaka of the University of Tokyo went further, saying it was virtually senseless to debate whether Abe's claim that "the situation is under control" is true.

And he agreed that at least in terms of hosting the Olympics, the nuclear plant posed no obvious risk to Tokyo.

"Look around, people are living in the city without any serious risk today," Tanaka said.

"Trying hard to convince the world that Japan is safe isn't enough," he said.

"What counts now is that the government makes it easier for everyone to understand — in tangible numbers — that it is, in fact, safe," Tanaka said.

"For example, we need to explain the leaks more clearly to the public and what it means. That is the responsibility of the government now" as Japan gears up for 2020, Tanaka said.

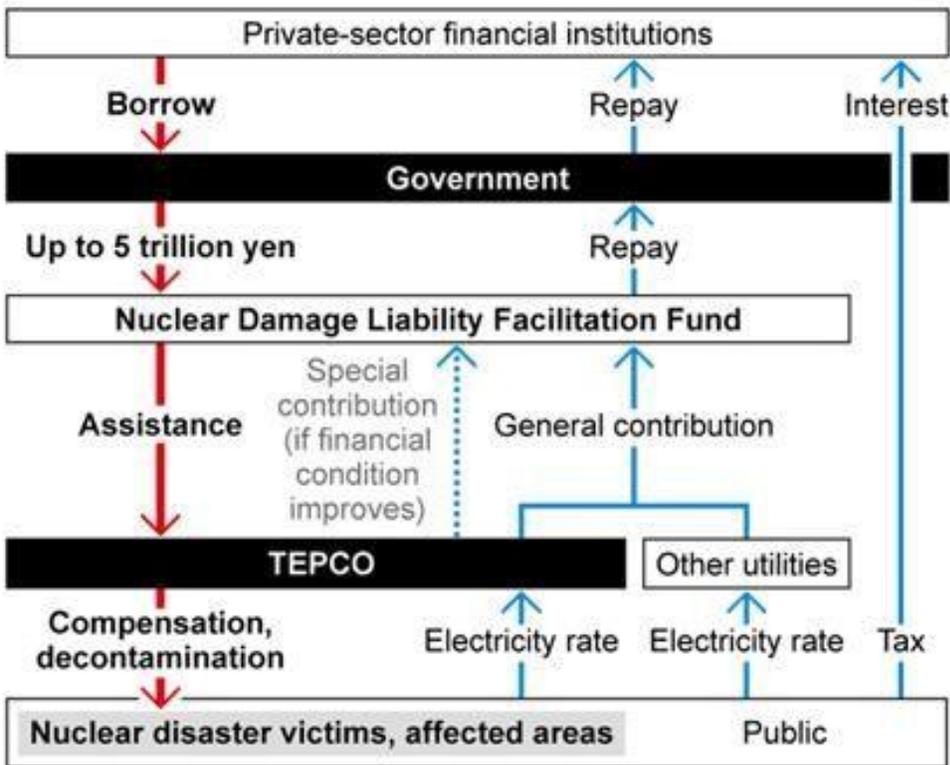

79 billion yen taxpayer money to help TEPCO

October 17, 2013

Board of Audit: Taxpayers face 79 billion yen tab for TEPCO assistance

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201310170069>

Government financial assistance to TEPCO

THE ASAHI SHIMBUN

The cost to taxpayers to help Tokyo Electric Power Co. compensate victims of the Fukushima nuclear disaster and clean up radioactive contamination could total 79.4 billion yen (\$810 million), according to Board of Audit estimates.

The figure is based on the assumption the government will lend 5 trillion yen, which is the maximum amount under a framework to support TEPCO, and is repaid over 31 years.

Under the setup, the government will lend the money to the operator of the crippled Fukushima No. 1 nuclear power plant through the Nuclear Damage Liability Facilitation Fund.

TEPCO and other power companies will pay back the principal by making “general contributions” to the fund that they will primarily finance through electricity rates.

TEPCO will additionally make “special contributions” from its earnings if its financial condition improves. Still, interest payments will be borne by the government.

It is almost certain that the loans will reach the 5-trillion-yen ceiling. The government has already provided more than 3 trillion yen for compensation, while nearly 1.3 trillion yen has been budgeted for decontamination.

Government auditors have warned that the public financial burden could grow further if compensation payouts and decontamination expenses increase.

“(The government) can gain public understanding (for its assistance to TEPCO) only by forecasting the total amount and timing of compensation with greater accuracy as soon as possible and providing a definite projection for the financial burden,” a Board of Audit report concluded.

The board estimates that it will take 31 years for the government to recoup the 5 trillion yen if the fund receives no special contributions from TEPCO. Interest payments will reach 79.4 billion yen.

The estimates also show that the collection period will shorten to 17 years and interest payments will drop to 45 billion yen if TEPCO allocates half of its net earnings projected under its rehabilitation plan to the special contributions.

TEPCO has yet to make a special contribution.

The estimates are based on the assumption that the government will borrow money from private-sector financial institutions at an ultra-low interest rate of 0.1 percent. The board has warned that the public financial burden will increase if interest rates rise.

This is the first time the Board of Audit has looked at the financial health of TEPCO, which was effectively brought under state control after the Fukushima nuclear crisis unfolded in March 2011.

Still, it remains unclear how much compensation to the victims and decontamination will total in the end, meaning taxpayers may shoulder a far greater financial burden if those costs snowball.

(This article was compiled from reports by Motoki Kaneko and Takashi Ebuchi.)

Why is TEPCO not accountable for its actions?

October 20, 2013

Whether Tepco fails or not, it's taxpayers' tab

by Tomoko Otake
Staff Writer

http://www.japantimes.co.jp/news/2013/10/20/national/whether-tepco-fails-or-not-its-taxpayers-tab/#.UmQBGM0_9k

It is impossible to put a price tag on all the pain and suffering inflicted on people as a result of the March 2011 meltdowns at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear plant.

The ongoing crisis has created more than 140,000 wandering "nuclear refugees," has stripped farmers and fishermen of their livelihoods, and continues to expose hundreds of plant workers to daily health risks as they battle to contain the radioactive water accumulating in leaky storage tanks and pipes and flowing into the ocean as groundwater, as well as other hazards.

The monetary cost alone is immeasurable because the crisis is far from over and the decontamination of areas hit by the radioactive fallout is way behind schedule. Just neutralizing the three reactors that suffered core meltdowns and the other reactor whose fuel pool looms as a major danger will take decades.

But one thing is clear: the final tab will be huge, and the public will end up paying for it, either through taxes or utility bills. **While estimates vary, the total cost will probably top ¥10 trillion — or 20 percent of what the central government collects every year through taxes, experts say.**

And last month's pledge by Prime Minister Shinzo Abe before the International Olympic Committee in Buenos Aires that the government will take the lead in bringing the crisis to an end, somewhat, in time for the 2020 Tokyo Olympics could mean additional financial burdens placed on taxpayers.

This has led to mounting calls in recent weeks, from academics and lawmakers, and even within the ruling, pro-nuclear Liberal Democratic Party, that the government should force Tepco into bankruptcy.

Doing so, they say, is also the only way for top management, as well as creditors and shareholders, to shoulder some of the blame for the fiasco at the inadequately defended coastal complex.

Others in the ruling party, meanwhile, propose splitting the utility into two parts, separating the profit-making power generation business from the unprofitable crisis-containment.

Tepco, which posted a ¥326.9 billion net loss in fiscal 2012, has stayed alive under a state-backed bailout scheme.

Through the Nuclear Damage Liability Fund, set up in September 2011, the firm has secured ¥5 trillion in public funds and is under effective government control amid enormous damages claims. As of June, the utility planned to pay an estimated ¥3.9 trillion in compensation, according to papers submitted by the fund and the utility to the government that month.

In addition to compensating victims of the disaster, the nation's biggest utility also bears the main onus of containing the radioactive water used to cool the damaged reactors, as well as the technologically daunting task of scrapping the stricken plant.

“Tepco is a private company, earning profits and listing its stock on the market,” said Masatoshi Akimoto, a Lower House LDP member. A rookie politician first elected in December, he heads a small study group with colleagues on the nation's energy policy.

“A normal private company would shoulder its management risks and would be accountable for its actions,” Akimoto said. **“How is it possible that a company that caused a nuclear accident can avoid bankruptcy, and its shareholders and creditor banks aren't held liable?”**

Akimoto acknowledged that his views are well outside the LDP mainstream. Still, he argued that the bankruptcy filing is the only way Tepco can be held accountable for its failure to bolster the plant's disaster defenses, when the risks the facility faced were no mysteries.

If Tepco goes under, he said, shareholders and creditors will also pay for the risks in investing in a nuclear plant operator. Their shares would plummet and they would be forced to lose much of their outstanding loans to Tepco. Management would be sacked and the utility's remaining assets would be sold off — saving “trillions of yen” for taxpayers, Akimoto figured.

The reality, however, is that the government is trying to prevent Tepco's failure at all costs, by introducing new accounting rules that smack of "window-dressing," fumed Kenichi Oshima, a professor of environmental economics at Ritsumeikan University in Kyoto.

On Oct. 1, the Ministry of Economy, Trade and Industry released new accounting rules for the nation's utilities whereby Tepco can now continue to report the six reactors at Fukushima No. 1 as assets, while booking depreciation reserves for the reactors over a 50-year period, even though four of the reactors will never run again, and the other two, anyway idled, face mounting calls for decommissioning.

Under previous rules for reactors whose operations had stopped prematurely, the utility had to report depreciation costs yet to be booked as a one-time extraordinary loss, which meant Tepco would have gone belly up under massive debts.

METI's rule changes have made it possible for Tepco to attach all future decommissioning costs onto utility bills. The move came after three meetings, between June and August, by a panel of experts within the ministry — with little public discussion and no deliberations in the Diet.

"This is the same as window-dressing, because it goes against the principles of corporate accounting, by which companies should report costs as costs, not as assets," Oshima said. "It's also wrong to change rules for depreciation halfway through."

Oshima estimated that the disaster has so far cost over ¥7.4 trillion. (See table) The scrapping of the damaged reactors, for example, could end up costing more than what is budgeted for now, as the current estimates are based on the assumption that the reactors undergo decommissioning after normal operations, he said.

Oshima said it is hard to estimate the total cost for the decontamination work, because it depends on how thorough the cleanup will be.

But according to a 2011 estimate by the nonprofit group Citizens' Nuclear Information Center, if all the affected land, roads, farms and forests are decontaminated, not just in Fukushima but also in "hot spots" in surrounding prefectures, the total cost will reach ¥28 trillion.

The government's bailout of Tepco comes with serious problems, Oshima argued, because it has effectively turned the nuclear power industry into a risk-free one.

“Nuclear power is a highly risky venture by nature,” Oshima said. “But if the government assumes all the consequences of a major disaster (without holding the guilty party accountable), nuclear power becomes a zero-risk industry. There’s no other industry like this.”

But Taku Yamamoto, a veteran Lower House member who heads the ruling party’s research committee on natural resources and energy, said Tepco should not go bankrupt or get broken up. “Tepco is a private company, and true, it’s like a zombie,” he said. “But we have a system where it still is the window (for all the compensation claims).”

Tepco needs to exist until it pays off all the compensation claims, Yamamoto said.

“If we let Tepco go bankrupt now, creditors would probably collect only 10 percent of their outstanding claims. Those creditors include disaster victims. To keep paying its obligations, it must keep standing, even in a zombie state.”

If the government forces Tepco to go under, the state will be sued for compensation by creditors and shareholders and thus be embroiled in a drawn-out court battle, Yamamoto said.

Oshima, while agreeing that the demise of Tepco alone will mean a loss of an institution through which compensation can be made, claimed the current arrangement is unhealthy.

“Why should the government pay all the costs of the disaster?” he asked. “Tepco should fail like any other firm does. What the government needs to do, instead, is to make sure the firm’s existing power generation facilities, workers and engineers are smoothly absorbed by a new entity, so electricity-generating operations continue.”

March 2011: Information barriers in crisis response

October 21, 2013

Obama cited bureaucratic barriers in nuclear crisis response

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201310210077>

By TOSHIHIRO OKUYAMA/ Senior Staff Writer

U.S. President Barack Obama feared that entrenched bureaucratic behavior would exacerbate an unfolding nuclear disaster in Japan and called on Tokyo to remove those barriers to avert a catastrophe, Foreign Ministry records show.

Obama talked with the prime minister, Naoto Kan, days after the Fukushima No. 1 nuclear power plant was damaged by the magnitude-9.0 earthquake and tsunami.

The two leaders spoke for 33 minutes from 10:22 a.m. on March 17, 2011. It was their second telephone conversation after the Great East Japan Earthquake struck six days earlier.

Obama was alarmed at the situation at the Fukushima plant and felt the Japanese government was not responding with sufficient urgency, according to the documents obtained by The Asahi Shimbun based on the freedom of information law.

The U.S. president told Kan he hoped a catastrophic situation could be avoided.

He also griped about bureaucratic barriers to offers of overseas assistance and said he hoped they would be removed so that support could be realized.

The two leaders spoke at the request of the U.S. side. It is not known how Obama spoke because the records were kept in Japanese.

At that time, U.S. officials believed that the pool holding spent nuclear fuel for the No. 4 reactor had lost water.

Earlier on March 17, John Roos, the U.S. ambassador to Japan at the time, had advised U.S. nationals to evacuate from an 80-kilometer radius of the Fukushima plant.

Kan told Obama, "We do not have the word 'retreat' (in our vocabulary). We are going all out to deal with (the crisis)," according to the Foreign Ministry records. He also said Japanese and U.S. experts were sharing information "without holding back anything."

The prime minister explained what was going on with the reactors and the spent nuclear fuel storage pools.

He said U.S. officials in charge of nuclear power plants were shown video footage of water remaining in the No. 4 reactor pool during discussions with their Japanese counterparts, which lasted until early March 17.

He also said Self-Defense Forces helicopters had dumped water over the No. 3 reactor pool shortly before their telephone conversation started.

Toward the end, Obama said he would keep in close touch with Kan. He promised to be ready to take a phone call from Kan at any time.

Kan said he would keep the U.S. side fully informed, particularly about the nuclear crisis.

It turned out that Kan and Obama did not discuss the situation again until March 30, or 13 days later. Their first conversation after the earthquake and tsunami was early on March 12.

* * *

In a recent interview, Kan said it was no surprise that the U.S. side felt there were bureaucratic obstacles in the early stages of the Fukushima nuclear crisis.

“I think the president was feeling what I was feeling,” Kan said. “Accurate information did not reach me. Information conduits were clogged up.”

Kan said information started to flow smoothly only after an integrated response headquarters set up in Tokyo Electric Power Co., the plant’s operator, was up and running.

Abe tones down rosy assessment of crisis

October 22, 2013

Abe soft-pedals assessment on Fukushima radioactive water leaks

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201310220048>

THE ASAHI SHIMBUN

Prime Minister Shinzo Abe toned down his rosy assessment of the Fukushima nuclear crisis that had helped Tokyo win its bid to host the 2020 Olympic Games.

At the Lower House Budget Committee on Oct. 21, the prime minister’s words were less assuring concerning the ongoing radioactive water leaks plaguing the nuclear plant.

"The situation is under control all in all," he said. "I believe that the impact of the contaminated water is blocked."

On Sept. 7 in Buenos Aires, Abe told the International Olympic Committee that the contaminated water problem was "under control." He also said radioactive water was "completely blocked" within the 300,000-square-meter harbor in front of the plant.

Tokyo was picked to host the 2020 Games after Abe's assurances, beating out Madrid and Istanbul. Abe's new assessment of the Fukushima situation came after Yasuhisa Shiozaki of his Liberal Democratic Party and Yuichiro Tamaki of the opposition Democratic Party of Japan raised the issue at the committee meeting.

Tamaki mentioned the widespread mistrust of Abe's evaluation given to the IOC.

"A survey conducted by a newspaper found that about 80 percent of respondents lacked faith (in Abe's assessment)," Tamaki said.

Abe responded by saying the government should provide additional and more accurate information.

Tamaki also pointed out that the real problem facing the government is how to stem the outflow of radioactive water and preventing it from reaching the sea.

"What has been blocked is the impact of contaminated water, not the contaminated water itself," he said.

Industry minister Toshimitsu Motegi echoed Abe's assessment, saying the contaminated water remains in a certain area.

In the latest of a series of leaks, Tokyo Electric Power Co., which operates the plant, said Oct. 21 that radioactive water exceeding safety standards had overflowed barriers surrounding storage tanks as a result of heavy rainfall a day earlier and likely made its way to the ocean.

TEPCO's "ineptitude"

October 22, 2013

No. 1 water woes laid to Tepco's ineptitude

Cleanup confounded by failure to foresee mess, accept advice

by Chico Harlan

The Washington Post

http://www.japantimes.co.jp/news/2013/10/22/national/no-1-water-woes-laid-to-tepcos-ineptitude/#.UmZrjFM0_9k

Two and a half years after the Fukushima No. 1 nuclear plant experienced its three reactor-core meltdowns, efforts to clean up what remains of the complex is turning into another kind of disaster.

The site now stores some 340 million liters of radioactive water, more than enough to fill Yankee Stadium to the brim. An additional 400 tons of toxic groundwater is flowing daily into the Pacific Ocean, and almost every week Tokyo Electric Power Co. acknowledges a new leak.

Tepco started the cleanup process more than two years ago and was subsequently given a government bailout as its debts soared. The job of dismantling the facility was supposed to give the company an opportunity to rebuild its credibility.

But many lawmakers and nuclear industry specialists say Tepco is perpetuating the kinds of mistakes that led to the March 2011 meltdowns: underestimating the plant's vulnerabilities, ignoring warnings from outsiders and neglecting to draw up plans for things that might go wrong. Those failures, they say, have led to the massive buildup and spills of radioactive water.

"Tepco didn't play enough of these what-if games," said Dale Klein, a former chairman of the U.S. Nuclear Regulatory Commission, who recently joined a Tepco advisory panel. "They didn't have enough of that questioning attitude" about their plans.

The spills into the ocean are far less toxic than the radioactive plumes that emanated from the plant after the earthquake and tsunami, forcing 160,000 people to move out of the vicinity. Thanks to that quick evacuation, experts say, there are no expectations of a Chernobyl-style spike in cancer cases — although the government is conducting thyroid checks on thousands of children. But the flow of radioactive water amounts to a slow-burning environmental disaster with implications for Japan's wildlife and its food chain.

The problems have prompted the central government to step in with around ¥50 billion to fund new countermeasures, including a subterranean "ice wall" designed to keep groundwater from flowing into radioactive buildings.

The latest government-led actions are particularly galling for some, who say Tepco should have taken similar measures earlier. One lawmaker, Sumio Mabuchi, who was also an adviser at the start of the crisis to then-Prime Minister Naoto Kan, says Tepco, deep in debt, neglected to take important steps against the groundwater two years ago because of concerns about its bottom line.

Tepco's president, Naomi Hirose, testified in the Diet last month that the utility hasn't "scrimped" on the cleanup, though he did say that it is "majorly at fault" for its failure to manage the groundwater buildup.

The 40-year decommissioning is expected to cost ¥10 trillion — roughly two years' worth of Tepco's revenue — and the company says it is trying to save up and cut other costs.

But for many Japanese, the company's assurances inspire little confidence. Two members of the Diet, speaking on condition of anonymity to share what they describe as sensitive details, say Tepco continues to spend irresponsibly on lobbying politicians, offering them free trips to nuclear sites that include meals and lodging in hot springs resorts. A Tepco spokesman said the company does not offer such trips.

Fukushima No. 1 is on an old riverbed, its backyard a line of forested hills and mountains. Even before the 2011 disaster, rainfall from across the region would funnel toward the plant. Such inflow was rarely a problem because a piping system collected groundwater and spit it into the ocean. Minor leaks would sometimes form in buildings built below sea level, but even that water, uncontaminated, was easy to pump out and dump.

The magnitude 9.0 earthquake and 15-meter tsunami of March 11, 2011, threw the plant's groundwater system out of whack. Damaged pipes no longer corralled the inflow, meaning the plant lost its first line of defense against water streaming in from the hillsides.

Worse, any water that flowed under or through the area picked up toxicity of its own. Groundwater that made its way into the reactor buildings also mixed with a separate channel of intensely contaminated water that had been used to douse and cool the reactors.

No longer could the groundwater simply be discarded into the ocean.

The first months of the disaster were chaotic, an improvised battle to cool melted nuclear fuel that involved fire trucks, helicopters, robots and workers. As the emergency calmed and the groundwater problem emerged, Tepco was left with two options: It could either block the groundwater from entering the site, or it could pump it out and store whatever had leaked into buildings.

Tepco opted for the latter — a mistake, many outside experts say.

Atsunao Marui, a groundwater expert and member of a government-led panel that advises Tepco, said the company was slow to assess just how rapidly groundwater from mountains was flooding the buildings. At the time the disaster struck, Tepco didn't have a single groundwater specialist among its 40,000 employees, Marui said.

Tepco also declined a June 2011 request from Mabuchi, the lawmaker and adviser to the prime minister, to build a special wall extending 30 meters underground around the reactor and turbine buildings, sealing them off from the groundwater flow. Tepco initially agreed to the project, Mabuchi said, but backed out because of concerns about the estimated cost of ¥100 billion.

“We are already in a very severe financial situation,” Tepco wrote to the Ministry of Economy, Trade and Industry in a letter shared with The Washington Post. “And by taking on an additional ¥100 billion, the market could evaluate that we are one step closer to insolvency. That is something we’d like to avoid.”

In the following months, Tepco never considered alternative options to cut off the groundwater, according to minutes from more than 10 hours of meetings, during which Tepco and a Cabinet-formed team of advisers planned a “road map” for decommissioning the facility.

The company’s plan was to pump toxic water from the reactor and turbine rooms and then cleanse it of radionuclides — isotopes that radioactively decay — using systems that worked like high-end Brita filters. Tepco would then have “clean water” that could be stored in tanks.

But Tepco’s attempts to create clean water have been repeatedly derailed. Two systems have proven successful in filtering cesium. But others have been plagued by mechanical troubles — not surprising, experts say, because they have been constructed at a breakneck pace, often with parts shrunken and custom-built to accommodate Fukushima No. 1’s cramped spaces.

Because of those malfunctions, some water stored in hastily built tanks is laced with contaminants, including strontium, which can burrow into bones and irradiate tissue. More than 1,000 gray tanks, some the size of small apartment buildings, now form a patchwork on a cliff above the plant — an area where workers once spent their breaks taking nature walks. Enough toxic water accumulates each week to fill an Olympic-size swimming pool. One such tank has leaked, another overflowed, and regulators fear that more spills are inevitable. Tepco must constantly build more tanks to keep pace with the accumulating water.

“It’s not sustainable,” said Lake Barrett, a new adviser to Tepco who directed cleanup operations at Three Mile Island after the 1979 nuclear accident in the United States.

Tepco estimates that 800 tons of water flows under the plant daily — half of it traveling into the ocean, the other half making its way into the facility’s buildings and requiring storage. Tepco acknowledged the long-presumed ocean flow in July; the company said it had held off on the disclosure because it didn’t want to worry the public until it was certain of a problem.

Both the government and Tepco say the ocean contamination is confined mostly to a man-made harbor around the plant.

But some scientists say that assurance plays down significant long-term concerns about marine life and the food chain. Cesium levels are still hundreds of times the pre-accident norm in areas beyond the harbor, said Ken Buesseler, a senior scientist with the Woods Hole Oceanographic Institution who has monitored waters around the nuclear plant, most recently last month.

Radionuclides also fall to the ocean floor, where they could be ingested by bottom feeders. Many local fish species show high-enough levels of radiation that the government bars their sale.

“I could swim in that water” outside the plant, Buesseler said. “But you might not want to eat those fish. It’s a serious concern for internal doses. (Radionuclides) are now on the seafloor and could stay in the food chain for years, if not decades.”

Some nuclear industry executives who have worked with Tepco say the company shouldn’t be faulted for prioritizing issues other than the groundwater. They note that Tepco has managed to cool the molten reactors while also reinforcing damaged buildings against further earthquakes.

But the buildup of contaminated water also complicates other work at the plant.

“Right now, the groundwater is the biggest problem at the plant, and one Tepco needs to solve thoroughly,” said Tsuneo Futami, who was superintendent of Fukushima No. 1 from 1997 until 2000. “Dealing with this is almost a prerequisite for decommissioning.”

The remaining options to deal with the buildup are unpopular or flawed. The latest plan includes the ice wall, a new groundwater pumping system and yet another system to filter radionuclides. But the ice-wall technology is unproven, and taxpayers will foot the bill because Tepco lacks the funding to deal with major, unplanned problems at the plant.

Tepco can repair its fragile economic situation with a restructuring plan featuring major cost-cutting that was approved by the government last year. But Tepco says its profitability also depends on the restart of its largest nuclear power plant, Kashiwazaki-Kariwa, a seven-reactor complex in Niigata Prefecture. A majority of Japanese, though, oppose nuclear power. All of the nation’s 50 operable reactors are currently shuttered.

Some activists say Tepco should be allowed to go bankrupt, with the government taking full control of the Fukushima No. 1 scrapping. But bankruptcy would cause “just one more disaster,” this one economic, said

Mana Nakazora, a Tokyo-based chief credit analyst at BNP Paribas. Bankruptcy might have been conceivable in the months after the disaster started, but Tepco has since been kept afloat with emergency loans from banks and cash injections from the government — debts that, if not paid, would rock the financial system.

Some nuclear engineers and government officials say Tepco has one other option that would ease management of the site: It can dump the stored water into the ocean, provided it can be refiltered and its now-high radiation levels lowered to within legal limits.

The International Atomic Energy Agency said in April that Japan should consider such “controlled discharges.” The chairman of Japan’s nuclear watchdog, Shunichi Tanaka, said last month that dumping might be necessary.

The National Federation of Fisheries Cooperative Associations said its members are against any releases, no matter the level of the water’s toxicity, and local governments also have expressed opposition.

Their stance highlights the enormous public distrust of Tepco: Few in Japan are willing to take the firm at its word if it says the controlled releases will be safe.

“They’re going to have to release the water eventually,” said Barrett, the adviser. “No ands, if or buts about it in my view. But how they get there is a huge societal problem, not just for Tepco but for Japan.”

No surprise to be expected from IAEA

IAEA Press Releases

Press Release 2013/19

IAEA Expert Remediation Mission to Japan Issues Preliminary Report

<http://www.iaea.org/newscenter/pressreleases/2013/prn201319.html>

21 October 2013 | *Tokyo* -- The International Atomic Energy Agency (IAEA)'s international expert mission to review remediation efforts in areas affected by the Fukushima Daiichi accident concluded

today with the presentation of a *Preliminary Summary Report* to Japan's Senior Vice-Minister of the Environment, Shinji Inoue.

The Follow-up IAEA International Mission on Remediation of Large Contaminated Areas Off-site the Fukushima Daiichi NPS recognised the huge effort and enormous resources that Japan is devoting to its remediation strategies and activities, with the aim of improving living conditions for people affected by the nuclear accident and enabling evacuees to return home.

The Mission Team highlighted important progress since the first IAEA remediation mission in October 2011, noted that Japan had made good use of advice from that earlier Mission, and offered fresh advice in a number of areas where it is still possible to further improve current practices, taking into account both international standards and the experience of remediation programmes in other countries.

"Japan has done an enormous amount to reduce people's radiation exposure in the affected areas, to work towards enabling evacuees to go back to their homes and to support local communities in overcoming economic and social disruption," said team leader Juan Carlos Lentijo, Director of the Division of Fuel Cycle and Waste Technology in the IAEA Department of Nuclear Energy.

"The Mission Team has been really impressed by the involvement of a wide range of ministries, agencies and local authorities in driving these crucial remediation efforts."

Among the findings of the Mission, which was requested by the Japanese government and began on 14 October, the team welcomed the extensive provision of individual dosimeters so that residents can monitor their own radiation dose rates, helping to boost public confidence.

Good progress has been made in the remediation of affected farmland, and comprehensive implementation of food safety measures has protected consumers and improved consumer confidence in farm produce. A comprehensive programme to monitor fresh water sources such as rivers, lakes and ponds is ongoing, including extensive food monitoring of both wild and cultivated freshwater fish.

The Mission encouraged the Japanese government to strengthen its efforts to explain to the public that an additional individual radiation dose of 1 millisievert per year (mSv/y), which it has announced as a long-term goal, cannot be achieved in a short time by decontamination work alone. In remediation situations, with appropriate consideration of the prevailing circumstances, any level of individual radiation dose in the range of 1 to 20 mSv/y is acceptable and in line with international standards and the recommendations of the relevant international organisations such as the IAEA, International Commission on Radiological Protection (ICRP), United Nations Scientific Committee on the Effect of Atomic Radiation (UNSCEAR) and World Health Organisation (WHO).

The Mission encouraged the relevant institutions in Japan to assess the role that the Nuclear Regulation Authority (NRA) could play in the independent review of the remediation activities, particularly those required for the long term. The Mission also encouraged the relevant organisations to conduct safety assessments of the facilities and activities for the long-term management of contaminated materials, and to allow for their independent review.

The Mission Team acknowledged that the Japanese authorities have implemented a practical option for remediating the region's extensive forest areas, taking a limited approach by removing material under the trees in a 20-meter buffer strip adjacent to residences, farmland and public spaces. It recommended concentrating efforts on areas that bring the greatest benefit in reducing doses to the public, while avoiding damage to the ecological functioning of the forest where possible.

The 16-person team consisted of international experts and IAEA staff working in a range of disciplines, including radiation protection, remediation technologies, waste management and stakeholder involvement.

The Mission's Preliminary Summary Report can be viewed [here](#). The final report will be presented to the Japanese government in December.

Background

The Mission, which is the follow-up to the *IAEA International Mission on Remediation of Large Contaminated Areas Off-site the Fukushima Daiichi NPS* in October 2011, had the following three objectives:

- To provide assistance to Japan in assessing the progress made with the remediation of the Special Decontamination Area (not included in the previous mission of 2011) and the Intensive Contamination Survey Areas;
- To review remediation strategies, plans and works, in view of the advice provided by the previous mission on remediation of large contaminated off-site areas; and
- To share its findings with the international community as lessons learned.

The Mission Team assessed comprehensive information provided by the Japanese authorities and held discussions with the relevant institutions, including national, prefectural and local institutions. It also visited the affected areas, including several sites where remediation activities were conducted and some temporary storage sites for radioactive waste and soil, as well as a survey area for an interim storage facility, and a demonstration facility for incineration of sewage sludge.

The Mission was in line with the *IAEA Action Plan on Nuclear Safety*, which was unanimously endorsed by the IAEA's Member States in September 2011 and defines a programme of work to strengthen the global nuclear safety framework.

The Agreement WHA 12-40 between WHO and IAEA

The World Health Organisation (WHO) and the International Atomic Energy Agency (IAEA) signed the Agreement “WHA 12-40” on 28th May 1959.

One should note in particular :

The International Atomic Energy Agency and the World Health Organization recognize that they may find it necessary to apply certain limitations for the safeguarding of confidential information furnished to them

...

The Secretariat of the International Atomic Energy Agency and the Secretariat of the World Health Organization shall keep each other fully informed concerning all projected activities and all programmes of work which may be of interest to both parties.

It is recognized by the World Health Organization that the International Atomic Energy Agency has the primary responsibility for encouraging, assisting and co-ordinating research on, and development and practical application of, atomic energy for peaceful uses throughout the world without prejudice to the right of the World Health Organization to concern itself with promoting, developing, assisting, and co-ordinating international health work, including research, in all its aspects.

Whenever either organization proposes to initiate a programme or activity on a subject in which the other organization has or may have a substantial interest, the first party shall consult the other with a view to adjusting the matter by mutual agreement.

?

Since the signing of this agreement, WHO has shown no autonomy of action towards achieving its stated objectives in the field of radiation protection.

On the contrary it has shown its capacity for misinforming the public about the health consequences of radioactive contamination caused by the civil and military nuclear industries.

WHO waited five years before visiting those territories that had been heavily contaminated by the accident at Chernobyl. They gave no instructions for evacuation or for the provision of clean food to the affected populations.

WHO has kept hidden the health consequences of this catastrophe, especially by not publishing the proceedings of the 1995 and 2001 conferences.

WHO still estimates the number of deaths caused by Chernobyl at less than fifty and attributes the health problems of populations of Belarus, Ukraine and Russia to fear of radiation.

WHO does not recognise the validity of the work published in 2009 by the Academy of Sciences of New York which estimates the number of deaths caused by Chernobyl to be nearly one million.

With Fukushima, WHO has the same attitude as for Chernobyl.

The World Health Organisation (WHO) does not respect its constitution which lays down the following principle:

“Informed opinion and active cooperation from the public are of paramount importance for improving the health of people ...”

In the first chapter, Article 1:

“The goal of the World Health Organization shall be the attainment by all peoples of the highest possible level of health.”

In chapter 2 – FUNCTIONS of WHO:

a) to act as the directing and co-ordinating Authority on International Health Work.

Revision of the agreement WHO / IAEA

The revision must be agreed by a General Assembly of WHO which is held in May each year. Before that, it must be placed on the agenda of the General Assembly. This is drawn up by the Executive Council in the January before. A proposal that the revision of the WHO-IAEA Agreement should be put on the agenda must be made to the Executive Council by a Member State and with the support of another Member State. Leading up to that, the support of recognized NGOs is very useful in convincing Member States to propose the revision and also useful for the final vote. It needs to be understood that putting an item on the agenda of the WHO is a long process that can take years. We know also that the more powerful Member States are able to influence decisions through informal channels.

20 millisieverts: An "optimum" balance between costs and benefits ?

October 23, 2013

IAEA urges Japan to give public a dose of reality on decontamination work

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201310230076>

THE ASAHI SHIMBUN

An International Atomic Energy Agency team is urging Japan to temper public expectations that decontamination work near the devastated Fukushima No. 1 nuclear power plant will quickly bring radiation levels with the national legal limit.

The team said in a report that there is a gap between what the ongoing cleanup operation can achieve and the expectations of residents in communities impacted by the nuclear disaster.

In the report, compiled on Oct. 21, the IAEA mission said most residents expected cleanup in their communities to lower contamination to an annual dose of 1 millisievert, the nation's safety limit.

But the team said **a reading of up to 20 millisieverts is acceptable** under international standards in areas where cleanup is under way, citing recommendations from international bodies such as the International Commission on Radiological Protection and the World Health Organization.

It urged the Japanese government to **better educate the public that an annual dose of 1 millisievert is the long-term goal**, and that that level cannot be reached in the short term through cleanup work alone.

The 1-millisievert yardstick is the legal annual dose for people living in a natural environment, excluding doses from medical X-rays and other sources.

Juan Carlos Lentijo, who led the IAEA mission involving a team of 13 experts, told a news conference on Oct. 21 that the Japanese government should find **an optimal balance between the costs and the benefits, with a target of achieving a dose of 20 millisieverts or less**.

The IAEA team has been in Fukushima Prefecture since Oct. 14 to observe the progress of decontamination work in areas surrounding the plant and identify challenges facing officials dealing with the nuclear crisis.

The team's report, which directed eight points of advice to Japan, said by offering the public a realistic picture of decontamination and avoiding unnecessary steps to lower radiation levels, the nation can reallocate funds for this effort to restoring vital infrastructure to improve living conditions.

It said the IAEA, and possibly the international scientific community, would back Japan in this "challenging task" in getting the public to accept a step-by-step approach to decontamination.

After the accident unfolded at the plant in March 2011 following the Great East Japan Earthquake and tsunami, the government ordered the evacuation of residents in communities with an annual dose of 20 millisieverts or more.

The government's decontamination work aims at bringing radiation levels in the heavily contaminated areas to within 20 millisieverts a year to allow residents to return and eventually to "1 millisievert or less" as a long-term goal.

Some local governments agreed that achieving the 1 millisievert a year target through cleanup work alone is not realistic.

In Date, Fukushima Prefecture, the city government told the IAEA team that there would be little progress in rebuilding efforts if it adhered to the 1-millisievert yardstick.

"It will be costly, require a lot more manpower and more time," a city official said.

Radiation levels at some sites in the city measured several millisieverts a year.

But a prefectural government official handling decontamination operation said such a level should be acceptable from a rebuilding viewpoint.

"An annual dose of 1 millisievert is a targeted long-term goal," said the official.

But most residents are intent on lowering the level to 1 millisievert a year, which they believe ensures their safety.

Most expressed their discontent when officials explained that decontamination work did not reduce radiation levels to within 1 millisievert a year at some sites at a meeting for residents in the Miyakoji district in Tamura, also in Fukushima Prefecture, on Oct. 14.

The central government completed cleanup in the district in June. Although it planned to allow residents to return to the district by lifting the evacuation order on Nov. 1, it is heeding their concerns and set to delay the timetable until next spring.

The district was originally part of the no-entry zone, an area within a radius of 20 kilometers from the crippled plant.

The U.N. agency also called for a realistic approach to cleanup in a report it compiled after a visit to Japan in October 2011. The central government plans to spend 5 trillion yen (\$50.86 billion) on decontamination work.

Abe sticks to his guns

October 23, 2013

Abe again insists that radioactive water at Fukushima plant is 'completely blocked'

<http://mainichi.jp/english/english/newsselect/news/20131023p2a00m0na008000c.html>

Prime Minister Shinzo Abe has again repeated his insistence that radioactive water leaks at the Fukushima No. 1 Nuclear Power Plant are being kept within the bay there.

"We are monitoring radiation levels, and they are far below the safety limits for radioactive materials. The effects of the contaminated water are being completely blocked," Abe said on Oct. 22 at the House of Representatives' Budget Committee, denying that radioactive materials are affecting the outside ocean. The remarks were made in response to a question by the Japanese Communist Party's Akira Kasai.

At the International Olympic Committee Session in September, Abe said that "the effects (of the radioactive water) are being completely blocked to inside of the bay" and "the situation is under control." However, in questioning during the Lower House plenary session on Oct. 16, he didn't use the word "completely" and qualified his "under control" statement with "overall," saying, "The effects are blocked to within the bay. Overall the situation is under control."

Kasai questioned Abe, "Why has your phrasing changed?" The prime minister responded, "Basically the phrases mean the same thing. From the stance of the impact on health as well, the effects are completely blocked. My thinking has not changed."

Meanwhile, on the subject of the Trans-Pacific Partnership (TPP) talks and the exemption of certain products from tariff elimination, minister in charge Akira Amari said, "By untouchable products, we mean

things that Japan must have for its survival. We have not specified particular products." The statement suggests that tariffs on 586 products under five important categories such as rice might be eliminated.

In its policy platform for the July House of Councillors election, the Liberal Democratic Party (LDP) wrote clearly that it would "prioritize exempting products like those in the five important types, and if we cannot secure their tariff status we will not hesitate to quit the negotiations." Koji Hata of the People's Life Party criticized the LDP for apparently backing off from this policy, calling it "betraying the people."

Kasai and Hata called for intensive Budget Committee deliberations on the radioactive water and TPP issues.

Anand Grover (UN) critical of IAEA Report

October 25, 2013

Human rights experts rap U.N. report on Fukushima radiation

Kyodo

http://www.japantimes.co.jp/news/2013/10/25/national/human-rights-experts-rap-u-n-report-on-fukushima-radiation/#.UmoV-VM0_9k

NEW YORK – Human rights experts, including a U.N. special rapporteur, are criticizing a U.N. scientific report dismissing concerns about the effects of radiation from the Fukushima nuclear disaster on the Japanese public.

Speaking Thursday at an event organized by U.S. and Japanese nongovernmental groups, U.N. special rapporteur on the right to health Anand Grover took issue with the report's conclusion that "there is nothing to worry about" for members of the public exposed to radiation from Fukushima No. 1.

The report was prepared by the U.N. Scientific Committee on the Effects of Atomic Radiation.

The committee, which studied the levels and effects of radiation exposure caused by the nuclear disaster after the March 11, 2011, earthquake and tsunami, found that for the general public, "no discernible increased incidence of radiation-related health effects are expected."

Grover, who visited Japan in November 2012 and compiled his own report on the situation from a human rights perspective, said the data on radioactive exposure is insufficient to rule out the possibility that low doses could have ill effects on health.

He also said that ensuring the participation of affected communities in decision-making is “one of the core obligations” of governments and that the public has a right to information.

Special rapporteurs are independent investigators tasked by the United Nations with investigating human rights issues and can only investigate a country if invited to do so by its government.

Mari Inoue, a representative of Tokyo-based Human Rights Now, meanwhile called for the UNSCEAR report to be revised.

She said the report should endorse evacuation from areas where exposure exceeds 1 millisievert of radiation per year, well below the Japanese government’s yardstick of 20 millisieverts per year.

It should also recommend continued study of contract workers exposed to radiation, increased community participation in the government response to the disaster, and recognition that it is too early to rule out future health effects for the exposed, Inoue said.

Also on Thursday, Human Rights Now released a statement signed by 64 community organizations in Japan calling for revisions to the report.

The UNSCEAR’s full report, including scientific data supporting its findings, has not yet been published. The group said when finished, the report will be “the most comprehensive scientific analysis of the information available to date.”

Special Report - Help wanted in Fukushima: Low pay, high risks and gangsters

Fri, Oct 25 2013

By Antoni Slodkowski and Mari Saito

IWAKI (Reuters) - Tetsuya Hayashi went to Fukushima to take a job at ground zero of the worst nuclear disaster since Chernobyl. He lasted less than two weeks.

Hayashi, 41, says he was recruited for a job monitoring the radiation exposure of workers leaving the plant in the summer of 2012. Instead, when he turned up for work, he was handed off through a web of contractors and assigned, to his surprise, to one of Fukushima's hottest radiation zones.

He was told he would have to wear an oxygen tank and a double-layer protective suit. Even then, his handlers told him, the radiation would be so high it could burn through his annual exposure limit in just under an hour.

"I felt cheated and entrapped," Hayashi said. "I had not agreed to any of this."

When Hayashi took his grievances to a firm on the next rung up the ladder of Fukushima contractors, he says he was fired. He filed a complaint but has not received any response from labour regulators for more than a year. All the eight companies involved, including embattled plant operator Tokyo Electric Power Co, declined to comment or could not be reached for comment on his case.

Out of work, Hayashi found a second job at Fukushima, this time building a concrete base for tanks to hold spent fuel rods. His new employer skimmed almost a third of his wages - about \$1,500 (£925) a month - and paid him the rest in cash in brown paper envelopes, he says. Reuters reviewed documents related to Hayashi's complaint, including pay envelopes and bank statements.

Hayashi's hard times are not unusual in the estimated \$150-billion effort to dismantle the Fukushima reactors and clean up the neighbouring areas, a Reuters examination found.

In reviewing Fukushima working conditions, Reuters interviewed more than 80 workers, employers and officials involved in the unprecedented nuclear clean-up. A common complaint: the project's dependence on a sprawling and little scrutinised network of subcontractors - many of them inexperienced with nuclear work and some of them, police say, have ties to organised crime.

Tepco sits atop a pyramid of subcontractors that can run to seven or more layers and includes construction giants such as Kajima Corp and Obayashi Corp in the first tier. The embattled utility remains in charge of the work to dismantle the damaged Fukushima reactors, a government-subsidized job expected to take 30 years or more.

Outside the plant, Japan's "Big Four" construction companies - Kajima, Obayashi, Shimizu Corp and Taisei Corp - oversee hundreds of small firms working on government-funded contracts to remove radioactive dirt and debris from nearby villages and farms so evacuees can return home.

Tokyo Electric, widely known as Tepco, says it has been unable to monitor subcontractors fully but has taken steps to limit worker abuses and curb the involvement of organised crime.

"We sign contracts with companies based on the cost needed to carry out a task," Masayuki Ono, a general manager for nuclear power at Tepco, told Reuters. "The companies then hire their own employees taking into account our contract. It's very difficult for us to go in and check their contracts."

The unprecedented Fukushima nuclear clean-up both inside and outside the plant faces a deepening shortage of workers. There are about 25 percent more openings than applicants for jobs in Fukushima prefecture, according to government data.

Raising wages could draw more workers but that has not happened, the data shows. Tepco is under pressure to post a profit in the year to March 2014 under a turnaround plan Japan's top banks recently financed with \$5.9 billion in new loans and refinancing. In 2011, in the wake of the disaster, Tepco cut pay for its own workers by 20 percent.

With wages flat and workers scarce, labour brokers have stepped into the gap, recruiting people whose lives have reached a dead end or who have trouble finding a job outside the disaster zone.

The result has been a proliferation of small firms - many unregistered. Some 800 companies are active inside the Fukushima plant and hundreds more are working in the decontamination effort outside its gates, according to Tepco and documents reviewed by Reuters.

Tepco, Asia's largest listed power utility, had long enjoyed close ties to regulators and lax government oversight. That came under harsh scrutiny after a 9.0 magnitude earthquake and a massive tsunami hit the plant on March 11, 2011.

The disaster triggered three reactor meltdowns, a series of explosions and a radiation leak that forced 150,000 people to flee nearby villages.

Tepco's hapless efforts since to stabilise the situation have been like someone playing "whack-a-mole", Minister of Economy, Trade and Industry Toshimitsu Motegi has said.

'NUCLEAR GYPSIES'

Hayashi is one of an estimated 50,000 workers who have been hired so far to shut down the nuclear plant and decontaminate the towns and villages nearby. Thousands more will have to follow. Some of the workers will be needed to maintain the system that cools damaged fuel rods in the reactors with thousands of tonnes of water every day. The contaminated runoff is then transferred to more than 1,000 tanks, enough to fill more than 130 Olympic-sized swimming pools.

Dismantling the Fukushima Daiichi plant will require maintaining a job pool of at least 12,000 workers just through 2015, according to Tepco's blueprint. That compares to just over 8,000 registered workers now. In recent months, some 6,000 have been working inside the plant.

The Tepco hiring estimate does not include the manpower required for the government's new \$330 million plan to build a massive ice wall around the plant to keep radiated water from leaking into the sea.

"I think we should really ask whether they are able to do this while ensuring the safety of the workers," said Shinichi Nakayama, deputy director of safety research at the Japan Atomic Energy Agency.

Japan's nuclear industry has relied on cheap labour since the first plants, including Fukushima, opened in the 1970s. For years, the industry has rounded up itinerant workers known as "nuclear gypsies" from the Sanya neighbourhood of Tokyo and Kamagasaki in Osaka, areas known for large numbers of homeless men.

"Working conditions in the nuclear industry have always been bad," said Saburo Murata, deputy director of Osaka's Hannan Chuo Hospital. "Problems with money, outsourced recruitment, lack of proper health insurance - these have existed for decades."

The Fukushima project has magnified those problems. When Japan's parliament approved a bill to fund decontamination work in August 2011, the law did not apply existing rules regulating the construction industry. As a result, contractors working on decontamination have not been required to disclose information on management or undergo any screening.

That meant anyone could become a nuclear contractor overnight. Many small companies without experience rushed to bid for contracts and then often turned to brokers to round up the manpower, according to employers and workers.

The resulting influx of workers has turned the town of Iwaki, some 50 kilometres (30 miles) from the plant, into a bustling labour hub at the front line of the massive public works project.

In extreme cases, brokers have been known to "buy" workers by paying off their debts. The workers are then forced to work until they pay off their new bosses for sharply reduced wages and under conditions that make it hard for them to speak out against abuses, labour activists and workers in Fukushima said.

Lake Barrett, a former U.S. nuclear regulator and an advisor to Tepco, says the system is so ingrained it will take time to change.

"There's been a century of tradition of big Japanese companies using contractors, and that's just the way it is in Japan," he told Reuters. "You're not going to change that overnight just because you have a new job here, so I think you have to adapt."

A Tepco survey from 2012 showed nearly half of the workers at Fukushima were employed by one contractor but managed by another. Japanese law prohibits such arrangements, in order to prevent brokers from skimming workers' wages.

Tepco said the survey represents one of the steps it has taken to crack down on abuses. "We take issues related to inappropriate subcontractors very seriously," the utility said in a statement to Reuters.

Tepco said it warns its contractors to respect labour regulations. The company said it has established a hotline for workers, and has organised lectures for subcontractors to raise awareness on labour

regulations. In June, it introduced compulsory training for new workers on what constitutes illegal employment practices.

Tepco does not publish average hourly wages in the plant. Workers interviewed by Reuters said wages could be as low as around \$6 an hour, but usually average around \$12 an hour - about a third lower than the average in Japan's construction industry.

Workers for subcontractors in the most-contaminated area outside the plant are supposed to be paid an additional government-funded hazard allowance of about \$100 per day, although many report it has not been paid.

The work in the plant can also be dangerous. Six workers in October were exposed to radioactive water when one of them detached a pipe connected to a treatment system. In August, 12 workers were irradiated when removing rubble from around one of the reactors. The accidents prompted Japan's nuclear regulator to question whether Tepco has been delegating too much.

"Proper oversight is important in preventing careless mistakes. Right now Tepco may be leaving it all up to the subcontractors," said the head of Japan's Nuclear Regulation Authority, Shunichi Tanaka in response to the recent accidents.

Tepco said it will take measures to ensure that such accidents are not repeated. The utility said it monitors safety with spot inspections and checks on safeguards for workers when projects are divided between subcontractors.

The NRA, which is primarily charged with reactor safety, is only one of several agencies dealing with the Fukushima project: the ministries of labour, environment, trade and economy are also responsible for managing the clean-up and enforcing regulations, along with local authorities and police.

Yousuke Minaguchi, a lawyer who has represented Fukushima workers, says Japan's government has turned a blind eye to the problem of worker exploitation. "On the surface, they say it is illegal. But in reality they don't want to do anything. By not punishing anyone, they can keep using a lot of workers cheaply."

Economy Minister Motegi, who is responsible for Japan's energy policy and decommissioning of the plant, instructed Tepco to improve housing for workers. He has said more needs to be done to ensure workers are being treated well.

"To get work done, it's necessary to cooperate with a large number of companies," he told Reuters. "Making sure that those relations are proper, and that work is moving forward is something we need to keep working on daily."

FALSIFIED PASSBOOK

Hayashi offers a number of reasons for his decision to head to Fukushima from his home in Nagano, an area in central Japan famous for its ski slopes, where in his youth Hayashi honed his snowboarding skills.

He says he was sceptical of the government's early claim that the Fukushima plant was under control and wanted to see it for himself. He had worked in construction, knew how to weld and felt he could contribute.

Like many other workers, Hayashi was initially recruited by a broker. He was placed with RH Kogyo, a subcontractor six levels removed from Tepco.

When he arrived in Fukushima, Hayashi received instructions from five other firms in addition to the labour broker and RH Kogyo. It was the sixth contractor up the ladder, ABL Co. Ltd that told him he would be working in a highly radioactive area. ABL Co reported to Tokyo Energy & Systems Inc, which in Fukushima manages some 200 workers as a first-tier contractor under Tepco.

Hayashi says he kept copies of his work records and took pictures and videos inside the plant, encouraged by a TV journalist he had met before beginning his assignment. At one point, his boss from RH Kogyo told him not to worry because any radiation he was exposed to would not "build up".

"Once you wait a week, the amount of radiation goes down by half," the man is seen telling him in one of the recordings. The former supervisor declined to comment.

The statement represents a mistaken account of radiation safety standards applied in Fukushima, which are based on the view that there is no such thing as a safe dose. Workers are limited to 100 millisieverts of radiation exposure over five years. The International Atomic Energy Agency says exposure over that threshold measurably raises the risk of later cancers.

After Hayashi's first two-week stint at the plant ended, he discovered his nuclear passbook - a record of radiation exposure - had been falsified to show he had been an employee of larger firms higher up the ladder of contractors, not RH Kogyo.

Reuters reviewed the passbook and documents related to Hayashi's employment. The nuclear passbook shows that Hayashi was employed by Suzushi Kogyo from May to June 2012. It says Take One employed Hayashi for ten days in June 2012. Hayashi says that is false because he had a one-year contract with RH Kogyo.

"My suspicion is that they falsified the records to hide the fact that they had outsourced my employment," Hayashi said.

ABL Co. said Hayashi had worked with the firm but declined to comment on his claims. Tepco, Tokyo Energy & Systems, Suzushi Kogyo and RH Kogyo also declined to comment. Take One could not be reached for comment.

In September 2012, Hayashi found another job with a subcontractor for Kajima, one of Japan's largest construction companies. He didn't want to go back home empty-handed and says he thought he might have been just unlucky with his first bad experience at the plant.

Instead, his problems continued. This time a broker who recruited several workers for the subcontractor insisted on access to his bank account and then took almost a third of the roughly \$160 Hayashi was supposed to be earning each day, Hayashi says.

The broker, according to Hayashi, identified himself as a former member of a local gang from Hayashi's native Nagano.

Ryo Goshima, 23, said the same broker from Nagano placed him in a crew doing decontamination work and then skimmed almost half of what he had been promised. Goshima and Hayashi became friends in Fukushima when they wound up working for the same firm.

Goshima said he was fired in December after complaining about the skimming practice. Tech, the contractor that had employed him, said it had fired another employee who was found to have skimmed Goshima's wages. Tech said Goshima left for personal reasons. The firm paid Goshima back wages, both sides say. The total payment was \$9,000, according to Goshima.

Kajima spokesman Atsushi Fujino said the company was not in a position to comment on either of the cases since it did not have a contract with Hayashi or Goshima.

"We pay the companies who work for us and instruct those companies to pay the hazard allowance," the Kajima spokesman said in a statement.

THE YAKUZA CONNECTION

The complexity of Fukushima contracts and the shortage of workers have played into the hands of the yakuza, Japan's organised crime syndicates, which have run labour rackets for generations.

Nearly 50 gangs with 1,050 members operate in Fukushima prefecture dominated by three major syndicates - Yamaguchi-gumi, Sumiyoshi-kai and Inagawa-kai, police say.

Ministries, the companies involved in the decontamination and decommissioning work, and police have set up a task force to eradicate organised crime from the nuclear clean-up project. Police investigators say they cannot crack down on the gang members they track without receiving a complaint. They also rely on major contractors for information.

In a rare prosecution involving a yakuza executive, Yoshinori Arai, a boss in a gang affiliated with the Sumiyoshi-kai, was convicted of labour law violations. Arai admitted pocketing around \$60,000 over two years by skimming a third of wages paid to workers in the disaster zone. In March a judge gave him an eight-month suspended sentence because Arai said he had resigned from the gang and regretted his actions.

Arai was convicted of supplying workers to a site managed by Obayashi, one of Japan's leading contractors, in Date, a town northwest of the Fukushima plant. Date was in the path of the most concentrated plume of radiation after the disaster.

A police official with knowledge of the investigation said Arai's case was just "the tip of the iceberg" in terms of organised crime involvement in the clean-up.

A spokesman for Obayashi said the company "did not notice" that one of its subcontractors was getting workers from a gangster.

"In contracts with our subcontractors we have clauses on not cooperating with organised crime," the spokesman said, adding the company was working with the police and its subcontractors to ensure this sort of violation does not happen again.

In April, the Ministry of Health, Labour and Welfare sanctioned three companies for illegally dispatching workers to Fukushima. One of those, a Nagasaki-based company called Yamato Engineering, sent 510 workers to lay pipe at the nuclear plant in violation of labour laws banning brokers. All three companies were ordered by labour regulators to improve business practices, records show.

In 2009, Yamato Engineering was banned from public works projects because of a police determination that it was "effectively under the control of organised crime," according to a public notice by the Nagasaki-branch of the land and transport ministry. Yamato Engineering had no immediate comment.

Goshima said he himself had been working for the local chapter of Yamaguchi-gumi since the age of 14, extorting money and collecting debts. He quit at age 20 after spending some time in jail. He had to borrow money from a loan shark to pay off his gang, which demanded about \$2,000 a month for several months to let him go.

"My parents didn't want any problems from the gang, so they told me to leave and never return," Goshima said. He went to Fukushima looking for a well-paying job to pay down the debt - and ended up working for a yakuza member from his home district.

DECONTAMINATION COMPLAINTS

In towns and villages around the plant in Fukushima, thousands of workers wielding industrial hoses, operating mechanical diggers and wearing dosimeters to measure radiation have been deployed to scrub houses and roads, dig up topsoil and strip trees of leaves in an effort to reduce background radiation so that refugees can return home.

Hundreds of small companies have been given contracts for this decontamination work. Nearly 70 percent of those surveyed in the first half of 2013 had broken labour regulations, according to a labour ministry report in July. The ministry's Fukushima office had received 567 complaints related to working conditions in the decontamination effort in the year to March. It issued 10 warnings. No firm was penalized.

One of the firms that has faced complaints is Denko Keibi, which before the disaster used to supply security guards for construction sites.

Denko Keibi managed 35 workers in Tamura, a village near the plant. At an arbitration session in May that Reuters attended, the workers complained they had been packed five to a room in small cabins. Dinner was typically a bowl of rice and half a pepper or a sardine, they said. When a driver transporting

workers flipped their van on an icy road in December, supervisors ordered workers to take off their uniforms and scatter to distant hospitals, the workers said.

Denko Keibi had no insurance for workplace accidents and wanted to avoid reporting the crash, they said.

"We were asked to come in and go to work quickly," an executive of Denko Keibi said, apologising to the workers, who later won compensation of about \$6,000 each for unpaid wages. "In hindsight, this is not something an amateur should have gotten involved in."

In the arbitration session Reuters attended, Denko Keibi said there had been problems with working conditions but said it was still examining what happened in the December accident.

The Denko Keibi case is unusual because of the large number of workers involved, the labour union that won the settlement said. Many workers are afraid to speak out, often because they have to keep paying back loans to their employers.

"The workers are scared to sue because they're afraid they will be blacklisted," said Mitsuo Nakamura, a former day labourer who runs a group set up to protect Fukushima workers. "You have to remember these people often can't get any other job."

Hayashi's experiences at the plant turned him into an activist. He was reassigned to a construction site outside Tokyo by his second employer after he posted an online video about his first experiences in the plant in late 2012. After a tabloid magazine published a story about Hayashi, his managers asked him to leave. He has since moved to Tokyo and filed a complaint with the labour standards office. He volunteered in the successful parliamentary campaign of former actor turned anti-nuclear activist, Taro Yamamoto.

"Major contractors that run this system think that workers will always be afraid to talk because they are scared to lose their jobs," said Hayashi. "But Japan can't continue to ignore this problem forever."

779 offers to help contain water crisis

October 25, 2013

Japan receives global offers to contain water spills at Fukushima No. 1

Bloomberg

http://www.japantimes.co.jp/news/2013/10/25/national/japan-receives-global-offers-to-contain-water-spills-at-fukushima-no-1/#.UmuVjVM0_9k

The government-linked nuclear decommissioning body said Friday it received expressions of interest from 779 companies and individuals with technology to help contain radioactive water spills at the wrecked Fukushima No. 1 nuclear plant after Japan launched a global appeal.

Tokyo made the appeal between Sept. 25 and Tuesday through the International Research Institute for Nuclear Decommissioning, formed in August to support Tokyo Electric Power Co., according to a statement by the industry ministry. About 30 percent of the proposals came from overseas, ministry official Yoji Ueda said Friday at a briefing.

The technology ranges from separating tritium from radioactive water to building ice walls to stem contaminated water flows into the ocean, according to the statement. Prime Minister Shinzo Abe last month vowed to end the nation's "ad hoc" response to the disaster. The government said it would spend ¥47 billion to stop the leaks.

IRID was formed in August by a group of 17 Japanese companies, including Toshiba Corp. and Mitsubishi Heavy Industries Ltd., to support efforts by Tepco.

Questions about JAEC's neutrality

October 24, 2013

Atomic commission advised to quit policy making

http://www3.nhk.or.jp/nhkworld/english/news/20131024_40.html

A government panel says the Japan Atomic Energy Commission should no longer set the country's nuclear policy.

Panel members on Thursday discussed a proposal for ending the policy-making role of the commission.

They gave their general approval to the proposal. Panel members said the commission's work is limited to the field of nuclear energy, while the industry ministry drafts the country's overall energy policy.

But some panel members question the ministry's neutrality, since it promotes nuclear energy.

The panel agreed to continue discussions on this and other related issues.

The commission has since 1956 revised Japan's long-term nuclear policy about once every 5 years.

The policy deals with issues such as the ratio of nuclear power in the country's total energy use and recycling spent nuclear fuel.

The panel has also been discussing abolition of the commission itself. It plans to make a decision by the end of this year.

NRA & TEPCO meet on Fukushima crisis

October 28, 2013

NRA, Tepco heads discuss Fukushima No. 1 water woes

Kyodo

<http://www.japantimes.co.jp/news/2013/10/28/national/nra-tepco-heads-discuss-fukushima-no-1-water-woes/#.Um4VFVOWT9k>

Nuclear Regulation Authority Chairman Shunichi Tanaka held a rare meeting Monday with Tokyo Electric Power Co. President Naomi Hirose to discuss ways to get a grip on the radioactive water spilling from the crippled Fukushima No. 1 nuclear power plant.

"To resolve the situation at the Fukushima plant, I want to hear frank opinions from you," Tanaka told Hirose at the outset of the meeting held at the NRA office in Tokyo.

The outcome of the talks may affect the course of the NRA's safety checks of two idled reactors at Tepco's Kashiwazaki-Kariwa nuclear plant in Niigata Prefecture. The utility seeks to have the two units restarted to improve its tough business conditions stemming from the Fukushima No. 1 crisis.

The repeated flows, spills and leaks of radioactive water plaguing Fukushima No. 1 have led NRA commissioners to doubt Tepco management adequately realizes the situation of the workers at the plant or whether the utility has the wherewithal to ensure the safety of the Kashiwazaki-Kariwa reactors.

Tepco has submitted an analysis of the recent water spills and measures it plans for preventing further incidents, including transferring about 20 workers from Kashiwazaki-Kariwa to Fukushima No. 1, but the steps have failed to impress the NRA.

The NRA made the Tanaka-Hirose meeting open to the media, except for the beginning, to allow what it called "frank discussions."

Tepco, which continues to struggle with the buildup of massive amounts of radioactive water at the Fukushima plant, filed for the NRA safety assessments for idled reactors 6 and 7 at Kashiwazaki-Kariwa in September.

But a formal safety screening meeting for the reactors, usually held in public, has not convened, meaning the assessment process has yet to get into full swing.

Tepeco is desperate to curtail the heavy costs it's paying to purchase fuel for thermal power generation in place of atomic power.

NRA, TEPCO heads meet over problems at Fukushima

http://www3.nhk.or.jp/nhkworld/english/news/20131028_23.html

The head of Japan's nuclear regulating body has summoned the president of Tokyo Electric Power Company to hear how the utility intends to prevent additional trouble at the crippled Fukushima plant.

Nuclear Regulation Authority Chairman Shunichi Tanaka met Naomi Hirose, president of the operator of the Fukushima nuclear power plant on Monday.

Tanaka asked Hirose what TEPCO plans to do to prevent radioactive water leaks and other problems at the plant.

Hirose later said he told Tanaka that he plans to send workers from other parts of the utility firm, including the idled Kashiwazaki Kariwa nuclear plant, to the Fukushima Daiichi plant.

Hirose said he also told Tanaka that his firm will provide support to the workers to ensure that they can make full use of their skills.

Tanaka reportedly said that he wants TEPCO to carry out drastic long-term reforms. He asked Hirose to improve the working conditions inside the Fukushima plant, including the radioactive decontamination process.

NRA Secretary-General Katsuhiko Ikeda, who also attended Monday's meeting, referred to the possibility that the agency will begin safety screening for 2 reactors at the Kashiwazaki Kariwa plant.

Ikeda repeated his stance that the agency will make a decision after carefully studying how TEPCO intends to improve the situation at the Fukushima plant.

The utility says it will be able to deal with the problems at the Fukushima plant and maintain safety at the Kashiwazaki Kariwa plant simultaneously.

But many NRA members have expressed skepticism about TEPCO's explanation.

Why the NRA can't win

October 27, 2013

Nuclear regulators can't win

<http://www.japantimes.co.jp/opinion/2013/10/27/commentary/nuclear-regulators-cant-win/#.Um4VgFOwT9k>

The Nuclear Regulation Authority – , which observed the first anniversary of its creation on Sept. 19, faces two diametrically opposed criticisms. Proponents of nuclear power generation criticize the NRA as the root cause of the delay in the government's policy to promote nuclear power, while "no-nuke" groups brand the body as a mouthpiece of the "nuclear power village" (the strong network of public organizations and power companies that work toward expansion of nuclear power).

These bitter criticisms coming from both ends of a spectrum seem to summarize the contradictions of Japan's nuclear power policy. The NRA has become a skewed organization because the idea behind creating it was to satisfy both proponents and opponents of nuclear power. That has resulted in the lack of capabilities to execute its missions, thus making nuclear power plants in Japan even more dangerous than before.

Besides drawing up regulatory standards, the NRA has during the past year tackled two principal issues: safety inspection of nuclear power plants and the fiasco at the crippled Fukushima No. 1 nuclear power plant of Tokyo Electric Power Co.

Prime Minister Shinzo Abe got himself laughed at when he said the situation at the Fukushima nuclear power plant was "under control."

He was talking about the leak of radioactively contaminated water from the plant at a general meeting of the International Olympic Committee (held in Buenos Aires in September in his bid to invite the 2020 summer games to Tokyo).

The leak was first detected in April, and things are going from bad to worse. A Tepco insider confided, "While it is true that we have been taking makeshift measures, the biggest cause has been the lack of cooperation with the NRA."

When a leak of contaminated water from a tank on the ground came to light in April, the NRA was hesitant to deal with the problem. NRA chief Shunichi Tanaka refused to work with Tepco and the trade and industry ministry's Agency for Natural Resources and Energy, saying it would be self-contradictory for his organization to both work out a plan to contain the leak and to do the regulation work.

This attitude came under bitter criticism from a professor at a national university well-versed in nuclear safety. He pointed out that the NRA first gave its tacit approval to Tepco and the energy agency pushing a

plan to build a bypass for underground water at the plant site while doing nothing to control contaminated water, and that it then started complaining only after the leak problem surfaced.

After Tokyo was selected as the site for the 2020 Olympics, the government decided to become fully involved with the problem of contaminated water at Fukushima No. 1. Simultaneously it was decided that the NRA work closely with Tepco.

But the Tepco insider said that this would not solve the problem because the NRA's secretariat charged with implementing the NRA's policies does not have sufficient capability to solve the problem.

The secretariat is currently staffed with a little more than 500 workers, mainly technical workers who came from the trade and industry ministry and the education and science ministry. Of them, about 300 are assigned to examining and inspecting the safety of nuclear reactors, leaving a very limited number of workers to be in charge of the accident at Fukushima No. 1 and contaminated water leakage from the plant.

Although the NRA was patterned after the Nuclear Regulatory Commission of the United States, the difference in scale is obvious. The U.S. NRC has nearly 4,000 full-time employees looking after 104 reactors in the U.S. against the NRA's some 500 employees in charge of 54 reactors in Japan.

The national university professor said that the NRA's shortcomings are not just in the number of workers but also in the quality of work. He pointed out that sufficient training has not been given to NRA staffers to get them familiar with real nuclear power plants. A nuclear engineer of a power company said that the NRA workers are just a disorderly crowd.

In preparation for the Diet session opening in October, the government planned to double the NRA's staff to 1,000. But the university professor said it would be "a mere drop in the bucket" because the increase comes from a merger with the Japan Nuclear Energy Safety Organization (JNES).

The merger was to take place when the NRA was created last year, but has been delayed due partly to the high wages being paid to high-ranking JNES officials who had parachuted down from the trade and industry ministry.

JNES came into being in 1999 following a criticality accident at a nuclear fuel reprocessing facility operated by JCO Co. in Tokai, Ibaraki Prefecture. It does not have a great reputation for how it undertakes inspection and regulatory work.

The Tepco insider said that even though there are capable experts in the former Japan Atomic Energy Research Institute (JAERI), it has been taboo to rely on JAERI, which merged with the Power Reactor and Nuclear Fuel Development Corporation and the Japan Nuclear Cycle Development Institute to form the Japan Atomic Energy Agency.

It must be recalled that the appointment of Tanaka as NRA chief was criticized since he is originally from JAERI.

The failure to use the human resources buried in JAERI has exposed nuclear reactors in Japan to greater risks, said the national university professor. Japan's nuclear power plants are becoming riskier because people from the nuclear power village are excluded from the NRA. This is a great contradiction.

On Sept. 2, the NRA concluded that a seismic fault near the Oi nuclear plant of Kansai Electric Power Co. in Fukui Prefecture was not active. This came only two months after the same body had proposed decommissioning the Tsuruga nuclear power plant of Japan Atomic Power Co., also in Fukui Prefecture, after an active fault was identified nearby.

These decisions would seem acceptable if based on scientific findings. But the truth is that the opinions of one of the four experts responsible for making the decisions, who is a geologist, swayed the outcome of their conclusions, according to a reporter at a national newspaper. The remaining three are dynamic geomorphologists. This episode shows just how unreliable the NRA's geological surveys are.

The university professor said that while it is true that the nuclear power village is partly responsible for sloppy nuclear power plant designs that have led to reactor accidents, it is also a fact that only the village has the necessary human resources.

In a bid to further promote nuclear power generation, the government and the ruling Liberal Democratic Party are preparing to reform the NRA. But they have not gone much further than superficially increasing the number of personnel as described above.

Not only has the restart of nuclear power plants been delayed but also the safety of such plants cannot be ensured. As a result of completely disconnecting the NRA from the nuclear power village, Japan's nuclear energy policy is drifting in the direction not favored by anybody.

This is an abridged translation of an article from the October issue of Sentaku, a monthly magazine covering Japanese political, social and economic scenes.

Tacit acceptance ?

October 27, 2013

Documents show government tacitly accepts TEPCO's refusal to pay for cleanup

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201310270048>

THE ASAHI SHIMBUN

Tokyo Electric Power Co., operator of the embattled Fukushima No. 1 nuclear power plant, declared early this year that it will not repay radioactive cleanup costs in Fukushima Prefecture, forcing taxpayers to shoulder the burden, The Asahi Shimbun has learned.

The government, which did not release TEPCO's statement, apparently accepts the refusal, in a tacit understanding to prevent the cash-strapped utility from being driven into bankruptcy.

Documents obtained by The Asahi Shimbun through a freedom of information request showed that TEPCO in February made clear its intention not to pay the full cleanup costs.

Under a special measures law designed to deal with radioactive waste, TEPCO is required to pay back costs involved in the decontamination operation that the government shouldered. The government is decontaminating areas around the plant that are highly polluted with radioactive substances.

The Environment Ministry, which is in charge of the cleanup, has asked TEPCO to repay a total of 40.4 billion yen (\$415 million).

The utility has repaid 6.7 billion yen to date.

In a document dated Feb. 21 sent to the ministry, TEPCO declined to pay most of the first invoice in November last year.

“The company reached a conclusion that it is too difficult to pay,” the paper stated.

In a reply to the ministry’s request for further explanation on the utility’s refusal to pay, TEPCO listed reasons why it is not repaying the money, totaling 7.4 billion yen for 95 projects, in a document dated Feb. 27.

The total sum the ministry asked the company to pay in that instance was 14.9 billion yen, including the figure in a second bill, involving 118 projects.

TEPCO also suggested that the ministry should consider settling their disagreement over the payment at the science ministry’s center for alternative dispute resolution. The mechanism was set up to mediate between parties that failed to settle compensation claims for damages from the nuclear disaster.

One of the payments TEPCO declined to make is 105 million yen to fund an Environment Ministry preliminary survey ahead of the construction of interim storage facilities to hold radioactive soil removed and other waste in the decontamination effort.

The company refused to pay, saying, “A preliminary survey and other studies are part of the projects that the government should undertake in accordance with its policy line.”

TEPCO also refused to pay 440 million yen for an experimental program that assesses the effectiveness of new decontamination technology and 960 million yen for public relations efforts.

“These steps are not based on the special measures law,” it said.

The Environment Ministry argued in a paper dated March 1 that, “How to interpret the special measures law is within the jurisdiction of the government, and TEPCO has the responsibility of paying.”

But the ministry has yet to take any steps to settling the dispute at the science ministry’s center for alternative dispute resolution. According to one estimate, the cleanup cost will total more than 5 trillion yen.

But TEPCO's refusal so far to pay the full amount involved in cleanup, and the government's failure to force the payment, showed that there is a tacit understanding between the two parties to prevent the utility from going into bankruptcy.

TEPCO crafted its rebuilding plan on the premise of receiving up to 5 trillion yen in financial assistance from national coffers. But the plan has effectively fallen apart.

The company expects to pay a total of 3.8 trillion yen in damages to affected residents. As of the current fiscal year alone, the government has set aside 1.3 trillion yen for the decontamination operation.

Many experts say they suspect that TEPCO is waiting for the government to finally decide to inject taxpayer money into the decontamination operation by continually refusing to repay the costs the government covered.

Meanwhile, some lawmakers within the ruling Liberal Democratic Party are now calling on the government to pick up the cleanup tab on behalf of TEPCO. The industry ministry welcomes the proposal.

On the other hand, the Finance Ministry wants the utility to pay the decontamination costs out of its revenues from increasing electricity rates.

Tepco trying to get more workers into Fukushima Daiichi

TEPCO seeks to rotate more workers to Fukushima nuclear plant

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201310280108>

THE ASAHI SHIMBUN

The president of Tokyo Electric Power Co. told the chairman of the Nuclear Regulation Authority Oct. 28 that the utility is seeking to place more of its workers at the embattled Fukushima No. 1 nuclear power plant to better deal with the continuing leaks of radioactive water.

TEPCO President Naomi Hirose talked about the plan with Shunichi Tanaka, chairman of the NRA, as the utility is facing mounting criticism over its handling of the situation.

Tanaka summoned Hirose to discuss how to fix the problems and improve working conditions for workers there.

Hirose explained that it is getting difficult for the utility to secure sufficient manpower at the plant and that it was grappling with tasks the company was not familiar with.

He even said workers there were having difficulty trying to communicate while wearing surgical masks to protect them from radiation.

The one-on-one meeting, their first, was held behind closed doors. One official with the NRA said the meeting was called to "listen to (TEPCO's) problems in a little heart-to-heart talk."

The Fukushima No. 1 plant has been plagued by numerous troubles, in addition to the enormous task of cooling its melted fuel rods. The most immediate challenge is how to prevent radioactive water from escaping into the sea.

Hirose said that TEPCO plans to mobilize more of its employees, including some from its hydraulic and thermal power plants, to the Fukushima No. 1 nuclear power plant as part of a company-wide effort to stop the leaks and proceed with decommissioning.

Tanaka also called on Hirose to implement sweeping steps to safeguard workers from high doses of radiation and other troubles at the plant by drawing up a long-term plan of action on how best to proceed.

IAEA interim report "little more than cheerleading"

Exposing IAEA to a dose of reality

by Andrew Dewit and Christopher Hobson

Special To The Japan Times

<http://www.japantimes.co.jp/opinion/2013/10/28/commentary/exposing-iaea-to-a-dose-of-reality/#.Um6nz10wT9k>

On Oct. 21 the International Atomic Energy Agency's Expert Remediation Mission to Japan submitted their preliminary findings based on their visit to Tokyo and Fukushima over the previous seven days.

Remediation is a very important area of the IAEA's work, and "aims to reduce the radiation exposure from contamination of land areas or other contaminated media, such as surface — or groundwater." In line with this role, the IAEA were requested to inspect Japan's decontamination efforts after the Fukushima No. 1 disaster. This is in fact their second visit, a followup to an October 2011 mission.

Reading the IAEA's findings, and contrasting them with the reality in Fukushima, one is left wondering whether the IAEA mission got lost in a Potemkin village during their trip.

The interim report consists of little more than cheerleading, highlighting 13 areas of "important progress," while providing eight points of very softball advice.

The IAEA's main finding, for example, is that Japan has "achieved good progress in the remediation activities and ... good progress in the coordination of remediation activities with reconstruction and revitalization efforts."

Team leader Juan Carlos Lentijo, director of the IAEA's Division of Fuel Cycle and Waste Technology, also breathlessly related that "The Mission Team has been really impressed by the involvement of a wide range of ministries, agencies and local authorities in driving these crucial remediation efforts."

The IAEA would seem to have no eyes for noticing "poor progress" and no vocabulary for expressing it, but they would have done Japan, the nuclear industry and the world a great favor by being more forthright. A final report on the mission will be submitted to the Japanese government in December, so they still have the chance to amend their recommendations and incorporate some of the difficult realities they have sidestepped to date.

One of the "highlights" identified by the IAEA team was Japan's "enormous efforts to implement the remediation program in order to reduce exposures to people in the affected areas, to enable, stimulate and support the return of people evacuated after the accident, and to support the affected municipalities in overcoming economic and social disruptions."

Yet making "efforts" seems far too ambiguous and subjective a standard for judging the program. Surely a better, more objective measure would be the number of people able to return to their homes with some reasonable sense of assurance that they can live there safely.

Indeed, on the same day that the IAEA submitted its preliminary findings to Shinji Inoue, senior vice minister of the environment, the Environment Ministry announced that decontamination efforts in six of the 11 municipalities in the exclusion zone around Fukushima No. 1 are considerably behind schedule and will need to be significantly revised.

That means more than 90,000 people will thus be unable to return to their homes in the exclusion zone for another three years, a reality that differs starkly from the positive account presented by the IAEA. And contrary to the IAEA's lauding of inter-agency cooperation, a large part of the problem is poor communication and deep distrust between the Environment Ministry and the region's municipal governments.

To date, decontamination attempts have been plagued by problems and setbacks. One of the biggest impediments has been determining what to do with the contaminated soil and debris, which in many cases has been left in temporary storage. This has been identified as an important factor in the Environment Ministry failing to use 76.6 percent of its budget for decontamination, according to the Board of Audit.

Of the money that has been spent, much has been wasted on shoddy work undertaken by contractors, as has been detailed by the Asahi Shimbun in its "Crooked Cleanup" investigation. Yet such problems are simply ignored in the IAEA's report. The remit of the mission was specifically limited to contaminated areas surrounding Fukushima No. 1, and not the plant itself, nor the massive movement of groundwater in and out of it.

The result is a rather surreal situation where the IAEA can praise Japan for its handling of the decontamination process, while overlooking the endless stream of problems at the stricken nuclear plant. In the advice it offers the Japanese government, the IAEA emphasizes the importance of improving communication "in order to achieve a more realistic perception of radiation and related risks among the population" and to "reduce some uncertainties and provide greater confidence in the decisions being made."

Surely the government getting a grip on the situation at Fukushima No. 1 is essential to accomplishing this. After all, the public's worries about radiation are stoked by Fukushima No. 1's inventory of accidents, mistakes and leaks of contaminated water, combined with Tokyo Electric Power Co.'s gross mismanagement and the government's limited attempts at oversight.

Another important part of that reality is the truly deplorable working conditions of the several thousand workers at the site. Recent articles on this issue have highlighted workers' serious depression and anxiety,

high levels of radiation exposure, alcohol abuse, low pay and a variety of other factors that are exacerbating the many other problems at the plant.

While the workers engaged in cleanup “efforts” around the site itself may not have to endure the full slate of dangers and deprivations faced by those at ground zero, they have an ample share of difficulties to contend with, such as the involvement of organized crime and questionable workplace practices.

These matters all impede remediation, but are completely absent from the IAEA’s account.

Rather than undue cheerleading, the IAEA ought to aim a few recommendations at remedying the poor governance and blatant mismanagement that has come to define the response by the Japanese government and Tepco to the nuclear accident. It is in no one’s interest, least of all the global nuclear industry’s, to pretend that all is well when it so manifestly is not.

Andrew DeWit is a professor in the School of Policy Studies, Rikkyo University. Christopher Hobson is an assistant professor in the School of Political Science and Economics, Waseda University.

TEPCO's profits

October 29, 2013

TEPCO likely to post mid-year profit

http://www3.nhk.or.jp/nhkworld/english/news/20131029_50.html

Tokyo Electric Power Company is likely to post a profit in its midterm earnings report.

The operator of the crippled Fukushima Daiichi nuclear power plant is expected to post about 1.1 billion dollars in profits for the April-September period.

It will be the company's first midterm profit since the nuclear accident in March 2011.

Profits rose due to an increase in electricity sales during this summer's record heat wave, as well as a rise in household rates in September of last year.

The company instituted huge spending cuts that include putting off repair work at other power plants and transmission facilities.

TEPCO aims to post a profit for the full business year that ends in March of 2014.

But the company will continue to face the huge costs of compensation related to the nuclear accident, as well as those of decommissioning nuclear reactors and measures to handle contaminated wastewater at the Fukushima plant.

TEPCO wants to restart 2 reactors at the Kashiwazaki Kariwa plant to improve earnings, but nuclear regulators have not yet begun the required safety screening.

Prefectural gov't pressed to compensate loss of donations

October 29, 2013

Aomori municipalities ask prefecture to cover lost 'power industry money'

<http://mainichi.jp/english/english/newsselect/news/20131029p2a00m0na007000c.html>

AOMORI -- A group of municipal governments in Aomori Prefecture have petitioned the prefectural government for **financial relief in place of donations that the power industry is going to discontinue from spring.**

The group handed over the request to Aomori Gov. Shingo Mimura on Oct. 28. While the city of Aomori and 24 other municipalities in the prefecture have received donations from the power industry in return for hosting nuclear energy-related facilities, the donations are set to be terminated at the end of fiscal 2013 due to the deteriorating business environment of power companies in the aftermath of the Fukushima No. 1 Nuclear Power Plant disaster.

The **massive donations** were initiated in fiscal 1994 by the Federation of Electric Power Companies of Japan -- comprising 10 power companies -- and Japan Nuclear Fuel Ltd in return for Aomori Prefecture's hosting of nuclear fuel cycle facilities. The municipalities utilized the donated money in regional promotional projects such as local festivals and fireworks events. **Over the past 20 years, a total amount of some 13 billion yen was paid to those municipalities,** which was distributed by a public utility foundation. The donations were renewed every five years. Following the Great East Japan Earthquake, the donations totaled 1.37 billion yen in fiscal 2011 and 2012, respectively. Around 872 million yen is scheduled to be contributed to the municipalities this fiscal year.

On Oct. 28, Aomori Mayor Hiroshi Shikanai, chairman of a group of 10 mayors in the prefecture, and Itayanagi Town Mayor Ichiro Tateoka, chairman of a group of 30 towns and villages in the prefecture, visited Gov. Mimura and requested that a new support system be created in place of the donations. In response, the governor said, "I'm aware that prefecture-wide promotion is necessary. I take your request seriously, but will make a decision in a comprehensive manner while taking our financial status into account."

The power industry has made the donations to "show consideration" for the 25 municipalities, which are not eligible for the central government's subsidy system under the so-called three laws for hosting power plants. The Aomori Prefecture village of Rokkasho -- the host of the Rokkasho Reprocessing Plant -- and 14 other municipalities in the prefecture benefit from the subsidy system.

Commenting on the municipalities' request, one senior prefectural government official said, "We've been financially-strapped. I wonder if we can obtain understanding among prefectural residents."

Professor Shuji Shimizu at Fukushima University, who is versed in local finance issues in municipalities hosting nuclear plants, said, "The financial structure, in which municipalities complain about the termination of donations, is distorted and problematic in itself. I must say the prefectural government, which has promoted such a structure, deserves the outcome, where it is pressed to make up for the money."

Takeshi Fukui, a lecturer at Fukui Prefectural University, said, "Aomori Prefecture is burdened with exceptional circumstances as it also hosts nuclear fuel cycle facilities. Measures to ease the drastic changes are necessary."

LDP wants gov't help on decontamination and storage costs

October 29, 2013

LDP wants government to cover Fukushima decontamination costs

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201310290072>

By SAWAAKI HIKITA/ Staff Writer

The ruling Liberal Democratic Party will propose that the government cover part of the costs for decontamination work around the Fukushima No. 1 nuclear plant and all expenses to build intermediate storage facilities for radioactive debris.

The decontamination costs alone are estimated at more than 5 trillion yen (about \$50 billion).

Under the current law, Tokyo Electric Power Co., operator of the crippled nuclear plant, must foot the entire bill for decontamination work and compensation to residents by borrowing funds from the government. TEPCO is also required to decommission the reactors at the plant with its own funds.

But LDP officials decided that it would be impossible for TEPCO to cover all the costs. They warned that if the current system is maintained, the reconstruction of Fukushima communities could be delayed.

“While paying attention to the discussions in the party, we will consider the proposal seriously if it is submitted to the government,” Chief Cabinet Secretary Yoshihide Suga said at a news conference on Oct. 29.

Finance Minister Taro Aso also appeared to support what would be a drastic change in the government’s policy on who should pay for the cleanup of the Fukushima disaster.

“I have doubts on the view that all responsibilities lie only with TEPCO,” Aso said.

The party’s headquarters to accelerate Fukushima reconstruction, headed by former LDP Vice President Tadamori Oshima, will compile a proposal that includes the new policy.

The LDP will discuss the matter with junior coalition partner New Komeito and government organizations, such as the Finance Ministry and the Ministry of Economy, Trade and Industry.

A final version will be submitted to the government and then be reflected in the budget for next fiscal year, which starts in April.

Beleaguered TEPCO is scheduled to soon show a revised financial rehabilitation plan to its creditors. The LDP announced the proposal to make clear the division of roles between the government and TEPCO in dealing with the Fukushima disaster before the utility’s plan is released.

Decontamination work in some communities around the nuclear plant has been completed. It was part of a huge project intended to speed up the return home of thousands of families that evacuated after the Great East Japan Earthquake and tsunami caused the meltdowns at the plant in March 2011. However, radiation readings have not declined to the predicted levels, and the actual decontamination work has been criticized as sloppy and ineffective.

The Environment Ministry complained that TEPCO was refusing to cover all the costs of the decontamination work as required under the law, but it took no significant measures to force the utility to pay.

The ministry also faces difficulties finding local governments willing to host intermediate storage facilities for the huge accumulations of radioactive soil and debris removed in the decontamination process.

TEPCO, meanwhile, is still struggling to prevent radioactive water from leaking at the Fukushima plant and spilling into the ocean.

The LDP’s proposal suggests separating the divisions in charge of contaminated water and decommissioning the reactors from TEPCO, and turning them into a government-affiliated organization or a spin-off company. That way, the electric power company can concentrate on its management and compensation payments.

A government council consisting of state ministers would work out business plans of the new organization and issue instructions, according to the proposal.

Thinking about it

October 29, 2013

Govt. to study paying part of decontamination cost

http://www3.nhk.or.jp/nhkworld/english/news/20131029_37.html

A Japanese Cabinet minister has suggested the government should bear part of the costs for clearing radioactive substances from the area around the Fukushima Daiichi nuclear power plant.

The central and local governments are currently conducting decontamination work and charging the costs to the plant's operator, Tokyo Electric Power Company.

But TEPCO has asked the government to cover some of the massive expenses. Government and governing party officials are discussing the utility's request.

On Tuesday, industry minister Toshimitsu Motegi told reporters that accelerating the cleanup work is crucial for early recovery of Fukushima Prefecture.

He said the government wants to study the matter from a comprehensive point of view, although there is a financial problem.

Finance Minister Taro Aso told reporters it is unfair to focus blame for the 2011 accident at the plant solely on TEPCO when the government has long promoted nuclear energy as a national policy.

He added that the government should discuss with the governing Liberal Democrat Party who should bear the decontamination costs, and how much.

Tepco refuses to fund outside cleanup

Utility leaves ministry holding ¥30 billion bill; exemption eyed

by Kazuaki Nagata

Staff Writer

http://www.japantimes.co.jp/news/2013/10/29/national/tepc-refuses-to-fund-outside-cleanup/#.Um_0KFOWT9k

Tokyo Electric Power Co. is refusing to reimburse the Environment Ministry for more than ¥30 billion that was spent to decontaminate land hit by radioactive fallout from the Fukushima No. 1 nuclear plant, the ministry said Tuesday.

Under the special decontamination law adopted in August 2011, the state is responsible for leading and initially financing the decontamination effort, but it can ask Tepco, responsible for the Fukushima crisis, to pay the bill later.

Tepco has paid ¥6.7 billion so far, while the Environment Ministry has sought ¥40.4 billion.

The ministry said Tepco is unwilling to pay for work not directly involving decontamination. For instance, the bill includes costs related to public relations and research and development.

The ¥6.7 billion Tepco has paid covers direct decontamination work such as washing road surfaces and removing tainted soil.

According to a document presented by the Ministry of Economy, Trade and Industry to senior ruling party officials this month, Tepco is insisting that shouldering the cost for decontamination as damages will be “duplicate payments” because it is already compensating for land and buildings.

Tepco “has said it will continue to think over whether it will reimburse the government, so we understand that Tepco has not finalized its decision to completely refuse to pay it back,” said Satoshi Watanabe of the Environment Ministry’s cleanup team, hinting Tepco may be sued. “This situation is totally unacceptable.”

The government has budgeted about ¥1.3 trillion for decontamination, of which about ¥470 billion has been used.

Facing trillions of yen in compensation payments for the Fukushima debacle and soaring fuel costs for thermal power to replace nuclear, Tepco may not even have the means to cover the decontamination bill.

Meanwhile, METI is considering exempting Tepco from paying most of the cleanup costs.

The government has not reached a consensus on the move, which could trigger a public backlash because it would mean further taxpayer help.

METI officials believe it would be difficult to win public approval for releasing Tepco from all of the decontamination costs, but it is considering limiting the bill to the ¥470 billion that has already been used, the sources said.

Finance Minister Taro Aso indicated Tuesday that his ministry may give the green light to using government money to clean contaminated areas around the Fukushima No. 1 nuclear complex.

“I wonder if we can put all the blame on Tepco, given that (nuclear policy) has been framed by the government,” Aso said.

Information from Kyodo added

Abe calls Koizumi's position on nukes "irresponsible"

October 25, 2013

Abe dismisses Koizumi's call for zero nuclear power plants

http://ajw.asahi.com/article/behind_news/politics/AJ201310250045

THE ASAHI SHIMBUN

Shinzo Abe has brushed aside the suggestion by Junichiro Koizumi, a former prime minister and his political mentor, that Japan move away from nuclear power generation.

"I think it is irresponsible to promise zero (nuclear power plants) at this stage," the prime minister said on a television program broadcast Oct. 24. It was recorded the previous day.

Abe said Japan cannot keep relying on thermal power generation, with all of its nuclear plants shut down until their safety is confirmed after the Fukushima nuclear disaster.

"Koizumi is probably playing his hunch (in arguing for zero nuclear plants), but Japan is losing nearly 4 trillion yen (\$41 billion) in national wealth a year," Abe said, referring to increased fuel costs for thermal plants. "We will be in big trouble if this continues."

In speeches, Koizumi, a popular prime minister for five years through 2006, has called for Japan to wean itself from atomic energy.

"Most business leaders say it is irresponsible to call for zero nuclear plants," the retired politician said recently. "But it is even more irresponsible to promote nuclear power without any prospect of constructing disposal sites for nuclear waste."

Abe was asked about Koizumi's arguments during a Lower House Budget Committee meeting on Oct. 21. "My teachers in politics are former prime ministers Koizumi and (Yoshiro) Mori," Abe said. "(But) as a person responsible for government, I will pursue a responsible energy policy so that people's lives and economic activities are not impacted under any circumstances."

During an Upper House Budget Committee meeting on Oct. 24, Tadatomo Yoshida, leader of the Social Democratic Party, pressed Abe to break away from atomic energy, showing photo panels of Koizumi and Akie Abe, the prime minister's wife, who has expressed her opposition to nuclear power.

"Both individuals are extremely important to me," Abe said. "But from the government's standpoint, (nuclear plants) are extremely important for a stable energy supply and economic activities."

Yoshida is asking for a meeting with Koizumi to discuss how they can work together to end Japan's reliance on atomic energy.

“As Koizumi said, political parties other than the ruling Liberal Democratic Party have outlined, albeit in varying degrees, a direction toward moving away from nuclear power,” Yoshida said at an Oct. 23 news conference. “If Abe makes up his mind, Japan will make a significant step forward.”

Kazuo Shii, chairman of the Japanese Communist Party’s executive committee, has also hinted that his party may form an alliance with Koizumi on the single issue of no nuclear plants.

“(Koizumi says) Japan must do away with nuclear plants because it cannot dispose of nuclear waste. It makes perfect sense,” Shii said Oct. 17. “We will cooperate with people with any stance as long as we agree on zero nuclear plants.”

Your Party chief Yoshimi Watanabe, Ichiro Ozawa, leader of the People’s Life Party, and former Prime Minister Naoto Kan of the Democratic Party of Japan have also shown support for Koizumi’s call for no nuclear plants.

Video clips spell out findings of panel probing nuclear crisis

by Sayuri Daimon

Staff Writer

<http://www.japantimes.co.jp/news/2013/10/30/national/video-clips-spell-out-findings-of-panel-probing-nuclear-crisis/#.UnILXF0wT9k>

The independent Diet panel investigating the Fukushima nuclear crisis wrapped up its mission and compiled a 592-page report in July 2012, but probably only a handful of people have read the full account and even fewer understand it.

However, six short video clips explaining the lengthy report in simple language have been a hit on the Internet, making it very easy to understand what happened at the Fukushima No. 1 nuclear plant. Starting Thursday, English versions will be available.

The video clips were made by a group of people who include university students and former members of the Diet panel, according to Satoshi Ishibashi, a representative of the group and a former director of the panel’s research project management team.

The six clips, which include titles such as “Was the nuclear accident preventable?” and “What happened inside the nuclear plant?” explain the catastrophe with illustrations and simple words that even elementary school students can understand.

They were part of efforts by the group, which was created last November by 18 people, to help the public understand what happened in Fukushima in March 2011 and to spur open discussions on the disaster’s lessons.

Titled the “Wakariyasui (easy to understand) Project,” it carries the subtitle “The Simplest Explanation of the National Diet of Japan Fukushima Nuclear Accident Independent Investigation Commission Report.”

Besides creating the video clips, the group offers workshops and lectures on the crisis.

“We spent six months compiling the report, but the problem is the report is not attractive to the public,” Ishibashi said.

“We poured taxpayers’ money and our effort into compiling the report, and if we don’t do anything more with it, it will simply have been a waste.”

The English versions of the video clips can be viewed at naiic.net/en/iv/ and the Japanese versions at naiic.net/iv/.

US offers help

October 31, 2013

U.S. energy chief offers Japan aid with nuke cleanup

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201310310098>

THE ASSOCIATED PRESS

U.S. Energy Secretary Ernest Moniz says he expects deepening cooperation with Japan over cleaning up and decommissioning of the crippled Fukushima No. 1 nuclear power plant.

Moniz says on Oct. 31 the world has a strong interest in seeing the next steps are "taken well and efficiently and safely" in the cleanup from the multiple meltdowns triggered by the March 2011 earthquake and tsunami on Japan's northeastern coast.

Moniz was on Oct. 31 with top Japanese officials during his visit, including industry minister Toshimitsu Motegi, who is overseeing the government's role in the plant cleanup.

Japanese regulators on Oct. 30 approved removal of fuel rods from an uncontained cooling pool at a damaged reactor building considered the highest risk at the plant.

M.Abe's priorities all wrong

ANALYSIS: Abe leads nuclear plant exports while problems pile up at home

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201310310074>

THE ASAHI SHIMBUN

As the Abe administration crows about Japan's first nuclear plant export after the 2011 disaster, it continues to face the daunting tasks of containing radioactive water at the stricken Fukushima plant and cleaning up contaminated communities.

"I'm delighted that commercial negotiations on a nuclear plant contract have been completed and an agreement has been reached," a beaming Prime Minister Shinzo Abe said at a news conference in Istanbul on Oct. 29.

The Turkish government the same day signed an agreement with a consortium led by Mitsubishi Heavy Industries Ltd. to build four nuclear reactors in the Black Sea city of Sinop at an estimated cost of more than \$22 billion (2 trillion yen).

Since he took office in December, Abe has been pushing exports of nuclear power plants, among other infrastructure facilities, as a pillar of his economic growth strategy.

His latest trip to Turkey came only five months after his last visit to discuss nuclear cooperation with Recep Tayyip Erdogan, his Turkish counterpart.

“The deal was sealed in one go,” said an aide to Abe, attributing the success to the prime minister’s initiative.

No one was perhaps more surprised than Abe about the outcome of the trip. Before leaving for Turkey on Oct. 28, Abe told aides he did not expect that a formal agreement would be reached during his visit.

The Abe administration has signed a nuclear energy agreement, a precondition for exporting nuclear technology, with Turkey and the United Arab Emirates.

Under Abe, the government has also agreed to start discussing a nuclear energy pact with Saudi Arabia and resumed talks with India, which were suspended after meltdowns at the Fukushima No. 1 nuclear power plant in March 2011.

The government hopes that the contract with Turkey will improve Japan’s chances in winning competition for nuclear power projects in Vietnam, India and Russia, among other countries.

Based on International Atomic Energy Agency forecasts, the industry ministry estimates that a maximum of 370 new nuclear reactors will be built around the world by 2030.

With construction costing 400 billion to 500 billion yen per reactor, Japanese companies, including MHI, Toshiba Corp. and Hitachi Ltd., are competing with foreign rivals for a slice of the market worth more than 100 trillion yen.

“Led by the prime minister, government officials have been working on many fronts,” Makoto Kubo, a Toshiba vice president, said at a news conference on Oct. 30. “We want to go ahead with (nuclear plant exports) in tandem with the government.”

According to government estimates released Oct. 29, Japan received 5.04 trillion yen worth of orders for exporting infrastructure facilities during the first nine months of the year, 50 percent more than the full-year amount for 2012.

“Aggressive efforts have paid off,” an official at the Cabinet Secretariat said. “The prime minister has led sales promotions in 21 countries.”

While pushing nuclear plant exports, Abe has said that Japan will lower the ratio of atomic energy in electricity generation. But he has not explained how he plans to reduce nuclear plants and by when.

At the Fukushima No. 1 plant, operator Tokyo Electric Power Co. has spent months struggling to keep ever-increasing radioactive water from leaking from storage tanks and other facilities.

In a speech at an International Olympic Committee meeting in September before the IOC members picked Tokyo to host the 2020 Games, Abe said, "The situation is under control," referring to the radioactive water problem.

But leaks have continued, with some water believed to be finding its way into the Pacific Ocean. Groundwater has been contaminated after mixing with water used to cool the reactors in which melted fuel is still releasing heat.

High levels of radioactive materials have also been detected in drainage ditches and observation wells on the premises.

Shunichi Tanaka, chairman of the Nuclear Regulation Authority, summoned TEPCO President Naomi Hirose on Oct. 28 and pressed the company to take a more effective approach to deal with the radioactive water problem.

On a longer term, decommissioning the reactors and removing radioactive materials covering surrounding areas are two primary challenges facing TEPCO.

On Oct. 30, the utility received NRA approval to begin removing nuclear fuel from a storage pool for the No. 4 reactor, one of the first steps toward decommissioning.

The No. 4 reactor is the first from which nuclear fuel will be removed among the four crippled reactors. TEPCO believes that it will take until the end of 2014 to remove about 1,500 fuel assemblies from the No. 4 reactor building.

Senior officials of the ruling Liberal Democratic Party on Oct. 30 approved an LDP task force's proposal calling on the government to play a greater role in cleaning up contaminated areas and other post-disaster operations.

Some estimate that 10 trillion yen will be required for decontamination, decommissioning and compensation to disaster victims, with clean-up operations accounting for half of the costs.

LDP panel members said TEPCO will not be able to shoulder the costs alone, and the nuclear crisis cannot be brought under control as long as the government leaves the task solely in the company's hands.

Still, some members of the LDP and junior coalition partner New Komeito are opposed to forking out taxpayer money for post-disaster operations in what would amount to a government bailout of TEPCO.

Some of the disaster victims were clearly not happy with Abe's push for nuclear plant exports while problems continue to mount in Japan.

Soichi Saito, a 63-year-old who evacuated from Futaba, Fukushima Prefecture, after the nuclear disaster, criticized Abe's double talk on nuclear energy policy.

"How dare he sell nuclear power plants abroad when he has not been able to bring an accident under control?" asked Saito, chief of an association of temporary housing residents in Iwaki in the same prefecture. "What does he think of victims of the nuclear disaster?"

(This article was compiled from reports by Kotaro Ono in Istanbul, Osamu Uchiyama and Norihisa Hoshino in Tokyo and Takuro Negishi in Iwaki.)

Is this a comeback?

October 30, 2013

Anti-nuclear Koizumi agitating for comeback?

by Reiji Yoshida

Staff Writer

<http://www.japantimes.co.jp/news/2013/10/30/national/anti-nuclear-koizumi-agitating-for-comeback/#.UnIK4VOwT9k>

Long silent and out of the public eye, former Prime Minister Junichiro Koizumi's recent rumblings against nuclear power are causing many to wonder if the most popular leader of recent decades is laying the groundwork for a political comeback.

The 74-year-old Koizumi has met separately with two opposition party heads — Tadatomo Yoshida of the Social Democratic Party and Yoshimi Watanabe of Your Party — to discuss his mission to rid the nation of all 50 of its nuclear reactors.

A visit to a spent-fuel disposal site in Finland following the 2011 Fukushima crisis converted him to an anti-nuclear activist, Koizumi claims.

Recent speeches given at closed-door meetings made the headlines of gossip magazines. Now Koizumi is stepping up his anti-nuclear campaign.

On Oct. 16, for the first time he allowed TV cameras from media outlets to shoot an anti-nuclear lecture in its entirety in Kisarazu, Chiba Prefecture.

Next up, Koizumi is scheduled to hold a news conference at the Japan National Press Club on Nov. 12, where he will face senior reporters from all the major news outlets for the first time since stepping down as prime minister in 2006.

“He has great power to send messages to the public. That’s what I felt today,” Yoshida of the SDP said after meeting Koizumi on Tuesday.

While serving as prime minister, Koizumi was often touted as a powerful communicator, a telegenic genius of the sound bite.

Critics called him a political agitator who labeled his foes “anti-reformers.” But his popularity with voters carried the Liberal Democratic Party to a landslide victory in the 2005 Lower House election, in part due to his quest to privatize the postal system.

In office, Koizumi rose above his party, a “lone wolf” who relied on communication skills to achieve his popularity. It is this approach, rather than by forming an alliance with a political force, that he appears to be adopting again to get his message across to the public.

During Tuesday’s meeting, Koizumi declined Yoshida’s offer to team up on the abolition of nuclear plants. Instead, Koizumi stressed that each party and politician should make their own appeals to the public, and denied any intention to form a new political party, as gossip magazines have speculated, according to Yoshida.

It's possible that Koizumi sized up the SDP and other anti-nuclear suitors and decided an alliance would not benefit him.

The SDP and Seikatsu no To (People's Life Party) — the only parties to advocate for the immediate abolition of all nuclear plants — performed poorly in the latest Lower House election, in July, and their public support rates have remained below 1 percent all year, according to NHK polls.

Another hurdle to an alliance: The two share few views with Koizumi other than the anti-nuclear stance. The SDP and Seikatsu no To support big government with increased spending on social security, while Koizumi was a champion of small government and free markets.

An advocate of pacifist policies, the SDP calls for cutting back U.S. military bases in Japan, while Koizumi was an earnest supporter of the Japan-U.S. security alliance.

"Nobody believes the SDP and Mr. Koizumi agree on (various policy issues.) They never agree on security issues, either," LDP Secretary-General Shigeru Ishiba said Tuesday.

Still, officials at the prime minister's office appear worried about Koizumi's potential to sway the public.

Many LDP lawmakers have pushed long and hard for nuclear power plants to be built in their constituencies. And Prime Minister Shinzo Abe has pledged to restart any of the 50 reactors that pass Nuclear Regulation Authority safety tests.

At the end of last month, Abe's Cabinet appointed Shinjiro Koizumi, a son of the former prime minister, as parliamentary secretary at the Reconstruction Agency.

This appointment was widely seen as an attempt to keep the young Koizumi, who is also popular with voters, under control, to prevent him from emerging, like his father, as a rising star of the anti-nuclear movement.

As a senior official at the Reconstruction Agency, the son is now obliged to toe the government line, including its energy policies.

On Wednesday, facing an opposition lawmaker during a Diet session for the first time, he was asked to explain his nuclear stance.

He simply responded that he would concentrate on urgent issues related to the wrecked Fukushima No. 1 nuclear plant, such as the problems of radioactive water and compensating local residents.

“I’m a parliamentary secretary and a member of the government,” he reportedly told the Diet session.

Nuclear not just a method of producing electricity

October 31, 2013

EDITORIAL: Industry ministry wrong body to control nuclear policy

<http://ajw.asahi.com/article/views/editorial/AJ201310310048>

Broad national debate is essential in charting the overall direction of nuclear energy policy because the disaster that occurred in Fukushima Prefecture proved that nuclear energy poses a huge risk to the entire nation.

The policymaking process requires wide-ranging input from all sorts of experts, including scientists and humanities scholars who are not proponents of nuclear power generation.

But there are troubling signs that the Ministry of Economy, Trade and Industry, which is a strong supporter of nuclear power, could gain even greater influence over policymaking on this issue.

If nothing is done, nuclear power policy could fall under the control of the so-called nuclear power village, a close-knit community of experts who are bent on continuing to promote nuclear energy.

This concern was sparked by an outline of proposals released last week by a panel of experts tasked with reviewing the role and mission of the Atomic Energy Commission.

The advisory panel called for scrapping the “nuclear energy policy guidelines,” which have been crafted by the AEC. The panel proposed that nuclear energy policy should instead come under the purview of the Basic Energy Plan, which was mapped out by the industry ministry.

The nuclear energy policy guidelines generally are updated every five years or so, but the programs laid out in the document often failed to go as planned.

It certainly makes sense for the Basic Energy Plan to contain programs concerning nuclear power generation.

But debate from a purely energy policy perspective is hardly sufficient for making decisions with regard to fundamental issues like the appropriateness of using atomic energy, the scale of nuclear power generation and the nation’s nuclear future.

Nuclear power generation, as we have learned, can have catastrophic results. It cannot simply be viewed as a method of generating electricity.

Nuclear power generation is also different in nature from other power generation systems because its technology carries the risk of being used to develop nuclear weapons.

The Japanese archipelago is prone to frequent natural disasters. Are the people of this country really willing to accept nuclear power? What kind of policy is desirable from the viewpoint of nuclear nonproliferation?

All these questions require not just opinions of nuclear experts, but debate from all sorts of perspectives, which was precisely the AEC's original mandate.

The AEC was established in 1956. Its original members included some prominent figures, such as Nobel-winning physicist Hideki Yukawa and Ichiro Ishikawa, the first chairman of Keidanren, which is today's Japan Business Federation.

But the AEC became nothing more than a rubber-stamp body when the promotion of nuclear power generation was adopted as official policy of the government.

As a result, the commission has been failing to perform its core function of critically reviewing the government's nuclear energy policy. It is hardly surprising that the AEC's reason for being has been called into question.

Even so, entrusting the industry ministry with the development of nuclear energy policy would be a risky and simplistic response to the problem.

Where in this attitude can we see lessons gleaned from the Fukushima nuclear disaster?

After the Fukushima nuclear crisis unfolded, German Chancellor Angela Merkel set up an ethics committee comprising advisers who are not nuclear power experts. Sociologists were part of the group. The committee discussed topics independently of nuclear experts who considered technical issues. Based on the discussions at the ethics committee, Merkel made the landmark decision to phase out nuclear power generation in Germany.

Japan has every reason to establish a similar committee to undertake a fundamental review of its nuclear energy policy.

The way the government has been preoccupied with responding to individual problems is now in serious doubt.

Split TEPCO: a "bad" company + a "good" company

November 1, 2013

INTERVIEW/ Shuya Nomura: Avoiding TEPCO's bankruptcy exacerbated Fukushima crisis

<http://ajw.asahi.com/article/views/opinion/AJ201311010009>

SPECIAL TO THE ASAHI SHIMBUN

The words from Prime Minister Shinzo Abe's mouth were clear: "The situation is under control." But radioactive water continues to leak from the Fukushima No. 1 nuclear power plant operated by Tokyo Electric Power Co.

The cleanup has remained in disarray since the accident started to unfold on March 11, 2011, and contaminated water spills have exposed structural problems.

The root cause of the Fukushima mess is the government's decision to avoid a TEPCO bankruptcy, according to Shuya Nomura, a member of the former National Diet of Japan Fukushima Nuclear Accident Independent Investigation Commission.

When the commission looked into the Fukushima nuclear disaster, Nomura said he saw measures being taken for the radioactive water that could only be described as stopgap.

In an interview with The Asahi Shimbun, Nomura also said bureaucrats should get off their "lazy butts" and stop acting like innocent bystanders.

Excerpts from the interview follow:

The misery began soon after the nuclear disaster, when the government opted to prevent TEPCO from going bankrupt.

Another idea floated at the time was to allow the utility to go through bankruptcy proceedings and have the government take over the job of cleaning up the site. However, the Finance Ministry, which did not want to throw away taxpayer money, apparently agreed with the opinion that failure to repay the company's debts to the banks would cause problems, and that the government needed to make sure that TEPCO honored the corporate bonds it had issued.

When TEPCO needed money, the government ended up giving loans to the company in the form of "government compensation bonds."

Officially, TEPCO took responsibility. But behind the scenes, the government exerted awkward control, like a "helping hands" comedy (in which one performer provides the arms for the performer in front, but without being able to see what is happening).

This, naturally, does not allow for a flexible response to the disaster. Additionally, TEPCO fell into a situation that made it difficult to prioritize the cleanup because the company became worried about how bankruptcy concerns would affect its stock price.

I toured the Fukushima No. 1 nuclear power plant in December 2011. This was when they began adding more tanks for storing contaminated water. Following harsh criticism for dumping the water into the

ocean soon after the earthquake without notifying nearby countries, a decision was made to just store it in the tanks.

But it was obvious to anyone who took a look that this would not bring the problem under control. If effective measures had been taken at this time, the crisis would not have grown so grave.

The public sees the problem as stemming from leaving the cleanup to TEPCO, but I don't think so. That's because after the disaster, TEPCO was not in a position to make independent decisions.

The public image we see is only TEPCO's, while the bureaucracy, the helping hands behind the scenes, acts like an innocent bystander. This is the problem.

The government, in an attempt to prevent disorder, makes itself out to be the hero, daringly rescuing us from the radioactive water. But I feel the government should first reconsider the lack of expertise and irresponsible handling by the bureaucracy, which has tolerated TEPCO's sloppy cleanup.

My greatest fears concern the 350,000 tons of radioactive water stored in the tanks. Even though, as Prime Minister Abe tells us, the effects of contaminated water runoff into the ocean have been blocked off in a contained area, we do not know whether the tanks on land could tip over and cause a massive spill.

What the government should now do is control the radioactive water stored in the tanks and put it through final disposal as soon as possible. Most of the funds the government has set aside will be used to stanch the further release of contaminated water, and there is no outlook for what to do with the water already in storage.

Discussion is fixated on whether to release filtrated water that still contains tritium, a radioactive isotope of hydrogen, into the sea, but no one has even spelled out how to dispose of the highly concentrated waste matter removed in the process.

SPLIT UP AND NATIONALIZE

I was involved in writing off bad debts under the minister in charge of financial affairs during the early 2000s, and I can't help but recall a lesson I learned during that time. **Throwing taxpayer money at a problem in piecemeal fashion has little effect.**

Unlike financial reconstruction, we cannot recover the taxpayer money we throw at the contaminated water problem. But now is the time for the political will to get the bureaucrats off their lazy butts. To do this, I think arrangements to bring in outside experts will be important.

The government has created response teams to deal with the contaminated water issues--one led by the Minister of Economy, Trade and Industry and another led by Cabinet ministers--but has left liaising with TEPCO up to the bureaucrats. What the government should do is promptly set up a task force of technical and management experts under the appropriate Cabinet ministers and dispatch it to TEPCO.

The government will have to invest a heavy dose of taxpayer money to take aggressive measures dealing with the radioactive water.

To win over the people's understanding, there must be another debate over what is to become of TEPCO, but this time without skirting the issue of responsibility for TEPCO shareholders and the financial institutions that lent money to the utility.

I believe the only solution is to split TEPCO into a company for decommissioning and disaster cleanup (a "bad" company) and a company for supplying electricity (a "good" company), force responsibility on banks and other investors by liquidating the former, followed by a complete nationalization, and then hand responsibility for decommissioning and the like to the government.

One more important perspective to consider is the global governance of nuclear power. Due to the risk that the effects of accidents can spill over borders, **we need to start thinking right away about nuclear power as part of the collective wisdom of humankind, to be governed by us all.**

An example we could learn from is the European Organization for Nuclear Research (CERN), the institute that discovered the Higgs boson and is jointly managed by its member states.

Japan should be proactive in using the world's knowledge during decommissioning and disaster response, and lead a movement to build a global cooperative framework.

(This article is based on an interview by Tsuyoshi Komano, staff writer.)

International compensation pact & US help

November 1, 2013

Japan to join nuclear compensation pact

http://www3.nhk.or.jp/nhkworld/english/news/20131101_16.html

A Japanese Cabinet minister has notified the United States of Japan's intention to join an international treaty on compensation for nuclear accidents.

Economy and industry minister Toshimitsu Motegi conveyed the message to visiting US Energy Secretary Ernest Moniz in Tokyo on Thursday.

The US government has been asking Japan to ratify the treaty, which is aimed at helping participating countries pay compensation for damage from nuclear accidents with funds contributed by member nations.

Moniz welcomed Japan's decision.

The ministers agreed to coordinate closely toward the conclusion of the pact.

Moniz expressed the US's willingness to continue to help Japan decommission the Fukushima Daiichi plant and stem leaks of contaminated water at the facility.

US, TEPCO to work together on Fukushima plant

http://www3.nhk.or.jp/nhkworld/english/news/20131101_35.html

The US Energy Secretary and the president of Tokyo Electric Power Company have agreed to enhance technical cooperation to better deal with problems at the damaged Fukushima Daiichi nuclear plant.

Secretary Ernest Moniz toured the plant on Friday accompanied by TEPCO President Naomi Hirose.

Moniz inspected wells to monitor the spread of underground radioactive contamination and equipment to pump up radioactive water close to the ocean.

Groundwater flows from nearby mountains into the plant compound, absorbs radioactive substances there and then leaks into the ocean. TEPCO is still unable either to identify exactly where radioactive

water is leaking or to keep track of the movement of groundwater.

Moniz reportedly said Energy Department researchers are currently working on technologies to contain contaminated water and they can be of help.

A radiation leak at the Hartford nuclear site in the state of Washington earlier this year prompted the US Energy Department to set up a research institute to develop technologies to handle such accidents.

Moniz and Hirose agreed to strengthen technical cooperation in 5 fields. These include disposal of radioactive water, preventing the contamination of underground water and the removal of melted nuclear fuel.

US ready to help decommission reactors in Fukushima

http://www3.nhk.or.jp/nhkworld/english/news/20131101_05.html

TEPCO reports first profit since 3/11

TEPCO reports 1st profit since Fukushima nuclear disaster

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201311010060>

THE ASAHI SHIMBUN

Tokyo Electric Power Co. posted its first profit since the Fukushima nuclear crisis started in March 2011, but the utility gave a dreary forecast as disaster-related costs continue to pile up.

TEPCO said Oct. 31 it secured a pretax profit of 141.6 billion yen (\$1.44 billion) for the April-September period, a sharp reversal from a loss of 166.2 billion yen a year earlier.

The company's household electricity rate hike from September 2012 pushed up revenue by 177 billion yen from a year earlier. The utility also cut 55 billion yen in spending by squeezing personnel costs and deferring repair work.

Those measures more than offset the increased fuel costs for thermal power generation to make up for lost capacity at its destroyed or idle nuclear reactors.

Nine of the 10 regional utilities either turned profits or cut losses in the half-year period, although the nation's 50 nuclear reactors will remain shut down until their safety is confirmed.

But industry executives said reactors must be brought back online as soon as possible to ensure a stable electricity supply.

TEPCO President Naomi Hirose, who is desperately seeking to restart reactors at the Kashiwazaki-Kariwa nuclear plant in Niigata Prefecture, voiced pessimism about the company's finances for the latter half of the current fiscal year.

"We are bracing for extremely grim earnings," he said, citing payments due to contractors toward the fiscal-year end in March.

TEPCO says the reactivation of one Kashiwazaki-Kariwa reactor will improve its earnings by more than 100 billion yen.

The utility submitted applications to the Nuclear Regulation Authority for safety screenings for two of the Kashiwazaki-Kariwa nuclear plant's seven reactors at the end of September.

An NRA screening to confirm whether a reactor complies with new nuclear safety standards that took effect in July is a prerequisite for a restart.

However, even if TEPCO ekes out a single-year profit, the long-term outlook remains bleak as costs for compensation, decontamination and decommissioning pummel the company's bottom line.

TEPCO has posted an extraordinary loss of about 3 trillion yen for compensation paid to those affected by the disaster at the Fukushima No. 1 nuclear plant. But government assistance has allowed the company to cancel out the deficit with an extraordinary profit of the same amount.

TEPCO has also avoided booking costs for decontamination work in areas around the Fukushima plant that will likely exceed 3 trillion yen. The utility refuses to pay much of the amount as required under law.

Government assistance to TEPCO is expected to reach its limit of 5 trillion yen in the near future.

The government has started talks with the ruling coalition about sharing the burden of the Fukushima decontamination costs.

PUSH CONTINUES FOR REACTOR RESTARTS

Kansai Electric Power Co. posted a pretax profit of 31.5 billion yen for the April-September period, compared with a loss of 171.9 billion yen a year earlier.

Electricity rate hikes from spring increased revenue by 120 billion yen, while costs were slashed by 77 billion yen.

But a senior company official said red ink would have been inevitable if two reactors at the Oi nuclear power plant in Fukui Prefecture had not been operational.

All nuclear reactors in Japan were taken offline by May 2012 following the Fukushima nuclear accident, but the two Oi reactors were able to operate from August 2012 to September this year.

"Only temporary factors allowed us to secure profits," Kansai Electric President Makoto Yagi said. "We continue to face harsh business conditions."

Six regional utilities including TEPCO and Kansai Electric have raised electricity rates since the Fukushima nuclear accident. A seventh, Chubu Electric Power Co., applied for a rate hike on Oct. 29.

Hokkaido Electric Power Co. reported a pretax loss of 37.6 billion yen for the six-month period.

"We have been unable to negate the impact of reactors being suspended, and it remains difficult to make profits," said Katsuhiko Kawai, president of Hokkaido Electric.

Hokkaido Electric, TEPCO, Kansai Electric, Shikoku Electric Power Co. and Kyushu Electric Power Co. have all applied for NRA safety screenings for their reactors.

But the nuclear watchdog appears unable to complete the screening for a single reactor by the end of the year.

According to the NRA, Shikoku Electric and Hokkaido Electric are expected to be the first applicants to submit all documents required for screenings. Even then, the full set of their documents is not expected until late November.

"It is extremely difficult to tell when the screening (for our reactor) will be completed," Shikoku Electric President Akira Chiba said.

TEPCO posts 1st half-year profit since 2011 crisis

http://www3.nhk.or.jp/nhkworld/english/news/20131031_45.html

Tokyo Electric Power Company has reported its first mid-term profit since the accident at the Fukushima Daiichi nuclear plant in 2011.

TEPCO posted on Thursday about 1.14 billion dollars in profits for the April-September period.

Sales for the period were nearly 32 billion dollars, up more than 12 percent from a year earlier, due to cost-cutting efforts as well as a rise in electricity rates.

Profits rose despite record fuel costs of about 14 billion dollars for thermal power generation due to the weaker yen and suspended operations at all its nuclear power plants.

The company put off repair work at other power plants and transmission facilities to cut spending by 3.7 million dollars. It also reduced labor costs by 1.8 million dollars from a year earlier.

TEPCO president Naomi Hirose told reporters the company still faces an uphill battle in its struggle with contaminated wastewater at the Fukushima plant.

But Hirose said the utility aims to post a profit for the full business year next March by further streamlining operations and postponing repair works until the next fiscal year.

Over a trillion yens (disaster relief) diverted

November 1, 2013

Audit Board: 1.3 trillion yen in post-quake recovery funds diverted elsewhere

<http://ajw.asahi.com/article/0311disaster/recovery/AJ201311010069>

THE ASAHI SHIMBUN

More than a trillion yen earmarked for disaster relief in areas affected by the March 11, 2011, disaster went to projects other than those the money was intended for, including Japan's so-called scientific whaling program, according to a new Board of Audit report.

"The rebuilding budget was financed through tax hikes on taxpayers," the Board of Audit report said. "The government agencies involved should therefore give appropriate consideration to disaster priorities. They must be held accountable and explain themselves."

The board examined government relief expenditures for fiscal 2011-2012. It said Oct. 31 that 23 percent of the projects audited, totaling 11 percent of the budget already spent, or 1.3 trillion yen (\$13.2 billion), had nothing to do directly with the Great East Japan Earthquake, tsunami or the Fukushima nuclear disaster.

The most recent revelations are not the first time news of wasteful spending has been made public.

In response to revelations that some post-quake relief funds were diverted, the government issued new guidelines in November 2012 that stipulated projects not directly linked to the reconstruction effort, or in disaster-hit areas, are not eligible for the funding.

The government at the time halted 35 such projects totaling 16.8 billion yen. One of the projects halted included the anti-seismic retrofitting of government buildings outside the disaster area.

According to the board's latest audit, a total of 19.9 trillion yen in fiscal 2011 and 2012 was allocated for disaster recovery. Using the new government guidelines, the board screened 1,401 rebuilding projects, totaling 15.2 trillion yen.

The results of the Board of Audit's inspection showed 912 projects were directly linked to rebuilding efforts in disaster-hit areas. Another 163 projects fell partially within the government guidelines, including tsunami countermeasures and anti-seismic retrofitting of school buildings outside disaster areas.

The remaining 326 projects had no direct correlation to the affected communities, even if their objective was disaster mitigation, the Board of Audit said.

The 15.2 trillion yen covered by the audit did not include special tax allocations to local governments. And of that amount, 11.4 trillion yen had been spent by the end of fiscal 2012.

Among the most notable projects deemed "irrelevant" was the partial funding of the Institute of Cetacean Research, which engages in so-called scientific whaling. The farm ministry spent 2.19 billion yen in fiscal 2011, partly to subsidize the institute. Most of that money was used to offset a deficit at the ICR and to guard Japan's whaling vessels.

The ICR was struggling financially due to a drop in the whale harvest and partly from the need to hire patrol vessels to counter sabotage efforts by the Sea Shepherd Conservation Society, an anti-whaling group.

The Board of Audit dismissed the farm ministry's argument that the payments benefited the rebuilding efforts in Ishinomaki, Miyagi Prefecture, which hosts an ICR facility.

Another project flagged was a labor ministry program to assist job seekers. It provided a 100,000 yen monthly allowance to people looking for jobs while receiving vocational training. It also subsidized private vocational schools and other institutions that train job seekers.

Of the total 1.23 billion yen spent in fiscal 2011 under that program, 970 million yen was used in 44 of Japan's 47 prefectures outside the hardest-hit prefectures of Iwate, Miyagi and Fukushima. The labor bureaus across Japan overseeing the program didn't even ask the job seekers receiving the funds and training if they were survivors of the 2011 disaster.

Following the advisory from the Board of Audit, the labor ministry the last fiscal year stopped trying to tap into the rebuilding budget for funds.

US will cooperate with Japan on cleanup and dismantling

November 2, 2013

TEPCO, U.S. to cooperate in Fukushima nuke plant cleanup

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201311020026>

THE ASSOCIATED PRESS

The utility operating Japan's crippled nuclear power plant said Nov. 1 that it will work with the U.S. Department of Energy in decommissioning the site and in dealing with radioactive water problems.

Tokyo Electric Power Co. President Naomi Hirose said he agreed to accept U.S. help in discussions with U.S. Energy Secretary Ernest Moniz as they visited the Fukushima No. 1 nuclear power plant on Nov. 1 to inspect preparations to remove fuel rods from a storage pool.

The plant has recently had a series of mishaps, including leaks of radioactive water from storage tanks. The incidents, many of them caused by human error, have added to concerns about TEPCO's ability to safely close down the plant, which suffered multiple meltdowns after being hit by a March 2011 earthquake and tsunami.

Following criticism of its perceived reluctance to accept foreign help, Japan has recently begun to show more willingness to do so.

Operators of the plant are currently making final preparations to remove fuel rods from an uncovered cooling pool at Unit 4--one of four reactor buildings damaged in the crisis, and the one considered at highest risk. Removing the fuel rods from the cooling pool is the first major step in a decommissioning process at the plant that is expected to take decades.

The fuel removal at Unit 4 was given preliminary approval by Japanese regulators on Oct. 30 and is to start by mid-November following a final go-ahead.

"As Japan continues to chart its sovereign path forward on the cleanup at the Fukushima site and works to determine the future of their energy economy, the United States stands ready to continue assisting our partners in this daunting yet indispensable task," Moniz said in a statement on Nov. 1. He said a U.S.-Japan commission to strengthen cooperation in civil nuclear research and development, as well as Fukushima cleanup, emergency response, and regulatory issues, will meet in Washington next week.

Despite public concerns over potential risks of radiation from the plant, Japan's ruling Liberal Democratic Party has pushed for a restart of the country's nuclear reactors, which are currently all offline for safety checks. Moniz said he expects nuclear power will remain a crucial part of the energy mix as the world tries to mitigate global warming.

"We will work together to tackle many challenges toward decommissioning," Hirose said in an interview with Japanese media. "I have high hopes that we will be able to benefit from U.S. experience and expertise at the Fukushima plant."

The two sides hope to contribute to global nuclear power by sharing technology in stabilizing and decommissioning the plant, Hirose said.

"The success of the cleanup also has global significance. So we all have a direct interest in seeing that the next steps are taken well, efficiently and safely," Moniz said in a speech on Oct. 31 in Tokyo.

Moniz, escorted by Hirose, inspected the Unit 4 pool area, as well as storage tanks for contaminated water, radioactive water treatment units and other facilities at the plant.

The reactor building was damaged by hydrogen explosions, and remains a source of international concern about a catastrophic open-air meltdown in case of a pool collapse, despite TEPCO's repeated reassurance that it has reinforced the pool and that the building can withstand another major earthquake.

TEPCO also has appointed a former U.S. regulator who led the cleanup of the 1979 Three Mile Island nuclear accident in the United States as an adviser.

Tepco confirms U.S. will help with Fukushima No. 1 dismantling, cleanup

by Mari Yamaguchi

http://www.japantimes.co.jp/news/2013/11/02/national/tepcu-confirms-u-s-will-help-with-fukushima-no-1-dismantling-cleanup/#.UnSk_VOwT9k

Tokyo Electric Power Co. President Naomi Hirose said the utility will work with the U.S. Department of Energy in decommissioning the Fukushima No. 1 nuclear plant and in dealing with radioactive water amassing at the site.

Hirose said he agreed to accept the offer of help in discussions with U.S. Energy Secretary Ernest Moniz as they visited Fukushima No. 1 on Friday to inspect preparations to remove spent fuel rods from the storage pool of reactor 4.

The plant has recently seen a series of setbacks, including radioactive water gushing from storage tanks into the Pacific. The incidents, many of them caused by human error, have added to concerns about Tepco's ability to safely dismantle the complex, which suffered multiple meltdowns after being hit by the March 2011 quake and tsunami.

Following criticism of its perceived reluctance to accept foreign help, Japan has recently begun to show more willingness to do so.

Final preparations are currently being made to remove fuel rods from the uncovered cooling pool of unit 4 — one of four reactor buildings damaged in the crisis, and the one considered at highest risk. Removing the fuel rods from the cooling pool is the first major step in a decommissioning process that is expected to take decades.

The fuel removal at reactor 4 was given preliminary approval by regulators Wednesday and is set to start by the middle of the month following a final go-ahead.

“As Japan continues to chart its sovereign path forward on the cleanup at the Fukushima site and works to determine the future of their energy economy, the United States stands ready to continue assisting our partners in this daunting yet indispensable task,” Moniz said in a statement late Friday.

He said a Japan-U.S. commission to strengthen cooperation in civil nuclear research and development, as well as Fukushima cleanup, emergency response and regulatory issues, will meet in Washington this week.

Despite public concerns over potential radiation risks from the No. 1 plant, the ruling Liberal Democratic Party has pushed for a restart of the country’s other nuclear reactors, which are currently all offline for safety checks. Moniz said he expects atomic power will remain a crucial part of the global energy mix as nations try to mitigate global warming.

“We will work together to tackle many challenges toward decommissioning,” Hirose said in an interview with public broadcaster NHK. “I have high hopes that we will be able to benefit from U.S. experience and expertise at Fukushima No. 1.”

Hirose said the two sides hope to contribute to global nuclear power by sharing technology in stabilizing and decommissioning the plant.

In a speech Thursday in Tokyo, Moniz said: “The success of the cleanup also has global significance. So we all have a direct interest in seeing that the next steps are taken well, efficiently and safely.”

Moniz, escorted by Hirose, inspected the reactor 4 pool area, as well as storage tanks for contaminated water, radioactive water treatment units and other facilities at the plant.

The reactor 4 building, damaged by hydrogen explosions in March 2011, remains a source of international concern about a catastrophic open-air meltdown in case of a pool collapse, despite Tepco’s

repeated reassurances that it has reinforced the pool and that the building can withstand another major earthquake.

Tepco also has appointed as an adviser a former U.S. regulator who led the cleanup of the 1979 Three Mile Island nuclear disaster in Pennsylvania.

US, TEPCO to work together on Fukushima plant

http://www3.nhk.or.jp/nhkworld/english/news/20131101_35.html

The US Energy Secretary and the president of Tokyo Electric Power Company have agreed to enhance technical cooperation to better deal with problems at the damaged Fukushima Daiichi nuclear plant.

Secretary Ernest Moniz toured the plant on Friday accompanied by TEPCO President Naomi Hirose.

Moniz inspected wells to monitor the spread of underground radioactive contamination and equipment to pump up radioactive water close to the ocean.

Groundwater flows from nearby mountains into the plant compound, absorbs radioactive substances there and then leaks into the ocean. TEPCO is still unable either to identify exactly where radioactive water is leaking or to keep track of the movement of groundwater.

Moniz reportedly said Energy Department researchers are currently working on technologies to contain contaminated water and they can be of help.

A radiation leak at the Hartford nuclear site in the state of Washington earlier this year prompted the US Energy Department to set up a research institute to develop technologies to handle such accidents.

Moniz and Hirose agreed to strengthen technical cooperation in 5 fields. These include disposal of radioactive water, preventing the contamination of underground water and the removal of melted nuclear fuel.

1 trillion yen of taxpayer money for decontamination

November 2, 2013

Gov't to spend 1 trillion yen in public funds for Fukushima decontamination

<http://mainichi.jp/english/english/newsselect/news/20131102p2g00m0dm065000c.html>

TOKYO (Kyodo) -- The government plans to use public funds for part of the activities to clean up the radiation-contaminated areas outside the crippled Fukushima Daiichi nuclear power plant in a major policy shift, with the total sum likely to top 1 trillion yen, sources close to the matter said Friday.

The plan to alleviate the financial burden Tokyo Electric Power Co. was supposed to face is in line with a ruling Liberal Democratic Party proposal compiled a day before on ways to accelerate the sluggish recovery from one of the world's worst nuclear crises.

Plant operator Tokyo Electric Power Co. is still expected to pay up to some 3 trillion yen because the government has no intention to exempt the utility from decontamination cost payments the state and local governments have already planned.

The state, for its part, plans to use public funds to respond to additional decontamination needs for infrastructure restoration, such as cleaning schools, parks and other public facilities that have been left without maintenance after residents fled from their homes.

It will also use funds to build interim storage facilities to keep radioactive soil and other waste created in the cleanup efforts.

The Environment Ministry has earmarked a total of 1.5 trillion yen for costs related to decontamination activities through fiscal 2013 ending next March and asked TEPCO to pay 40 billion yen of the funds it has so far used.

But the utility has only paid back 6.7 billion yen, citing delays in clerical work and the utility's tough business conditions.

TEPCO is struggling due to increase in fuel imports for boosting thermal power generation to make up for the loss of nuclear power. It also needs funds to compensate people and companies affected by the crisis as well as to scrap the crippled reactors at the Fukushima plant.

State to spend over ¥1 trillion of taxpayer money for Fukushima decontamination work

<http://www.japantimes.co.jp/news/2013/11/02/national/state-to-spend-over-%C2%A51-trillion-of-taxpayer-money-for-fukushima-decontamination-work/#.UnVOY1OwT9k>

Kyodo

In a major policy shift, the government will use more than ¥1 trillion in public funds to clean up contaminated areas around the Fukushima No. 1 plant, according to sources[....]

Taxpayer money yes but on certain conditions

EDITORIAL: No-nukes road map needed before taxpayers made to pay for cleaning up TEPCO's mess

<http://ajw.asahi.com/article/views/editorial/AJ201311020038>

The ruling Liberal Democratic Party has thrashed out plans to deal with the consequences of the Fukushima nuclear disaster and take care of affected areas, but many questions remain unanswered.

The most important feature of the LDP proposal calls for using money in state coffers to finance future decontamination work and the construction of interim storage facilities for contaminated soil and other radioactive materials.

The Abe administration is set to take responsibility for meeting this formidable challenge.

DON'T USE TAXPAYER MONEY TO BAIL OUT TEPCO

In our editorials, we have consistently pointed out that Tokyo Electric Power Co., the operator of the crippled Fukushima No. 1 nuclear power plant, cannot be expected to fully bear the costs of cleaning up the mess. Public funds will have to be used.

But the government's financial commitment is not sufficient to ensure that the work to decommission the reactors at the plant will go smoothly. We cannot be optimistic, especially considering how the government has been responding to the leaks of contaminated water at the plant on an ad hoc basis.

The government should unveil, as soon as possible, a clear and convincing road map toward phasing out nuclear power generation, showing details about systems and procedures for decommissioning all nuclear reactors in Japan. This is vital for making sure that taxpayer money will not be used simply for bailing out TEPCO.

Under the LDP's proposals, TEPCO will pay for the cost of decontamination work that has been done so far, estimated at between 1.3 trillion yen (\$13.2 billion) and 1.5 trillion yen. The government will bear the cost of future decontamination work. The utility has also agreed to use its own money to pay compensation to victims.

The Fukushima meltdowns were a man-made disaster. The primary blame should be placed on TEPCO, which failed to implement the appropriate safety investments to make the plant less vulnerable to natural disasters. From this point of view, there is a compelling case for requiring the utility to bear all the costs of dealing with the consequences of the accident triggered by the 2011 Great East Japan Earthquake and tsunami.

But the amount needed to pay compensation, decontaminate polluted areas and decommission the reactors is simply too huge--more than 10 trillion yen according to one estimate--for a single company to cover. If TEPCO is required to pick up the entire tab, the utility could be tempted to take a reckless

approach to its business operations in a bid to secure profits. By that, we mean that it must not cut corners on the issue of paying adequate compensation to victims and making the necessary capital investment for stable electricity supply.

TEPCO recently reported its first half-year profit since the accident flared. But the black ink figure is a product of accounting gimmicks to prevent compensation expenses from depressing the bottom line. The company also went to considerable lengths to put off booking repair expenses. The earnings results were engineered through creative accounting, so to speak.

TEPCO is eager to restart the idled reactors at its Kashiwazaki-Kariwa nuclear plant in Niigata Prefecture, even though it is still struggling with the Fukushima cleanup. That is because it is under strong pressure to notch up profits.

If TEPCO bears all the cleanup costs, the money will have to come from higher electricity charges imposed on consumers in the Tokyo metropolitan area, which the utility serves.

The government is also partly responsible for the Fukushima accident because it has promoted nuclear power generation as a national policy and failed to tighten lax nuclear safety regulations.

For these reasons, we have been calling on the government to use tax money to deal with the consequences of the nuclear disaster.

LAY OUT A NUCLEAR-FREE FUTURE

But there are certain conditions that must be met before using the tax money.

For one thing, it must be made clear that TEPCO is effectively bankrupt. That is the only way to minimize the financial burden on taxpayers.

Under current law, there are some potential problems with TEPCO filing for bankruptcy, which requires that priority be placed on paying back the huge amount of debt the company owes to investors who bought its corporate bonds. That means financial relief to victims could be put on the back burner.

The overall cost of decontamination is estimated to be around 5 trillion yen. Any plan to put a financial burden of trillions of yen on taxpayers will not win public support unless TEPCO stakeholders, especially its creditor banks, are held strictly accountable for the problem.

The most important condition for using taxpayer money to sort out the situation, however, is that the government should take responsibility and announce a plan to wean the nation from its dependency on nuclear power.

The government must not be allowed to permit the restart of one offline reactor after another after establishing a precedent for tax financing of part of the cost of dealing with the aftermath of the nuclear accident.

Prime Minister Shinzo Abe himself has pledged to reduce Japan's dependence on nuclear power generation.

The government should start the process by announcing that older reactors and those that are unable to pass the safety inspections by the Nuclear Regulation Authority will be decommissioned as quickly as possible. The government should also promise not to permit the construction of any new nuclear power plant or the reconstruction of a reactor within an existing plant.

CREATE EFFECTIVE SYSTEM FOR DECOMMISSIONING REACTORS

The government should also pull the plug on the long-standing program to establish a nuclear fuel recycling system and scrap the Monju prototype fast-breeder reactor and the Rokkasho fuel reprocessing plant in Aomori Prefecture. That would free up the budgets for these projects as well as reserves set aside by electric utilities for them and allow the money to be used to finance measures to be taken at the Fukushima plant.

After that, the government should swiftly work out specific plans to build facilities for the final disposal of radioactive waste, and deal with the stockpiles of plutonium stored both in and outside Japan.

Another urgent task is the establishment of a dependable system to decommission reactors. The LDP's proposals offer no decisive plan for decommissioning the reactors at the Fukushima No. 1 plant and tackling the problem of radioactive water, although the party mentioned some proposed ideas. These included setting up a special unit for these tasks within TEPCO, spinning off such a unit from the utility and turning the company into an independent administrative agency.

It is clearly necessary to consider creating an independent entity responsible for decommissioning reactors for all nuclear plant operators, including TEPCO. At the very least, the current situation in which TEPCO is seeking to restart the Kashiwazaki-Kariwa plant while grappling with the Fukushima cleanup must not be allowed to continue.

Trying to bring the Kashiwazaki-Kariwa plant back online to ease the financial burden on the public would be putting the cart before the horse.

Another priority task is to secure a safe working environment for workers at the Fukushima plant. With TEPCO's ability to perform the necessary tasks on its own in doubt, the government should take responsibility for protecting the health and welfare of Fukushima workers and establish a system to provide necessary human and other resources for the tasks that need to be carried out at the plant.

There will be no true improvement in the situation if the government decides to dip into state coffers to cover the costs without making serious efforts to solve all these challenges

.

Japanese taxpayers are completely unwilling to pay for cleaning up TEPCO's mess.

--The Asahi Shimbun, Nov. 2

Increase Gov't involvement

November 4, 2013

Govt. to be more involved in Fukushima cleanup

http://www3.nhk.or.jp/nhkworld/english/news/20131104_18.html

The Japanese government plans to increase its involvement in recovery efforts from the Fukushima nuclear accident. Efforts include financing work to remove radioactive material from soil and decommission reactors at the Fukushima plant.

Chief Cabinet Secretary Yoshihide Suga said in a speech in Tokyo on Monday that it's high time to review the policy for recovery efforts.

Suga said the previous government, led by the Democratic Party, chose to have Tokyo Electric Power Company respond to the accident on its own, even though the government could have taken charge of some of the work.

Suga said the government will coordinate its policy with proposals from the main governing Liberal Democratic Party.

An LDP taskforce came up with proposals last week, suggesting that after current decontamination plans are carried out, the government could finance further cleanup efforts as a public works project.

It also called for a greater government role in decommissioning damaged reactors, building and managing

facilities for storing soil removed in the decontamination process, and addressing the problem of tainted water leaks.

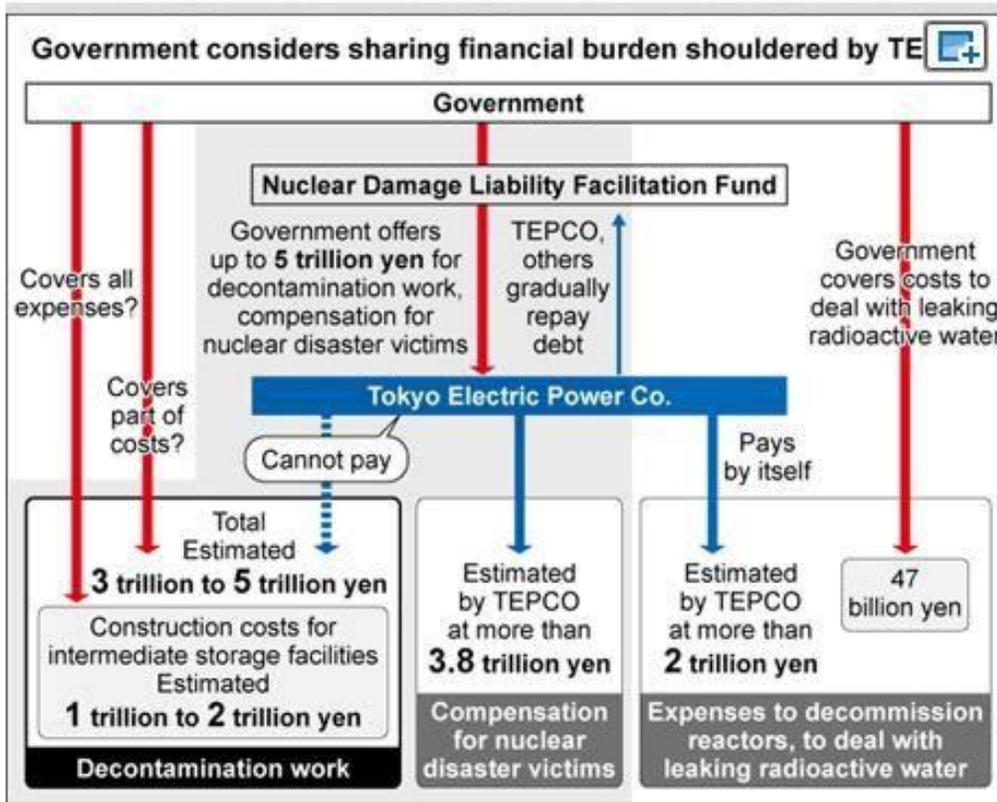

On Friday, Finance Minister Taro Aso said he respects and will carefully study the proposal

More money for TEPCO

November 5, 2013

Government considers additional funds for Fukushima measures, blames DPJ

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201311050066>

THE ASAHI SHIMBUN

The government is considering shouldering a larger financial burden in dealing with the Fukushima No. 1 nuclear plant accident, a mess the top government spokesman blamed on the previous administration.

The Abe administration has apparently decided that Tokyo Electric Power Co., the operator of the plant, cannot afford to cover all the costs related to the nuclear disaster that started in March 2011.

Based on a proposal that the ruling Liberal Democratic Party will submit to Prime Minister Shinzo Abe, Chief Cabinet Secretary Yoshihide Suga indicated the government would bear part of the costs for future decontamination work around the plant and to build intermediate storage facilities for radioactive debris.

The government is also expected to provide funds for decommissioning the plant's reactors and dealing with the radioactive water leaks that continue to plague work around the site.

Suga also said the government plans to review related laws on nuclear damage compensation and the Nuclear Damage Liability Facilitation Fund during the regular Diet session next year.

He said the ongoing problems related to the Fukushima disaster stem from a decision by the Democratic Party of Japan-led government.

"The previous administration wrongly took a course of having TEPCO (deal with the accident) without the involvement of the government," Suga said in a speech in Tokyo on Nov. 4. "It's time to review the way."

He said the government could have been involved in certain things to alleviate the damage.

The DPJ-led government last year put the utility under virtual state control and provided loans to TEPCO via the Nuclear Damage Liability Facilitation Fund. The funds are intended to pay compensation to nuclear disaster victims as well as expenses for decontamination work in the surrounding communities.

More than 10 trillion yen (\$101 billion) is needed to deal with all of the Fukushima plant problems, according to estimates. But the ceiling of government loans to TEPCO under the framework is 5 trillion yen.

Under the LDP's proposal, TEPCO will have to pay for the estimated 2 trillion yen in costs for already planned decontamination work.

The Abe administration will review the division of roles between the government and the utility based on the LDP's proposal.

But criticism remains in both the ruling and opposition camps because the current plan means taxpayer money will be used without seeking the responsibility of TEPCO's shareholders and creditor banks.

One LDP member said, "To gain the support of taxpayers, our priority should be to lead TEPCO into bankruptcy to take responsibility for the accident."

New report by TEPCO on the causes of the nuclear disaster

TEPCO preparing new report on Fukushima

http://www3.nhk.or.jp/nhkworld/english/news/20131106_27.html

The head of Tokyo Electric Power Company says the utility is preparing a new report on what caused the crisis at its Fukushima plant.

The step is seen as part of the company's efforts to gain understanding for restarting 2 reactors in Niigata Prefecture, central Japan.

TEPCO President Naomi Hirose told a Lower House panel on Wednesday that the company plans to shortly release its findings on Fukushima.

Hirose said TEPCO has continued to examine the cause of the March 2011 disaster through an expert panel. Members include US and British nuclear power experts.

The new report follows one released in June 2012 on the results of the company's own investigations. But the first report left many questions unanswered.

Hirose said TEPCO will also present the report to Niigata Prefecture for review.

A prefectural technical panel is examining safety features of the Kashiwazaki-Kariwa plant, where the utility hopes to restart 2 reactors.

TEPCO apparently decided a further probe into Fukushima was needed to gain the prefecture's approval.

China demands "accurate" information on Fukushima crisis

November 6, 2013

China at U.N. demands 'accurate' nuclear account from Japan

AFP-JJI

<http://www.japantimes.co.jp/news/2013/11/06/national/china-at-u-n-demands-accurate-nuclear-account-from-japan/#.UnoezSewT9l>

UNITED NATIONS – China is demanding that Japan provide “accurate” information on how it is handling new fallout from the Fukushima nuclear disaster [...]

UN nuclear inspectors in Japan as China demands openness

IAEA has recommended Japan to establish an effective plan and mechanisms for the long-term management of contaminated water

http://www.business-standard.com/article/international/un-nuclear-inspectors-in-japan-as-china-demands-openness-113110600257_1.html

Inspectors from the UN's nuclear watchdog arrived in Tokyo today to monitor marine pollution near Fukushima as China demanded Japan provide "accurate" information on how it is handling the crisis.

China told the UN General Assembly it was worried about radioactive water leaks from the Japanese plant, which went into meltdown after being hit by a tsunami in March 2011.

"China follows closely the countermeasures to be adopted by Japan," China's deputy UN ambassador Wang Min told a debate on the International Atomic Energy Agency (IAEA).

"We urge the Japanese side to spare no effort in minimising the subsequent impact of the accident and provide timely, comprehensive and accurate information to the international community," Wang added.

China and Japan have a series of bilateral disputes, and the new comments are certain to annoy the Japanese government, which is already under major domestic pressure over Fukushima, diplomats in New York said.

Wang said the 2011 disaster had "sounded the alarm bell for nuclear safety" even though China "firmly" supports the use of nuclear power.

South Korea also said it was worried about the radioactive leaks but gave more support to Japan.

Fukushima "continues to be a source of serious concern, especially to adjacent countries, because of the spillage of contaminated water into the sea," said South Korea's deputy UN ambassador Sul Kyung-Hoon.

South Korea "appreciates the Japanese government's efforts to share relevant information with the international community," Sul added, while calling on the IAEA to strengthen assistance to Japan.

IAEA director general Yukiya Amano said the UN atomic watchdog "has recommended that Japan establish an effective plan and mechanisms for the long-term management of contaminated water.

"The announcement by the Japanese government of a basic policy for addressing this issue was an important step forward," Amano added.

The first batch of IAEA experts arrived in Japan today at the invitation of the Japanese government as it looks to bolster its credibility.

The two researchers from the Environment Laboratories in Monaco are planning to analyse sea water near Fukushima, the agency said.

NHK : Removing Spent Fuel (video)

November 6, 2013

No.4 reactor pool shown to media

http://www3.nhk.or.jp/nhkworld/english/news/20131106_35.html

The operator of the Fukushima Daiichi plant has shown the media the pool for nuclear fuel units at the No.4 reactor. Work to remove the units will begin this month.

The upper part of the No.4 reactor building was badly damaged in March 2011 just after the massive earthquake.

The pool on the upper floor of the building contains 1,533 units, the largest single set in a pool at the plant. The number includes 1,331 spent fuel units still emitting high radiation. The Tokyo Electric Power Company plans to move them all to a different location.

On Wednesday, TEPCO officials allowed the media to see the pool.

Most of the debris that filled the 10-meter-square pool after the explosion has been removed.

Workers will use a crane to transfer the units to a container designed to block radiation. It will be filled with 22 units before being lowered to the ground and transported to a storage facility.

TEPCO plans to remove all the units by the end of next year.

The work is said to be the first milestone in a decommissioning project that's estimated to take 40 years.

TEPCO planning holding company

November 9, 2013

TEPCO to introduce holding company structure in fiscal 2016

http://ajw.asahi.com/article/behind_news/politics/AJ201311090056

THE ASAHI SHIMBUN

Tokyo Electric Power Co. plans to introduce a holding company structure to enhance efficiency, help new entrants to the power industry and quell criticism over its handling of the Fukushima nuclear crisis, sources said.

TEPCO's plan, which could take effect as early as fiscal 2016, would put separate companies in charge of thermal power generation, the power grid and retailing under the umbrella of a holding company.

The realignment could help to push through government plans to separate power generation and transmission operations at electricity companies that currently hold virtual regional monopolies. Spin-offs of power transmission and distribution functions would facilitate the use of the power grid by new companies to the market.

The government hopes to realize these changes from fiscal 2018 to 2020 as a key component of power industry reforms.

TEPCO also plans to eliminate its 10 branch offices to streamline the current three-tier hierarchy comprising a head office, branch offices and service centers, the sources said.

Sections at the head office, including the corporate affairs, accounting and human resources departments, will be integrated and may be assigned to take orders from other companies, the sources said.

Further cost cuts will be pursued by keeping meticulous records of fuel and other expenses on a unit-by-unit basis at TEPCO's power stations.

TEPCO is rushing to realign itself because the radioactive water crisis at the Fukushima No. 1 nuclear plant has fueled calls for an overhaul of the utility's corporate structure.

Criticism is intensifying that TEPCO is banking on a government bailout. The government and the ruling Liberal Democratic Party are discussing plans to use public funds to shoulder part of the post-disaster cleanup expenses at and around the Fukushima nuclear plant.

The utility apparently hopes to win public understanding for receiving taxpayer money by touting its willingness to cooperate in power industry reforms.

TEPCO first announced plans to introduce a holding company structure in November 2012. The utility spun off three of its arms into financially autonomous "in-house companies" in April. It hopes to introduce the new corporate structure once the Electricity Business Law is amended next year at the earliest, the sources said.

An LDP panel recommended the use of government money to shoulder part of the enormous costs for the Fukushima cleanup, including decontamination and building intermediate storage facilities for radioactive debris. It also proposed that TEPCO's arm in charge of decommissioning nuclear reactors and dealing with radioactive water leaks be spun off either into an in-house company, separate company or government-affiliated institution.

For now, TEPCO plans to spin off its nuclear reactor decommissioning operations only into a dedicated in-house company.

“I doubt that a pared-down company would be able to keep doing such demanding work for the coming four decades,” TEPCO President Naomi Hirose said about the decommissioning process.

However, TEPCO has yet to decide what to do with its nuclear power arm and nuclear reactor decommissioning arm under the proposed holding company structure.

Separating the nuclear reactor decommissioning arm could lead to an easier government injection of public funds and a more radical overhaul of TEPCO’s corporate structure.

TEPCO plans holding company system amid wariness from financial institutions

<http://mainichi.jp/english/english/newsselect/news/20131108p2a00m0na016000c.html>

To cut costs and boost its competitive edge, the stricken Fukushima nuclear plant's operator Tokyo Electric Power Co. (TEPCO) has begun deliberations toward establishing a holding company system as early as fiscal 2016.

Subsidiary companies dedicated to fuel and thermal power generation, power distribution and transmission, and retail, respectively, will be established under the holding company, in alignment with plans to separate power production from power distribution and transmission as part of electricity system reforms.

The plans, to which financial institutions that have loaned funds to TEPCO have expressed caution, will be incorporated into the company's comprehensive special business plan set to be revised before the end of the year.

In preparation for the move, in April, TEPCO introduced an in-house company system to foster further independent decision-making by reorganizing the company into three separate divisions and an additional section dedicated to human resources and other head office functions.

Under the new proposed plan, the three divisions will become three separate subsidiaries under the umbrella of the head office section, which will become the holding company. The fuel and thermal power generation company will sell electricity to businesses that will buy it for high prices. Meanwhile, the retail

subsidiary will buy from power generation firms that offer low prices. Such measures carry the possibility of further streamlining TEPCO operations. The fate of a division dedicated to nuclear reactors and decommissioning will be deliberated at a later time.

Because the Electricity Business Act does not permit major utilities to split off into separate companies, TEPCO must wait for the passage and implementation of an electricity business law amendment in the ordinary session of the Diet next year. This would push back the company spin-offs to fiscal 2016 or 2017. If the plan pans out, it will precede the Ministry of Economy, Trade and Industry's plan to carry out the division of power generation and distribution between fiscal 2018 and 2020.

Even if TEPCO does separate its power generation functions from its power distribution and transmission functions, if they both remain under the umbrella of a TEPCO holding company, there is no guarantee that complete neutrality of the distribution and transmission subsidiary will be maintained. Financial institutions, in addition, are wary of TEPCO's plans to establish a holding company because of the chance that the treatment of collateral for loans to the company will change.

"We still can't predict if the loans will be repaid," said one executive of a financial firm.

There also remains the possibility that demands to change the company's reorganization method and timing will arise.

What's a few million yen between friends?

November 9, 2013

Experts commissioned by nuclear watchdog fail to report ¥40 million in funding

<http://www.japantimes.co.jp/news/2013/11/09/national/experts-commissioned-by-nuclear-watchdog-fail-to-report-%C2%A540-million-in-funding/#.Un9L2yewT9k>

JJI

At least 10 university experts commissioned by the Nuclear Regulation Authority to discuss safety rules failed to report over ¥40 million they received in donations and research funding from the atomic energy industry, sources said Saturday.

They received the undeclared money from power companies, nuclear plant makers and other related entities and had not declared this total as of late October, according to documents reviewed by Jiji Press based on the information disclosure law.

The NRA commissions experts to discuss nuclear safety standards and other regulations, and asks them to disclose the amount of money provided to them since fiscal 2009. The industry watchdog does not verify reports of such funds.

Of the experts who failed to report part of the funding they received, five took part in discussions about new safety measures, two participated in talks on regulatory systems and another two attended meetings on the Fukushima disaster.

According to materials provided by universities to which they belong, Yutaka Abe, a professor at the University of Tsukuba, had the highest unreported amount, at around ¥13.14 million.

That sum consisted of ¥2 million in donations from Mitsubishi Heavy Industries Ltd., ¥3 million in research funding from Tokyo Electric Power Co. and ¥8.15 million in donations and research funding from JFE Engineering Corp., which makes coolant water storage facilities for nuclear plants.

Yosuke Katsumura, a professor at the University of Tokyo who was a member of a panel on seawater inflows for reactor 5 of Chubu Electric Power Co.'s Hamaoka plant, ranked second with ¥9.98 million.

The amount he received comprised ¥700,000 in donations from Hitachi Ltd., ¥3 million in research funding from Mitsubishi Heavy and ¥6.28 million in similar funding from the Central Research Institute of Electric Power Industry, a body set up by power companies.

In an interview, Abe said, "I think I reported only what fell under the categories set by the regulation authority." Katsumura claimed he failed to report some of the funding because it slipped his mind.

More money from Gov't for the Nuclear Damage Liability Facilitation Fund (NDF)

November 9, 2013

Nuke crisis compensation fund to get capital boost, expanded responsibilities

<http://mainichi.jp/english/english/newsselect/news/20131109p2a00m0na009000c.html>

The government is planning to inject as much as 5 trillion yen in additional capital into the Nuclear Damage Liability Facilitation Fund (NDF) and transforming the compensation body into a funding portal for a broad array of nuclear crisis-related costs, it was learned on Nov. 8.

Under the proposal, designed to increase the monies available for compensation and decontamination included in an "accelerated Fukushima disaster recovery" plan now under consideration by the government and ruling parties, the maximum public funding available to the NDF would jump from the present 5 trillion yen to 8-10 trillion yen.

Using 5 trillion yen worth of interest-free loans that the government issued to the NDF, the fund is currently loaning funds to Fukushima No. 1 nuclear plant operator Tokyo Electric Power Co. (TEPCO), primarily as a capital base to pay disaster compensation. The NDF is supposed to ask the government to exchange bonds for cash to extend loans to TEPCO.

Both compensation payments and decontamination costs, however, are now expected to cost significantly more than had originally been estimated, and the government is set to allow TEPCO to broaden its use of NDF loans to cover cleanup and other disaster-related costs. In turn, the government plans to issue more interest-free bonds to the NDF to bring up its funding.

The government is furthermore considering including expanded compensation for Fukushima residents affected by the nuclear crisis in the accelerated recovery bill. The increase would be intended to guarantee sufficient support funding for both residents moving quickly back into areas evacuated in the wake of the plant meltdowns, and the relocation costs of residents of badly contaminated "difficult to return" areas. These compensation payments were originally expected to total some 3.8 trillion yen, but many expect that figure to rise to 5-6 trillion yen.

The government also plans to provide the estimated 2 trillion yen-plus for decontamination via the NDF. The government is covering the cleanup costs for the time being and will demand to be reimbursed by TEPCO later -- a setup designed to prevent the near-term concentration of the decontamination costs from plunging the utility in a state of capital deficit.

Related to the cleanup operations, the government is also considering channeling funds through the NDF to support creating mid-term storage sites for contaminated soil. Building the sites is expected to cost about 1 trillion yen, which would be drawn from proceeds of an increased "new power source development" tax levied on electricity bills.

Collecting the funds within a short period, however, could cause power bills to spike, prompting the move to use NDF capital to cover disposal site construction in the short-term. The funds would then be recovered over many years from power source development tax receipts.

All this extra capital for the NDF will require the government to issue 3-5 trillion yen more in interest-free bonds to the NDF, though this figure will remain uncertain as long as the total cost of decontamination is unknown. A concrete estimate of the cleanup costs is likely to be long in coming, and the government is considering boosting debt issuances in stages as required.

Broadly speaking, the nuclear disaster response policy funnels funds to TEPCO in the form of government loans via the NDF, which the government would then recover over the long-term -- ultimately placing the burden of cleanup and recovery on TEPCO and the electric power industry as a whole. In concrete terms, the NDF will repay the debts to the government using general contributions paid by the 11 nuclear power producers in Japan and special contributions extended by TEPCO.

Another 3 trillion yen for the NDF to provide bonds to TEPCO (2)

November 11, 2013

State considers loaning TEPCO additional 3 trillion yen

<http://ajw.asahi.com/article/economy/business/AJ201311110038>

THE ASAHI SHIMBUN

The government is weighing additional loans of 3 trillion yen (\$30.2 billion) to the operator of the crippled Fukushima No. 1 nuclear power plant, sources said.

The excess funds would be intended to enable Tokyo Electric Power Co. to pay compensation to victims of the 2011 nuclear disaster and complete decontamination work around the facility quickly.

At present, the framework for government loans to TEPCO, as previously set by the Democratic Party of Japan-led government, limits loans to 5 trillion yen. TEPCO, along with other utilities, is obliged to repay the loans over time.

Under the existing system, the government first issues government bonds of 5 trillion yen. Then, the government-affiliated Nuclear Damage Liability Facilitation Fund gradually cashes the bonds to provide funds to TEPCO. Electric power companies, including TEPCO, have up to 30 years to pay off the debt.

As part of efforts to support the plant operator financially, the ruling coalition has recommended to Prime Minister Shinzo Abe that TEPCO cover the estimated 2 trillion yen in costs for already planned decontamination work. At the same time, it called on the government to bear expenses of an estimated 1 trillion yen to build intermediate storage facilities for radioactive debris, as well as part of the costs for future decontamination work.

If the proposal is accepted, the financial burden TEPCO has to shoulder will be eased drastically.

However, the utility has already spent 3.8 trillion of the 5 trillion yen on compensation for nuclear disaster victims.

Because the government is currently considering raising the amount of indemnity for those who will likely be unable to return home over their lifetime, the entire loan of 5 trillion yen almost certainly will be swallowed up in compensation payments.

In addition, as costs for decontamination work in the surrounding communities are estimated at between 3 trillion yen and 5 trillion yen, the government has decided that it is impossible for TEPCO to cover all the expenses related to the nuclear disaster under the current framework.

At issue now is how TEPCO and other electric power companies will repay the additional 3 trillion yen.

If the utilities try to pay off the loans over a short period, they will have to raise electricity rates significantly. Meanwhile, if they extend the payback period, the amount of interest payment, paid for with taxpayers' money, will rise.

Thus, the government will inevitably face a backlash from the electric power industry, which will probably make it difficult to provide additional loans quickly.

Secrecy & nuclear security

November 12, 2013

EDITORIAL: Secrecy supported nuclear safety myth

<http://ajw.asahi.com/article/views/editorial/AJ201311120026>

In 1997, the government produced a secret document describing measures to be taken to protect nuclear power plants from terrorist attacks.

It listed security measures, such as the installation of intrusion detection sensors, as well as steps that would be taken by the Self-Defense Forces, police and the Maritime Safety Agency, now called Japan Coast Guard.

The Asahi Shimbun later obtained a copy of the confidential document and reported on its content in September 2011.

If a current version of the document with the same content exists, would it be designated as a “specific secret” for protection under the proposed new state secrets legislation?

One key question with regard to continuing Diet debate on the bill to protect state secrets is how information concerning nuclear power plants should be treated.

As an example of what kind of information concerning nuclear safety would be designated as a state secret under the envisioned law, Masako Mori, minister in charge of the bill, cited “the situation of the implementation of security measures by police to protect nuclear plants.”

But the scope of information that would be withheld is not clear.

Mori also said the design drawings of nuclear power plants would not be subject to confidentiality. Then, how about other related information? A wide range of information concerning nuclear safety could be designated as confidential information.

Independent experts would be involved in the development of the criteria for designating information as a specific secret to be protected. But they would not have the power to check the appropriateness of individual cases of designation.

It is understandable that certain pieces of information concerning safeguard measures at nuclear plants would be designated as secrets. But once the law is enforced, it would be extremely difficult for any third party, including the Diet and courts, to examine and judge the legitimacy of the designation.

Under the proposed law, bureaucrats would be effectively allowed to decide what information should be designated as a state secret. We fear that such decisions could be made in an arbitrary manner.

Let us think about one case in point.

In 1984, the Foreign Ministry secretly made estimates of casualties that could result from an attack against a nuclear power plant. The simulations showed that the number of acute deaths could reach up to 18,000 unless mass emergency evacuation was carried out.

The ministry, however, classified the estimates as “for internal use only” because of concerns about the impact of the information on the anti-nuclear movement.

The simulations covered cases of a so-called station blackout--the total loss of power sources for a nuclear plant--due to the destruction of power transmission lines and the electric supply system within a given plant. That’s the situation that developed at the Fukushima No. 1 nuclear power plant after the Great East Japan Earthquake and tsunami hit on March 11, 2011.

If the results of the ministry’s estimation had been published, more effective safety measures might have been taken at the Fukushima plant. But the information was actually classified as confidential and not shared even within the government.

As a result, a serious nuclear security flaw was overlooked. The “safety myth” concerning nuclear power generation was apparently supported by the bureaucratic penchant for secrecy and the inaction of politicians who allowed the problem to remain untouched for so long.

It was not until September 2011, six months after the disaster unfolded at the Fukushima plant, that an expert panel of the government’s Atomic Energy Commission published a report on measures for greater nuclear security, such as steps to enhance protection against terrorist attacks on nuclear power plants. It was the first report from the expert group in three decades or so.

The government has a history of covering up vital information and postponing crucial decisions. Things will only become worse if the proposed legislation is enacted.

Will protecting “specific secrets” really make this nation safer? We should re-examine this question thoroughly.

--The Asahi Shimbun, Nov. 12

Three assemblies - previously damaged - cannot be transported by cask

Source : Reuters

<http://www.reuters.com/article/2013/11/14/japan-fukushima-removal-idUSL4N0IZ0TR20131114>

Some spent fuel rods at Fukushima were damaged before 2011 disaster

By Aaron Sheldrick

TOKYO Thu Nov 14, 2013 6:20am EST

Nov 14 (Reuters) - Three of the spent fuel assemblies due to be carefully plucked from the crippled Japanese nuclear plant at Fukushima in a hazardous year-long operation were damaged even before the 2011 earthquake and tsunami that knocked out the facility.

The plant's operator, Tokyo Electric Power Co, or Tepco, said the damaged assemblies - 4.5 metre high racks containing 50-70 thin rods of highly irradiated used fuel - can't be removed from Fukushima's Reactor No. 4 using the large cask assigned to taking out more than 1,500 of the assemblies.

One of the assemblies was damaged as far back as 1982, when it was mishandled during a transfer, and is bent out of shape, Tepco said in a brief note at the bottom of an 11-page information sheet in August.

In a statement from April 2010, Tepco said it found **two other spent fuel racks in the reactor's cooling pool had what appeared to be wire trapped in them. Rods in those assemblies have pin-hole cracks and are leaking low-level radioactive gases,** Tepco spokesman Yoshikazu Nagai told Reuters on Thursday.

The existence of the damaged racks, reported in a Fukushima regional newspaper on Wednesday, came to light as Tepco prepares to begin decommissioning the plant by removing all the spent fuel assemblies from Reactor No. 4.

"The three fuel assemblies ... cannot be transported by cask," Tepco spokeswoman Mayumi Yoshida said in an emailed response to queries on Thursday, referring to the large steel chamber that will be used to shift the fuel assemblies from the pool high up in the damaged reactor building to safe storage.

"We are currently reviewing how to transport these fuel assemblies to the common spent fuel pool," she said.

Tepco is due within days to begin removing 400 tonnes of the dangerous spent fuel in a hugely delicate and unprecedented operation fraught with risk. Each assembly contains radiation equivalent to around 10 times that of the atomic bomb dropped on Hiroshima in 1945.

Having to deal with the damaged assemblies is likely to make that task more difficult and could jeopardise a 12-month timeframe to complete the removal that many have already called ambitious.

RISKY, COMPLEX OPERATION

Three reactors suffered core meltdowns at the Fukushima Daiichi plant north of Tokyo after the March 2011 disaster that triggered explosions and forced the evacuation of 160,000 people from nearby towns and villages.

Tepco, which has floundered in trying to bring the plant under control in the two and a half years since the disaster, is now moving to full decommissioning at the six-reactor facility.

The most urgent task is to remove the fuel assemblies from the unstable Reactor No. 4, which due to their height - about 18 metres above ground level - are more vulnerable to any new earthquake. The operation is seen as a test of Tepco's ability to move ahead with decommissioning the whole facility - a task likely to take decades and cost tens of billions of dollars.

Lake Barrett, a former U.S. nuclear regulator who is advising Tepco, visited the Fukushima site on Wednesday and endorsed preparations for the removal of the assemblies.

"While removal of the fuel is usually a routine procedure in operating a power plant, the damage to the reactor building has made the job more complex," he said, adding he was "genuinely impressed by the thoroughness of the effort and Tepco's contingency planning."

Tepeco has said the assembly removal process will begin around mid-November, but has not given an exact date, citing what it says are security reasons.

The assemblies must first be lifted from their storage frames in the pool and individually placed in a steel cask - kept all the while under water to prevent overheating. The cask, weighing around 90 tonnes when filled, will then be hoisted by crane from the pool, lowered to ground level and transported by trailer to a common storage pool about 100 metres away.

TEPCO: Cutting jobs to cut costs

November 17, 2013

TEPCO considering early retirement plan to cut costs

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201311170026>

THE ASAHI SHIMBUN

Tokyo Electric Power Co. plans to cut costs by offering early retirement packages for up to 1,000 employees, but some executives say a reduction in manpower could exacerbate the problems the utility faces.

TEPCO is now discussing whether to include the early retirement program in its rebuilding plan that will be revised before the end of the year, sources said.

One purpose of the proposed cost-cutting measure is to quell criticism against TEPCO--and calls for its bankruptcy--as the government moves toward using public funds to help the utility deal with the crisis at its stricken Fukushima No. 1 nuclear power plant.

The company is thinking of an early retirement program that would cover several hundred to about 1,000 employees, but the terms for those who agree to retire early have not been settled, sources said. If implemented, TEPCO will offer the package in the first half of the next fiscal year after reaching an agreement with the company labor union.

However, some TEPCO officials are hesitant about the plan, citing the enormous difficulties in decommissioning the reactors at the Fukushima No. 1 plant and ending the persistent problem of radioactive water leaks at the site.

“We are going ahead with compensation matters and power generation with the minimum number of workers so now is not the right time to be reducing the work force,” one TEPCO executive said.

The utility would also have to come up with additional funds to finance the early retirement program, which would be TEPCO’s first since the Fukushima nuclear accident started in March 2011.

As of March this year, TEPCO had about 37,000 employees, a decrease of about 2,400 from April 2011. The decline is due to a sharp increase in the number of workers who have left the company and the utility’s restrictions on new hires.

Under its current rebuilding plan, TEPCO set a goal of reducing its work force to 36,000 by the end of the current fiscal year. That target has nearly been reached, but implementing an early retirement program could show the public that it is serious about downsizing.

The ruling Liberal Democratic Party and coalition partner New Komeito have submitted a plan for the government to use public funds to cover some of the costs of decontaminating areas polluted by radiation.

The central government has already decided to use 47 billion yen (\$469 million) in public funds to build an underground wall of frozen soil to prevent groundwater from entering the Fukushima plant site and mixing with contaminated water.

These plans have sparked criticism that taxpayer money is being used to prop up TEPCO. Some members of the ruling and opposition parties have even called for the utility to undergo bankruptcy proceedings.

TEPCO’s revised rebuilding plan also includes: splitting off a separate company to handle the decommissioning of reactors and contaminated water problem; creating a holding company in fiscal 2016 or later; and eliminating all 10 branch offices of the company.

Tepco aiming to cut 1,000 jobs via voluntary redundancy

<http://www.japantimes.co.jp/news/2013/11/16/national/tepcos-aiming-to-cut-1000-jobs-via-voluntary-redundancy/#.UoeUYOIo3BI>

JJI

Tokyo Electric Power Co. is looking to shed 1,000 jobs through a voluntary redundancy program to boost efficiency and improve earnings, sources revealed Saturday.

Aiming to invite applications by the autumn of 2014, Tepco will shortly propose the idea to its labor union, the sources said. It would be the first program of its kind implemented by the utility.

The operator of the crippled Fukushima No. 1 nuclear power station will include the redundancy program in its comprehensive business plan to be revised possibly by the end of the year, according to the sources.

Tepco's existing business plan, which was approved by the government in May 2012, calls for slashing 3,600 jobs in its parent group to reduce the workforce to 36,000 by the end of March. **The utility is believed to have almost achieved this target by curbing employment of new graduates.**

But the company still needs to show it is stepping up streamlining efforts to gain financial support from the government for decontamination of areas polluted by the wrecked reactors of the Fukushima No. 1 plant, the sources said. The facility suffered three core meltdowns in March 2011.

By further cutting fixed costs, Tepco also hopes to smooth the way for additional loans totalling some ¥500 billion, including for refinancing purposes, that it hopes to receive next month from various financial institutions, the sources said.

Under the revised business plan, Tepco will pledge to abolish all of its 10 branches and shift to a holding company structure as early as fiscal 2016. In addition, it is expected to show readiness to lower electricity rates if reactors at Tepco's Kashiwazaki-Kariwa nuclear plant in Niigata Prefecture are reactivated, the sources said.

Why TEPCO cannot accept the quake caused 3/11 disaster

November 17, 2013

Cracks in Tepco's 3/11 narrative

<http://www.japantimes.co.jp/opinion/2013/11/17/commentary/cracks-in-tepcos-311-narrative/#.UokjnSewT9k>

Sentaku Magazine

"While I was with Tokyo Electric Power Co. (Tepco), a question was raised internally as to whether or not the measuring pipe installed at the Fukushima No. 1 nuclear power plant, the diameter of which is about the same as that of a human thumb, can withstand an earthquake. But Tepco has yet to make clear

whether or not the March 2011 earthquake damaged that pipe,” says Toshio Kimura, a former Tepco plant engineer.

Kimura, 49, who served the company for 17 years from 1983 to 2000 and worked at Fukushima No. 1 for 12 years, is strongly of the view that pipes in the plant were damaged seriously by the quake before a subsequent tsunami struck the plant.

He thus casts doubt on Tepco’s position that the tsunami caused loss of all the power sources, thus leading to the disaster. He says, “An effective means of determining the true cause of the accident would have been to analyze recorded data related to transient phenomena — data that show what happened near the reactor cores. Even though more than two years have passed since the disaster, however, **Tepco has only released partial data.**”

“So I demanded that Tepco release the relevant data. It made public the data on Aug. 19 for the first time.” But it was found later that the data did not represent the whole data.

In September, Kimura prepared a report titled “Leakage from the piping in the Fukushima No. 1 nuclear power plant caused by vibrations from the earthquake.”

The transient phenomena recorder records various measurements in a nuclear power plant at every one-hundredth of one second. It accumulates such data as a reactor’s output, pressure and temperature and coolant’s flowing volume. Analysis of these data makes it possible to accurately identify “process behaviors” or what is happening in an nuclear reactor.

Specifically the analysis clarifies the time sequences of a process like, for example, a pump having stopped first, causing a coolant flow to decline, then lowering the water level and raising the reactor core temperature.

For Kimura, Tepco’s failure to release these data for such a long time looked only too unnatural.

In analyzing the data, Kimura took special note of the fact that natural circulation of coolant stopped. Along with an isolation condenser, natural circulation of coolant constitutes the “lifeline” in case loss of all the power sources occurs. Even if a primary loop recirculation pump, which pumps coolant water into the reactor core, stops functioning due to loss of all the power sources, natural circulation of coolant is supposed to maintain 10 percent of normal core flow of coolant.

Analysis of the data showed, however, that immediately after the earthquake hit, about 30 percent of coolant inside the core started flowing backwards and that after the coolant flow returned to the normal

flow direction, the core flow fluctuated and eventually became less than zero. All these occurred before the nuclear power plant was struck by the tsunami.

Why is it that cooling by natural circulation of coolant became dysfunctional along with the isolation condenser right after the earthquake? Kimura believes that piping rupture was the very cause of the loss of these two “lifelines”

There are a couple of phenomena that seem to correspond to what Kimura believes happened. One is that a pump designed to draw up water from the bottom of the containment vessel seems to have been activated frequently, indicating that damage to piping caused coolant to leak and accumulate at the bottom of the vessel.

The other is that radioactive contamination was taking place at a much faster rate than was estimated by Tepco. A Tepco report said that the reactor water level reached the top of nuclear fuel approximately three hours after the earthquake, i.e., at around 5:46 p.m. (on March 11, 2011) and that radioactive vapor leakage from the containment vessel due to damage to the reactor core started afterward.

But the same report contained a contradictory statement that when a plant operator tried to enter into the reactor building at 5:19 p.m. on the same day, he had to give up because the dose of radioactivity was too high. This shows that the meltdown was taking place earlier than Tepco estimated. This corroborates Kimura’s inference that immediately after the earthquake, piping was damaged and coolant started leaking, thus rapidly lowering the reactor water level and igniting the meltdown.

Behind Tepco’s continued refusal to release all the data and to admit that the earthquake damaged the piping is a fear that serious doubts will arise about the safety of its Kashiwazaki-Kariwa nuclear power plant in Niigata Prefecture, which it hopes to restart as soon as possible. It has been known that at the time of the 2007 Chuetsu offshore earthquake, damage to piping due to the quake caused a fire at the nuclear power plant.

Niigata Gov. Hirohiko Izumida played a leading role in remedying the situation at the time. Because of this experience, he strongly demanded that Tepco construct pipes related to venting radioactive vapor underground to make it quake-proof.

Since the governor accepted Tepco’s proposal to build pipes for the second venting equipment underground in addition to the first venting equipment, whose pipes are built on the ground level, mass media reported that restart of the nuclear power plant is certain. But this is wrong. Izumida explained that Tepco’s proposal does not constitute a request for restart. The truth is that the hurdle for restart has been raised. **The Niigata prefectural government has created a technical committee on nuclear plant**

safety. Among the subjects of discussion at the committee is “the impact of an earthquake on important equipment.”

If a theory that the earthquake damaged piping in the Fukushima No. 1 nuclear plant gains credibility during the discussions, Tepco will have to build underground pipes for the second venting equipment. This means that restart will be impossible until the completion of the quake-proof second venting equipment and that Tepco will have to push new measures to make the nuclear power plant quake-proof. Then financial institution may refuse to give new loans to Tepco or call on it to revise its management plan or resume discussions on resolution of Tepco. This is why Tepco will never accept the theory that the quake, not the tsunami, caused the Fukushima nuclear disaster.

Discussions at Niigata Prefecture’s technical committee on nuclear plant safety will have great impact on restart of not only the Kashiwazaki-Kariwa nuclear power plant but also other nuclear power plants in Japan. It likely will not be long before “lies” by Tepco are brought to light.

This is an abridged translation of an article from the November issue of Sentaku, a monthly magazine covering Japanese political, social and economic scenes.

More money from 3 megabanks for TEPCO

November 19, 2013

TEPCO to seek additional loans from megabanks

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201311190045>

THE ASAHI SHIMBUN

Tokyo Electric Power Co. is asking three megabanks to extend it additional loans above and beyond the 500 billion yen (\$5 billion) already scheduled in late December.

TEPCO and the government's Nuclear Damage Liability Facilitation Fund put in the request at some time up to Nov. 18, sources said.

The size of the loan will be finalized following further discussions. The additional funds are set to be included into the utility's rehabilitation program that will be reviewed in December.

The rehabilitation program already incorporates 1 trillion yen in loans.

The three megabanks--Sumitomo Mitsui Financial Group, Mizuho Financial Group and Mitsubishi UFJ Financial Group, along with the Development Bank of Japan--extended a total of 700 billion yen in loans in summer 2012.

The remaining 300 billion yen in new loans is scheduled to be dispersed next month along with 200 billion yen in refinancing.

The new request for loans from TEPCO is expected to be used to cover costs for increased thermal power production following the 2011 nuclear disaster, and for making investments in overseas projects.

However, because the megabanks already have a huge amount of outstanding loans to TEPCO, bank officials are expected to move cautiously in meeting the latest request to raise the loan figure.

No on-site leaders & cost-cutting (Interview with "Happy")

November 19, 2013

Insider: Fukushima work slows by lack of on-site supervision, cost-cutting

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201311190075>

THE ASAHI SHIMBUN

He goes by the name "Happy" on Twitter, and he has more than 87,000 followers on the social networking site eager to know what is going on inside the wrecked Fukushima No. 1 nuclear power plant.

Happy has been working at nuclear plants for nearly 20 years. In October, he had a book published titled "Fukushima Daiichi Genpatsu Shusoku Nikki" that documents 700 days at the Fukushima plant since the March 2011 earthquake and tsunami.

With the decades-long decommissioning of the reactors getting under way, Happy spoke with The Asahi Shimbun about the radioactive water leaks and other problems plaguing plant operator Tokyo Electric Power Co., and working conditions at the crippled facility. Following are excerpts of that interview:

* * *

Question: TEPCO has started removing fuel from the storage pool for the No. 4 reactor. What do you think?

Answer: We have come all this way since the No. 4 reactor building was reduced to a wretched state (due to a hydrogen explosion). It is because of the workers who have put in strenuous efforts, despite being exposed to radiation.

Q: Why did you decide to tweet on conditions at the plant?

A: When the accident first occurred, media reports were not accurate and contained much speculation. I thought, "I must send out correct information as much as I can."

Q: What is behind the string of problems, such as the radioactive water leaks?

A: At the nuclear plant, we usually work in teams of five to 10. A team leader cannot stay at the site for a long time because his accumulated radiation dose is already high. For that reason, he sometimes gives instructions, writing memos and drawing charts, without going to the site. I suspect that workers have misunderstood instructions and made mistakes in the absence of the leader.

Q: What do you think of TEPCO's efforts to contain the crisis?

A: Immediately after the accident, the head office provided what is needed at the site, taking no account of cost. Prime Minister Yoshihiko Noda declared at the end of 2011 that the accident had been brought under control. I began to hear more often than before that spending requests (from plant officials) were denied by the head office.

We are using polyethylene pipes, a type we find at home centers, around the radioactive water storage tanks where metal pipes are required. The idea was to save time and money.

Q: What needs to be done to ensure there are enough skilled workers for the next 30 to 40 years, which will be required for the decommissioning?

A: **It is necessary to guarantee long-term employment.** Workers are only allowed to be exposed to up to 100 millisieverts of radiation over five years. Subcontractors pull workers from the site if they are exposed to 20 millisieverts in one year.

For example, we are exposed to about 20 millisieverts in just three months if we remove debris around a reactor building. Workers at subcontractors, who work only at nuclear plants, will have no jobs for the remaining nine months.

Yearlong employment must be secured by providing them with other tasks, such as decontamination work in low-radiation areas or jobs at thermal power plants.

(This article is based on an interview by Tetsuya Kasai.)

IAEA to keep an eye on fuel removal

November 20, 2013

IAEA experts to observe decommissioning

http://www3.nhk.or.jp/nhkworld/english/news/20131120_13.html

The global nuclear watchdog says it will send a team of experts to Japan this month to inspect decommissioning work at the Fukushima Daiichi nuclear power plant.

The International Atomic Energy Agency team will visit from November 25th to December 4th at the request of the Japanese government. The team includes 19 IAEA and international experts.

They'll travel to the plant to observe work to remove fuel assemblies from the storage pool in the No. 4 reactor building.

They'll also conduct hearings with officials of the Japanese government and the Tokyo Electric Power Company.

The team plans to examine how TEPCO is managing radioactive wastewater at the plant.

The IAEA sent analysts to monitor marine pollution around Fukushima from November 6th to 12th. Based on a report by the analysts, the 19 inspectors arriving later this month will also review marine monitoring activities around the Fukushima plant.

They'll submit a report to the Japanese government based on their findings.

November 19, 2013

IAEA to review fuel removal work at Fukushima No. 4 reactor this month

<http://www.japantimes.co.jp/news/2013/11/19/national/iaea-to-review-fuel-removal-work-at-fukushima-no-4-reactor-this-month/#.UougNCewT9k>

The government said Tuesday that International Atomic Energy Agency experts will visit Japan later this month to study such issues as the just-started fuel removal work at a pool inside a damaged reactor building at the Fukushima No. 1 nuclear complex.

The IAEA mission, to be led by Juan Carlos Lentijo, director of the IAEA Division of Nuclear Fuel Cycle and Waste Technology, will be in Japan from Nov. 25 to Dec. 4. The team will release a summary of its review on the final day, a government official said.

The announcement was made as delicate work by Tokyo Electric Power Co. to eventually remove more than 1,000 fuel assemblies from the spent fuel pool in the No. 4 reactor building entered its second day.

On Monday, workers successfully extracted four unused fuel assemblies from the fuel rack and placed them in a transportation cask also inside the spent fuel pool, filled with water around 12 meters deep.

Once the cask is filled with 22 fuel assemblies, workers will lower it to a trailer and take it to another pool around 100 meters away, which will provide more stable conditions for keeping the fuel cool. It is expected to take about a week to complete the work cycle for the first cask.

Tepeco will review the work flow after it finishes one cycle. It has not yet decided when it will start taking out the spent fuel, which is more difficult to handle than unused fuel because it is highly radioactive and emits heat as radioactive elements in the fuel decay.

The pool, located on the top floor of the reactor building, holds 1,533 fuel assemblies, including 202 unused ones. Tepeco plans to finish the removal work by the end of 2014.

A fuel assembly is a bundle of fuel rods comprised of zirconium metal tubes with pellets inside. The pellets, made of uranium, serve as the actual fuel for nuclear reactors.

The operation requires extreme prudence, as it is an unprecedented attempt to remove fuel from a building that saw its roof and walls blown up by a hydrogen explosion in 2011 when the nuclear crisis began.

Tepeco has cleared away large pieces of rubble that fell onto the upper floor of the reactor building as a result of the explosion and created a huge steel-framed cover to blanket the reactor building.

During the crisis immediately after the earthquake and tsunami of March 11, 2011, reactors 1, 2 and 3 experienced core meltdowns.

The No. 4 reactor only suffered a hydrogen explosion as all of its fuel was stored in the spent fuel pool because it was undergoing periodic maintenance work at the time.

The IAEA team will consist of 19 experts, some of whom have knowledge of how the plant should deal with the buildup of massive amounts of radioactive water, according to the government official.

It will be the second time that Japan has accepted an IAEA review mission on work toward decommissioning the four stricken reactors at Fukushima No. 1.

Too "perilous" a task for TEPCO

November 19, 2013

Fukushima job feared too perilous for Tepco

<http://www.japantimes.co.jp/news/2013/11/19/national/fukushima-job-feared-too-perilous-for-tepco/#.Uouz1yewT9k>

by Miya Tanaka

Kyodo

Tokyo Electric Power Co. has finally moved into the decommissioning process at the Fukushima No. 1 nuclear plant, **despite doubt over its ability to manage a highly dangerous effort that will take decades.**

The start Monday of removing fuel from the cooling pool high up in the damaged reactor 4 building was one of the few bright pieces of news to come out recently from the plant, which has been plagued with frequent radioactive water leaks and other troubles over the past year.

But the work poses another challenge to the utility, with its success or failure expected to affect the following process of retrieving the fuel from the pools for reactors 1, 2 and 3, as well as the melted fuel inside the damaged cores.

"Spent fuel has potentially a very large risk. . . . I am personally more worried about (handling) it than the radioactive water problem," Nuclear Regulation Authority Chairman Shunichi Tanaka said in late October.

Tepco President Naomi Hirose has vowed to take "all possible measures" to ensure safety, while another senior official said it is "very unlikely" that an incident will occur that could rekindle a sustained nuclear chain reaction, or criticality.

But some experts don't feel reassured.

"It is quite certain that various kinds of troubles will occur, but I don't think Tepco has prepared enough safety measures," said Hideyuki Ban, co-director of the Citizens' Nuclear Information Center, a group against nuclear power.

Among his concerns is an accident occurring after workers place fuel assemblies into transport casks inside the spent fuel pool on the shattered building's fifth floor. As each of these 90-ton containers are filled, they will be lowered about 32 meters to the floor below so they can be trucked to another building.

Tepco claims its analyses show that the impact on the radiation level at the complex's perimeter would be small even if a container were to be dropped and broken open.

Ban, however, said Tepco should look for options other than lowering the containers directly to the first floor, and that he is worried workers wouldn't even be able to approach a container that has been damaged to the point where it is releasing high levels of radiation.

In addition to the decommissioning work, Tepco's fight to manage the massive amount of radioactive water accumulating at the plant continues, with no quick remedy in sight.

Tepco has set up some 1,000 tanks to store the toxic water, which is increasing at a rate of about 400 tons a day as groundwater seeps into the basements of the reactor buildings and mixes with the water used to cool the three crippled units.

Its plans for water storage have turned out to be poor, with a series of leaks afflicting tanks that were quickly put together by bolting steel plates together amid the urgent need to expand capacity.

The structural weakness of these tanks is not the only flaw. A string of human errors that led some tanks to overflow and workers to be splashed with radioactive water alarmed regulators who saw it as a sign that Tepco's ability to manage on-site activities was deteriorating and that morale was weakening.

With the utility apparently overwhelmed by the huge workload, Prime Minister Shinzo Abe's administration has been stepping up its involvement in the cleanup activities, saying the matter "should not be left up to Tepco alone."

The Abe team's first move was to set aside ¥47 billion in public funds for projects to lessen the "technically challenging" radioactive water problem, including an unprecedented attempt to build a huge sunken ice wall to stop the groundwater from reaching the reactor buildings.

Based on a key proposal endorsed by the ruling parties earlier this month, the government is also considering shouldering some of the costs for decontaminating areas outside the plant, which could reach ¥5 trillion and is to be paid by Tepco.

The move would be a relief to the utility, which is in need of massive piles of cash to deal with compensation payments, the plant decommissioning and decontaminating off-site areas.

The utility has barely been kept afloat under a financial assistance scheme involving a government-backed fund created since the March 2011 start of the nuclear crisis. It also received a ¥1 trillion capital injection from the fund last year.

But in return for what could be seen as another bailout, pressure is growing on Tepco to revise its organizational structure so it can better manage the radioactive water and decommissioning operations.

“We can’t ask the public to shoulder the financial burden without securing public support. So we want Tepco to substantially reform itself,” said Tadamori Oshima, a lawmaker in the ruling Liberal Democratic Party who was involved in devising the proposal.

Sources have said Tepco is considering creating an in-house company to take charge of the decommissioning, but some experts speculate the utility’s true intention is to stave off possible calls for more drastic steps that could even threaten its existence.

While the government has been against forcing Tepco to declare bankruptcy because it would disrupt the compensation payments and cleanup missions, some ruling and opposition camp lawmakers continue to insist that stakeholders and creditor banks be held liable before using public funds to settle the crisis.

Tetsunari Iida, head of the Institute for Sustainable Energy Policies, said, “In my view, plans that do not involve legal liquidation are nothing more than a deception.”

Secrets bill and nukes

November 24, 2013

NATIONAL | KANSAI PERSPECTIVE

Secrets bill raises fears among nuclear foes

<http://www.japantimes.co.jp/news/2013/11/24/national/secrets-bill-raises-fears-among-nuclear-foes/#.UpJhuiewT9n>

BY ERIC JOHNSTON

STAFF WRITER

OSAKA – In late 2005, U.S. government officials, invited by Japan, observed a counterterrorism drill at the Mihama nuclear plant in Fukui Prefecture and came away worried about the security situation at the complex.

Some 2,000 police officers, firefighters, nuclear power officials, local authorities and residents were involved in the exercise, in which the plant comes under attack by foreign terrorists who entered the harbor by boat.

The focus of much of the drill was on evacuating residents, but the U.S. officials were more concerned about what they felt were security gaps. This led Washington to push Tokyo to pay more attention to physically protecting the facilities.

Today, as the Liberal Democratic Party-New Komeito ruling bloc prepares to enact a new state secrets law, the question of what happens to information about nuclear plant security is being batted about, especially in Kansai.

Fukui Prefecture is home to 13 commercial reactors, all of which, before the recent shutdown, provided power to distant Osaka and Hyogo prefectures, as well as neighboring Kyoto and Shiga.

It is also home to the Monju prototype fast-breeder reactor. Originally designed to burn plutonium, Monju has been idle for nearly two decades after a sodium leak from a cooling unit and the resulting fire on Dec. 8, 1995, made headlines, along with the attempt to cover it up.

Video shot inside the plant by the operator showing the extent of the damage was initially hidden, leaving it to the prefecture to uncover the truth.

“In 1995, Fukui Prefecture courageously entered the Monju fast-breeder reactor accident site and videotaped the damage, thus revealing the coverup undertaken by the owner/operator. Passage of the state secrets bill would inhibit or prevent local authorities from taking such action again,” said Kyoto-based anti-nuclear activist Aileen Mioko Smith.

The government says the purpose of the secrets bill is to prevent damaging leaks of information vital to national defense and diplomacy, and to prevent spies and terrorists from acquiring such sensitive information. In a blog, Upper House Councilor Yosuke Isozaki of the LDP recently took a jab at people who are concerned that information related to nuclear power plants would be classified.

“Under the basic law, information can be classified to prevent terrorism. This means information related to the investigation of terrorist activities. Even people who have just a little bit of knowledge about the law should instantly understand when they read the (secrets bill) that it doesn’t apply to nuclear power information,” Isozaki wrote.

But that raises the fundamental question of who, exactly, gets to judge what constitutes a terrorist activity at a nuclear plant and how they would make decisions about classifying information based on that judgment.

In late October, at a meeting of opposition lawmakers, Ken Hashiba of the Cabinet Office said at a public hearing on the bill that it was possible information related to the security of nuclear power facilities could become classified. This appeared to be a more general statement than Isozaki’s.

For their part, many in the Kansai region and elsewhere remain concerned.

“There have already been 359 instances where the Ministry of Economy, Trade and Industry has used the excuse of protecting nuclear materials (to not release information) and 449 cases where the Nuclear Regulation Authority has designated documents as secret,” the daily Kyoto Shimbun said in a recent editorial.

The paper warned there was lots of room for the government to expand the “terrorism-related” category to things like evacuation plans or the routes to be used when nuclear fuel is transported by land or sea, often through crowded municipalities. Anti-nuclear activists often keep track of fuel shipments to and from the Fukui plants.

The worries in Kansai were heightened in early October when the Fukushima Prefectural Assembly warned it was possible that, under the guise of preventing terrorism, the government would use the new law to designate atomic plant problems or information that could protect residents as classified, especially in an emergency.

“Because information from the System for Prediction of Environmental Emergency Dose Information (SPEEDI) network was not appropriately disclosed (after the 3/11 quake), some of the residents in Namie were evacuated to an area with high radiation,” the assembly said in a statement, referring to one of the Fukushima Prefecture towns contaminated by radioactive fallout from the March 2011 core meltdowns at the Fukushima No. 1 power plant.

The SPEEDI network is a series of monitoring stations around the country that sound the alarm when large amounts of radioactive material are emitted by power plants or other atomic facilities. In an emergency, METI, the NRA and local governments would be responsible for warning residents about dosage levels.

Officially, however, local government heads in the Kansai region have yet to address the issue. Most remain focused not on the secrets bill or nuclear power itself, but on what they will have to do to deal with an emergency involving Fukui’s reactors.

Shiga Prefecture recently simulated a nuclear accident at one of the Fukui plants and learned that there might not be enough fresh water in storage to cope with the loss of a fallout-tainted Lake Biwa, which provides drinking water for 14.5 million people.

Other Kansai governments, however, are more concerned about a bigger question: how to coordinate a widespread evacuation.

While the apparent lack of transparency on nuclear safety measures under the secrets bill has been widely discussed, receiving less attention is the question of whether ordinary citizens who are involved in anti-nuclear protests might be targeted and investigated under the new law, or whether the heads of local government that host reactors will find their demands for data on plant operations or costs blocked in the name of “terrorism.”

“In the past, Japanese utilities cooperated with the police to identify, isolate and observe members of the Japanese Communist Party and their supporters. But most of these efforts at ideological discrimination were ruled to be in violation of the Constitution,” Fukui Prefectural Assemblyman Masao Sato of the JCP wrote on his official blog.

Many nuclear power employees either belong to, or support, the JCP. They have often helped bring to light information about problems at the plants. Saito fears the new secrets bill will empower the police to crack down further on their efforts.

“It’s clear that security information at nuclear power plant facilities will be classified as secret. But it’s also possible that under the pretext of doing a background check, the families and friends of nuclear plant workers will be tracked and the information gathered on them will be kept secret,” he said.

Kansai Perspective appears on the fourth Monday of each month, focusing on Kansai-area developments and events of national importance with a Kansai connection.

Vigilance necessary on power industry reform

November 24, 2013

Monitor power industry reform

<http://www.japantimes.co.jp/opinion/2013/11/24/editorials/monitor-power-industry-reform/#.UpJVKSewT9k>

The recent revision to the law on electricity business marks only the first step in a three-stage reform of Japan’s power utility industry that will take years to complete. Continued vigilance is needed to make sure that the reform will not be watered down in the subsequent process and will achieve greater competition by facilitating entry of new suppliers to the market, thereby offering consumers more choice in services at lower costs.

The revised law enacted by the Diet on Oct. 13 set in motion a long process of freeing up the nation’s electricity sector from the regionally monopolized supply system, which dates back to 1951. An independent body will be created by around 2015 to coordinate power supply by observing demand

nationwide. When a power shortage is feared in one region, the entity will have the authority to order utilities in other regions to share electricity with it, by boosting their own power generation if necessary.

The subsequent process of reform is set in the supplementary provisions of the law. According to the timeline, the government will submit separate legislation to the Diet in 2014 to fully liberalize the retail electricity market by around 2016, allowing new entrants to sell electricity to households — business that has been monopolized by the existing 10 major regional power companies.

Another bill to be submitted to the Diet in 2015 will separate these utilities' power generation and distribution business by around 2020, thereby making the transmission and distribution networks — currently controlled by the regional utilities — accessible to new entrants on equal conditions.

This third stage of reform is expected to usher in full-scale competition in the power industry — and therefore it is feared that there will be lingering resistance not only among the existing utilities but also in some political circles. Makoto Yagi, chairman of the Federation of Electric Power Companies, said stable supply of electricity has been maintained as the major utilities controlled both power generation and transmission, and called for a “flexible review” of the reform if problems emerge in working out more details of the process.

The government has explained that the lengthy, multi-staged reform process has been set so that the changes will not disrupt the stable supply of power. Close monitoring is necessary to ensure the subsequent process of reform does not deviate from its objective.

The nation's electricity business has been gradually liberalized since the 1990s, but power supply to households, which accounts for about 40 percent of the electricity market, has remained the monopoly of the 10 big regional utilities. In the business of selling electricity to large-lot users, new entrants accounted for a mere 3.5 percent of the total supply in fiscal 2012, due to the high costs to access the transmission and distribution networks of the major utilities.

It was the disaster at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear power plant in March 2011 and subsequent power shortages that prompted the government to seek the overhaul of the regional monopoly in the power supply system.

The launch of the new independent body to coordinate power supply should help fill regional gaps in supply capacity in cases of natural disasters, and rolling blackouts like the one introduced after the nuclear disaster will be less likely if power supply across regional blocs is facilitated by the entry of new suppliers. The success of the reform will depend on whether it will bring more competition to the power industry, thus benefiting users.

Please extend money for compensation

November 25, 2013

Nuclear damage compensation fund asks assistance

http://www3.nhk.or.jp/nhkworld/english/news/20131125_29.html

A Japanese fund is asking the government and financial institutions to extend money to help Tokyo Electric Power Company compensate local people affected by Fukushima Daiichi nuclear plant accident.

The steering committee of the state-backed nuclear compensation fund made the proposal on Monday. They have reviewed the utility's comprehensive business plan that aims to improve its operation.

The committee members say TEPCO should make the utmost effort to deal with contaminated water and decommissioning the damaged nuclear plant. It also asks the utility to lead efforts to reform Japan's electric power system.

The committee says it would be difficult for TEPCO alone to shoulder the costs of the accident.

It says when the compensation fund writes a new business plan for TEPCO, it should ask the government and financial institutions to make appropriate contributions for sharing the costs.

The nuclear compensation fund is expected to come up with the business plan by the end of this year.

How independent is the JAEA?

November 24, 2013

Four NRA advisers get funds from Monju operator

<http://www.japantimes.co.jp/news/2013/11/24/national/four-nra-advisers-get-funds-from-monju-operator/#.UpJUUiewT9k>

JJI

Four outside experts in panels set up by the Nuclear Regulation Authority said they have together received more than ¥33 million in research funds from the Japan Atomic Energy Agency, which runs the experimental Monju fast-breeder reactor prototype.

The NRA requires its advisers to report any funds received from power companies and discloses those reported on its website. **But the disclosure rule does not apply to money from the JAEA because it is not a power company.**

The four professors are Yutaka Abe at the University of Tsukuba, Akira Yamaguchi at Osaka University, and Seiichi Koshizuka and Yosuke Katsumura at the University of Tokyo.

The four said that they just followed the NRA's rules and that they did not find it necessary to report the funds.

Documents obtained by Jiji Press show that since fiscal 2009, the JAEA has given Abe more than ¥19.4 million for seven research projects, Yamaguchi ¥8.9 million for three projects, and Koshizuka nearly ¥4 million and Katsumura some ¥900,000 for one project each.

Abe and Yamaguchi are members of a panel that drafted new nuclear plant regulatory standards. Koshizuka participated in a regulatory system panel, and Katsumura was a member of a panel on the seawater problem at Chubu Electric Power Co.'s Hamaoka nuclear plant.

The JAEA is an independent administrative agency and, at the same time, a member of the Japan Atomic Industrial Forum, consisting of power companies and nuclear plant-related firms.

"Troika of irresponsibility" bickering over cleanup

November 25, 2013

INSIGHT: 'Troika of irresponsibility' behind Fukushima water crisis

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201311250074>

By YASUAKI OSHIKA/ Staff Writer

Tokyo Electric Power Co.'s shortcomings, the Finance Ministry's stubbornness and the industry ministry's need for a scapegoat combined to create the radioactive water crisis at the Fukushima No. 1 nuclear power plant.

And while the three key players refuse to be held accountable for Japan's worst nuclear disaster, this "troika of irresponsibility" is still bickering over the cleanup process as contaminated water continues to leak into the plant ground and the ocean.

The risks of radioactive water leaks were known months after the plant was rocked by the Great East Japan Earthquake and swamped by the ensuing tsunami on March 11, 2011.

Plans to contain the potential water problem were drawn up at the time. But TEPCO was unwilling to spend money on such measures, some of which were adopted two years later by the government.

The utility has, in fact, shown little sense that the Fukushima accident is its problem.

The Finance Ministry and the Ministry of Economy, Trade and Industry, meanwhile, have been busy fighting over who should pay for cleaning up communities contaminated by radioactive fallout from the Fukushima nuclear plant.

Five months after the triple meltdown at the plant, ruling and opposition lawmakers in August 2011 enacted a special measures law on decontamination, authorizing the government to seek payments for such work from TEPCO.

According to Yoshimi Okunushi, a senior Environment Ministry official familiar with the discussions, the Finance Ministry guarded against committing taxpayer money and maintained that "the polluter-pays principle" must apply.

Issei Tajima, a former Lower House member of the Democratic Party of Japan who was involved in drafting the bill, said the Finance Ministry had some "harsh talk" on expenses.

The industry ministry, left out of the loop in the process, lobbied the ruling Liberal Democratic Party this year to revise the law and inject taxpayer money into the decontamination efforts, saying such work should be implemented as public-works projects.

A task force of the ruling coalition submitted a package of proposals to Prime Minister Shinzo Abe on Nov. 11, calling for greater government involvement in decontamination, decommissioning and the radioactive water problem.

On the surface, the industry ministry appears to have gotten its way, but the language in the proposal reflects the Finance Ministry's fierce opposition to such an attempt.

The proposal said costs for decontamination work already planned should be borne by TEPCO, but that "further efforts" should be made "from the standpoint of public works."

"Further efforts' do not mean decontamination," a senior Finance Ministry official said. "We will continue to seek payments for decontamination work from TEPCO."

A senior industry ministry official admitted that it failed to influence the coalition task force as it had hoped.

"The Finance Ministry mounted a sweeping offensive to (tone down) the language," the official said. "We suffered one setback after another."

But the industry ministry has never stepped forward to take control of the Fukushima situation, especially in talks about the huge task of decommissioning the crippled reactors, which is expected to take more than 30 years.

Soon after the Fukushima nuclear disaster started, many officials proposed setting up a government agency in charge of decommissioning, saying the unprecedented task cannot be entirely left in TEPCO's hands.

But it wasn't until Nov. 11 this year when the coalition task force called on the government to act as a command center for dealing with decommissioning and the radioactive water problem.

The proposal suggested that TEPCO's division in charge of decommissioning be reorganized into an in-house company, spun out as a separate company or turned into a government-affiliated independent administrative agency.

Industry ministry bureaucrats oppose state involvement, saying the government cannot handle the decommissioning process. They point to the scandal-ridden Japan Atomic Energy Agency, an independent administrative agency that operates the problem-plagued Monju prototype fast-breeder reactor.

A midlevel official indicated that the industry ministry does not want to take responsibility.

“The ministry hates to lose a scapegoat,” the official said, alluding to TEPCO.

The industry ministry has called for taxpayer money to fund the decontamination work partly because TEPCO will be unable to draw up a viable rehabilitation program if it is required to cover the enormous costs, estimated at 5 trillion yen (\$49 billion) or more.

Also in the months after the nuclear disaster started, a plan was drawn up to build walls to prevent groundwater from flowing into the reactor buildings. But that idea never materialized due to TEPCO’s opposition to spending.

Only in August this year did the government decide to install frozen soil walls partly with public funds after radioactive water found its way into the ocean.

A government committee on measures to deal with radioactive water noted that this method has never been used for a large-scale project spanning more than 10 years.

“People say TEPCO can (build walls) on its own if common technology is used,” committee chairman Yuzo Onishi, a professor emeritus at Kyoto University, said. “A national budget can be obtained only for incomplete, advanced technology.”

The government plans to spend only 47 billion yen on the radioactive water problem, including the frozen soil walls.

Onishi is critical of the approach.

“They are mobilizing resources step by step, much like the wartime Japanese military,” he said.

The Fukushima nuclear crisis may also have something in common with the nation’s “lost two decades,” the economic stagnation caused largely by the government’s reluctance to inject public funds into disposal of bad bank loans.

Majority worried about secrets bill

November 26, 2013

At Fukushima hearing, all speakers criticize state secrets bill

http://ajw.asahi.com/article/behind_news/politics/AJ201311260068

THE ASAHI SHIMBUN

FUKUSHIMA--The ruling Liberal Democratic Party invited Namie Mayor Tamotsu Baba to speak about the state secrets protection bill, expecting support by a leader near the Fukushima nuclear disaster site to quell criticism against the legislation.

The party's plan, however, backfired.

"I am afraid no clear bounds were established about what should be designated a state secret," Baba told a hearing on the bill here on Nov. 25. He also said he cannot trust a government that tends to keep information under wraps.

In fact, all seven speakers at the hearing criticized the bill, saying its ambiguous wording leaves open the possibility of abuse and its harsh penalties could keep citizens in the dark about matters that directly affect their lives.

The ruling coalition, which railroaded the bill through a Lower House committee on Nov. 26, organized the hearing in the prefectural capital. Apart from speakers and politicians, only 50 members of the public could attend after obtaining admission tickets from Diet members.

Since the bill was submitted to the Lower House late last month, calls have grown for specific guidelines on what constitutes a state secret under the legislation.

But the ruling coalition and opposition parties failed to clearly define such state secrets in closed-door meetings and the debate at the Lower House's special committee on national security.

The administration of Prime Minister Shinzo Abe tried to reassure leaders of Fukushima Prefecture that the designation of state secrets will not concern information about nuclear power plants.

But experts at the hearing agreed there is room for officials to stretch the bounds of the legislation, and that the government has already given contradictory views about nuclear plant information.

The LDP expected Baba to show an understanding to the necessity of the legislation. The ruling party noted that nuclear power plants are not specified in the bill.

But Baba instead mentioned the government's bungling of information in the early stages of the disaster at the Fukushima No. 1 nuclear power plant in March 2011.

The government failed to quickly release data from the computer-simulated System for Prediction of Environmental Emergency Dose Information (SPEEDI). Much like a weather map, the system shows the predicted spread of radioactive materials following an accident.

Lacking the SPEEDI information, many Namie residents fled toward areas of high radiation levels during the evacuation.

Residents in Fukushima Prefecture are particularly worried about the concealing of information under the legislation, in light of the water leaks and other problems at the Fukushima No. 1 plant, as well as the decommissioning process that is expected to take decades to complete.

"The general public is concerned about officials' broad interpretation of state secrets," said Yumiko Nihei, professor of law at Sakura no Seibo Junior College who was invited by the opposition Democratic Party of Japan to give her views at the hearing.

Nihei, who called for a halt to the bill, also said the government should respect the opinions of the public. The government solicited views from the public on its website in September. Of the 90,480 comments posted, 77 percent were opposed to the legislation.

Nobuyoshi Hatanaka, a professor of the Japanese Constitution at Iwaki Junior College, stressed the importance of the government having a well-informed public before making a crucial policy decision.

“Defense and diplomacy are the central government’s sole prerogative, but how can the central government facilitate the benefit for the public without keeping the public informed?” he said.

He spoke on the invitation of New Komeito, the LDP’s junior coalition partner.

The bill lists four areas of protection for state secrets: defense, diplomacy, the prevention of harmful activities, such as spying, and the prevention of terrorist activities.

Hiroyasu Maki, vice chairman of the Fukushima Bar Association and a speaker at the hearing, said the government has varied its language about security measures concerning nuclear power plants.

“On one day the government says ‘routine security measures are not state secrets,’ whereas on another day it says ‘a security plan drawn up in response to tips on possible terrorist activities at potentially targeted nuclear power plants may be designated as state secrets,” he said.

Maki, invited to the hearing by the DPJ, said this occurred because the bill’s clauses are ambiguous and can cover a wide range of issues.

The government bill sets a maximum 10-year prison term for violators who leak state secrets. With **no clear guidelines on what constitutes a state secret**, potential whistle-blowers and journalists hoping to expose government corruption may back off to avoid arrest. That, in turn, could undermine the public’s right to know.

Kiyohiko Toyama, a New Komeito member of the Lower House, stressed at the hearing that legitimate news-gathering activities will not be punished.

He said “extremely unlawful acts” by journalists, as defined in the bill, include deception, assault, blackmail, property theft, intrusion and gaining illegal access.

Maki countered that reporters may be significantly discouraged from digging for the truth because the bill can allow investigative authorities to arbitrarily determine an “extremely unlawful act” in news gathering.

Mitsugi Araki, a lawyer invited to speak by the Japanese Communist Party, said the simple act of distributing fliers to residences could be punished as an unlawful intrusion under the legislation.

Even LDP members of the Fukushima prefectural assembly expressed concerns about the bill after the hearing.

The Fukushima prefectural assembly in October adopted a statement calling on the government and the Diet to proceed with caution in discussing the legislation.

After the hearing, Shoichi Kobayashi, an LDP assembly member, echoed the criticism that the scope of designated state secrets remains blurred.

“I’m afraid that the government and the Diet themselves have not had sufficient debate over that point,” he said.

Fukushima residents plead against state secrets bill

<http://mainichi.jp/english/english/newsselect/news/20131126p2a00m0na014000c.html>

Fukushima residents hold banners against the state secrets bill in front of a building where the public hearing was held in Fukushima, on Nov. 25. (Mainichi)

FUKUSHIMA -- Fukushima Prefecture residents expressed their concern about a controversial state secrets protection bill at a public hearing, amid fear that information on the crippled nuclear plant might be concealed if the bill was passed.

The House of Representatives' special committee for national security held a public hearing in Fukushima on Nov. 25 where representatives of Fukushima residents offered their opinions on the special secrets protection bill.

Yumiko Nihei, a professor from Fukushima-based Sakura no Seibo Junior College, received a request to speak at the hearing on Nov. 21, just four days before the session. While she thought that the government would use this opportunity to claim its willingness to listen to locals' opinions before passing the bill in the lower house, she felt that she should clarify her position on the matter after seeing the plant disaster.

"I'm still not sure if I should teach young women in this city," said Nihei in the hearing session, as information about the plant hasn't been properly provided after the disaster. "I'm opposed to a bill that denies people's access to information," she added.

Another speaker at the session, Tamotsu Baba, mayor of the town of Namie, said "If information concerning the nuclear plant was categorized as special secrets against terrorism, the government could hide it under the bill."

After the hearing session, however, Baba expressed his frustration, saying "**Fukushima residents' voices didn't seem to reach the committee members.**"

Even nuclear proponents...

November 25, 2013

Nuclear firm concerned about secrecy bill

http://www3.nhk.or.jp/nhkworld/english/news/20131125_43.html

A representative of a nuclear-related company in Fukushima voiced concern about the proposed state secrets legislation at a public hearing on Monday.

Yukiteru Naka is the chairman of a company that has been involved in equipment design and

maintenance at nuclear plants.

He said the draft legislation may make workers too fearful of punishment to relate what they've learned at their nuclear plants.

He said that although it is important to strengthen anti-terror measures, too much control of information exerts psychological pressure on workers.

Naka's company provides the stricken Fukushima Daiichi plant with 60 employees that do clean-up and decommissioning work.

He said the bill would make it even harder to recruit workers for the decommissioning work, which it is believed will take 40 years.

Naka said it had once been taboo to raise questions about nuclear plant safety, and that created the myth that nuclear plants were safe.

He said there will be no nuclear safety without disclosure of information, and that the bill should not be applied to the nuclear power industry.

Who said transparency?

November 26, 2013

Ruling coalition seeking to ramrod state secrets bill through Lower House

http://ajw.asahi.com/article/behind_news/politics/AJ201311260066

THE ASAHI SHIMBUN

The ruling coalition on Nov. 26 railroaded the state secrets protection bill through a Lower House committee, ignoring overwhelming opposition at a public hearing the previous day in Fukushima city and outrage from opposition parties over the lack of debate.

With the current Diet session scheduled to end on Dec. 6, the Liberal Democratic Party and junior coalition partner New Komeito were seeking to ramrod the legislation through the Lower House in time for a vote in the Upper House. If passed by both chambers, the new law would instill harsher penalties, including up to 10 years in prison, for the leaking of designated state secrets.

At a morning session of the Lower House special committee on national security, the LDP and New Komeito put a bill that included revisions proposed by Your Party and the Japan Restoration Party to a vote to send it to the floor before final deliberations were held.

Opposition party directors of the special committee harshly criticized the move, saying sufficient debate had not been conducted.

Ruling coalition directors of the special committee proposed taking a vote on the legislation on the morning of Nov. 26. However, members from the Democratic Party of Japan, Japan Restoration Party, Japanese Communist Party and People's Life Party opposed the vote on the grounds of insufficient debate. Prime Minister Shinzo Abe sat in on the session where questions were asked about the revised legislation. However, before further deliberations could be conducted in the special committee, an LDP director submitted a special motion requesting a vote on the legislation. LDP, New Komeito and Your Party members voted for the bill. Japan Restoration Party members left the committee room in protest, while other opposition parties voted against the legislation.

After the special committee vote, Gen Nakatani, an LDP director, said, "We revised the proposal as much as possible to address the concerns held by the public."

However, Atsushi Oshima, a DPJ director, called the vote a "defeat for the legislative branch."

After the vote, five opposition parties--the DPJ, Japan Restoration Party, JCP, People's Life Party and the Social Democratic Party--requested a meeting with Lower House Speaker Bunmei Ibuki to ask that the legislation not be brought to a vote before the entire Lower House. They argued that railroading the bill through the special committee was an outrage that damaged the fundamentals of a democracy.

However, Ibuki refused to meet with the opposition parties. The Lower House was scheduled to vote on the legislation later on Nov. 26.

Japan Restoration Party members had said they would support the revised legislation if they received assurances from the prime minister that a third-party organ would be set up to oversee the designation of state secrets.

Hiroshi Yamada, a Japan Restoration Party special committee member, asked Abe if he would set up such an entity. Abe twice said he would make efforts to set up such a body, adding, "I believe it would be better to set up such an organ."

Takao Fujii, a Japan Restoration Party special committee director, said after the session that Abe had given a clear response.

When asked why party members vacated the committee room before the vote, Fujii said that action was to protest the lack of debate.

However, because the establishment of a third-party agency has not been written into the legislation, it remains to be seen if it will actually be set up as stated by Abe.

Abe also said that the prime minister would serve in an oversight function regarding the designation and declassification of state secrets.

Forcing bill through Lower House

November 26, 2013

Ruling bloc rams secrets bill through Lower House

Opposition balks after panel skips further debate on contentious legislation

<http://www.japantimes.co.jp/news/2013/11/26/national/ruling-bloc-rams-secrets-bill-through-lower-house/#.UpTbgSfij9k>

by Ayako Mie
Staff Writer

The ruling coalition forced its contentious state secrets bill through the Lower House on Tuesday evening amid calls from all but one of the opposition forces for further deliberations on its provisions.

The bill was immediately sent to the Upper House after the ruling Liberal Democratic Party and its junior coalition partner, New Komeito, and Your Party of the opposition camp supported the bill at the plenary session of the lower chamber.

With only the support of Your Party, the ruling bloc earlier in the day rammed the bill through the Lower House's special committee for national security.

Disregarding normal procedures, committee Chairman Fukushima Nukaga of the LDP moved to end deliberations after Prime Minister Shinzo Abe took questions at the committee. Normally there is debate before the committee votes on a bill, but the ruling bloc bypassed the procedure to get the bill to the Lower House plenary session later in the day.

Angered by the ruling bloc's maneuver, the Democratic Party of Japan, Seikatsu no To (People's Life Party) and the Japanese Communist Party voted against the bill in the committee.

Key to Tuesday's committee vote was whether Nippon Ishin no Kai (Japan Restoration Party), which had reached an agreement on amendments with the ruling coalition last week, would vote for the bill. Despite that agreement, Nippon Ishin repeatedly threatened to vote against the bill if the LDP and New Komeito tried to steamroller it through the committee.

Nippon Ishin has sought assurances from Abe that an independent panel will be created to oversee the classification of the state secrets. As it stands now, the bill states only that an oversight mechanism will be considered.

During the committee session Tuesday, Abe tried to placate Nippon Ishin by saying an independent body would be created before the bill is passed.

In the end, however, the party walked away, insisting more deliberations are needed, considering that 70 percent of the public feels the Diet should not rush to pass the bill.

"Rather than saying I am sorry about the forcible action by the ruling camp, I have to say the ruling camp is steering the Diet in a high-handed way, leveraging on a comfortable majority in both chambers," said Takao Fujii, Nippon Ishin's general council chairman, after the party walked away from the vote.

The opposition camp lodged a protest with Lower House Speaker Bunmei Ibuki, demanding that he not allow the bill to be sent to the plenary session, to no avail.

The opposition parties are especially critical of the ruling bloc for trying to hold a vote Tuesday, only one day after the amended bill was submitted to the committee, which also held a public hearing in Fukushima Prefecture.

Everyone who took part in Monday's public hearing expressed either opposition to or concern about the bill, fearing it could be used to infringe on the public's right to know. **As it reads now, the bill gives the government the power to designate state secrets at its discretion.**

For its part, the ruling coalition contends that after more than 45 hours in the Lower House committee, there had been enough deliberation on the bill.

"With the amendment agreed upon with Nippon Ishin and Your Party, we did our best to ease the public's concerns about the bill," said the LDP's Gen Nakatani, leader of the ruling camp's special committee members.

The bill allows the government in power to designate state secrets, keep them classified for an indefinite time, and provides stiff penalties for leaks or for attempts to learn such secrets in a manner deemed problematic.

Secrets bill must not become law

November 27, 2013

EDITORIAL: Secrets protection bill must not be allowed to become law

<http://ajw.asahi.com/article/views/editorial/AJ201311270048>

In what can only be termed the power of the majority in the wrong hands, the ruling coalition railroaded the state secrets protection bill through the Lower House on Nov. 26.

We seriously question the Abe administration's perception of democracy and fundamental human rights. The dangers posed by this bill have been pointed out by news organizations as well as legal experts, constitutional scholars, historians and numerous concerned citizens groups. As the nature of this bill became more widely known, public opinion also began to turn increasingly against it.

And let us not forget that only the day before the bill cleared the Lower House, it received the thumbs-down from all seven panelists who had been invited to state their opinions at a public hearing held in the city of Fukushima.

Yet, the ruling coalition simply rammed the bill through the chamber in blatant disregard of the will of the people and the opposition camp's call for further deliberation.

As we have repeatedly pointed out, the most dangerous aspect of this legislation is that it is designed to keep the public in the dark about what the government has designated as state secrets for protection. This

means that any reason for information to remain a secret will itself remain a secret, thereby breeding more secrets, ad infinitum, without the public's knowledge.

SECRECY TO BE JEALOUSLY GUARDED

The designation of massive volumes of information as state secrets will be effectively left to the discretion of bureaucrats. This would obviously require the presence of an independent organ that is empowered to constantly monitor the legitimacy of each designation, determine how long designated information ought to remain withheld, and order changes to be made as needed. However, such an organ is unlikely to be created under the state secrets protection legislation.

The government has a duty to promise the sovereign populace that today's state secrets will be eventually declassified. But the proposed legislation is full of loopholes that will enable the government to keep them secret even after 60 years, or simply scrap them quietly.

This is how the bureaucracy will jealously guard its secrecy.

And there will be stiff penalties for conscientious civil servants who decide to blow the whistle, or journalists and ordinary citizens who try to find out the truth.

A healthy balance must exist between the government's authority to control information and the public's right to know.

Japan's information disclosure system is still underdeveloped. To enact this state secrets protection legislation now would only tip the balance even more heavily in the government's favor.

STATE COMES FIRST

The Global Principles on National Security and the Right to Information, or the Tshwane Principles for short, were drawn up in June in Tshwane, South Africa. The process took two years and involved more than 500 security and human rights experts from over 70 countries and regions. Organizations that were involved include the United Nations, the Organization of American States and the Organization for Security and Cooperation in Europe.

Around the world, a growing number of countries are now bolstering their secrets protection laws as a way to combat terrorism, and Tshwane Principles offer guidelines on information control.

The 50-point principles recognize that the public authorities may restrict the public's right of access to information on national security grounds, but they also require the public authorities to clearly specify the duration of classification. The principles also require oversight bodies to have legally guaranteed access to all information, and exempt from punishment anyone who is not a public servant.

Japan's state secrets protection bill violates the Tshwane Principles in every way.

In the Diet session, Prime Minister Shinzo Abe said it was vital to have a law to protect state secrets that is comparable with those of the United States and European nations.

But he dismissed the Tshwane Principles as unimportant, claiming they were "issued by a private organ" and have not been "authorized" as international principles.

Not only Abe, but most individuals speaking on behalf of the government and the ruling coalition have made it amply clear that the interests of the state must come before those of the people.

Former Foreign Minister Nobutaka Machimura asserted, "It makes no logical sense at all to guarantee the people's right to know and not be able to guarantee the survival of individuals and the state."

Machimura's assertion is tantamount to blackmail against the people. We wholeheartedly agree that national security is of vital importance. But Machimura clearly has no understanding whatsoever that there is no democracy without the public's right to know.

GOING AGAINST GLOBAL TREND

The impracticality of implementing what the state secrets protection bill purports to set in place has become amply clear from the series of Diet debates we have heard so far.

Under the government's bylaws, there are currently 420,000 "specially controlled secrets" pertaining to diplomacy and national security. The government claims there will be fewer secrets under the new legislation, but there is no doubt that the number will be in the order of hundreds of thousands.

How are the prime minister and the Cabinet ministers going to check them all? A supplemental provision of the amendment bill, submitted by the ruling coalition and the opposition Japan Restoration Party and Your Party, proposes to consider the establishment of a new organ that will examine and oversee the criteria by which information may be classified as state secrets.

Abe referred to such an organ before the Diet on Nov. 26, but there is no guarantee whatsoever that it will be created.

Just getting a panel of experts to examine the criteria will

definitely not prevent arbitrary classification of information as state secrets. Nor will it eliminate the likelihood of government ministries and agencies taking advantage of the legislation to hide inconvenient information.

If an independent oversight organ is to be established, it must be staffed with enough people to handle massive volumes of state secrets and be given the authority to demand the declassification of privileged information.

What the government is trying to do with this new legislation runs completely counter to today's global current in the maintenance and disclosure of state secrets as well as its obligation to respect people's rights guaranteed by the Constitution.

The debate will move to the Upper House. This bill must never be allowed to become law.

--The Asahi Shimbun, Nov. 27

Editorial: More discussion needed to prevent state secrets bill from destroying democracy

<http://mainichi.jp/english/english/perspectives/news/20131127p2a00m0na004000c.html>

The ruling coalition's ramming of a controversial special state secrets bill, which would impose harsh penalties on those who leak classified government information, through the House of Representatives on Nov. 26 has stunned the public.

Prime Minister Shinzo Abe was absent from the chamber's special committee on national security when it approved the bill. Since the voting session was aired live, the ruling coalition comprised of the Liberal

Democratic Party (LDP) and the New Komeito party reportedly decided not to show the public that it rammed the bill through in the presence of the prime minister.

This has suggested that even the ruling bloc cannot take pride in the passage of the bill through the powerful chamber. During a public hearing in Fukushima the previous day, all the attendees demanded that the bill be either scrapped or deliberated cautiously. However, such desperate calls from the area affected by the nuclear crisis did not reach the legislative branch of the government.

The bill cleared the lower house after only 20 days of deliberations. The bill does not clearly show the scope of information that could be classified as special state secrets, and the legislative and judicial branches cannot check classified government information. Moreover, a decision on rules on releasing declassified information will be made sometime later.

Ensuring that members of the public can access government information is one of the key basics of a democratic society. However, if the bill is to be enacted and come into force, it could discourage citizens as well as journalists from seeking access to such information for fear of harsh punishment, blocking government information from circulating in society. The Diet failed to thoroughly deliberate the bill to clarify these problems. Flaws in the bill are beginning to surface one after another.

The prime minister failed to provide a sufficient explanation of the bill during the campaign for the House of Councillors election in July this year and made no mention of the legislation in his policy speech at the outset of the ongoing Diet session. Nevertheless, the Abe administration is now taking a tough line in a bid to ensure the bill becomes law during the current Diet session that ends on Dec. 6. This highlights the arrogance that the ruling coalition is now showing only four months after it regained a majority in the upper chamber, which had been controlled by opposition parties, in the July poll.

A few opposition parties further tainted the issue by reaching a compromise with the government over the bill in an easy-going manner. An agreement that the coalition reached with the Japan Restoration Party (JRP) and Your Party to revise the bill has not changed its core elements at all. The ruling bloc agreed to consider setting up a third-party organization to examine whether the government's classification of internal information as special secrets is appropriate, as demanded by the JRP, but stopped short of pledging to establish such an independent panel.

As a result of their negotiations, some clauses of the bill have even worsened, such as the extension of the maximum period during which government information could be classified as special secrets to 60 years. As such, these parties could be regarded as nothing but forces complementary to the ruling parties.

Although the bill cleared the lower house, legislators should scrutinize whether such legislation is truly necessary once again.

It is understandable for the government to classify information that could pose a threat to national security over a certain period.

Currently, the National Public Service Act, the Self-Defense Forces Act and the legislation on the protection of secrets regarding the U.S. and Japan Mutual Defense Assistance Agreement specifically outlaw leaks of government information. Those who leak confidential information face up to one, five and 10 years in prison, respectively, under these laws.

The government has officially confirmed that there have been five serious cases in which public servants leaked classified information over the past 15 years. Defendants in these cases either evaded indictment or were handed prison terms far shorter than the maximum terms provided for under these three laws.

The government should place priority on creating systems in all the administrative organs to prevent confidential information from leaking and ensure all officials abide by the rules on information management.

Under the bill, information on defense, diplomacy and national security as well as that regarding the prevention of terrorist attacks could be classified as special state secrets. Investigations into offenses that have disrupted public security -- which center on surveillance activity -- could restrict the human rights of members of the public.

Serious questions remain as to whether such new legislation should be created even if it raises the possibility that citizens will be punished for attempting to gain access to government information.

The bill would neither sufficiently guarantee people's right to know nor establish a system to check information designated as secrets. There are numerous other problems with the bill.

The upper house should hold thorough discussions to highlight problems involving the bill instead of making haste to pass it into law, and clearly show the danger that the bill poses to the public.

Japan Reacts to Fukushima Crisis By Banning Journalism

<http://www.globalresearch.ca/japan-reacts-to-fukushima-crisis-by-banning-journalism/5359632>

By Washington's Blog

Global Research, November 27, 2013

Washington's Blog

Japan - Like the U.S. - Turns to Censorship

2 weeks after the Fukushima accident, we reported that the government responded to the nuclear accident by trying to raise acceptable radiation levels and pretending that radiation is good for us.

We noted earlier this month:

Japan will likely pass a new anti-whistleblowing law in an attempt to silence criticism of Tepco and the government:

Japanese Prime Minister Shinzo Abe's government is planning a state secrets act that critics say could **curtail public access to information on** a wide range of issues, including tensions with China and the **Fukushima nuclear crisis**.

The new law would dramatically expand the definition of official secrets and journalists convicted under it could be jailed for up to five years.

In reality, reporters covering Fukushima have long been harassed and censored.

Unfortunately, this is coming to pass. As EneNews reports:

Associated Press, Nov. 26, 2013: Japan's more powerful lower house of Parliament approved a state secrecy bill late Tuesday [...] Critics say it might sway authorities to withhold more information about nuclear power plants [...] The move is welcomed by the United States [...] lawyer Hiroyasu Maki said the bill's definition of secrets is so vague and broad that it could easily be expanded to include radiation data [...] Journalists who obtain information "inappropriately" or "wrongfully" can get up to five years in prison, prompting criticism that it would make officials more secretive and intimidate the media. Attempted leaks or inappropriate reporting, complicity or solicitation are also considered illegal. [...] Japan's proposed law also designates the prime minister as a third-party overseer.

BBC, Nov. 26, 2013: Japan approves new state secrecy bill to combat leaks [...] The bill now goes to the upper house, where it is also likely to be passed.

The Australian, Nov. 25, 2013: Japanese press balks at push for 'fascist' secrecy laws [...] Taro Yamamoto [an upper house lawmaker] said the law threatened to recreate a fascist state in Japan. "This secrecy law represents a coup d'etat by a particular group of politicians and bureaucrats," he told a press conference in Tokyo. "I believe the secrecy bill will eventually lead to the repression of the average person. It will allow those in power to crack down on anyone who is criticising them – the path we are on is the recreation of a fascist state." He said the withholding of radiation data after the Fukushima disaster showed the Japanese government was predisposed to hiding information from its citizens and this law would only make things worse. [...] The Asahi Shimbun newspaper likened the law to "conspiracy" regulations in pre-war Japan and said it could be used to stymie access to facts on nuclear accidents [...] Foreign Correspondents' Club of Japan president Lucy Birmingham: "We are alarmed by the text of the bill, as well as associated statements made by some ruling party lawmakers, relating to the potential targeting of journalists for prosecution and imprisonment."

Activist Kazuyuki Tokune: "I may be arrested some day for my anti-nuclear activity [...] But that doesn't stop me."

Lawrence Repeta, a law professor at Meiji University in Tokyo: "This is a severe threat on freedom to report in Japan [...] It appears the Abe administration has decided that they can get a lot of what they want, which is to escape oversight, to decrease transparency in the government by passing a law that grants the government and officials broad authority to designate information as secret."

U.S. Charge d'Affairs Kurt Tong: It's a positive step that would make Japan a "more effective alliance partner."

Prime Minister Shinzo Abe: "This law is designed to protect the safety of the people."

See also: Japan Deputy Prime Minister talks about "learning from the Nazis" — Previously said to let elderly people "hurry up and die" (VIDEO)

Rather than addressing the problems head-on, the Japanese government is circling the wagons.

Unfortunately, the United States is no better. Specifically, the American government:

- Censors journalists who raise inconvenient truths
- Pressured the Japanese government to re-start its nuclear program, and is allowing Fukushima seafood to be sold in the U.S.
- Weakened safety standards for U.S. nuclear reactors after the Fukushima disaster

As we noted 6 months after Fukushima melted down:

American and Canadian authorities have virtually stopped monitoring airborne radiation, and are not testing fish for radiation. (Indeed, the EPA reacted to Fukushima by raising "acceptable" radiation levels.)

The failure of the American, Canadian and other governments to test for and share results is making it difficult to hold an open scientific debate about what is happening.

Earlier this year, the acting EPA director signed a revised version of the EPA's Protective Action Guide for radiological incidents, which *radically relaxing the safety guidelines agencies follow in the wake of a nuclear-reactor meltdown or other unexpected release of radiation*. EPA whistleblowers called it "a public health policy only Dr. Strangelove could embrace."

As we noted right after Fukushima happened, this is standard operating procedure for government these days:

When the economy imploded in 2008, how did the government respond?

Did it crack down on fraud? Force bankrupt companies to admit that their speculative gambling with our money had failed? Rein in the funny business?

Of course not!

The government just helped cover up how bad things were, used claims of national security to keep everything in the dark, and changed basic rules and definitions to allow the game to continue.

See this, this, this and this.

When BP – through criminal negligence – blew out the Deepwater Horizon oil well, the government helped cover it up (the cover up is ongoing).

The government also changed the testing standards for seafood to pretend that higher levels of toxic PAHs in our food was business-as-usual.

So now that Japan is suffering the worst nuclear accident since Chernobyl – if not of all time – is the government riding to the rescue to help fix the problem, or at least to provide accurate information to its citizens so they can make informed decisions?

Of course not!

The EPA is closing ranks with the nuclear power industry

Indeed, some government scientists and media shills are now "reexamining" old studies that show that radioactive substances like plutonium cause cancer to argue that they help **prevent** cancer.

It is not just bubbleheads like Ann Coulter saying this. Government scientists from the Pacific Northwest National Laboratories and pro-nuclear hacks like Lawrence Solomon are saying this. [Update.]

In other words, this is a concerted propaganda campaign to cover up the severity of a major nuclear accident by raising acceptable levels of radiation and saying that a little radiation is good for us.

Any time the results of bad government policy is revealed, the government just covers it rather than changing the policy.

460,000 documents may become "special secrets"

November 30, 2014

Under new law, about 460,000 documents likely to be called 'special secrets'

<http://www.japantimes.co.jp/news/2014/11/30/national/politics-diplomacy/new-law-460000-documents-likely-called-special-secrets/#.VHuLF8l5Cos>

Kyodo

The government will likely designate around **460,000 documents as "special secrets" deemed highly sensitive in the areas of diplomacy, defense, counterterrorism and counterespionage** after a state

secrecy law takes effect on Dec. 10, a Kyodo News survey covering 19 government offices showed Sunday.

The documents are currently considered as highly confidential state secrets in the area of national security and diplomacy based on a 2007 government guideline, with the Cabinet Secretariat keeping the largest portion of around 353,000 items as of late last year.

Signaling the opaqueness of the new system aimed at toughening penalties on leakers of secrets, only three of the 19 government offices provided concrete answers regarding how much information they plan to label as “specially designated secrets” when the secrecy law takes effect.

Others said they are still “considering” the matter or “refraining from answering” just weeks before the entry into force of the controversial law that has triggered concern that the public’s right to know will be undermined.

But it is believed the 460,000 documents currently deemed highly confidential will be treated as special secrets under the new law.

Many offices did not answer questions on issues such as which section will be in charge of dealing with whistle-blowers who have suspicions about the arbitrary classification of state secrets by the government in violation of the secrecy law.

Kyodo News asked the 19 government offices in mid-November to respond to its questionnaire and received answers by Nov. 25.

In addition to the Cabinet Secretariat, the Foreign Ministry had 21,826 documents deemed as secrets requiring special control as of late last year, the Public Security Intelligence Agency had 15,292 documents and the National Police Agency had 13,951 documents.

The Defense Ministry, which has its own system to control secrets, kept about 45,000 documents categorized as secrets.

The Finance Ministry and the Financial Services Agency said they would not designate any documents as special secrets under the secrecy law on their own, as they would share such secrets designated by other government bodies through budgetary requests and other sessions.

The Cabinet Office said it might have one document related to defense issues that could be designated as a special secret.

Asked whether current secrets will be labeled as special secrets under the new law, the Foreign Ministry said it will “narrow down” the items and “newly add” other documents.

The Fire and Disaster Management Agency said “nearly all” the documents currently categorized as secrets will also be treated as secrets under the new system.

The Cabinet Office, meanwhile, said that it might add other information as special secrets.

Yukiko Miki, the head of nonprofit organization Access-Info Clearinghouse Japan, said she senses “excessive secretiveness” in the government offices as it is difficult to imagine that the contact point for whistle-blowers or other details have not yet been decided at this point.

“It makes me worry that the information disclosure level of each government office after the secrecy law takes effect might be very low. If information is not substantially disclosed, it is impossible to check whether the law is being implemented appropriately,” she said.

Fuk-hush-ima Law?

State Secrets Act to suppress Fukushima information

http://www.theecologist.org/News/news_round_up/2139614/state_secrets_act_to_suppress_fukushima_information.html

Oliver Tickell
30 October 2013

Japan's new State Secrets Act promises a fearful clampdown on journalist and whistle-blowers. Critics say its main purpose is to lock down information about Fukushima.

The Act is already being referred to by campaigners as the "Fuk-hush-ima Law

Japan's prime minister Shinzo Abe is planning a new State Secrets Act that could suppress publication and dissemination of information about the Fukushima nuclear disaster and other contentious issues.

A draft of the new law was approved by his cabinet last week and is likely to be passed in the current Parliamentary session, since Abe's Liberal Democratic Party-led bloc enjoys a big majority in both houses of parliament. Moreover the opposition is fragmented and disorganised.

The law would impose harsh penalties on those who leak secrets, or even try to obtain them. Journalists found to be breaking the law could be sent to prison for five years. Government employees releasing secret information could be imprisoned for a decade.

Media and legal experts also say the law is both broad and vague, giving the Japanese government enormous scope to determine what would actually qualify as a state secret. Furthermore the law makes no provision for any independent review process, leaving wide latitude for abuse.

"Basically, this bill raises the possibility that the kind of information about which the public should be informed is kept secret eternally," Tadaaki Muto, a lawyer and member of a task force on the bill at the Japan Federation of Bar

Associations, told Reuters. "Under the bill, the administrative branch can set the range of information that is kept secret at its own discretion."

The proposed law names four categories of 'special secrets', which would be covered by protection - defense, diplomacy, counter-terrorism and counter-espionage. It would also create a powerful new National Security Agency modelled on the US's NSA.

Critics of the Act believe that one of its main objectives could be to prevent the release of information relating to the ongoing nuclear catastrophe at Fukushima - reported today to have already cost as much as \$100 billion. The Act is already being referred to by campaigners as the "Fuk-hush-ima Law".

Industry ministry continued pushing nukes even right after 3/11

December 2, 2013

Ministry continued promoting nuclear power right after Fukushima accident

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201312020059>

THE ASAHI SHIMBUN

The industry ministry began working to continue promoting nuclear power even immediately following the disastrous meltdowns at the Fukushima No. 1 nuclear power plant in March 2011, sources said.

The Asahi Shimbun has obtained a copy of **the ministry's confidential internal document titled, "Toward the Renaissance of Nuclear Energy,"** which was compiled in late March 2011.

The report was written by a senior ministry official familiar with nuclear power facilities and distributed to its executives involved in designing the country's energy policy, according to the sources.

The in-house document was used as a basis to determine the nation's future nuclear policy in the aftermath of the disaster triggered by the Great East Japan Earthquake and tsunami on March 11, 2011, the sources said.

In the introduction, the ministry outlines the overall purpose of the report, saying "the stable supply of energy will be impossible without nuclear power," and that "the government will announce its decision to maintain the nuclear promotion policy."

The document also states in the introduction that Japan “will resuscitate nuclear energy, and rebuild the basis for promoting exports of infrastructure facilities,” indicating that the ministry would continue to advance nuclear power generation and further expand nuclear facilities exports.

Saying the success of nuclear power promotion would be the symbol of “the ministry’s revival,” the document gives the status of a key national policy to nuclear power advancement.

Regarding exports of nuclear plants, it promises that Japan “will analyze factors behind the current tragedy and share information with the world.”

Because the pro-nuclear Abe administration has said, “We will share our experience of the accident and lessons learned from the disaster with countries of the world,” the ministry’s report can be regarded as a prototype for Prime Minister Shinzo Abe’s nuclear policy.

The internal document consists of four chapters: emergent measures (to address the accident); declaration in an emergency situation; formation of a new nuclear watchdog agency; and the dismantlement of Tokyo Electric Power Co. and establishment of a new electricity supply business system.

Apparently, based on the report, the Nuclear Regulation Authority was established by the Democratic Party of Japan-led government.

The document also stipulates that nuclear plant operators would be allowed to bring their reactors back online when the reactors were deemed to meet new safety standards. All the nation’s 50 nuclear reactors have been taken offline in the aftermath of the Fukushima disaster.

The idea was likely used as a basis for the course taken by the Abe administration as well as the DPJ-led government, which said they would approve the restarts of nuclear facilities that pass a screening by the NRA.

The NRA is currently screening reactors across the country, including ones at TEPCO’s Kashiwazaki-Kariwa plant in Niigata Prefecture, to assess if they meet its new safety standards.

Meanwhile, the ruling coalition is working to pass a contentious state secrets protection bill through the current Diet session, which ends Dec. 6, promising stiff prison sentences for those handling information designated as “specified secrets” who leak them.

Under the bill, specified secrets will cover four areas: defense; diplomacy; prevention of spying and other harmful activities; and prevention of terrorism.

Documents and other materials related to nuclear promotion, including the industry ministry's report that The Asahi Shimbun obtained, could be candidates to be classified as specified secrets if the bill becomes law.

If the bill is enacted, Japanese citizens may become unable to check the planning processes of government nuclear policies in the future.

1,700 skilled personnel in core divisions to leave TEPCO soon

December 3, 2013

Tepco expects 1,700 to quit by March

<http://www.japantimes.co.jp/news/2013/12/03/business/tepco-expects-1700-to-quit-by-march/#.Up30Yifj9k>

Kyodo

By the end of next March, Tokyo Electric Power Co. expects 1,700 workers will have taken voluntary retirement since the 2011 start of the Fukushima No. 1 nuclear plant calamity, amid uncertain business prospects and pay cuts, according to Tepco documents.

Employees from the business strategy division at Tepco's head office as well as nuclear engineers account for around 40 percent of the retirees, raising fears that the loss of personnel could affect the utility's core activities.

By age, junior and midlevel employees younger than 40 years old make up around 70 percent of all retirees.

With annual salaries having been cut by 20 to 30 percent and uncertainty over the company's future, Tepco plans to include measures to improve the treatment of employees in a business turnaround plan it is currently revising.

According to the documents obtained Monday by Kyodo News, voluntary retirees jumped from 134 in fiscal 2010 to 465 in the year the nuclear crisis started.

The figure reached 712 in fiscal 2012 and Tepco estimates that around 560 will leave the company voluntarily in the current fiscal year through March 2014.

As part of its cost-cutting efforts, Tepco is seeking to reduce its workforce by 3,600 to 36,000 in two years from fiscal 2011 to fiscal 2013. Although the company is likely to meet this target, **it is losing skilled personnel in core divisions, which could further complicate its decommissioning work.**

Tepco needs massive funds to compensate people and companies affected by the nuclear crisis and to carry out the decades-long decommissioning of the Fukushima plant's crippled reactors.

"No place for such totalitarian-style legislation"

December 2, 2013

The politics of secrets

<http://www.japantimes.co.jp/opinion/2013/12/02/editorials/the-politics-of-secrets/#.Up42Pyfij9n>

The contentious bill for protection of state secrets — now under deliberation in the Upper House — even keeps secret what pieces of government information have been designated as special secrets and could punish people who try to obtain them, even if they are not aware that the information they seek has been given such a designation. There is no place for such totalitarian-style legislation, which threatens press freedoms and the people's right to know, in democratic Japan.

Under the bill, officials who handle designated secrets can be punished by up to 10 years in prison for leaking them. People who "conspire," "incite" or "instigate" in the leaking of designated secrets can be sentenced to up to five years in prison — even if the secrets in fact have not been leaked to them.

The bill can be read to mean that citizens — including journalists and members of civic groups, for example — could be punished for trying to access government-designated secrets even if it is done in a casual manner. They could be accused of "conspiracy" for discussing approaching government officials for pieces of information that happened to have been designated as special secrets, or "incitement" for just

asking officials to release such information. Even if they have no way of knowing beforehand whether the information they're seeking is a designated secret.

Prime Minister Shinzo Abe repeatedly brushed aside concerns that the bill will restrict the people's right to know. But when it actually goes into force, the threat of such heavy penalties alone could be enough to discourage efforts by people to find out what their government is doing.

Masako Mori, state minister in charge of the legislation, told an Upper House committee session that the government would consider creating a code of conduct between government officials and journalists. She then retracted the statement a day later, saying that such an act could discourage reporting activities by media organizations. But later in the same day she returned to the original position over the matter.

This and many other flip-flops in government explanations regarding the bill suggest that the government itself has no clear idea about what kinds of relevant concrete measures it plans to take in accordance with the legislation.

People's concern that their right to know could be undermined is evident in the unanimous opposition to the bill expressed by participants in the Nov. 25 public hearing held in the city of Fukushima. Seven officials and experts invited by both the ruling coalition and the opposition camp were speaking on the basis of their experience in the Fukushima nuclear crisis.

Mayor Tamotsu Baba of the town of Namie, picked by the Liberal Democratic Party to speak at the hearing, pointed out that the scope of information to be designated as special secrets is too wide and too vague. On the basis of the experience that many local people were exposed to low-level radiation because the government did not promptly disclose a prediction by SPEEDI (System for Prediction of Environmental Emergency Dose Information) after the meltdowns at the Fukushima No. 1 nuclear power plant, Baba expressed distrust toward the government's inclination to conceal a wide range of information from the public.

Both Baba and Hiroyasu Maki, vice president of the Fukushima Prefectural Bar Association, invited by the Democratic Party of Japan, expressed a fear that the government will hide more information about nuclear power plants. Maki said that once the bill is enacted, the scope of government secrets will expand due to bureaucrats' arbitrary interpretation and application, and that information on such matters as damage to tanks containing radioactive water from the crippled nuclear power plant may be hidden.

A reply by an LDP lawmaker present that nuclear power plants will not be subject to the application of the bill was not convincing. Both Baba and Maki pointed out that the government can hide information concerning nuclear power plants by justifying the act as necessary for the sake of counterterrorism.

Yukiteru Naka, chairman of Tohoku Enterprise Co., picked by Nippon Ishin no Kai (Japan Restoration Party), said that people have the right to know correct information about the safety of nuclear power plants. He said that it is important to allow the existence of whistle-blowers, apparently referring to the lack of a provision in the bill to protect whistle-blowers. The statements by these three people are much more convincing than the explanations by the LDP lawmaker.

Mitsugi Araki, a lawyer, picked by the Japan Communist Party, pointed out that it is impossible for people to know what information has been designated as special secrets and that they may be punished for unknowingly seeking or leaking such secrets. He said that this would "terrorize" people and have the effect of restricting their various activities.

Nobuyoshi Hatanaka, a specially appointed professor at Iwaki Junior College, picked by New Komeito, said that it is impossible to promote people's public interests if they are prohibited from access to government-held information even though security and diplomacy are matters to be handled by the government.

These people convincingly demonstrated the grave problems inherent in the secrecy bill.

As if to ignore the fears expressed by these people about the bill, the LDP, New Komeito and Your Party rammed the bill through the Lower House on the night of the following day. After the bill reached the floor of the Upper House, Abe has again said that the secrecy bill has “layers of devices” to prevent arbitrarily designation of government information as special secrets. But it is clear that the bill does not have such mechanisms.

The bill would solidify control and monopoly of government information by the administrative branch — and in concrete terms by bureaucrats — without independent oversight.

A revision made to the bill calls on the government to “consider” a third-party mechanism to examine the validity of the classification process, but government officials indicate that such an organ would be set up within the government organization. It is clear from the government’s explanations so far that such an organ would only do perfunctory examinations and would not examine the content of designated secrets. In the Upper House interpellation, lawmakers — whether they are from the ruling or opposition bloc — must expose the dangerous nature of the bill and do their utmost to kill it.

Bent on starting again, yet "independent and critical"?

December 4, 2013

Team of int'l experts to advise on safety culture at TEPCO

<http://mainichi.jp/english/english/newsselect/news/20131204p2g00m0dm060000c.html>

LONDON (Kyodo) -- An international taskforce of nuclear experts will start meeting in January to advise Tokyo Electric Power Co. on safety issues, according to Barbara Judge, who has been called in by the Japanese utility to draw up a new culture and standards.

Judge, former chairwoman of Britain's Atomic Energy Authority, is currently assembling a team of six experts who will gather about four times a year to assess plans by the utility, known as TEPCO, to improve the safety culture at its plants.

Judge was appointed by TEPCO following criticism of the company's attitude to safety in the aftermath of the disaster at the Fukushima Daiichi nuclear power plant in 2011.

Three reactors suffered core meltdowns after cooling systems were left without power following the huge earthquake and tsunami in northeastern Japan.

Judge has already established an office within the company to oversee working practices led by a former colleague from Britain. This newly created body of international experts will review the work of this office and provide best practice from all over the world.

"This taskforce will be a way to give the Japanese and TEPCO the benefit of international expertise on the specific issue of safety which is what they need in order to reopen the plants," Judge told Kyodo News.

"No one country can ever have enough experience...it needs cooperation and collaboration," she said.

Judge is the deputy chairwoman of an advisory committee of outside experts set up by TEPCO. The body is led by former U.S. Nuclear Regulatory Commission Chairman Dale Klein.

Judge, a lawyer who has also worked in banking, has been visiting Japan since the 1980s and says she feels "honored" to have been given this role.

She says safety must now be an absolute priority for everyone working at TEPCO and staff should be actively praised for raising any worries relating to safety.

"Our goal is to have the best safety culture in the world. We know the Japanese can do it," said Judge.

Previously she had been critical about the pace and quality of reforms at TEPCO, but now feels the company is now "doing a good job" and is genuinely committed to cleaning up its act.

"If I thought they were paying lip-service to what I was suggesting and the Nuclear Safety Oversight Office (the in-house regulator set up by Judge), I wouldn't be wasting my time. We (Klein and Judge) feel it's our job to be independent and critical," she said.

Judge believes that despite recent setbacks nuclear energy is essential to revitalize Japan's economy.

"At the moment Japan is buying liquefied natural gas (LNG) at the highest price in the world and I don't think, even with wind, sun and LNG, that enough power will be generated to bring the economy back to where it should be," she said.

She feels TEPCO should be allowed to restart the Kashiwazaki-Kariwa plant in Niigata Prefecture as long as it meets all the requirements laid down by the new regulator.

Judge argues that as well as safety, TEPCO needs to improve its public relations.

"It's important for TEPCO and other producers to start communicating with the public about what goes on in the plants and talk about the benefits and detriments in an even-handed fashion," she said.

Judge says TEPCO's public communications are getting better and she would like to see the utility create visitor centers at reactor sites in order to increase awareness.

TEPCO has also been criticized for delays in informing the public about leaks of radioactive material into the ocean.

Work is currently under way at the Fukushima Daiichi plant to remove assemblies from the spent fuel pool in the No. 4 reactor building. It is expected to take up to 40 years to decommission the plant.

Journalists worried about Secrets bill

December 4, 2013

Foreign journalists in Japan raise concerns over state secrets protection bill

http://ajw.asahi.com/article/behind_news/politics/AJ201312040056

By MASATO TAINAKA/ Staff Writer

Foreign journalists in Japan say the state secrets protection bill that the Abe administration is trying to push through the Diet before the current session ends on Dec. 6 will only make their already difficult jobs that much harder.

David McNeill, 48, a Tokyo correspondent for the British newspaper The Independent, predicts that the anonymity prevalent in Japan's bureaucracy that is already quite secretive will only broaden.

When Japanese bureaucrats accept interviews, they often attach a condition that they are not to be identified in stories. McNeill thinks they may become even more reluctant to speak on the record if the bill is passed.

“After the accident at the Fukushima No. 1 nuclear power plant (in March 2011), a lot of us tried to find workers inside the power plant. Now if we interview those people, maybe we could be breaking the law,” he said.

Another journalist questioning the legislation is Jake Adelstein, 44, a Tokyo correspondent with the U.S. online magazine The Daily Beast, whose investigative reports have covered issues involving police and financial scandals.

“The state secrets protection bill aims to crush investigative reporting,” he said.

Adelstein cited the fact that information disclosure in Japan is slow and that the bill has yet to make it clear whether a third-party organization tasked with determining whether designations of secrets are appropriate will actually be established.

“Some foreign investors are saying that they will stop investing in Japanese markets. In a country where freedom of the press is not established, the risk (of investment) is high because it is difficult to obtain objective economic information,” he said.

Meanwhile, German freelance journalist Siegfried Knittel, 68, said both Germany and Japan are U.S. allies. But the difference, he said, is that Germany openly criticizes U.S. policy where Japan is less likely to do so. Underlying Prime Minister Shinzo Abe’s rush to pass the bill is Japan’s eagerness to please the United States, he argued.

Knittel said Abe was supposed to promote policymaking initiated by lawmakers instead of powerful bureaucrats. At present, however, Abe is hastening to pass the “bill to strengthen bureaucrats’ powers,” he said.

All experts at Diet hearing worried about Secrets bill

December 4, 2013

Experts voice concern over secrecy bill at Diet hearing

<http://mainichi.jp/english/english/newsselect/news/20131204p2g00m0dm015000c.html>

TOKYO (Kyodo) -- All of the experts invited to appear at a Diet hearing on Tuesday expressed concern about controversial legislation to toughen penalties for leakers of state secrets that the ruling bloc is aiming to enact this week.

Lawyer Yoichi Eto of the Japan Federation of Bar Associations, who has been analyzing the bill, called for the secrecy bill to be scrapped during his appearance as an unsworn witness in the session of the upper house's security committee, saying the bill could be "used for the suppression of free speech and for political suppression."

Referring to the "special secrets" of the state concerning counterterrorism, diplomacy, defense and counterespionage that the bill targets, Eto said, "While it may be necessary to protect special secrets in terms of security, the beneficiary of security should be the people," calling for the highest priority to be placed on respecting the people's right to know.

Toshiaki Hibino, the head of the Japan Federation of Newspaper Workers' Unions, also said the bill should be scrapped, noting that public servants who have been providing information to journalists will be intimidated and certainly stop passing on information that the public should know.

Toshio Seya, former head of the Regional Banks Association of Japan, acknowledged the necessity of the bill but expressed concern about the possibility that private individuals will be punished under the envisioned law, calling for careful deliberations.

The ruling Liberal Democratic Party and its coalition ally the New Komeito party pushed the bill through the lower house last week and now plan to have it clear the upper house by Friday, the end of the current Diet session.

Eto and Hibino were recommended as witnesses by opposition parties, while Seya was recommended by the ruling coalition.

28 billion dollars investment plan for TEPCO

December 5, 2013

TEPCO prepares \$28 billion investment plan

http://www3.nhk.or.jp/nhkworld/english/news/20131205_26.html

Tokyo Electric Power Company is planning to spend about 28 billion dollars over 10 years to improve its business performance.

The utility needs to increase profits in the wake of the Fukushima Daiichi nuclear disaster to pay for the plant's decommissioning and compensate those affected.

The firm's new investment plan says it will rebuild and modernize thermal power plants more than 40 years old, mainly in the Tokyo Bay area.

The utility hopes to raise the thermal plants' efficiency, as it is expected to have to reduce its dependence on nuclear power.

And it plans to build facilities to handle shale gas imported from North America. The low-priced gas is expected to cut costs.

TEPCO will also invest in overseas gas development projects.

The investment plan is to be finalized this month.

Ishiba has not changed in mind on "terrorism"

December 4, 2013

Ishiba validates secrecy bill fears

<http://www.japantimes.co.jp/opinion/2013/12/04/editorials/ishiba-validates-secrecy-bill-fears/#.UqCpYifij9k>

On Nov. 29, Liberal Democratic Party Secretary-General Shigeru Ishiba criticized public demonstrations near the Diet building by those opposed to the state secrets bill. "I believe the tactics of simply shouting (opinions) at the top of one's voice seems not so different from an act of terrorism in essence," he wrote in his blog of that date.

In the apology and "correction" that he issued Dec. 2, Ishiba crossed out the phrase "not so different from an act of terrorism" in a manner that left it legible and added "different from the way a democratic method should be." Obviously Ishiba intended his blog readership to understand that his original sentiment remained intact.

This episode shows that the LDP's No. 2 official fails to understand the importance of protests and demonstrations as a fundamental democratic means for citizens to express their opinions and demands as guaranteed by Article 21 of the Constitution, which in part says, "Freedom of assembly and association as well as speech, press and all other forms of expression are guaranteed."

Ishiba's statement also has rekindled concerns over the definition of terrorism in the secrecy bill. The fear that the bill could be used to silence citizens who express political opinions or demands is clearly not groundless. Ishiba's reaction to the demonstrations brought into sharp relief the danger of the bill and validated the fears of the bill's opponents.

In specifying a procedure to qualify people for handling designated secrets, Article 12 of the bill provides for the examination of whether a person under consideration is linked to "designated harmful activities," including spying, or has links to "terrorism." The article's definition of terrorism includes the following phrase: activities that force political and other principles or opinions on the state and other people. This is far more encompassing than the widely accepted definition of terrorism: The systematic use of violence to create a general climate of fear in a population and thereby to bring about a particular political objective.

Under the government's definition, it cannot be ruled out that state authorities would regard political, civic and other activities by citizens aimed at persuading the government and other organizations or people to consider opposing opinions or demands as acts of terrorism. It also suggests that the state would not hesitate to monitor, investigate or suppress their activities, even before such activities become public. And since information related to anti-terrorism activities may be designated as special secrets under the bill, such moves by the police and other government organizations would largely be shielded from scrutiny. Moreover, if someone learns of such actions by the state and leaks this information to others, they could face arrest.

All of this suggests that freedom of thought and conscience as guaranteed by Article 19 of the Constitution will be in grave danger if the secrecy bill becomes law. The secrecy bill could give rise to a society in which citizens must live in constant fear that they could be placed under surveillance by the state at any time. While the secrecy bill has many flaws, the existence of Article 12 alone is sufficient reason to kill it.

Japan should not sign Convention on Supplementary Compensation for Nuclear Damage

December 4, 2013

Japan should shun treaty that will shield nuclear tech suppliers

<http://www.japantimes.co.jp/community/2013/12/04/voices/japan-should-shun-treaty-that-will-shield-nuclear-tech-suppliers/#.UqCFkyfij9k>

Dear Foreign Minister Fumio Kishida,

Although you are probably unaware, longtime readers of The Japan Times may recall that in April 2011, I sent an open letter to then Prime Minister Naoto Kan (“Who pays for nuclear nightmare?” Hotline to Nagata-cho, April 19, 2011) asking about who was going to pay for the massive costs resulting from the disaster at the Fukushima No. 1 nuclear plant.

This question was prompted in part by the existence of documents revealing that as early as November 1971, officials at the U.S. Atomic Energy Commission (AEC) expressed concern about design flaws in General Electric’s Mark I nuclear reactors. All of the reactors that experienced meltdowns at Fukushima No. 1 were of this type.

In fact, in a memo dated Sept. 25, 1972, the top safety official at the AEC, Joseph Hendrie, agreed that elements of the General Electric (GE) reactor design could contribute to a core meltdown in the event of an accident. However, he refused to take action because doing so “could well mean the end of nuclear power.”

Further, by 1976, three GE nuclear engineers became so concerned about the dangerous shortcomings of the GE design that they resigned their highly paid positions in protest and testified about the reasons they had done so before the U.S. Congress. Yet no substantive corrective action was taken.

While this may now seem like old news, the question of who is going to pay for the massive and ever-growing cost associated with the 30-to-40-year-plus cleanup and associated compensatory damages has yet to be finalized, beyond ad hoc financial assistance dished out to Tepco by the Japanese government — i.e., ultimately by taxpayers in Japan, both Japanese and foreign.

The question now is whether this is fair in the face of possible financial liability on the part of GE, especially since the company built part of the Fukushima No. 1 complex as a turnkey operation. GE was also involved in shaving down the 35-meter-high cliff at the plant’s construction site to only 10 meters above sea level, thereby greatly increasing the plant’s vulnerability to tsunami.

Is GE financially liable for its part in the Fukushima No. 1 disaster? No one can answer that question until a thorough investigation of the relevant facts and applicable laws has been undertaken. Yet such an investigation has not been conducted either in Japan or anywhere else. Why not?

What gives this question particular urgency are recent news reports that **Japan is now preparing to sign a treaty known as the Convention on Supplementary Compensation for Nuclear Damage. This treaty assigns accident liability *entirely to plant operators* rather than equipment and technology vendors.**

At the moment, this treaty is not yet legally binding inasmuch as it requires a total of five countries to ratify it. At present only four nations have done so: the U.S., Romania, Morocco and Argentina. Thus, if Japan ratifies this treaty, it will, as the fifth nation, bring this treaty into force.

On Nov. 1, Kyodo News reported that you, Foreign Minister Kishida, intend to ask the Diet to ratify this treaty early next year. Ratification would appear to make examination of GE’s responsibility for the Fukushima disaster moot since, moving forward, Japan will be unable to hold GE or any other domestic or foreign nuclear equipment vendor financially liable, no matter how defective or dangerous the equipment they installed is. This is of special concern inasmuch as Japan currently has an additional 23 boiling water reactors of similar design to those in service at Fukushima No. 1.

I am aware there is a positive side to this treaty, i.e., that U.S. Energy Secretary Ernest Moniz recently promised assistance with the cleanup at Fukushima No. 1 once Japan ratifies the treaty. Yet, could the U.S. afford to be seen to be *withholding* technical assistance to Japan when the Pacific Ocean, the common resource of both nations, continues to serve as a sewer for Fukushima’s radioactively contaminated water?

But the real question, Foreign Minister Kishida, is this: As someone who is responsible for protecting Japan's national interest, is it fair to taxpayers in Japan to be saddled either directly or indirectly with the massive costs of the Fukushima cleanup for a generation or more when there is good reason to believe that GE is legally liable for at least a portion of that cost?

As someone deeply attached to this country and its people, I appeal to you to postpone introducing this treaty to the Diet for ratification until the question of GE's financial responsibility for the ongoing disaster has been clarified.

BRIAN VICTORIA

Kyoto

Japan needs independent watchdog to gain public's trust

December 7, 2013

INTERVIEW/ Peter Bradford: Independent watchdog needed to monitor Fukushima work

<http://ajw.asahi.com/article/views/opinion/AJ201312070014>

By SHIRO NAMEKATA/ Correspondent

PERU, Vermont--An independent watchdog should oversee the daunting task of decommissioning the crippled Fukushima No. 1 nuclear plant and combating the contaminated water problem, a former member of the U.S. Nuclear Regulatory Commission said.

Although Prime Minister Shinzo Abe's government plans to increase its involvement in the efforts at the plant, outside experts are needed because plant operator Tokyo Electric Power Co. and members of the "nuclear village" have already lost the public's confidence, said Peter Bradford, a nuclear expert with experience in dealing with the 1979 Three Mile Island accident.

In a recent interview with The Asahi Shimbun, Bradford also said an important task of Japan's nuclear authority is to listen to the voices of those affected by the disaster and to get the public involved in the decision-making process.

Excerpts from the interview follow.

Question: How do you evaluate the contaminated water problem at the Fukushima No. 1 nuclear power plant?

Bradford: For anyone with a background in nuclear power and nuclear regulation, it is impossible not to be sympathetic, first toward the people in Japan, but also toward the officials and the people in TEPCO who are trying to deal with these conditions because there has been nothing like it in the nuclear industry elsewhere.

The Three Mile Island accident was just one reactor and did not involve substantial issues with the water. Chernobyl was a much worse accident but still just one reactor and did not present the kind of long-term cooling issues that Fukushima does.

There just aren't the same kinds of groundwater issues. The situation in Japan is unique, and there aren't a lot of easy answers.

One thing that seems to be different in Japan, from the way we would approach a serious nuclear accident in the U.S. system, is that much more has been left to TEPCO to do, whereas during the Three Mile Island accident--and I am sure it would be true in any other one as well--the Nuclear Regulatory Commission became very much involved in the accident management process.

The private company had to notify NRC with regard to any release of radioactivity and get permission for releases of radiation to the air or to the water.

NRC had representatives at the reactor site from the beginning of the accident, and then sent many more people afterward. It became the primary focus of the commission for two years after the accident.

My impression is that Japan's Nuclear Regulation Authority is being asked to spend a lot of its time--maybe most of its time--on the question of reopening the other 50 reactors, and it has been less involved in the management of the accident.

Q: There is an argument in Japan that the NRA's main task is to keep nuclear power plants safe, and that it should not deal with the contaminated water problem because it does not have enough expertise in such areas as hydrology or geology.

A: A nuclear regulatory authority does not normally expect to have to deal with these complicated hydrology or geology questions, but if this were in the United States, either NRC or the Department of Energy, they would hire the people that they needed for expertise.

Their expertise was being brought to bear on the problem, with some independence from the company responsible for the accident. That way they are not involved in issues relating to accident cost liability.

The public is inevitably going to be skeptical of TEPCO because it is the company that caused the accident. The same thing happened at Three Mile Island.

TEPCO has begun to bring in people from other countries, but these are still “nuclear village” people. They’re just international nuclear village instead of Japanese nuclear village.

Q: Did NRC provide technical assistance following the Three Mile Island accident?

A: Most of the technical assistance came either from the rest of the nuclear industry, which convened their own response centers, or from our national laboratories, which are technically part of the Department of Energy, because they have a much greater research capability.

But the decisions as to what the licensee--the plant owner--was permitted to do were made by NRC, drawing on the expertise of whoever we needed to have involved.

Also, the process of explaining to the public what was being done, and giving the public an opportunity to participate in decision-making through hearings, was all done by NRC.

If the public had a substantial concern about a proposed activity, they would take it to NRC, to be involved through the hearing process, and the committee could reflect it in whatever decisions we had to make.

After Three Mile Island, a number of groups were formed in the area that were concerned about the cleanup or were concerned about allowing the second nuclear plant to resume operations, and they raised a number of different types of concerns, ranging from technical issues to issues like psychological stress on residents.

NRC agreed to hold public hearings mostly on the subject of restarting the second unit. But some had to do with aspects of the cleanup of the damaged plant. These hearings became a vehicle for these groups to be able to continually raise their concerns about what was happening at the site.

In the three months after the accident, I probably went to the site or just to people’s homes in the area for about 10 times. I would just get in my car and drive 2-1/2 hours up to there from Washington, D.C.

Q: Was it a mission of NRC to explain the situation to the public?

A: Before the accident, NRC had assured the public that nuclear power was safe, and then we had an accident. It was most important just to go and hear what their feelings were. It seemed to make a lot of difference to these people, some of whom were very angry.

There was an evacuation that only lasted five days. It was nothing like what has happened in Fukushima, but it was very upsetting especially to parents with young children.

They wanted reassurance as to whether it was safe to go on living there. But mainly, they just wanted somebody from Washington to listen, just to feel that their views and their experiences mattered.

On one occasion, the licensee needed to release a quantity of radioactive krypton gas from the containment into the atmosphere two or three months after the accident.

The public, like the fishermen at Fukushima, did not want any more radiation. But it was necessary to get the radiation levels in the containment down enough so that workmen could begin to actually work on the reactor levels--the same kind of discussion you have now about the water.

We asked the nongovernmental organization Union of Concerned Scientists to review the activity and make a report of their own. They had credibility with the public that certainly the licensee company and probably the government did not have.

When the group said it was a reasonable thing to do, it was very helpful in reassuring the public that that release would be acceptable.

I don't have the impression that anyone has asked independent groups to review any of the activities at the Fukushima plant. It might help to sort through which activities with the contaminated water are reasonable and which ones pose some danger.

And there is no reason to think that the public is going to be any more reassured by them than they would be by a TEPCO employee or a government employee. **You really have to be willing to involve people who have been skeptical about nuclear power if you expect to expand the public credibility.**

Peter Bradford, born in 1942, served as a member of the Nuclear Regulatory Commission between 1977 and 1982. He is currently an adjunct professor at Vermont Law School and senior fellow at the school's Institute for Energy and the Environment.

TEPCO will try to sell power outside usual service areas

December 4, 2013

TEPCO plans to sell power outside its home turf

<http://ajw.asahi.com/article/economy/business/AJ201312040052>

By MARI FUJISAKI/ Staff Writer

Tokyo Electric Power Co. plans to enter the turfs of other electricity suppliers in fiscal 2014, a move that could lead to full-scale competition in an industry long monopolized by regional utilities, sources said.

The success of TEPCO's plan, however, depends on whether the operator of the stricken Fukushima No. 1 nuclear plant gains approval to restart reactors in Niigata Prefecture.

TEPCO plans to first sell electricity to corporate users outside its usual Kanto service areas, and then to individual households when the government fully liberalizes the electricity retailing business in fiscal 2016, the sources said.

The policy will be included in TEPCO's revised rehabilitation plan due before the end of the year, according to the sources.

With TEPCO's operations encumbered by the 2011 Fukushima accident, other regional utilities are entering the market in the Tokyo metropolitan area, TEPCO's prime territory.

In October, Chubu Electric Power Co. acquired an 80-percent stake in Diamond Power Corp., an electricity retailing subsidiary of trading house Mitsubishi Corp., and began selling power in the capital and other areas.

Kansai Electric Power Co. also plans to sell electricity in the Tokyo area starting in spring 2014.

TEPCO's electricity rates are the highest among the nine major regional utilities, excluding Okinawa Electric Power Co. The company will likely be **forced to lower rates and take other measures to compete.**

According to its rehabilitation plan, TEPCO plans to lower its electricity rates after it restarts two idle reactors at the Kashiwazaki-Kariwa nuclear plant in Niigata Prefecture in summer 2014.

But before that can happen, the Kashiwazaki-Kariwa plant will have to pass the Nuclear Regulation Authority's new safety standards.

In addition, many in the general public oppose TEPCO's reactor restart plan.

If TEPCO's nuclear reactors cannot resume operations, the company will have only a limited amount of electricity to sell outside its service areas.

TEPCO chairman to retire soon

December 6, 2013-12-06

Tepco chairman reportedly to retire next June

<http://www.japantimes.co.jp/news/2013/12/06/national/tepcO-chairman-reportedly-to-retire-next-june/#.UqGgNyfij9k>

JJI

Tokyo Electric Power Co. Chairman Kazuhiko Shimokobe plans to step aside after a general shareholders' meeting next June, sources said Friday.

Shimokobe believes that Tepco can pave the way for its business reconstruction after the disaster at the Fukushima No. 1 nuclear plant with the planned adoption of a revised special business program by the end of this month, sources said.

Tepco's management and the government are expected to ask Shimokobe to stay on. At the same time, they will look for his successor, but that would appear to be difficult, according to the sources.

Shimokobe, **former head of the steering committee of the Nuclear Damage Liability Facilitation Fund**, a public-private body helping Tepco with compensation payments, played a leading role in the utility's rationalization.

He became Tepco chairman in June 2012, succeed Tsunehisa Katsumata.

Shimokobe, who registered as a lawyer in 1974, took the post of vice president of the Japan Federation of Bar Associations in 2007.

A way of "making investigative journalism illegal"

Source : The Guardian

<http://www.theguardian.com/world/2013/dec/05/whistleblowers-japan-crackdown-state-secrets>

Japan whistleblowers face crackdown under proposed state secrets law

Officials who leak 'special state secrets' and journalists who seek to obtain them could face prison if bill is approved this week

- theguardian.com, Thursday 5 December 2013 15.14 GMT

Whistleblowers and journalists in Japan could soon find themselves facing long spells in prison for divulging and reporting state secrets, possibly including sensitive information about the Fukushima nuclear disaster and the country's souring relations with China.

Under a special state secrets bill expected to pass on Friday, public officials and private citizens who leak "special state secrets" face prison terms of up to 10 years, while journalists who seek to obtain the classified information could get up to five years.

Critics of the new law say it marks a return to the days of prewar and wartime Japanese militarism, when the state used the Peace Preservation Act to arrest and imprison political opponents.

"It is a threat to democracy," said Keiichi Kiriya, an editorial writer for the Tokyo Shimbun newspaper, adding that the legislation would "have a chilling effect on public servants, who could become wary about giving the information" to journalists.

In the aftermath of the Edward Snowden leaks, Japan has come under pressure from Washington to better protect state secrets – including intelligence shared by the US – at a time of rising regional tensions.

Japan's prime minister, Shinzo Abe, says the law is crucial if his US-style national security council, approved this week, is to function properly.

The law is seen as part of his conservative project to bolster Japan's security in response to escalating tensions with China and concern over North Korea's nuclear weapons programme.

Abe, who does not have to fight an election for another three years, is expected to push ahead with his nationalist agenda, including constitutional reforms that would end the military's purely defensive role.

The secrecy bill's hasty passage through the lower house has been marked by noisy public demonstrations and opposition from journalists, lawyers, politicians, academics and scientists, as well as film directors and manga artists concerned about freedom of expression.

They say the prospect of prison terms will deter whistleblowers from leaking sensitive or embarrassing information in the public interest, and journalists from trying to obtain it.

The upper house of Japan's parliament is expected to approve the bill before the end of the current parliamentary session on Friday, possibly later on Thursday.

The chief criticism of the bill is its vague definition of what constitutes a state secret, potentially giving officials carte blanche to block the release of information on a vast range of subjects, including measures to counterbalance China's growing military influence in the region, and the safety of the country's nuclear reactors.

"There are few specifics in the law, which means it can be used to hide whatever the government wishes to keep away from public scrutiny," said Mizuho Fukushima, an opposition MP.

"In its current form, the prime minister can decide by himself what constitutes a secret."

The law would apply to four areas – defence, diplomacy, counter-terrorism and counter-espionage – and gives officials the power to keep sensitive information out of the public domain indefinitely.

Senior politicians insist the law will not be used to gag the press or restrict the public's right to know.

But the justice minister, Sadakazu Tanigaki, refused to rule out police raids of newspapers suspected of breaking the law.

Masako Mori, the state minister in charge of the bill, said the law could be applied to Japan's nuclear power industry, because it is a potential target for terrorists. But she denied the legislation would affect the release of information about radiation leaks at Fukushima Daiichi.

Last week, the secretary general of the governing Liberal Democratic party, Shigeru Ishiba, angered many when he likened people protesting against the bill to terrorists. He later apologised for the remarks.

"There is a demand by the established political forces for greater control over the people," said Lawrence Repeta, a law professor at Meiji University. "This fits with the notion that the state should have broad authority to act in secret. It seems very clear that the law would have a chilling effect on journalism in Japan."

Widespread opposition to the law is testing Abe's popularity. A recent poll by the Asahi Shimbun newspaper found public support for Abe has dropped to below 50% for the first time since he took office last December. More than 60% of those polled expressed concern that the bill was being rushed into law.

In response, Abe this week attempted to dismiss claims that officials would abuse the law to prevent the disclosure of information that is in the public interest. "There is a misunderstanding," he said. "It is obvious that normal reporting activity of journalists must not be a subject to punishment."

Abe said the government would set clearer definitions of state secrets and appoint a third party to oversee possible violations. Critics point out that the proposed body, comprising senior officials from the foreign and defence ministries and the national police agency, is far from independent.

"What we need is a third party, not a quasi-third-party system that can check," said Banri Kaieda, leader of the main opposition Democratic party of Japan. "I can say with certainty now that the bill is created by bureaucrats for the bureaucrats to hide information."

The prospect of harsh penalties for Snowden-style whistleblowers and their reporter associates has prompted concern outside Japan. Reporters Without Borders accused Japan of "making investigative journalism illegal".

It said in a statement: "How can the government respond to growing demands for transparency from a public outraged by the consequences of the Fukushima nuclear accident if it enacts a law that gives it a free hand to classify any information considered too sensitive as a state secret?"

Navi Pillay, the UN high commissioner for human rights, accused Japan's government of imposing the legislation with little public debate. "They should not rush through the law without first putting in proper safeguards for access of information and freedom of expression as guaranteed in Japan's constitution and international human rights law," she said.

The law reflects a decline in Japan's standing as a protector of the free press. In the Reporters Without Borders press freedom index for 2013, it dropped 31 places from 2012 to a new low of 53rd out of 179 countries.

Abe's promises "not safeguards"

December 10, 2013

ANALYSIS: Abe offers reassurances, not safeguards, on state secrets law

http://ajw.asahi.com/article/behind_news/politics/AJ201312100055

THE ASAHI SHIMBUN

Prime Minister Shinzo Abe on Dec. 9 promised citizens that their lives will not be affected by the state secrets protection law, but he failed to explain how this will be achieved.

Instead of announcing safeguards against possible abuse, Abe essentially asked the public to place trust in himself, the government and bureaucrats to do the right thing.

"Ordinary lives of people will never be threatened," Abe told a news conference at the prime minister's office in Tokyo, a day after the extraordinary Diet session ended. "The existing scope of secrets will not be expanded."

Abe mentioned media reports that said private citizens could face severe punishment by blogging about stories they hear from their friends, and that free creative activities, such as filmmaking, will be limited.

"But such things will never happen," Abe said.

The law was enacted last week amid widespread protests from the public and opposition lawmakers that its vague wording could lead to arbitrary designations of state secrets of any information. Criticism was also lodged at the lack of any independent organization to oversee whether the designations are appropriate.

Abe acknowledged that his efforts to win public support for the bill were lacking.

"I think I should have taken more time to provide more detailed explanations," Abe said. "From now on, I will explain carefully to erase people's concerns."

The prime minister and the ruling coalition were criticized as ignoring public opinion in their determination to railroad the bill through the Diet.

Abe said that move was needed for the good of Japan.

"It was necessary to enact (the law) as soon as possible, along with establishing the national security council, so that we can protect the lives and property of our citizens," Abe said.

The state secrets protection law covers four areas: defense; diplomacy; prevention of spying and other harmful activities; and prevention of terrorism. Its purpose, ruling coalition officials say, is to prevent leaks of information that could jeopardize Japan's national security.

“There have been no rules on how to handle specified secrets so far,” Abe explained.

The prime minister said the security situation surrounding Japan has become increasingly severe, referring to China’s new air defense identification zone that covers skies above the disputed Senkaku Islands in the East China Sea.

“If we failed to establish rules to manage secret information, we would not be able to gain information from foreign countries,” Abe said.

Abe added that rules will also be set for the disposal of classified information, pointing to ambiguities in the actions of the previous government led by the Democratic Party of Japan.

“The DPJ-led government disposed of 30,000 defense secrets in only three years,” Abe said. “It remains unknown why those secrets were discarded and who was responsible for that.”

The prime minister said the state secrets protection law “will dramatically enhance transparency and make clear the responsibility.”

However, Abe did not offer any new measures on how to ensure transparency, a key sticking point in arguments against the law.

The Abe administration has vowed to set up monitoring bodies to check the appropriateness of state secret designations. But those organizations will be established within the government, and bureaucrats--the same people with the power to designate state secrets--are expected to play a central role.

The prime minister also did not touch upon how much information will be kept secret after the law takes effect and for how long.

In addition, he did not explain how those authorized to handle state secrets will be selected and did not address the concerns about invasions of privacy in the process.

The new legislation stipulates that people in the private sector who leak state secrets could face up to 10 years in prison.

For private sector people allowed to manage state secrets, governmental agencies will be allowed to delve into their personal information, including drinking habits, loans and family members’ nationalities, after obtaining their consent.

Abe said he will make sure everything is on the up and up.

“The prime minister will be obligated to report to an information preservation advisory panel about (newly designated) specified secrets at least once a year, and the advisory panel will present its opinion to the Diet,” he said.

But under the law, even this advisory panel will not be allowed to investigate individual state secret designations.

The same day, Deputy Chief Cabinet Secretary Katsunobu Kato said it will be difficult to allow a body completely independent from the government to check the appropriateness of state secret designations.

“Political value judgments will be inevitably necessary,” Kato said on a TV program. “The government of the moment will make decisions from the perspective of national security.”

Although the legislation states that the new law will go into effect within a year, Abe did not give a definitive timeframe.

“I hope to enforce it at an appropriate time, after providing sufficient explanations,” he said.

Nukes need TWO panels

December 10, 2013

Abe wants ministerial panels for nuclear issues

http://www3.nhk.or.jp/nhkworld/english/news/20131210_30.html

Prime Minister Shinzo Abe has instructed his Cabinet ministers to set up ministerial panels to address policies on nuclear power and highly radioactive nuclear waste.

Abe spoke to the ministers on Tuesday about Japan's new basic energy policy, which he hopes the Cabinet will approve in January.

The prime minister wants one group of relevant ministers to address nuclear power policies that are necessary to establish responsible measures for energy production.

Abe wants another ministerial panel to deal with highly radioactive nuclear waste, which is created during operations at nuclear power plants.

Chief Cabinet Secretary Yoshihide Suga told reporters after the Cabinet meeting that Japan's energy supply has become a very significant issue after the nuclear accident in Fukushima.

Suga said it's important that all members of the government become involved and take the initiative. He added that the government is especially determined to take the lead in dealing with highly radioactive nuclear waste.

State secrets regulation, conspiracy, etc.

Ishiba says media reports on state secrets should be regulated

http://ajw.asahi.com/article/behind_news/politics/AJ201312120043

December 12, 2013

By SACHIKO MIWA/ Staff Writer

A ruling party executive suggested that media coverage of state secrets specified under new legislation should be regulated, contradicting the prime minister's assurances that the public's right to know will not be compromised.

Shigeru Ishiba, secretary-general of the Liberal Democratic Party, also told the Japan National Press Club on Dec. 11 that those who reported specified secrets could be punished.

“I think the act (of reporting specified secrets) will be kept in check in one way or another if our nation’s safety is put at great risk,” he said. “It will be eventually up to judicial judgment (whether those who reported them should be punished).”

The ruling coalition of the LDP and New Komeito railroaded the legislation, which toughens penalties against public servants and others for leaking secrets that could jeopardize Japan’s national security, through the Diet on Dec. 6.

Ishiba effectively retracted his comments later in the day, but the remarks revealed not only his ignorance of the law’s provisions, but also his intention to put protection of government secrets before the public’s right to know.

Article 22 of the state secrets protection law says: “Due consideration should be given to freedom of reporting and news gathering that contribute to the guarantee of the people’s right to know.”

The Abe administration added the clause in response to criticism that the legislation could infringe on the public’s right to know by intimidating whistle-blowers and journalists.

At a news conference days after the law was enacted, Prime Minister Shinzo Abe attempted to dispel deep-rooted concerns by emphasizing that the public will not be deprived of their right to know.

The state secrets protection law also says, “News gathering activities for publishing and reporting are considered legitimate unless they violate laws and regulations or are done in an excessively unjust manner.”

It does not stipulate any punishment for those who reported specified secrets.

“I found that those who reported (specified secrets) will not be subject to punishment, although public servants who leaked (them) will be punished,” Ishiba told reporters at the LDP headquarters two hours after the news conference.

He also said he did not mean to ask for media coverage of specified secrets to be kept in check.

Still, Ishiba repeatedly emphasized that reports on specified secrets could endanger national security and the lives of citizens, implicitly demanding that media organizations refrain from reporting those secrets.

“It is by no means good that a nation’s peace and security, and people’s lives, safety and property will be adversely affected (by reports on specified secrets),” he said. “If media organizations decide to report (specified secrets) despite being aware of such risks, they should consider their own responsibilities.”

On Dec. 12, Ishiba again expressed doubts that media organizations should be free to report specified secrets.

“(Specified secrets) will have grave consequences on the nation’s security and the people’s lives and safety if they come out into the open,” he said on a radio program. “What will happen if a large number of people died (as a result of reporting)?”

Ishiba recently equated protests to the state secrets protection legislation with terrorism on his blog and was forced to withdraw his remarks.

Government takes another stab at unpopular 'conspiracy' legislation

http://ajw.asahi.com/article/behind_news/politics/AJ201312120063

December 12, 2013

THE ASAHI SHIMBUN

The government is seeking to rejuvenate decade-old legislation to make the act of “conspiracy” a punishable crime, even if no criminal act has been committed.

Word of the move sparked revived criticism that such a law could lead to prosecution against civil advocacy groups for the mere act of communicating. Even members of Prime Minister Shinzo Abe’s administration questioned the need for a conspiracy law.

Chief Cabinet Secretary Yoshihide Suga told reporters on Dec. 11 that government would not try to advance the measure during the next Diet session, which starts in January.

But government officials say the legislation is needed in part to bolster police powers to fight terrorism before Tokyo hosts the 2020 Summer Olympic Games. The event will draw huge crowds from around the world and is seen as an inviting target for terrorists.

The legislation is also seen as a key law enforcement tool to fight organized crime. It would penalize mere complicity in plots to commit serious criminal acts in an “organized” way as part of “activities of a group.”

“Conspiracy legislation is a necessity from a global perspective in the light of the (United Nations) Convention Against Transnational Organized Crime,” a senior government official said Dec. 11. “We have always been discussing the issue, which is an international requisite.”

The Diet has voted in favor of signing the U.N. convention, which was adopted by the world body in 2000. However, Japan says it needs its own domestic law covering acts of conspiracy before it can sign the convention.

Bills to strengthen current laws have been submitted on three occasions to the Diet since 2003. But protests by the general public and opposition parties have forced lawmakers to abandon the legislation each time.

The legislation would criminalize acts of conspiracy regarding more than 600 types of crimes, even if they have not been committed. Critics are also concerned over potential abuse of the law by authorities.

The Abe administration came under heavy fire for steamrolling the state secrets protection bill through the Diet earlier this month. The approval ratings for Abe’s Cabinet dropped across the board in surveys conducted by various media organizations after the law was enacted.

That led the prime minister’s office to reject calls by some in his administration to submit a conspiracy bill, or a set of bills to amend related laws, during the next Diet session. The Abe administration instead plans to take its time to discuss the issue and lay out its argument for the conspiracy legislation.

But criticism runs deep.

“The state secrets protection law, conspiracy legislation and the wiretapping law are all part of a single package,” said lawyer Yuichi Kaido. “Once the conspiracy legislation is enacted, the government could next seek to expand the law to allow wiretapping to clamp down on conspiracy.”

Yoshitomo Ode, a Tokyo Keizai University professor and an expert in the Criminal Procedure Law, also voiced concerns.

“Making uncommitted acts of crime eligible for punishment would very likely engender false charges in a manner that is expedient to investigative authorities,” Ode said.

Even an aide to Abe said Japan does not need conspiracy legislation.

“We have to strive to let foreigners know that Japan is such a safe and secure country,” the aide said.

A senior administration official said, “I believe the state secrets protection law is necessary, but conspiracy legislation would have a more direct impact on the general public.”

The Liberal Democratic Party’s platform for the December 2012 Lower House election made no direct mention of conspiracy legislation.

The only reference that can be construed as similar stated, “We will bolster measures to fight organized crime, including crackdowns on cross-border crime rings.”

TEPCO releases new info on 3/11

December 13, 2013

New findings on Fukushima accident to be released

http://www3.nhk.or.jp/nhkworld/english/news/20131213_22.html

Tokyo Electric Power Company says the early breakdown of a reactor cooling system, coupled with failed attempts to inject water into the reactor, led to the meltdown of the number 3 reactor after the March 2011 quake and tsunami.

The operator of the crippled Fukushima Daiichi nuclear plant is still verifying the details of the accident in March 2011.

The latest findings are the follow-up to a study whose findings were made public in June 2012.

The previous study found that a meltdown began at the plant's Number 3 reactor at about 10:40 AM on March 13th, 2011 -- 2 days after the quake and tsunami.

The latest findings include analysis of how the meltdown started.

TEPCO says the readings of the reactor's water gauge early that morning suggested that the water levels inside the reactor were low enough to expose part of the fuel above the water's surface.

This indicates that the functions of the emergency cooling system had already been lost.

It also says water injections by fire engines started shortly after 9 AM on March 13, but they could have been ineffective because of leaks from the piping.

TEPCO plans to disclose the findings to the public later on Friday. The utility says it will continue its investigation to find out why massive amounts of radioactive substances were released and how this happened.

No third-party for nuclear secret designation

December 12, 2013

Japan has no third-party oversight body for nuclear secrets

<http://mainichi.jp/english/english/newsselect/news/20131212p2a00m0na013000c.html>

There has been no third-party body in Japan for nearly 15 months to check the validity of the designation by the central government and nuclear plant operators of information related to nuclear power facilities as secrets, it has been learned.

No third-party oversight body has been set up since the establishment in September 2012 of the Nuclear Regulation Authority (NRA). This means that the government and nuclear plant operators have decided what should be made secret behind closed doors with no external checking functions. While the recently enacted state secrecy law poses serious questions over the way in which the government is to designate information as "special secrets," the latest revelation is likely to call into question the government's stance toward a third-party oversight body.

In response to growing global threats of terrorism, Japan revised the Nuclear Reactor Regulation Law in 2005 to require power companies to set up rules to protect nuclear materials and designate information related to the security of nuclear facilities as "secrets." The rules apply to information related to equipment designed to prevent attacks on facilities and thefts of nuclear materials, emergency contact systems and management of doorways at facilities and so on.

Under the revised law, the government conducts inspections once a year to confirm whether designation of information as secrets is appropriate and such secrets are not subject to the Freedom of Information Act. If nuclear plant operators and administrative officers leak such information, they will face up to one year in prison or fines of up to 1 million yen.

Meanwhile, according to the NRA's secretariat, the Nuclear and Industrial Safety Agency (NISA), the NRA's predecessor, set up a nonbinding oversight committee on protection of secrets related to nuclear materials, which consisted of university professors, lawyers and the like. The panel was established because of concerns arising during Diet deliberations that nuclear-related information could be designated as secrets freely by the government and nuclear plant operators and outsiders had no way of knowing what were made secrets. The oversight panel had held a meeting almost every year since 2005 to check whether information was designated as secrets beyond necessity.

However, when the NISA was replaced by the NRA in September 2012 -- after the March 2011 Great East Japan Earthquake -- the oversight committee was abolished. What should be done over a third-party body has been left up to the NRA and no discussions have been made on the issue ever since. Because of all this, the NISA and the NRA confirmed designation by nuclear plant operators of information as secrets at a total of 60 nuclear facilities in fiscal 2012, but the secrets were not checked by a third-party body, sources say. The NRA secretariat has not revealed the number of secrets, saying, "We have not counted them."

There was not a case in which the oversight committee had not judged in the past that information was improperly designated as a secret, but in its last meeting held in March 2012, the panel screened 380 pieces of secret information, sources say.

The NRA secretariat's nuclear security office says, "We recognize the need for third-party checking. Although it could be judged that inspections by the NRA (which is highly independent from the Cabinet) are sufficient and it is not necessary to set up a third-party body, we are tied down to other duties so that no discussions have been made at the NRA."

Masahiro Usaki, professor at Dokkyo Law School, said that it is difficult for the NRA to play the role of an oversight body, which consists of experts on information disclosure and crisis management, because it is tasked mainly with handling technical problems although it is highly independent of the government. He said a third-party oversight body should be established as soon as possible. "The government is negligent in its duties because it has left secret designation up to electric power companies even though the public has lost confidence in nuclear power," he added.

December 12, 2013(Mainichi Japan)

Using gains on state-owned TEPCO shares

December 15, 2013

TEPCO share sales to fund decontamination work

http://www3.nhk.or.jp/nhkworld/english/news/20131215_10.html

The government of Japan has increased the estimated cost of decontamination work by 10 billion dollars, as a result of the Fukushima Daiichi nuclear power plant accident in March 2011.

Original estimates for decontaminating buildings and soil tainted with radioactive fallout by the end of fiscal 2013 were about 15 billion dollars.

The governing coalition made a proposal last month to accelerate recovery and rebuilding work.

The government has reviewed the cost of decontamination and building intermediate storage facilities for radioactive waste and soil.

It has also reviewed how the cost should be paid by Tokyo Electric Power Company.

On top of what TEPCO will pay from its ordinary profit every year, the government plans to use gains on the sale of utility shares to cover the cost of decontamination.

The state-backed Nuclear Damage Liability Facilitation Fund currently owns TEPCO shares valued at about 10 billion dollars.

If the gains are not enough, TEPCO will shoulder the additional cost.

The cost of building intermediate storage facilities is estimated to be about 10 billion dollars. Radioactive soil and debris collected during decontamination work will remain there for up to 30 years.

It will be funded by a special account for energy with the tax money for electric power source development.

The burden on TEPCO will be alleviated with such measures. However, using gains on the sale of state-owned shares and tax money may invite criticism that the government is in effect rescuing the company.

Raising loan ceiling for TEPCO again

December 15, 2013

Tepco loan ceiling may hit ¥10 trillion

Kyodo

<http://www.japantimes.co.jp/news/2013/12/15/national/tepco-loan-ceiling-may-hit-%C2%A510-trillion/#.Uq3pXifj9l>

The government might raise its loan ceiling for Tokyo Electric Power Co. to ¥10 trillion from the current range of ¥5 trillion to ¥9 trillion, in light of the compensation payments and radioactive decontamination work it must carry out in the wake of the 2011 Fukushima disaster, sources said Saturday.

It is also considering financing the cost of the decontamination work, currently estimated at ¥2.5 trillion, by selling Tepco shares held by a state-backed fund, the sources said.

The decision on the additional assistance for Tepco will be made later this month. The measures would be included in the utility's new business turnaround plan to be compiled by the company and the fund by the end of the year.

Under its current loan scheme, the Nuclear Damage Liability Facilitation Fund, which provides financial assistance to the utility, is allocated a type of government bond worth up to ¥5 trillion, which carries no interest and can be cashed by Tepco when necessary.

The government is considering lifting the bond issuance ceiling by about ¥4 trillion to ¥5 trillion, with ¥2.5 trillion earmarked for decontamination and ¥1 trillion for storage facilities for radioactive waste, the sources said.

The government is studying how much additional assistance will be needed for damage compensation, they said.

To alleviate the financial burden on the operator of the crippled Fukushima No. 1 nuclear plant, the bailout fund will sell Tepco shares acquired in July 2012, the sources said.

The utility received ¥1 trillion in public funds and fell under effective state control when the fund bought its shares and acquired a majority of the company's voting rights at the time. The capital injection was meant to help the nation's largest utility avoid bankruptcy.

The state-backed fund hopes to gain about ¥2 trillion from the shares, assuming the rise sharply in step with efforts to increase Tepco's revenues in the turnaround plan. The utility will shoulder the remaining decontamination costs if earnings from shares fall short, the sources said.

Before the crisis, Tepco's shares fetched more than ¥2,000 each but have since plunged to around ¥500. Critics doubt it will rise as the fund expects.

December 14, 2013

Gov't mulls raising loan ceiling for TEPCO

<http://mainichi.jp/english/english/newsselect/news/20131214p2g00m0dm040000c.html>

TOKYO (Kyodo) -- The government is considering raising the ceiling on loans available to Tokyo Electric Power Co. for compensation payments and decontamination work following the 2011 nuclear disaster from the current 5 trillion yen to 9 trillion to 10 trillion yen, sources close to the matter said Saturday.

The government plans to decide on the additional assistance for TEPCO later this month, while the operator of the crippled Fukushima Daiichi nuclear complex seeks to include the assistance in its business plan to be reviewed by year-end, according to the sources.

Under the current loan scheme, the Nuclear Damage Liability Facilitation Fund is allocated a type of government bond up to 5 trillion yen, which carries no interest and can be cashed by TEPCO when necessary.

The government is considering lifting the bond issuance ceiling by about 4 trillion to 5 trillion yen. Of the additional assistance, 2.5 trillion yen is to be earmarked for decontamination work and 1 trillion yen for construction of facilities to store radioactive waste from decontamination, the sources said.

The government is now studying how much additional assistance will be necessary for damage compensation, they said.

December 14, 2013(Mainichi Japan)

Ominous words indeed

December 15, 2013

Ishiba's ominous words

http://www.japantimes.co.jp/opinion/2013/12/15/editorials/ishibas-ominous-words/#.Uq7-_yfij9k

Liberal Democratic Party Secretary-General Shigeru Ishiba raised a public outcry when, in a blog entry dated Nov. 29, he referred to public demonstrations near the Diet building by those opposed to the state secrets bill — which was subsequently enacted on Dec. 6 — and wrote, “I believe the tactics of simply shouting (opinions) at the top of one’s voice seems not so different from an act of terrorism in essence.”

Since the law’s definition of terrorism includes the phrase “activities that force political and other principles or opinions on the state and other people,” Ishiba’s statement underscored the very real danger that the law could undermine freedom of speech, expression, thought and conscience as guaranteed by the

Constitution. U.N. officials have also stated that they regard the law as running counter to Article 19 of the U.N. International Covenant on Civil and Political Rights of 1996, to which Japan is a party.

Ishiba caused another commotion on Dec. 11 when he expressed opinions on news reports that divulge information designated as special secrets under the law. At a news conference at the Japan National Press Club, he said that if reporting such secrets puts the nation's security in grave danger, "the act will be curbed by some method." Although he later backpedaled slightly, what he said was enough to raise concern that, at the very least, the LDP's No. 2 official is considering using the state secrets law to control the media. Ishiba also hinted that reporters who have divulged such secrets may be punished by stating that final judgments would be rendered in court.

At a news conference held later that same day at LDP headquarters, Ishiba revised his earlier statement and said that he was only asking for self-restraint on the part of the media when they report on classified information. He also said that such reporting activities would not be subject to punishment.

Nonetheless, attention should be paid to his original statement, which used the phrase "the act will be curbed by some method." This wording can be interpreted as referring to a non-media organization actively curbing reporting activities rather than relying on "self-restraint" on the part of the media.

At the LDP headquarters news conference, Ishiba said that if the media report on classified information, they should do so at their own risk and take full responsibility for their actions. These words could be interpreted as a veiled warning for journalists to use self-restraint or face the consequences.

On a Dec. 12 radio show, Ishiba said, "What if news media report on information whose revelation they know would greatly affect the nation's safety, and what if the reporting leads to the deaths of many people?" This was a clear hint that it would be best if such reporting is not done. But it must be remembered that the media have the responsibility and duty to report information that they believe the people have a right to know.

The National Secrets law says that sufficient consideration must be given to the freedom to carry out reporting activities that contribute to ensuring the people's right to know. But Ishiba's statements point to the possibility that this clause is mere window-dressing. Ishiba clearly places state decisions to conceal "secrets" above the people's right to know — a pillar of democracy — and backs the idea of controlling the media — something that is done in authoritarian societies, not democracies. His statements, with their chilling totalitarian undertones, constitute enough of a basis to push for the repeal of the state secrets law.

Ishiba's call for media controls draws ire from opposition parties

http://ajw.asahi.com/article/behind_news/politics/AJ201312130057

December 13, 2013

By SACHIKO MIWA/ Staff Writer

Ruling Liberal Democratic Party Secretary-General Shigeru Ishiba has provoked a backlash from opposition parties and even surprised the prime minister by advocating media restrictions concerning state secrets specified under new legislation.

"What's that?" an aide quoted Prime Minister Shinzo Abe as asking. "Is there something wrong with him?"

Ishiba on Dec. 11 suggested at the Japan National Press Club that media coverage of information designated under the state secrets protection law, promulgated on Dec. 13, should be regulated.

The Lower House member effectively retracted his statements, but again stirred controversy the following day.

"(Media outlets) would argue that they are free (to report specified secrets) because they are practicing press freedom and are not subject to punishment," Ishiba said on a radio program Dec. 12. "(But) what will happen if a large number of people died (as a result of reporting)?"

Akihiro Ohata, secretary-general of the Democratic Party of Japan, criticized Ishiba's remarks for causing confusion about whether press freedom will be respected or not.

Seiji Mataichi, secretary-general of the Social Democratic Party, was more direct.

"(Ishiba's remarks) have given away more of the real motive of the government and ruling coalition," Mataichi said in a statement. "They want to suppress freedom of speech, reporting and news gathering, deprive the people of their right to know, and put a gag on the nation."

The ruling coalition of the LDP and New Komeito steamrolled the legislation through the Diet on Dec. 6 despite widespread criticism that the public's right to know will be undermined.

Just days before the law's enactment, Ishiba equated street protests against the legislation with terrorism on his blog. He was forced to withdraw those remarks.

"He will be considered a dangerous politician if he repeatedly says the wrong thing," a senior LDP official said Dec. 12.

Ishiba, a security policy expert and a former chief of the Defense Agency, the predecessor of the Defense Ministry, has long emphasized the importance of protecting state secrets.

At a news conference Dec. 12, Chief Cabinet Secretary Yoshihide Suga said the government will not take exception to Ishiba's remarks at the Japan National Press Club.

"We understand that he made supplementary explanations to keep the record straight," he said.

New Komeito leader Natsuo Yamaguchi only said that media organizations are free to report information they have gathered through appropriate means.

Too much for Japanese banks?

Banks look to cut off new lending to TEPCO after 300 billion yen loans

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201312160068>

THE ASAHI SHIMBUN

Commercial banks that have extended loans to Tokyo Electric Power Co. have agreed to offer an additional 300 billion yen (\$2.91 billion) to the struggling utility, while considering ending any future lending to it.

With TEPCO's debt from 77 private financial institutions swelling to an unprecedented level by month's end, the creditor banks are weighing capping their loans to the utility at 4.5 trillion yen, sources at the banks and the Nuclear Damage Liability Facilitation Fund said.

The additional 300 billion yen will raise TEPCO's total debt to 4.5 trillion yen, more than twice the amount before the March 2011 earthquake and tsunami triggered the accident at the utility's Fukushima No. 1 nuclear power plant.

The largest creditor bank for TEPCO, Sumitomo Mitsui Banking Corp., has offered about 990 billion yen, three times higher than before the nuclear disaster began to unfurl.

Under normal circumstances, Japan's large-scale banks typically lend around 200 billion yen to their respective major corporate customers.

Subsequently, **the government and the commercial banks have concluded that it will be difficult for private financial institutions to extend additional new loans to TEPCO.**

While the banks may not provide more new loans from next year, the utility will be allowed to refinance its existing debt, according to the sources.

The financial institutions are also weighing whether to make the existing collateralized loans unsecured, if the utility is allowed to refinance them. TEPCO has received a total of more than 1 trillion yen of secured lending to date.

The utility's shaky finances are being shored up by taxpayer money, as the Abe administration has apparently decided TEPCO alone cannot shoulder the entire costs related to the nuclear disaster.

The government will cover part of the costs of decontamination work around the Fukushima plant and compensation for victims of the nuclear disaster. It plans to raise the ceiling of government loans to TEPCO from the current 5 trillion yen to 9 trillion to 10 trillion yen.

Those financial measures will be included in the utility's rehabilitation plan, scheduled to be compiled by year-end.

While it is estimated that TEPCO will have to pay up to 2.5 trillion yen to complete cleanup work near the stricken plant, the Finance Ministry has decided to include more than 350 billion yen in the fiscal 2014 draft budget to help the utility accelerate decontamination efforts.

If the proposal is approved, the government will spend nearly 2 trillion yen for cleanup work.

Currently, TEPCO plans to erect new thermal power plants as well as expand its gas-related business. Funds for such new businesses will be procured by establishing new joint ventures with other companies and borrowing money via the ventures.

The new sources of power are needed to make up for the shutdown of the utility's nuclear reactors following the accident. TEPCO has applied to the Nuclear Regulation Authority for safety screenings to allow the restarts of its No. 6 and No. 7 reactors at the Kashiwazaki-Kariwa nuclear power plant in Niigata Prefecture.

(This article was written by Hidefumi Nogami and Mari Fujisaki.)

Gov't to reduce TEPCO's financial burden

December 17, 2013

Plan in works to ease TEPCO's cleanup burden

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201312170046>

THE ASAHI SHIMBUN

The government plans to reduce the financial burden of Tokyo Electric Power Co. by allocating gains from future sales of TEPCO shares for cleaning up Fukushima nuclear disaster areas, sources said.

The move is bound to stoke controversy as leftover assets from government-sponsored corporate rehabilitation have traditionally gone into state coffers.

TEPCO, operator of the crippled Fukushima No.1 nuclear plant, is expected to spend up to 2.5 trillion yen (\$24.3 billion) for decontaminating communities affected by radioactive fallout.

According to sources, the plan will be discussed at a meeting of the government's nuclear emergency response headquarters as early as Dec. 20 as part of steps to speed up reconstruction and support TEPCO.

It will also be included in TEPCO's rehabilitation plan, expected to be completed by the end of the year.

The government-backed Nuclear Damage Liability Facilitation Fund owns TEPCO shares worth 1 trillion yen in book value. It plans to sell its stake in the late 2020s and 2030s after the utility turns around its finances.

The government expects 2 trillion yen in gains if the stock sells at 900 yen per share, compared with 524 yen on Dec. 16, which would cover a large part of TEPCO's decontamination costs.

A government source said the proposed arrangement will serve as "an incentive for efficient operation," saying that TEPCO will have to pay less for decontamination if its corporate value improves and share price rises.

But critics could argue that profits should be returned to taxpayers because the government knew that its investment would be lost if the utility went bankrupt.

The state-backed Industrial Revitalization Corp. transferred 43.2 billion yen in assets to state coffers when it was disbanded in 2007 after turning around Daiei Inc., Kanebo Ltd. and other companies.

About 1 trillion yen made on sales of government-held shares in Japan Tobacco Inc. this spring was used for reconstruction from the 2011 Great East Japan Earthquake and tsunami, which triggered triple meltdowns at the Fukushima No. 1 plant.

The government is providing loans to TEPCO through the Nuclear Damage Liability Facilitation Fund to help the utility in decontamination and paying compensation to nuclear disaster victims. It plans to raise the maximum amount of loans from 5 trillion yen to 9-10 trillion yen.

About 5-6 trillion yen would be used for compensation, and 1 trillion yen would be used for intermediate storage facilities for radioactive debris, in addition to 2.5 trillion yen for decontamination.

(This article was written by Mari Fujisaki and Takashi Ebuchi.)

Too easy to hide information on nuke safety (state secrets law)

State secrets law raises concern about safety of nuclear power plants

December 17, 2013

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201312170006>

THE ASAHI SHIMBUN

There is growing concern that the government may be tempted to keep sensitive information on the safety of nuclear power plants under wraps once the state secrets protection law goes into force.

Experts cite the government's secretiveness that hindered access to U.S. contingency plans on how to respond to a total power failure resulting from a terrorist strike against a nuclear power plant even before disaster struck the Fukushima No. 1 nuclear power plant nearly three years ago.

On several occasions up to 2008, the U.S. government shared details with Japan on its contingency plans for responding to a catastrophic situation involving a nuclear power plant. The information was passed to what was then the Nuclear and Industrial Safety Agency (NISA) in Japan.

But the section chief in charge of such steps at NISA acknowledged that he was kept out of the loop. The official said he was not privy to the information. The official was interviewed by The Asahi Shimbun in autumn 2011, months after the nuclear accident unfolded in March that year.

NISA limited access to the U.S. contingency plans known as B.5.b to only a handful of its senior officials. This was because the U.S. government provided the information on the understanding it would remain classified.

The Japan Federation of Bar Associations has expressed strong concern that the new law on state secrets may embolden the government's propensity to hold back crucial information on nuclear safety.

One reason for this is that the legislation leaves unclear what matters will be designated as state secrets and who will have authorization to determine what should be withheld from the public.

"A tendency to hold back on vital information left nuclear power plants vulnerable to earthquakes and tsunami, resulting in the nuclear disaster," said Yutaka Saito, a member of the federation's task force on problems related to information. "We cannot fully engage in discussion about safety if information is withheld."

B.5.b was developed after the 9/11 terrorist attacks against the United States as a response to a possible strike on a nuclear facility.

B.5.b stipulates that operators of U.S. nuclear power plants must prepare for a total power failure by equipping themselves with transportable batteries; by developing procedures for manually operating vent valves and reactor-core cooling systems; by organizing instruction manuals setting out the procedures; and by training operators to implement the measures.

The U.S. Nuclear Regulatory Commission (NRC), an independent body of the U.S. government, established the policy to deal with a total power failure triggered by the same circumstances that caused the Twin Towers at the World Trade Center to collapse after commercial airliners commandeered by terrorists deliberately crashed into the buildings.

Nuclear experts believe that the B.5.b procedures could have provided crucial guidance during the first few days of the Fukushima nuclear crisis.

But NISA did not share the information with the Japan Atomic Energy Commission, which oversaw anti-terrorist steps, nor operators of nuclear power plants, such as Tokyo Electric Power Co., which owns the crippled Fukushima No. 1 facility; nor did NISA oblige utilities to put contingency measures in place that reflected the points raised by B.5.b, leaving nuclear power plants without steps to cope with the loss of all power sources.

Due in part to the availability of batteries as backup power sources, NISA concluded that to prepare for a total power failure or a terrorist attack was not a top priority for Japanese nuclear power plants.

But when disaster struck the Fukushima No. 1 plant, staff there were unable to respond to the crisis swiftly and adequately.

Technicians spent too long confirming proper procedures and obtaining appropriate equipment before operating vent valves with automotive batteries or manually trying to decrease pressure inside the nuclear reactors.

The result was meltdowns at the No. 1 through No. 3 reactors and hydrogen explosions at the No. 1, No. 3 and No. 4 reactors within days of the crisis triggered by the Great East Japan Earthquake and tsunami on March 11, 2011, that left the Fukushima plant in total blackout.

The Diet panel looking into the nuclear accident, the Fukushima Nuclear Accident Independent Investigation Commission, said in a report in June the following year that the Fukushima disaster could have been averted if NISA, while handling the sensitive information, had notified utilities about steps described in B.5.b and obliged them to put the steps in place.

TEPCO mentioned B.5.b in its report the same month, saying, "It could have helped delaying the development of the accident."

It also said the content of B.5.b was not deemed to be information that private operators of nuclear power plants in Japan are not allowed to have access to.

With regard to B.5.b, TEPCO said in a summary of the accident in March this year that it likely would have noticed the existence of B.5.b if it had closely monitored efforts overseas to bolster safety precautions around nuclear facilities.

By June 2011, three months after the Fukushima disaster, the U.S. government released key points of B.5.b.

The official who oversees emergency measures at the Nuclear Regulation Authority, which succeeded NISA in 2012, now has access to relevant B.5.b literature.

Gregory Jaczko, a former NRC chairman, told The Asahi Shimbun in an interview in September that B.5.b was initially clandestine to prevent would-be terrorists from learning about the vulnerability of nuclear power plants. He served as NRC chairman at the time of the Fukushima crisis.

B.5.b was declassified after the Fukushima disaster because U.S. authorities decided that making it public would contribute to the improved safety of nuclear power plants.

The U.S. nuclear industry also wanted to reassure the public that it had measures in place to cope with a contingency such as those raised in B.5.b, he added.

(This article was written by Toshihiro Okuyama and Hiroo Sunaoshi.)

French journalists allowed in Fukushima Pref.

December 18, 2013

French journalists inspect Fukushima Pref.

http://www3.nhk.or.jp/nhkworld/english/news/20131218_22.html

French journalists have toured Fukushima Prefecture to see how residents are tackling radiation contamination from the accident at the Fukushima Daiichi nuclear power plant.

French radiation protection specialists arranged the tour for about 20 journalists. The specialists are concerned that French media reports on Fukushima may not have been accurate.

The journalists visited Yanagawa Town in Date City. They observed radiation checks of dried

persimmons, a local specialty. Firms recently resumed shipments of the persimmons for the first time in 3 years.

The reporters heard that contamination levels have all been within the safety standard.

They also visited a former peach orchard that now serves as a first point of storage for contaminated soil.

The journalists learned that authorities were able to secure the use of the site with the cooperation of locals.

Pierre LE HIR, a reporter for Le Monde newspaper, said it was impressive to see how hard people are working to ensure local farm produce is safe for consumption.

He said he hopes to correct sometimes biased views about Fukushima in France through his reporting.

Takamitsu Sawa - "A strong totalitarian tendency"

December 16, 2013

Abe shows totalitarian bent

by Takamitsu Sawa

The "old" Liberal Democratic Party that former Prime Minister Junichiro Koizumi is supposed to have destroyed is making a strong resurgence as is the traditional "triangle" of the LDP, the Ministry of Economy, Trade and Industry (METI) and the Japan Business Federation (Keidanren).

When Prime Minister Shinzo Abe goes abroad, he is often accompanied by as many as 100 business leaders as he busies himself with exporting nuclear reactors and other infrastructural items through "top-level sales campaigns."

Furthermore, defying the traditional practice of determining wage levels through labor-management negotiations, Abe has asked Keidanren Chairman Hiromasa Yonekura to raise the wages of workers and this request has been handed down to Keidanren member corporations.

His intervention in wage negotiations clearly indicates that Japan is **a nation of highly controlled state capitalism, transcending a free market economy.** Moreover, should a constitutional revision come to restrict freedom of speech, Japan would become a de facto totalitarian state.

At least at this point, the results of “Abenomics” — economic policies pursued by Abe’s government — have fallen far short of being dramatic. Preliminary figures of the National Accounts Statistics show that the growth rate of private consumption, which is an engine of economic growth, has been on a downward trend — decreasing from 0.8 percent in the January-March period of 2013 to 0.6 percent in April-June and to 0.1 percent in July-September.

Meanwhile, thanks to an unprecedented easy-money policy adopted by the Bank of Japan, the value of yen against other currencies is falling and stock prices are going up, although there have been temporary slowdowns in the process.

But even with a cheap yen, exports in terms of volume are on a declining trend contrary to expectations. This has coupled with increased import of fossil fuels necessitated by the total suspension of the operation of nuclear power plants, causing imports to exceed exports. Thus Japan has become a trade deficit country.

I had expected Abe to undertake political reform including constitutional revisions after confirming that his Abenomics has worked well. But my expectations have turned out to be off the mark.

Apparently having gained self-confidence after his LDP won a resounding victory in the Upper House election in July, he submitted to the Diet two major legislative bills — a bill to protect specially designated state secrets and a bill to create the National Security Council, patterned after a U.S. body bearing the same name.

Although Abe has succeeded in having the Diet enact these two bills, it should be remembered that history offers numerous examples of impetuous and intemperate excess leading to self-destruction.

Koizumi’s structural reform plans were aimed at turning the market into a free and competitive one and thus creating an environment in which the market will give full play to its potential. In contrast, Abenomics follows the line of state capitalism with a high degree of control. This means that it will deprive individuals and corporations of freedoms in the economic sphere.

On the social front, the Abe administration also has a strong totalitarian tendency because of its move toward depriving individuals of freedoms. Such a tendency is exemplified by the enactment of the state secrets law and its call for a constitutional revision designed to restrict freedom of speech and basic human rights if they run counter to “public interest and public order.”

I would like to add, as a reminder, that **conservatism emphasizes libertarianism in the economic sphere and order and traditions in the social and political sphere.**

Former Prime Ministers Yasuhiro Nakasone and Koizumi were pure-blooded conservatives as they advocated “small government” and regarded the market as omnipotent while visiting Yasukuni Shrine to pay their respects to the war dead.

In the United States, the Republican Party follows conservatism while the Democratic Party advocates liberalism. Liberalists insist that government intervention is indispensable because, if everything related to the economy is totally placed in the hands of the market, imbalances like unemployment and instability like the boom-bust cycle cannot be avoided. At the same time, liberalists seek to guarantee maximum freedoms in the social and political fronts.

The Abe administration is neither conservative nor liberal. In short, I cannot help calling it “totalitarian.” Yet, very seldom do I encounter opinions criticizing the Abe administration for endangering freedoms. Quite belatedly, on Nov. 28, a group of 31 scholars issued a statement expressing their opposition to the state secrets law.

Major newspapers are divided into two camps — one group supporting the law and the other opposing it. There once were heated debates in newspapers for and against Abenomics, but they seem to have subsided.

Since the Constitution has not yet been revised, freedom of speech is presumably still guaranteed. But journalistic bravery in expressing criticism appears to have been paralyzed either because mass media have been overwhelmed by the Abe administration’s high spirits or because they are under overt or covert pressure.

I cannot help thinking that the current Japan is drifting away from the modern Western European ideals based on liberalism, democracy and individualism.

In her recent book titled “NOT FOR PROFIT: Why Democracy Needs Humanities,” Martha C. Nussbaum, professor of philosophy at the University of Chicago, issued a warning against neglecting knowledge gained through humanities for the sake of pursuing short-term profits and economic growth.

With regard to both natural and social science, she wrote: “When practiced at their best, moreover, these other disciplines are infused by what we might call **the spirit of humanities**: by searching critical thought,

daring imagination, empathetic understanding of human experiences of many different kinds, and understanding of the complexity of the world we live in.”

She added: “Cultivated capacities for critical thinking and reflection are crucial in keeping democracies alive and wide awake.”

Under the Abe administration, there is a growing tendency to allocate larger budgets to university departments of natural science, engineering, medicine and pharmacology — sectors considered to contribute to economic growth. Thus the tendency to neglect humanities and social science is becoming stronger.

I would like to ask readers: **Which country would you prefer not to live in — a country without economic growth or a country without democracy.**

How to ensure NHK's independence?

December 21, 2013

Editorial: New NHK president must keep a close eye on authority

<http://mainichi.jp/english/english/perspectives/news/20131221p2a00m0na004000c.html>

Katsuto Momii, special advisor to Nihon Unisys Ltd., is set to succeed NHK President Masayuki Matsumoto, whose tenure expires Jan. 24. Momii is the third consecutive president to be recruited from outside the public broadcaster. However, it remains unclear how NHK's Board of Governors -- many of whom are close to Prime Minister Shinzo Abe -- arrived at their choice of Momii.

One might be tempted to question if there was any way for Matsumoto to serve another term. He should be credited for his managerial prowess over the past three years, including cutting NHK subscription fees, reducing the number of NHK employees and trimming their salaries, which were often criticized as being too high. All of these efforts were made in spite of the adversity accompanying the March 2011 Great East Japan Earthquake.

At the same time, NHK's news reports on issues including nuclear reactor restarts and Osprey deployment have been criticized as "biased" in political and business circles, though the broadcaster's coverage was by no means partial. In an opinion poll NHK conducted in July, nearly 80 percent of viewers said the broadcaster's programs in general were "fair and impartial." In spite of the results, Matsumoto decided to step down -- as if he had been cornered into doing so.

The NHK president is appointed with consent from nine out of the 12 members of the Board of Governors. **"Recently, the selection of NHK presidents appear to rely upon personal connections with people in political and business circles,"** commented Satoshi Daigo, professor emeritus at the University of Tokyo. Daigo is also a co-representative of a group called "NHK o Kanshi Gekirei Suru Shichosha Community" (Viewers' community for monitoring and encouraging NHK). Considering the run of appointments from business circles, Daigo's assessment makes sense.

But is this kind of approach desirable for picking out a president? Since those from business circles are often stakeholders in such social issues as restarting reactors, it is questionable whether they can maintain a neutral stance in reporting.

Momii is urged to stand firm in defense of fair and impartial public broadcasting, just as he pledged at a news conference on Dec. 20. To that effect, he should distance himself from politics and fulfill the role of keeping an eye on authority.

The enactment of the controversial special secrets protection law is a specific topic for consideration. Was NHK's coverage of the process leading to enactment of the law sufficient? We are not debating the pros and cons of the law, but rather stressing that viewers can make their own decisions only after the broadcaster has delved into problems arising from the law and sorted out the challenges. The public was frustrated that the law was hard to understand. Did NHK manage to respond to questions that viewers wanted to know about the legislation?

A challenge that remains for NHK is building a system of broadcasting programs on air and over the Internet simultaneously. If NHK is to collect viewing fees from all households across the country under such a system, the Broadcast Law needs to be revised, a task that would put the new president's caliber to the test.

Prime Minister Abe recently expressed his view that NHK should report on territorial issues more strategically. Such remarks should not intimidate workers at the public broadcaster. NHK is urged to maintain an environment in which employees can report the news and produce programs in a free atmosphere. Such a setting should **ensure the medium's independence**, guarantee the quality and appeal of its broadcasting, and lead to viewers' confidence.

Fukushima plan approved by Cabinet

December 21, 2013

Cabinet approves new approach to rebuilding Fukushima

<http://ajw.asahi.com/article/0311disaster/recovery/AJ201312210036>

THE ASAHI SHIMBUN

The Abe Cabinet approved guidelines that take a more realistic approach to rebuilding Fukushima Prefecture after the 2011 nuclear accident, including abandoning the goal of having all evacuees return to their homes.

But the plan, approved on Dec. 20, could raise criticism because taxpayers will bear the brunt of the burden.

Under the plan, the central government will provide additional compensation to evacuees to buy land and homes where they now reside. Compensation for psychological distress will also be paid to evacuees who are uncertain if they can ever return home.

The new approach will likely increase the number of evacuees who give up hope of returning home, leading to population decreases that could affect local governments. Central government officials plan to consult with local government officials about the future status of those municipalities.

At the same time, the central government is also considering providing an additional 900,000 yen (\$8,600) in compensation to each evacuee who decides early on to return home.

The guidelines will also revise the method used to determine how much radiation the returnees are exposed to. Until now, estimates of radiation exposure were calculated based on airborne levels. In the future, returnees will be given dosimeters to measure their individual radiation doses.

This change is expected to relax the standards for deciding on what areas need decontamination from radiation.

While the new guidelines will maintain the long-term goal of annual radiation levels of 1 millisievert or less as the cutoff point for decontamination, the individual radiation level readings are expected to come out lower than the airborne readings.

That would in effect weaken the standard at which decontamination is required and would lead to reduced clean-up expenses.

Reflecting the huge task involved in rebuilding Fukushima communities, the new guidelines do not provide a timetable of when evacuees can return to specific municipalities nor does it include a road map to create an environment to allow evacuees to return home.

Some mayors have already voiced criticism that the new guidelines do not provide a vision for the future of Fukushima, raising doubt that the guidelines will in fact accelerate the rebuilding process.

The central government will also provide additional loans to Tokyo Electric Power Co., the operator of the crippled Fukushima No. 1 nuclear power plant, because of the ballooning costs for dealing with the accident. The central government now estimates that at least 11 trillion yen will be needed.

Under the law, TEPCO is supposed to bear the entire burden, but the central government decided to pay for the construction of interim storage facilities for contaminated soil. The central government will also raise the upper limit for interest-free loans to TEPCO from 5 trillion yen to 9 trillion yen.

By providing additional funds to TEPCO, the central government is also bound to face criticism for essentially putting the financial burden on taxpayers.

However, Toshimitsu Motegi, the industry minister, explained the need for government involvement.

“Measures have been delayed because everything was forced on TEPCO,” he said at a Dec. 20 news conference. “We will accelerate rebuilding in Fukushima by clearly delineating the roles to be played by the central government and TEPCO.”

HEAVIER BURDEN ON TAXPAYERS

Of the 11 trillion yen needed to deal with the nuclear accident, about 2.5 trillion yen will go to decontamination, about 1.1 trillion yen will be used for construction and management of interim storage facilities and about 5.4 trillion yen will be required for compensation.

In addition, at least 2 trillion yen more would be needed for decommissioning the reactors at the Fukushima No. 1 plant and to deal with radiation-contaminated water there.

While TEPCO and the electric power industry will have to repay the loans from the government used for compensation and decontamination work, most of the money will likely come in the form of higher electricity rates.

The cost for constructing interim storage facilities will also be repaid over 30 years in the form of a tax that is already included in electricity rates. About 35 billion yen is expected to be paid from that tax in the next fiscal year. Any additional costs for decontamination will be directly covered by taxpayer money.

There are also plans to reduce the burden on taxpayers. One is to have the government-backed Nuclear Damage Liability Facilitation Fund sell off the TEPCO shares it possesses and use the gains to pay for decontamination work. If TEPCO share prices rise due to improved corporate performances, the burden on taxpayers would be reduced.

But some within the utility doubt that the share prices will increase over time.

Since it was pointed out from the very beginning that there would be limits to what TEPCO could shoulder, having the central government bear some of that burden can be considered a move in a more realistic direction.

Still, little debate was conducted during the Upper House election in the summer over the government providing assistance to TEPCO.

Normally, when companies undertake rehabilitation after racking up huge debts, shareholders and financial institutions that provided the loans would be asked to absorb some of the losses.

However, since the central government has provided 1 trillion yen in capital to TEPCO and because of concerns about the effect on paying compensation, bankruptcy proceedings were never an option with TEPCO.

That means taxpayers' wallets will take a hit while shareholders are left free of bearing any responsibility for the mess that TEPCO is now in.

Mrs. Judge sees improvement in TEPCO

December 20, 2013

Monitor sees improvement in Tepco culture

Safety taking priority over efficiency with internal reform

<http://www.japantimes.co.jp/news/2013/12/20/national/monitor-sees-improvement-in-tepco-culture/#.UrRB2ifij9k>

by Kazuaki Nagata
Staff Writer

Forcing Tokyo Electric Power Co. into bankruptcy so the battered utility can get a fresh start is a notion that has been floated by critics and lawmakers, but it's a bad idea, says Barbara Judge, deputy chairwoman of Tepco's nuclear reform monitoring committee.

Facing huge compensation payments for the public havoc wreaked by the Fukushima No. 1 meltdowns and exorbitant bills for the decontamination and decommissioning work, Tepco has been unable to function as a normal company. This, critics and lawmakers say, could negatively affect morale and performance.

They say that the government should place Tepco into bankruptcy, take charge of the compensation problem and spin off the decommissioning work so a new Tepco can focus on its core job: providing electricity.

"I don't believe you're doing anyone a favor by forcing a company into bankruptcy, any company into bankruptcy," said Judge, a former chairwoman of the U.K. Atomic Energy Authority, during an interview Tuesday at Tepco's headquarters.

The nuclear reform monitoring committee, formed in September 2012, is headed by Dale Klein, a former chairman of the U.S. Nuclear Regulatory Commission. Its purpose is to keep an eye on Tepco's efforts to reform its nuclear division.

"I don't think (employees) get more motivation by working for a company that's been through bankruptcy in general," Judge said.

Instead, the government should work more closely with Tepco and give it the tools it needs to become healthy again, she said.

“You get more motivation from people by turnarounds . . . and by going through tunnels and coming out the other end (rather) than just by jumping off the roof and starting to swim.”

She recommends dividing Tepco’s nuclear division in two. One section would handle power generation and the other would tackle the reactor decommissioning, which requires a completely different skill set.

Judge, who was hired by Tepco to spearhead its “self-regulation” and “social communications” efforts, said the division has been making progress in shifting from “a culture of efficiency” to “a culture of safety.”

One small step forward was made when the utility set up a nuclear safety oversight office directly under the board of directors to serve as the in-house regulator, she said.

The NSOO is divided into three groups, with one at Fukushima No. 1, one stationed at the massive Kashiwazaki-Kariwa nuclear plant in Niigata Prefecture, and the third at Tepco’s headquarters.

She said the NSOO played an important role last month overseeing the plan to begin removing fuel rods from the cooling pool of reactor 4 in Fukushima.

When the utility finished transferring the first special transport cask of fuel rod assemblies from reactor 4 to a safer building, the NSOO halted the removal process for a few days to conduct a safety review.

Under normal circumstances the workers would have forged ahead. But Judge said the NSOO was prudent in calling for an immediate safety review.

She recalled that when the company decided to establish the NSOO, many employees appeared to wonder if it was really necessary.

Even those who were transferred to the NSOO appeared bewildered about their role and were shy about giving their opinions at meetings.

But as time went by, they opened up and their commitment grew, and the successful start of the fuel removal has given them confidence and motivation, Judge said.

Another area that needed improvement when Judge came in was corporate communications.

“They weren’t really in touch with their consumers . . . when they did talk to them, it was in a very technical way,” she said.

“I also thought that this was a culture of efficiency and not a not culture of safety.”

Internal reform, through a new social communications office set up in April, has helped Tepco get better at dealing with the public, Judge said.

For instance, the utility is trying harder to explain what is going on at Fukushima No. 1 and with other related matters in a way laymen can understand.

Even though she said communications have improved, it is still doubtful whether the new office has been truly effective, considering how Tepco was unwilling to admit that toxic water was seeping into the Pacific until the day after the Upper House election in July, a blunder that Judge has harshly criticized.

“I’d like to say myself how disappointed and distressed I was when I arrived in Japan yesterday,” she said at a news conference July 26. “To find that the communication with respect to the water problem has been so difficult and so late was devastating.”

While Judge points out some of the areas where Tepco has made progress, the public is still concerned by the problems that continue to plague Fukushima No. 1.

Judge said Tepco will just have to keep demonstrating that it has changed if it is ever going to win back the public’s trust.

For example, the utility will have to “not just pass, but excel” in an upcoming safety evaluation to restart the reactors at the Kashiwazaki-Kariwa plant, she said.

Improved, TEPCO? TEPCO involved in bid-rigging

December 21, 2013

TEPCO group firm, 35 others fined over power line bid-rigging

<http://mainichi.jp/english/english/newsselect/news/20131221p2g00m0dm034000c.html>

TOKYO (Kyodo) -- Japan's antimonopoly watchdog said Friday it has imposed fines of around 740 million yen on 36 firms, including a group firm of Tokyo Electric Power Co., for **fixing bids related to power line construction work**.

TEPCO group firm Transmission Line Construction Co. took a leading role in bid-rigging for projects to build overhead power lines while Tokyo-based Kandenko Co., a TEPCO subcontractor, took such a role in projects to build underground power lines, the Japan Fair Trade Commission said.

TLC was fined around 110 million yen, Kandenko about 100 million yen and Sumitomo Electric Industries Ltd., based in Osaka City, roughly 30 million yen.

The commission said some officials of TEPCO had encouraged or facilitated the bid-rigging.

The 36 firms based in 13 prefectures rigged bidding for the overhead and underground power line construction work as far back as late January 2012 by deciding beforehand on successful bidders.

"The jackboots come closer and closer"

Japan's designated secrets bill - the sound of the jackboots

Saul Takahashi 10 December 2013

<http://www.opendemocracy.net/opensecurity/saul-takahashi/japans-designated-secrets-bill-sound-of-jackboots>

Japan's new secrecy law is yet another disturbing symptom of the country's rising militarism, broadening the government's power to classify state secrets amidst increased belligerence in the region.

As if it ever needed repeating, the people of Japan were once again treated to a reminder of how secretive and arbitrary their government can be during the nuclear disaster in Fukushima 2011. Government foot-dragging and reluctance to divulge information meant that people remained exposed to high doses of radiation for over a month after the meltdown with potentially grave health consequences. Now, what is easily the most right wing government Japan has seen in decades has forced through parliament a bill to classify “special secrets” that would essentially give the executive carte blanche to withhold information on a massive scale, not seen since the period of militarism directly leading up to, and during, World War 2.

The law, known as the Designated Secrets Bill, was hurriedly rammed through the more powerful lower house on 26 November, and then passed through the upper house in equally speedy fashion on 6 December. It gives unrestricted power to the executive to designate a broad range of information as national secrets. There are no effective checks or balances, no truly meaningful opportunity for the involvement of any independent body, and no effective way to ensure that the executive is not abusing its power. Only the barest of outlines of information regarding what sort of information has even been designated as secret will be disclosed to the public. The bill would violate the right of people’s right to access information, severely punish whistleblowers, and have a chilling effect on journalism, civil society organizations, and the actions of concerned citizens.

The government has repeated the mantra that the bill is necessary because Japan is a “heaven for spies” due to a lack of espionage and state secrets legal infrastructure. They would have the people believe that the government lacks the power to keep information confidential, and that Tokyo is full of foreign agents who freely collect sensitive secrets. Nothing could be further from the truth – the government already designates a wide range of information as confidential – 410,000 pieces of information have been designated so since a sweeping government policy was implemented on this in 2009.

In addition, in response to a question in parliament, Prime Minister Abe admitted that the government was aware of five cases of “leaks of important information by civil servants” over the past fifteen years. Five cases over fifteen years can hardly be described as a “heaven”. The truth, as even the government admits, is that this bill is intrinsically connected with another bill adopted by parliament in November, establishing a National Security Council much along the lines of the US body by the same name. Indeed, the Secrets bill specifically provides for the sharing of designated secrets with foreign governments, who are apparently more trustworthy than Japan’s own people.

Constitutional infringement

There are four categories of information listed in the bill that could potentially qualify for designation as a secret - defense, diplomacy, “designated dangerous activities”, and prevention of terrorism - but they are worded in an extremely broad manner. Seemingly any kind of information related to defense could qualify, as well as any “important security related information” in the area of foreign relations, any information related to official efforts in the area of counter terrorism, and any information related to “activities potentially harmful to national security”. The possible designations of particular information as

'secret' are essentially infinite; though there is a principled maximum period of sixty years (already extremely long) stipulated in the amended bill, there are also categories of information – almost equally sweeping - which it is possible to designate secret with no time limit. The role envisioned for parliament is extremely limited, to the extent that it would most probably be meaningless.

The bill does state that, in applying the law, the government should “fully take into account” journalistic reporting “aimed at ensuring the peoples’ right to access information”. These provisions are “vague” to say the least, and appear to grant the government leeway to decide which reporting is “aimed at ensuring” this right. But punishments for the revealing of secrets are severe – up to ten years imprisonment for civil servants or persons subcontractors dealing with secrets. Persons who obtain secrets through illegal means are also subject to up to ten years imprisonment, and persons who “incite” the revealing of secrets are subject to up to five years imprisonment. Persons who reveal secrets through negligence can also be subject to imprisonment, as are persons who “incite” or conspire to divulge secrets.

It is worth pointing out that the right to access information is not only a vital element of the right to freedom of expression, but also a fundamental human right guaranteed by the Japanese constitution. Article 21 states that “freedom of...speech, press, and all other forms of expression are guaranteed” and, in accordance with developments in international law, this article has been interpreted by the Japanese courts to include the right to access information. The same article also states that the government must “refrain from violating fundamental human rights in an unreasonable manner” in applying the law, begging the question as to what “unreasonable” means in this new environment.

Even worse, article 21 goes on to say that reporting by the media will not be punished “insofar as those activities are aimed solely at ensuring the public interest and are not based on illegal or clearly unreasonable methods”. There is no definition of what the “public interest” means in this context, and just how the government will ascertain this. The government has even stated that some bloggers and other social media activists may not fall under the definition of “media” in this article, indicating that even the above pathetic safeguards would not apply.

As one could imagine, public outcry regarding the bill has been intense with near-daily demonstrations and criticism from human rights organizations, including the Japanese Bar Association, former prominent conservative MPs, academic societies, journalist societies, and prefectural and local councils. Unusually for a country that is used to being under the radar of international scrutiny, the bill was also the target of harsh criticism from human rights actors in the United Nations. The UN Human Rights Council Special Rapporteur on Freedom of Expression together with the Special Rapporteur on the Right to Health issued a statement criticizing the sweeping provisions of the bill, and the lack of protection for whistle blowers. The UN High Commissioner for Human Rights also expressed similar concerns.

Government responses to these concerns have been a shining example of evasion, vagueness, and a condescending ‘shut up and trust us’ mentality – indeed, the fact that the government opened the bill to public comment for only two weeks, as opposed to the normal practice of a full month, shows the contempt in which it holds views it does not agree with. One NGO filed a request for the minutes of the

meetings of a government panel that had discussed the provisions of the bill – minutes that date back to 2008. In an insult to the notion of government accountability, the documents the NGO was provided with were almost completely redacted, i.e. blacked out.

A new chilling effect

In one telling response to the obvious question of what would entail a “clearly unreasonable method” of reporting, Minister Masako Mori, the female Cabinet member charged by Prime Minister Abe to steer the bill through parliament seemingly for no reason other than placing a woman in front of the cameras would give the bill a ‘soft’ image, gave the example of the infamous Nishiyama case of 1972. Takichi Nishiyama, a former journalist for Mainichi Shimbun, a major Japanese broadsheet, was arrested for obtaining information from a Japanese Foreign Ministry secretary (with whom, it later came to light, he had been having an affair) regarding a secret agreement between Japan and the US surrounding the return of Okinawa to Japanese sovereignty. Though the agreement that had been made public by the two governments had stated that certain expenses totaling USD 4 million would be paid by the US, this was an outright lie, and the secret agreement specified that the costs would be footed by the Japanese.

For his efforts in exposing government deception of the people, Nishiyama was convicted in 1978 of inciting a civil servant to reveal confidential information. 30 years later, declassified US government documents confirmed Nishiyama’s allegations – and yet his name is used by the government as a good example of ‘bad’ journalism. Tellingly, Mori has declared that subjects of intense public debate, such as the Trans-Pacific Partnership (TPP) economic agreement currently being negotiated behind closed doors with the United States and other countries, could be designated as secrets. And government reassurances have been unable to quell fears that with such broad provisions in the bill, important information regarding nuclear safety could be designated as secret as well.

Perhaps most important in all of this is the chilling effect that the law would have on people accessing or publishing any sort of information. With the opaque phrasing of the law persons will have no idea as to whether information they are accessing or publishing is in fact a designated secret. The Japanese Bar Association notes that, under the provisions of the bill, it is entirely plausible that people could be accused and tried without them or their lawyer being told exactly what information they are accused of having revealed. Unsurprisingly, government assurances that persons who accidentally come across or reveal secrets would not be punished are not convincing – and logic indicates that, even if they ended up not being punished, such persons would be subject to investigation.

In the early hours of 5 December, the government announced in response to mounting pressure that it would create two 'independent' bodies to oversee implementation of the law and ensure that there was no abuse. However, of these two bodies, only one is truly independent – a panel of legal experts which will advise the PM in creating guidelines regarding the designation of secrets, and which will receive an annual report on implementation of the law. However, it appears that the PM will only provide this panel with a simple outline stating the number of pieces of information that had been designated secret by category. Beyond that, there is no clarity as to how this panel would operate, and how much power it would actually

have. It would be child's play for the government to appoint a panel of government cronies to rubber stamp a one page note.

Calling the other body to be created "independent" is an insult to one's intelligence. The "oversight committee for information retention" will monitor application of the law and ensure that there is no abuse, and is clearly the more powerful body of the two. However, it will be made up of undersecretaries (the highest ranking civil servants) from the Foreign and Defence Ministries – the two ministries that will undoubtedly be designating the largest number of secrets. Unsurprisingly, no one in Japan expects any kind of serious oversight from this body.

Many opposed to the bill have pointed out strikingly similar language in legislation from darker times, in particular the infamous National Defence and Public Security Act of 1941, which was used by the government to jail opponents of the war effort. The Japanese experience from those days is that government secrets lead to more government secrets, and then to war. To use a phrase the generation that remembers the 1930s often uses to describe the creeping nature of militarism - the jackboots come closer and closer.

And now the "crime of conspiracy"

December 22, 2013

Abe's second strike against freedoms

<http://www.japantimes.co.jp/opinion/2013/12/22/editorials/abes-second-strike-against-freedoms/#.Urfnfvi9l>

The Abe administration has reportedly started preparations for introducing the "crime of conspiracy" by revising the law on the punishment of organized crime and the control of proceeds resulting from crime.

Although it has not been decided when a revision bill will be submitted to the Diet, there is the danger that it will give the government a strong weapon to control civic movements, especially those that oppose government policies.

The recently enacted state secrets law will not only greatly limit people's access to government information but also punish those who try to get secret information even if they didn't know it was designated as secret. The introduction of the crime of conspiracy will further weaken freedoms that have already been hollowed out by the secrecy law. So it is important for citizens to start a widely based action to stop this move by the administration.

If the crime of conspiracy is introduced, one could be punished for joining others to plan a crime even if it is not actually carried out or even if no concrete preparations have been made — a huge departure from the current principle that arrests can be made only when a crime has actually been committed or attempted.

In the past, the Liberal Democratic Party-New Komeito administration, including the first Abe administration in 2006, submitted three similar bills on criminal conspiracy to the Diet. All of them were killed because of the efforts of the opposition parties and the Japan Federation of Bar Associations. They feared that the bills' loose definition of conspiracy could lead to abuse.

Judging from these earlier bills, the crime of conspiracy will likely cover more than 600 types of crimes punishable by at least four years of imprisonment at present, including murder and burglary.

Citizens need to remember that LDP Secretary-General Shigeru Ishiba only recently equated demonstrations against the state secrets bill with acts of terrorism and that the law already has a provision to sentence people who “conspire,” “incite” or “instigate” the leaking of designated secrets to up to five years in prison — even if the secrets have not been leaked.

It is inevitable that conspiracy investigations will widely employ informers as well as wiretapping, including the monitoring of email communications. Thus the crime of conspiracy could be used to suppress civic movements, serving as a tool to violate freedoms of speech, thought and expression as guaranteed by the Constitution.

The government will argue that the enactment of a bill to introduce the crime of conspiracy is needed for Japan to ratify the 2000 United Nations Convention Against Transnational Organized Crime, which Japan signed in December that year.

But the bill submitted in 2006 by the first Abe administration covered as many as 615 different types of crimes, including violations of the Road Traffic Law, the Corporate Tax Law, the Employment Security Law and the Public Offices Election Law. It is clear that to include such a wide range of crimes is incongruous with the aims of the U.N. convention, which targets crimes that are transnational in nature and involve criminal organizations.

The crime of conspiracy bill is the Abe administration's second attack on citizens' freedoms, following the state secrets law. Citizens must actively oppose the administration's moves.

Impropriety?

December 22, 2013

Firms linked to municipal assembly members received nuclear facility contracts

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201312220026

By SATOSHI OTANI/ Staff Writer

ROKKASHO, Aomori Prefecture--With the public alarm over the safety of nuclear facilities following the 2011 Fukushima nuclear accident, municipal assembly members would be expected to monitor closely any local nuclear-related project and avoid any appearance of impropriety.

However, The Asahi Shimbun has learned that did not occur in Rokkasho, Aomori Prefecture, which is home to a number of facilities connected to the nation's nuclear fuel recycling program.

Five construction companies in the village won construction orders totaling at least 520 million yen (\$5 million) in fiscal 2011 and 2012 after the accident at the Fukushima No. 1 nuclear power plant. All five companies were headed by individuals related to incumbent Rokkasho municipal assembly members.

The nuclear fuel recycling facilities are operated by Japan Nuclear Fuel Ltd., which handed out the construction contracts.

The five companies in question are now headed by either the wife, son or younger brother of a Rokkasho municipal assembly member. However, all five assembly members once served as president of the companies and three were the founders.

The assembly members connected to the construction companies in question denied that any conflict existed.

"Even if orders were won, that does not mean I have no say with Japan Nuclear Fuel," one assembly member said.

Another was resigned to criticism that might arise because of the contracts from Japan Nuclear Fuel.

An official with Japan Nuclear Fuel declined to provide specific information about the contracts, and only said the agreements were commissioned based on the quality, price and construction volume that the companies could provide.

According to construction work records submitted to the Aomori prefectural government by the five companies, in fiscal 2011 and 2012, the firms won between two to nine contracts from Japan Nuclear Fuel. The amounts of the contracts totaled between 30 million yen and 220 million yen.

According to sources at the five companies as well as other construction companies in Rokkasho, whenever Japan Nuclear Fuel gives out orders to local companies rather than major construction firms, it is always limited to two joint ventures undertaken by the five companies.

The five companies also receive other contracts serving as subcontractors for nuclear fuel recycling facility construction work commissioned by Japan Nuclear Fuel.

According to the assembly members as well as a private-sector economic research company, between 30 to 50 percent of the total sales of the five companies come from projects related to the nuclear fuel recycling facilities.

The five companies had been winning construction orders from Japan Nuclear Fuel from before the Fukushima nuclear accident.

The facilities at Rokkasho form a core part of a planned program to process spent nuclear fuel from Japanese reactors in order to reuse it as nuclear fuel.

After the Fukushima nuclear accident, the central government then under the control of the Democratic Party of Japan reviewed the nation's nuclear energy policy. In September 2012, the 18 members of the Rokkasho municipal assembly approved a document calling for the continuation of the nuclear fuel recycling program.

It had been learned that Japan Nuclear Fuel officials lobbied the municipal assembly members to pass such a document.

Pro-nuclear pressure from all sides

December 23, 2013

Nuclear power backers picking up steam on reactor restarts

<http://ajw.asahi.com/article/0311disaster/analysis/AJ201312230062>

THE ASAHI SHIMBUN

Japan's 2011 nuclear disaster triggered feverish calls among citizens and even politicians to abandon the nation's reliance on nuclear power.

But almost three years later, pro-nuclear officials, business leaders and utilities wielding awesome economic and political clout are regaining strength and maneuvering to tighten the noose around local government leaders who have been demanding that Japan do away with nuclear power.

LDP, DPJ SUPPORT 'NOT ANTI-NUKE' CANDIDATE

One example is the way the recent mayoral race in Tokai, Ibaraki Prefecture, played out. Tokai is home to the Tokai nuclear power plant, the nation's first nuclear plant, and the Tokai No. 2 plant, along with related facilities.

Osamu Yamada won the September election with support from the ruling Liberal Democratic Party and the main opposition Democratic Party of Japan.

The LDP has championed nuclear power for decades and is eager to get the nation's reactors back online, arguing that this clean source of energy is indispensable to propping up the economy.

The DPJ, on the other hand, has been promoting a nuclear phaseout by the end of 2039. However, many DPJ members in local chapters are not on board, as became clear in the Tokai mayoral race.

Yamada won a landslide against his opponent, who was supported by the Japanese Communist Party and ran on the platform of pulling the plug on nuclear power.

Yamada's victory was a bitter irony to his predecessor, Tatsuya Murakami. Murakami played a prominent role in efforts by local leaders around the nation to advance the idea of a nuclear phaseout through a network called "Mayors for a Nuclear Power Free Japan," which was first organized in 2012.

Two months before the mayoral election, Murakami, who had served four terms since 1997, announced that he would not seek re-election.

Murakami named Yamada his successor, giving Yamada high marks for his ability to administer affairs.

Murakami became deeply skeptical of nuclear power after an accident at a fuel processing facility in Tokai village operated by JCO Co. in 1999, which resulted in the deaths of two people.

Fast-forward to the accident at the Fukushima No. 1 nuclear power plant in March 2011. The disaster convinced Murakami that the Tokai No. 2 nuclear plant should be decommissioned, and he was very outspoken on the subject.

Murakami warned that the Tokai No. 2 plant would have met the same fate as the crippled Fukushima No. 1 plant--complete loss of power after the Great East Japan Earthquake and tsunami--if it had been engulfed by a tsunami just a little higher than that for which it was prepared.

The tsunami that struck the Tokai No. 2 plant in March 2011 was estimated at 5.4 meters. The plant's breakwater structure is 6.1 meters high.

As Japan's oldest nuclear power plant, the Tokai plant first went online in 1966. It ended its service in 1998. It is currently in the process of decommissioning. Japan Atomic Power Co. owns both Tokai plants.

Murakami's growing call for mothballing the Tokai No. 2 plant alarmed Kenjiro Shimoji, a member of the Ibaraki prefectural assembly and whose constituency includes Tokai, along with six pro-nuclear members of the village assembly.

They criticized Murakami, saying he had not listened to the viewpoints of others and ignored the fact that those who work in nuclear facilities in the village have contributed to the community's well-being.

They also blasted Murakami for championing a nuclear phaseout after the village saw a steep decline in sales at convenience stores and hotels due to the suspension of operations at the Tokai No. 2 nuclear power plant after the Fukushima crisis.

Shimoji has strong ties with the nuclear industry.

Before he won his first seat in the prefectural assembly in 2010, Shimoji had served as an aide to Hiroshi Kajiyama, an LDP lawmaker in the Lower House who hails from a local electoral district including Tokai. Kajiyama previously worked for the predecessor of the government-affiliated Japan Atomic Energy Agency, which operates research facilities in Tokai. Pro-nuclear members of the village assembly are backed by companies in the nuclear industry.

Although one of those described Murakami as "leaning too far for a break with nuclear power," many villagers sided with Murakami on his cautious approach to nuclear power in the races prior to the September vote.

The pro-nuclear bloc considered the recent Tokai mayoral election as one they could not afford to lose. They moved fast to select a candidate who was not averse to the continuation of nuclear power generation.

Several months before the election, Shimoji and the six village assembly members invited Yamada to a dinner to determine his stance on nuclear power.

"I am not anti-nuclear power," Yamada told the politicians.

Kajiyama and Shimoji plotted to gain support for Yamada from villagers in Tokai who commute to the neighboring city of Hitachi to work for engineering and electronics giant Hitachi Ltd.

Both politicians agreed that Akihiro Ohata, DPJ secretary-general and a member of the Lower House, would be the right person to do the job of rallying the support of Hitachi employees. Before becoming a politician, Ohata served as an official with Hitachi's labor union.

"Kajiyama contacted Ohata last year and they decided they should pick a candidate who could cooperate with them on the matter and thereby maintain the status quo at the village," Shimoji said.

In the spring, Shimoji began talking Yamada about entering the race for mayor.

Murakami was not invited to the pre-election rally held on Aug. 30 by the joint team of LDP and DPJ supporters who sit on Yamada's election staff.

In an interview with The Asahi Shimbun, Yamada said he decided to run to prevent a division in the village.

"The issue of nuclear power is important, but we also have other issues to look at in terms of the development of the village," he said.

Unlike Murakami, Yamada has no intention to join the Mayors for a Nuclear Power Free Japan network. He said nobody should be able to stop reactor restarts as long as all safety issues are confirmed by the Nuclear Regulation Authority and local governments hosting the facilities give the green light to restarts. However, Yamada said that does not mean he will approve the resumption of the Tokai No. 2 plant.

"I have listened to what my predecessor thinks on this issue, and I need to take into account how people in municipalities surrounding Tokai stand on this," Yamada said. "I don't want others to quickly assume that the wind has now shifted (with my taking office)."

UTILITY AROUSES UPROAR OVER HOSPITAL IN SAGA PREFECTURE

Power utilities, which have stable revenue from electricity rates under a regional monopoly system, are also dominating players in regional economies. Regional business federations have often been headed by top executives of power utilities.

Kyushu Electric Power Co. is no exception.

Shingo Matsuo, its honorary adviser, served as chairman of the Fukuoka-based utility when he was named chairman of the Kyushu Economic Federation.

“We are posting daily deficits of 1 billion yen (\$9.6 million) (from our idled nuclear reactors),” Matsuo said during an opening ceremony for a cancer treatment facility in Saga Prefecture in May. “It would be no big matter if only we could restart (our reactors) four days earlier.”

Matsuo was referring to the 4 billion yen in promised, but unfulfilled, donations by Kyushu Electric to help build the Saga Heavy Ion Medical Accelerator in Tosu, which is subsidized by the governments of Saga and Fukuoka prefectures. He was sending a clear message that Kyushu Electric would make good on its promise only if it was allowed to restart its offline nuclear reactors.

Kyushu Electric donated 300 million yen of the promised 4 billion yen at the end of fiscal 2011, but put the rest on hold because of a downturn in its bottom line. That stemmed from the fact that all its nuclear reactors were shut down after the Fukushima nuclear disaster began to unfold.

Matsuo’s remarks were perceived as a sign of arrogance on the part of the electric power industry and sparked an uproar. He was later forced to apologize after a protest by the Saga prefectural assembly.

SHIGA GOVERNOR FEELS DWARFED BY POLITICAL PUNCH OF POWER INDUSTRY

Elsewhere, on the political scene, Shiga Prefecture Governor Yukiko Kada said she realized the enormous clout of the electric power industry when two reactors were reactivated at the Oi nuclear power plant in neighboring Fukui Prefecture in summer 2012.

Kada said her resistance to the restarts was tamped down by pressure that came from all sides.

Local industry had been cooperative in Shiga Prefecture’s power-saving initiative in 2011, but made an about-face the next year and pressed the governor by asking if the prefectural government could “provide its own supply of electric power.” She was hard-pressed to ignore the opinions of manufacturing plants, which abound in Shiga Prefecture.

“They had probably been given various explanations (by Kansai Electric Power Co., operator of the Oi nuclear plant),” Kada said. “I realized a governor’s authority did not account for much in the face of a power utility.”

Kada is currently worried about the chances of re-election for a fellow governor, Hirohiko Izumida of Niigata Prefecture, who remains cautious about approving the restart of a nuclear plant in his own prefecture.

“The power industry is so influential that nobody can antagonize it and still be elected,” Kada said.

NIIGATA GOVERNOR UNDER MOUNTING PRESSURE

Izumida is little different from many of his fellow governors in that he counts local business circles among his core power bases. His election committee is headed by Eiichi Tsurui, president of Hokuriku Gas Co. and former head of the Niigata Chamber of Commerce and Industry.

Communities in Niigata Prefecture that used to rely on the Kashiwazaki-Kariwa nuclear power plant for their livelihoods are stepping up moves to seek restarts of reactors there.

In July this year, Toshihiko Maruyama, a member and former chairman of the Kashiwazaki city assembly, saw representatives of other parts of Japan hosting nuclear plants push openly for reactor restarts in their own communities. Maruyama was attending a council meeting in the capacity of an adviser to a union of assembly heads from municipalities hosting nuclear plants.

"Why don't we push for restarts at Kashiwazaki-Kariwa?" Maruyama told Kazumi Sato, chairman of the Kariwa village assembly, during the meeting.

That overture resulted in the Nov. 20 creation of the Kashiwazaki-Kariwa study group on a future energy community, which organized about 100 members of local commerce and industry. The group is pushing for a restart of the nuclear plant, where all seven reactors have remained idle since March 2012.

"Several thousand jobs have been lost because of the idle reactors," Maruyama said. "So many livelihoods have been wiped away from our community. The local economy is only withering."

Maruyama denied that Tokyo Electric Power Co., operator of the Kashiwazaki-Kariwa plant, is behind the creation of the study group. But the group does present an antithesis to Izumida, who has not backed down in his face-off with TEPCO as the utility has sought to have the No. 6, No. 7 and other reactors reactivated at the Kashiwazaki-Kariwa plant.

"We are not exactly applying pressure," Maruyama said. "This is our way of expressing our views to our governor."

A separate consortium of companies in the nuclear power sector in Niigata Prefecture also held a lecture session in Kashiwazaki in September to promote the use of nuclear energy to revitalize the regional economy.

Meanwhile, Governor Izumida is standing firm.

"I am planning to use an extra budget to provide aid to offset ramifications of the long-lasting hiatus of the nuclear plant," Izumida said in a message to The Asahi Shimbun, which requested an interview. "I will do my utmost to block corporate bankruptcies and job losses."

"Nuclear safety myth raising its ugly head again"

December 24, 2013

EDITORIAL: Nuclear safety myth is raising its ugly head again

<http://ajw.asahi.com/article/views/editorial/AJ201312240044>

Electric power companies have filed formal applications with the Nuclear Regulation Authority for permission to restart 14 idled nuclear reactors on grounds the facilities meet new regulatory standards. The Abe administration is keen to allow utilities to bring their reactors back online.

But the grim reality is that efforts by local governments to develop emergency evacuation plans have not made satisfactory progress.

Before any of the offline reactors are restarted, a workable plan must be in place in preparation for a possible serious nuclear accident.

No matter what precautions are built into a safety system, a totally unexpected situation can occur at any time. That's a bitter lesson to be gleaned from the 2011 disaster that crippled the Fukushima No. 1 nuclear plant.

LOCAL GOVERNMENTS IN A BIND

The local governments that have been entrusted to work out evacuation plans are tearing their hair out in the face of the many tough challenges they are confronting.

Stunned by the scale of damage caused by the Fukushima accident, the central government decided that local governments within a 30-kilometer radius of nuclear power plants must have disaster response plans in place. Previously, this was limited to local entities within eight to 10 kilometers of nuclear power plants.

As a result, the number of cities, towns and villages that are subject to the requirement has risen sharply to 135 from 45. They have been under extreme pressure to craft evacuation plans on an unprecedented scale.

Nuclear disasters are quite unlike any natural catastrophe. Since radiation is invisible, residents in affected areas have no way of knowing what danger they are facing. The fallout from a severe nuclear accident affects a huge area.

In response to pleas for assistance from local governments, the government's Nuclear Emergency Preparedness Council, which comprises all Cabinet ministers, ordered ministries and agencies this

autumn to help local governments develop the evacuation plans. But there are many complicated and formidable challenges to be overcome.

In dealing with radiation, it is vital to ensure that accurate information is obtained and disseminated swiftly. During the Fukushima nuclear crisis, however, the government, for fear of causing a panic among the public, used many terms and phrases that didn't reflect the reality. As a result, the risk of radiation exposure was not communicated effectively to local residents, causing many people to be exposed unnecessarily. Just ensuring that correct information will be provided in a timely manner to the public in a way that doesn't cause a panic is itself a tricky task.

It is also difficult to secure evacuation routes. In the rural, depopulated areas where nuclear power plants are located, there aren't many roads local residents can use to flee. The limited routes mean they will be clogged with traffic if tens of thousands of cars use them.

In situations where multiple disasters are taking place simultaneously, such as a massive earthquake and tsunami triggering a severe nuclear accident, local roads are likely to become impassable. In such cases, many people will be unable to use their cars, which are vital for quick evacuation.

It then becomes a tall order to figure out where and how people who can't move or be moved easily, like hospitalized patients, should be evacuated. In the Fukushima disaster, there were many tragedies in which the condition of patients deteriorated sharply during the evacuation process, sometimes resulting in their deaths.

In addition, each nuclear power plant has its own unique geographical conditions.

SAFETY IGNORED

The Ikata nuclear power plant in Ehime Prefecture, one of the facilities preparing to restart idled reactors, is located near the root of the Sadamisaki Peninsula, which is long and narrow.

If a major accident occurs at the plant, some 5,000 people living in areas farther along the peninsula will be left isolated. The local government is considering a scenario in which they are evacuated by ship. But that might not be a workable idea given the danger of tsunamis.

The Tokai No. 2 power plant in Ibaraki Prefecture, the nuclear power plant closest to the Tokyo area, is located in an area with a sizable daytime population. The daytime population within 30 kilometers of the

plant is around 980,000. According to an estimate by the prefectural government, it would take 15 hours to evacuate 90 percent of the people within 5 kilometers of the plant. It would take twice as long if the Joban Expressway, a highway running through the region, becomes impassable.

Fukui Prefecture hosts 14 nuclear reactors, the largest number among prefectures. A major accident at any one of them could lead to a massive release of radioactive materials into the atmosphere. That would render other reactors around inaccessible. The situation could trigger a chain reaction of nuclear accidents.

The plight of these local governments underscores one fundamental problem with the locations of nuclear power plants in Japan: Many of them have been built at sites where there should be no nuclear reactor.

The guidelines for assessing and approving the proposed locations of nuclear power plants were established in 1964. They require that a radius of certain distance from a nuclear plant have no form of human habitation.

While testifying as an unsworn witness at a session of the Diet's Fukushima accident investigation commission, however, Haruki Madarame, then chairman of the Nuclear Safety Commission, expressed the view that the guidelines had been created to allow the construction of nuclear power plants.

In fact, the decisions on how large the radius of the uninhabitable zones should be for specific nuclear plants have been based on excessively optimistic assumptions concerning accidents. As a result, many plants were built in areas where a swift evacuation of local residents is effectively impossible.

Banking on the nuclear safety myth, the government has promoted a policy of locating nuclear plants mainly in depopulated areas suffering from a decline of the local industries.

LESSONS ALREADY FORGOTTEN?

In the United States, no nuclear reactor can be operated without a workable evacuation plan. **In Japan, however, even the newly created regulatory standards don't require an evacuation plan as a prerequisite for operating a reactor. The development of the plans has been entrusted to the local governments while there is no central government agency responsible for assessing the feasibility of the developed plans.**

Now that the safety myth has been shattered, the government should quickly decide to decommission all reactors for which there is no practical evacuation plan.

Some of the local governments have no choice but to support the restarts of nuclear reactors because of the importance of the nuclear facilities for the local economy.

Some local government chiefs may approve the plant operators' plans to bring offline reactors back on stream even if there is only a questionable, insufficient plan to deal with a crisis.

Will vital decisions concerning the safety of local residents be left to discretionary judgment of the local government chiefs? Will this nation move toward restarting nuclear reactors while there are huge differences in the preparedness for nuclear emergencies among the local communities? That would be **like performing on the flying trapeze without a safety net.**

Proponents of nuclear power generation argue that electricity charges will go up unless atomic energy is used to produce electricity. They also claim that keeping reactors offline would have a negative impact on the domestic economy. Even these people, however, wouldn't say reactors should be restarted quickly even if there is no reliable system to protect the safety of local residents.

Five reactor meltdowns have occurred around the world in the past in 30 or so years. The government must not try to revive the safety myth by putting too much faith in the ability of humans to prevent nuclear disasters.

--The Asahi Shimbun, Dec. 24

Difficult to export nukes without TEPCO

December 25, 2013

Without TEPCO, nuclear plant builders left with export risks

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201312250069>

By YASUAKI OSHIKA/ Staff Writer

Nuclear reactor manufacturers in Japan are finding it tough to do business abroad, partly because their main potential partner is so caught up in bringing the crippled Fukushima plant under control.

It is often difficult for the companies to win overseas contracts unless they take part in nuclear power generation, in which they have little expertise.

Prior to the nuclear crisis that unfolded in March 2011, the government hoped that Mitsubishi Heavy Industries Ltd., Toshiba Corp. and Hitachi Ltd. would export reactors in tandem with Tokyo Electric Power Co.

TEPCO was expected to provide services related to plant operations.

Tadashi Maeda, managing executive officer at the Japan Bank for International Cooperation and one of the architects of the nuclear plant export strategy, said the 2011 disaster at TEPCO's Fukushima No. 1 plant shattered initial calculations.

"We planned to go abroad with a package that included assurances on safety and training of engineers," said Maeda, a former special adviser to the Cabinet. "But with TEPCO out of the picture, all we have is equipment for export."

Japan is not expected to embark on construction of new reactors after the triple meltdowns at the Fukushima plant, the worst nuclear disaster since the 1986 Chernobyl accident. Overseas markets have become crucial for MHI, Toshiba and Hitachi.

Without TEPCO on hand, however, the companies often need to be involved in plant operations to win overseas orders.

An international consortium that includes MHI on Oct. 29 reached a "broad framework" of agreement with the Turkish government to build four reactors in the Black Sea city of Sinop.

On the same day, visiting Prime Minister Shinzo Abe signed a joint declaration on cooperation in nuclear energy with his Turkish counterpart, Recep Tayyip Erdogan.

The Sinop project, a deal estimated to be worth 2 trillion yen (\$19 billion), represents MHI's first success at exporting nuclear plant technology.

MHI will be responsible for installing the Atmea 1, a new type of reactor developed with French reactor manufacturer Areva SA. It will be the first time for it to do so.

MHI President Shunichi Miyanaga is well aware of the potential risks.

"The project is entirely different from those for domestic electric power companies," he said. "We will try to identify all the risks involved and solve problems one by one."

The broad framework is nothing but a verbal agreement. The official contract covering engineering and construction will not be concluded until after MHI completes a two-year study on natural conditions and economic feasibility.

"It will be difficult (to carry out the project) if an active fault is discovered on the site," said Senior Vice President Terumasa Onaka, general manager of MHI's nuclear energy systems division.

In particular, the company will have to make a sizable financial investment in operating the Sinop plant.

"We have to reinforce our financial base further (in preparation for the project)," Miyanaga said.

MHI learned a hard lesson from a U.S. nuclear power plant project.

In 2012, the U.S. Nuclear Regulatory Commission suspended operations of the San Onofre nuclear plant in California after cooling water containing radioactive materials leaked from piping for one of the four steam generators MHI supplied.

Southern California Edison Co., the plant operator, went to the International Court of Arbitration in October, demanding MHI pay \$4 billion in compensation, including costs for decommissioning the reactors.

The amount is nearly three times as large as MHI's pretax profit for the year ended March 2013. MHI has argued that the damages be limited to \$137 million for the steam generators.

Japan started pushing nuclear plant exports in 2009 but suffered a setback at the end of that year.

A Hitachi-led Japanese consortium lost a contract in the United Arab Emirates to a group of South Korean companies that included Korea Electric Power Corp. and Doosan Heavy Industries and Construction Co.

Up to 370 reactors are expected to be built around the world, particularly in emerging economies, by 2030. The UAE contract offered one of the first bites in those projects.

Hiroki Mitsumata, who was director of the nuclear energy policy planning division at the Agency for Natural Resources and Energy, part of the industry ministry, said the loss upset Japan.

“Samsung was leading in electronics, and Korean films and dramas were all the rage in video content,” Mitsumata said. “We feared that South Korea’s offensive would continue in the nuclear business as well.”

The Democratic Party of Japan, which came to power in 2009, lacked an economic growth strategy.

Maeda of the Japan Bank for International Cooperation, who was close to DPJ heavyweight Yoshito Sengoku, called on him to promote exports of nuclear plants.

“Despite advanced technology, reactor makers have failed to break into global markets,” he said. “We need to export infrastructure packaged with maintenance and services.”

In 2010, the DPJ government under Prime Minister Naoto Kan included “exports of packaged infrastructure” into its new economic growth strategy.

It also appointed Maeda and Harufumi Mochizuki, a former administrative vice industry minister and another advocate of nuclear plant exports, as special advisers to the Cabinet.

At the industry ministry, Takaya Imai, who was deputy director-general of the trade and economic cooperation bureau, spearheaded efforts to promote nuclear plant exports. Imai now serves as secretary to Prime Minister Shinzo Abe.

TEPCO was expected to partner with reactor makers in export projects. The utility adopted overseas expansion as a goal under its new management plan.

However, the troika of the industry ministry, reactor makers and TEPCO ground to a halt when the Fukushima No. 1 plant was devastated by the tsunami spawned by the March 2011 Great East Japan Earthquake.

A Toshiba-led consortium obtained preferential negotiating rights for Turkey’s Sinop project in 2010, but negotiations were suspended after the nuclear disaster and TEPCO eventually pulled out of the group.

Toshiba in 2008 won a contract to build two reactors at the South Texas Project nuclear plant in the Lone Star State, and TEPCO also decided to invest in the project but withdrew after the nuclear disaster.

TEPCO also was unable to play a central role in International Nuclear Energy Development of Japan Co., a joint venture set up in 2010 by utilities and reactor makers under an industry ministry initiative aimed mainly at exporting nuclear plants to Vietnam.

Last year, Hitachi purchased Horizon Nuclear Power Ltd., a British nuclear power generation company. Hitachi will supply four to six reactors and plans to sell its interest in Horizon after its plants begin operations. Still, it will have to be involved in nuclear power generation for a certain period.

Areva, which began exporting nuclear plants before Japanese rivals, knows firsthand about the risks contractors can end up with when things go wrong.

It was sued for damages over construction delays and safety upgrades in a project to build a new type of reactor at the Olkiluoto nuclear plant in Finland. The company was forced to sell its power transmission and distribution division in 2009 to raise funds for compensation.

TEPCO presents 10-year business plan

December 25, 2013

TEPCO's 10-year business plan presented

http://www3.nhk.or.jp/nhkworld/english/news/20131225_37.html

Japan's state-backed fund for nuclear crisis compensation has **broadly approved** a 10-year business plan by Tokyo Electric Power Company, the operator of the disaster-hit Fukushima Daiichi power plant.

The Nuclear Damage Liability Facilitation Fund held a meeting of its steering committee on Wednesday to discuss the plan.

The plan outlines the restarting next year of 2 of the 7 idle reactors at the Kashiwazaki-Kariwa plant in Niigata Prefecture on the Japan Sea Coast. The 2 reactors are now undergoing safety screenings by the government.

TEPCO plans to restart 2 more reactors at the same plant in 2015.

But it says the remaining 3 reactors will not start until 2016, or even possibly until 2023, as preparations are needed to meet new government safety standards.

The utility says it aims to reduce fuel costs for thermal plants by resuming the idle reactors and making profits between one and 2 billion dollars per year.

If the profits are realized the utility plans to gradually reduce electricity charges by up to about 10 billion dollars annually over the next 10 years.

The plan also includes an increase in the government funding for interest-free loans to the utility to pay for compensation and decontamination work from the nuclear accident in March 2011.

The utility and the fund will apply to the government for approval of the plan on Friday.

NRA Tanaka meets LDP lawmaker

December 25, 2013

Nuclear regulatory body chief meets LDP lawmaker

http://www3.nhk.or.jp/nhkworld/english/news/20131225_29.html

The head of Japan's nuclear regulatory body has met a ruling party lawmaker to discuss its operations.

Nuclear Regulation Authority Chairman Shunichi Tanaka has avoided meetings with politicians and utility officials, to underscore the body's independence.

This is because the former regulatory agency, which oversaw the sector at the time of the 2011 accident at the Fukushima Daiichi nuclear plant, was criticized for being controlled by the plant's operator.

A project team of the Liberal Democratic Party studying nuclear power regulation recently submitted a set of proposals regarding the NRA's operations to Chief Cabinet Secretary Yoshihide Suga.

Team leader Yasuhisa Shiozaki met Tanaka on Wednesday and gave him a copy of the proposals.

The document criticizes the NRA as becoming isolated rather than independent. It urges the body to meet more people and hear a wide range of opinions, be fully accountable to win the public's trust and to put more effort into personnel training.

Shiozaki told Tanaka to make independent decisions only after communicating with a wide variety of people.

Tanaka said that will take time but he will try to meet more people next year.

Tanaka later told reporters he asked that the meeting be open to the media to avoid doubts about the NRA's independence. He stressed that the body remains firmly committed to independence.

Tanaka suggested that he will meet utility managers, saying understanding their ideas is crucial for ensuring nuclear safety.

New NHK president will be under scrutiny

December 26, 2013

All eyes on the new NHK chief

<http://www.japantimes.co.jp/opinion/2013/12/26/editorials/all-eyes-on-the-new-nhk-chief/#.UrxMwrT8nIU>

NHK's Board of Governors on Dec. 20 appointed Katsuto Momii, former president of Nihon Unisys, a major computer and communication systems and software company, as the next president of Japan's public broadcast organization. His three-year term starts Jan. 25.

How to cope with the rapidly changing environment caused by digital innovations is a big challenge for NHK. But the most important task for Momii will be to keep a distance from politics and to refrain from intervening in NHK's right to freedom of expression as a news organization. He is close to business leaders who have strong ties with Prime Minister Shinzo Abe.

Momii reportedly supports the state secrets law, which severely limits ordinary citizens' and journalists' access to government information, as well as Abe's ideas for revising the Constitution.

At an earlier stage to select the next NHK president, the Board of Governors had regarded current NHK President Masayuki Matsumoto as the main candidate. Matsumoto, a former president of Central Japan Railway Co. (JR Tokai), introduced lower TV broadcast subscription fees in October 2012. He also improved NHK's revenue-expenditure balance sheet by carrying out wage cuts and by increasing the number of people who pay fees to receive NHK satellite broadcasts.

But Matsumoto suddenly announced Dec. 5 that he will step down Jan. 24, the last day of his first term. Apparently he became fed up with the Diet's approval in November of Abe's appointment of four new members to the Board of Governors. All of the new members are close to Abe, including author Naoki Hyakuta and philosopher Michiko Hasegawa. Opposition by four of the 12 board members can veto the appointment of a new NHK president.

In the Abe Cabinet and the Liberal Democratic Party, there has been deep criticism of NHK's reporting on the issues of nuclear power generation, the deployment of the Osprey tilt-rotor transport planes by the U.S. armed forces and territorial disputes.

Abe's selection of the new four members for NHK's Board of Governors is regarded as an expression of his desire to change NHK's reporting direction and his intention to intervene in the selection of the new NHK president. The Board of Governors, NHK's highest decision-making body, determines NHK's basic policy and supervises the activities of NHK executives, including those of the NHK president. The prime minister cannot appoint the NHK president; that's the task of the Board of Governors. NHK's operations are not covered by tax or commercial funding, but rather by TV subscription fees. The purpose of these systems is to ensure the editorial independence of NHK as a news organization.

We hope that Momii understands and respects the principle behind the systems. He should refrain from large-scale cost-cutting in the production of radio and TV programs because program quality would likely deteriorate as a result. He should strive to ensure that NHK provides high-quality news, documentaries, and education/cultural programs that are based on wide coverage and scrupulous research.

Most importantly, Momii should make it his mission to ensure that NHK employees can express themselves freely at work and produce programs that reflect their sense of duty and conviction as members of a public broadcast organization. In nutshell, he should refrain from any acts that could undermine NHK's independence.

State secrets could be destroyed by civil servants

December 30, 2013

Special state secrets could be destroyed at discretion of officials

<http://mainichi.jp/english/english/perspectives/news/20131230p2a00m0na013000c.html>

The possibility has emerged that under the new heavy-handed state secrets law, **information designated as a special state secret could be destroyed by civil servants with jurisdiction over the information before declassification**, drawing criticism from experts.

Under the state secrets protection act, a special state secret can be destroyed after declassification with the approval of the prime minister, but the law does not address the possibility of destroying information during its special state secret classification.

The possibility was revealed in the government's response to a question from opposition Democratic Party of Japan (DPJ) legislator Akira Nagatsuma asking whether information could be destroyed while it is designated a special state secret. The Cabinet approved a response on Dec. 6, the day the state secrets law was passed, that "it cannot be denied that through a government ordinance, information could be destroyed before it is declassified if it is found to be truly unavoidable to preserve the secret."

Article 5 of the new law seeks Cabinet members with the authority to designate special secrets to institute necessary regulations through government ordinances. What sort of rules will be established regarding the disposal of information before declassification will be a point of contention between now and when the law goes into effect -- next fall at the earliest.

While Nagatsuma's question addressed the handling of information while it is designated as a special state secret, what will happen to information after its special secrets status is lifted?

According to the Public Records and Archives Management Act, the information would be transferred to the National Archives or destroyed with the prime minister's approval. However, this law allows for exceptions if other laws are applicable.

For example, "defense secrets" as stipulated by the 2001 revised Self-Defense Law are exempt from the Public Records Act because of a Defense Ministry directive that all declassified information be destroyed. As a result, at least 40,000 defense secrets files were destroyed between 2007 and 2012.

During Diet deliberations on the state secrets bill, the government claimed that special secrets would be subject to the Public Records Act. It also explained that special secrets whose classification periods last for over 30 years would be transferred to the National Archives, preventing any loopholes as in the case of defense secrets.

However, it has been made clear from the government's response to Nagatsuma that a rule to make possible the destruction of information during its designation as a special state secret could be established. The Cabinet Office, which has jurisdiction over the state secrets law, says that the government's response has at its basis the Defense Ministry's bylaws in which an official in charge of a defense secret is permitted to destroy it if there is adequate reason to judge that it is unavoidable and no other method exists to protect it.

Yukiko Miki, head of the nonprofit organization Access-Info Clearinghouse Japan, which has been monitoring the issue of defense secret disposal, is concerned that the government is envisioning the same rules for special state secrets as for defense secrets.

"If that's the case, there's a danger that information will be destroyed arbitrarily," she warned. Meanwhile, a Cabinet Office official told the Mainichi, "We are not yet at the stage of setting down government ordinances or directives, and cannot yet say whether we will set rules on disposal."

Pact with IAEA

Fukushima Govt. & Fukushima Medical University Signed Secrecy Pact With IAEA
<http://www.fukuleaks.org/web/?p=11993>

January 1st, 2014 |

Tokyo Shimbun is reporting the results of their investigation into the dealings of the Fukushima prefecture government, the medical university and the IAEA. There has been ongoing suspicion about the openness and honesty of what has been ongoing in Japan. Tokyo Shimbun has confirmed that these government entities did sign a secrecy agreement with the IAEA. The Fukushima Medical University has been the main source of all public data on exposure and had been dictating what medical care many in the region were allowed to receive related to radiation issues.

Both the prefecture and the medical university have been the subject of growing distrust from the public due to their efforts to downplay problems and withhold information from the public. Tokyo Shimbun's work has confirmed this problem to be the case. A machine translation of the article is below.

It found that the memorandum of mutual cooperation that connects Fukushima and (IAEA), Fukui prefectures International Atomic Energy Agency, one upon request or province or IAEA, terms that can be private information that you are sharing is included were. For this provision, it is not seen as a problem in

prefectural assembly, there is also the voice of criticism that “in the lead ahead of the particular secret protection law”.

The Memorandum of Understanding with the IAEA, in December last year, Fukushima Prefecture were signed respectively in October this year, Fukui Prefecture.

In Fukushima Prefecture, Prefectural University of Medicine has concluded with the IAEA for the health impact study prefecture, radiation for the management of radioactive waste and decontamination. There are “exemplary arrangements” document as detailed MOU provisions marked to be “to ensure the confidentiality of information designated as confidential by the other party” is included in the document.

I signed a cooperation with the IAEA in relation to human resource development of the nuclear field in Fukui Prefecture, there was a secret language specified in the memorandum.

Both county, you are not information that is secret specified at this stage, but measured data and accident information, for such thyroid cancer in children, IAEA or province side, you secret designated as such as “stir up anxiety of residents” For example, there is a possibility that the information will not be published.

Person in charge of the Ministry of Foreign Affairs played a memorandum of adjustment that “because it is negotiated every international, it can not be said either of the IAEA and Japan may or sought secret designation clause” in the interview.

However, according to people familiar with the matter of prefectures, when the exchange memorandums and government agencies in each country, that there are rules that incorporate the wording of the secret specified in the IAEA.

The IAEA has compiled a report and “there was no modulation of Health by exposure” in the Chernobyl nuclear accident.

Muto Ruiko head of the Fukushima nuclear power plant prosecution team is concerned, “there is a precedent that has the hidden information about the health effects of Chernobyl IAEA. Fukushima also become the Ninomai” he said.

IAEA Press Releases

Press Release 2012/34

IAEA, Fukushima Prefecture Sign Cooperation Memorandum

15 December 2012 | *Koriyama, Fukushima Prefecture, Japan* -- IAEA Director General Yukiya Amano and the Governor of Fukushima Prefecture, Yuhei Sato, today signed a *Memorandum of Cooperation* confirming their willingness to implement concrete projects to help alleviate the consequences of the accident at TEPCO's Fukushima Daiichi Nuclear Power Station.

The Memorandum, signed on the sidelines of the three-day *Fukushima Ministerial Conference on Nuclear Safety*, includes arrangements to promote cooperation in two key areas: one on radiation monitoring and remediation between the IAEA and Fukushima Prefecture, and the other on human health between the IAEA and Fukushima Medical University.

The Memorandum also highlights plans for a training centre in Fukushima Prefecture to help reinforce emergency preparedness and response activities, supported by the Government of Japan and Fukushima Prefecture. An IAEA Response and Assistance Network (RANET) Capacity Building Centre will be designated, with IAEA radiation monitoring equipment to be deployed in case of need, and to provide training in emergency preparedness and response in Japan and the Asia Pacific region.

"With this framework, the wisdom of the international community as well as the IAEA will be utilised in the process of reconstruction in Fukushima," said Japan's Minister of Foreign Affairs, Koichiro Gamba, who attended the signing ceremony.

"I'm very much encouraged by the conclusion of this Memorandum and I believe this will serve to promote reconstruction in Fukushima," said Governor Sato. "We will also be able to disseminate to the rest of the world the knowledge and experience to be gained from the activities that we are conducting, and we hope this will be a symbol of Fukushima."

"The IAEA has expertise in the areas of remediation and decontamination, as well as environmental monitoring and human health," said Director General Amano. "It is our hope that we will support Fukushima and at the same time serve as a bridge connecting the Prefecture and the world."

The *Fukushima Ministerial Conference*, which started on Saturday, is organised by the Government of Japan in co-sponsorship with the IAEA.

<http://www.fmu.ac.jp/radiationhealth/>

15 Dec 2012 Fukushima/IAEA MOC was ratified.

<http://www.fmu.ac.jp/radiationhealth/news/20121215-1.html>

Cooperation between Fukushima Medical University and the International Atomic Energy Agency
15 December, 2012

Fukushima Medical University

1. The government of Fukushima Prefecture and the International Atomic Energy Agency (IAEA) signed on 15 December 2012, in Koriyama City, Fukushima, on the occasion of the Fukushima Ministerial Conference on Nuclear Safety, the "Memorandum of Cooperation between Fukushima Prefecture and the International Atomic Energy Agency following the Accident at TEPCO's Fukushima Daiichi Nuclear Power Station".

2. This Memorandum is made between Fukushima Prefecture and the IAEA in order to confirm the willingness of both sides to implement cooperative activities.

3. Under this Memorandum, "Practical Arrangements between Fukushima Medical University and the International Atomic Energy Agency on Cooperation in the Area of Human Health" are made. The objective of these Practical Arrangements is to set forth the framework for the cooperation and relationship between Fukushima Medical University and the IAEA on cooperation in the area of Human Health. The scope of cooperation is health management survey, capacity building and research, enhancement of public awareness and exchange of expert support and information.

4. Under this Practical Arrangements, 3 projects are proposed.

4.1 Enhancing radiation medicine education by building capacity of health professionals and medical students

4.2 Strengthening research cooperation in radiation disaster medicine including post-traumatic stress disorders

4.3 Development of a specific training package for medical radiation physicists in support to nuclear or radiological emergency situations

Time to react

A year to become politically active

Dec 31, 2013

<http://www.japantimes.co.jp/opinion/2013/12/31/editorials/a-year-to-become-politically-active/#.UsMksbTrXIU>

As Japan greets the new year of 2014, the political situation surrounding the nation's citizens is not bright. This is primarily because the Abe administration and the ruling coalition of the Liberal Democratic Party and New Komeito on Dec. 6 forced the state secrets bill through the Diet and enacted it. People face the danger of the law undermining their right to know, freedom of the press and freedoms of thought, conscience and expression.

And this law goes hand in hand with the one that established the National Security Council. Since the NSC law does not require the keeping of minutes of NSC meetings, what the two laws mean is that the prime minister, the chief Cabinet secretary, the foreign minister and the defense minister can secretly make decisions that greatly affect the fate of the nation and all citizens.

This year the fundamental democratic principle that is declared in the preamble of the Constitution — that sovereign power resides with the people — will be tested. It will be all the more important for citizens to carefully monitor the nation's politics and carry out various efforts at the grass-roots level aimed at upholding their sovereignty.

The state secrets law gives the heads of administrative bodies the discretionary power to designate information related to security, diplomacy, counter-intelligence and counterterrorism as special secrets. This power enables the bureaucracy to hide an almost limitless amount of information from the people and their representatives in the Diet. This will have the effect of putting the bureaucracy above the Diet and allowing it to make important decisions, especially in the areas of security and diplomacy, without providing sufficient information to the Diet.

People should realize that the law carries the danger of completely undermining the fundamental principles of the Constitution. Article 41 of the Constitution says: "The Diet shall be the highest organ of state power, and shall be the sole lawmaking organ of the State."

The important task for people as they greet the new year is to brace themselves for protecting the fundamental principles of the Constitution as stated by its preamble and Article 41.

In addition to declaring that sovereign power resides with the people, the preamble of the Constitution says, "Government is a sacred trust of the people, the authority for which is derived from the people, the powers of which are exercised by the representatives of the people, and the benefits of which are enjoyed by the people."

What people saw in 2013 was that the Diet is not fulfilling its duties as stipulated by the Constitution. Clearly the Lower House failed to spend sufficient hours for discussions on the state secrets bill. After the bill was rammed through the Lower House, the situation in the Upper House was worse.

Although many problems were pointed out with regard to the bill during the Lower House discussions, the ruling coalition was obsessed with the idea of hurriedly making the bill into a law.

The Upper House's special committee on the bill spent 23 hours for discussions, only about half the number of hours given to discussions in the Lower House counterpart committee — this despite the fact that the Lower House discussions were inadequate and that the role of the Upper House is to amend the excess or inadequacy of the Lower House and to listen to minority opinions.

Despite this deplorable situation, Prime Minister Shinzo Abe said on Dec. 4 that adequate discussions were made in the Upper House, and the LPD and New Komeito forced the bill through the Upper House and enacted the bill on Dec. 6.

It is important for people to remember what happened that day and to make efforts to reject the political forces that work to weaken the function of the Diet and corrode the important rights as guaranteed by the Constitution.

The reason that the Abe administration and the ruling coalition made haste in passing the bill is clear. As people's movements to oppose the bill were gaining momentum, they feared that if Diet deliberations on the bill were prolonged, many defects of the bill would become clear to the eyes of people and the bill might fail to be passed by the Diet.

This inversely shows that the powers that be fear people who have the ability to see through the essence of the matter. This is all the more reason why the people must continue to closely examine what bureaucrats and politicians do and to manifest their opinions through daily activities including sending letters, issuing statements, making speeches, organizing study meetings, taking part in demonstrations and casting their votes in elections.

With only the support of about a quarter of all the voters, the LDP and New Komeito gained the majority in the Upper House in the July election. This was made possible because some 48 percent of eligible voters did not bother to participate.

People should realize that abstention is tantamount to giving carte blanche to the parties that win an election. Although there will be no scheduled Diet elections in 2014, it should be a year in which people discard their political apathy. They can express their political will in local elections, including the Tokyo gubernatorial election in February, and through various grassroots activities.

This year, the Abe administration will try to scrap the long-established weapons-export ban and to discard the government's long-standing constitutional interpretation that Japan cannot exercise the right to collective self-defense.

These moves could directly involve Japan in conflicts abroad, possibly including combat missions of the Self-Defense Forces in foreign countries. Abe's ultimate goal is to change the war-renouncing Article 9 of the Constitution.

In view of these important moves, people cannot afford to be indifferent to politics. This year they must closely watch politics and express their opinions.

The Abe administration's economic policy appears to have somewhat brightened the nation's economy — at least temporarily. But in fiscal 2014, the financial burden people must shoulder will increase as exemplified by the consumption tax hike from April. The danger of economic bubbles cannot be excluded because the main pillar of Abenomics is to increase the nation's monetary base in an unprecedented manner.

The administration is also pushing the Trans-Pacific Partnership free trade scheme. But this is primarily an attempt to place the interests of international businesses above the interests of sovereign states. People need to carefully examine whether these moves will really improve their welfare and to take concrete civic actions in protest of such policies if they believe the opposite will be the case.

December 30, 2013

Shoddy work to cut costs and save time

Worker aghast at shoddy work on Fukushima radioactive water storage tanks

January 04, 2014

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201401040008>

By MASAKAZU HONDA/ Staff Writer

URUMA, Okinawa Prefecture--Yoshitatsu Uechi recalls with disgust the disregard for worker safety, the makeshift plans and the cost-cutting measures, including the use of adhesive tape on key equipment, at his job last year.

He said an emphasis on saving time and expenses was clear when he helped to build storage tanks for radioactive water accumulating at the site of Japan's worst-ever nuclear accident.

"I couldn't believe that such slipshod work was being done, even if it was part of stopgap measures," Uechi told The Asahi Shimbun.

He was one of 17 workers from Okinawa Prefecture who were sent to the crippled Fukushima No. 1 nuclear power plant on June 28, 2012. The 48-year-old from Uruma said he worked on foundations and storage tank assembly between July 2 and Dec. 6, 2012.

He said he was sent to various places at the site, including "H3," an area now known as the spot where high radiation levels have been found due to leaks of radioactive water from the storage tanks.

The leaking tanks are just part of the problem of contaminated water that continues to build up and leak into the ocean from the plant.

One rainy day in late October, Uechi and a colleague were told to wear yellow raincoats on top of their protective gear and head to the "E" area close to H3. They were instructed to cover the openings of five or six storage tanks that lacked their top lids.

Uechi climbed to the top of a nearly 10-meter-tall storage tank and found white adhesive tape covering an opening about 30 centimeters across. The tape was all that separated Uechi and the surface of radioactive water only 50 cm below.

After using a blade to remove the tape, Uechi said his legs trembled at the sight of shiny raindrops hitting the water surface.

He applied a sealing agent on the opening, fit a disk-shaped steel lid he had brought with him, and quickly fastened it with bolts.

Uechi said he had been instructed to use four bolts, but he saw that the component had eight bolt holes. Workers were told to keep away from the radioactive water storage tanks, which had high radiation levels, even on the outside.

“I wore a raincoat even on sunny days to block the radiation when I had to go near highly radioactive water,” Uechi said.

His seasoned colleagues told him that the use of adhesive tape was one of the makeshift measures devised on the site to deal with the sharp increase in the stockpile of radioactive water.

But he said he was surrounded by signs of shoddy work to slash costs and time requirements. For example, wire nets were used instead of reinforcing bars during the placement of concrete for storage tank foundations.

And to save on the sealing agent used to join metal sheets of the storage tanks, waterproof sheets were applied along the joints inside flange-type cylindrical tanks. Some of these tanks were later found to be leaking radioactive water.

Uechi said the tip of a special clamping bolt snapped and fell into an opening between the bottom and foundation of a storage tank, possibly causing damage.

Rain and melting snow had washed away the anti-corrosive agent applied around clamping bolts on a bottom plate, reducing its sealing effect, he said.

And many second-hand materials were in use, Uechi added.

The prime contractor for the work project was Taisei Corp., one of Japan’s leading general contractors.

“We decline to comment on individual work projects,” a Taisei representative said. “We are implementing and supervising work projects in an appropriate manner.”

Uechi said he was hired by a construction company, a third-tier subcontractor of Taisei, based in Yonabaru, Okinawa Prefecture.

He received work instructions from foremen and supervisors of Taisei's first-tier and second-tier subcontractors.

Uechi said his job contract was revised in mid-August, after he raised questions about the ambiguity of the wording, so he was hired by the second-tier subcontractor afterward.

TEPCO has a new chairman

January 7, 2013

Abe meets next TEPCO chairman

http://www3.nhk.or.jp/nhkworld/english/news/20140107_41.html

Japan's Prime Minister Shinzo Abe has asked the next chairman of Tokyo Electric Power Company to make the most of its ability and resources to handle the nuclear accident at the Fukushima Daiichi power plant.

Abe met Fumio Sudo, who was chosen on Tuesday to be TEPCO's chairman from April.

Abe said all TEPCO workers should take to heart the fact that the utility exists to pay compensation to those affected by the accident, to decommission reactors at the plant, and to supply power in a stable way.

He asked Sudo to introduce competitive management methods and not be complacent about the status of a local monopoly like before.

Sudo told reporters after the meeting that the biggest problem with TEPCO's management is that it lacks the idea of global competition.

He said Japan's power rates are more than double those in the United States and South Korea, and that this should be changed by all means.

Jan. 7, 2014 - Updated 10:33 UTC

TEPCO new chairman chosen

http://www3.nhk.or.jp/nhkworld/english/news/20140107_35.html

The operator of the Fukushima Daiichi nuclear power plant is getting a new chairman. The board of directors at Tokyo Electric Power Company has chosen an outside director Fumio Sudo for the top post.

Sudo will replace the current chairman Kazuhiko Shimokobe. Shimokobe expressed his intention to step down last month after the utility submitted a new business plan to the government.

Sudo joined Kawasaki Steel in 1964. In 2005, he became president of JFE Holdings, which was set up through Kawasaki's merger with another steelmaker, NKK. He has been an outside director for TEPCO since 2012.

In drafting the company's business plan, **Sudo proposed steps to streamline operations and boost profits.**

He also requested that the government shoulder part of the cost for decontamination at the Fukushima Daiichi plant.

Sudo will officially assume the post on April 1st.

Jan. 7, 2014 - Updated 07:57 UTC

TEPCO tries to restore public trust

January 9, 2014

TEPCO withheld Fukushima radioactive water measurements for 6 months

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201401090060>

THE ASAHI SHIMBUN

Tokyo Electric Power Co. has withheld 140 measurements of radioactive strontium levels taken in groundwater and the port of the Fukushima No. 1 nuclear plant between June and November last year.

TEPCO has been releasing the combined levels of all radioactive substances, including strontium, that emit beta rays, at the crippled nuclear plant. But strontium levels exceeded the all-beta readings in some instances, leading the utility to decide they were “wrong” and to withhold them from public releases, TEPCO officials said Jan. 8.

Previously, TEPCO officials said they had not released the data because the numbers were not confirmed.

Company officials on Jan. 8 insisted the utility had no intention to conceal information. They said they did not disclose the data simply because of inconsistencies in the information.

They said TEPCO will release correct readings after determining the cause of the discrepancies by the end of this month

"Does anyone in authority tell the truth about Fukushima?"

<http://www.globalresearch.ca/fukushima-meltdowns-a-global-conspiracy-of-denial/5363827>

Fukushima Meltdowns: A Global Conspiracy of Denial

By William Boardman

Global Research, January 05, 2014

Does anyone in authority anywhere tell the truth about Fukushima?

If there is any government or non-government authority in the world that is addressing the disaster at Fukushima openly, directly, honestly, and effectively, it's not apparent to the outside observer what entity that might be.

There is instead an apparent global conspiracy of authorities of all sorts to deny to the public reliably accurate, comprehensible, independently verifiable (where possible), and comprehensive information about not only the condition of the Fukushima power plant itself and its surrounding communities, but about the unceasing, uncontrolled release of radioactive debris into the air and water, creating a constantly increasing risk of growing harm to the global community.

While the risk may still be miniscule in most places, the range of risk rises to lethal in Fukushima itself. With the radioactive waste of four nuclear reactors (three of them in meltdown) under uncertain control for almost three years now, the risk of lethal exposure is very real for plant workers, and may decrease with distance from the plant, but may be calculable for anyone on the planet. No one seems to know. No one seems to have done the calculation. No one with access to the necessary information (assuming it exists) seems to want to do the calculation.

There is no moral excuse for this international collusion. The excuses are political or economic or social, but none of them excuses any authority for withholding or lying about information that has potentially universal and destructive impact on everyone alive today and everyone to be born for some unknown generations.

Japanese authorities may be the worst current offenders against the truth, as well as the health and safety of their people. Now the Japanese government has passed a harsh state secrets law that threatens to reduce or eliminate reliable information about Fukushima. The U.S. government officially applauded this heightened secrecy, while continuing its own tight control on nuclear information. Japanese authorities are already attacking their own people in defense of nuclear power: not only under-measuring and ignoring varieties of radioactive threat, but even withholding the iodine pills in 2011 that might have mitigated the growing epidemic of thyroid issues today. Failing to confront Fukushima honestly, the Japanese are laying the basis for what could amount to a radiological sneak attack on the rest of the world.

Just because no one seems to know what to do about Fukushima is no excuse to go on lying about and/or denying the dimensions of reality, whatever they might be.

There are hundreds, probably thousands of people with little or no authority who have long struggled to create a realistic, rational perspective on nuclear threats. The fundamental barrier to knowing the scale of the Fukushima disaster is just that: the scale of the Fukushima disaster.

Chernobyl 1986 and Fukushima 2011 are not really comparable

Chernobyl is the closest precedent to Fukushima, and it's not very close. Chernobyl at the time of the 1986 electric failure and explosion had four operating reactors and two more under construction. The Chernobyl accident involved one reactor meltdown. Other reactors kept operating for some time after the accident. The reactor meltdown was eventually entombed, containing the meltdown and reducing the risk. Until Fukushima, Chernobyl was considered the worst nuclear power accident in history, and it is still far from over (albeit largely contained for the time being). The Chernobyl Exclusion Zone of roughly 1,000 square miles remains one of the most radioactive areas in the world and the clean-up is not even expected to be complete before 2065.

At the time of the March 11, 2011, earthquake and tsunami, the Fukushima plant had six operating reactors. Three of them went into meltdown and a fourth was left with a heavily laden fuel pool teetering a hundred feet above the ground. Two other reactors were undamaged and have been shut down. Radiation levels remain lethal in each of the melted-down reactors, where the meltdowns appear to be held in check by water that is pumped into the reactors to keep them cool. In the process, the water gets irradiated and that which is not collected on site in leaking tanks flows steadily into the Pacific Ocean. Within the first two weeks, Fukushima radiation was comparable to Chernobyl's and while the levels have gone down, they remain elevated.

The plant's corporate owner, Tokyo Electric Power Company (TEPCO), in turn effectively owned by the Japanese government after a 2012 nationalization, began removing more than 1,500 fuel rod assemblies from the teetering fuel pool in November, a delicate process expected to take a year or more. There are additional fuel pools attached to each of the melted down reactors and a much larger general fuel pool, all of which contain nuclear fuel rod assemblies that are secure only as long as TEPCO continues to cool them. The Fukushima Exclusion Zone, a 12-mile radius around the nuclear plant, is about 500 square miles (much of it ocean); little specific information about the exclusion zone is easily available, but media coverage in the form of disaster tourism is plentiful, including a Google Street View interactive display.

Despite their significant differences as disasters, Chernobyl and Fukushima are both rated at 7 – a “major accident” on the International Nuclear Event Scale designed in 1990 by the International Atomic Energy Agency (IAEA). That is the highest rating on the scale, a reflection of the inherent denial that colors most official nuclear thinking. Designed by nuclear “experts” after Chernobyl, **the scale can't imagine a worse accident than Chernobyl which, for all its intensity, was effectively over as an accident in a**

relatively short period of time. At Fukushima, by contrast, the initial set of events was less acute than Chernobyl, but almost three years later they continue without any resolution likely soon. Additionally Fukushima has three reactor meltdowns and thousands of precarious fuel rod assemblies in uncertain pools, any of which could produce a new crisis that would put Fukushima clearly off the scale.

And then there's groundwater. Groundwater was not a problem at Chernobyl. Groundwater is a huge problem at the Fukushima plant that was built at the seashore, on a former riverbed, over an active aquifer. In a short video, nuclear engineer Arnie Gundersen makes clear why groundwater makes Fukushima so hard to clean up, and why radiation levels there will likely remain dangerous for another hundred years

Fukushima Unit #3 activity led to some panic-driven reporting in 2013

The Japanese government and nuclear power industry have a history of not telling the truth about nuclear accidents dating back at least to 1995, as reported by New Scientist and Rachel Maddow, among others. Despite Japan's history of nuclear dishonesty, Japanese authorities remain in total control of the Fukushima site and most of the information about it, without significant objection from most of the world's governments, media, and other power brokers, whose reputation for honesty in nuclear matters is almost as bad as Japan's. In such a context of no context, the public is vulnerable to reports like this from the Turner Radio Network (TRN) on December 28:

**** NEWS FLASH – URGENT ** STEAM SUDDENLY EMANATING FROM FUKUSHIMA REACTOR # 3 – WEST COAST OF NORTH AMERICA SHOULD BEGIN PREPARATIONS FOR POSSIBLE RADIATION CLOUD WITHIN 3 TO 5 DAYS**

Five days after this story was posted, the “radiation cloud” had not developed despite the story's assertion that: “Experts say this could be the beginning of a ‘spent fuel pool criticality (meltdown)’ involving up to 89 TONS of nuclear fuel burning up into the atmosphere and heading to North America.” The story named no “experts” and provided links only to TEPCO announcements in Japanese. The bulk of the story reads like an infomercial for “protective” gear of various sorts that TRN makes a point of saying it does NOT sell. Despite such obvious warning signs, others – such as The Ecologist and Gizmodo – reported the threat of “another meltdown” at Fukushima Unit #3 as imminent.

Clarification and reassurance quickly started chasing the “new meltdown” rumor around the Internet. ENENEWS (Energy News) promptly posted the TEPCO reports in English, demonstrating that there was nothing “sudden” about the steam releases, they've been happening more or less daily since 2011, but condensation caused by cold weather makes them visible. At FAIREWINDS (Energy Education), Arnie Gundersen posted on January 1:

“... the Internet has been flooded with conjecture claiming that Fukushima Daiichi Unit 3 is ready to explode.... Our research, and discussions with other scientists, confirms that what we are seeing is a phenomenon that has been occurring at the Daiichi site since the March 2011 accident.... While the plants

are shutdown in nuke speak, there is no method of achieving cold shut down in any nuclear reactor. While the reactor can stop generating the actual nuclear chain reaction, **the atoms left over from the original nuclear chain reaction continue to give off heat that is called the decay of the radioactive rubble (fission products).... constantly releasing moisture (steam) and radioactive products into the environment.**" [emphasis added]

In other words, Fukushima Unit #3 continues to leak radioactivity into both air and water, as Units #1 and #2 presumably do as well. But as Gundersen explains, the level of radioactivity has declined sharply without becoming benign:

"When Unit 3 was operating, it was producing more than 2,000 megawatts of heat from the nuclear fission process (chain reaction in the reactor). Immediately after the earthquake and tsunami, it shut down and the chain reaction stopped, but Unit 3 was still producing about 160 megawatts of decay heat. Now, 30 months later, it is still producing slightly less than 1 megawatt (one million watts) of decay heat.... 1 megawatt of decay heat is a lot of heat even today, and it is creating radioactive steam, but it is not a new phenomenon."

Reassurances about Fukushima are as misleading as scare stories

The reassuring aspects of the condition of Unit #3 -- radioactive releases are not new, they're less intense than they once were, the nuclear waste is cooling -- while true enough, provide only a false sense of comfort. Also true: radiation is released almost continuously, the releases are uncontrolled, no one seems to be measuring the releases, no one seems to be tracking the releases, no one is assessing accumulation of the releases. And while it's true that the waste is cooling and decaying, it's also true that a loss of coolant could lead to another uncontrolled chain reaction. ("Fukushima Daiichi Unit 3 is not going to explode," says Gundersen in a headline, but he can't know that with certainty.)

For the near future, what all that means, in effect, is that the world has to accept chronic radiation releases from Fukushima as the price for avoiding another catastrophic release. And even then, it's not a sure thing.

But there's another aspect of Fukushima Unit #3 that's even less reassuring. Unit #3 is the one Fukushima reactor that was running on Mixed oxide fuel, or MOX fuel, in its fuel rods. MOX fuel typically uses Plutonium mixed with one or more forms of Uranium. Using Plutonium in fuel rods adds to their toxicity in the event of a meltdown. In part because Plutonium-239 has a half-life of 240,000 years and can be used to make nuclear weapons of "dirty bombs," its use in commercial reactors remains both limited and controversial. Because it contains Plutonium, MOX fuel is more toxic than other nuclear fuel and will burn at lower temperatures. As Natural Resources News reported in 2011:

"The mixed oxide fuel rods used in the compromised number three reactor at the Fukushima Daiichi complex contain enough plutonium to threaten public health with the possibility of inhalation of airborne

plutonium particles.... Plutonium is at its most dangerous when it is inhaled and gets into the lungs. The effect on the human body is to vastly increase the chance of developing fatal cancers.”

Reportedly, TEPCO plans don't call for the removal of the MOX fuel in Unit #3 for another decade or more. Fuel removal from Units #1, #2, and #3 is complicated by lethal radiation levels at all three reactors, as well as TEPCO's inability so far to locate the three melted cores with any precision.

There is ample reason to hope that Fukushima, despite the complex of uncontrollable and deteriorating factors, will not get worse, because even the Japanese don't want that. But there is little reason to expect anything but worsening conditions, slowly or suddenly, for years and years to come. And there is even less reason to expect anyone in authority anywhere to be more than minimally and belatedly truthful about an industry they continue to protect, no matter how many people it damages or kills.

The perfect paradigm of that ruthlessly cynical nuclear mentality is the current Japanese practice of recruiting homeless people to work at Fukushima in high level radiation areas where someone with something to lose might not be willing to go for minimum wage.

TEPCO's financial plan "built on shaky ground"

January 9, 2014

Tepco's flawed turnaround plan

http://www.japantimes.co.jp/opinion/2014/01/09/editorials/tepcos-flawed-turnaround-plan/#.Us_x97TrV1s

Tokyo Electric Power Co.'s proposed new financial turnaround plan is built on shaky ground since it continues to rely on the restart of the idled reactors at its Kashiwazaki-Kariwa nuclear power plant in Niigata Prefecture, where local authorities remain wary of restarting operations while the contaminated-water mess continues at the utility's crippled Fukushima No. 1 nuclear power plant.

Tepco's scenario in its previous plan compiled in May 2012 proved to be pie in the sky, as it was built on the assumption that the Kashiwazaki-Kariwa plant, the world's largest in terms of output capacity, would be reactivated in April 2013 — which did not happen. The Nuclear Regulation Authority's screening of Tepco's applications to resume the operation of reactors Nos. 6 and 7 at the plant began in November after a two-month delay, and it remains unclear how long the process will take.

The utility, which also needs massive financial support from the government, should review the plan and draw up a more credible scenario in which the company can regain profitability through greater efficiency of operation — without relying on the restart of its nuclear power plants.

After the March 2011 meltdowns at Fukushima No. 1, Tepco was effectively placed under state control in 2012 as the government injected ¥1 trillion into the embattled utility through the state-backed Nuclear Damage Liability Facilitation Fund and obtained a majority of the company's shares with voting rights. A mechanism was created for the fund to lend up to ¥5 trillion in interest-free loans to Tepco to pay for compensating victims of the nuclear disaster and cover the cost of decontaminating areas contaminated by radioactive fallout. Still, Tepco has been asking for increased support from the government on the grounds that such costs proved larger than expected and are too much for the company alone to shoulder. The new turnaround plan, submitted by Tepco and the fund in late December for government approval, calls for raising the ceiling on interest-free loans to ¥9 trillion, and assumes that the state will cover the expense for additional decontamination work and ¥1.1 trillion in construction and maintenance costs of a temporary storage for contaminated soil.

If the plan is approved, the government will be more deeply involved in the work to clean up the mess from the meltdowns, while placing a cap on Tepco's financial burden so that its rehabilitation can move forward. Increased government support means greater use of taxpayer money. If it is going to approve the new plan, the government needs to publicly explain why.

The turnaround plan meanwhile assumes that the reactors at the Kashiwazaki-Kariwa plant — currently all idled — will be restarted beginning in July. While noting that ¥100 billion to ¥200 billion in annual pretax profits can be expected for eight years beginning in fiscal 2015 if all seven reactors are restarted, it points to the possibility of an additional hike in electricity charges of up to 10 percent this year if none of the reactors is restarted.

The new plan, effectively a joint product of Tepco and the government, comes on the heels of the Abe administration's draft basic energy policy, which calls nuclear energy an "important base-load power source that serves as a foundation" for the nation's energy supply stability — a clear turnaround from the previous Democratic Party of Japan-led administration's policy of seeking a phaseout of nuclear power generation in Japan by the 2030s.

It is ironic that the Tepco rehabilitation plan, on one hand, calls for additional public financial support to clean up the mess from the nuclear disaster at the Fukushima plant and, on the other, presumes that the restart of the Kashiwazaki-Kariwa plant will rebuild the utility's finances.

Niigata Gov. Hirohiko Izumida, whose consent will be necessary for restarting the plant, remains opposed on the grounds that thorough examination of the Fukushima plant disaster needs to come first. The NRA says the safety screening of the Kashiwazaki-Kariwa plant could be suspended if a serious problem emerges in the ongoing efforts to manage the aftermath of the Fukushima plant meltdowns.

Power companies say the huge cost of imported fuel for thermal power generation to make up for the suspended nuclear power generation weighs heavily on their finances, and they have cited this as the main reason for raising electricity rates since the 2011 Great East Japan Earthquake.

Prime Minister Shinzo Abe says the nation is losing trillions of yen each year on additional fuel imports and that nuclear power is an economically advantageous source of energy that will be essential to keep the Japanese economy competitive.

Still, Abe's new energy plan seems oblivious to the huge cost of a nuclear disaster like the Fukushima No. 1 accident. Tepco's rehabilitation plan itself testifies to the costs — so huge that even the giant utility is unable to cover them on its own, thus requiring the injection of taxpayer money.

Tepco's new rehabilitation plan calls for a ¥4.8 trillion reduction in its expenses over 10 years through such measures as introduction of more competitive bidding for materials procurement and voluntary retirement programs for 2,000 employees from the group workforce in fiscal 2014.

Tepco says it will reorganize itself into a holding company system and separate its power generation, transmission and retail businesses into three separate companies by April 2016, ahead of the schedule set by the power industry reform law enacted in 2013. It also plans to embark on the electricity retail business in parts of Japan that are currently serviced by other regional power monopolies when the second phase of the reform to liberalize electricity retail starts in 2016.

While further streamlining its operations, Tepco should explore these new avenues of business growth, rather than seek a return to its old model that depended on nuclear power for profitability.

TEPCO paid far too much for goods and services

January 10, 2013

Tepco overpaying to procure goods, services: contract-screening panel

http://www.japantimes.co.jp/news/2014/01/10/national/tepc-overpaying-to-procure-goods-services-contract-screening-panel/#.Us_wu7TrV1s

Kyodo

An in-house Tepco panel has found that the financially troubled utility paid **two to five times more than reasonable levels in buying goods and services to run its operations.**

The panel's investigation found that Tokyo Electric Power Co. came up with a quote of ¥21 million for work at one of its nuclear power plants that the panel said could be reduced by ¥10 million.

It also estimated that work for laying underground cables could be reduced by as much as 33 percent by opening the bid to more businesses.

The panel even found a case where a quote for daily wages of an employee was inflated to ¥49,000 from an original estimate of ¥12,000 as a result of farming out the work to multiple layers of subcontractors.

he panel even found a case where a quote for daily wages of an employee was inflated to ¥49,000 from an original estimate of ¥12,000 as a result of farming out the work to multiple layers of subcontractors.

The panel, made up of experts hired from outside, is tasked with investigating contracts worth ¥1 billion or more at the utility as it struggles to contain the Fukushima No. 1 nuclear plant catastrophe. Since October 2012, the panel has helped achieve cost cuts of around ¥17 billion, according to Tepco.

“As the utility has received government funds and asked the public to share the burden, it needs to slim down even further,” panel Chairman Sakon Uda said.

Under its restructuring plan, Tepco aims to achieve ¥4.82 trillion in cost reductions between fiscal 2013 and 2022 through such measures as opening at least 60 percent of procurement to competitive bidding.

[Waste site referendum
NARAHARA, Fukushima Pref.

Jiji

A group of Fukushima residents in the fallout-hit town of Naraha on Friday requested that a local ordinance be drafted to hold a referendum on accepting interim nuclear waste storage in the municipality.

Such a facility would be a disincentive for young residents to return, said Keiichi Matsumoto, who is leading the group. Matsumoto, 65, stressed that residents should be given an opportunity to make a decision on the issue.

The group issued the request directly to Naraha Mayor Yukiei Matsumoto. The mayor will convene a municipal assembly within 20 days and submit a draft ordinance to enable the proposed vote along with his own opinion on the ordinance.

Last month, the group presented a petition for such an ordinance to the municipal board of election. The board confirmed there were 2,151 valid signatures, far more than the 126 (one-50th of the voting population) required for an ordinance.

Naraha is one of the municipalities the central government has asked to host interim facilities for storing radioactive soil and other waste.

The Naraha government is ready to consider accepting an interim facility for low-level radioactive waste but not high-level contaminated soil.]

Nuke industry recruits

January 12, 2013

Nuclear industry holds recruiting event in Tokyo

http://www3.nhk.or.jp/nhkworld/english/news/20140112_20.html

A nuclear industry organization held a recruiting event in Tokyo on Sunday.

Students who will graduate in the spring of 2015 gathered for the event featuring 22 companies and organizations. They included utility firms and reactor manufacturers.

The annual event is held in Tokyo and Osaka. It attracted 420 people, slightly more than the 388 who came last year, but still about one-fifth of the number before the nuclear accident in Fukushima.

Some companies are visiting universities around the country to recruit students.

A participant from a trading firm selling radiological equipment says he would like to recruit enough people to continue the business. He said the situation has become more difficult as fewer young people are studying subjects related to nuclear power generation.

Takuya Hattori heads the Japan Atomic Industrial Forum, which hosted the event. He says the industry needs to secure personnel, regardless of the government's nuclear policy.

He says a key issue is whether the industry can show it has an appealing future.

A 23-year-old student studying nuclear engineering at a graduate school in Tokyo says he wants to work for a plant maker that manufactures reactors to support the decommissioning in Fukushima and to develop equipment that secures nuclear safety.

Another 23-year-old student, who is studying radiation at a graduate school in Tokyo and is from Fukushima, says he felt powerless when the nuclear accident occurred.

He said his parents don't want him to work in the industry, but he wants to be involved in the decommissioning work and contribute to the reconstruction of his home prefecture.

A 23-year-old woman, who is studying the removal of radioactive substances and is also from Fukushima, says she was shocked by the accident and started to study the subject in graduate school.

She said she wants to enter a company that is involved in decontamination so that she can help Fukushima.

"A step back about 20 years" (Japan's energy plan)

<http://www.japantimes.co.jp/opinion/2014/01/12/commentary/japan-goes-back-to-the-future-to-affirm-energy-foundation/#.UtLOkbSnGSp>

Japan goes back to the future to affirm energy 'foundation'

by Philip White

Jan 12, 2014

ADELAIDE, AUSTRALIA – On Dec. 6 the Japanese government released a new draft Basic Energy Plan for public comment. This will replace the 2010 BEP, which is still legally current despite the fact that its foundations were blown away by the March 11, 2011, nuclear accident at the Fukushima No. 1 plant.

In September 2012, the then Democratic Party of Japan (DPJ) government issued an "Innovative Strategy for Energy and the Environment," which set the unprecedented goal of phasing out nuclear power by 2039. But this did not have the same legal status as the BEP, and when the Liberal Democratic Party (LDP) won back power in the December 2012 election, it declared that it would review the DPJ's strategy from scratch, stating that it did not support a nuclear phase-out.

The recently released draft BEP goes as close as possible to preserving the pre-Fukushima nuclear status quo, but with all nuclear power plants currently closed down and public opinion still strongly in favor of a nuclear phase out, it was unable to set ambitious targets for nuclear energy.

The 2010 BEP aimed for 50 percent of electricity generation from nuclear power by 2030, with at least 14 new nuclear power plants being constructed in that time, but the recently released draft eschews targets altogether, settling instead for qualitative statements affirming the continuing role of nuclear power. It states that nuclear energy is an "important baseload power source that serves as a foundation" for the stability of Japan's energy supply.

The word "foundation" was added for emphasis after the draft was initially released, even though one of the drafting committee members pointed out that over-emphasis reduces credibility.

An aspect of the DPJ's "Innovative Strategy" that attracted criticism from all sides was the nuclear fuel-cycle policy. The strategy purported to maintain the existing policy, which meant reprocessing all spent

nuclear fuel to separate plutonium, at the same time as phasing out the proposed means of consuming that plutonium, namely using it as fuel in nuclear reactors (be they standard light-water reactors or fast-breeder reactors). Besides domestic criticism of this contradiction, it was also criticized by officials in the U.S. government who were concerned about the proliferation implications of more plutonium stockpiles.

Economy, Trade and Industry Minister Toshimitsu Motegi jumped on this contradiction during his Dec. 6 press conference announcing the draft BEP. He implied that the new draft resolved this problem because it states that nuclear power plants will continue to operate, but in fact the draft gives no indication of what steps will be taken to ensure that Japan's plutonium stockpile does not grow.

Japan now has 44 tons of separated plutonium (enough to make over 5,000 nuclear weapons), 34.9 tons stored in Europe and 9.3 tons stored in Japan.

Given the push to restart the Rokkasho Reprocessing Plant, the very limited capacity to consume plutonium even if permission is given to restart some of Japan's idled nuclear reactors, and the fact that Japan does not yet have a fuel fabrication plant designed to manufacture plutonium-based fuel for light-water reactors, it is inevitable that Japan's in-country plutonium stockpile will grow if reprocessing resumes.

Even more back to the future than the draft BEP contents was how the BEP was produced. After the Fukushima No. 1 nuclear plant accident, the DPJ government commenced a review of energy and environment policy. After deliberations in a committee that included more or less equal numbers of nuclear critics, proponents and neutral people, in June 2012 three scenarios were announced — based on 0 percent, 15 percent and 20 to 25 percent of electricity generation from nuclear energy. In July-August, these scenarios were put to a broad national debate, the outcome of which was that a clear majority of the public supported a nuclear phase-out. The national debate played a crucial role in pushing the DPJ government to support a nuclear phase out in its "Innovative Strategy."

Besides repudiating the DPJ's goal of phasing out nuclear energy, the LDP government also revamped the policy-drafting committee, drastically reducing the number of nuclear critics. The chairman, Akio Mimura, who had played a problematic role in the DPJ review, was retained. He became even more outspoken in his support of nuclear energy and did not hesitate to make disparaging remarks about the contributions of the two remaining nuclear critics on the committee.

But the clearest evidence of the reversion to the old ways was the manner in which public comments on the draft BEP were called. The draft was produced by the secretariat (provided by the Agency for Natural Resources and Energy) without consultation with committee members.

It was said to be based on the committee's discussions, but there was no indication of how members' views were reflected. When it was presented to the committee on Dec. 6, many of the members said they had not even had time to read it, yet it was released for public comment on the same day.

At the following meeting, held Dec. 13, a draft slightly amended on the basis of comments at the previous meeting was tabled, but the deadline for public comments was only extended two days to Jan. 6. Chairman Mimura spoke as if the committee would probably not reconvene before a Cabinet decision was made on the BEP sometime in January.

Presumably some formal response to the public comments will be produced, but it seems that the government does not regard it as necessary for the committee to be given a chance to comment on the public comments. Apparently there are no plans for public hearings to be held.

From a process perspective, this represents **a step back about 20 years**. The first official example of public participation in Japan's nuclear energy policymaking process occurred in 1994. Before that, there was no public participation and policymaking committees were held in secret. A major step toward greater public participation and disclosure of information occurred after the December 1995 sodium leak and fire at the Monju fast breeder reactor. Although public participation was not conducted in good faith, at least lip service was paid. It seems that the current government has decided that it doesn't even need to pay lip service.

No doubt this is partly due to the LDP government's determination to totally repudiate the DPJ government's record. A precedent was established with the DPJ's 2012 national debate on energy policy. For the first time the public was allowed to exert influence on energy policy. But for the nuclear industry this was a precedent they did not want repeated ever again.

Some LDP politicians support a phase-out of nuclear energy, and popular former LDP Prime Minister Junichiro Koizumi has come out strongly in favor of a nuclear phase out, but the current LDP hierarchy has been working overtime to protect the nuclear industry.

What with rescuing Tokyo Electric Power Co., whose management led to the Fukushima nuclear disaster, Prime Minister Shinzo Abe acting as chief salesman for nuclear exports, and now this gung-ho approach to energy policymaking, it is back to the future turbocharged.

Philip White is a Ph.D. student at Adelaide University's Center for Asian Studies. He was working as international liaison officer for the Tokyo-based Citizens' Nuclear Information Center at the time of the Fukushima No. 1 nuclear plant accident.

Gov't approves TEPCO's business plan

January 15, 2013

Industry minister approves TEPCO's revival plan based on reactor restart

http://ajw.asahi.com/article/behind_news/politics/AJ201401150089

REUTERS

The trade ministry on Jan. 15 approved a revival plan for Tokyo Electric Power Co., the utility responsible for the Fukushima nuclear disaster, its second attempt at restoring its battered finances.

The plan hinges on TEPCO restarting its Kashiwazaki-Kariwa nuclear power plant to cut fossil fuel costs, a contentious undertaking staunchly opposed by the local governor.

An earlier plan by TEPCO outlining a revival after its Fukushima plant was hit by a massive earthquake and tsunami in 2011, triggering triple meltdowns at the site, had to be torn up because it could not restart Kashiwazaki.

"As for the restart of Kashiwazaki-Kariwa ... this is simply an assumption built into the financial plan," industry minister Toshimitsu Motegi said as he gave formal approval of the plan to TEPCO President Naomi Hirose.

The previous revival plan revolved around a Kashiwazaki restart in early 2013. The new plan envisages a restart of two reactors at the station in July.

Motegi and Hirose said there may be a time lag between the plan's assumption and any restarts.

The recovery of Fukushima Prefecture, dealing with compensation for those who lost homes and businesses and decommissioning the damaged plant are national priorities, Motegi told Hirose.

"TEPCO will throw all available resources at taking responsibility for Fukushima. We will compensate every last person and the company has many things to do in order for residents to return quickly," Hirose said.

The company, which is majority owned by the government after an earlier bailout, said in the plan it may increase electricity prices if there are long delays in the restart schedule.

The new plan sees deeper cost cuts and more staff reductions than in the previous version. TEPCO says it is aiming to report recurring profit of 167.7 billion yen (\$1.62 billion) in the year through March 2015.

The utility said it would seek savings on fuel purchases of 650 billion yen annually by buying supplies in partnership with other companies.

POLITICAL DEBATE

The disaster at Fukushima, the worst nuclear crisis since Chernobyl in 1986, eventually brought about the halt of all nuclear power plants in Japan so they could be vetted under tougher new standards.

Opposition to nuclear power remains strong in the country and is set to become a major issue in an election next month for governorship of metropolitan Tokyo, which owns a stake in TEPCO.

Most candidates are opposed to restarting nuclear power plants and one, former prime minister Morihiro Hosokawa has received the strong backing from Junichiro Koizumi, one of Japan's most popular leaders, who ruled between 2001 and 2006.

In the nearly three years since the disaster, the utility has been plagued by a string of setbacks at the Fukushima station north of Tokyo, including leaks of highly radioactive water last year, prompting the government to step in with more support.

The local governor in Niigata, where Kashiwazaki is located, has been a vocal opponent of TEPCO's management and has questioned whether the company has the ability to operate a nuclear station, following the failings in its preparation and response to the disaster. He has publicly called for the utility's liquidation.

Govt. approves TEPCO's 10-year business plan

http://www3.nhk.or.jp/nhkworld/english/news/20140115_39.html

Japan's government has approved a 10-year business plan from Tokyo Electric Power Company that relies on restarting nuclear reactors to turn its business around.

Industry minister Toshimitsu Motegi on Wednesday gave approval of the plan to TEPCO President Naomi Hirose. The utility was effectively put under state control after the 2011 nuclear crisis at its Fukushima Daiichi plant.

The chairman of the steering committee for the state-backed fund for nuclear accident compensation, Akio Harada, was also present.

Motegi told Hirose that the Japanese people are taking a critical look at the company. He said TEPCO must make efforts at reform with a resolve to be reborn as a new company.

Hirose replied that he regards the plan as a promise to the people. He said the utility will use all its management resources to fulfill its responsibilities related to the accident.

Under the plan, TEPCO hopes to begin restarting reactors in stages at its Kashiwazaki-Kariwa plant in Niigata Prefecture from July.

The utility envisions earning an annual pretax profit of between 950 million and 1.4 billion dollars by resuming nuclear power generation and rebuilding aging thermal power plants.

The utility says it will then gradually lower electricity fees by up to 9.6 billion dollars annually over the following decade.

The firm plans to set aside 19 billion dollars to create a task force to deal with contaminated water and to dismantle reactors at the Fukushima plant.

The business plan also says profits from sales of TEPCO shares held by the state-backed compensation fund will be used for decontamination efforts.

The utility plans to close all 10 of its branch offices in its service area and to reduce its group workforce by 2,000 employees.

TEPCO says these efforts will cut costs by about 46 billion dollars, helping the company become a competitive business.

TEPCO's plan " a pie in the sky idea"

January 16, 2014

Niigata governor calls TEPCO's turnaround plan a 'pie in the sky'

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201401160065>

Government officials in Niigata Prefecture criticized Tokyo Electric Power Co.'s rebuilding plan that includes bringing idled nuclear reactors back online.

They questioned whether the utility could implement the plan according to schedule and raised doubts about TEPCO's commitment to safety.

TEPCO's plan, approved by the central government on Jan. 15, calls for restarting four reactors at the Kashiwazaki-Kariwa nuclear power plant in Niigata Prefecture. The utility aims to resume operations at the plant's No. 6 and 7 reactors as early as July.

Niigata Governor Hirohiko Izumida bluntly called the plan "a pie in the sky idea."

Despite his critical stance, Izumida met with TEPCO President Naomi Hirose on Jan. 16 to hear how the company plans to rebound from the accident at the Fukushima No. 1 nuclear plant caused by the Great East Japan Earthquake and tsunami on March 11, 2011.

"Shareholders and banks have not taken responsibility (for the accident), and it is a ridiculous plan from a safety standpoint," Izumida said at the meeting.

The governor has never hidden his distrust of the utility. He strongly objected when TEPCO announced plans in July 2013 to submit an application to the Nuclear Regulation Authority for checks to determine if the No. 6 and 7 reactors at the Kashiwazaki-Kariwa plant complied with the government's new safety standards.

Izumida was incensed because the utility failed to notify the Niigata prefectural government beforehand that it was planning to submit the application, part of the process toward resuming operations at the two reactors.

Although the governor did conditionally approve the filing of the application in September, he has long insisted that he would only consent to the resumption of reactor operations after the investigation and review of the Fukushima nuclear accident are completed.

Izumida has been especially critical of the fact that TEPCO has yet to clearly explain why it took nearly two months after the onset of the nuclear disaster to admit that meltdowns had occurred at the Fukushima plant.

“A major point of the review of the accident is to determine if (TEPCO) is a company that can be trusted,” Izumida said Jan. 15.

For its part, TEPCO is hoping that the NRA will soon determine the facility complies with the stricter safety standards so that the two reactors can be restarted in July or August.

The utility also hopes to bring back online the No. 1 and 5 reactors by February 2015 after safety upgrades are finished.

The mayors of the two municipalities that host the Kashiwazaki-Kariwa plant also made clear they need more reassurances before giving their consent to the resumption of operations.

“A major precondition will be the implementation of measures to secure the safety of the plant,” said Kashiwazaki Mayor Hiroshi Aida.

Kariwa Mayor Hiroo Shinada said TEPCO’s plan will not automatically lead to reactor restarts. “The rebuilding plan is the basis for injecting public funds by the central government, while the resumption of operations at the plant is a completely different issue,” he said.

In Fukushima Prefecture, officials were focusing on another measure in TEPCO’s turnaround plan to prevent highly radioactive water from leaking into the groundwater and ocean at the Fukushima No. 1 plant.

The plan calls for purifying all water contaminated by radioactive materials, with the exception of tritium, by the end of fiscal 2014.

“We would welcome any measure that contributes to the stability of the Fukushima No. 1 plant,” Tetsu Nozaki, head of the Fukushima Prefectural Federation of Fisheries Cooperative Associations, said.

The federation has postponed plans to resume fishing due to repeated discoveries that contaminated water was reaching the ocean.

In August 2013, about 300 tons of highly radioactive water was found to have leaked from storage tanks at the Fukushima plant. That forced the postponement of fishing trials off the coast of Iwaki, which would have been the first attempt to resume fishing operations since the start of the Fukushima nuclear accident.

“If the contaminated water can truly be controlled, that would lead to a resumption of the fishing industry,” Nozaki said. “I hope they take measures to prevent contaminated water, be it from the rain or groundwater, from flowing into the ocean.”

Niigata governor criticizes TEPCO business plan

http://www3.nhk.or.jp/nhkworld/english/news/20140115_25.html

The governor of Niigata Prefecture, which hosts a nuclear plant run by Tokyo Electric Power Company, has criticized the utility's 10-year business plan.

Tokyo Electric, or TEPCO, says it hopes to revive itself as a profitable company. The firm must also deal with the crippled Fukushima Daiichi nuclear plant.

Under the plan, TEPCO hopes to resume operations of reactors at its Kashiwazaki-Kariwa plant in the prefecture on and after July.

Niigata Governor Hirohiko Izumida said on Wednesday that the plan appears impossible to realize.

He said a company that has yet to sum up the 2011 nuclear disaster at the Fukushima plant is unqualified to run nuclear reactors.

Izumida said he plans to meet TEPCO President Naomi Hirose on Thursday.

The governor said he will tell Hirose that the firm should fully verify the Fukushima plant accident. He also hinted that it's too early to discuss whether to restart nuclear reactors.

Jan. 15, 2014 - Updated 06:21 UTC

Antinuke lawyer refused taxi ride to Monju reactor

January 16, 2014

Taxi company under fire for refusing ride to anti-nuclear lawmaker

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201401160046

By SAWAAKI HIKITA/ Staff Writer

The transport ministry has admonished a taxi company in Tsuruga, Fukui Prefecture, for denying service to a Liberal Democratic Party lawmaker due to his opposition to nuclear power.

On Jan. 7, an aide to Masatoshi Akimoto, a newly-elected Lower House lawmaker from Chiba's No. 9 constituency, called the taxi company to request a car so his boss could visit the Monju prototype fast-breeder reactor in Tsuruga for an inspection.

The employee in charge of dispatching taxis used the Internet to look into Akimoto's stance on nuclear energy issues. The employee then told the aide the taxi company's main customers are associated with the nuclear power industry. He then said, "We are rejecting people who take an anti-nuclear stance (and are seeking to abolish nuclear power plants)."

The transport ministry called the denial of service unlawful after being contacted by Akimoto. Ministry officials told the company its policy was in violation of the Road Transportation Law, which stipulates that taxi companies are required to accept all customers, with a few exceptions. The company was instructed to change its policy.

Chief Cabinet Secretary Yoshihide Suga also criticized the taxi company at a Jan. 15 news conference, saying, "There is not justification whatsoever for what happened."

It is extremely unusual for a taxi company to refuse fares on the basis of a person's stance on a political issue.

The taxi company later told The Asahi Shimbun, "The employee in charge of dispatching taxis apparently thought that by accepting customers who take an anti-nuclear stance, our company will lose jobs."

Taxi firm in 'nuclear city' refuses to provide car to anti-nuclear lawmaker

<http://mainichi.jp/english/english/newsselect/news/20140115p2a00m0na004000c.html>

TSURUGA, Fukui -- An employee of a taxi company here refused to provide a car to Liberal Democratic Party House of Representatives legislator Masatoshi Akimoto because the ruling party lawmaker stands against nuclear power, it has been learned.

According to Akimoto and the taxi firm, the lawmaker's secretary called the company on Jan. 7 to make a reservation for a taxi which Akimoto wanted to use for his tour of nuclear facilities in the city sometime in the second half of this month.

A company official in charge later found through the Internet that Akimoto was in fact insisting on breaking with nuclear power generation. The official then called the lawmaker's office to say that the company was not in a position to provide taxi services to anti-nuclear people because many people related to the nuclear industry use taxis there. The city of Tsuruga hosts the Monju prototype fast-breeder reactor and the Tsuruga Nuclear Power Plant.

The taxi company apologized to Akimoto although it said its employee had acted on his own judgment. The Ministry of Land, Infrastructure, Transport and Tourism's Chubu District Transport Bureau in Nagoya confirmed the fact and urged the taxi company to prevent similar misdeeds.

Akimoto advocates a policy of gradually reducing the country's reliance on nuclear power and withdrawing from the nuclear fuel cycle program.

The company told the Mainichi Shimbun, "It is not our company's policy to refuse to take reservations. There was a lack of guidance for employees." Akimoto said, "That's something that should never happen."

The Nuclear Regulation Authority has recognized that the Tsuruga nuclear plant sits on an active fault, while the Monju prototype fast-breeder reactor has had a string of problems including skipping on equipment inspections. Therefore, there are no prospects that the nuclear facilities will be reactivated in the near future. The situation is such that the regional economy in Tsuruga, which is dependent on nuclear power projects, has slipped into stagnation.

January 15, 2014(Mainichi Japan)

TEPCO rejects arbitrator's proposal for compensation

January 15, 2014

TEPCO rejects arbitration body's settlement plan

http://www3.nhk.or.jp/nhkworld/english/news/20140115_33.html

The operator of the damaged Fukushima Daiichi nuclear plant has reportedly rejected an arbitrator's proposal to settle compensation claims by evacuees over their health concerns.

A group of evacuees from Iitate, a village located near the plant, told reporters on Wednesday that Tokyo Electric Power Company had told them it cannot accept the settlement.

They quoted the utility as saying that the grounds for the settlement are not clear.

About 180 former residents of the village's Nagadoro district filed claims with the Center for Settlement of Fukushima Nuclear Damage Claims, which was set up by the science ministry.

They are seeking compensation for the anxiety they've experienced over potential health problems due to radiation exposure. They say they were exposed to radiation for longer than necessary because officials

were late in issuing an evacuation order for the district.

The arbitrator decided last year to recommend that the utility compensate the claimants. It began presenting specific settlement proposals to the villagers last month.

Lawyers for the residents say TEPCO should accept the settlement because the utility earlier promised to respect the arbitrator's proposals.

TEPCO replied that it is trying to confirm the center's views on the proposal and that it will take swift action based on the findings

TEPCO's business plan & safety

January 16, 2014

Niigata governor criticizes TEPCO business plan

http://www3.nhk.or.jp/nhkworld/english/news/20140116_31.html

The governor of the prefecture that hosts Tokyo Electric Power Company's Kashiwazaki-Kariwa nuclear power plant has criticized the utility's turnaround plan for failing to put top priority on safety.

Niigata Governor Hirohiko Izumida made the criticism when the firm's president Naomi Hirose visited him on Thursday to explain the 10-year business plan.

Izumida said the company fails to fully look into the accident at its Fukushima Daiichi nuclear power plant, and that the plan puts safety considerations on the back burner.

The central government approved the plan on the previous day. Its main pillar is restarting reactors at the Kashiwazaki-Kariwa plant in stages starting in July, to regain the company's profitability.

Hirose told the governor that the timing of the restart was set only tentatively to draft the earnings plan. He said it never represents a formal schedule.

Izumida said in response that it was regrettable that the utility made no consultation with the prefecture in deciding on a plan that affects the plant's safety.

The governor said Tokyo Electric faces financial difficulty because it caused the accident. He said it's essential to fully examine the disaster in efforts to build a system of corporate governance to prevent a recurrence. Izumida later told reporters that he will keep watch on how the company scrutinizes the Fukushima crisis.

Hirose said the firm will do what should be done, including a probe into Fukushima and formulation of a plan to prevent disasters and evacuate neighborhood residents during emergencies.

Alternative Dispute Resolution & compensation

January 18, 2014

Lawyers probe TEPCO's snubbing of out-of-court settlement proposals

<http://mainichi.jp/english/english/newsselect/news/20140118p2a00m0na014000c.html>

The Fukushima Bar Association (FBA) has begun investigating Tokyo Electric Power Co. (TEPCO)'s refusal to accept non-binding out-of-court settlement proposals to resolve monetary disputes with its employees.

The proposals are being offered by a governmental alternative dispute resolution (ADR) entity set up to handle disputes over compensation for the Fukushima No. 1 Nuclear Power Plant disaster. For residents to get compensation from TEPCO, first they make a request to the power company, which calculates how much they can receive. Residents who find this amount unreasonable can take their cases to the ADR entity.

The ADR group is a sub-organization of a committee that decides on the national government's policy on nuclear disaster compensation. The group's lawyers hear the arguments of both sides in each dispute before proposing a settlement.

Though the entity's proposals for settlement disputes are not legally binding, TEPCO has said it will respect them -- one of the "three vows" it made concerning compensation under a plan released Jan. 15. However, despite this vow, its actions until now indicate it has taken quite the opposite stance.

On Jan. 4, the Mainichi Shimbun reported that TEPCO had rejected a ruling by the ADR entity over a dispute between the company and its employees regarding compensation payments for the nuclear disaster. TEPCO was in effect demanding the return of a portion of some employees' compensation payments, but the ADR entity rejected TEPCO's arguments and recommended a resolution in which the company would instead pay millions of yen more in compensation.

Following this news, the FBA decided to begin an investigation, but it is not the FBA's first such move. In September last year, the association released a statement in the name of its chairman demanding the government strongly urge TEPCO to follow the settlements proposed by the ADR entity.

On Jan. 15, the bar association sent documents to 177 members that read in part, "If the situation is as it has been reported, nothing has been done (by the government to urge TEPCO to follow the proposals)." The documents ask for any information regarding instances of TEPCO rejecting the ADR entity's proposals.

Meanwhile, the Mainichi Shimbun learned from a source about two more cases of TEPCO rejecting settlement proposals, both involving employees working at or near the nuclear plant. Their compensation payments have been cut even though their homes are in areas restricted due to radiation contamination, forcing them to continue living away from their homes.

TEPCO's refusals to follow the ADR entity's proposals have not been limited to disputes with its employees either, as one case involves a non-employee in Iitate, Fukushima Prefecture.

"When TEPCO refuses a settlement proposal, the disaster victims have the large burden of filing suits forced upon them," said Yuji Wakasugi, vice chairman of the FBA. "We will look at the results of our investigation and consider whether we need to act further on this issue."

The Mainichi Shimbun asked TEPCO for the number of ADR entity proposals it has rejected, but a representative of the company's public relations department would only say there were "multiple" cases.

TEPCO's promises

January 21, 2014

Fukushima Daiichi NPS Prompt Report 2014

Fukushima Daiichi NPS Prompt Report (Jan 21,2014)Recent topics:TEPCO ANNOUNCES SWEEPING NEW PLAN WITH GOVERNMENT FOR FUKUSHIMA RENEWAL, COMPENSATION, AND REORGANIZATION

http://www.tepco.co.jp/en/press/corp-com/release/2014/1233729_5892.html

TOKYO-A sweeping new plan that will provide for a decades-long Fukushima cleanup, compensate victims, and put Tokyo's electric utility on a solid financial footing was announced by the Tokyo Electric Power Company on January 15.

The plan was assembled by TEPCO and Japan's government, with the cooperation of a consortium of financial institutions that will provide credit and liquidity over the next several years. It calls for ultimately returning TEPCO to the private capital markets, easing the burden on Japan's taxpayers, while boosting compensation to victims of the March 2011 disaster and bolstering cleanup efforts.

It also calls for creation of a new entity within TEPCO that will be exclusively focused on the Fukushima decommissioning and decontamination activity. The unit will incorporate experts from outside the company, including international experts.

"This plan is a truly national, and in some ways international, effort that will address the human, environmental, and economic challenges that lie ahead," said TEPCO President Naomi Hirose. "The plan provides for a better future for the people of Fukushima, a durable structure for the decommissioning work, and a path to financial independence for our company so that we can continue to serve the people of Japan while minimizing the burden on the public."

TEPCO needs long-term growth to continuously generate resources for fulfilling its responsibility in Fukushima. TEPCO itself will cut 1.4 trillion yen additionally in expenses and invest 750 billion yen over 10 years. The plan also calls for financial institutions to provide 2 trillion yen in credit to support investment for long-term growth. The plan will provide TEPCO with a holding company structure in April 2016 that will enable TEPCO to address both responsibility in Fukushima and competitiveness to survive in the fully liberalized electricity market.

As part of the plan, TEPCO pledges to ensure that every eligible individual will receive compensation "down to the last person," with total compensation exceeding 5 trillion yen. It also pledges to make the compensation accurately and promptly, and to defer to the decisions of mediators.

At the Fukushima Daiichi plant itself, which was crippled by a tsunami following the March 2011 earthquake, the plan calls for additional resources and major improvements in water management, including cleaning of all contaminated water (except Tritium) within the next fiscal year. And it sets an ambitious goal of removing the nuclear fuel debris from at least one of damaged reactors by the first half of 2020. The plan incorporates the company's recently announced decision to turn undamaged units 5 and 6 into research centers that will enhance the ability to proceed with the cleanup and add to the overall decommissioning capabilities of the new entity.

A detailed summary of the plan may be downloaded at http://www.tepco.co.jp/en/press/corp-com/release/2014/1233624_5892.html.

President Hirose's comment for the release of the plan may be seen at <http://www.tepco.co.jp/en/corpinfo/overview/individual02-e.html>

TEPCO, Inc. is a provider of electricity to the Kanto region, which includes Tokyo and Yokohama. The company is headquartered in Tokyo. The Fukushima Daiichi Nuclear Power Station was struck by a tsunami after an earthquake that occurred in March 2011. For more information, please go to <http://www.tepco.co.jp/en/index-e.html>

Compensation: \$40 billion

21.01.2014_No19 / News in Brief

Tepco Expects Fukushima Compensation To Be USD 40 Billion

<http://www.nucnet.org/all-the-news/2014/01/21/tepco-expects-fukushima-compensation-to-be-usd-40-billion>

Unplanned Events & Incidents

21 Jan (NucNet): Tokyo Electric Power Corporation says it intends to “bolster” efforts to award compensation to those affected by the March 2011 Fukushima-Daiichi accident with total payouts expected to be in the region of 40 billion US dollars (USD) (29 billion euros).

In documents posted in English on its website, Tepco also said that as part of a new comprehensive business plan, it will improve the regime it has established for rebuilding the area around the nuclear station.

The utility, now under government control, will increase the number of personnel involved in the rehabilitation of Fukushima prefecture and create an internal decommissioning company to handle all decommissioning issues at the facility.

Decommissioning costs have been put at around USD 20 billion, the plan reveals.

Tepco said it intends to create employment in Fukushima by building a coal-fired thermal power plant and a number of research and development facilities.

The plan also involves pursuing the restart of at least two reactor units at the Kashiwazaki-Kariwa nuclear power station in northern Niigata prefecture.

The plan is a trilateral partnership between Japan’s central government, Tepco and financial institutions.

It focuses on – and substantially increases – compensation. It also addresses the decommissioning of Fukushima-Daiichi, nuclear safety and Tepco’s future business operations.

An agreement between Tepco and its biggest lenders includes more than USD 9.6 billion in cost cuts.

The 'New Comprehensive Special Business Plan' is online in English:

TEPCO sells hospital to real estate developer for 10 billion yen

January 24, 2014

Tepco selling hospital to Tokyo Tatemono

<http://www.japantimes.co.jp/news/2014/01/24/business/tepco-selling-hospital-to-tokyo-tatemono/#.UuJhbLQo-aQ>

JJI, Kyodo

Tokyo Electric Power Co. has reached a deal to sell an affiliated hospital to major real estate developer Tokyo Tatemono Co. for ¥10 billion.

The building and land in the Shinanomachi district of Shinjuku Ward owned by Tokyo Denryoku Hospital will be transferred to Tokyo Tatemono on March 31.

The building is likely to be demolished because Tokyo Tatemono is considering residential and commercial use for the site.

Tepco initially planned to keep the hospital even after the March 2011 triple meltdown crisis started at its Fukushima No. 1 nuclear plant.

But the utility decided to sell the facility in June 2012 when then-Vice Tokyo Gov. Naoki Inose strongly demanded its sale at the firm's general shareholder meeting. The Tokyo Metropolitan Government is a major shareholder of Tepco.

The hospital, built in 1979, stands on a 5,609-sq.-meter site. Only Tepco employees and former employees can use the hospital, but its occupancy rate was only 30 percent.

Scandal-tainted hospital chain Tokushukai had planned to acquire the hospital and Tokushukai founder Torao Tokuda told Inose about it in November 2012.

Tokushukai joined bidding for the hospital sale but withdrew after the Tokyo District Public Prosecutor's Office raided the group last September over its suspected illegal electioneering.

Inose, who was elected Tokyo governor in December 2012, stepped down from the post last month following the revelation he had received ¥50 million from the scandal-hit group.

Prosecutors have been investigating whether the ¥50 million was in exchange for Inose's favorable treatment for Tokushukai's attempt to acquire the hospital.

IAEA Report Praises Japan's Efforts To Reduce Residual Radiation Doses

<http://www.nucnet.org/all-the-news/2014/01/24/iaea-report-praises-japan-s-efforts-to-reduce-residual-radiation-doses>

Unplanned Events & Incidents

24 Jan (NucNet): The International Atomic Energy Agency has recognised Japan's efforts to reduce annual residual radiation doses in areas affected by the Fukushima-Daiichi accident to less than one millisievert a year (mSv/yr), but stressed **that this target is a long-term goal and cannot be achieved in a short time or through decontamination work alone.**

The final report of an expert mission that reviewed remediation and reconstruction efforts in Fukushima prefecture says progress has been achieved following the first IAEA remediation mission in October 2011, including the remediation of farmland and forest areas.

But the report says authorities must sustain current public communication efforts and improve them where necessary, especially with a view to explaining to the public that, in remediation situations, any level of individual radiation dose in the range of one to 20 mSv/yr is acceptable and "in line with international standards".

According to the report, Japan has allocated significant resources and is carrying out intense work to remediate areas affected by the Fukushima-Daiichi accident and promote the return of evacuees to their homes.

The report says comprehensive implementation of food safety measures is in place to protect consumers and improve consumer confidence in farm produce, and this is reflected in an increase in the economic value of the crops.

The report welcomes progress by municipalities and the national government in the development and establishment of temporary storage facilities for contaminated materials generated by remediation activities.

It says progress had been made towards the national government's creation of interim storage facilities, with the cooperation of municipalities and local communities.

The IAEA said in a statement that the Japanese authorities provided "comprehensive information" on their remediation programme.

The report is online: www.iaea.org/newscenter/focus/fukushima/final_report230114.pdf

Consumer money used by utilities to buy fund-raising party tickets

January 27, 2014

Utilities secretly buy tickets for pro-nuclear minister's fund-raisers

http://ajw.asahi.com/article/behind_news/politics/AJ201401270057

THE ASAHI SHIMBUN

Using money paid by consumers, nuclear plant operators have secretly bought tickets worth several million yen a year for fund-raising parties of Akira Amari, a pro-nuclear Cabinet minister, since 2006, The Asahi Shimbun learned.

The utilities have kept each ticket purchase at 200,000 yen (\$2,000) or less to prevent their names from appearing in the political fund reports of Amari, the minister in charge of economic revitalization, sources said.

It was already reported that directors of electric power companies have made individual donations to the ruling Liberal Democratic Party, but **the utilities were found for the first time to have bought fund-raising party tickets with electricity fees paid by consumers.**

Amari, an LDP lawmaker with economic and industrial interests, exerts strong influence on energy policy and advocates reactivating idled nuclear reactors.

In July, he sought Niigata Governor Hirohiko Izumida's approval of Tokyo Electric Power Co.'s application for safety screening in preparation for restarting two reactors at its Kashiwazaki-Kariwa nuclear plant.

Amari's office told The Asahi Shimbun it handles and reports political funds appropriately. It declined to discuss details beyond those entered in reports.

Nine regional utilities that operate nuclear plants bought tickets for Amari's parties in 2006, when he became minister of economy, trade and industry, according to senior officials of electric power companies. The electric power industry falls under the jurisdiction of that minister.

The companies together spent about 1 million yen for each party. Their share was determined based on the size of company operations, the sources said.

The arrangement was maintained for the following years, and affiliates of the utilities sometimes joined.

TEPCO dropped out of the framework after the triple meltdown at its Fukushima No. 1 nuclear power plant following the March 2011 Great East Japan Earthquake and tsunami.

But the eight other utilities have continued to spend about the same amount on tickets for Amari's parties, the sources said.

Amari's fund management organization held an average of nine fund-raising functions a year between 2006 and 2012, according to its political fund reports.

The utilities are believed to have spent an average of several million yen a year on more than one party, the sources said.

One official of a utility whose share is 10 percent or less said the company spent about 1 million yen in some years, indicating that the utilities' purchases totaled 10 million yen or so in certain years.

TEPCO initially played a leading role in the joint purchase, and it evaluated Diet members based on their influence on and cooperation with nuclear power policy.

Amari was one of the politicians to whom the nuclear power industry attached priority, and the value of ticket purchases for his fund-raisers was among the largest for lawmakers, the sources said.

The nine utilities declined to comment on individual purchases of party tickets. Kansai Electric Power Co. added that it never buys tickets in cooperation with other utilities.

Toru Nakakita leaves NHK over nukes

January 30, 2014

NHK Asks Expert Not to Talk about N-Power on Radio

<http://jen.jiji.com/jc/eng?g=eco&k=2014013000599>

Tokyo, Jan. 30 (Jiji Press)--A program director at Japan Broadcasting Corp. (NHK) has asked Toyo University Prof. Toru Nakakita not to give his views on nuclear power on radio in order to avoid impacting the upcoming Tokyo gubernatorial election, Nakakita said Thursday.

The director asked Nakakita, 62, to speak about something else in a morning radio program, but he turned down the request and pulled out of the program, according to the professor.

The program in question is a three-hour show aired from 5 a.m. on every weekday.

As Nakakita was scheduled to speak in a short segment on business in Thursday's show, he sent the director a written outline on Wednesday afternoon of what he planned to say.

He wrote he would explain, from the perspective of an economist, that operational costs at nuclear power plants are rising to near the costs of power generation using coal or oil.

(2014/01/30-17:17)

NHK radio regular quits after anti-nuclear commentary nixed

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201401300075

THE ASAHI SHIMBUN

A veteran radio show commentator quit his job at Japan Broadcasting Corp. (NHK) after the public broadcaster told him to drop the subject of nuclear power during the Tokyo gubernatorial election, sources said.

For about 20 years, Toru Nakakita, a professor of economics at Toyo University, had been in charge of the “Business Outlook” segment of the “Radio Asa Ichiban” show aired weekdays from 5 a.m. to 8 a.m. on NHK Radio Daiichi.

Nakakita said his original manuscript for the Jan. 30 program pointed out the increase in costs for the resumption of nuclear reactor operations, saying “damages to be paid in the wake of a nuclear plant accident are extraordinarily high.”

However, when he showed the manuscript to a program director on the day before the scheduled broadcast, Nakakita was asked to change the theme.

He said that NHK told him not to talk about “nuclear issues during the Tokyo gubernatorial election campaign period.” The election is scheduled for Feb. 9.

“We should have substantial debates precisely because it is the campaign period,” Nakakita said. “NHK reacted with excessive voluntary restraint, which shows a lack of awareness of the issue.”

NHK said its intention was different.

“We did not mean to refrain from broadcasting an anti-nuclear power debate,” an NHK official said. “During the Tokyo gubernatorial election, in which nuclear power generation is a major issue, presenting opinions from both sides is needed to secure impartiality. We asked (Nakakita) to change the subject, judging that the program presented by one person would not meet this goal.”

Nakakita, formerly with the Foreign Ministry, served as the deputy chairman of the Council for the Asian Gateway Initiative in the first Shinzo Abe Cabinet.

Group lawsuit against GE Japan, Hitachi and Toshiba

January 31, 2014

1,400 sue makers of Fukushima nuke reactors

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201401310200>

THE ASAHI SHIMBUN

Hundreds of people filed a group action lawsuit Jan. 30 against the manufacturers of the reactors at the crippled Fukushima No. 1 nuclear power plant to apportion blame for the accident that occurred there in March 2011.

In their quest for compensation at the Tokyo District Court, the 1,400 plaintiffs argued that the companies bear responsibility for the emotional distress they suffered after the reactor meltdowns.

The plaintiffs include evacuees from the Fukushima disaster caused by the 2011 Great East Japan Earthquake and tsunami. They are suing General Electric Japan, Hitachi Ltd. and Toshiba Corp., which produced the reactors used at the facility, even though the nuclear damage compensation facilitation law stipulates that only facility operators have an obligation to pay reparations in the event of an accident.

"Funds for compensation paid by Tokyo Electric Power Co. to disaster victims are originally from electricity charges and taxpayer money," said Akihiro Shima, the plaintiffs' attorney, at a news conference in Tokyo the same day. It is unfair for reactor makers to shoulder no liability, the lawyer added.

Of the plaintiffs, 1,000 are Japanese, including 38 residents of Fukushima Prefecture. The remaining 400 are from South Korea, Taiwan and other countries and regions that have nuclear plants.

The plaintiffs' group argued that they "have suffered emotional pain from radiation exposure" or "were shocked and felt fear over the spread of radioactive substances after watching video footage of the accident."

The complainants insist that the nuclear damage compensation facilitation law is unconstitutional, and therefore invalid, because it prevents people from filing suits that question the responsibility of reactor makers.

One of the plaintiff attorneys emphasizes the lawsuit's significance.

"It is a lawsuit designed to drag the makers of the reactors out of hiding," said Hiroyuki Kawai, who is also representing TEPCO shareholders in a lawsuit they have filed against the utility's executives.

The amount of claimed compensation was set low--just 100 yen (\$1) per person--because the lawsuit is primarily intended to force the reactor makers to accept their responsibility.

January 30, 2014

Lawsuit filed against Fukushima plant makers

http://www3.nhk.or.jp/nhkworld/english/news/20140130_26.html

A group of about 1,400 people has filed a lawsuit against the 3 manufacturers of the Fukushima Daiichi nuclear station to seek compensation for the accident at the plant.

The group is demanding that Toshiba, Hitachi and General Electric of the United States pay 100 yen, or about one dollar, to each plaintiff in damages.

The plaintiffs include residents of Fukushima Prefecture and foreign countries.

Japan's Act on Compensation for Nuclear Damages holds only plant operators liable for compensation.

The plaintiffs say the exemption of plant manufacturers violates the Constitution.

They also say the plant makers did not take necessary measures although experts had pointed out the possibility of a major accident.

Lawyers for the plaintiffs said the exemption of manufacturers protects the nuclear plant industry.

They also said they want to expand the group to some 10,000 people.

All 3 firms declined to comment.

Jan. 30, 2014 - Updated 10:20 UTC

TEPCO: 190 billion yen profit in 9 months

February 1, 2014

TEPCO posts profit of 190 billion yen, expects return to black for fiscal 2013

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201402010032>

Electricity rate hikes helped Tokyo Electric Power Co., operator of the crippled Fukushima nuclear plant, post an ordinary profit of 189 billion yen (\$1.84 billion) for the first nine months of fiscal 2013.

The company also forecast a 57-billion-yen profit for fiscal 2013, which ends in March.

With its nuclear plants shut down for safety checks, **TEPCO said its fuel costs for thermal power plants totaled 2.07 trillion yen in the April to December period**, a year-on-year increase of 75 billion yen and the first time such expenses have exceeded 2 trillion yen.

But rate hikes increased revenue by 220 billion yen. The company also cut repair expenses by 53 billion yen by deferring work and trimmed personnel costs by 19 billion yen by curbing new hiring.

Changes to accounting rules allowed TEPCO to reduce extraordinary losses over the Jan. 31 delisting of the No. 5 and No. 6 reactors at the Fukushima plant to 40 billion yen. Before the industry ministry revised rules for reactor decommissioning last autumn, the company would have had to book 170 billion yen in one-time charges.

The utility was required to show prospects of an ordinary profit for fiscal 2013 to continue to receive funding from creditors.

Under its new rehabilitation plan approved by the government in January, TEPCO plans to secure a profit in fiscal 2014 on the condition that two reactors restart in summer at its Kashiwazaki-Kariwa nuclear power plant in Niigata Prefecture.

Reactivation, however, is far from guaranteed because nuclear regulators are looking into potential active faults beneath the plant.

Niigata Governor Hirohiko Izumida is also opposed to a restart.

Another secret deal

February 21, 2014

Abe: It was 'mistake' to deny secret nuke pact with U.S.

http://ajw.asahi.com/article/behind_news/politics/AJ201402010028

THE ASAHI SHIMBUN

Prime Minister Shinzo Abe said the government should never have denied its secret agreement with Washington that allowed U.S. warships to bring nuclear weapons into Japan.

"I think it was a mistake to keep (the arrangement) from the public," Abe told a Lower House Budget Committee meeting Jan. 31. "I want to show how the government thinks about this issue."

Abe was responding to former Foreign Minister Katsuya Okada of the opposition Democratic Party of Japan, who said, "Successive prime ministers cannot make an excuse if they are criticized for having lied to the public."

Abe's Liberal Democratic Party denied the existence of such an arrangement during its nearly uninterrupted decades-long reign of power until 2009.

In 2010, an expert panel under the DPJ-led government said Tokyo and Washington had "a secret agreement in a broad sense" that allowed U.S. warships carrying nuclear weapons to call on Japanese ports or pass through Japanese territorial waters.

Not on the same wavelength: Pr.Nakakita and NHK

January 31, 2014

Professor cancels radio appearance after NHK declines talk on nuclear power issue

<http://mainichi.jp/english/english/newsselect/news/20140131p2a00m0na009000c.html>

Public broadcaster NHK has declined to allow a regular guest on its radio program to talk about nuclear power on the grounds of the upcoming Tokyo gubernatorial election, leading him to cancel his appearance on the program.

Toru Nakakita, 62, a professor of economics at Toyo University, canceled his appearance on an NHK morning radio show after he was asked to change the subject for the program from the nuclear energy issue to something else, it was learned on Jan. 30.

Nakakita is a long-time regular guest on the program, which is titled "Radio Asa Ichiban" and is aired every morning from 5 a.m. Monday through Friday. He has had a monthly slot in the program's segment titled "Business Tenbo" (Business outlook) for more than 20 years. He had been scheduled to appear on the program on Jan. 30 to discuss the cost of restarting nuclear reactors and the risk of accidents at nuclear plants.

However, when he sent his script to NHK the day before his appearance, NHK staff in charge told him, "Please do not take up this subject because it could affect voting behavior."

Nakakita, in turn, insisted repeatedly that he was "not supporting any specific person" in connection with the Feb. 9 Tokyo election. He questioned NHK if he should change part of his script, including a sentence saying, "Economic growth can be achieved even with a zero-nuclear policy" -- a phrase that NHK saw as a problem.

He subsequently received a call from the head of the NHK Radio Center, who told him, "Please talk about the issue as you like after the Tokyo election." Nakakita eventually gave up appearing on the Jan. 30 show.

"Shouldn't we be able to offer materials for discussion and allow voters to make a steady choice all the more because it is during the campaigning period?" questioned Nakakita.

A representative at NHK's public relations department said, "Because the nuclear power issue is one of the points of contention in the gubernatorial race, it is necessary for us to be even fairer during the campaigning period. It was difficult for us to take measures through our production method, so we asked him to change the subject."

Will Japanese power industry ever change?

February 5, 2014

EDITORIAL: Power industry must change its old-fashioned ways

<http://ajw.asahi.com/article/views/editorial/AJ201402050030>

Will Japan's electric power industry ever change? We fear we sound like a broken record everytime we voice this thought out loud.

Kansai Electric Power Co.'s affiliates and other business partners have been caught rigging bids for power line installation projects ordered by KEPCO.

The Fair Trade Commission has not only issued a cease-and-desist order to the offending businesses and ordered them to pay a surcharge, but has also instructed KEPCO, whose employee allegedly induced or facilitated the violations, to take measures to prevent a recurrence.

In a bid-rigging case such as this, it is unusual for the watchdog body to demand remedial action from the party that ordered the projects.

But KEPCO is not the only utility that has brought disgrace upon itself in this manner. In December, Tokyo Electric Power Co. was also involved in a similar bid-rigging case, in which a TEPCO employee played a role, and ordered by the FTC to clean up its act.

TEPCO and KEPCO are Japan's No. 1 and No. 2 utilities, respectively. We are shocked that both power giants have been engaged in shady deals even after the March 2011 nuclear disaster at the Fukushima No. 1 power plant.

Electric power companies have raised their electricity charges one after another, claiming growing fuel costs for thermal power generation because their nuclear reactors remain offline.

But utilities are allowed to set their electricity rates by applying the so-called full cost pricing method and they enjoy a monopoly in their service areas. As a result, cost-saving has never been a real concern for them. Moreover, they maintain inappropriately close ties with related businesses that provide cushy jobs to their retired executives. This is the nature of the power industry that has been pointed out repeatedly, and bid-rigging only symbolizes the rot.

Refusing to mend their outdated ways, the utilities are calling vociferously for the restart of offline nuclear reactors, suggesting that they will have to raise their charges again if reactors remain idle. This is insane.

In addition to the problems involving private-sector companies, there are issues that have to do with relations of mutual reliance between the electric power industry and the ruling Liberal Democratic Party, as recent investigative reporting by The Asahi Shimbun has brought to light.

Here are some facts: The total amount of donations made to the LDP by power company executives in 2012 was 4.3 times more than the previous year; in a bid to get LDP lawmakers to support the construction of new nuclear reactors, the Federation of Electric Power Companies of Japan provided "model answers" to a questionnaire distributed within the LDP; to financially back Akira Amari, minister in charge of economic revitalization, nine utilities purchased tickets for his fund-raising parties in a way that would not violate the Political Fund Control Law.

The Asahi Shimbun's reports suggest that the close ties between the power industry and the LDP became less obvious in the immediate aftermath of the Fukushima nuclear accident, but the ties were apparently revived upon the LDP's return to power.

Prime Minister Shinzo Abe has warned Fumio Sudo, who will become TEPCO's chairman in April, against "relapsing to the pre-3/11 smugness arising from regional monopoly."

But if Abe truly means what he says, his ruling party should prove itself to be of a different stripe from the power industry. Specifically, the Abe administration ought to restrict the flow of money from the power industry to the LDP and keep everything transparent and aboveboard.

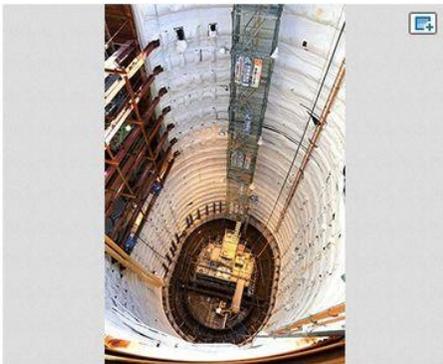

Once that is done, the administration needs to forge ahead with electric power system reforms, enhance supervisory functions of the markets and various regulations, and get the electric power industry to transform itself into a competitive and self-reliant industry.

Economic revitalization is possible only by dismantling the old-fashioned structure of the power industry.

Anti-terrorism and confidential information

Nuke plant operators hush-hush on anti-terrorism measures

http://ajw.asahi.com/article/behind_news/politics/AJ201402050055

Media representatives observe the underground chamber into which venting equipment will be installed at the Hamaoka nuclear plant in December. Reporters were told by Chubu Electric Power Co. not to take photos above their line of vision. (Yuta Takahashi)

THE ASAHI SHIMBUN

Operators of nuclear power plants say they are restricting media access to some important facilities as part of efforts to thwart terrorist attacks.

Tougher safety standards for nuclear plants that went into effect last July in the aftermath of the 2011 nuclear disaster in Fukushima Prefecture include measures to deal with the threat of terrorist strikes.

Another factor is the controversial state secrets protection law that will take effect later this year. **The utilities are keen to duck any criticism that they are allowing any confidential security information to be disclosed.**

In many cases, the restrictions to information disclosure go beyond what nuclear regulators have said should be kept under wraps.

The new standards require that plant operators install filtered venting equipment designed to lower pressure and filter radioactive substances in the event of serious accidents. That scenario also envisages a 9/11-style terrorist attack using aircraft.

As 2013 came to a close, Tokyo Electric Power Co. decided to deny media access to venting equipment at its Kashiwazaki-Kariwa nuclear plant in Niigata Prefecture. Although reporters were previously allowed to observe part of the installation process of venting equipment connected to the reactor containment vessel, **the equipment will remain off-limits to the media from now.**

During a Dec. 18 meeting, the Nuclear Regulation Authority decided that it will not publicize information about the alignment of equipment when it conducts inspections of the safety measures implemented by plant operators.

"Releasing alignment maps could provide a source of information for terrorists," said an official with the NRA secretariat.

TEPCO officials said their decision to keep the venting equipment off-limits to the media was in line with the NRA's thinking on the matter.

However, a secretariat official pointed to the differences between inspections in which very specific details may emerge and media coverage and visits.

"The NRA defined the handling of information during inspections," the official said. "We never intended for the decision to allow for the covering up of information in relation to media coverage and visits to the plants."

On Dec. 20, Chubu Electric Power Co. allowed media representatives to observe installation work of venting equipment at its Hamaoka nuclear power plant in Shizuoka Prefecture. Reporters were told not to specify the exact location of a 36-meter-deep underground chamber in their articles.

"Please be careful of the angle of your photos," a utility employee also told the gathered media.

The company said that the venting equipment could become off-limits to the media in the future. Similar media restrictions were made by Chugoku Electric Power Co. last autumn at its Shimane nuclear plant.

When Tohoku Electric Power Co. was installing venting equipment at its nuclear plant last May, it prohibited photographs of the construction and instead provided media organizations with its own photos. In another area, digital cameras brought in by reporters were checked to ensure that no security cameras were included in the shots.

That was a time when discussions were being held on the extent of anti-terrorism measures to be included in the new nuclear safety standards.

"From the standpoint of safety control, we cannot even disclose what types of information are being subject to restrictions," said an official with Hokkaido Electric Power Co.

The nuclear plant operators are also wrestling with how to handle the emergency control rooms that would allow for remote-controlled cooling of reactors. Those rooms were also included in the new safety standards.

Much like the venting equipment, the emergency control rooms will be vital in the event of a serious accident.

The utilities have not yet begun construction of the control rooms and they have not yet decided whether to open such work to the media.

Officials of the electric power companies have also touched upon the state secrets protection law that will go into effect in late 2014.

"If photographing and opening up the plant site to the media is subsequently banned, we would be unable to retract what we have already made available," said a senior official with Chubu Electric. "It would be the electric power companies that would be held responsible should any problem occur. For that reason, we have to aggressively protect our facilities."

One expert said the utilities were taking the opposite course of their Western counterparts.

"Ordinarily, information about safety measures at nuclear plants should be aggressively released. In the West, information is disclosed about the extent to which the plants are being protected to show what is being done to prevent terrorism," said Kenichi Oshima, a professor of environmental economics at Ritsumeikan University in Kyoto.

"The equipment will not become stronger just because the information is made confidential," he said. "If such information was kept secret, the concerns of residents would increase because they would not know what measures were being implemented."

Can NHK be trusted?

February 7, 2014

EDITORIAL: NHK governors undermining trust in public broadcaster

<http://ajw.asahi.com/article/views/editorial/AJ201402070059>

Writers and scholars are free to embrace and present any idea. But when they take part in running public broadcasts, they need to show a proper sense of balance.

That is why the Broadcast Law stipulates that governors of Japan Broadcasting Corp. (NHK) are required to possess the ability to make "fair judgment concerning public welfare."

In this regard, we strongly doubt that two NHK governors, Naoki Hyakuta and Michiko Hasegawa, meet this requirement.

Hyakuta, a best-selling novelist, not only made a campaign speech for a candidate of the Tokyo gubernatorial race, but he also repeatedly demeaned other candidates by calling them “lowlifes.”

Two months before her appointment as NHK governor, Hasegawa, a Saitama University professor emeritus specializing in comparative ideology and Japanese cultural studies, contributed a piece to a collection of essays paying tribute to Shusuke Nomura, a right-wing activist who shot himself at the president’s office of The Asahi Shimbun in Tokyo in 1993. Her writing has stirred controversy.

The two were appointed by Prime Minister Shinzo Abe. Chief Cabinet Secretary Yoshihide Suga said that making campaign speeches on behalf of candidates and expressing thoughts and beliefs “do not violate the Broadcast Law.” He indicated such acts are not a problem.

However, the law provides such restrictions as limiting the number of governors who belong to the same political party because of the assumed risk that those governors could wield political influence.

For the same reason, the law does not give governors the power to involve themselves in the production of individual programs.

Just because there are no provisions restricting the behavior of governors, it does not mean they can do as they like and ignore their responsibilities as supervisors of the public broadcaster.

The way Hyakuta publicly slandered other candidates is a problem beyond the Broadcast Law. His character and judgment as a decent member of society rather than an NHK governor should be questioned.

Nomura brought pistols into The Asahi Shimbun’s Tokyo head office in 1993, and shot himself to death while talking with the president and other Asahi executives. In her essay, Hasegawa wrote: “Once he (Nomura) chanted “Sumeramikoto iyasaka” (Long live the emperor) three times, (regardless of what the ‘humanity declaration’ and the Japanese Constitution say), the reigning emperor once again became an ‘akitsumikami’ (deity who is a human being).”

Was her appointment appropriate in terms of the requirements for an NHK governor? The administration is urged to clarify its view.

NHK explains on its website what a public broadcaster is. Unlike a state-sponsored broadcaster, which is “run under strong state supervision,” a public broadcaster is “run independent from state control,” according to NHK.

However, NHK’s management structure makes it difficult to maintain its independence from the government. This is because the prime minister appoints governors, and the board of governors has the power to appoint and dismiss the NHK chairman.

That is all the more reason why the administration and NHK need to maintain tension to keep a proper distance from each other and make efforts to restrain themselves to uphold public trust for fairness.

NHK must not undermine the trust that viewers and listeners as well as its staff members have painstakingly built for many years.

--The Asahi Shimbun, Feb. 7

Gov't will form panel on Fukushima information

February 07, 2014

Govt. to form panel on Fukushima plant information

http://www3.nhk.or.jp/nhkworld/english/news/20140207_01.html

The Japanese government will include local residents in a planned panel on how best to inform the public on the status of the crippled Fukushima Daiichi nuclear plant.

Currently, the government and the plant's operator, Tokyo Electric Power Company, hold news conferences to announce how efforts to scrap reactors and address radioactive wastewater are going at the plant. They also release information on the plant through their websites.

Their announcements have been drawing persistent criticism for using many technical terms and being unhelpful for specific information.

The complaints have prompted the government to set up a panel to determine possible problems with the current information system.

Sources say the panel will include evacuees from the 2011 nuclear disaster, officials from local municipalities, and representatives from farming and fishing groups.

Their first session is scheduled for February 17th in Fukushima City. The panel's meetings will be open to

the public with gallery seats prepared for ordinary citizens.

The government says this is the first time since the nuclear accident that civilians will join a state-established panel on the plant's containment efforts.

Withholding of radiation measures

February 11, 2014

Troubled waters?: A worker holds a fish during an analysis of radioactive materials in the specimen at the Marine Ecology Research Institute's central laboratory in Onjuku, Chiba Prefecture, in December. Leaks of contaminated water into the Pacific Ocean from Tokyo Electric Power Co.'s Fukushima No. 1 nuclear plant, damaged in the March 2011 earthquake and tsunami, have raised questions about the safety of eating seafood caught off Japan. | BLOOMBERG

National

Regulators expected to demand detailed explanation for latest evasion

Tepco hid record-level radiation data last July

<http://www.japantimes.co.jp/news/2014/02/11/national/tepcu-withheld-record-level-radiation-data-last-summer/#.UvpaZIXrV1u>

JJI

Tokyo Electric Power Co. did not tell the public until recently that massively high levels of radiation were found in groundwater collected last July at the Fukushima No. 1 nuclear plant, even though the utility was aware of the data that month, according to sources.

Tepco released the data on Feb. 6 showing that the groundwater contained a record 5 million becquerels per liter of radioactive strontium-90.

When Tepco reported the data to the Nuclear Regulation Authority last week, it initially claimed that it had only recently compiled the data, NRA sources said.

However, the embattled utility later corrected the timing, apparently **showing that it had withheld the record readings**, the sources said.

The withholding of the radiation data looks to be the latest in a long line of missteps for the utility, experts said.

Regulators are expected to demand a detailed explanation from Tepco, the sources said.

According to the NRA and other sources, Tepco first said it had detected 900,000 becquerels of beta ray-emitting radioactive materials, including strontium-90, from the groundwater last July.

When the firm later measured levels of strontium-90 alone, it found that the groundwater contained 5 million becquerels.

But Tepco concluded at the time that the data were inaccurate, citing the huge difference in the two measurements, **despite knowing that its method of measuring beta ray-emitting materials could show lower-than-actual levels**, the sources said.

Because the utility has repeatedly changed its explanations, the NRA secretariat has asked it for more detailed information.

Tepco claimed that although the company was aware of the data last July, it released them only recently after its accuracy was finally confirmed this month.

Previous reports said Tepco belatedly revealed last year that some 300 tons of groundwater was flowing into the sea daily, after mixing with radioactive water used to cool the plant's three stricken reactors.

Tepco had been trying to gain the consent of local fisheries groups to discharge excess water into the sea, after promising to reduce its radiation levels.

How good was 3/11 news coverage?

February 11, 2014

Many foreigners in Fukushima fled after crisis, news reporting questioned

<http://mainichi.jp/english/english/newsselect/news/20140211p2g00m0dm074000c.html>

SENDAI (Kyodo) -- Many foreign nationals living in Fukushima Prefecture at the time of the March 2011 nuclear crisis say they relocated either to their home countries or within Japan, according to a survey by a nonprofit group.

The Fukushima International Association said its survey also showed that they were troubled by the difference in media coverage between Japan and their home countries and that **most of them relied on TV rather than radio because of language barriers.**

Of the 70 foreigners who were living in the prefecture in late 2012 and interviewed by the association, 51 people (73 percent) said they evacuated. Of them, 29 left Japan for their home countries, while 21 moved out of the prefecture and one within the prefecture.

While simple comparisons are hard to make, this represents a disproportionately high ratio of evacuees when compared with the entire population of the prefecture.

According to the prefectural government, up to around 164,200 people relocated after the crisis, in May 2012, accounting for 8 percent of the overall population of 2 million.

The questionnaire was given to the 70 people interviewed as well as 30 others on other questions. Among them, 53 people had known the prefecture was host to nuclear power stations before the March 11, 2011 quake and tsunami that triggered the nuclear crisis.

At the end of 2010, 11,190 foreign residents were living in the prefecture, with just over 60 percent having either Chinese or Filipino nationalities. The total dropped to 9,489 at the end of June 2013. Of the 100 people surveyed, 88 people said they gathered information from TV when the crisis took place, far more than the 30 who cited radio.

One man said, "Japanese newspapers were slower in providing information than media in my home country and were not trusted very much. I relied on information from my home country."

He also said the community radio service provided instructions for evacuation but it was hard to understand audio information.

Many others had trouble understanding the situation even when they watched television. One person could not understand why the then Chief Cabinet Secretary Yukio Edano was giving a daily press conference with a "serious look" on TV.

"I learned from television that I probably needed to evacuate. But I was worried, not knowing where the nuclear power plant was and also about radiation," another respondent said.

New book on Fukushima disaster (not just a Japanese accident)

February 11, 2014

<http://ecowatch.com/2014/02/11/fukushima-book-warns-next-nuclear-disaster/>

Fukushima Book Warns Complacency Could Lead to Next Nuclear Disaster

<http://ecowatch.com/2014/02/11/fukushima-book-warns-next-nuclear-disaster/>

Union of Concerned Scientists

Today is the official publication date for the book *Fukushima: The Story of a Nuclear Disaster* (New Press, \$27.95), the first comprehensive account of the March 2011 Japanese catastrophe, and it has already elicited glowing reviews. *Kirkus Reviews* called it “a gripping, suspenseful page turner.” *Booklist*, in a starred review, described the book as “thriller-like” and “a cautionary analysis of the perils of nuclear power the world over.” And *Publisher’s Weekly* called it an “eye-opening exposé ...[that] points to the scary fact that America can suffer a Fukushima-type event if critical steps are not taken.”

Co-authored by two of America’s leading nuclear power experts and an award-winning journalist, the book provides the most authoritative analysis to date of what happened during one of the worst nuclear disasters of all time. The book, which took nearly two years to research and write, is based on technical analyses, interviews with the principal players, and information gleaned from thousands of pages of documents obtained from the U.S. Nuclear Regulatory Commission (NRC) and other federal agencies, the Tokyo Electric Power Company (TEPCO)—the plant’s owner—and independent Japanese commissions.

The first half of the book provides the riveting details of the March 11, 2011, disaster triggered by the one-two punch of a magnitude 9 earthquake, which caused Fukushima Daiichi’s six boiling water reactors to lose off-site electric power, and a 50-foot tsunami, which knocked out back-up diesel generators supplying power to five of the reactors and much of the facility’s electrical distribution system.

Co-authors **David Lochbaum, director of the Union of Concerned Scientists’ (UCS) Nuclear Safety Project; Edwin Lyman, a UCS senior scientist; and Susan Q. Stranahan, the lead reporter of the Philadelphia Inquirer’s Pulitzer Prize-winning coverage of the Three Mile Island nuclear accident,** take readers on a guided tour of the harrowing events that followed over days, weeks and months. Along the way, they supply lucid explanations of how the disaster happened and how it could have been averted, profiling the people who went to heroic lengths to try to take control of a runaway catastrophe that still reverberates today. Radioactive contamination has displaced more than 80,000 people, the cost of cleanup and victim compensation could swell to \$125 billion, and radioactively contaminated water from the site continues to leak into the ocean. Over time, Fukushima-related cancer deaths are expected to number in the thousands.

But the book is more than a disaster diary. It also provides a clear-eyed look at the Japanese regulatory regime that helped make the disaster all but inevitable, and makes a strong case that U.S. oversight is plagued by the same complacent attitude and undue industry influence. Indeed, **the chapters that focus on the NRC's shortcomings are as disturbing as the Fukushima calamity itself.**

“The NRC hasn’t heeded all the lessons of Fukushima and is slow-walking post-Fukushima regulatory changes,” said Lyman, a physicist. “Likewise, the agency has failed to address a number of longstanding threats, including the risks of overcrowded spent fuel pools, unenforced fire protection standards, and inadequate emergency planning.”

Lyman and his co-authors warn that if NRC commissioners insist on watering down the agency post-Fukushima task force’s recommendations for strengthening safeguards, it will only be a matter of time before a similar event happens in the U.S. They point out that:

- U.S. nuclear plants are vulnerable to catastrophic natural disasters, multiple system failures and terrorist attacks.
- U.S. nuclear plants are not much better equipped than Japanese plants to cope with severe accidents.
- U.S. emergency plans are not designed to protect the public in the aftermath of Fukushima-scale accidents or fully address the problem of long-term land contamination.

“Fukushima wasn’t a ‘Japanese’ nuclear accident,” said Lochbaum, a nuclear engineer who worked in the industry for 17 years before joining the UCS staff. **“It was an accident that happened to occur in Japan. Japanese and U.S. regulators share the same mindset that severe, supposedly ‘low probability’ accidents are unlikely and therefore it is not worth the time and money to protect plants from them.”**

“How many Fukushimas will we have to go through before NRC commissioners get it through their heads that it could happen here?” Lochbaum concluded.

TEPCO criticized by NRA (again)

February 12, 2014

Japan's nuclear regulator raps Fukushima operator over radiation readings

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201402120080>

REUTERS

Japan's nuclear regulator has criticized the operator of the stricken Fukushima plant for incorrectly measuring radiation levels in contaminated groundwater at the site.

Almost three years since the reactor meltdowns at the Fukushima No. 1 nuclear power plant, Tokyo Electric Power Co (TEPCO) still lacks basic understanding of measuring and handling radiation, Nuclear Regulation Authority (NRA) Chairman Shunichi Tanaka said on Feb. 12. The utility has been widely criticized for an inept response to the March 2011 disaster.

TEPCO said last week that groundwater drawn from a monitoring well last July contained a record 5 million becquerels per liter of dangerous radioactive strontium-90--more than five times the total beta radiation reading of 900,000 becquerels per liter recorded in the well, which is around 25 meters from the ocean.

TEPCO said there was a calibration mistake with one machine measuring strontium levels of well water at the plant, and it had also found an error with devices that decipher all-beta radiation.

"Something like this cannot happen ... This (data) is what becomes the basis of various decisions, so they must do their utmost to avoid mistakes in measuring radiation," Tanaka told reporters, though he added the mistake did not pose a serious safety risk at the plant.

The legal limit for releasing strontium 90, which has a half-life of around 29 years, into the sea is 30 becquerels per liter.

A TEPCO spokesman said the utility will re-check all-beta radiation readings of groundwater in light of the record strontium levels.

Last year, radiation leaks, power outages and other mishaps sparked international concern and prompted Japan's government to step in with more funds and support. As part of a turnaround plan approved by the government last month, TEPCO hopes to re-start its biggest nuclear power plant, Kashiwazaki Kariwa, this summer.

TEPCO in November began the hazardous process of removing hundreds of brittle spent fuel rods from the damaged No. 4 reactor building at Fukushima. It said last week it had removed about 9 percent of more than 1,500 unused and spent fuel assemblies in the reactor's storage pool.

DJP: Role of state-backed nuclear crisis fund should be expanded

February 19, 2014

DPJ calls for more power for nuclear crisis fund

http://www3.nhk.or.jp/nhkworld/english/news/20140219_16.html

Japan's main opposition Democratic Party is calling for greater oversight of decommissioning and cleanup at the Fukushima Daiichi nuclear plant by a state-backed nuclear crisis fund. It says this should include powers to investigate the operator's work.

The proposal comes as the government prepares a bill to expand the role of the Nuclear Damage Liability Facilitation Fund set up to support Tokyo Electric Power Company after the nuclear accident. The bill would allow the fund to observe work to scrap the damaged reactors and decontaminate radioactive water at the plant.

The DPJ says the Fund should be given more power than the government bill provides for. The party says this will ensure the necessary work at the plant moves forward.

The DPJ proposes that the fund be authorized to investigate TEPCO and that the operator be required to provide information.

It says this will prevent the operator from neglecting its responsibilities on the grounds that its business is suffering.

The proposal also calls for greater financial transparency. It says the basis for calculating the cost of scrapping the reactors should be fully accounted for, to avoid limitless public spending.

It also recommends that the fund establish a mechanism to work closely with international experts and receive technical guidance and advice.

The Democratic Party will submit their proposal to the government on Thursday.

Feb. 19, 2014 - Updated 07:29 UTC

Public hearings on screenings

February 19, 2014

NRA to hold public hearings on nuclear screenings

http://www3.nhk.or.jp/nhkworld/english/news/20140219_24.html

Japan's nuclear regulator says it will set the order of priority for final safety screening at 6 nuclear plants seeking permission to restart reactors.

Members of the Nuclear Regulation Authority met on Wednesday to discuss ways to move forward with

the screening.

The utility companies applied for the required safety checks on the 10 reactors last July.

The NRA has agreed to prioritize the plants for screening and issue a draft report on the results of safety checks at one of the plants.

The report is considered the final step in obtaining NRA approval to restart reactors.

Regulators will first determine whether the utilities' own assessments of ground motion intensity at times of major earthquakes are appropriate.

NRA officials plan to decide in 2 to 3 weeks which plants are ready for final reporting.

They have also agreed to take 4 weeks to seek public opinion on the first draft report. They plan to hold public hearings in municipalities around the nuclear plants, and solicit opinions on technical aspects of the screening.

Feb. 19, 2014 - Updated 07:35 UTC

How independent can NRA be?

February 21, 2014

EDITORIAL: NRA should ignore industry minister's remark on reactor screening

<http://ajw.asahi.com/article/views/editorial/AJ201402210050>

Industry minister Toshimitsu Motegi made the following comment on the Nuclear Regulation Authority's safety screening process for nuclear power plants, a prerequisite for restarting reactors: "For some plants, a long time has passed since their operators filed applications for screening. If the NRA shows the prospects of the screening, it will be useful for utilities to make plans for future operations."

Motegi's comment is an insult to the purpose of the law on the establishment of the nuclear watchdog that attaches importance to its independence and gives top priority to safety.

We strongly urge the minister to refrain from making such comments that could put pressure on the NRA.

The NRA must not be influenced by outside sources. Its mission is to conduct thorough safety checks from scientific and technical viewpoints without regard to the intentions of power companies and the industry ministry, which are eager to put nuclear power plants back online.

Motegi made the remarks on Feb. 18 in response to Hokkaido Electric Power Co.'s announcement a day earlier that it intends to raise utility charges again.

Last July, as soon as the NRA started screening under its new safety standards, Hokkaido Electric applied for safety checks of the Nos. 1, 2 and 3 reactors at its Tomari nuclear power plant.

In September, the utility raised electricity rates for households by an average 7.73 percent on the premise that the three reactors would be restarted one by one in December and later.

However, this week, the company said it would apply to the industry ministry for another price hike because it was not sure when those reactors will be put back online.

Motegi asked Hokkaido Electric to make efforts to avoid the price hike and suggested that the NRA show the prospects of the screening process.

He said his request was not intended to affect the screening process. But if such prospects are shown, it would benefit the utilities, and the industry minister is in no position to encourage the NRA to do so.

Motegi must not forget that the NRA was established because cozy relations between the former Nuclear and Industrial Safety Agency under the industry ministry and the former Nuclear Safety Commission resulted in lax safety regulations.

The biggest factor hampering progress in the screening process lies with the operators of nuclear power plants. The utilities have underestimated the new safety regulation standards, leading to delays in preparing documents for screening their reactors.

Some operators presented half-baked scenarios of natural disasters while others failed to seriously consider an occurrence of a severe accident.

Their approach to the new safety regulation standards raises a key question: Have they really learned lessons from the disaster at the Fukushima No. 1 nuclear power plant?

The Tomari nuclear power plant, in particular, has had many problems.

In assessing the effectiveness of measures to deal with serious accidents at the No. 1 and No. 2 reactors, Hokkaido Electric used analysis data for the No. 3 reactor, whose structure is different.

The NRA harshly criticized the company's approach, likening it to using a stand-in for an exam. The watchdog said there was no way it could carry out the screening process.

The company's assumptions concerning tsunami were deemed "inappropriate," and its assessment on the impact from volcanic eruptions was "inadequate."

In addition, Hokkaido Electric was required to re-analyze the underground structure of the No. 3 reactor.

Motegi said he should refrain from commenting on why it is taking so much time for the NRA to carry out screenings. What he should do instead is correct the slack attitude of power companies.

Referring to Motegi's comment, NRA Chairman Shunichi Tanaka said, "We do not regard it as a message to us."

But a day earlier, the deputy secretary-general of the NRA Secretariat, which is in charge of actual screening work, indicated an acceptance of Motegi's suggestion, saying it was "a natural comment as industry minister."

To maintain its independence, the NRA must always take a resolute stand.

NRA official says Fukushima problems raising questions over TEPCO's competence

<http://mainichi.jp/english/english/newsselect/news/20140222p2a00m0na002000c.html>

A senior Nuclear Regulation Authority (NRA) official on Feb. 21 said a string of problems at the crippled Fukushima No. 1 Nuclear Power Plant was raising questions over the competence of the plant's operator, Tokyo Electric Power Co. (TEPCO).

Hideka Morimoto, deputy secretary-general of the NRA secretariat, made the comment at a news conference in reference to troubles including the recent finding that some 100 tons of highly contaminated water had leaked from a storage tank at the plant.

"This will generate controversy over TEPCO's safety culture and its ability to cope as a business operator," he told the news conference.

At the same time, Morimoto said that the agency would strictly handle the safety screening of the Kashiwazaki-Kariwa Nuclear Power Plant that TEPCO seeks to restart in accordance with the law -- indicating that the screening and the handling of the Fukushima plant would be treated as separate issues.

Meanwhile, Morimoto said that the agency would consult with the International Atomic Energy Agency over whether it is appropriate to grade the Fukushima disaster on the International Nuclear and Radiological Event Scale. The NRA secretariat deemed that major leaks of contaminated water that occurred in the summer of last year would comprise a level 3 incident on the scale -- the fifth most serious level. But the Fukushima nuclear disaster as a whole is regarded as a level 7 incident -- the highest rating. This has sparked comments that the ratings lack consistency.

February 22, 2014(Mainichi Japan)

TEPCO, poor management and repeated leaks

February 25, 2014

TEPCO criticized for poor water management that led to 100-ton leak

<http://mainichi.jp/english/english/newsselect/news/20140225p2g00m0dm035000c.html>

TOKYO (Kyodo) -- Nuclear regulators on Monday criticized that Tokyo Electric Power Co. may have been able to minimize the 100 tons of toxic water leak from a tank at the crippled Fukushima Daiichi nuclear complex if its water management was sound.

The direct cause of the incident was a wrong valve setting, which led toxic water to be injected into the tank that was nearly full. But Nuclear Regulation Authority Commissioner Toyoshi Fuketa said the plant should have been managed so that leaks are prevented even if valves are controlled erroneously.

TEPCO admitted during a meeting with regulators and experts on Monday that workers at a control room had not been paying much attention to the data of the water level filling the tanks that should have been receiving the toxic water.

"The water transfer operation to a tank area called 'E' started from Feb. 17 and it was going smoothly after that. So the monitoring activities became lax (during the time the wrong tank in the 'H6' area was receiving water)," one of the TEPCO officials said.

But Fuketa criticized, "The failure of checking the water level of the tanks that should have been receiving water was a problem from the viewpoint of preventing the situation from worsening."

According to TEPCO, the water level of the E area tanks was basically flat, even though a pump to send radioactive water was operating.

Meanwhile, an alarm warning of a rise in water level in the H6 area tank was issued Wednesday afternoon, but workers judged that the water-level gauge malfunctioned because of the irregular readings it started to show afterward.

Another NRA official said, "I think it's not right to blame machines (without thorough consideration) when something difficult to understand occurs."

More than nine hours after the alarm went off, workers noticed that the tank in the H6 area was overflowing water.

February 24, 2014

TEPCO official: Change of culture needed

http://www3.nhk.or.jp/nhkworld/english/news/20140224_38.html

A senior official of Tokyo Electric Power Company has apologized for the repeated leaks of contaminated water from tanks at the Fukushima Daiichi plant.

TEPCO Managing Executive Officer Takafumi Anegawa was speaking to reporters on Monday after Japan's nuclear regulators criticized the operator for the latest massive leak.

Anegawa said he thinks a change in corporate culture is needed to avoid such repeated mistakes. He said he understands the problems and that **he will do his best to improve the management, but that this takes time.**

Feb. 24, 2014 - Updated 12:04 UTC

Nuclear regulators criticize tainted water leak

http://www3.nhk.or.jp/nhkworld/english/news/20140224_27.html

Japan's nuclear regulators have criticized the operator of the crippled Fukushima Daiichi nuclear power plant for failing to prevent massive leakage of highly radioactive water.

Tokyo Electric Power Company announced last Thursday that 100 tons of water containing record high levels of radioactive substances had overflowed from a storage tank near the No. 4 reactor building.

Company officials on Monday briefed experts of the Nuclear Regulation Authority that the leakage occurred when valves that should have been closed were left open. This allowed tainted water to enter the tank that overflowed. They reported that workers have not been sufficiently monitoring the levels of water inside the tank.

NRA official Toyoshi Fuketa said that water gauges, alarms and other devices have been in place to prevent water leaks but they were not functional.

He asked TEPCO officials to take thorough measures to ensure these devices will fully work.

Another official asked the utility to investigate if there were mishaps by workers. When work to attach number plates on the valves was ongoing, the valves may have been opened.

Feb. 24, 2014 - Updated 10:53 UTC

Govt. to ensure TEPCO reviews steps against leaks

http://www3.nhk.or.jp/nhkworld/english/news/20140224_18.html

The Japanese government says the operator of the Fukushima Daiichi nuclear power plant needs to review its measures to prevent radioactive water leaks.

Chief Cabinet Secretary Yoshihide Suga spoke to reporters on Monday after it was revealed that about 100 tons of highly radioactive water had leaked from a tank near the No. 4 reactor building last week.

Tokyo Electric Power Company has been conducting an in-house investigation to determine whether the leak occurred because someone left valves open. It has been interviewing workers at the plant.

Suga said the leak has stopped and the water had not reached the ocean because no spillways near the tank lead to the sea.

But he said TEPCO should collect the leaked water and contaminated soil.

Suga also said that to prevent similar accidents, the company needs to review its measures based on the tough working environment at the plant and rebuild its organizational structure.

He said the government will try to ensure that TEPCO implements steps to prevent problems, including those resulting from human error.

TEPCO opens control room to media

February 26, 2014

Control room at Fukushima plant shown to media

http://www3.nhk.or.jp/nhkworld/english/news/20140226_34.html

The operator of the Fukushima Daiichi nuclear plant has opened the central control room for the facility's No.1 and 2 reactors to media for the first time since the 2011 accident.

Tokyo Electric Power Company organized the visit on Wednesday ahead of the 3rd anniversary of the March 11th earthquake and tsunami that cut off power and crippled the plant.

The room between the reactors is where workers struggled to contain the crisis 3 years ago amid rising radiation levels and the impact of a hydrogen explosion at the No. 1 reactor building.

Radiation in the room just after the accident measured one millisievert per hour. The level has fallen to less than one-150th of that figure, but those entering the room are still required to wear full-face masks and other protective gear.

The room has been cleared of debris including ceiling panels and emergency batteries. Scribbled numbers next to a water gauge suggest how workers tried to monitor the reactor's cooling water using flashlights.

Media representatives were also allowed to enter the No. 5 reactor building, which escaped damage, and visit a site for building new types of tainted water storage tanks.

Plant chief Akira Ono said he had wanted to show them the central control room sooner, but could not due to high radiation levels.

Ono also apologized to Fukushima Prefecture residents and others for a recent leak of highly contaminated water from a tank. He pledged efforts to recover the water, find the cause of the leak and take steps to prevent a recurrence.

NRA doubles its staff to ca.1,000

March 3, 2014

NRA welcomes new staff following merger

http://www3.nhk.or.jp/nhkworld/english/news/20140303_24.html

Japan's nuclear regulator has acquired hundreds of employees, including nuclear engineers, by absorbing an institution engaged in nuclear safety.

The Nuclear Regulation Authority held a ceremony on Monday to welcome **more than 380 administrative officials and engineers from the Japan Nuclear Energy Safety Organization.**

The organization was merged into the NRA on Saturday. JNES was an independent corporation that administered the inspection of nuclear power plants and the study of nuclear safety.

NRA Chairman Shunichi Tanaka said at the ceremony that there are high expectations for the engineers. He called on them to help the NRA become an organization that is trusted by the nation.

With the intake, **the NRA has doubled its staff to about 1,000.** The integration is expected to help the Authority strengthen its capabilities to conduct safety assessments of nuclear power plants.

The NRA also plans to set up a new department to nurture employee expertise.

Similarities between Bikini and Fukushima

March 4, 2014

Students seek out Bikini, Fukushima parallels

by Aiko Kaneshi and Tomomi Miura

Kyodo

<http://www.japantimes.co.jp/news/2014/03/04/national/students-seek-out-bikini-fukushima-parallels/#.UxX7i4XrV1s>

FUKUSHIMA – Sixty years have passed since the U.S. detonated a hydrogen bomb in a test on Bikini Atoll in the Marshall Islands in 1954, but for one former resident of a town near the crippled Fukushima No. 1 nuclear power plant, the hardships the islanders faced are all too easy to imagine.

Keiko Takahashi, 21, and three other Japanese university students visited the Marshall Islands for the March 1 anniversary of the test. In the lead-up to the weeklong trip, they studied footage and interviewed experts in Japan about the nuclear tests.

The more they studied, the more they saw similarities between how radioactive fallout had affected the islanders and their own communities — residents forced to give up hope of returning to their contaminated hometowns, communities broken apart, and long-lasting health concerns, to name just a few.

In the case of Takahashi's hometown, Okuma, which hosted the nuclear plant, the entire population of about 11,000 remains evacuated almost three years since the Tokyo Electric Power Co. nuclear power plant was crippled in the magnitude-9 earthquake and tsunami on March 11, 2011.

While Takahashi lives in a dormitory at Fukushima University, in the city of Fukushima, her five family members currently reside in Iwaki, another city in the prefecture.

Prior to the nuclear plant disaster, her family worked in the forestry industry in Okuma for three generations. As a young child, Takahashi used to stroll around the town with her father, a local history lover, and research local water sources and bridge names for holiday projects in elementary school, she recalled.

"I know it's highly (unlikely) we'll ever go back to Okuma," Takahashi said. "But even though our livelihoods there are gone, we as human beings who have lived there have memories and feelings for the place.

"I want to make sure the history and culture of Okuma are recorded and passed on, so that it will not become just a 'sad town,'" she said.

Through the visit to the Marshall Islands, Takahashi said she wanted to hear the experiences of former residents of the Bikini and Rongelap atolls, whose hometowns are still uninhabitable due to nuclear contamination even six decades later. She says she wants to know how they maintain their bonds and sense of belonging as well as how to pass such relationships on to the younger generation.

Kaede Nagashima, 18, from the city of Fukushima, said she hopes to learn how the local people dealt with concerns about exposure to radiation, given her own struggles over the past three years since the nuclear crisis started.

Another participant, 25-year-old Kai Sato, said, "I want to contemplate what role education can play in order for us to survive and live on, leaving our hometowns behind." Sato, a second-year student at the graduate school of Fukushima University, aims to become an elementary school teacher.

The fourth member of the group, Motoi Aizawa, 22, a first-year student at the graduate school of Waseda University in Tokyo, is not from the disaster-struck area around the Tepco plant but from Shizuoka Prefecture, where the Fukuryu Maru No. 5 — a tuna trawler that was exposed to the 1954 fallout while fishing near Bikini Atoll — came from.

Aizawa said she used to know very little about the Bikini Atoll incident but that since the Fukushima nuclear disaster, she has started researching how tons of tuna caught in the ocean near Bikini in the immediate aftermath of the Fukuryu Maru radiation exposure were sold, despite fears of contamination.

"I want to learn about the current situation regarding nuclear damage on a global scale," she said of the purpose of the trip.

Hiroko Aihara, a freelance journalist from the city of Fukushima who accompanied the students to the Marshall Islands, said, "If we look at history, (the Bikini Atoll incident) 60 years ago and Fukushima are connected along the same lines."

She said she hopes to establish a bond with others around the world who have suffered from nuclear-related incidents by meeting them in person.

Quake or tsunami? Still no consensus

March 5, 2014

THREE YEARS AFTER: Quake or tsunami? Panels at odds over cause of Fukushima nuclear disaster

<http://ajw.asahi.com/article/0311disaster/analysis/AJ201403050061>

<image: <http://idata.over-blog.com/5/60/51/72/January-2014/isolation-condensators.jpg>>

THE ASAHI SHIMBUN

The thousands of families wanting to know what specifically led to the Fukushima nuclear disaster that turned their lives upside down might have to wait decades for an answer.

The different panels that investigated the cause of the triple meltdown could not even agree on the time the tsunami struck the Fukushima No. 1 nuclear power plant on March 11, 2011.

The government and Tokyo Electric Power Co., operator of the stricken plant, maintain that a tsunami of unforeseeable size was solely to blame. TEPCO also said the accident was inevitable after it started to unfold.

However, a Diet investigation panel raised the possibility that shocks from the magnitude-9.0 Great East Japan Earthquake were also partly responsible, **an argument that could have serious implications for safety measures at nuclear plants and the extent of responsibility of TEPCO and the government.**

Seismic ground motions largely fell within anticipated levels, although they slightly exceeded maximum expected levels at some locations. However, the tsunami heights far outstripped levels envisaged by government regulators.

The Nuclear Regulation Authority and TEPCO are continuing with their respective investigations.

One point of contention concerns workers' testimonies that they saw water leaking near the isolation condensers in the No. 1 reactor building at the time of the accident.

The Diet's Fukushima Nuclear Accident Independent Investigation Commission said seismic shocks could have damaged a piping system for the isolation condensers, which lost water and were no longer able to sufficiently cool the reactor.

The NRA inspected the site in May 2013 and said the water leaks likely did not come from damaged isolation condensers. The inspectors instead said the water probably sloshed out of a spent fuel storage pool during the shaking from the quake and entered a duct. TEPCO espouses the same theory.

No consensus has been reached on the matter.

"I found (the isolation condensers) were damaged to a lesser extent than I had expected," said Atsuhiko Kosaka, a nuclear safety liaison officer with the NRA secretariat. "But the matter should be studied further."

The tsunami arrival time is also being contested.

The Diet investigation panel said seismic shocks could have damaged at least one of the backup diesel generators for the No. 1 reactor, which it said had stopped operating before the tsunami hit.

A wave gauge installed 1.5 kilometers off the coast of the nuclear plant recorded a second, bigger tsunami wave at 3:35 p.m. The Diet panel argued the tsunami reached the plant compound at 3:37 p.m. or later, after the backup diesel generators stopped working and all power supply was lost.

TEPCO countered that theory by presenting a new statement in October based on a reanalysis of photos of the tsunami and power supply records.

The utility said the camera clock was off by 6.5 minutes or so and argued that the tsunami arrived at 3:36 p.m., around the same time the backup diesel generators went offline. TEPCO concluded the generators stopped working because they were inundated by the tsunami.

COULD MELTDOWN HAVE BEEN AVERTED?

Another question is whether the plant's operators and chief could have prevented the meltdowns of the No. 1, No. 2 and No. 3 reactors if they had made different decisions or taken other measures.

The government's Investigation Committee on the Accident at the Fukushima Nuclear Power Stations pointed to operations of the high pressure coolant injection (HPCI) system, one of the emergency core cooling systems for the No. 3 reactor.

Operators halted the HPCI system at 2:42 a.m. on March 13 at their own discretion, fearing the system would fail under the abnormal circumstances at the time. They later attempted to reactivate the HPCI system, but to no avail.

The government investigation panel said water injection into the reactor was suspended for nearly seven hours because the operators stopped the HPCI system without securing an alternative means to cool the reactor. The stoppage fueled the progression of the core meltdown process, the panel said.

The government panel also noted that fire engines were late in providing an alternative way to inject water into the reactor.

TEPCO, however, rebutted this theory when it presented new analysis results in December that reversed its previous views.

The utility said the HPCI system was actually injecting less water into the reactor than it had previously believed, causing water levels to drop and the reactor core to melt sooner than earlier thought.

In other words, TEPCO argued that the core meltdown could probably not have been averted even if the workers had kept the HPCI system running at the No. 3 reactor.

The utility also said fire engines were not injecting enough water into the reactors after the cooling systems had stopped.

TEPCO connected fire engine pumps to conduits of the reactor buildings to pump water into the reactors after the cooling systems had failed.

But the utility said part of the water flowed into condensers through branch pipes along the way and never reached the reactors. It never occurred to TEPCO workers at the time that there were such escape routes for the water, the utility added.

“Failures in water injection from the fire engines present a major problem, but in the first place, there should have been an alternative arrangement, alongside the cooling systems, to allow water to be injected into the reactors as soon as the accident started,” said Fumiya Tanabe, a former chief research scientist with the Japan Atomic Energy Research Institute, one of the predecessors of today’s Japan Atomic Energy Agency.

“Such an arrangement could have cut the chain of events that led to the (hydrogen) explosions.”

(This article was written by Akira Hatano and Senior Staff Writer Hisashi Hattori.)

Final report of 3/11 doesn't bring much

March 8, 2014

Nuclear experts issue final Fukushima report

http://www3.nhk.or.jp/nhkworld/english/news/20140308_20.html

A nuclear energy panel has released its final report on the March 2011 accident at the Fukushima Daiichi nuclear power plant.

The Atomic Energy Society of Japan set up the investigation committee in August 2011. It consists of about 40 experts from universities and research institutes.

In a report published on Saturday, the committee calls for enhanced measures to deal with natural disasters and serious accidents.

The report says nuclear energy experts failed to have the results of their studies reflected in measures to guard against unexpectedly serious accidents caused by natural disasters such as earthquakes and tsunami.

It also acknowledges that the Atomic Energy Society had little understanding about the role experts should play in enhancing nuclear safety. It says the organization lacked awareness of natural disasters and failed to make sufficient efforts to maintain neutrality.

The report urges the nuclear experts to realize that they would not be qualified to be involved in the atomic energy field if they cannot properly deal with severe accidents or tackle disaster prevention.

The report also includes an analysis made by the committee, based on its own computer simulation, about how the meltdown of the reactors occurred.

The report says the damage caused by the March 11 earthquake was not enough to seriously affect the safety functions of the reactors at the Fukushima Daiichi nuclear plant. The findings contradict those of other institutions.

Observers say the panel has failed to fully investigate the disaster by making use of the Atomic Energy Society's human resources and expertise.

They also say the report, published 3 years after the Fukushima accident, sheds little new light on the disaster.

NRA requirements are missing important issues

March 10, 2014

EDITORIAL: Nuclear watchdog should continue with reforms reflecting lessons from Fukushima

<http://ajw.asahi.com/article/views/editorial/AJ201403100058>

Nuclear power plants in Japan are going through a safety review by the Nuclear Regulation Authority (NRA), which they must pass to resume their operations. The review process is now approaching its first crucial stage.

The NRA has made progress in narrowing the list of reactors that are likely to meet the new safety standards, and so the nuclear watchdog expects to announce soon the power plants that will be given “priority screening” for a restart.

Politicians eager for restarts tend to call the nation’s new safety regulations “the world’s most stringent.” They sound as if no problems will remain with Japan’s nuclear power plants as long as the safety standards are met.

However, that is not the case.

There are major outstanding issues that are not included in the NRA’s regulatory requirements, such as drawing up evacuation plans by local governments in the vicinity of the plants to prepare for a contingency and finding sites to store spent nuclear fuel for many years. On top of that, the NRA’s safety review process itself is still in the middle of reform.

The NRA’s screening has not yet fully incorporated lessons learned from the disaster at the Fukushima No. 1 nuclear power plant. For example, it does not address such a serious issue as the concentration of many reactors in a relatively narrow area.

CONCENTRATION OF REACTORS NOT ADDRESSED

Let us remind ourselves that the Fukushima No. 1 nuclear power plant released massive amounts of radioactive materials after reactors Nos. 1-3 went into meltdown in rapid succession three years ago. The whole of Japan was plunged into endless terror, not knowing how serious the accident would be. If reactor No. 4’s spent fuel pool overheated, significantly destroying the spent fuel rods, there was a danger that no one would be able to go near the plant to contain the crisis due to alarming levels of radioactive contamination.

If that had occurred, it was possible that reactors No. 5 and No. 6, which were shut down at the time, as well as the four reactors at the Fukushima No. 2 nuclear plant, located only 12 kilometers away, might have also been crippled. In other words, up to 10 reactors at the plants might have released radioactive substances.

This “worst case scenario” was avoided, only due to the fervent efforts by workers at the plants, as well as a stroke of luck that a massive amount of water gushed into reactor No. 4’s spent fuel pool.

Still, the accident sent shock waves through nuclear regulators around the world. Light water reactors, the type most commonly used around the globe, were damaged so severely that they released huge amounts of radiation. In addition, the regulators were made to realize the potential risks of spent fuel pools and building reactors being located in close proximity to each other.

After the Fukushima accident, many countries, including Japan, re-examined their emergency responses to nuclear accidents resulting from natural disasters and began to ask nuclear power operators to come up with countermeasures to deal with a scenario of simultaneous multiple nuclear accidents.

Japan’s nuclear power plants tend to be clustered too close together in narrow areas, far closer than the widespread distribution of nuclear plants in other countries.

The Kashiwazaki-Kariwa plant in Niigata Prefecture has seven reactors. Within Fukui Prefecture, there are 14 reactors, including one prototype fast-breeder reactor. In light of this concentration of reactors, the NRA’s regulation is too mild.

“We are aware of a need to discuss this issue, but have not done it yet,” NRA Chairman Shunichi Tanaka said. It seems this is because the NRA believes it will be some time until multiple reactors start to operate simultaneously at one site.

However, nuclear plants containing fuel rods are potentially dangerous even if they are not online. Even if only one reactor is running, as long as there are other reactors nearby, there is danger of the damage spreading in the event of an accident. Especially when numerous operators of nuclear power plants are involved, the situation cannot be left in their hands alone.

This is a matter Japan should put a priority on tackling. How does the NRA expect to explain the results of its safety reviews without squarely dealing with the concentration problem?

INSPECTIONS SHOULD BE DONE WITHOUT WARNING

The new regulations have become far more stringent in terms of the equipment that is designed to prepare for natural disasters such as tsunami and earthquakes.

It requires the operator to simulate possible severe accidents and establish a “safety goal” that limits the likelihood of having a core accident at each reactor to once every 10,000 years at most. Under the new requirements, the operator is required to strengthen the structure and equipment of the reactors to that end.

This kind of approach has been adopted widely in the West. In Japan, it was debated for more than a decade, but the “safety myth” of Japanese reactors prevented this from being adopted by nuclear power plant operators.

As far as this numerical safety goal is concerned, Japanese reactors are almost on par with reactors in other countries, but not the best in the world. The operators seem put out at being asked to comply with more requirements in regard to their equipment, but they should consider them the minimum steps in a disaster-prone country such as Japan.

On the other hand, regulation is still weak regarding human factors such as accident response while in operation. Planning against terror attacks only presupposes the possibility of terrorists crashing airplanes into nuclear power plants. A fundamental overhaul is necessary. The NRA should crack down harder, not just inspect the drills, but follow the methods of other countries to conduct on-site, emergency accident or terror attack drills without prior notice.

JAPAN HAS TO CATCH UP FAST

The Fukushima accident occurred under a system of lax regulations that favored the operator. We are a lap behind the Western countries in terms of enforcing stronger regulations, and we need to catch up quickly.

The NRA should make a better effort to explain to the public what it is doing. Granted, the NRA does broadcast its chairman's news conferences and screening meetings via the Internet, but we wonder whether information about its screenings and regulations is reaching the general public. We also urge the NRA to strengthen its involvement in the creation of evacuation programs.

It is also essential that the NRA trains and motivates its staff, who are conducting safety inspections. The nuclear regulation agency, the NRA's secretariat, absorbed the former Japan Nuclear Energy Safety Organization (JNES), which resulted in the number of staff expanding to roughly 1,000. JNES used to be responsible for safety reviews prior to the Fukushima accident and was criticized for being “too close” to

operators. The new agency must alter this mind-set, maintain a healthy distance when dealing with the operators and improve the quality of the regulatory measures.

To achieve this, the NRA must maintain its independence from the nuclear lobby and ensure that the importance of its regulatory actions is understood by all members of its staff.

The Abe administration and the plant operators are trying to rush into restarts. However, the NRA must at all times maintain a draconian standard for its reviews and constantly seek to improve itself.

--The Asahi Shimbun, March 9

Nuclear disaster: A very expensive business

March 11, 2014

Fukushima nuclear disaster taking toll on corporate and family finances

<http://mainichi.jp/english/english/perspectives/news/20140311p2a00m0na018000c.html>

Businesses and households in Japan have been forced to shoulder greater financial burdens since the outbreak of the crisis at the Fukushima No. 1 Nuclear Power Plant as the shutdown of all the country's nuclear reactors and the rising costs of dealing with the atomic disaster have pushed up electricity prices.

The government of Prime Minister Shinzo Abe intends to go ahead with reactivation of idled nuclear reactors, but public trust in nuclear power has not been restored and evacuation plans for local residents and other emergency measures have not been fully drawn up based on the assumption that accidents could occur. There are many people who stand against any move to place top priority on near-term economic benefits to reactivate nuclear reactors.

"We will thoroughly examine nuclear reactors based on regulation standards of the Nuclear Regulation Authority (NRA) that are the strictest in the world and proceed to reactivate those reactors that are confirmed to be conforming with them," Prime Minister Abe said at a news conference on March 10.

Following the shutdown of the nuclear reactors, utility firms in the country have been operating their thermal power plants at full capacity, resulting in an increase in imports of fossil fuel such as liquefied natural gas (LNG). Japan's imports of fossil fuel stood at 7.1 trillion yen in 2013 -- double the pre-disaster level in 2010 -- due in part to a devaluation of the yen and the rising prices of natural resources. The costs of responding to the Fukushima nuclear disaster, including those for decommissioning the Fukushima nuclear plant, paying compensation and conducting decontamination work, are likely to increase to 11 trillion yen as of now.

Most of the sharp rises in the costs for fuel and handling of the nuclear disaster are to be added to electricity bills. Six power firms, including Tokyo Electric Power Co. (TEPCO), have already raised electricity charges, and Chubu Electric Power Co. is applying for government permission to raise electricity prices. The average household is expected to spend 7,476 yen in April 2014 -- the average monthly electricity rate charged by nine utility firms across the country (except for the power firm in Okinawa Prefecture) -- a rise of slightly less than 20 percent from the pre-disaster level. Power demand dropped about five percent from the pre-disaster level on the backdrop of not only well-established energy-saving efforts but also from cost-cutting efforts among households and corporations.

The reactivation of nuclear reactors is the last resort for utility firms to curb electricity price hikes. TEPCO anticipates that by reactivating just one nuclear reactor it will improve its earnings by 120 billion yen a year and thus reduce costs such as those for importing LNG. Conversely, if nuclear reactors were to remain offline, utility firms would find it difficult to keep going. As Hokkaido Electric Power Co. has decided to consider raising electricity prices again, other utility firms could also raise electricity charges, threatening to cast a chill over the economy that has been on a recovery track.

Nevertheless, the country remains split over whether to use nuclear power in the future. The Abe administration, which regards the new regulations as "the world's highest standards," wants to give endorsement to the safety of nuclear power. But nuclear consultant Satoru Sato says, "We can't say Japan's safety standards are 'the world's best' because of insufficient standards for anti-terrorism measures and protection against fires. To say they are the world's best will have a negative effect such as causing carelessness."

Efforts have not progressed to deal with the country's nuclear policy based on the assumption that accidents could occur. The government requires 135 municipalities within a 30-kilometer radius from nuclear plants across the country to work out evacuation plans. But according to the NRA secretariat, only 58 of the municipalities, or 40 percent of them, had drawn up such plans as of Jan. 28, underscoring the manifestation of the negative effect stemming from the government's stance to leave the matter to local governments.

The mechanism remains ambiguous as to how the central and local governments should coordinate with one another and make important decisions in emergencies, including a decision to start evacuating. A senior official of a power firm says, "With the current size of our company, it is difficult to secure manpower to deal with an accident." Therefore, it is not clear whether the central and local governments and utilities will actually be able to respond properly in emergencies.

Learning lessons from the Fukushima disaster, the government pledged to make a clean break from the "safety myth" of nuclear power. In reality, however, the government is leaving the job up to the NRA. The

government is far from regaining public trust in nuclear power largely because it has failed to take necessary measures.

March 11, 2014(Mainichi Japan)

Fukushima nuclear damage costs are mounting

http://www3.nhk.or.jp/nhkworld/english/news/20140311_26.html

Three years after the earthquake and tsunami that crippled the Fukushima Daiichi nuclear power plant, total costs for dealing with the damage are estimated to exceed 11 trillion yen, or 107 billion dollars.

NHK obtained the figure by adding up the latest estimates released by the government and the plant's operator, Tokyo Electric Power Company.

The costs include 24 billion dollars for decontamination of areas around the plant, and 11 billion dollars for construction of temporary storage facilities for radioactive waste and debris. 19 billion is earmarked for decommissioning and disposal of contaminated water. Compensation for damages is forecast by TEPCO to exceed 48.5 billion dollars.

Other costs, including those of building public housing for evacuees and ongoing health checks for the people of Fukushima Prefecture, will amount to 5.5 billion dollars.

But the total costs are believed to be far larger than these estimates. That's because the current figures don't include costs for the final disposal of waste from cleanup operations, and expenditures for government personnel who handled the disaster.

Analysts say that costs for decommissioning projects, which would continue for 40 years, and damages paid to residents will inflate the total costs still further.

Leaked Emails Expose NRC's Cover-Up of Safety Concerns Days After Fukushima Disaster

Brandon Baker | March 10, 2014 9:37 am

When an earthquake and tsunami struck Fukushima, Japan leading to a nuclear disaster three years ago, U.S. residents wondered if the aging nuclear facilities in their own country were at risk. What they didn't know is that the federal government's nuclear arm worked actively in the days after the incident, trying to cover up the perils that existed in the states.

According to a report from NBC, a U.S. Nuclear Regulatory Commission (NRC) campaign to reassure people about nuclear safety standards coincided with agency experts consistently presenting similar questions behind the scenes. Through a Freedom of Information Act request, *NBC* acquired a string of March 2011 emails that clearly show the cover-up.

"While we know more than these say, we're sticking to this story for now," Scott Burnell, an NRC public and media relations manager wrote in one email.

From: Burnell, Scott

Date: Wednesday, March 16, 2011, 11:11 AM

Folks, the expected calls are coming in – We need a better response ASAP!

In the days following the Fukushima disaster, the NRC split its talking points into two segments with different information: "public answer" and "additional technical, non-public information." Here's an example of a question the NRC expected to face, followed by the public and non-public answers:

Q. What happens when/if a plant 'melts down'?

Public Answer: In short, nuclear power plants in the United States are designed to be safe. To prevent the release of radioactive material, there are multiple barriers between the radioactive material and the environment, including the fuel cladding, the heavy steel reactor vessel itself and the containment building, usually a heavily reinforced structure of concrete and steel several feet thick.

Additional, non-technical, non-public information: The melted core may melt through the bottom of the vessel and flow onto the concrete containment floor. The core may melt through the containment liner and release radioactive material to the environment."

One example of a concerted cover-up came five days after the initial reports that an earthquake and tsunami knocked out the power and cooling systems at the six-reactor Fukushima Daiichi nuclear power plant. *MSNBC* used NRC estimates to rank the U.S. nuclear plants that were most at risk if an earthquake

were to hit nearby land. Burnell and members from the NRC's lobbying arm, the Nuclear Energy Institute, emailed staff members with instructions to find errors in the article, but none came up. He also told experts likely to appear on TV how to deny certain claims.

From: Burnell, Scott

Date: Wednesday, March 16, 2011, 6:22 AM

I know you're going to have a cow over this - somewhat inevitable when a reporter new to the subject tries to summarize things. Apart from "you're totally off-base," what specific technical corrections can we ask for??

OPA (Office of Public Affairs) - this is likely to spark a lot of follow-up. The immediate response would be "that's a very incomplete look at the overall research and we continue to believe U.S. reactors are capable of withstanding the strongest earthquake their sites could experience." I'll share whatever we get from the experts.

Former U.S. Energy Secretary Steven Chu appeared on *CNN* on March 20, 2011 but hesitated when an on-air personality asked him if U.S. nuclear plants could withstand an earthquake that measured 9.0 on the Richter scale. NRC spokesman David McIntyre had his own ideas for how Chu should have handled the question.

From: McIntyre, David

Date: Sunday, March 20, 2011, 10:01:00 AM

He should just say "Yes, it can." Worry about being wrong when it doesn't.

Sorry if I sound cynical.

More than 30 of the country's 100 nuclear power reactors have the same brand of General Electric reactors or containment system that used in Fukushima, according to the *NBC* report. The median reactor age in the U.S. is 34.

The oldest is the Ginna plant near Rochester, N.Y., licensed in 1969. Only four of the reactors began generating power in 1990 or later.

Americans aren't the only ones concerned with old reactors. Last week, 240 Greenpeace activists from national and regional offices took action across Europe to highlight the risk of aging reactors.

<http://www.nbcnews.com/storyline/fukushima-anniversary/japans-well-placed-nuclear-power-advocates-swat-away-opponents-n50396>

A good deal of what is said here about Japan and its nuclear village is also true for France and probably for other countries too. (RSDN)

Japan's Well-Placed Nuclear Power Advocates Swat Away Opponents By Douglas Birch, R. Jeffrey Smith and Jake Adelstein, Center for Public Integrity

TOKYO — When Taro Kono was growing up as the son of a major Japanese political party leader, he had what he calls a “fever for the atom.” Like many of his countrymen, he regarded nuclear power plants as his country’s ticket to postwar prosperity, a modern, economical way to meet huge energy needs on an island with few natural resources.

Over the next five decades, pro-nuclear sentiment led Japan to build the world’s third largest fleet of nuclear reactors. Its officials spent more than two decades and \$22 billion building a factory to create plutonium-based nuclear reactor fuel, the largest ever to be subject to international monitoring. The facility is slated for completion in October at Rokkasho on Japan’s northeast coast, kicking off a new phase in the country’s long-term plan to increase energy independence.

By the time Kono was elected to the parliament, known as the Diet, at the age of 33 in 1996, however, he had become a skeptic about the Rokkasho plant. After interrogating scientists and meeting with critics, he

concluded that a vast array of new reactors fueled by its plutonium faced huge technical challenges, posed a major proliferation risk, and probably would not reap the financial benefits claimed by its backers. He told the American ambassador at an embassy dinner in 2008 that its high costs were improperly kept hidden from the public.

But Kono's campaign in Japan against the plant has now been systematically squashed, in what he and his allies depict as a telling illustration of the powerful political forces — cronyism, influence-buying and a stifling of dissenting voices — that have kept the nuclear industry and its backers in the utilities here going strong.

By all accounts, the Japanese nuclear industry's sway and its governmental support remain high, even in the face of technical glitches, huge cost overruns, and accidents like the meltdowns of three reactors at Fukushima three years ago this week — which led to the abrupt closure of all its remaining reactors.

The government of Prime Minister Shinzo Abe, who leads Kono's party, announced in February its support for restarting some reactors and possibly building new ones, designed specifically to burn plutonium-based fuel.

Abe did so with apparent confidence that he has the enduring support — if not of the public — of the so-called “nuclear power village,” a tightly-woven network of regulators, utility industry executives, engineers, labor leaders and local politicians who have become dependent on nuclear power for jobs, income, and prestige.

Kono, a fluent English-speaker who received his undergraduate degree from Georgetown University, said in an interview that he has been talking about nuclear power “for the last 16 to 17 years,” but “no one really paid attention, right?”

Kono was unable to defeat the plutonium fuel program, he said, because its powerful constituency includes not only members of the ruling party, but bureaucrats, media leaders, bankers and academics. The louder he complained, the more these elites turned their backs on him. Just 60 legislators out of 722 in the parliament's lower and upper chambers have joined the anti-nuclear caucus he helped organize.

Industry officials contend that Rokkasho's completion makes sound fiscal sense. Yoshihiko Kawai, president of Japan Nuclear Fuel Ltd., the consortium of 85 utilities and other companies that owns the plant, has argued that making new plutonium-based fuels from old reactor fuel — according to the Rokkasho plan — was thrifty, not wasteful. “By directly disposing of spent fuels, we would be just throwing this energy resource away,” he told Plutonium Magazine in 2012.

A broadside over dinner

On a warm, cloudless fall evening in 2008, Kono brought his strong views about the corrupting influence of the “nuclear village” to a dinner at the walled residence of U.S. ambassador to Japan Thomas Schieffer, a longtime friend and former business partner of President George W. Bush.

Schieffer was eager to take the measure of a rising politician who opposed Bush’s plan for wider use of plutonium-based nuclear fuels around the globe, under a program known as Global Nuclear Energy Partnership that envisioned a large role for the Rokkasho plant.

Seated in the small dining room of the residence where Douglas MacArthur met Emperor Hirohito in 1945, Kono attempted to sketch out the institutional reasons why Japan’s bureaucrats and its utilities remained wedded to what he considered an outdated nuclear policy. A confidential embassy summary of the unusual conversation, full of criticism by Kono of his country’s policies, was published by Wikileaks in 2011.

Kono said junior officials in the government, who saw plutonium fuels as a costly technological dead end, were trapped by policies they had inherited from more senior lawmakers whom Japanese culture did not permit them to challenge. He complained that under Japanese parliamentary customs, he could not hire or fire committee staff but often had to rely on bureaucrats loaned from government agencies, all with a vested interest in promoting nuclear power. Any questions he asked were quickly passed back to those agencies.

A desire for the atom

Japan’s appetite for nuclear power seems quixotic for a nation devastated by its dark underside: the plutonium- and uranium-fueled weapons developed by American scientists. **But one lesson its leaders took from the explosions over Nagasaki and Hiroshima was that they should master the technology that defeated them.**

“I saw the mushroom cloud from my naval operation base in Takamatsu,” a young sailor named Yasuhiro Nakasone recalled in his autobiography. Nakasone, who would become Japan’s top science official and then its prime minister from 1982 to 1987, said he concluded that if Japan didn’t use the atom for peaceful purposes, it would “forever be a fourth-rate nation.”

That impulse was nurtured, carefully and secretly, by Washington. A 1954 cable to the director of the CIA — declassified only eight years ago — called for an “atomic peace mission” to Japan by U.S. nuclear scientists and reactor-company officials to overcome prevailing anti-nuclear sentiment and help “revive the hopes of the deflation-oppressed Japanese in reconstructing their economy.”

To carry out what the cable described as “an enlightenment propaganda program,” the agency in particular enlisted the assistance of Matsutaro Shoriki, a former head of the Tokyo police commission in the 1920s who had gone on to become a prominent publisher and broadcaster. The Yomiuri Shimbun, his newspaper, enthusiastically promoted nuclear power and Shoriki himself helped found Japan’s Atomic Industrial Forum, a tight alliance of companies and utilities. He died in 1969.

Beginning in 1966, Japan started building about one reactor a year. From the start, however, Japan planned to use uranium-fueled light-water reactors — the technology in predominant use around the globe — only until it had created a new energy system based on advanced, breeder reactors, so named because they can both consume and produce plutonium in what in principle could be an endless cycle, almost like perpetual-motion machines.

Uranium was initially — and mistakenly — thought to be rare. And breeders, initially predicted to be less costly than conventional reactors, have proven expensive to build, difficult to operate, and hard to secure, provoking France, Britain, and the United States to cut back or close their breeder programs several decades ago.

As a young man, Kono read in his “manga” comic books that breeder reactors were ideal for Japan, because they could provide the country with energy for thousands of years “without having to burn oil,” he wrote in his recent book on the Fukushima disaster. The major Japanese utilities all supported this claim, and helped spread that **word through advertising expenditures that totaled \$27.6 billion over the past four decades, according to a 2013 investigation by the Asahi Shimbun newspaper**, the Center’s partner in this examination of Rokkasho.

Construction of the Rokkasho plant began in 1993 and was initially supposed to be finished by 1997, but technical setbacks and construction problems forced a delay of nearly two decades. Paul Dickman, a senior policy fellow at Argonne National Laboratory in Illinois, the center of U.S. breeder reactor research, said Rokkasho is “a great facility.” But he also said it was a “construction project that’s gone out of control,” because Japan chose to modify an existing French design for such plants, rather than simply copying it.

A dissenting view is suppressed

Throughout Rokkasho's construction, the Japanese Ministry of Economy, Trade and Industry has been a bastion of pro-nuclear boosterism. But four officials in its economic and industrial policy bureau dared to challenge orthodoxy in 2004, when they prepared a 26-page Powerpoint entitled "The Unstoppable Nuclear Fuel Cycle" that called the planned plutonium-based nuclear program outdated and its promoters corrupt.

The presentation, obtained by the Center for Public Integrity, said nuclear policymaking was controlled by "those involved with and interested in the nuclear power industry." It noted that four of the Atomic Energy Commission's five members had a professional or financial stake in the industry, presaging a widespread criticism of the organization in the aftermath of the Fukushima disaster.

The presentation also predicted that building, operating, and decommissioning the Rokkasho plant would cost almost \$190 billion, and warned that the practicality of building special reactors to burn the fuel it would make "has yet to be proven." In a rush to embrace plutonium recycling, it said, Japan's political leaders had "ignored the lack of conclusive research" and failed to acknowledge technical criticisms.

Although the authors urged that their report be published to encourage a public debate, it was instead suppressed, and they were all swiftly purged from the policy bureau, according to a source with direct information about METI's response. The Mainichi Shimbun newspaper finally disclosed the report's existence in 2012.

Officials with METI declined the Center for Public Integrity's request for an interview.

The AEC meanwhile disregarded the policy bureau's advice, and approved initial testing of the Rokkasho plant in 2006, which contaminated its pipes and equipment with highly radioactive dust, solvents, and other wastes. That ended any hopes of simply mothballing the plant. Any future decommissioning will take decades and cost \$16 billion, according to AEC estimates.

Members of the Liberal Democratic Party, which has ruled Japan since 1955 except for a year in the 1990s and for a three-year period ending in 2012, have been rewarded for their pro-nuclear stance with campaign donations from the 10 giant electrical utilities that control around 96 percent of the nation's power supply.

The largest of these, the Tokyo Electric Power Co., or TEPCO, formally ended its direct corporate donations in 1974. But it systematically encouraged "voluntary" donations by company executives and managers to a fund-raising entity created by the ruling party, according to a 2011 investigation by Asahi. At least 448 Tepco executives donated roughly \$777,000 in total to the entity between 1995 and 2009, according to campaign finance documents obtained by Asahi and shared with the Center.

A TEPCO spokesman told Asahi that the donations were “based on the judgment of the individual and the company is not involved. We do not encourage such donations.” But Tepco executives, in interviews with Asahi reporters, said the company repeatedly stipulated how much they should donate — roughly \$3,900 for top executives, \$3,300 for executive vice presidents, and \$1,700 for managing directors, the newspaper said.

Heaven-sent officials

Tepco’s influence has also been enhanced by its enthusiastic participation in revolving door-employment practices similar to those involving bureaucrats and companies in Washington, D.C.

A METI report in 2011, prepared at the insistence of nuclear opponents in Japan’s tiny Communist Party, said for example that between 1960 and 2011, Tepco hired 68 high-level government officials. From 1980 to late 2011, the report said, four former top-level bureaucrats from METI’s own Agency for Natural Resources and Energy became vice presidents at other electric utilities. The practice is known here by the amusing term, amakudari, for appointees who “descended from heaven.”

Tepco officials also regularly move into key regulatory positions, part of a migration known as ama-agari, or “ascent to heaven” that has involved dozens of top utility officials. More than 100 such utility executives between 2001 and 2011 were able to keep drawing an industry paycheck while also working part-time for the government, a practice that is legal here, according to a former member of the Japanese Diet Lower House Economy and Industry Committee, who spoke on background. An official working in the Nuclear Regulation Authority’s research division, in an interview, said on condition of anonymity that the ama-agari system is “like having cops and thieves working in the same police station.”

Perhaps the most significant instance of ama-agari was the Liberal Democratic Party’s appointment in 1998 of Tokio Kano, a longtime TEPCO executive, as chairman of the parliamentary committee that oversees METI and as the parliamentary secretary of science and technology. Both are posts crucial to the nuclear energy industry, and Kano used them to advance legislation enabling plutonium-based fuel to be burned in some standard reactors — not just breeders. He also pushed through a law requiring that all spent nuclear fuel be sent to Rokkasho or similar Japanese plants.

Taro Kono, the industry critic, charged that Kano “acted like the secretary general of whatever committee had anything to do with energy and electricity.” Kono says that when he himself raised objections to nuclear policies during committee meetings, Kano would say “well, there’s a strange voice in this room, but we kind of got unanimous consent” and then proceed.

When Kano retired from the parliament in 2011, he returned to TEPCO — where he had kept an office throughout his work writing legislation — as a special adviser.

Kano declined the Center's request for an interview. But he told Asahi in 2011 he remains convinced that nuclear power is sensible. "Reactors were built because local residents strongly desired them, and it's a fact they generated employment and income," he said. "Some researchers say that low-dose radiation is good for your health. It's a persuasive argument."

Kano separately told The New York Times that year it was "disgusting" that his critics considered him a TEPCO "errand boy" merely because he had the business community's support.

Funds and wastes cement Rokkasho's role

The Aomori region where the Rokkasho plant is located, with a windswept coastline and harsh climate, ranks near the bottom of the nation's 47 prefectures, or statelets, in per capita income. "You can't grow much," says Taro Kono, the anti-nuclear activist lawmaker, who said he understands the plant's local appeal. "It's a tough place to live."

In the 1980s, the central government tried and failed to stimulate Aomori's economy with sugar beet farming and a tank farm for petroleum reserves, both of which faltered. So the nuclear plant's construction, which started in 1993, turned out to be a vital source of jobs, taxes, and even tourism — contributing around 88 percent of the village's total tax revenue in 2012, according to Aomori Prefecture officials. A Japanese study last year said it had boosted per capita income levels by 62 percent.

Moreover, to smooth the way for the plant, the central government pays the village — which has a population of just 12,000 — \$25.9 million in grants yearly under a special nuclear subsidy program created in Tokyo to promote the siting of nuclear energy facilities all over the country. **The grants have amounted to more than \$2,300 annually for every man woman and child in the village**, according to prefecture officials. The village's Chamber of Commerce has reported that roughly 70 percent of the businesses there are now involved with or dependent upon the nuclear industry.

Of course, the downside of the program for local citizens is that Rokkasho has since become a storage site for 3,000 tons of highly radioactive spent fuel from commercial power plants, waiting to be processed into new plutonium. To win the right to do this, **Japan's electric power monopolies 16 years ago pledged that the vast bulk of that spent fuel would be recycled as fuel — or it would be sent back.**

But doing so would swamp spent-fuel pools at reactor sites that are already close to capacity, Japanese officials say, and could doom the Abe government's plans to reopen many of Japan's 50 surviving reactors.

Kono says renegotiating this agreement — which many politicians regard as sacrosanct — is the single biggest challenge to unraveling the plans of the “nuclear village.”

A latent nuclear arsenal?

After the Fukushima disaster, some of Kono's political adversaries embraced another argument in favor of the country's reactors and the Rokkasho plant that may seem surprising to some in the West: Operating these facilities sends a useful signal to would-be aggressors that Japan could quickly develop nuclear arms.

“There's a pro-nuclear power plant argument that we need to keep the nuclear reactor running so that we can pretend that we may have a nuclear weapon one day,” Kono said during the late-night interview in his apartment house.

Shigeru Ishiba, a former defense minister who was Kono's rival for a ruling party leadership post in 2009 and is now its general secretary, caused a stir in October 2011 when he told Sapio, a right-wing magazine, that Japan's commercial nuclear reactors “would allow us to produce a nuclear warhead in a short amount of time.” He added: **“It's a tacit deterrent.”**

Many prominent Japanese officials still want the capability to produce nuclear arms if they were needed, according to Naoto Kan, who held a series of top government financial and strategic policy positions before becoming Japan's prime minister from 2010 to 2011, representing the Democratic Party of Japan — the LDP's main rival. He said the desire for a nuclear weapons capability is an important source of support for Japan's plutonium programs.

“Inside Japan, and that is not only within the Democratic Party of Japan, there are entities who wish to be able to maintain the ability to produce Japan's own plutonium,” Kan said in an interview with the Center for Public Integrity in his parliamentary office. “They do not say it in public, but they wish to have the capability to create nuclear weapons in case of a threat.”

Japan has a pacifist constitution, and a 47-year-old policy of ruling out the production, possession or introduction of nuclear weapons on Japanese soil. It has signed and ratified the Nuclear Non-Proliferation Treaty and is a leading advocate of nuclear arms control.

Moreover, all of Japan's existing plutonium stockpile is under International Atomic Energy Agency safeguards, while its uranium — a linchpin of any effort to restart the country's civilian reactors — is largely imported.

These large challenges would have to be overcome for Japan to embark on a weapons program, according to Jacques E.C. Hymans at the University of Southern California and other scholars.

But a potential linkage between Rokkasho's product and nuclear weapons has hung over the program from the start. Kumao Kaneko, a 76-year-old former director of the Nuclear Energy Division of Japan's Ministry of Foreign Affairs, told the Center for Public Integrity that Tokyo pressed the Carter administration in 1977 for permission to start producing plutonium partly to ensure Japan had a weapons option. [Restored this background]

The U.S. has long been concerned about potential development of a Japanese bomb, since Japan has the scientific skills, infrastructure and — most important — the raw explosive material in the form of plutonium, hundreds of pounds of weapons-grade uranium, and the technology to produce more. Washington's worry is that such an arsenal would set off a regional arms race, complicating Japan's relations with its neighbors, some of whom would clamor for a similar capability.

U.S. policymakers have pursued a two-pronged path to blocking that development: Over the past four years, they have quietly brought a stream of Japanese diplomats and military officers into highly restricted U.S. nuclear weapons centers — including the Strategic Command headquarters in Nebraska, a Minuteman missile base in Montana, and a Trident submarine base outside Seattle — to remind them of the robustness of the U.S. nuclear deterrent.

The U.S. also has gently urged Japan to cap or reduce the size of its plutonium stockpile. Its officials have encouraged Japan to reopen its closed reactors, in part so any newly-created plutonium can be burned at the same rate it is being produced. U.S. officials confirm they've also pressed Japan to give up, through repatriation to the United States, some of its existing plutonium stocks before production gets under way.

But the U.S. has not urged Japan to cancel its Rokkasho project, several current and former senior U.S. and Japanese officials said. Authorities say one reason Washington has not offered that advice is that killing it — and all the future nuclear power plants linked to it — would increase Japan's dependence on traditional energy supplies and drive up their price on the world market, adversely impacting the U.S. economy.

“Obviously what is done in the long term at Rokkasho is a decision for the Japanese people, the Japanese government to make,” Deputy Energy Secretary Daniel Poneman said during a July 2012 press conference in Tokyo. He added that “to the extent that there would be paths forward for Rokkasho” that could avoid increasing Japan’s stockpile of plutonium, “that would be a good thing.”

Poneman coupled this, however, with a public pitch for letting Japan use nuclear power to reduce carbon emissions, acknowledging that it is an important tool “for our friends and colleagues in Japan ... who are very worried about climate change.”

Jon Wolfstahl, who until two years ago served as a nonproliferation expert on the staff of Vice President Joe Biden and the White House National Security Council, said many in the administration believed that Japan wouldn’t listen to pleas for canceling Rokkasho, and that insisting on it would only fracture U.S. relations with the country.

“They don’t need the United States to tell them that Rokkasho is a giant waste of money and that there’s no need for them to start marching down this road,” Wolfstahl said. “But I’m not sure there’s much the U.S. could do about it.”

Gary Samore, who directed nuclear proliferation policy at the White House during Obama’s first term, put it more bluntly: “If the Japanese government really decided, ‘yes, we’re going to turn it on,’ then the Obama administration would have to make a decision,” he said.

Either the United States will have to stick “with existing policy, which is not to object,” or it will have to try to persuade Japan to abandon its plutonium manufacturing plan.

Toshihiro Okuyama and Yumi Nakayama, staff writers for the Japanese newspaper Asahi Shimbun, contributed reporting for this article.

Holding-up radiation results?

March 25, 2014

Gov't team withholds high radiation data on three Fukushima sites

<http://mainichi.jp/english/english/newsselect/news/20140325p2a00m0na008000c.html>

A Cabinet Office team has delayed the release of radiation measurements from three Fukushima Prefecture municipalities, and plans to release them later with lower, recalculated results, the Mainichi learned on March 24.

The three municipalities are currently covered by evacuation orders imposed after the March 2011 Fukushima No. 1 nuclear plant meltdowns -- evacuation orders the government plans to lift in the near future. According to one source, the original measurements were higher than expected, prompting the Cabinet Office team -- set up to support victims of the nuclear disaster -- to hold the results back over worries they would discourage residents from returning.

The Mainichi has acquired documents drawn up in November last year detailing the radiation measurements and intended for release. The documents, however, were never made public.

According to this and other sources, the measurements were taken in September last year in the city of Tamura's Miyakoji district, the village of Kawauchi and the village of Iitate by the Japan Atomic Energy Agency (JAEA) and the National Institute of Radiological Sciences (NIRS), using new dosimeters.

The measurements were taken by leaving the dosimeters for several days indoors and outdoors at schools, houses and other buildings, as well as in plastic boxes set up on farmland and in the wilderness. The data was given to the Cabinet Office team in mid-October. Most radiation measurements have been done from the air, and the Cabinet Office team wanted to compare results taken on the ground with these measurements and make radiation estimates by job type -- such as farmer or forestry worker -- and the assumption that people would spend eight hours outdoors and 16 indoors per day.

According to an inside source, the Cabinet Office team had noticed that measurements taken with older dosimeters distributed by Fukushima Prefecture municipalities to residents showed radiation measurements much lower than those recorded by aerial surveys. The Cabinet Office team had planned to release the latest measurements at meetings held by a Nuclear Regulation Authority team -- comprising national government officials, experts and prefectural residents -- between September and November last year, putting special emphasis on how low the figures were.

The new results, however, were significantly higher than expected, with the largest gap coming in Kawauchi. There, the Cabinet Office team had predicted radiation doses of 1-2 millisieverts per day, but the data showed doses at between 2.6 and 6.6 millisieverts. Cabinet Office team members apparently said that the numbers would "have a huge impact" and "we will need to explain them to the local municipalities," and release of the results was put off.

At the request of the Cabinet Office team, the JAEA and NIRS then recalculated the results by ditching the assumption that people would be outside eight hours a day, using instead 2010 statistics on how people spent their time collected by public broadcaster NHK. Under these new assumptions, a farmer was now expected to spend around six hours a day outdoors. The new, lower radiation exposure results were submitted to the Cabinet Office team this month and are scheduled to be released soon to the three municipalities concerned.

Atsuo Tamura, an official on the Cabinet Office team, admitted the team had drawn up the unreleased documents and that the radiation results had been recalculated, but denied it was hiding anything, saying, "We did not hold the results back because they were too high. We did so because it was necessary to look into whether the assumptions for residents' lifestyle patterns matched reality."

However, associate professor of radiation and hygiene Shinzo Kimura of Dokkyo Medical University told the Mainichi, "The assumption of eight hours a day outside, 16 hours inside is commonly used, and it is strange to change it. I can't see it as anything but them fiddling with the numbers to make them come out as they wanted."

The Miyakoji district of Tamura is set to have its evacuation order lifted on April 1, and the eastern part of Kawauchi is expected to have its evacuation order lifted sometime during the 2014 fiscal year.

Withholding of radiation readings exposes gov't push for evacuees' return

<http://mainichi.jp/english/english/perspectives/news/20140327p2a00m0na009000c.html>

Recent revelations that a Cabinet Office team delayed the release of radiation measurements from three Fukushima Prefecture areas, planning to release them with lower, recalculated results, have exposed a government push to have residents' return to nuclear disaster-hit areas.

Experts have raised questions about the government's move, suggesting that officials intended to send residents back to those areas from the outset and that they manipulated data to achieve that purpose.

The three areas -- the Miyakoji district of the city of Tamura, the village of Kawauchi and the village of Iitate -- remain subject to evacuation orders imposed after the 2011 Fukushima No. 1 nuclear plant meltdowns. The government plans to lift these orders in the near future. According to one source familiar with the measurement process, the original radiation exposure readings from new, individual dosimeters were higher than expected, prompting the Cabinet Office team to withhold the results. Officials feared the higher readings would discourage residents from returning.

The measurements were taken in September last year by the Japan Atomic Energy Agency (JAEA) and the National Institute of Radiological Sciences (NIRS) at the request of the Cabinet Office team, which was set up to support nuclear disaster victims. Team members initially intended to release the measurements during meetings of a Nuclear Regulation Authority (NRA) review panel between September and November last year. However, the measurements provided at an Oct. 3 meeting were not these results, but data from a fiscal 2012 survey using conventional dosimeters distributed to residents by six Fukushima Prefecture municipalities. The average radiation exposure doses in that survey were 0.2 to 0.7 millisieverts per year -- significantly lower than the estimates based on aerial surveys, which ranged from 0.7 to 2.9 millisieverts per year.

Yuichi Moriguchi, a professor at the University of Tokyo who serves as a member of the NRA panel, criticized the move by the Cabinet Office team, saying at the meeting that the data could mislead residents to think that the actual exposure doses would be one-fourth of the estimates based on aerial surveys. He warned that residents might suspect officials had underlying intentions. In response, Atsuo Tamura, an official with the Cabinet Office team, stated, "We wanted to show that the data for individual doses ranged in distribution, even within the same areas."

According to sources familiar with the matter, officials had initially expected that substantially low doses would be recorded even with the new dosimeters, which are capable of keeping track of exposure doses on an hourly basis, and had planned to release the results of the September 2013 measurements using the new dosimeters to highlight the safety of the areas. However, some of the results were higher than what they had expected.

When Moriguchi was shown the unreleased documents, which the Mainichi has acquired, he commented that the estimates based on the measurements using new dosimeters were "exactly what were expected."

"There seems to be no particular problem. I don't understand why they withheld the figures. At the meeting, I sensed that officials wanted to make radiation doses appear low through the use of individual dosimeters. Things have gone just as I suspected," he said.

Juichi Ide, an official with the Kawauchi Village Office, said, "I don't remember receiving any report on the survey results. We want to see the data because some residents allowed us to use their homes for the

survey. If they withheld the results simply because the radiation doses were high, that would be shocking."

Most of the Cabinet Office team members are employees of the Ministry of Economy, Trade and Industry. They apparently had expected that the new dosimeters would serve as the trump card in promoting evacuees' return to their hometown.

According to sources familiar with the surveys, the Cabinet Office team commissioned the JAEA and NIRS to take measurements in June last year. Although the Cabinet Office team had originally requested a survey in six municipalities within areas preparing for the lifting of evacuation orders, the measurements were conducted in only three of the six municipalities in a rush to obtain results. The JAEA and the NIRS took measurements over several days in each of the three municipalities between early and mid-September last year and submitted the results to the Cabinet Office team in mid-October.

NIRS official Masami Torikoshi, who oversaw the survey, said workers were under pressure to quickly produce results ahead of the NRA review panel meeting. Tamura of the Cabinet Office team, however, denied having applied any pressure, saying, "Releasing the survey results at the NRA panel was just one option, and we didn't ask them to produce results in time for that." However, Tamura admitted that he had rushed to compile documents intended for release to submit them to the NRA panel. The panel is tasked with discussing measures for residents' return.

The government is promoting residents' return to areas where annual exposure doses are below 20 millisieverts, but it has yet to win their confidence -- a factor in its high expectations for dosimeter readings in line with the readings it had hoped to see. Polls have found that a majority of residents uphold radiation levels to be under 1 millisievert per year -- the government-designated limit for general members of the public.

While the government officially decided on March 10 that the evacuation order on the Miyakoji district of the city of Tamura would be lifted on April 1, a 72-year-old woman evacuated from the area told the Mainichi, "Even if I return, I won't be able to pick mountain vegetables. There are only few people who are rejoiced (over the decision). But it's hard for me to say, 'I don't want to return to my hometown.'"

The woman continued, "We see radiation measurements being conducted everywhere, but hardly any results. They probably show only what's convenient for them. I don't think the measurements are conducted in order to protect us."

Japan's management of plutonium

March 26, 2014

Abe defends Japan's management of weapons-grade plutonium

<http://mainichi.jp/english/english/newsselect/news/20140326p2g00m0dm055000c.html>

THE HAGUE (Kyodo) -- Prime Minister Shinzo Abe on Tuesday defended Japan's management of nuclear materials including weapons-grade plutonium, dismissing concern that a massive amount of nuclear substances could be used for non-civilian purposes.

"The International Atomic Energy Agency has concluded that all the plutonium in Japan is for peaceful purposes under its safeguards," Abe told a press conference on the final day of the Nuclear Security Summit in The Hague.

"We voluntarily have disclosed information about our management of plutonium and the information is more detailed than advised in international guidelines," he said.

In responding to a question on why Japan retains as much as 9 tons of plutonium, Abe said, "We made it very clear this time that **we will stick to the principle of having no plutonium that does not have a specified use.**"

According to the governmental Japan Atomic Energy Commission, Japan retains 9 tons of plutonium in domestic facilities and 35 tons of plutonium in Britain and France.

During the summit in the Dutch city, Japan and the United States announced an agreement in which Tokyo will return hundreds of kilograms of highly enriched uranium and weapons-grade plutonium that U.S. President Barack Obama said would be "enough for a dozen nuclear weapons."

The materials, provided by the United States for research during the Cold War era, are kept in a research facility in Tokaimura, northeast of Tokyo.

The Chinese Foreign Ministry said it "welcomes" Japan's agreement with the United States, describing it as the first step in the right direction.

Ministry spokesman Hong Lei, however, called for further action, saying, "**Japan still stockpiles other sensitive nuclear materials, which far exceed its actual normal needs.**" China earlier expressed concern that Japan's nuclear stockpile poses a proliferation risk as it could be used for weapons.

Japan reached the agreement with the United States as part of efforts to reduce global stockpiles of nuclear materials, a main theme of the biennial summit which was launched in 2010 at the initiative of Obama.

Obama described Japan's decision to reduce its stock of nuclear materials as "a major commitment" during a joint press conference with Dutch Prime Minister Mark Rutte to wrap up the summit.

Abe pointed to Japan's measures against possible nuclear terrorism such as round-the-clock police guard at atomic power plants and regular deployments of Coast Guard vessels in waters near nuclear plants, which are typically built near the coast.

Tohoku Electric sues TEPCO for compensation

March 28, 2014

Tohoku Electric seeks damages from TEPCO for Fukushima disaster

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201403280043>

By MIHO TANAKA/ Staff Writer

SENDAI--Tohoku Electric Power Co. said March 27 it will seek compensation from Tokyo Electric Power Co. **for damages caused by the Fukushima nuclear disaster.**

The Sendai-based regional utility said it will send TEPCO an initial bill of 170 million yen (\$1.67 million) by the end of this month to cover expenses for relocating Tohoku Electric facilities out of evacuation zones in Fukushima Prefecture, and for the purchase of protective gear to guard against radiation.

"We are sending our first bill because certain progress has been made--three years since the onset of the disaster--in TEPCO's compensation payments to residents," Makoto Kaiwa, Tohoku Electric president, said at a March 27 news conference.

The initial bill will be followed by **further demands for redress to cover operational losses, including lost sales of electric power due to the evacuation of residents and stagnated economic activity**, Tohoku Electric officials added.

The continuing disaster at the Fukushima No. 1 nuclear power plant prompted Tohoku Electric in March 2013 to cancel its project to build a Namie-Odaka nuclear power plant, which would have straddled the municipalities of Namie and Minami-Soma in Fukushima Prefecture.

But Tohoku Electric said it has no plan to seek a sum of more than 18 billion yen, invested in the Namie-Odaka project, in damages from TEPCO.

Kaiwa said it would be difficult from a legal viewpoint to seek damages for the abandoned Namie-Odaka project.

"We decided to recall the project after considering all elements at hand, including public sentiment in the prefecture and the incomplete acquisition of all land plots at the plant site," he said.

"We will deal appropriately with the demands," TEPCO said in a statement.

David Mc Neill on fallout measurements

Concerns Over Measurement of Fukushima Fallout

By DAVID MCNEILL | THE CHRONICLE OF HIGHER EDUCATION MARCH 16, 2014

Photo

http://www.nytimes.com/2014/03/17/world/asia/concerns-over-measurement-of-fukushima-fallout.html?_r=0

TOKYO — In the chaotic, fearful weeks after the Fukushima nuclear crisis began, in March 2011, researchers struggled to measure the radioactive fallout unleashed on the public. Michio Aoyama’s initial findings were more startling than most. As a senior scientist at the Japanese government’s Meteorological Research Institute, he said levels of radioactive cesium 137 in the surface water of the Pacific Ocean could be 10,000 times as high as contamination after Chernobyl, the world’s worst nuclear accident.

Two months later, as Mr. Aoyama prepared to publish his findings in a short, nonpeer-reviewed article for Nature, the director general of the institute called with an unusual demand — that Mr. Aoyama remove his own name from the paper.

“He said there were points he didn’t understand, or want to understand,” the researcher recalled. “I was later told that he did not want to say that Fukushima radioactivity was worse than Chernobyl.” The head of the institute, who has since retired, declined to comment for this article. Mr. Aoyama asked for his name to be removed, he said, and the article was not published.

The pressure he felt is not unusual — only his decision to speak about it. Off the record, university researchers in Japan say that even now, three years after the triple meltdown at the Fukushima Daiichi

plant, they feel under pressure to play down the impact of the disaster. Some say they cannot get funds or university support for their work. In several cases, the professors say, they have been obstructed or told to steer clear of data that might cause public “concern.”

“Getting involved in this sort of research is dangerous politically,” said Joji Otaki, a biologist at Japan’s Ryukyu University who has written papers suggesting that radioactivity at Fukushima has triggered inherited deformities in a species of butterfly. His research is paid for through private donations, including crowdfunding, a sign, he said, that the public supports his work. “It’s an exceptional situation,” he said.

The precise health impact of the Fukushima disaster is disputed. The government has defined mandatory evacuation zones around the Daiichi plant as areas where cumulative dose levels might reach 20 millisieverts per year, the typical worldwide limit for nuclear-power-plant workers. The limit recommended by the International Commission on Radiological Protection is one millisievert per year for the public, though some scientists argue that below 100 millisieverts the threat of increased cancers is negligible.

In an effort to lower radiation and persuade about 155,000 people to return home, the government is trying to decontaminate a large area by scraping away millions of tons of radioactive dirt and storing it in temporary dumps. Experts at Japan’s National Institute of Advanced Industrial Science and Technology put the cost of this project at \$50 billion — widely considered an underestimate.

The chance to study in this real-life laboratory has drawn a small number of researchers from around the world. Timothy A. Mousseau, a professor of biological sciences at the University of South Carolina who has written widely on Chernobyl, studies the impact of radiation on bird and insect life. He has published papers suggesting abnormalities and defects in some Fukushima species. But he said his three research excursions to Japan had been difficult.

In one case, a Japanese professor and two postdoctoral students dropped out of a joint research paper, telling him they could not risk association with his findings. “They felt it was too provocative and controversial,” he said, “and the postdocs were worried it could hamper their future job prospects.”

Mr. Mousseau is careful to avoid comparisons with the Soviet Union, which arrested and even imprisoned scientists who studied Chernobyl. Nevertheless, he finds the lukewarm support for studies in Japan troubling: “It’s pretty clear that there is self-censorship or professors have been warned by their superiors that they must be very, very careful,” he said.

The “more insidious censorship” is the lack of funding at a national level for these kinds of studies, he added. “They’re putting trillions of yen into moving dirt around and almost nothing into environmental assessment.”

Long before an earthquake and tsunami triggered the Fukushima meltdown, critics questioned the influence of Japan's powerful nuclear lobby over the country's top universities. Some professors say their careers have been hobbled because they expressed doubts about the nation's nuclear policy and the coalition of bureaucrats, industrialists, politicians and elite academics who created it.

Mr. Aoyama, who now works at Fukushima University, sees no evidence of an organized conspiracy in the lack of openness about radiation levels — just official timidity. Despite the problems with his *Nature* article, he has written or co-written eight published papers since 2011 on coastal water pollution and other radiation-linked themes.

But stories of problems with Fukushima-related research are common, he said, including accounts of several professors' being told not to measure radiation in the surrounding prefectures. "There are so many issues in our community," he said. "The key phrase is 'don't cause panic.'"

He is also critical of the flood of false rumors circulating about the reach of Fukushima's radioactive payload.

Ken Buesseler, a senior scientist at the Woods Hole Oceanographic Institution's department of marine chemistry and geochemistry, in Massachusetts, who has worked with Mr. Aoyama, said he has spent much of his professional energy fighting the rumor mill. The cause is not helped, he added, by institutional attempts to gag Japanese professors.

"Researchers are told not to talk to the press, or they don't feel comfortable about talking to the press without permission," Mr. Buesseler said. A veteran of three post-earthquake research trips to Japan, he wants the authorities to put more money into investigating the impact on the food chain of Fukushima's release of cesium and strontium. "Why isn't the Japanese government paying for this, since they have most to gain?"

One reason, critics say, is that after a period of national soul searching, when it looked as if Japan might scrap its commercial reactors, the government is again supporting nuclear power. Since the conservative Liberal Democrats returned to power, in late 2012, Prime Minister Shinzo Abe has begun trying to sell Japan's nuclear technology abroad.

Much of the government funding for academic research in Japan is funneled through either the Japan Society for the Promotion of Science or the Ministry of Education, Culture, Sports, Science and Technology. Proposals are screened by government officials and reviewed by an academic committee.

Yusuke Shoji, a spokesman for the ministry, cannot say how many proposals for studying the impact of radiation had been greenlighted, but he insists that the application system is fair. “The screening is conducted by peer review, so we don’t direct or don’t favor one particular research field,” he said. “We assess applications purely from the scientific point of view.” The Japan Society also says its applications process is not politicized.

Professors, meanwhile, say that rather than simply defend what is a piecemeal approach to studying the disaster, the government should take the lead in creating a large, publicly financed project.

“If we’ve ever going to make any headway into the environmental impact of these disasters, statistical power, scientific power, is what counts,” said Mr. Mousseau of the University of South Carolina. “We get at it with massive replication, by going to hundreds of locations. That costs money.”

Correction: March 17, 2014

An earlier version of the headline with this article misstated the actions of the Japanese government. There are deep differences over how to determine the health impact of the Fukushima disaster. The authorities are not “squelching” efforts to measure the effects of the accident.

Lifting evacuation orders means less compensation to pay

April 2, 2014

Gov't eyes swift lifting of Fukushima evacuation orders to limit damages payouts

<http://mainichi.jp/english/english/newsselect/news/20140402p2a00m0na011000c.html>

The government is set to make all-out efforts to lift its evacuation orders for municipalities in Fukushima Prefecture as quickly as possible in a bid to hold down the amounts of compensation for damages from the 2011 nuclear crisis.

About 80,000 residents of areas for which evacuation orders have not been lifted are taking shelter elsewhere.

Reconstruction Minister Takumi Nemoto said at a news conference after a Cabinet meeting on April 1, "There is a need for us to use all our resources to lift evacuation orders for as many areas as possible where people can return home early." Nemoto made the statement in response to a proposal presented to Prime Minister Shinzo Abe by the ruling coalition's "Headquarters for Accelerating Reconstruction after the Great East Japan Earthquake." The government intends to lift evacuation orders for as many areas as possible during the so-called "intensive reconstruction period" through fiscal 2015.

And yet, at least some of the municipalities that still have evacuation areas are reluctant to accept the government's move.

The government pays 100,000 yen each every month to those people who have been forced to evacuate from areas around the crippled Fukushima No. 1 Nuclear Power Plant to compensate for their psychological pain. But the government will stop such payments to residents of both "residential restriction zones" and "zones being prepared for the lifting of evacuation orders" one year after the evacuation order is lifted for them. **In other words, the earlier the government lifts the evacuation order, the smaller the amounts of compensation it needs to pay.**

Naraha, where most of its area has been designated as a "zone being prepared for the lifting of evacuation orders," is taking precautions against the government's plan, saying, "For those municipalities that were forced to evacuate in their entirety, the longer the evacuation period becomes, the longer it will take to reconstruct them. It is too hasty and unrealistic to think they will be restored in one year and discontinue (compensation payments)." An official of the Katsurao Municipal Government said, "The residents are divided over the compensation issue. We want the government to continue to extend support in one form or another until each one of the residents puts their lives in order."

Yoshiaki Nakagawa, an official in charge of decontamination at the Iitate Municipal Government, said, "As for our return to the village, decontamination is important. When the residents return, the living conditions for such things as farming, medical institutions and shopping must be in place." The local government plans to set the timing of lifting the evacuation order in line with the reality. Therefore, it is considering lifting the evacuation order in March 2016 -- one year later than the date proposed by the central government.

New boss at TEPCO to take up challenges

April 2, 2014

New Tepco chief ready to face challenges

<http://www.japantimes.co.jp/news/2014/04/02/national/new-tepco-chief-ready-to-face-challenges/#.UzwjDlfi91s>

Sudo brings risk management skills to nation's toughest job

by Sayuri Daimon
Staff Writer

When Kazuhiko Shimokobe signaled late last year his intention to step down as chairman of Tokyo Electric Power Co., as the company and the government were forging a new 10-year business plan, officials knew it would be difficult to find a successor.

“As we tried to compile the plan, all of the outside directors felt we were really facing an extremely difficult environment. At that point, I’m sure nobody, including myself, wanted to continue serving as an outside director beyond June this year,” recalled Fumio Sudo, who on Tuesday took over as chairman of Tepco.

Skyrocketing compensation payments and costs for decontamination work, and the continuous increase of radioactive water at Fukushima No. 1 are just a few reasons why few people were eager to lead the embattled company.

In the end it was Sudo, a former president of steel maker JFE Holdings Inc., who was tapped to take over from Shimokobe, a lawyer who was brought in from the outside in June 2012 to serve as chairman.

Though initially reluctant, Sudo decided that steadily implementing the business plan and tackling all the problems bedeviling Tepco would result not only in reviving the utility but also in rebuilding Japan, he said.

“Considering the urgent need, I thought I had to push myself and take on this responsibility,” Sudo told The Japan Times in an interview last Thursday.

The revised business plan, which took effect this month, includes measures to increase government bond issuance to ¥9 trillion from ¥5 trillion to help Tepco pay compensation to victims of the nuclear crisis and to reduce costs by ¥4.8 trillion over the next 10 years.

It also seeks to reactivate two of the reactors at the Kashiwazaki-Kariwa power plant in Niigata Prefecture, in July and August, to reduce the heavy cost of importing fossil fuels for thermal power generation.

Sudo, who led Kawasaki Steel Corp. to consolidate with NKK Corp. to create JFE Holdings in 2002, said that the huge debt held by Japan Airlines and the old Japanese National Railways were limited and the figures were clear, but how much money Tepco will need for compensation and other costs in the coming years is uncertain.

Under the new turnaround plan, Tepco estimates that its compensation payments will reach roughly ¥4.9 trillion.

“Even skilled corporate managers can’t see the end to the problem,” Sudo said. “But even as this situation continues, we must face the challenge directly. At least the roles of the government and financial institutions are becoming clear now.”

But he admitted that there are problems that will not be easy to resolve, such as the seemingly nonstop glitches and mistakes plaguing Fukushima No. 1 and the lack of experienced workers there.

“We have 4,000 to 5,000 people working (at Fukushima No. 1) every day, but only about 1,000 are Tepco employees. The rest are third- and fourth-level subcontractors from across the country,” the chairman said.

“There is an annual radiation exposure limit for each person. Wearing bulky protective gear, workers have difficulty communicating with other workers only 5 meters away. . . . And under such circumstances, supervisors also face a tough time managing the workers.”

Though the utility conducts training for workers, their allowable radiation exposure reaches the limit in half a year and experienced workers have to leave.

Tepco has no choice but to ask subcontractors to continue looking for new — and inexperienced — workers.

Emphasizing the importance of risk management skills, he recalled his experience in the Great Hanshin Earthquake in 1995.

He was deputy head of Kawasaki Steel's Chiba steel plant. Under him was the Nishinomiya plant in Hyogo Prefecture.

As soon as he heard the news that morning that shinkansen operations were suspended, he ordered his staff to purchase all available seats on flights between Tokyo and Osaka. He also chartered two helicopters.

"I've gone through such crises, but there aren't many people who have experienced a serious accident in the field. . . . Without such experience, I know it's not easy to maintain operations," he said.

Saddled with trillions of yen in compensation payments, Tepco also needs to improve its financial standing. The company has already received a ¥1 trillion capital injection from the government-backed Nuclear Damage Liability Facilitation Fund, which effectively left it under government control.

The 73-year-old Sudo said Tepco will have to change, especially in terms of cost management.

For example, Tepco's 92 power-generating units are now competing with each other to be the most cost-efficient, and the new transparency means it's clear to see how they rank against each other.

The major challenge Tepco faces, according to Sudo, is whether it can regain the public trust it lost in the Fukushima debacle.

"To do that, Prime Minister (Shinzo) Abe ordered us to work hard to pay compensation to the victims in Fukushima, to decommission the nuclear reactors there and at the same time ensure a steady supply of electricity in the Kanto region. I totally agree with him."

Sudo added that Tepco's in-house company in charge of the decades-long decommissioning of Fukushima No. 1 will tap nuclear power experts from the private sector, including Toshiba Corp., Hitachi Ltd. and Mitsubishi Heavy Industries, Ltd.

But Sudo, meanwhile, insists the government needs to decide the country's energy policy going forward.

Since the nuclear crisis started, policy has flip-flopped as the parties in power changed. Under the 2010 plan, nuclear power was to generate 53 percent of the nation's electricity by 2030, but with the 2011 Fukushima disaster, that target was put on hold.

Under the Democratic Party of Japan, the government announced in 2012 that nuclear power would be completely phased out by 2030.

The current ruling bloc, made up of the Liberal Democratic Party and New Komeito, has yet to set new concrete goals for the energy mix.

“We are mere players,” Sudo said. “The government should decide the percentage of Japan’s energy supply to be generated by nuclear power and how many years nuclear power plants should operate. The government must decide whether it is 40 years, 50 years or 35 years.”

Monju - more cheating

April 11, 2014

Inspection report falsification suspected at Monju fast-breeder

<http://mainichi.jp/english/english/newsselect/news/20140411p2g00m0dm036000c.html>

TSURUGA, Japan (Kyodo) -- The operator of the Monju prototype fast-breeder reactor in Fukui Prefecture is suspected of falsifying its inspection report to regulators as they later found new pieces of equipment that had not been inspected there, Nuclear Regulation Authority sources said Thursday.

The Japan Atomic Energy Agency's Monju reactor -- which is designed to use extracted plutonium and uranium to produce more fuel than it consumes, while generating electricity -- has been effectively banned from operating since last May following the revelation of lax safety inspections at the facility in Tsuruga, Fukui Prefecture.

The discovery and the agency's alleged failure to report it to the regulators are all but certain to keep the reactor from operating for an extended period of time although the Monju project is expected to remain alive under the government energy policy to be finalized soon.

In November 2012, Monju reactor equipment was found not to have been inspected in about 10,000 cases.

The operator said in its report last September that while it had failed to inspect reactor equipment in about 14,000 cases, it finished inspecting all pieces of equipment, or roughly 47,500 in all, that were subject to its investigation, including those which had not been inspected previously.

But when the regulators inspected about 80 pieces of reactor equipment last month, at least nine that were related to the Monju reactor's secondary cooling circuit had not been inspected by the operator, the sources said. The operator had not reported it.

The operator has acknowledged its failure to report, according to the sources. An official of the operator declined to comment on the matter, however.

The sources said the operator also made improper corrections in its inspection records in more than 100 sections, a deviation from the operator's internal regulation.

While the regulators had planned to inspect 700 pieces of equipment last month, they stopped doing so after inspecting about 80 of them, because they found many that had not been inspected and many corrections in the operator's inspection records.

The Monju project has been regarded as central to realizing the country's ideal nuclear fuel cycle, which aims to reprocess spent nuclear fuel and reuse the extracted plutonium and uranium as reactor fuel.

But the reactor has remained largely offline since first achieving criticality in 1994 due to a series of problems, casting doubt on the project's viability.

April 11, 2014(Mainichi Japan)

New textbooks very silent about Fukushima disaster

April 10, 2014

Fukushima accident mentioned in only 1 elementary school science textbook

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201404100036

By TSUYOSHI NAGANO/ Staff Writer

Only one of the six science textbooks approved for use at elementary schools from the next academic year covers the issue of the Fukushima nuclear accident triggered by the 2011 earthquake and tsunami disaster.

The textbooks are the first to be screened and approved by the education ministry since the triple meltdown at the Fukushima No. 1 nuclear power plant. The results of the screening were announced April 4.

Five of the six publishers considered taking up the topic, but four eventually gave up. This was mainly because the word “atom” is not included in the education ministry’s curriculum guidelines for science in elementary school, making teaching how a nuclear plant works even harder than it is.

An editor at one publisher also said, “We could not deal with the issue negatively when our textbook is used in some municipalities hosting a nuclear plant.”

Even the science textbook from Dainippon Tosho Publishing Co., the only one that covers the accident, simply wrote: “The earthquake off the Pacific coast of the Tohoku region triggered an accident at a nuclear power plant.” The textbook mentioned effective use of resources as a lesson from the accident.

One publisher, though, tried hard to include an analysis of radiation in its science textbook for sixth graders.

“(Radiation) is an issue we will face for years,” said Takahiro Yano, editor in chief of the elementary school science textbooks division at Gakko Tosho Co. “We thought that if it is a science textbook, the issue should be included.”

But as the word “radiation” is also not included in the guidelines, publishers cannot take up the issue directly.

Under the circumstances, Gakko Tosho tried to include an explanation of radiation at the bottom of a one-page column on the life of Marie Curie, a Polish-born physicist and chemist who conducted pioneering research on radiation.

The publisher tried to relate the column with the guidelines and included two lines on a water solution--which is taught under the guidelines for sixth-graders--because Curie used a water solution in her study.

However, the textbook failed to pass the ministry’s screening.

“There is no appropriate relation with the curriculum guidelines,” the education ministry’s comment said.

The publisher finally gave up on including the column after repeated discussions did not change the ministry's view.

Nuclear future: Who will be responsible for what?

April 12, 2014

Gov't, energy industry squabble over who will take responsibility for nuclear accidents
<http://mainichi.jp/english/english/perspectives/news/20140412p2a00m0na017000c.html>

In this collage, Prime Minister Shinzo Abe, top; Chairman of the Federation of Electric Power Companies of Japan Makoto Yagi, left; and Chairman of the Nuclear Regulation Authority Shunichi Tanaka, right, are seen, with Kyushu Electric Power Co.'s Sendai Nuclear Power Plant in Kagoshima Prefecture in the background. (Mainichi)

The government has decided on its first basic energy plan since the Fukushima nuclear disaster and is again pushing to make nuclear power a crucial part of it. But it's unclear who will handle the decisions to reactivate individual nuclear plants or respond in the event of another nuclear disaster.

The energy plan, passed by the Cabinet on April 11, makes reviving nuclear power a national policy. Under the plan, energy companies will continue to own nuclear plants and be held responsible if a disaster occurs.

Previously, the Federation of Electric Power Companies of Japan (FEPC) had no major objections to a completely free energy market. But in November last year, after seeing an outline of the new energy plan and its onus on utilities, the federation did an about-face. Energy companies represented by the federation were reluctant to face increased competition from a free energy market on top of the potential costs of a nuclear disaster.

In February this year, lawmakers hailing from the Kansai region and backed by the FEPC opposed a free energy market during a meeting on revisions to the Electricity Business Act at the Liberal Democratic Party headquarters. They argued that a stable energy supply should be the top priority.

The federation took into account the huge cost of dealing with a nuclear disaster as a private operator -- as highlighted by the disaster at the Fukushima No. 1 plant operated by Tokyo Electric Power Co. (TEPCO).

The Fukushima disaster has already cost around 11 trillion yen in compensation and costs for decontamination, reactor decommissioning and countermeasures against contaminated water. Yet the figure is likely to rise further. The national government contributed around 1 trillion yen to TEPCO not long after the disaster, and it has spent additional funds combating contaminated water, but it has not provided other forms of support. Meanwhile, the government has left the issue of its responsibility for the nuclear disaster untouched, even though nuclear power was part of the national energy strategy.

Just after the March 2011 disaster, TEPCO officials warned fellow utility J-Power about the dangers of becoming a nuclear power plant operator. J-Power's first plant, the Oma Nuclear Power Plant, is under construction in Aomori Prefecture.

"It's no good to have a nuclear power plant. If an accident happens, your company will be done for," a TEPCO official told the utility.

Facing a government that has avoided taking direct responsibility for the nuclear disaster though it is empowered to set energy policy, electric companies have been trying to win concessions in that policy. They threaten to obstruct efforts to free up the energy market, resisting the separation of power generation and transmission.

At the same time, utilities hope to amend the Atomic Energy Damage Compensation Law -- which does not limit compensation required of energy companies -- to place the responsibility for paying for a nuclear disaster in the government's hands once the damage reaches a certain level.

However, a senior government economic affairs official argues, "Energy companies have said both now and in the past that 'Nuclear power is cheap.' If that's the case, they should do their work without government help."

The differing stances show that despite the national government steering its policy toward nuclear power, the question of whether responsibility for a nuclear accident falls on the government or energy companies remains clouded.

Similarly, though the government takes a proactive attitude towards reactivating nuclear plants in its basic energy plan, it says decisions to reactivate reactors will be based on Nuclear Regulation Authority (NRA) standards.

Yet NRA Chairman Shunichi Tanaka has repeatedly said the NRA will not intervene in societal, popular or government decisions. As such, it is unclear who will give the go-ahead to restart nuclear plants and who will assume responsibility for them.

"Disaster and change in Japan" - Richard Samuels

April 9, 2014

Post-Fukushima reform throws up a few surprises

<http://www.japantimes.co.jp/community/2014/04/09/voices/post-fukushima-reform-throws-up-a-few-surprises/#.U0pfDledHQg>

by Gianni Simone
Special To The Japan Times

*The magnitude-9 earthquake and tsunami that hit Japan on March 11, 2011, devastated the northeast, killing more than 15,000 people and causing level 7 meltdowns at three reactors at the Fukushima No. 1 nuclear power plant. Observers believed the sheer size of the catastrophe and its subsequent effects provided the country with an opportunity to reform and turn the page on two decades of political, social and economic crisis. In his 2013 book "3.11: Disaster and Change in Japan," **Richard Samuels**, director of the MIT Japan Program, chronicles the 18 months that followed the disaster and explains why this opportunity for change wasn't followed by substantial progress. Here, Samuels expands on some of the issues he examined in his book:*

Your book was published on the second anniversary of 3/11, and you actually submitted your manuscript in 2012. Considering what's happened in Japan since the book has come out, would you write the same book now?

In certain areas there have been more changes than I had first observed, particularly in the energy sector, where it seems there's going to be major restructuring. Really large vertically integrated utilities are going to be broken up, at least to a certain degree, in favor of smaller and smarter utilities. We will see nuclear power return, but nothing like the ambitious plans the government initially had. Secondly, the regulatory body seems to have more traction than anybody expected.

On the security side, we have seen changes in security environment and policy but rather than 3/11, they are linked to two other things: one is China's provocations in the China Sea; the other is the election of (Prime Minister Shinzo) Abe, who is more ambitious on the military side. On the local government side, we have seen local governments around Japan help Tohoku by sending their officials to the disaster area. Even though their number is declining, there are still 1,500 local government officials from around Japan in Tohoku. This has been a very important development. Surprisingly, though, we have seen dissatisfaction among the Japanese not only toward the central government but even their local leaders, particularly in Tohoku. As a consequence, local mayors have been thrown out of office one after the other in subsequent elections. These are the developments I didn't anticipate in my book.

How do you judge the Democratic Party of Japan? Do you think it was incompetent or just very unlucky, or maybe a little bit of both?

They were certainly unlucky. We can't do a final analysis yet, particularly about (then-Prime Minister Naoto) Kan's management of the crisis. He was already under enormous pressure to leave because his party was revolting around him — even before 3/11. So he became the chief villain. The question is, does he really deserve it? I think probably not. Mistakes were made, that's for sure, but before he agreed to leave the leadership he held the party and the government hostage to pass the supplementary budget in order to provide the necessary resources. This was important leadership, especially for someone who was leaving the scene. I think there will be a reevaluation of his role.

On the other side, we have a Liberal Democratic Party that comes under criticism in your book.

In my book there is a critique of the LDP as having colluded with the utilities, the bureaucrats and the academics on the energy issue. It was too cozy a relationship, especially when you have both regulation and promotion of nuclear power in the same ministry. On the other hand, even the DPJ was very pro-nuclear both before and after the catastrophe. So it's not as if one party was in favor and the other was against.

Were you surprised by the results of the political elections in December 2012, and the way the LDP won?

Yes, I was. Everybody saw the polls according to which people were overwhelmingly opposed to nuclear power, and then the elections saw the biggest pro-nuclear party triumph. This suggests a couple of things. One is that people don't always vote on their poll preferences. There are other issues, and Abe was very successful running on an economic platform. The Japanese may have disliked nuclear power but they hated an economic lethargy even more. What's more, 10 million less voters cast ballots in 2012 compared to the previous poll — the lowest turnout ever in a national postwar election. This shows that people had lost confidence in the government.

The fact that people went into the streets again to protest the situation after so many years of lethargy can be seen as an important development. What are your thoughts on this?

That's true, but don't forget it took a long time for those groups to get going. Then the DPJ backed off and embraced the zero option. But when the DPJ disappeared, so did the protests. Now they only draw dozens, maybe a couple of hundred people, once or twice a month, whereas they were drawing hundreds of thousands every Friday night during the 2012 summer. So it's true that robust political mobilization was back for the first time in two generations but, still, it wasn't sustained.

Regarding security policy, what is Japan's current position in relation to the U.S. on one side and other Asian countries on the other?

Well, the U.S. is Japan's military ally, and both governments have consistently tried to reinforce an alliance that proved very successful during 3/11 when the Japanese public finally came to believe in its importance and efficacy. As you know, Japan right now has a difficult relationship not only with China and North Korea, but even with South Korea, which is troubling. What's in question sometimes is whether the U.S. is repositioning toward the Far East in the face of a more powerful China.

In the past, Abe has explicitly targeted Article 9 of the Constitution and the LDP has generally moved away from the country's postwar pacifism.

When Abe tried to do this in 2007 he was met with a vigorous public pushback, so he has given up on changing Article 9 and is now moving toward reinterpreting the article. This doesn't require a change in the Constitution but only a declaration by the government that the implementation of Article 9 allows other kinds of capabilities, particularly regarding collective self-defense. An actual constitutional change would be a much more difficult legal obstacle and would face more public opposition.

Abe's visit to Yasukuni Shrine in December was met with international criticism. Do you think the government will ever agree on establishing an alternative secular war memorial?

That's actually the U.S. government's clear preference, because both the Yasukuni narrative about the war crimes trials and the version of Japanese history presented at the Yushukan (the military and war museum located within Yasukuni Shrine) are repugnant to all the countries. Abe blatantly ignored all that and went anyway. This is not the work of a realist but of an ideologue. What is striking about the visit is that in the months before, Japan had the sympathy of the world. China was seen as provocative — a would-be hegemon and a bully — while Japan was seen as a victim. But what Abe did changed everything and called attention on Japan's inability to come to grips with its war responsibilities. This is a problem for the Japan-U.S. relationship.

How do you judge Abe's decision?

Well, if you look at this from his point of view, he's held the door open to China for over a year. He was ready to talk and they didn't come. So given his ideology he was fairly patient, but he decided at the end of the day that he wanted to do this, thinking that their relations couldn't get any worse because they were already screwed up.

Do you think that the opposition parties have a chance to win the next Lower House elections?

Absolutely not. The LDP is divided on some issues, including nuclear power, so we may see some fighting about that. However public support for the DPJ now stands at 6 percent. Unless the party is reborn somehow or there is a reconfiguration of party structure it really has no challenge to the LDP right now. New Komeito has a stable base but it's not going to either grow or shrink. The Communist Party is in single digits. The Restoration Party never really got the traction people expected. Your Party didn't go anywhere. They are all in single digits. However, the LDP only has 37-40 percent of the public's favor, so they will need to build a coalition to reach a majority, which means they must convince New Komeito.

A breach of freedom of information

April 15, 2014

Hyogo blocks release of nuke crisis study data

<http://www.japantimes.co.jp/news/2014/04/15/national/hyogo-blocks-release-of-nuke-crisis-study-data/#.U01Kilfi91s>

by Eric Johnston
Staff Writer

Hyogo officials are blocking the release of data from a simulation run last year predicting what would happen to surrounding prefectures in the event of a meltdown crisis at one of Fukui Prefecture's four atomic plants.

Citizens' groups said Tuesday they were told by Hyogo officials earlier this month that the data would be released before May along with data from a new simulation the prefecture is conducting.

The backtrack on the data release has raised concerns that the prefecture is trying to downplay the possibility of a worst-case scenario for disaster planning purposes.

Hyogo officials weren't immediately available for comment.

Last year, Hyogo Prefecture did a study of the effects of a meltdown disaster at Fukui's four nuclear power plants, in Takahama, Oi, Mihama and Tsuruga, that plotted the possible directions of radiation plumes in the event of a Fukushima-like calamity.

The results showed that, depending on wind direction and weather, the city of Sasayama could receive a maximum radiation dosage of 167 millisieverts over a seven-day period, which is especially risky for children and more than three times higher than the International Atomic Energy Agency's standard for dispensing iodine tablets.

In the worst-case scenario, Kobe could receive a maximum radiation dose of 62 millisieverts over a week, while other Hyogo towns could see levels of between 50 and 100 millisieverts, also over a one-week period.

While Hyogo released the results of what could happen inside the prefecture, it did not make public what might happen in neighboring prefectures. Concerned this would make it more difficult for localities to draw up emergency plans and for a coordinated, Kansai-wide response, anti-nuclear activists and other citizens pressed Hyogo to release the entire study.

Hyogo Prefecture resident Juro Yamamoto filed a freedom of information request in February for the release of all simulation data on Fukui, Kyoto and Shiga prefectures. The request was granted, in writing, by Hyogo Gov. Toshizo Ido's office on March 7.

However, the information has yet to be made public. Yamamoto called on prefectural officials Tuesday to release it immediately.

"When I spoke to prefectural officials in charge of disaster planning, I was told that the data couldn't be released right away and to wait. Then, on Thursday, I was told that the data would be released along with new simulation results. The information is supposed to be released within 15 days of the approval, but not to release it after that is a violation of the freedom of information ordinance," he said in an official appeal to the governor Tuesday.

Far more contaminated than first announced

April 12, 2014

August water leak at No. 1 far more toxic than announced: Tepco

<http://www.japantimes.co.jp/news/2014/04/12/national/august-water-leak-at-no-1-far-more-toxic-than-announced-tepco/#.U0wJnFfi91s>

Kyodo

Tokyo Electric Power Co. said Friday that toxic water found to have leaked last August at one of the huge tanks at the accident-hit Fukushima No. 1 nuclear power plant was far more contaminated than initially announced.

After recalculating the radiation level, Tepco said **the water contained 280 million becquerels per liter of beta ray-emitting radioactive materials such as strontium-90, instead of 80 million becquerels.**

A total of 300 tons of toxic water was found to have leaked at that time, part of which is believed to have flowed into the adjacent Pacific Ocean. The Nuclear Regulation Authority assessed the severity of the incident to be level 3 on an eight-point international scale.

Tepco decided to review data on 173 water samples it took until last October, as it found readings may be lower than actual figures due to improper measurement formulas.

As for 104 samples, Tepco analyzed them again as it had kept them. But the utility did not have the remaining 69 samples, including the water that leaked, so it calculated the radiation level by using a theoretical formula.

Conflicting interests keep energy policy uncertain

April 15, 2014

Nuclear power's share in new energy policy remains clouded as interests clash

<http://mainichi.jp/english/english/perspectives/news/20140415p2a00m0na010000c.html>

Despite the government releasing a basic energy plan on April 11, it has foregone setting goals for the share of nuclear power, renewable energy and other power sources, as competing interests keep the future of Japan's energy policy uncertain.

Policymakers from both the Liberal Democratic Party (LDP) and New Komeito had aimed to put numerical targets for renewable energy into the basic energy plan, but were stymied by hardline opposition from the Ministry of Economy, Trade and Industry. The reason for the opposition: should there be a spread of renewable energy, which is comparatively expensive, it would lead to higher energy bills that would put pressure on household budgets and corporate profits.

The new energy plan calls nuclear power an "important base load power supply" and paves the way for the resumption of idled reactors, replacing aging plants, and even the construction of new plants. One reason for the government promoting nuclear power in this way is that, should resumption of idled reactors continue to be delayed, causing higher energy bills and setting the economy on a downward path, it will affect the administration's public support. The government worried that if it did not highlight the importance of nuclear power, atomic energy might be scrapped completely amidst the backlash that has followed the Fukushima No. 1 Nuclear Power Plant disaster. The Ministry of Economy, Trade and Industry's desire to keep the nuclear industry alive is also evident.

So how should the nuclear industry be kept alive? One plan that has been secretly discussed within the government and the energy industry is using public money as well as funds contributed by the power industry to buy energy produced from nuclear sources at a set rate under a system similar to the fixed-income tariff system introduced to help spread renewable energy.

However, there is strong criticism within the government that introducing an energy-buying system that ensures the profits of energy companies that own nuclear plants would, in the words of one senior industry ministry official, "only make the criticism of nuclear power stronger."

Meanwhile, a senior official of the industry ministry has argued for nuclear energy as a necessary source of power in the event that oil or gas imports are cut off. However, an executive at one power company expressed doubt about that argument. It is all but impossible that the share of nuclear power in the nation's energy supply will reach 30 percent like before the nuclear disaster, and the executive says, "If it's only accounting for 10 or 20 percent, its value as a secure energy source declines."

Furthermore, Kyushu Electric's Sendai Power Plant in Kagoshima Prefecture is the top candidate for having its reactors restarted, but Kyushu Electric is doubtful about the government's commitment to nuclear power. A senior executive at Kyushu Electric Power Co. says, "It is the national government that has decided that nuclear energy is important, but when nuclear power became a talking point in the Tokyo gubernatorial election, the government forestalled deciding on the energy plan. There is no way the government is prepared to assume the responsibility of promoting nuclear power."

However, problems do not stop with nuclear power. An LDP meeting evaluating the basic energy plan was full of Diet members representing renewable energy interests like biomass and hydroelectric power,

and rumors have abounded in the LDP that an influential Diet member and former minister of economy, trade and industry has gone from supporting nuclear power to supporting renewable energy and was trying to get numerical targets for renewable energy into the energy plan. Just like with nuclear power, political gains and losses come into play with the corporations and interest groups associated with different kinds of renewable energy.

Regarding a decision on the so-called "best mix" of energy sources the government is aiming for, Minister of Economy, Trade and Industry Toshimitsu Motegi said, "It is not something that will take as long as two or three years." However, with a solution to the contaminated water issue at the Fukushima plant still elusive and the damaged reputation of nuclear power, deciding on an energy ratio for atomic energy will prove difficult. Should discussions on the energy policy end in coordination between conflicting interests, it could leave serious problems in the future.

Reduce the role of Atomic Energy Commission

April 18, 2014

Govt. approves bill to limit nuclear panel's role

http://www3.nhk.or.jp/nhkworld/english/news/20140418_26.html

Japan's government has approved a bill that would limit the role of an advisory panel that has served to promote nuclear energy for over half a century.

The bill that won Cabinet endorsement on Friday would revise the law governing the Atomic Energy Commission, whose chief duty is to compile the nation's nuclear energy policy.

The commission's role came under review following disclosures 2 years ago that it held secret meetings only with pro-nuclear parties -- including power utilities and bureaucrats -- during the course of compiling the policy.

The government's bill says the commission will no longer draw up the policy and will instead offer its basic ideas on nuclear energy.

Its role would be limited to solving problems related to nuclear power, such as how to deal with radioactive waste and what do to with the damaged Fukushima Daiichi power plant.

The number of commissioners would be reduced from 5 to 3, and a new code of conduct would be introduced to ensure neutrality and transparency.

Once the bill is enacted, the commission's chair and members will be appointed following Diet approval.

Radiation information: Why the secrecy?

April 19, 2014

EDITORIAL: Fukushima and the world benefit from full disclosure of radiation information

<http://ajw.asahi.com/article/views/editorial/AJ201404190033>

What should policymakers think about the effects of exposure to low levels of radiation in areas affected by the Fukushima nuclear disaster?

The fact that there is an insufficient amount of established scientific knowledge about the effects of low-dose radiation makes it all the more important for the government to offer detailed explanations and disclose all relevant information when it adopts policy measures to deal with the problem.

The government recently released the findings from a survey it conducted to assess the relation between dose estimates based on air dose rates and actual individual radiation doses at various locations in Fukushima Prefecture.

The survey was aimed at obtaining data about radiation doses under circumstances that are similar to actual living conditions, instead of mechanical estimates, in evacuated areas where it is difficult to take actual measurements due to high levels of radiation.

The survey results clearly indicate a strong correlation between data obtained with measuring equipment shaped like the human body and integral individual doses estimated from air dose rates.

Residents in evacuated areas face the decision of whether or not to return to their homes when the evacuation order for their communities is lifted. They are keen to know the actual dose of radiation they would receive when they return to their towns and villages rather than the air dose level.

As the government will consider lifting evacuation orders for specific areas, establishing a reliable formula for estimating actual individual radiation doses is vital for residents in deciding whether or not to return to their communities. The survey is a welcome first step in the effort.

However, the government carried out the survey without announcing it, raising suspicions that it had been hiding the information because the results were undesirable.

The decision to do the survey was made last summer. But the government didn't disclose any information about it during meetings on the return of evacuees to their homes held with the Nuclear Regulation Authority, nor in meetings with residents of the city of Tamura to discuss the lifting of the evacuation order for a district in the city.

Why the secrecy?

Explaining its failure to inform the public about the survey, the government says it took time to ensure that its formula for making estimates was scientifically correct. The government also says it didn't plan to publish any interim report on the survey.

But there is strong public distrust of the government's stance toward disclosure of information concerning the devastating nuclear accident. This is partly due to the chaotic state of affairs during evacuations caused by poor information disclosure.

If the survey was designed to provide useful information for evacuees, the government should have made it widely known that it was conducting the survey. It also should have disclosed information on a timely basis about progress and prospects even before all the data had been accumulated.

There is a global trend toward greater disclosure of data held by governments, with due care to protect individual information, for the purpose of developing better policies.

Data about the Fukushima meltdowns is among the most valuable information held by Japan, and it should be shared publicly with the rest of the world.

Not much is known about the effects of exposure to low-dose radiation. It is also true that there are various views and opinions about such exposure itself.

Under the guiding principle of putting priority on the interests of residents, the government should spare no effort to ensure that important knowledge and information about the disaster--reviewed and assessed by experts both at home and abroad--will be shared by the entire public.

--The Asahi Shimbun, April 19

Motegi on the defensive over radiation survey results

April 19, 2014

Minister sorry for delay in releasing survey results on radiation exposure

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201404190048>

THE ASAHI SHIMBUN

Industry minister Toshimitsu Motegi apologized April 18 for a six-month delay in releasing the results of a survey in Fukushima Prefecture about the amount of radiation each resident will likely be exposed to per year.

"I am sorry for any anxiety I might have caused," Motegi said at a news conference held after a Cabinet meeting.

In a separate news conference, Atsuo Tamura, counselor of the Cabinet Office, which commissioned two organizations to conduct the survey, explained that bureaucrats shared the results of the survey but decided to refrain from releasing them publicly without consulting Motegi or other politicians in high-ranking positions.

In July 2013, the Cabinet Office's team in charge of assisting the lives of nuclear disaster victims asked the National Institute of Radiological Sciences and the Japan Atomic Energy Agency to look at the situation in the municipalities of Kawauchi, Iitate and Tamura, which included zones being prepared for the lifting of evacuation orders.

From August to September, the two organizations measured radiation doses in the air at farmland, forests, homes and schools, and also checked readings of dosimeters carried by some people. As a result, they concluded that the radiation dose each individual is likely to be exposed to is about 70 percent of the airborne dose.

Taking lifestyle patterns and other factors into account, they estimated the radiation dose for individuals in various occupations.

The survey results were submitted to the government on Oct. 11 last year. At the time, a council of experts attached to the Nuclear Regulation Authority was considering changing the method to measure radiation doses, from one based on airborne radiation to readings found on dosimeters carried by local residents.

However, the government failed to inform the NRA council that it was doing the survey.

“That was because the survey had not been completely finished,” an official of the Cabinet Office said.

The government finally released the results of the survey on April 18.

On April 1, the government lifted its evacuation order in the Miyakoji district in Tamura, which was also covered by the survey.

“If the government had released the survey results immediately, local governments and residents would have been able to think about and work out measures to deal with the radiation (in more detail),” said Shinzo Kimura, an associate professor at Dokkyo Medical University, who is well-versed in measures against radiation.

Some residents were also unhappy about the delay in releasing the survey findings.

“The industry ministry still has a tendency to cover up (important information),” said Upper House lawmaker Teruhiko Mashiko of the opposition Democratic Party of Japan who represents Fukushima Prefecture.

The government is planning to lift its evacuation order in a district of Kawauchi as early as July. However, the survey showed that the estimated radiation dose for each farmer there stood at 3 millisieverts a year, higher than the government’s long-term goal of 1 millisievert a year.

The government is leaning toward dosimeter readings rather than airborne levels as a long-term goal as part of moves to make decommissioning work easier.

If radiation doses are estimated using dosimeter readings, then acceptable airborne radiation doses would increase by 40 percent.

However, a high-ranking Japan Atomic Energy Agency official said that is not feasible.

"It will be impossible to do so (from a scientific viewpoint)," said Takuma Momose, who was involved in the survey.

Only adults were subject to the latest survey. For future surveys, however, the government is considering estimating the radiation dose each child is likely to be exposed to over the course of a year.

(This article was compiled from reports by Shinichi Sekine, Miki Aoki and Asako Myoraku.)

Motegi denies hiding radiation report around Fukushima plant

<http://mainichi.jp/english/english/newsselect/news/20140418p2g00m0dm082000c.html>

TOKYO (Kyodo) -- Industry Minister Toshimitsu Motegi on Friday denied that the government hid for six months the outcome of a radiation study around the crisis-hit Fukushima Daiichi nuclear complex, but apologized for having given "the impression" that the outcome announcement delayed.

An interim report on the study on radiation measurement with dosimeters carried by individuals was compiled in October, showing that the radiation level in some areas in the city of Tamura and other villages is beyond 1 millisievert per year -- a level the government is eventually seeking to achieve in contaminated areas.

But the report was not made public before April 1 when the government lifted for the first time an evacuation order imposed on an area within a 20-kilometer radius of the Fukushima plant. The area was a district in Tamura.

"Some media have reported as if the government hid information or manipulated data, but that is not a fact," said the economy, trade and industry minister, who is also in charge of issues to assist people affected by the nuclear crisis.

But he also said, "I feel sorry for stirring concerns among people who got the impression that our information provision was delayed."

A government team decided to conduct the radiation study at 43 points in Tamura and the villages of Kawauchi and Iitate last July, hoping to address concerns among evacuees seeking to return to their

homes. The study found that individual dose levels were above the usual-time limit of 1 millisievert per year at 27 measurement points.

The interim report was posted on the website of the Ministry of Economy, Trade and Industry on Monday, April 19, 2014(Mainichi Japan)

Stop lying about safety standards, says Izumida

April 23, 2014

Niigata governor: State must stop lying about nuclear safety standards

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201404230062>

THE ASAHI SHIMBUN

The governor of Niigata Prefecture said the central government must stop spreading the lie that its new safety requirements for nuclear power plants are “the world’s strictest standards.”

Hirohiko Izumida said the government’s new setup for nuclear power facilities is filled with holes, fails to address unexpected developments and puts the onus on local governments to protect residents in the event of a nuclear accident.

“Although (the new requirements) do not measure up to international standards, (the central government) is not working to change the current situation,” Izumida said in a recent interview with The Asahi Shimbun. “(The state) is lying by insisting that it has done what it has not done.”

Niigata Prefecture is home to seven idled reactors at the Kashiwazaki-Kariwa nuclear power plant. Tokyo Electric Power Co. is seeking approval to restart reactors there.

TEPCO is also the operator of the Fukushima No. 1 nuclear power plant, which suffered a triple meltdown after the 2011 Great East Japan Earthquake and tsunami knocked out power at the site.

In light of the nuclear accident, the Abe administration last year introduced tougher safety standards for nuclear power facilities. The new requirements are intended to strengthen measures to prevent serious accidents from natural and other disasters. For example, utilities are now required to have more than one power source at their nuclear facilities.

Currently, the nation's 48 reactors are all offline.

Utilities have submitted applications to the Nuclear Regulation Authority to restart 17 reactors under the new safety standards. The screening for Kyushu Electric Power Co.'s Sendai plant in Kagoshima Prefecture could be completed before this summer.

However, Izumida said those reactors cannot be considered "safe" even if the NRA concludes that they meet the new standards.

"The standards assume that nuclear accidents are inevitable, and meeting the standards alone would not assure the safety of residents," he said.

The Niigata governor said local governments, therefore, must prepare to protect their citizens in the case of emergencies, including devising effective evacuation plans on their own.

"If local governments fail to properly address an emergency situation, they will not be able to secure the safety of residents," Izumida said.

However, he said current laws and regulations make it difficult for local authorities to compile viable plans.

In talks with former U.S. nuclear regulatory chief Gregory Jaczko last month, the Niigata governor said local authorities cannot develop effective evacuation plans unless the central government reviews its entire framework related to disaster management.

Izumida also told The Asahi Shimbun that it will be particularly difficult for local governments to respond to simultaneous multiple disasters.

He said residents using roads to flee from a nuclear disaster following an earthquake and tsunami could end up stuck due to damage or congestion and be exposed to radiation for a longer period. As a solution, Izumida proposed building nuclear shelters in citizens' homes.

The governor also criticized the central government's stance toward nuclear facility management, arguing that the Abe administration has not taken "human factors" into consideration.

"(The state) believes that just examining the performance of equipment is sufficient to confirm safety," Izumida said. "It does not consider what to do when something unexpected happens."

The governor said many unknowns remain, including who will work at a highly contaminated nuclear plant site following a serious accident.

He also questioned the current system that allows plant operators to decide whether to cool reactors with seawater, which will ruin the reactors and cause heavy financial damage.

Can utilities fund political parties?

April 22, 2014

Nine utilities buy fund-raising party tickets for Aso

http://ajw.asahi.com/article/behind_news/politics/AJ201404220044

THE ASAHI SHIMBUN

Nine operators of nuclear plants have bought tickets to Deputy Prime Minister Taro Aso's fund-raising parties for at least 10 years but avoided having their names listed in his political fund reports, The Asahi Shimbun learned.

The electric power companies each limited their spending per party to 200,000 yen (\$1,950) or less.

Any sum over 200,000 yen must be entered into a politician's political fund reports under the Political Fund Control Law.

Similar payments by utilities were revealed in an Asahi Shimbun report in January concerning fund-raising tickets for Akira Amari, a pro-nuclear Cabinet minister who is in charge of economic revitalization.

In response to an inquiry by The Asahi Shimbun, an official with Aso's office said, "We handled the political fund reports properly based on the Political Fund Control Law."

The nine utilities, regional monopolies that derive their revenues from electricity rates paid by consumers, want to restart their idled reactors. Prime Minister Shinzo Abe is currently seeking to promote nuclear power despite continued anti-nuclear sentiment among the public following the Fukushima nuclear disaster.

According to senior executives with the utilities, **the nine companies spent about 1 million yen together for each of Aso's fund-raising parties.** They divvied up their share based on the size of their business operations.

Tokyo Electric Power Co., operator of the Fukushima No. 1 nuclear plant and the largest of all the utilities, halted its purchases after the 2011 triple meltdown at the plant.

But the other companies have continued to spend amounts similar to those before the nuclear accident.

Political fund reports of several entities linked to Aso showed that he held an average of three fund-raising parties a year between 2000 and 2012.

The combined purchase by the utilities is estimated to average several million yen a year. The nine utilities declined to discuss details of their individual purchases.

An official of Kansai Electric Power Co., the second largest and most reliant on nuclear power of all utilities, said, "(Kansai Electric) does not buy tickets in collaboration with other companies."

Aso, 73, who doubles as finance minister and has enormous clout in crafting the nation's energy policy, is closely associated with Fukuoka-based Kyushu Electric Power Co., the fourth largest utility after TEPCO, Kansai Electric and Chubu Electric Power Co.

Aso is from Fukuoka Prefecture and used to run a core company of the family's Aso group before he turned to politics.

Kyushu Electric's Sendai nuclear power plant in Kagoshima Prefecture is widely expected to be the first nuclear power plant to go back online, possibly in summer.

“Trust in the electric power company is high in the local region,” Aso said at a news conference on April 18, referring to the Sendai nuclear plant.

Interview with Katsutaka Idogawa, former mayor of Futaba, Fukushima Prefecture, April 21, 2014:

At 9:30 in

- *Katsutaka Idogawa, former mayor of Futaba in Fukushima Prefecture:* There are still about 2 million people living in the prefecture, who have all sorts of medical issues. The authorities claim this has nothing to do with the radiation fallout from Fukushima. I demanded that the authorities substantiate their claim in writing, but they ignored my request. There are some terrible things going on in Fukushima. [...] The biggest problem is that there is no one to help us. [...] I talked to local authorities in different places in Fukushima, but no one would listen to me. They believe what the government says, while in reality radiation is still there — and it is killing children. They are dying of heart conditions, asthma, leukemia, thyroid complications. Lots of kids are extremely exhausted after school, others are simply unable to attend PE classes. But the authorities are still hiding the truth from us, and I don’t know why. Don’t they have children of their own? It hurts so much to know they can’t protect our children.

At 22:30 in

- *Sophie Shevardnadze, host:* The United Nations report on the radiation fallout from Fukushima says no radiation-related deaths or acute diseases have been observed among the workers and the general public exposed. So it’s not that dangerous after all? Or is there not enough information available to make proper assessments?
- *Idogawa:* This report is completely false. The report was made by a representative of Japan – Professor Hayano. Representing Japan, he lied to the whole world from the UN podium. It’s a real

shame that the authorities hide the truth from the whole world, from the UN. We need to admit that actually many people are dying, we are not allowed to say that [...]

Rebuilding trust in Tepco

<http://www.japantimes.co.jp/opinion/2014/04/24/commentary/japan-commentary/rebuilding-trust-tepco/#.U1jyBlfi91s>

by Christopher Hobson
Special To The Japan Times

“The Sorcerer’s Apprentice” is a famous poem by Goethe, perhaps better known in Japan for its appearance in Disney’s “Fantasia.” In the story, the sorcerer departs, leaving the apprentice to do the chores. Tired of doing them, the apprentice tries to use his magic to get the broom to do the work. The apprentice soon finds himself in trouble, unable to control the magic he has unleashed. The broom continues to bring more and more water, and the place starts to flood. Just as the situation begins to appear hopeless, the sorcerer returns and stops the spell, preventing a disaster.

At the Fukushima No. 1 nuclear power plant, the Tokyo Electric Power Co. now finds itself in an uncannily similar situation to the foolish sorcerer’s apprentice. In its desire for maximizing profits, it took shortcuts and did not invest sufficiently in safety. On March 11, 2011, Tepco discovered the consequences of playing with forces it could not completely control. And like Goethe’s story, Tepco is threatened by a seemingly never-ending stream of water, much of it is contaminated. Unfortunately for Tepco, and the rest of us, there is no master sorcerer who can stop the flow of water.

Given the sheer volume of water that Tepco is dealing with, as well as the high-pressure conditions in which they have been operating, it is hardly surprising that there have been repeated problems with water leaks.

As many of the storage tanks were hastily constructed, and water continues to build up day by day, there will surely be more problems in the future. At present, 1,000 tanks hold 440,000 tons of contaminated water, and workers aim to double the storage capacity by 2016. With so much water being stored, future mishaps are all but inevitable.

It is in this context that the manager of the plant, Akira Ono, recently acknowledged to reporters that “it’s embarrassing to admit that there are certain parts of the site where we don’t have full control.” After appearing in a Reuters report reprinted in The Japan Times, this statement presented itself as yet another reason to attack Tepco: their own plant manager admitting they are not in control of the plant! Yet do we really need more reasons to criticize Tepco? Their bumbling, incompetent, self-centered mismanagement of Fukushima No. 1 has ensured them a permanent place in Japan’s corporate hall of shame.

Rather than being used to lambast Tepco once again, Ono’s admission should actually be seen as a positive step forward. This may seem counterintuitive, but stating that Tepco is not in complete control of the plant is doing nothing more than confirming a very obvious reality.

It is precisely Tepco’s continual assurances that everything is fine, and Prime Minister’s Shinzo Abe’s exaggerated claims to Olympic officials in Buenos Aires, that generate more skepticism among the public. Even Goethe’s apprentice acknowledged the situation was beyond what he could handle. Continuing to pretend that the situation at Fukushima is under control when it so blatantly is not is reminiscent of Monty Python’s skit involving the deluded Black Knight: “It’s just a flesh wound!” (It’s just a small leak, it won’t happen again).

Until now, whenever there is a problem at the plant — no matter how big or small — a media frenzy soon occurs, which is inevitably followed by Tepco issuing an apology and an assurance that the problem will be fixed. Not only does this cycle continue to provoke more concern in much of the general public, it also results in confusion about the kind of risks that exist at the plant.

For most people, who lack the scientific knowledge to properly assess what is going on, any leak or problem at the plant generates fear and worry. This response is completely understandable considering Tepco’s woeful record of transparency.

A much better approach would be for Tepco to be more up front and honest in explaining the situation at the plant. This is perhaps the only way that it might be able to begin rebuilding some degree of trust with the public.

This trust is vital for differentiating between risks. Until Tepco can prove itself to be more transparent and believable in its explanations of what is happening at the plant, it is understandable that most people will not believe any claims that a problem is “small” even if it happens to be the truth.

Decommissioning of the plant is expected to take 30 to 40 years, and many serious challenges lie ahead. There will be more leaks and problems at the No. 1 plant. There will also have to be the controlled release

of contaminated water into the ocean. Public support and understanding will be needed through these difficult processes.

For this to happen, Tepco needs to begin to rebuild its credibility with the public in the same way that Japan's Nuclear Regulation Authority has tried to demonstrate its independence and strict approach to safety.

Tepco's regaining the trust of Japan's public is just as difficult a task as resolving the technical challenges in decommissioning the plant. The only way this might happen is by the rest of Tepco following the lead of Ono and beginning to be more honest and transparent about the problems in Fukushima.

Information concealed even before secrets law

April 29, 2014

Ahead of secrets law, information concealed on nuclear facilities

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201404290064

A rally is held in front of the head office of Kansai Electric Power Co. in Osaka to protest the restart of nuclear reactors on April 11. (Asahi Shimbun file photo)

THE ASAHI SHIMBUN

Kiyohiko Yamada has studied the situation surrounding the problem-plagued nuclear fuel reprocessing plant in Aomori Prefecture for a quarter-century, but the information he recently saw was perhaps the most startling.

“Why are there so many blacked-out parts?” Yamada, 57, who lives in Misawa, Aomori Prefecture, said he thought when he viewed the website of the Nuclear Regulation Authority (NRA).

The page was an application form for construction work submitted to the government in January by Japan Nuclear Fuel Ltd. (JNFL), the operator of the reprocessing plant in Rokkasho, next to Misawa.

The JNFL had censored the names of all the buildings described in the form, months before the state secrets protection law was enacted in December last year in the name of protecting national security.

The law, which covers nuclear facilities, has been criticized as vaguely worded and a potential tool to conceal embarrassing information among those in power. Violators of the law could face prison terms.

Anti-nuclear activists fear current actions, including the concealment of information and harassment, could portend things to come when the secrets law actually does take effect by December this year.

A sense of secrecy even surrounds certain pro-nuclear movements.

“Going ahead of the law, the government started concealing information in an arbitrary manner,” said Yamada, who started monitoring the Rokkasho reprocessing plant, which will extract plutonium from spent nuclear fuel, 25 years ago using disclosed information. “I wonder whether the information I have collected is regarded as state secrets subject to the law and I will be punished.”

In mid-March, Asahi Shimbun reporters visited a reading room of the NRA in Tokyo’s Roppongi district and checked six installments of JNFL’s applications. The names of the buildings were redacted in all of the forms.

Each application consisted of many detailed documents. The pages with the concealed portions were new and had apparently replaced older versions.

According to NRA officials, the old pages were replaced around summer 2013, when discussions on the state secrets protection bill had already started.

Government officials in charge of the issue explained in the Diet that blueprints of nuclear power-related facilities were not subject to protection under the secrets law, but information related to security of those facilities was covered.

The NRA and the JNFL stopped concealing the names of the buildings in the application forms this month after being asked by the reporters why such information had been redacted.

‘I JUST WANTED TO ASK A QUESTION’

In Fukushima Prefecture, home of the stricken Fukushima No. 1 nuclear power plant, emotions still run high over the issue of nuclear energy.

In July 2013, Ruri Sasaki was waiting in front of JR Fukushima Station in the prefectural capital, where pro-nuclear Prime Minister Shinzo Abe was scheduled to give a speech for a candidate in the Upper House election.

The 41-year-old homemaker from Nihonmatsu, also in Fukushima Prefecture, carried a board that read: "I have a question for the prime minister. Are you for or against the decommissioning of nuclear power plants?"

Sasaki hoped Abe would make his stance clear if he noticed the board. But several men surrounded her, and one of them told her, "This is not a place to ask questions."

They confiscated her board and repeatedly demanded her name and address.

Fearing for her safety, she fled to her car. Tears welled up in her eyes, and she was unable to drive for a while.

One of the men was a secretary to a Lower House member of the ruling Liberal Democratic Party. "We wanted to avoid confusion in a place where the prime minister came," he later said.

When Sasaki was talking with the men, she took a video of the quarrel with her mobile phone. She later posted it on the YouTube video-sharing site.

Comments came in from people throughout the country. One of them read, "It is an oppression of freedom of expression."

However, unfounded rumors about Sasaki began to spread in her hometown.

Neighbors whispered that she went to Fukushima city to complain to the prime minister. Others said she had joined a political activist organization.

Despite those experiences, Sasaki said she believes she will try to raise a board again if the opportunity arises.

“I just wanted to ask a question. Unless I express my opinions with courage, I will become a sheep to those in power,” she said.

WORKSHOP ON RADIATION EDUCATION

In March, when Asahi Shimbun reporters were viewing the censored NRA documents in Tokyo, a letter arrived at a junior high school in Osaka about a workshop for teachers on radiation education.

The summer program was scheduled to be held at a private university in Osaka Prefecture.

Two names in the letter were listed as the workshop organizers: the university and Kansai Genshiryoku Kondankai (Council on nuclear power in the Kansai region).

According to participants of last year’s workshop, about 20 people took part in the two-day, one-night program. They observed nuclear reactors, learned about radiation and then discussed how to teach classes about the information.

The participants were given transportation allowances, and their accommodation and food expenses were covered.

“Kansai Genshiryoku Kondankai is shouldering all of those costs,” said a professor of the private university.

The workshop started for junior high school teachers in summer 2012, a year and a few months after the accident started at the Fukushima No. 1 nuclear power plant. The secretariat of Kansai Genshiryoku Kondankai, located in a building in Osaka, sent letters to junior high schools in the Kinki region, which centers on Osaka Prefecture, and Fukui Prefecture to gather participants.

“The workshop is held so that teachers have an accurate knowledge on the risks and fears of radiation,” said a staff member of the secretariat.

According to the website of the organization, its chairman is a professor emeritus at Kyoto University.

Asahi Shimbun reporters asked the secretariat staff member about the organization's member companies, program expenses, policies and relations with electric power companies.

"We cannot reveal them because our organization is a voluntary group," she said.

However, Asahi Shimbun reporters later learned that a vice president of Kansai Electric Power Co. had been the organization's chairman until January 2012, and that some staff members of the secretariat were employees of Kansai Electric.

The woman at the secretariat, who is also employed by the utility, said she did not know if the organization followed certain policies.

But a citizens' group found the policies through an information disclosure request to the government. The policies read, "The organization aims to contribute to the promotion of the development and utilization of nuclear power."

Kansai Electric is currently trying to restart reactors at its Oi nuclear power plant and the Takahama nuclear power plant, both located in Fukui Prefecture.

TEPCO's first profits since 3/11

April 30, 2014

Tepco moves into black for first time since Fukushima meltdowns

Kyodo

<http://www.japantimes.co.jp/news/2014/04/30/business/corporate-business/tepco-moves-black-first-time-since-fukushima-meltdowns/#.U2IYnlfi91s>

Tokyo Electric Power Co. said Wednesday it moved into the black in fiscal 2013 amid drastic cost-cutting efforts since its Fukushima No. 1 nuclear complex was wrecked by the natural disasters of March 2011, bleeding the utility dry.

Tepco, which is undergoing restructuring under effective state control, reported a group net profit of ¥438.65 billion in fiscal 2013, which ended March 31, compared with a loss of ¥685.29 billion the previous year.

It also posted a group pretax profit of ¥101.42 billion against a loss of ¥326.96 billion in fiscal 2012.

But Tepco's struggle to get its business back on track is likely to continue, with prospects unclear on when the company will be able to restart the Kashiwazaki-Kariwa nuclear plant in Niigata Prefecture — a key element in its turnaround plan.

Tepco has been reluctant to resort to another electricity rate hike even if the Kashiwazaki-Kariwa plant fails to resume operations from July, as assumed in the firm's revamped turnaround plan that was approved by the government in January.

Meanwhile, group sales in fiscal 2013 increased 11 percent from the previous year to ¥6.63 trillion, supported by electricity rate hikes in 2012 to cope with surging fuel costs for thermal power generation while all Tepco's nuclear reactors remained offline.

Tepco did not release an earnings outlook for the current fiscal year due to the continuing uncertainty over resuming operations at Kashiwazaki-Kariwa.

All of the nation's 16 commercial nuclear power stations are currently offline, as reactors have to clear new safety requirements introduced after the Fukushima nuclear meltdowns. Tepco filed for a state safety assessment of reactors 6 and 7 at Kashiwazaki-Kariwa last September, but it is not clear when the process will end.

Reactions to Oishinbo manga

April 30, 2014

Manga about work at Fukushima No. 1 stirs locals' ire

by Tomohiro Osaki

Staff Writer

http://www.japantimes.co.jp/news/2014/04/30/national/manga-about-work-at-fukushima-no-1-stirs-locals-ire/#.U2Np_Ffi91s

Cartoon characters who suffered nosebleeds after a visit to the Fukushima No. 1 nuclear plant are turning into a headache for manga publisher Shogakukan.

Locals are apparently angry about the “misleading” depictions in an episode of the popular manga series “Oishinbo” published Monday in the weekly Big Comic Spirits magazine.

Visiting the stricken plant two years after the 2011 nuclear catastrophe, a group of characters, all newspaper journalists, are momentarily exposed to hourly radiation levels of 1,680 microsieverts. After their tour, which takes them near the plant’s six reactors, lead character Shiro Yamaoka begins to complain of “extreme exhaustion” as well as sudden nosebleeds that span days. His colleagues confess to suffering similar symptoms.

Later, when they meet a character named Katsutaka Idogawa — based on a real-life former mayor of the town of Futaba in Fukushima Prefecture — they learn that he too has suffered repeated nosebleed attacks and felt “unbearably sick” since the accident.

“Many Fukushima residents have been afflicted by the same symptoms. It’s just they don’t say it openly,” Idogawa tells them.

In another scene of the episode, the team of reporters complain that they were allowed to publish only a handful of photos taken at the site, an apparent dig at plant operator Tokyo Electric Power Co’s rigorous censorship of the media.

In response, a Twitter user with the handle @jyunichidesita who claimed to be a resident of the city of Koriyama, Fukushima Prefecture, expressed anger at the depictions. The user claimed he or she had “never suffered such symptoms over the past three years.”

By noon Wednesday, the protest had been re-tweeted more than 13,000 times.

When contacted by The Japan Times, the editorial department of Shogakukan was unapologetic. Speaking on condition of anonymity, the weekly’s managing editor said the publisher had been inundated with phone calls and emails from readers saying the descriptions risk arousing public prejudice against the prefecture.

The editor said the episode drew on “meticulous reportage” conducted by manga author Tetsu Kariya and his team in Fukushima. Nothing the Idogawa character said deviated from the opinion of the real-life mayor, the editor insisted. Kariya himself once told the media that he had suffered several bouts of nosebleeds and been plagued by unusual fatigue following his visits to the plant.

However, the managing editor stressed that the publisher was not pointing the finger at radiation exposure as the cause of the characters' illnesses. He noted that Yamaoka, the main character, is at one point assured by a doctor that no medical studies indicate radiation in Fukushima could have resulted in his nosebleeds.

The editor, however, also added doctor and radiation expert Eisuke Matsui, another real-life character who appeared in the episode, told the editorial staff that "the connection between sickness and radiation is not exactly zero" and that his opinion would be reflected in future episodes.

In an apparent attempt to dodge further criticism, the editorial department said in a statement dated Monday: "We would like to stress that past 'Oishinbo' episodes clearly stated that it would be a huge loss for consumers if they balked at eating (Fukushima) foods proved safe just due to their lack of understanding."

An unacceptable franco-japanese agreement

Source : Réseau Sortir du Nucléaire

Press Release - May 2nd 2014

Shinzo Abe's visit to France: the Network "Sortir du Nucléaire" denounces a draft agreement that has scandalous repercussions for the French and for the Japanese.

France is putting pressure on Japan to restart a disastrous fast breeder reactor in order to test fuel for the Astrid reactor!

According to Yomiori Shimbun, France has asked Japan to revive the disastrous Monju fast breeder reactor in order to be able to test the fuel for Astrid, the prototype reactor developed by the CEA! This project will be formally recognised at a summit meeting on May 5, when Prime Minister Abe is visiting France. The Network "Sortir du Nucléaire" denounces this draft agreement as outrageous both for the French and for the Japanese and calls on parliamentarians to oppose its signature.

The Japanese press reveals an imminent French-Japanese nuclear agreement

According to the daily newspaper *Yomiuri Shimbun*, the visit of Japanese Prime Minister Shinzo Abe to France will lead the way to the signing on Monday May 5 of research agreements into so-called "fourth generation" nuclear production. As part of this research, France would call upon Japan to use the Monju fast breeder reactor, which has been shut down for nearly 4 years, in order to test the plutonium fuel for the prototype reactor Astrid (Advanced Sodium Technological Reactor for Industrial Demonstration).

According to the newspaper, in response to repeated requests from France, the Japanese government intends to accelerate the programme of reforms at the Japanese Atomic Energy Agency to ensure that the Monju reactor passes the required safety tests for starting up again.

A scandalous agreement for both the French and the Japanese

If this agreement is actually signed, it will allow the Commissariat à l'Energie Atomique (Atomic Energy Commission) to move several steps further towards the realisation of the Astrid project, presenting the French once again with a "fait accompli". [1] Without any consultation and without even any discussion during debates about energy transition, the nuclear industry will have introduced through the back door the development of a dangerous, disastrous and exorbitantly expensive technology.

This agreement would be equally disastrous for the Japanese, victims of one nuclear accident, who will have imposed on them, in spite of their opposition, the starting up of a reactor known for its many accidents and long term breakdowns. To add insult to injury, the agreement is due to be signed just weeks after suspicions were raised that the Japanese Atomic Energy Agency falsified inspection reports on Monju [2]. **For both the French and Japanese leaders, satisfying the desires of the nuclear industry appears to be more important than protecting the population [3]!**

Fast breeders - a technology that should be abandoned urgently!

The fast breeder reactor, using plutonium and sodium, is an inherently dangerous technology. France and Japan are among the last countries in the world to continue down this cul-de-sac, even though the technology has proved to be catastrophic.

The Monju fast breeder reactor came online in 1995 and was shut down in the same year following a sodium leak that triggered a major fire. It was started up again in May 2010 only to be shut down in August of the same year after a new problem was discovered. It produced electricity for one hour. It is situated on an active seismic fault [4], and was also hit by a typhoon in September 2013 that put its data transfer system out of action [5]. In May 2013, the Japanese nuclear safety authority had even prohibited it from ever being started up again.

As for Astrid, the so-called "fourth generation" reactor is simply a new version of the disastrous Superphénix reactor. Over a period of twelve years, this reactor operated for less than 200 days at full power and in the end will have cost 12 billion euros. At a time when the French government is imposing austerity measures, it is unacceptable that such costly, useless and absurd projects continue to receive a blank cheque.

What sense can there be in the legislation on energy transition if large scale projects are carried out in parallel without even being submitted to the vote by Deputies in Parliament? The Network "Sortir du Nucléaire" calls on French parliamentarians, who should be the first to be concerned with the choice of direction of French energy policy to oppose the signing of this unjust agreement and to prevent the pursuit of fast breeder technology, whether in France or in Japan.

TEPCO to repay (small) part of debt to 3 banks

May 3, 2014

TEPCO to repay 150 billion yen in post-Fukushima loans

<http://mainichi.jp/english/english/newsselect/news/20140503p2g00m0dm020000c.html>

TOKYO (Kyodo) -- Tokyo Electric Power Co. will repay 150 billion yen in debt -- part of the emergency loans it received in the wake of the 2011 Fukushima nuclear crisis -- to three major Japanese banks in December, bank officials said Friday.

The three are the Bank of Tokyo-Mitsubishi UFJ, Mizuho Bank and Sumitomo Mitsui Banking Corp. The utility known as TEPCO received roughly 2 trillion yen in loans from the three and other banks, mostly without collateral, to deal with the nuclear crisis.

Following the repayment, TEPCO will be screened to receive future loans from the banks.

In April, TEPCO repaid 4 billion yen in emergency loans to the government-backed Development Bank of Japan, with a further 4 billion yen payment planned in October.

But the utility still faces difficulties in procuring funds on its own. It aims to restart issuing corporate bonds in fiscal 2016, but it is still uncertain if it can do so as its business operations will remain unstable, given the suspension of its Kashiwazaki-Kariwa nuclear plant.

Experts offer advice to TEPCO (NHK video)

May 2, 2014

Nuclear Watch: Experts Offer Advice to TEPCO

<http://www3.nhk.or.jp/nhkworld/newsline/201405022011.html>

US and UK experts (TEPCO panel members Dale Kein and Barbara Judge) explain that TEPCO still needs to:

- · Improve communication (speed, transparency, clarity of handouts to public)
- · Organise an international support network to help decontaminate the plant.

According to Mrs. Judge, bringing international expertise is a way to gain public trust.

Oishinbo's impact

May 15, 2014

Editorial: Don't suppress debate on nuclear power, effects of radiation on health

<http://mainichi.jp/english/english/perspectives/news/20140515p2a00m0na010000c.html>

A manga work that depicts Fukushima Prefecture residents having nosebleeds following the outbreak of the nuclear crisis has stirred controversy. The content of the work is highly questionable and it is understandable that many Fukushima residents are furious about it. Moreover, concerns have been raised that the work could arouse further harmful rumors against the prefecture.

However, it is feared that there may be moves to take advantage of the controversy to suppress discussion on the pros and cons of nuclear power and the effects of radiation on human health. The public should hold calm discussions on how to dispel Fukushima residents' concerns about their health as well as to restore disaster-hit areas.

The manga series in question is "Oishinbo," published in Shogakukan Inc's "Shukan (Weekly) Big Comic Spirits." In an installment published earlier in May, "Oishinbo" depicts the protagonist suffering from a nosebleed after visiting the tsunami-ravaged Fukushima No. 1 Nuclear Power Plant.

In the latest installment carried in the issue of the magazine released on May 12, a former Futaba mayor says, "There are many people in Fukushima who have nosebleeds and suffer from severe exhaustion because they have been exposed to radiation."

Also in the latest installment, an associate professor at Fukushima University says, "Fukushima is no longer inhabitable. You can't safely live there," based on his experiences of decontaminating areas tainted by radioactive substances. The manga also shows some residents of Osaka, which has accepted and disposed of rubble from quake- and tsunami-hit Iwate Prefecture, complaining about health hazards.

The Fukushima Prefectural Government, the Iwate Prefectural Government, the Osaka prefectural and municipal governments and the Environment Ministry among other entities strongly protested against the manga work. They argue the piece could fuel harmful rumors, that decontamination work has proven effective and that radiation levels in rubble from disaster-hit areas are well below the permissible levels set by the government.

A study conducted by the U.N. Scientific Committee on the Effects of Atomic Radiation denies that the number of patients with cancer and genetic illnesses will increase. It is difficult to imagine people suffering from nosebleeds just because they have visited the crippled nuclear plant. Still, little is known about the impact of exposure to low levels of radiation over a long period on human health.

Some experts point to the possibility that the psychological stress residents of areas affected by the nuclear disaster suffer from could adversely affect their immune systems, eventually causing them nosebleeds or a sense of fatigue.

Fears have been raised that the latest controversy could discourage people to freely discuss the safety of atomic power stations and the impact of radiation on human health. The nuclear crisis is attributable primarily to the government's promotion of its nuclear power policy based on the groundless myth of nuclear plants' infallible safety. As "Oishinbo" points out, the way the government has disclosed information on the leak of radioactive substances from the crippled power plant deserves severe criticism. The government's official position that radioactively contaminated water is under control has also certainly evoked a sense of distrust among members of the public. A long-term follow-up study should be conducted on the impact of exposure to low levels of radiation over a long period on human health.

There are many other points of contention that need to be addressed. However, members of the general public, politicians and experts cannot hold constructive debate on these matters if they become emotional. All members of the public should consider these matters calmly with Fukushima residents.

Oishinbo's impact (2)

Yoroku: Ambiguities around nuclear disaster spawn host of harmful rumors

<http://mainichi.jp/english/english/perspectives/news/20140515p2a00m0na003000c.html>

In April 1813, a rumor spread like wildfire around Edo -- present day Tokyo -- that eating soba noodles would kill you. The numbers of people sitting down to a bowl of soba dropped drastically, and many soba restaurants closed for a time. Concerned neighborhood officials finally began moving to quell the rumor that June.

This is one of the anecdotes included in the volume "Edo no fuhyo higai" (Damaging rumors of Edo) by Kozo Suzuki. What started that particular rumor? Did a diner actually die of food poisoning? Or perhaps someone had an allergic reaction. Whatever the case, blaming it on soba was believable enough, and the rumor grew to gargantuan proportions.

It is sometimes said that the more serious and vaguer a problem is, the more rumors that problem will spawn. The deadly noodle rumor that swept through Edo two centuries ago is a reflection of the anxieties of the people who lived there. We have an equivalent problem today, where uncertainty about risk and severity has bred repeated waves of harmful rumors: radioactive contamination from the Fukushima No. 1 nuclear plant.

And one recent factor being criticized for encouraging this uncertainty and thereby the nasty rumors is the manga "Oishinbo," which sparked controversy with its depiction of a character who gets nosebleeds after visiting the crippled Fukushima plant. Another character also expresses doubts about the effectiveness of decontamination operations and says, "No one should live in Fukushima."

It's common scientific knowledge that the radiation dose absorbed by the main character in the manga will not cause nosebleeds. It's also true, however, that the effects of low radiation doses remain largely unknown. The Ministry of the Environment protested that it has confirmed the effectiveness of its decontamination operation, but the more the government says such things, the more doubtful the public tends to become. Meanwhile, it is the people of Fukushima who are suffering most because of the ambiguity that continues to cling to this issue despite its importance.

It is necessary to overcome this ambiguity that could spawn harmful rumors and deepen common perceptions of risk. In this time of atomic emergency, we call on Japanese society to do its utmost to support the people who have suffered and lost the most to this calamity. ("Yoroku," a front-page column in the Mainichi Shimbun)

Tempting people with compensation?

May 18, 2014

Government sweetening the pot for storage of Fukushima radioactive waste

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201405180020>

THE ASAHI SHIMBUN

The central government is compiling a generous compensation plan to overcome the reluctance of two towns to host intermediate storage facilities for radioactive waste from the Fukushima nuclear disaster.

Measures being considered for the municipalities of Okuma and Futaba include buying or renting properties at inflated real estate values and covering the costs to relocate the grave sites of relatives.

Okuma and Futaba are hosts to Tokyo Electric Power Co.'s crippled Fukushima No. 1 nuclear power plant. The two towns and the Fukushima prefectural government have not given their consent for the intermediate storage facilities, with many residents fearing the facilities will become permanent fixtures in their backyards.

The waste, expected to fill the equivalent of 23 Tokyo Domes, is currently being kept temporarily in various locations in Fukushima Prefecture where decontamination work has been conducted.

The government under then Prime Minister Naoto Kan announced in August 2011 that intermediate storage facilities would be needed to take in the waste from those locations.

However, little progress has been made on constructing intermediate storage facilities, and the government says the delay has affected further decontamination efforts and overall reconstruction in Fukushima.

Large parts of Okuma and Futaba continue to have high levels of radiation, and prospects are dim that residents who fled the areas can return to their homes in the near future. The radiation levels have also pushed down real estate values in the two municipalities.

Under the central government's compensation plan, **the real estate values will be calculated on the assumption that the land and buildings will one day be available for use after radiation levels have fallen far enough for the evacuation orders to be lifted.**

Government compensation will be separate from the compensation that local residents can receive from TEPCO.

Residents have also raised concerns that they would be unable to visit graves in Okuma and Futaba if the intermediate storage facilities are constructed there.

The central government's plan would not only cover the costs of moving the gravestones and remains away from the storage facilities, but it would also pay for memorial services that would be needed in line with the transfer.

In addition, the government would provide support if the local communities decide to construct a new cemetery in a location where radiation levels are comparatively low.

For families that do not want to move the graves, the central government will consider allowing the graves to remain at their current sites. The intermediate storage facilities could be designed to avoid such grave sites, and family members would be allowed to visit the graves even after the facilities are completed

Abe adamant that nobody has been "directly affected" by radiation

May 18, 2014

Abe seeks to dispel radiation concerns stirred by Japanese manga

<http://mainichi.jp/english/english/newsselect/news/20140518p2g00m0fp005000c.html>

TOKYO (Kyodo) -- Prime Minister Shinzo Abe on Saturday sought to dispel concerns stirred by a famous Japanese comic which linked radiation exposure from the crippled Fukushima Daiichi nuclear complex to nosebleeds, saying there is not a single case of someone's health known to have been damaged through exposure.

In a recent edition of the long-running comic "Oishinbo," the main character is shown having a nosebleed after visiting the plant, where three nuclear reactors melted down and buildings exploded days after a huge earthquake and tsunami hit northeastern Japan in 2011.

"There is no confirmation that someone's health has been directly affected by radioactive substances," Abe told reporters after visiting Fukushima Medical University to be briefed about radiation effects in the wake of the disaster at the Fukushima plant.

"There is a need for the state to make all-out efforts to deal with baseless rumors," Abe said and vowed to provide accurate information to eliminate such concerns.

The premier also said his government will study whether the way it has been providing information to the public was sufficient.

During his one-day trip to Fukushima, Abe watched a simulated thyroid examination at the medical university. Radioactive iodine released in nuclear accidents can accumulate in thyroid glands due to breathing or ingestion, and increase the risk of thyroid cancer.

Oishinbo's impact (3)

Comic publisher accepts criticism over Fukushima controversy

<http://mainichi.jp/english/english/newsselect/news/20140519p2g00m0dm042000c.html>

TOKYO (Kyodo) -- The publisher of a weekly comic magazine said Monday it accepts a wave of criticism over depictions of the situation at the Fukushima Daiichi nuclear complex in a long-running comic called "Oishinbo."

In Monday's installment of the series — now suspended indefinitely — Hiroshi Murayama, who is also managing editor of the weekly Big Comic Spirits magazine the series runs in, includes an afterword in which he writes of feeling a strong pang of responsibility for the outrage caused by recent issues of the manga.

In an episode last month, the manga's characters fall ill and get nosebleeds after visiting the meltdown-hit Fukushima No. 1 power plant. The illustrations quickly sparked outrage online, and many complained to publisher Shogakukan Inc. that the story might fuel prejudice toward people from Fukushima.

"We take criticism to heart and will once again re-examine the whole concept of expression," Shogakukan Inc. said in the latest issue of the Big Comic Spirits, responding to criticism from not only people in disaster-hit Fukushima Prefecture but also the central government.

The comic "Oishinbo," about the adventures of a food writer, came under fire when a recent episode showed its main character having a nosebleed during his visit to the nuclear power plant devastated by a massive earthquake and subsequent tsunami in March 2011.

People in Fukushima said the scene runs counter to the truth and viewed it as harmful rumor as the scene may give readers the impression that local people have been suffering nosebleeds due to radiation from the crippled plant.

In the latest issue, the comic magazine carried a 10-page section to include opinions from medical experts and academics.

Shogakukan also explained that Oishinbo's author, Tetsu Kariya, had run the episode to raise awareness about the effects of residual radioactive substances and low dose exposure.

Earlier, Kariya insisted he spent two years looking into what was going in Fukushima and said he did not understand why he had to face criticism.

Their voices, he said, are rarely heard because they are reluctant to complain of sickness for fear of being branded as "overly squeamish."

Manga author Tetsu Kariya, who has made repeated visits to the plant since the triple meltdowns, decided that “it’s wrong to ignore the voices of those people just because these are considered in the minority and likely to unsettle others,” Murayama said in the endnote.

“As editor in chief, I decided Kariya’s viewpoint was worth presenting to readers for their opinions,” he said.

The main characters in the long-running “Oishinbo” (“The Gourmet”) series are culinary writers working for a fictional newspaper company.

On Monday, in the last episode before the manga’s suspension, they conclude that, as journalists, they must face the pain of “telling the truth” about Fukushima. Remaining silent, they decide, is equal to “lying to the Fukushima residents.”

When it comes to the livability of Fukushima, there is a tendency to “sugarcoat your language in order to spare the feelings of the residents,” one reporter says, “but I think doing so is hypocritical.”

He adds: “As a human being, I would like to encourage people in Fukushima to have the courage to flee their dangerous homeland.”

The characters are apparent stand-ins for author Kariya, who wrote in a blog post that he “can only spread the truth.”

“Trumpeting the safety of Fukushima may have pleased some. But deception is what I abhor most,” he said.

Monday’s issue devotes 10 pages to laying out the opinions of 13 experts and municipalities.

One of them, Hiroaki Koide, an assistant professor at the Kyoto University Research Reactor Institute, says that from a medical point of view the connection between nosebleeds and radiation exposure can’t be entirely ruled out.

Backing Kariya, he adds: “The government is not only indifferent to taking responsibility for the accident, but determined to erase it from people’s memory.” Such irresponsibility, he insists, is “almost criminal.”

Meanwhile, municipalities including Osaka and Fukushima prefectures and the town of Futaba have lodged complaints with the publisher.

Latest edition of manga magazine drawing attention

http://www3.nhk.or.jp/nhkworld/english/news/20140519_22.html

The latest edition of a manga series with a storyline that's come under fire for depicting health problems relating to radiation exposure in Fukushima Prefecture hit the shelves on Monday.

The long-running Oishinbo series in the Big Comic Spirits weekly magazine is put out every Monday by major Japanese publisher, Shogakukan.

Last month, the series had the main character, a newspaper reporter, experiencing nosebleeds after returning from a visit to the damaged Fukushima Daiichi nuclear power plant.

A former mayor of Futaba Town, which co-hosts the plant, then appears in the comic to explain that many residents of the prefecture are suffering the same symptoms.

The episode has drawn heavy criticism for linking nosebleeds to radiation exposure in Fukushima Prefecture. The government and critics of the story say it is promoting baseless rumors that the prefecture is dangerous.

This week's edition of the magazine carries a special feature that presents opinions from 13 experts about the claims made in the Oishinbo episode, as well as the view of the chief editor.

The editor says the episode was intended to raise questions about radioactive substances and low-dosage radiation. He expressed hope that the controversy will promote public discussion that will help determine the future of the Japanese people.

The appearance of the latest edition has received a mixed reaction from people in Fukushima.

One Fukushima city resident says he's never heard of people around him suffering nosebleeds.

A local woman stressed that the residents of Fukushima were hurt by the manga story. She says they felt like they were being hit by a new nuclear scare, even though radiation levels have now dropped and food products are being found safe.

Another woman says that even though the comic supposedly carried the views of people having some relation to Fukushima Prefecture, she feels the people who really live there have been ignored.

A 59-year-old man says it would be worrisome if radioactivity is really to blame for nosebleeds. But he says the issue is a sensitive one and should have been presented with more care, as it is unknown whether the case is true.

A woman says it is important to raise such issues, as the nuclear accident is being forgotten already. She says she hopes people in other prefectures will know that Fukushima residents are getting back on their feet.

Shogakukan says the Oishinbo series will not appear in the magazine for a while in line with the plan adopted earlier.

Depictions of characters' radiation-induced illnesses 'give voice' to silent Fukushima residents

'Oishinbo' editor defends manga

<http://www.japantimes.co.jp/news/2014/05/19/national/oishinbo-editor-defends-manga/#.U3omCyji-1s>

by Tomohiro Osaki
Staff Writer

The editor of "Oishinbo" defended on Monday the decision to depict characters in the cooking comic book as potentially hurt by radiation in Fukushima, calling it a "meaningful" attempt to sound the alarm about the grim, and largely overlooked, reality of life in the prefecture.

In Monday's installment of the series — now suspended indefinitely — Hiroshi Murayama, who is also

managing editor of the weekly Big Comic Spirits magazine the series runs in, includes an afterword in which he writes of feeling a strong pang of responsibility for the outrage caused by recent issues of the manga.

In an episode last month, the manga's characters fall ill and get nosebleeds after visiting the meltdown-hit Fukushima No. 1 power plant. The illustrations quickly sparked outrage online, and many complained to publisher Shogakukan Inc. that the story might fuel prejudice toward people from Fukushima.

While acknowledging the raft of angry letters received by the publisher, Murayama stopped short of offering an apology. He did, however, note that Shogakukan is taking the outcry seriously and would conduct a policy review.

Murayama said the story line was meant to spotlight the truth that "parts of Fukushima are indeed dangerous and uninhabitable" and "some local people are worried about health problems linked to radioactive fallout."

Their voices, he said, are rarely heard because they are reluctant to complain of sickness for fear of being branded as "overly squeamish."

Manga author Tetsu Kariya, who has made repeated visits to the plant since the triple meltdowns, decided that "it's wrong to ignore the voices of those people just because these are considered in the minority and likely to unsettle others," Murayama said in the endnote.

"As editor in chief, I decided Kariya's viewpoint was worth presenting to readers for their opinions," he said.

The main characters in the long-running "Oishinbo" ("The Gourmet") series are culinary writers working for a fictional newspaper company.

On Monday, in the last episode before the manga's suspension, they conclude that, as journalists, they must face the pain of "telling the truth" about Fukushima. Remaining silent, they decide, is equal to "lying to the Fukushima residents."

When it comes to the livability of Fukushima, there is a tendency to "sugarcoat your language in order to spare the feelings of the residents," one reporter says, "but I think doing so is hypocritical."

He adds: "As a human being, I would like to encourage people in Fukushima to have the courage to flee their dangerous homeland."

The characters are apparent stand-ins for author Kariya, who wrote in a blog post that he "can only spread the truth."

"Trumpeting the safety of Fukushima may have pleased some. But deception is what I abhor most," he said.

Monday's issue devotes 10 pages to laying out the opinions of 13 experts and municipalities. One of them, Hiroaki Koide, an assistant professor at the Kyoto University Research Reactor Institute, says that from a medical point of view the connection between nosebleeds and radiation exposure can't be entirely ruled out.

Backing Kariya, he adds: "The government is not only indifferent to taking responsibility for the accident, but determined to erase it from people's memory." Such irresponsibility, he insists, is "almost criminal."

Meanwhile, municipalities including Osaka and Fukushima prefectures and the town of Futaba have lodged complaints with the Publisher.

May 21, 2014

TEPCO ready to release radiation, not information, during Fukushima crisis

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201405210045>

THE ASAHI SHIMBUN

In the chaotic early stages of the Fukushima nuclear disaster, Tokyo Electric Power Co. was preparing a last-ditch countermeasure that would have released a large amount of radiation on an unknowing public.

Masao Yoshida, the manager of the Fukushima No. 1 nuclear plant, told a government committee that dry venting was planned on March 14, 2011, to prevent rising pressure from causing the containment vessel of the No. 3 reactor to break apart, according to documents.

Venting is an emergency measure to prevent a containment vessel from rupturing and spewing huge amounts of radioactive materials into the atmosphere. But venting also results in the release of such substances, including radioactive iodine that can cause thyroid gland cancer, albeit at a lower level.

However, residents around the nuclear plant were never warned about the venting plan. At the time, the government had called on TEPCO and the Fukushima prefectural government not to make any announcements about the precarious situation at the No. 3 reactor to avoid panic among the public.

Under TEPCO's manual to deal with nuclear accidents, the company is required to share as much information as possible with the central government and local municipalities about venting plans for possible evacuation and other emergency measures.

Dry venting was never carried out at the Fukushima plant, partly because an explosion at the No. 3 reactor building reduced pressure within the containment vessel. That explosion led to the release of radioactive materials, but the containment vessel remained largely intact.

Yoshida acknowledged the dry venting plan in testimony given to the government's Investigation Committee on the Accident at the Fukushima Nuclear Power Stations. The Asahi Shimbun recently obtained a copy of Yoshida's testimony.

In his exchanges with investigators, Yoshida described the crisis at the plant early on March 14, 2011, three days after the Great East Japan Earthquake and tsunami.

Water pumped in to cool nuclear fuel at the No. 3 reactor had dried up, and pressure was rising within the containment vessel.

TEPCO first attempted wet venting, in which steam containing gases that include radioactive materials is passed through water kept in the suppression chamber of the reactor. The measure can reduce the level of radioactive materials in the steam, but that effort failed at the Fukushima plant, according to the document.

At 6:23 a.m., TEPCO considered dry venting, a process that does not involve steam passing through water, at the No. 3 reactor, according to the document. Dry venting leads to the release of radioactive materials at concentrations between 100 and 1,000 times greater than through wet venting.

Shortly before 7 a.m., TEPCO conducted a simulation exercise related to dry venting, and later forecast radioactive iodine would be carried in a north-northwest direction by wind blowing from the south-southeast, the document showed.

Within three hours of dry venting, radiation levels near the district of Soma in northern Fukushima Prefecture were forecast to reach 250 millisieverts, more than double the 100-millisievert level used as a guideline for the ingesting of iodine tablets to prevent thyroid gland cancer, according to the document.

At 7:49 a.m., central government officials told TEPCO not to release information about the situation to the public. TEPCO officials later conducted another simulation about the spread of radioactive materials in the event of dry venting.

While TEPCO was still attempting wet venting, a hydrogen explosion at the No. 3 reactor building at 11:01 a.m. reduced the pressure in the containment vessel, eliminating the need for dry venting, according to Yoshida.

He told investigators he never knew about the media blackout concerning the No. 3 reactor. Yoshida told the investigators, "Public relations officials can do whatever they want to, such as issuing press releases, but we at the plant had our hands full trying to deal with the accident."

A TEPCO official told The Asahi Shimbun that the company had considered dry venting, but it did not make that information available to local residents.

The official simply said that when the company was studying the possibility of dry venting, it eventually became unnecessary to carry out the procedure.

Yoshida's testimony underscores the confusion over who should inform residents about the possibility of dry venting. Such information would be vital for those concerned about possible radiation exposure who may be planning to flee the area.

As Yoshida's testimony showed, informing the public may not be high on the list of priorities of workers trying to bring a nuclear accident under control.

Yoshida died of cancer last year.

Although more than three years have passed since the Fukushima nuclear accident started, no clear rules have been set on how to integrate measures dealing with a nuclear accident with the evacuation of local residents.

“Residents should be informed the minute consideration has begun on such an important decision as dry venting,” said Hideaki Kubori, a lawyer knowledgeable about corporate governance. “Companies have an obligation to protect the safety of residents during a serious incident.

“With the central government and TEPCO having failed to clarify responsibility even after three years, discussions should not begin on resuming operations at nuclear plants,” he said.

Yoshida's interviews kept secret

May 23, 2014

Yoshida wanted his comments on crisis kept secret

http://www.japantimes.co.jp/news/2014/05/23/national/yoshida-wanted-his-comments-on-crisis-kept-secret/#.U3-srCji_IU

by Reiji Yoshida

The government on Friday released a written request from Masao Yoshida, the late chief of the Fukushima No. 1 power plant, that a Diet investigation panel not publicly disclose any of the 28 hours of interviews on how he handled the March 2011 meltdowns.

The Diet panel received all of the records of the interviews that a separate governmental panel conducted with him from July 22 to Nov. 6 in 2011. Yoshida submitted the request to ensure that the records “will not be leaked” to a third party.

In the note, dated May 29, 2012, Yoshida said that he was worried his accounts might include factual errors because he was speaking from memory, several months after the nuclear crisis began, and that some of his comments about the other people involved might lead to “misunderstandings” if they were taken out of context.

“I request that (the Diet investigation panel) strictly manage (the records) so that they will not be leaked to a third party,” Yoshida said in the note, a copy of which was posted on the Cabinet Secretariat’s website.

Based on the request, the government has refused to release the records of the interviews. The Asahi Shimbun said it obtained a copy and has started publishing excerpts.

Chief Cabinet Secretary Yoshihide Suga told a press briefing that the government released the entire text of the request to make Yoshida's intention clear.

May 22, 2014

Yoshida interviews to stay sealed: Suga

http://www.japantimes.co.jp/news/2014/05/22/national/yoshida-interviews-to-stay-sealed-suga/#.U3-s9iji_IU

by Reiji Yoshida
Staff Writer

Chief Cabinet Secretary Yoshihide Suga on Thursday again refused to release a confidential record of interviews with the deceased chief of the Fukushima No. 1 power plant, although he said the government might consider doing so at the family's request.

Suga's comment came in response to an earlier remark by Osaka Mayor Toru Hashimoto, co-leader of Nippon Ishin no Kai (Japan Restoration Party).

Hashimoto bashed the government for not releasing the record of the government's interviews with Masao Yoshida, who was head of the plant during the triple core meltdown in March 2011.

The record was produced by a government panel that was investigating the crisis, and handed over to another investigative team set up by the Diet.

Before the hand over took place, Yoshida submitted a written request for the Diet panel not to publicize any of its cont

TEPCO to woo Tokyo area

May 23, 2014

TEPCO to supply electricity outside Tokyo area

<http://ajw.asahi.com/article/business/AJ201405230028>

THE ASAHI SHIMBUN

Tokyo Electric Power Co. said May 22 that it plans to sell electricity outside the Tokyo metro area beginning this fall.

TEPCO Customer Service Corp., a subsidiary of the operator of the embattled Fukushima No. 1 nuclear power plant, told the industry ministry that TEPCO will provide electricity on a country-wide basis starting as early as October.

The utility plans to raise sales outside the Tokyo area to 34 billion yen (\$334 million) by fiscal 2016, and to 170 billion yen by fiscal 2023.

By selling power in areas it has not serviced before, as well as collaborating with other utilities, TEPCO plans to cover losses related to the Fukushima nuclear crisis and the shutdown of reactors.

TEPCO will try to woo Tokyo-based companies to make bulk purchases of electricity to be used at their branches, plants and shops across the nation by offering them lower prices than other major power producers.

The utility will organize a sales promotion base in the western Kansai region or the Chubu region next year.

To supply power to regions outside the area it now serves, **TEPCO will procure electricity from outside sources that include factories with in-house generators.**

TEPCO's decision came as Chubu Electric Power Co. and Kansai Electric Power Co. began selling electricity in the Tokyo metropolitan area.

The power company is **also making efforts to cut costs for thermal power generation by forming tie-ups with other utilities.**

With all of the nation's nuclear reactors currently offline, increasing fuel costs have been weighing on the finances of power companies.

"First, we will reduce expenses in the thermal power division," Fumio Sudo, who became the chairman of TEPCO in April, has said.

TEPCO currently estimates that it can cut costs to the tune of 650 billion yen a year if it collaborates with other power or gas suppliers in various fields ranging from fuel procurement to installation and operations of power plants.

TEPCO is currently in talks with Chubu Electric Power, Tokyo Gas Co. and Osaka Gas Co. in **efforts to establish a joint venture**. TEPCO is expected to discuss the details of possible collaborations with those firms as early as the end of the month, and will decide which company to work with to set up the joint venture by the end of this fiscal year.

SOS from frontline worker ignored on 3/11- Yoshida's regrets

May 23, 2014

Fukushima plant chief admitted mishandling of reactor cooling system

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201405230034>

THE ASAHI SHIMBUN

A wrong instruction issued by the manager of the Fukushima No. 1 nuclear plant after an emergency cooling system failed possibly led to an early meltdown at the No. 1 reactor, documents show.

Before his death from cancer last year, Masao Yoshida told a government committee that he felt "regret" for making a "wrong presumption" in handling the critical situation in the wake of the Great East Japan Earthquake and tsunami.

According to a copy of Yoshida's testimony, recently obtained by The Asahi Shimbun, a worker at the plant's central control room noticed that the cooling system, an isolation condenser (IC) attached to the No. 1 reactor, was losing its functions on the evening of March 11, 2011.

Suspecting that the condenser was losing cooling water, the worker requested that Yoshida, who was in the emergency response center, take steps to refill the condenser with water using a light oil-powered pump.

The No. 1 reactor lost electric power at 3:37 p.m., about an hour after the magnitude-9.0 quake jolted the plant compound.

The isolation condenser serves as a last-ditch measure to cool the reactor when ordinary pumps cannot operate due to a lack of outside power supplies and emergency generators.

Placed above the reactor vessel, it cools steam from the pressure vessel, condenses it into water and returns water into the reactor.

Steam is cooled as it passes through piping in a water-filled tank, which needs to be refilled after water evaporates in the process.

But Yoshida was unaware of how the mechanism worked, because it was the first time that an isolation condenser was operated at the plant in 20 years.

Not realizing that the worker's request meant the isolation condenser was losing functions, Yoshida only instructed workers to continue preparations to pour water into the reactor vessel--an order that should have been given when the emergency cooling system was functioning.

In its report, the Investigation Committee on the Accident at the Fukushima Nuclear Power Stations of Tokyo Electric Power Co. concluded that **"at the time there was nobody present in the plant who had years of experience in IC operations, not even training or experience in IC inspections."**

In his testimony, Yoshida said he "knew almost nothing about how to control IC," adding that the condenser is "a unique system." The lack of knowledge about the condenser made it difficult for him to grasp meaning of the request from the central control room, he added.

The testimony also showed that while Yoshida was widely hailed by the media as the "man who saved Japan," he had a number of regrets in his response to the nuclear crisis. As for his response to the isolation condenser on the No. 1 reactor, he admitted he had an "overwhelming sense of regret" for not realizing what was an "SOS" from frontline workers.

He also testified that there was no “suggestion” of any kind from the headquarters of TEPCO, the operator of the plant, as to how the plant workers should manage the isolation condenser.

If Yoshida had been aware of the condenser’s mechanism and realized it had become dysfunctional, he could have taken steps to prevent the early meltdown at the No. 1 reactor, such as venting to handle the rising pressure in the reactor vessel and restoring the functions of the isolation condenser.

Yoshida only realized that the isolation condenser was possibly not functioning after reports showed a rise in radiation levels inside the No. 1 reactor building at around 10 p.m. on March 11, 2011.

The government’s analysis estimates that the core of the No. 1 reactor became damaged at around 6 p.m., and the reactor went into meltdown two hours later.

(This article was compiled from reports by Hideaki Kimura and Kyoko Horiuchi.)

Gov't will not release interviews (follow-up)

May 24, 2014

Government shows no intention of disclosing Fukushima disaster interviews

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201405240045>

By SHINICHI SEKINE/ Staff Writer

Successive Cabinets have refused to release details of firsthand accounts of the Fukushima nuclear disaster, despite an understanding by a government investigation committee that the information from 772 interviewees could be made public.

The media and other third parties have been denied access to the testimonies about Japan’s worst-ever nuclear accident. The government is still showing reluctance even after The Asahi Shimbun started reporting excerpts from interviews involving Masao Yoshida, who was the manager of the Fukushima No. 1 nuclear plant when it was hit by the March 2011 earthquake and tsunami.

When pressed on the issue, Chief Cabinet Secretary Yoshihide Suga said May 23 the government could only release the records if it receives permission from the interviewees.

“There will be no problem if (they) make requests (to disclose their testimonies),” the government’s top spokesman said at a news conference.

But The Asahi Shimbun learned that the government’s Investigation Committee on the Accident at the Fukushima Nuclear Power Stations had agreed on July 8, 2011, before it started the investigation, that those interviewed could disclose the content of their interviews, such videotaped testimonies to the media.

The panel agreed that the interviews would be closed sessions.

It also said it would disclose testimonies “to the extent necessary” and withhold contents that might reveal identities and information that the interviewees do not want released.

Questions remain over the exact cause of the triple meltdown at the Fukushima nuclear plant, and conflicting reports have been released on what occurred in the early stages of the disaster.

A copy of Yoshida’s testimony to the committee obtained by The Asahi Shimbun revealed that 90 percent of the approximately 720 workers defied Yoshida’s orders and fled the plant at a critical juncture.

The records of the investigation have been transferred to the Cabinet Secretariat’s office for the preparation of nuclear safety regulatory organization reform.

The office says the records should not be made public in principle, and it has not confirmed the interviewees’ intentions on whether to disclose their hearings.

One interviewee related to the Democratic Party of Japan said he told the government committee that he did not care if the records were made public. He added that the committee has never approached him to confirm his intention on the matter.

On May 23, the ruling Liberal Democratic Party’s project team on nuclear regulation and its panel on environmental issues agreed to continue applying pressure on the government to release Yoshida’s testimonies.

“Such records must be made public to the maximum possible extent in order to prevent such a tragic accident from occurring again,” said Yasuhisa Shiozaki, depute chair of the LDP’s Policy Research Council.

The government on May 23 released a written request by Yoshida that stated he did not want his interviews to be publicly disclosed.

“I do not intend for any of my interviews to be made public. There may be contents in which I misunderstood the facts based on memory distortions and other factors,” Yoshida, who died last year of cancer, said in the note.

His request was submitted when the government committee handed his testimonies to a Diet investigation panel.

But the copy of Yoshida’s testimony obtained by The Asahi Shimbun shows that he immediately agreed when told by interviewers that the records could be made public in the future.

Courts' mission to "protect residents' personal rights"

March 22, 2014

Court recognizes 'invasion of personal rights' in ruling against reactor restarts

<http://mainichi.jp/english/english/perspectives/news/20140522p2a00m0na012000c.html>

The Fukui District Court's ruling that ordered against reactor restarts at the Oi nuclear plant in Fukui Prefecture has acknowledged a possible "invasion of personal rights" of residents living within a 250-kilometer radius of the plant if a nuclear accident occurs.

The court's May 21 decision, which ordered plant operator Kansai Electric Power Co. (KEPCO) not to restart the No. 3 and No. 4 reactors at the Oi nuclear plant in Oi, Fukui Prefecture, is certain to affect KEPCO's plans for reactor restarts while safety screenings are under way by the Nuclear Regulation Authority (NRA). The screenings are based on new standards drawn up in the wake of the Fukushima No. 1 Nuclear Power Plant disaster.

Unlike any past rulings in similar lawsuits, the court recognized that the plant "poses a realistic, imminent danger in this quake-prone country" -- taking the enormous effect of the Fukushima nuclear disaster into consideration. The lawsuit is one of the numerous cases filed with courts across the country contesting the safety of nuclear power plants in the aftermath of the Fukushima nuclear disaster.

In a provisional injunction petition filed with the Osaka District Court by a group of some 260 residents in the Kansai region in March 2012 demanding the suspension of the No. 3 and No. 4 reactors at the Oi nuclear plant, whether the nuclear reactors could be safely halted in the event of a major earthquake became a point of contention. The Osaka District Court rejected the petition in April last year, ruling that the nuclear reactors -- then still online -- met the safety standards and that there was no tangible danger to be recognized.

The residents filed an immediate appeal, arguing that KEPCO underestimated possible quake damage, but the Osaka High Court also rejected their demand on May 9 this year on the grounds that NRA's safety screenings are underway. "It is not appropriate to decide whether reactor restarts should be banned before the screenings are concluded," the ruling said.

Lawyer Katsuhiko Kabuki, who represented the plaintiffs in the petition, hailed the Fukui District Court's decision that ruled against reactor restarts. "It is a refined ruling that declared that the mission to protect residents' personal rights lies with the courts, while drawing a line from KEPCO's economic and commercial interests."

Regarding the difference in court decisions over the same issue, Kabuki said, "In the case of a provisional injunction, the factor of urgency is taken into consideration, whereas the latest decision faced the issue squarely. Because this is a ruling of a formal trial, it bears graver significance."

Takayoshi Igarashi, former professor at Hosei University, said, "Judges hand down rulings according to their conscience. It is natural for decisions over nuclear plant safety to turn out different depending on how they perceive the Fukushima nuclear disaster. It is likely that courts will continue to make conflicting decisions, but I believe the Supreme Court will ultimately come up with a uniform decision."

There are numerous similar lawsuits filed in the wake of the Fukushima nuclear disaster, in which residents living near nuclear plants are demanding a ban on nuclear plant restarts at courts in Sapporo, Shizuoka, Matsue, Kagoshima and elsewhere. There are also other lawsuits over the Oi nuclear plant pending in courts in Kyoto and Otsu.

In the past, there were only two rulings in which residents won lawsuits over nuclear plant issues -- the 2003 decision by the Kanazawa branch of the Nagoya High Court, which nullified the construction permission for the Monju prototype fast-breeder reactor in Fukui Prefecture, and the 2006 decision by the Kanazawa District Court, which ordered the suspension of the Shika nuclear plant's No. 2 reactor in Ishikawa Prefecture. However, those decisions were subsequently overturned at higher courts, fixing the residents' defeats.

NRA Chairman Shunichi Tanaka distanced himself from the Fukui District Court's ruling, saying, "I have nothing to say about a judicial ruling. We will continue our safety screenings on the Oi nuclear plant as ever based on our own ideas."

Because the court decision requires far severer regulatory criteria for the Oi reactors than the NRA's safety standards, which Tanaka describes as "the world's strictest," the appeal trial of the case will likely focus on that issue as a major point of contention.

While the NRA's guidelines urge residents living within a radius of 30 kilometers from a nuclear plant be evacuated in the event of a nuclear disaster, the Fukui District Court recognized far greater repercussions, ruling that a nuclear disaster could pose a danger to residents within a 250-kilometer radius from the plant.

The NRA has heretofore defined its role as a mere examiner of whether nuclear reactors meet regulatory standards and stated that it "will not decide whether a nuclear plant should be restarted or not." An official with the NRA secretariat said, "Unless the Fukui District Court's decision is overturned in appeal trials, the plant operator wouldn't be able to decide to reactivate the reactors" -- suggesting a possible impact of the court ruling on KEPCO's decision to bring the reactors online.

Fukui court ruling:What does it mean?

May 23, 2014

Reflect on Fukui nuclear ruling

http://www.japantimes.co.jp/opinion/2014/05/23/commentary/reflect-on-fukui-nuclear-ruling/#.U3-tWSji_IV

The Fukui District Court's ruling this week that it will not allow the restart of two nuclear power reactors run by Kansai Electric Power Co. challenges the Abe administration's energy policy of keeping nuclear power as a key source of the nation's electricity supply despite the safety risks that materialized in the wake of the Fukushima nuclear power plant disaster in March 2011.

The court's Wednesday ruling was on a lawsuit filed by a group of 189 people from Tokyo, Fukui and other prefectures against the 2012 restart of two of the reactors at Kepco's Oi Nuclear Power Plant in Oi, Fukui Prefecture.

The two Oi reactors — the first to have been reactivated after all of the nation’s nuclear reactors were shut down following the triple meltdowns at Tokyo Electric Power Co.’s Fukushima No. 1 plant — were taken offline last year for regular maintenance, leaving the nation again without nuclear power.

The content of the court’s ruling, in effect, questions the plans by power firms and the government to restart more than a dozen nuclear reactors around the country just three years after the disaster in Fukushima, where roughly 130,000 local residents remain displaced from their homes due to the effects of radiation fallout and Tepco continues to struggle to cope with the aftermath of the reactor core meltdowns caused by the massive earthquake and tsunami.

The district court said the Nos. 3 and 4 reactors at the Oi plant have “structural deficiencies” in their safety measures against severe earthquakes, and determined that restarting their operation would violate the fundamental rights to life of plaintiffs who live within 250 km of the plant — the maximum range where the effects of a worst-case nuclear power plant disaster are estimated to spread in simulations based on the Fukushima case.

Prime Minister Shinzo Abe, in reversing the previous Democratic Party of Japan-led administration’s nuclear phaseout policy, has emphasized the economic viability and supply stability of nuclear energy. He has repeatedly dismissed the no-nuclear option in Japan’s energy mix as unrealistic, noting that the nation is losing trillions of yen each year due to the increased cost of fuel imports to run thermal power generators to make up for the shutdown of nuclear power plants.

The ruling dismissed a similar argument by Kepco in court, noting that it is legally irrelevant to discuss people’s fundamental rights to life on the same level as the question of rising costs of generating electricity.

It went on to say that even if Japan suffers large trade deficits because of the nuclear power plant shutdowns, the real loss of national wealth is when people become unable to live stable lives on their land — an apparent reference to the shattered lives of those residents around the Fukushima plant who were forced to flee their homes. The court also called the radiation fallout from the Fukushima disaster “the worst environmental contamination” in Japan’s history and brushed aside as completely missing the point the argument that the nation needs to have nuclear power as a clean energy that reduces emissions of global warming gases.

One of the key points of the ruling is that operation of the Oi reactors needs to be stopped if there is “even a slightest chance” that the reactors’ ability to keep cooling their cores and contain radioactivity could be lost — as happened in the case of the Fukushima No. 1 plant — if the plant is crippled by severe earthquakes.

The crucial point of the ruling is its contention that it is inherently impossible to determine on scientific grounds that an earthquake more powerful than assumed in the operator's worst-case scenario would not happen. It noted that since 2005, four nuclear power reactors around the country have experienced quake shocks more powerful than the maximum level anticipated on their sites. It is "groundless optimism" in this quake-prone country that such a temblor would never hit the Oi plant, the ruling stated.

In the wake of the Fukushima disaster, the government last year introduced what it calls the world's toughest safety standards on nuclear power plants, which obliges utilities to put in place specific countermeasures against severe accidents such as earthquakes and tsunamis. So far, nine power companies have applied to the Nuclear Regulation Authority for safety screening of their plans to restart 18 reactors at 11 nuclear power plants around the country.

The power companies have invested heavily in additional safety features at their nuclear power plants to meet the updated standards. The cost of imported fuel due to the nuclear shutdowns has weighed heavily on their earnings, with six of the nation's 10 power firms reporting pretax losses for the year that ended in March. The costs have been passed on to electricity rates, and the utilities warn that they will have to raise the rates even higher if they remain unable much longer to restart the nuclear reactors.

Kepeco has applied for NRA screening of its plans to restart the Nos. 3 and 4 Oi reactors. The company has appealed Wednesday's ruling to a higher court, and until the ruling is finalized, the utility will be legally able to reactivate the Oi reactors once it gets the go-ahead from the NRA and relevant government authorities.

Officials say the district court ruling will not affect what they are doing. Chief Cabinet Secretary Yoshihide Suga says the government has no plans to change its policy of seeking the restart of reactors that have cleared the NRA's screenings, with the consent of host municipalities.

NRA chief Shunichi Tanaka has also said the regulation authority will "continue our own examination of the Oi plant" based on the new safety standards.

The Abe administration and the power companies need to stop and reflect on the Fukui court ruling in the context of what the events of the Fukushima disaster. The core meltdowns at Tepco's Fukushima plant took place after the operator deliberately underestimated tsunami risks and failed to take necessary precautions. When it hit, Tepco sought to excuse its lack of preparedness by characterizing the tsunami as simply beyond the scope of "conventional assumptions."

What the ruling called the “groundless optimism” about safety of the Oi plant can be a malady common to all nuclear power plants in this country. The “safety myth” in nuclear power was shattered in the Fukushima disaster. Such a myth should not be resurrected.

Who's done it?

May 27, 2014

Fukushima puzzle: Who ordered halt to pumping of seawater at stricken plant?

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201405270056>

By HIDEAKI KIMURA/ Staff Writer

The identity of the individual in the prime minister's office who exacerbated the nuclear disaster seems destined to forever remain a mystery.

All that is known is that a call was made from the office in Tokyo to Masao Yoshida, the late manager of the crippled Fukushima No. 1 nuclear power plant, calling for reconsideration of his plan to pump seawater into the No. 3 reactor.

Giving up the plan to switch to seawater early on the morning of March 13, 2011, later led to a brief period when water was not being pumped into the No. 3 reactor. That led to overheating of the reactor, which dangerously added to the unfolding crisis triggered by the Great East Japan Earthquake and tsunami two days previously.

Plant operator Tokyo Electric Power Co. released video of teleconferences related to the Fukushima nuclear accident in 2012, but the footage left it unclear who had made the phone call to Yoshida asking that fresh water be used instead of seawater.

TEPCO officials cited concern that pumping in seawater would lead to irreparable damage. Yoshida gave hours of testimony to the government's Investigation Committee on the Accident at the Fukushima Nuclear Power Stations between July and November 2011. The Asahi Shimbun recently obtained a copy. Yoshida died last July of esophageal cancer.

He was asked about the pumping in of water to the No. 3 reactor. Seawater had been pumped into the reactors of the Fukushima No. 1 plant in an attempt to cool the nuclear fuel.

Yoshida instructed his subordinates to continue pumping in seawater to the No. 1 reactor even after he received a phone call on the evening of March 12, 2011, from Ichiro Takekuro, the senior TEPCO expert who was based at the prime minister's office at the time of the accident. Takekuro gave the instruction to stop pumping seawater.

A similar debate about whether seawater or fresh water should be pumped in also took place for the No. 3 reactor early on March 13, 2011.

According to Yoshida's testimony to the government panel, nuclear fuel in the No. 3 reactor had become exposed because of a lack of water. At 5:42 a.m., Yoshida received a report that tanks holding fresh water were all empty. He decided to switch to seawater.

However, at 6:43 a.m. Yoshida received a phone call from a TEPCO employee based at the prime minister's office, saying there was an emergency.

Video of teleconferences have shown that at that time Yoshida was being asked to avoid using seawater as much as possible because of the damage it could do to the reactors.

When Yoshida received the 6:43 a.m. call, he immediately complied with the request to switch to fresh water.

In his testimony, Yoshida said that someone in the prime minister's office had picked up the phone used by the TEPCO employee.

Yoshida said, "I always felt that we would have to use seawater so I believe that I said from the very beginning that we had to go with seawater. However, I later received a phone call from the prime minister's office and told to do something, so I responded that we would try our best to find other sources (of fresh water)."

However, Yoshida became more fuzzy when the question turned to who made the call from the prime minister's office.

"I am sorry, but my memory of that moment is missing so I have no recollection of who it was that I spoke to," Yoshida told investigators. "I can only talk in terms of what may have been possible."

Yoshida gave as possibilities high-ranking TEPCO officials who were at the prime minister's office at the time as well as officials of the Nuclear and Industrial Safety Agency, the now-defunct body then responsible for regulating and supervising the nuclear power industry. However, he gave no definitive answer.

According to video of the teleconferences, at 9:13 a.m., Sakae Muto, the TEPCO executive vice president in charge of nuclear energy who was at the off-site center in Fukushima Prefecture, raised doubts about pumping in fresh water. He is heard saying, "We have to begin thinking about using seawater. Have you discussed this with the prime minister's office?"

Yoshida continued to scramble to find fresh water, but at 12:18 p.m. he gave the instructions to switch to seawater because all the fresh water had been used.

Yoshida felt it would take about 10 minutes to make the switch. However, it was not until 1:11 p.m. that the pumping of seawater began. That meant about a hour had passed with no water entering the No. 3 reactor.

Shimazaki out of the picture: This can't be good news

May 28, 2014

Pro-nuclear expert replacing NRA commissioner who raised flag on quake risk

http://ajw.asahi.com/article/behind_news/politics/AJ201405280023

THE ASAHI SHIMBUN

Replacements for two outgoing commissioners of the Nuclear Regulation Authority suggest the Abe administration will find it easier to gain approval for restarts of the nation's nuclear reactors.

Few people in government circles and the nuclear industry will be sorry to see Kunihiro Shimazaki go. His successor is expected to more quickly give the green light to reactivate nuclear power plants.

Shimazaki, who is 68 and a professor of seismology, proved to be a thorn in the side of electric power companies with his calls for a reassessment of the force with which seismic waves and tsunami could pummel nuclear plants being considered for restarts.

Kenzo Oshima, 71, a former undersecretary-general at the United Nations, is also stepping down. Both men are leaving because their terms expire in September.

The two newly named NRA commissioners are Satoru Tanaka, 64, a professor of nuclear engineering at the University of Tokyo, and Akira Ishiwatari, 61, a professor of geology at Tohoku University. Their terms are for five years.

With Shimazaki out of the picture, the NRA will have to get by without a seismology expert to offer advice.

Tanaka once served as president of the Atomic Energy Society of Japan, and clearly is a proponent of nuclear energy. He has been a professor since 1994 at the University of Tokyo, a respected base of nuclear engineering research in Japan. He has also served on committees related to nuclear energy set up by the Ministry of Economy, Trade and Industry, a staunch backer of the nuclear industry.

The business sector, notably electric power companies, griped that Shimazaki was hindering efforts to resume operations at nuclear plants idled since the 2011 nuclear disaster in Fukushima Prefecture. An executive with Kyushu Electric Power Co. summed up those sentiments by saying, "Shimazaki made us suffer."

Kyushu Electric had applied for a speedy inspection of its relatively problem-free Sendai nuclear plant in Kagoshima Prefecture in its request to bring the facility back online.

Shimazaki was in no mood to acquiesce without making Kyushu Electric put in some hard work. He told the utility to reconsider the maximum force of a quake that could strike the plant. It meant the utility had to take additional safety steps, effectively thwarting the company's hopes of resuming operations in time for this summer when electricity demand peaks.

With memories of the triple meltdown at the Fukushima No. 1 nuclear power plant still fresh, Shimazaki lashed out at electric power companies over their failure to take adequate measures to deal with towering tsunami that could devastate the coast of the Tohoku region.

It is feared that in his remaining months as commissioner, Shimazaki will continue calling for higher estimates of expected quakes--which would delay NRA approval of reactor restarts.

On May 14, executives of the Kansai Economic Federation and Kyushu Economic Federation met with Katsuhiko Ikeda, the NRA secretary-general, to request that approval be given to resumed operations at nuclear plants as soon as possible.

In government circles, officials had clearly grown weary of the way Shimazaki conducts business. "While tougher inspection standards were called for, Shimazaki kept raising the hurdle for inspections and he never reached a conclusion," said one high-ranking administration official.

At a May 9 meeting of a policy committee within the ruling Liberal Democratic Party, Yasuhisa Shiozaki, the deputy policy chief, openly criticized Shimazaki when he said, "While it is acceptable to have seismologists on the NRA, the same cannot be said for someone who knows absolutely nothing about nuclear energy."

With Tanaka as a commissioner, expectations are high that NRA approval of reactor restarts will become a formality.

As a member of an advisory panel on energy policy when the Democratic Party of Japan held power, Tanaka came out in favor of maintaining the ratio of electricity generated through nuclear energy at about 20 percent.

It was also recently learned that three years ago, Tanaka received about 1.6 million yen (\$16,000) in research funds and remuneration from a nuclear plant manufacturer and a foundation linked to Tokyo Electric Power Co., operator of the stricken Fukushima plant.

Tanaka told The Asahi Shimbun in a 2012 interview that no amount of self-reflection over the Fukushima nuclear accident would be adequate considering the scale of the disaster. At the same time, he said, "Nuclear energy is still a technology that is needed in terms of energy security as well as for its contributions to the industrial sector."

Hideyuki Ban, a co-director of the anti-nuclear Citizens' Nuclear Information Center, said, "I have doubts about whether someone who has long been a proponent of nuclear energy can become thoroughly involved in regulation."

He said Tanaka's appointment could damage trust in the NRA.

The other new commissioner, Ishiwatari, has only tepid links to the nuclear industry. Those who have worked with him in the NRA describe him as an able coordinator with a keen sense of the task in hand.

Applications have been filed with the NRA to reactivate 18 reactors at 11 nuclear power plants.

What is the real impact of court rulings?

May 28, 2014

Utility could fire up reactors despite legal block

Kepeco could defy courts and restart Oi reactors despite legal block

by Eric Johnston

Staff Writer

<http://www.japantimes.co.jp/news/2014/05/28/national/kepeco-defy-courts-restart-oi-reactors-despite-legal-block/#.U4ZH6Cji91s>

Last week's ruling by the Fukui District Court blocking the restart of two reactors at the Oi power plant in Fukui Prefecture continues to create controversy, with operator Kansai Electric Power Co. saying it may defy the decision and fire up the reactors if three conditions are met even as safety concerns mount.

"We've appealed the verdict, which means the ruling is not yet confirmed. Our thinking hasn't changed about restarting the reactors as soon as their safety has been confirmed," Kepeco President Makoto Yagi said Tuesday.

Kepeco has appealed to the Kanazawa branch of the Nagoya High Court. A decision could take two or three years. After that, depending on the verdict, it could be appealed to the Supreme Court, adding more years before a final decision is reached.

In addition to getting the green light from the Nuclear Regulation Authority on safety issues, Yagi said that central and local permission would also be conditions for restarting the reactors. The pro-nuclear administration of Prime Minister Shinzo Abe is expected to grant approval quickly.

But getting local consent could now be much trickier. Traditionally, that was something of a formality, involving little more than a statement by municipalities in Fukui Prefecture that host nuclear plants and the governor, all of whom are pro-nuclear.

Since the Fukushima nuclear crisis of 2011, however, political leaders in towns and villages, particularly in adjacent Kyoto and Shiga prefectures, have become more vocal in demanding a say in whether Fukui's atomic plants are safe to restart.

In the event of an accident at one of them, the port city of Maizuru, Kyoto Prefecture, which is located just a few kilometers from the Fukui border and is home to a Maritime Self-Defense Forces base, might become the front line evacuation and rescue center for those fleeing Fukui.

In a worst-case scenario, Maizuru itself would need to be evacuated, as much of the city's population of nearly 89,000 lives within 30 km of the Oi nuclear facility.

But cooperation between Fukui, the central government and Kansai-area leaders on developing a regional response to a nuclear accident in Fukui has long been difficult. That has increased concerns among local politicians that pressure by Abe, Kepco and pro-nuclear Fukui politicians on the NRA to approve restarts will ignore Maizuru's concerns, drawing a response from the city's mayor.

"We need a safety check involving experts selected by Maizuru and Kyoto Prefecture," Maizuru Mayor Ryozo Tatami told reporters on Tuesday.

If upheld by the higher courts, the Fukui decision will be a landmark case that greatly expands the number of localities nuclear power advocates will have to consider when formulating local safety procedures. **The ruling said residents living within 250 km of the Oi facility are entitled to seek an injunction against restarting the reactors.**

The NRA is considering restarting them under the new rules, but Kepco has already warned that the Kansai region will face the summer without electricity from the No. 3 and 4 reactors at Oi.

The Abe administration, which is pushing hard to restart some idled reactors as soon possible, is backing the appointment of new experts to the NRA that it feels will be more cooperative than some current commissioners.

One of the strictest commissioners has been Kunihiko Shimazaki, 68, whose criticism of earthquake safety measures has earned him the wrath of pro-nuclear politicians, utilities and business lobbies.

Shimazaki's term ends in September. Abe hopes to replace him with Tokyo University professor Satoru Tanaka 64, who is on record as favoring nuclear power past 2030, when only five of Japan's 50 remaining reactors would be less than 30 years old.

Don't turn NRA into "toothless" watchdog

May 29, 2014

EDITORIAL: Nuclear watchdog must not be made toothless

<http://ajw.asahi.com/article/views/editorial/AJ201405290026>

Prime Minister Shinzo Abe has a habit of trying to promote policy changes through political appointments. His administration seems to have employed this political ploy to achieve its goals in the area of nuclear safety inspections.

This is the only possible way to put proposed replacements for two outgoing commissioners of the Nuclear Regulation Authority (NRA) into perspective.

Of the four commissioners working under NRA Chairman Shunichi Tanaka, Kunihiko Shimazaki and Kenzo Oshima will retire in September when their terms expire.

The administration has decided to replace them with Satoru Tanaka, a professor of nuclear engineering at the University of Tokyo, and Akira Ishiwatari, a professor of geology at Tohoku University. Tanaka is former president of the Atomic Energy Society of Japan, while Ishiwatari is former president of the Geological Society of Japan.

The nominations are expected to be approved by the Diet.

What concerns us most is Shimazaki's retirement from his post and the selection of Satoru Tanaka as a new commissioner.

Shimazaki, a seismologist, has been strongly criticized by electric utilities and the business community for applying rigorous standards in assessing whether seismic faults near nuclear facilities are active.

But such criticism is unfair because most seismologists agree with his risk assessments. We hope that Ishiwatari, a geologist, will conduct safety inspections from a purely scientific viewpoint.

Satoru Tanaka, who will effectively replace Oshima, a former diplomat, is an engineer who has been promoting nuclear power generation while serving as a member of government advisory panels related to atomic energy, including the Advisory Committee for Natural Resources and Energy of the Ministry of Economy, Trade and Industry (METI).

The Abe administration apparently intends to eventually promote him to the post of NRA chief to succeed Shunichi Tanaka.

Based on the lessons gleaned from the Fukushima nuclear disaster, the NRA was established as a powerful new nuclear safety watchdog that operates independently of METI, a staunch backer of the nuclear power industry. During its first one year and eight months of operation, the body has reasonably performed its role of enforcing strict regulations.

The question is how Satoru Tanaka will contribute to the NRA's job performance as the nuclear regulator. There are still many challenges that need to be tackled in continuing moves to reform the nuclear power industry, one of which is the empowerment of the Secretariat of the Nuclear Regulation Authority. The NRA is also tasked with helping local governments struggling to develop workable plans for the evacuation of their communities during nuclear emergencies and changing the mind-set of electric utilities.

The new nuclear safety standards, which were established last year, need to be reviewed constantly to reflect the latest scientific knowledge. The NRA commissioners have very important roles to play in all these efforts.

Even after the triple meltdown at the Fukushima No. 1 nuclear power plant, Satoru Tanaka has consistently argued that nuclear power generation is necessary technology.

In its final report, the accident investigative committee of the Atomic Energy Society of Japan, led by Tanaka, cited the "lack of sufficient understanding among the experts concerning the roles that they have to perform" and the "lack of sufficient attention to safety among the regulatory authorities." The report was compiled only through internal discussions within the society, which has been often criticized for its closed nature.

Can Satoru Tanaka serve as a fair and unbiased nuclear regulator? Can he do his job purely from the viewpoint of safety, based on soul searching as a specialist of nuclear technology in the face of the Fukushima nuclear disaster? Can he carry out his job as a regulator independently of his personal belief

that nuclear power generation and the program to establish a nuclear fuel recycling system should be promoted?

If he can't, he is not qualified to sit on the NRA.

The terms of the remaining two commissioners will expire next year and the tenure of the chairman will come to an end in 2017.

The government should not be allowed to make the nuclear watchdog toothless by nominating experts who are convenient to it and the industry.

--The Asahi Shimbun, May 29

Yoshida not in agreement with TEPCO's head office

June 1, 2014

Despite talk of pullout, Hosono says he backed Yoshida's resolve not to abandon Fukushima plant

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201406010019>

THE ASAHI SHIMBUN

The liaison between Prime Minister Naoto Kan and Masao Yoshida, manager of the Fukushima No. 1 nuclear power plant at the onset of the March 2011 accident, urged Kan to support Yoshida's belief that workers should not be withdrawn as the crisis worsened.

Goshi Hosono, who was serving as a special adviser to the prime minister at that time, told The Asahi Shimbun that he advised Kan to back Yoshida, though some executives in the head office of the plant's operator, Tokyo Electric Power Co., had suggested that all workers should withdraw from there.

Months after the onset of the accident, the government's Investigation Committee on the Accident at the Fukushima Nuclear Power Stations of Tokyo Electric Power Co. questioned Yoshida and compiled a report. By showing him its sections related to Hosono, The Asahi Shimbun interviewed him for nearly three hours.

Hosono, a Democrat Party of Japan lawmaker, said he felt the biggest disagreement between Yoshida and the TEPCO head office occurred on the night of March 14, 2011, three days after the nuclear accident broke out. It was soon after it became impossible to inject cooling water into the No. 2 reactor.

On that night, Hosono twice received telephone calls from Yoshida. In the first of the two calls, Yoshida said water could not be pumped into the reactor.

Hosono recalled, "I understood that Yoshida suggested the possibility that people at the Fukushima No. 1 plant will become unable to work there. The suggestion meant that all of the workers at the plant will have to withdraw from there."

In the second call, Yoshida told Hosono that water had begun to enter the reactor. When Hosono asked Yoshida, "You can hold on to your tasks, can't you?" Yoshida replied, "All right. We can still make efforts here. Our morale has not weakened."

Hosono said he thought, "Yoshida has regained his former self." Unlike in the first call, Hosono felt Yoshida's strong determination to never give up in resolving the nuclear crisis.

Around the same time, TEPCO President Masataka Shimizu repeatedly tried to contact industry minister Banri Kaieda. Hosono had heard from Kaieda and Chief Cabinet Secretary Yukio Edano that TEPCO wanted to withdraw all the workers from the Fukushima No. 1 plant.

"The idea of withdrawing the workers (from the plant) was expressed by officials at the company (headquarters), including President Shimizu. I felt that their stance differed from that of Yoshida," Hosono recalled.

"(My impression was) Yoshida had decided in his mind to stay in the plant. The prime minister's office also decided to support him completely. The problem was whether TEPCO (headquarters) had the resolve to support him and other workers in the plant," Hosono said.

"TEPCO employees stationed in the prime minister's office appeared to be operating in a mind-set that there were no more ways remaining to deal with the accident," Hosono recalled.

By those remarks, Hosono revealed a big difference that existed in the stance between Yoshida and employees at TEPCO's head office on whether the workers at the plant should be withdrawn.

After receiving the second call from Yoshida, Hosono advised Kan, "The situation at the Fukushima No. 1 plant is one in which workers can make progress there. We should respect Yoshida's judgment."

Before dawn on the next day, March 15, Kan summoned Shimizu to the prime minister's office and told him, "A pullout cannot be allowed."

Soon after 6 a.m. on the same day, some abnormalities occurred in the No. 2 reactor but the radiation level did not rise. At 6:42 a.m., Yoshida ordered workers at the Fukushima plant to wait in the compound so that they could return to their posts immediately if problems occurred.

However, 90 percent of the workers withdrew to the Fukushima No. 2 nuclear power plant, located about 10 kilometers from the No. 1 plant, ignoring Yoshida's instructions, according to Yoshida's testimony to the government's investigation committee.

Since the nuclear accident broke out, Hosono has seldom accepted interviews on how the government dealt with the accident.

As three years had passed, he thought, "My memory is approaching its limits. The time has about come for me to talk about the details."

He recently saw Asahi Shimbun reports based on transcripts from the government's investigation committee's questioning of Yoshida. Hosono consented to an interview with The Asahi Shimbun. (This article was written by Hideaki Kimura and Kyoko Horiuchi.)

"An overpowering sense of helplessness"

June 2, 2014

Hopelessness reigned after TEPCO said Fukushima crisis 'out of control'

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201406020049>

By HIDEAKI KIMURA/ Staff Writer

One of the darkest hours in the Fukushima nuclear disaster came very early on when plant operator Tokyo Electric Power Co. said the situation was out of control.

After hearing this, nuclear experts and government officials gathered at the prime minister's office in Tokyo got ready to throw in the towel, even though the plant manager was on-site and standing firm.

In interview with The Asahi Shimbun, Goshi Hosono, a special adviser to Naoto Kan, the prime minister at that time, conveyed the utter panic and hopelessness that gripped people in the room.

TEPCO executives said the nuclear reactors "are now out of control" as signs emerged of major damage to the No. 2 reactor's containment vessel. From that point, it seemed the only recourse would be to evacuate all plant workers as quickly as possible as a meltdown at the Fukushima No. 1 plant became inevitable.

Hosono's account offers the most complete picture to date of the helplessness that raged as the enormity of the disaster became apparent early on March 15, 2011, four days after the earthquake and tsunami that triggered the crisis.

TEPCO officials became hugely alarmed around 2 a.m. or 3 a.m., when the pressure inside the reactor containment vessel started shooting up, prompting them to state that things are "out of control."

But then the courageous words of plant manager Masao Yoshida, who had spoken to Hosono just the day before, sprang to mind. Yoshida, who was in charge of dealing with the on-site situation, had boldly told Hosono, "I will do my best and stand firm."

Several senior executives from TEPCO headquarters arrived at the prime minister's office. They included Ichiro Takekuro, who was serving in a liaison capacity, and Susumu Kawamata, general manager of TEPCO's Nuclear Quality & Safety Management Department.

Hosono said the remark about the situation being out of control "was not made by a specific individual, but rather as a team of TEPCO members."

"It was shocking to hear the words 'out of control' from TEPCO. With nuclear experts saying the situation was out of control, there was no way I could tell them to keep it under control."

But Hosono was not in a quitting mood and tried to shake them out of their pessimism.

"I told TEPCO, 'Experts should be able to say something even in a situation like this. It's not the time to be low spirited. We have to do something, so just try to come up with a plan,' I told them strongly."

No one seemed to have anything meaningful to offer. Other nuclear experts who were present at the office, like Haruki Madarame, chairman of the Nuclear Safety Commission, shared the same mind-set with TEPCO that all options had run out in containing the disaster.

"With nothing we could do, we felt an overpowering sense of helplessness," Hosono recalled. A full-withdrawal of all workers from the plant would mean that TEPCO had given up any hope of averting a full-scale disaster.

"Overall, we all thought the withdrawal had to be stopped no matter what, but we didn't have anything to back up our belief. How do we do this ... ? With TEPCO saying there was nothing they could do, we were consumed by hopelessness," said Hosono.

The members gathered at the prime minister's office were unable to reach an agreement on the level of withdrawal from the facility. But Hosono advised Kan to trust Yoshida, rather than TEPCO, when reaching his final decision.

In the end, Kan told TEPCO President Masataka Shimizu the same day that he would not allow the company to pull out all its workers.

* * *

The following is what Fukushima plant manager Masao Yoshida told a government inquiry panel about the situation at the stricken facility on March 14-15, 2011:

"It's because the water, it isn't going in. If water can't go in, the fuel, it's just going to melt away."

"It could be plutonium, it could be something else, but all substances amounting from the fuel are going to be released. It's going to be a much more serious matter than the current cesium situation because all the radioactive substances are going to be released and dispersed outside. We're imagining the collapse of eastern Japan."

"The situation is going to be more than a Chernobyl-class disaster, maybe not exactly like the film 'The China Syndrome,' but more like that. Then, we'll have to stop pumping water into the No. 1 and No. 3 reactors as well."

NISA officials first to flee after disaster

June 3, 2014

Nuclear safety inspectors first to flee stricken Fukushima plant

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201406030026>

By SHINICHI SEKINE/ Staff Writer

Safety inspectors with the government's nuclear watchdog body were the first to flee when disaster struck the Fukushima No. 1 nuclear power plant in March 2011.

The exodus of Nuclear and Industrial Safety Agency (NISA) officials compromised communications between the government and plant operator Tokyo Electric Power Co. at a critical juncture.

This unexpected turn of events shows that the government itself was not sure what role it should play in the nuclear crisis.

The plant manager, Masao Yoshida, who died last year of esophageal cancer, was questioned by the government's Investigation Committee on the Accident at the Fukushima Nuclear Power Stations several months after the accident. The Asahi Shimbun obtained a copy of his testimony.

According to his testimony, on March 15, 2011, four days after the Fukushima plant was hit by the magnitude-9.0 Great East Japan Earthquake and tsunami, 90 percent of the workers in the plant withdrew to the Fukushima No. 2 nuclear power plant some 10 kilometers away, ignoring Yoshida's order to remain in and around the compound of the No. 1 facility.

Before that, however, NISA inspectors fled the site immediately after the accident even though they should have stayed to assess what steps were needed to deal with the accident. They went to makeshift government headquarters set up about five kilometers from the No. 1 plant.

On March 15, the makeshift facility was transferred to Fukushima city, some 50 kilometers away.

With all government safety inspectors absent from the No. 1 nuclear power plant, the government had no direct means to grasp what was happening there. As a result, it was forced to depend entirely on TEPCO for information.

But channels of communication between the government and TEPCO did not go smoothly. This chaotic situation prompted the prime minister, Naoto Kan, to go to TEPCO's head office in Tokyo. That was the catalyst for the government and TEPCO to jointly set up headquarters in Tokyo, 230 kilometers away, to deal with the nuclear accident.

The government's investigation committee's reports based on Yoshida's recall of the events highlight the withdrawal of the No. 1 plant's workers to the No. 2 plant even though the government's safety inspectors were the first to flee.

After the accident, the government reviewed its manual to deal with nuclear disasters. In a future nuclear emergency, it was decided that safety inspectors of the Nuclear Regulation Authority (NRA), the successor to NISA, must stay in an "emergency office" set up in the command center of a nuclear power plant and gather information.

However, the standards are not clear about how long safety inspectors or other government officials should remain in the event of a major accident like the one at the Fukushima No. 1 plant or what roles they should play. Also left unsaid is precisely the kinds of information they would be expected to gather.

The National Personnel Authority stipulates that the amount of radiation a public servant is exposed to at the time of a nuclear accident must not exceed 100 millisieverts. After the Fukushima accident, the limit was temporarily raised to 250 millisieverts. However, it was abolished in December 2011. No new limit has been decided.

When a nuclear accident occurs, the prime minister is expected to order the Self-Defense Forces or other government organizations to leap into action.

"In effect, it only means that the government supports the operator of a plant where the accident took place," said Hideka Morimoto, deputy secretary-general of the NRA Secretariat.

The government's stance that the operator of the plant is the main player to deal with an accident remains unchanged even after the triple meltdown at the Fukushima facility.

"We are not assuming that an accident the operator cannot control will take place," said NRA chairman Shunichi Tanaka.

Fukushima is still a disaster

News Flash: Fukushima Is Still a Disaster

http://www.truthdig.com/report/item/newsflash_fukushima_is_still_a_disaster_20140603#

By Harvey Wasserman

U.S. Ambassador to Japan Caroline Kennedy wearing a yellow helmet and a mask inspects the central control room for the Unit 1 and Unit 2 reactors of the tsunami-crippled Fukushima Daiichi nuclear power plant last month. AP /Toru Yamanaka

The corporate media silence on Fukushima has been deafening even though the melted-down nuclear power plant's seaborne radiation is now washing up on American beaches.

Ever more radioactive water continues to pour into the Pacific.

At least three extremely volatile fuel assemblies are stuck high in the air at Unit 4. Three years after the March 11, 2011, disaster, nobody knows exactly where the melted cores from Units 1, 2 and 3 might be.

Amid a dicey cleanup infiltrated by organized crime, still more massive radiation releases are a real possibility at any time.

Radioactive groundwater washing through the complex is enough of a problem that Fukushima Daiichi owner Tepco has just won approval for a highly controversial ice wall to be constructed around the crippled reactor site. No wall of this scale and type has ever been built, and this one might not be ready for two years. Widespread skepticism has erupted surrounding its potential impact on the stability of the site and on the huge amounts of energy necessary to sustain it. Critics also doubt it would effectively guard the site from flooding and worry it could cause even more damage should power fail.

Meanwhile, children nearby are dying. The rate of thyroid cancers among some 250,000 area young people is more than 40 times normal. According to health expert Joe Mangano, more than 46 percent have precancerous nodules and cysts on their thyroids. This is "just the beginning" of a tragic epidemic, he warns.

There is, however, some good news—exactly the kind the nuclear power industry does not want broadcast.

When the earthquake and consequent tsunami struck Fukushima, there were 54 commercial reactors licensed to operate in Japan, more than 12 percent of the global total.

As of today, not one has reopened. The six at Fukushima Daiichi will never operate again. Some 30 older reactors around Japan can't meet current safety standards (a reality that could apply to 60 or more reactors that continue to operate here in the U.S.).

As part of his desperate push to reopen these reactors, Prime Minister Shinzo Abe has shuffled the country's regulatory agencies, and removed at least one major industry critic, replacing him with a key industry supporter.

But last month a Japanese court denied a corporate demand to restart two newer reactors at the Ooi power plant in Fukui prefecture. The judges decided that uncertainty about when, where and how hard the inevitable next earthquake will hit makes it impossible to guarantee the safety of any reactor in Japan.

In other words, no reactor can reopen in Japan without endangering the nation, which the court could not condone.

Such legal defeats are extremely rare for Japan's nuclear industry, and this one is likely to be overturned. But it dealt a stunning blow to Abe's pro-nuke agenda.

In Fukushima's wake, the Japanese public has become far more anti-nuclear. Deep-seated anger has spread over shoddy treatment and small compensation packages given downwind victims. In particular, concern has spread about small children being forced to move back into heavily contaminated areas around the plant.

Under Japanese law, local governments must approve any restart. Anti-nuclear candidates have been dividing the vote in recent elections, but the movement may be unifying and could eventually overwhelm the Abe administration.

A new comic book satirizing the Fukushima cleanup has become a nationwide best-seller. The country has also been rocked by revelations that some 700 workers fled the Fukushima Daiichi site at the peak of the accident. Just a handful of personnel were left to deal with the crisis, including the plant manager, who soon thereafter died of cancer.

In the meantime, Abe's infamous, intensely repressive state secrets act has seriously constrained the flow of technical information. At least one nuclear opponent is being prosecuted for sending a critical tweet to an industry supporter. A professor jailed for criticizing the government's handling of nuclear waste has come to the U.S. to speak.

The American corporate media have been dead silent or, alternatively, dismissive about the radiation now washing up on our shores, and about the extremely dangerous job of bringing intensely radioactive fuel rods down from their damaged pools.

Fukushima's General Electric reactors feature spent fuel pools perched roughly 100 feet in the air. When the tsunami hit, thousands of rods were suspended over Units 1, 2, 3 and 4.

According to nuclear engineer Arnie Gundersen, the bring-down of the assemblies in Unit 4 may have hit a serious snag. Gundersen says that beginning in November 2013, Tokyo Electric Power removed about half of the suspended rods there. But at least three assemblies may be stuck. The more difficult half of the pile remains. And the pools at three other units remain problematic. An accident at any one of them could result in significant radiation releases, which have already far exceeded those from Chernobyl and from the bombings of Hiroshima and Nagasaki.

At least 300 tons of heavily contaminated Fukushima water still pour daily into the Pacific. Hundreds more tons are backed up on site, with Tepco apologists advocating they be dumped directly into the ocean without decontamination.

Despite billions of dollars in public aid, Tepco is still the principal owner of Fukushima. The "cleanup" has become a major profit center. Tepco boasted a strong return in 2013. Its fellow utilities are desperate to reopen other reactors that netted them huge annual cash flow.

Little of this has made its way into the American corporate media.

New studies from the Nuclear Regulatory Commission have underscored significant seismic threats to American commercial nuclear sites. Among those of particular concern are two reactors at Indian Point just north of New York City, which sit near the highly volatile Ramapo Fault, and two at Diablo Canyon, between Los Angeles and San Francisco, directly upwind of California's Central Valley.

The U.S. industry has also suffered a huge blow at New Mexico's Waste Isolation Pilot Project. Primarily a military dump, this showcase radioactive waste facility was meant to prove that the industry could handle its trash. No expense was spared in setting it up in the salt caverns of the desert southwest, officially deemed the perfect spot to dump the 70,000 tons of high-level fuel rods now backed up at American reactor sites.

But an explosion and highly significant radiation release at the pilot project last month has contaminated local residents and cast a deep cloud over any future plans to dispose of American reactor waste. The constant industry complaint that the barriers are "political" is absurd.

While the American reactor industry continues to suck billions of dollars from the public treasury, its allies in the corporate media seem increasingly hesitant to cover the news of post-Fukushima Japan.

In reality, those gutted reactors are still extremely dangerous. An angry public, whose children are suffering, has thus far managed to keep all other nukes shut in Japan. If they keep them down permanently, it will be a huge blow to the global nuke industry—one you almost certainly won't see reported in the American corporate media.

Cloud over NRA's credibility

June 4, 2014

The NRA doesn't need a 'yes man'

<http://www.japantimes.co.jp/opinion/2014/06/04/editorials/nra-doesnt-need-yes-man/#.U48Bjyji91s>

The Abe administration's May 27 nomination of two new commissioners of the Nuclear Regulation Authority could cast a cloud over the nuclear watchdog's credibility since one of them, Satoru Tanaka, is a nuclear energy proponent with close ties with the community of industries, bureaucracy and academia that has promoted nuclear power generation in this country. Lawmakers must scrutinize his nomination when it reaches the Diet floor to determine if he is capable of objectively carrying out his duties.

To replace two NRA commissioners whose terms end in September — Kunihiro Shimazaki, a seismologist who served as head of the Seismological Society of Japan, and Kenzo Oshima, a former ambassador to the United Nations — the administration nominated Tanaka, a professor of the University of Tokyo who specializes in the nuclear fuel cycle and treatment of nuclear waste, and Akira Ishiwatari, a professor of geology at Tohoku University who served as head of the Geological Society of Japan.

It's not difficult to discern the intentions of Prime Minister Shinzo Abe, government bureaucrats and Liberal Democratic Party lawmakers who want to restart idled nuclear power plants behind the decision to not renew the tenure of Shimazaki and instead seek to appoint Tanaka.

Shimazaki is known for his strict approach to the safety of nuclear power plants. Through the study of geological faults at plant sites and examination of the steps taken at plants to cope with major quakes and tsunami, he has confronted power companies that seek to reopen their plants. He determined that a fault below the No. 2 reactor of Japan Atomic Power Co.'s Tsuruga nuclear power plant in Fukui Prefecture is an active fault. In screening of the Nos. 3 and 4 reactors of Kansai Electric Power Co.'s Oi nuclear power plant in the same prefecture, he demanded that the company strictly review the depth of a fault that can become the focus of an earthquake. His demand has ruled out the possibility of an early restart of the two reactors. Some pro-nuclear LDP lawmakers have reportedly been unhappy with Shimazaki.

In contrast, Tanaka has close ties with the nuclear power establishment. He served as an official of the Japan Atomic Industrial Forum from 2010 to 2012, received more than ¥500,000 in rewards from Tepco (Tokyo Electric Power Co.) Memorial Foundation in fiscal 2011 and received a donation of ¥600,000 from Hitachi-GE Nuclear Energy, Ltd. in fiscal 2011. His affiliation with the JAIF and the monetary gifts will likely fall within the scope of conditions that disqualify candidates for NRA commissioners, which were set by the then Democratic Party of Japan-led administration in July 2012. Under the conditions, an NRA commissioner should not have been a member of a nuclear power company and related entities and should not have received a reward from these entities in the past three years.

Shinji Inoue, senior vice minister of the Environment Ministry, said the Abe administration followed what the law says but not the conditions set by the DPJ government in nominating Tanaka to the NRA position. But Inoue contradicted his own earlier statement in the Diet that the government should follow the conditions.

Tanaka became a member of the Advisory Committee for Natural Resources and Energy under the trade and industry ministry in June 2011. He is known to have stressed in the committee the need for Japan to maintain a certain level of nuclear power generation and to keep a fast-breeder reactor as an option for the nation's energy policy. Given his career record and stance, one wonders just how objectively he will screen power companies' applications for restart of nuclear power plants.

Public trust in the NRA could be lost if its neutrality is in doubt. Japan's system of nuclear regulatory oversight was reformed after the 2011 Fukushima nuclear disaster because the now-defunct Nuclear and Industrial Safety Agency was under the umbrella of the trade and industry ministry — which promotes nuclear energy. Established in September 2012 to replace NISA, the NRA's oversight of the nuclear power industry must be strict and transparent.

Will investigation interviews be made public ?

June 5, 2014

Suga: Fukushima interviews could be made public

http://www3.nhk.or.jp/nhkworld/english/news/20140605_27.html

Japan's Chief Cabinet Secretary Yoshihide Suga says the country's government will publicize interviews with Tokyo Electric Power Company and government officials about the accident at the Fukushima Daiichi nuclear plant if they give consent.

A government-appointed accident investigation committee interviewed 772 people after the 2011 accident for a report. They include the plant's former head Masao Yoshida, who died last year.

Suga said on Thursday that the government sees no problem with publicizing the interviews, except for parts that concern national security or the rights and interests of a third party.

He said the government would release them based on the freedom of information law.

The government has not publicized any of the interviews on grounds that they were conducted with the understanding that it would not do so.

Jun. 5, 2014 - Updated 07:36 UTC

TEPCO shareholders to demand disclosure of nuke accident interviews

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201406050055>

THE ASAHI SHIMBUN

A group of Tokyo Electric Power Co. shareholders looks set to file a lawsuit to force the government to release records of interviews it had with 772 people to determine the cause of the Fukushima nuclear disaster in 2011.

The group first plans to ask the Cabinet Secretariat, which keeps the records, to disclose them. If it refuses, as is expected, the group will immediately file an administrative lawsuit with the Tokyo District Court.

It is also waging a separate legal action against TEPCO to determine the responsibility of company executives for the nuclear accident.

The government established the Investigation Committee on the Accident at the Fukushima Nuclear Power Stations in May 2011, two months after the triple meltdown at the Fukushima No. 1 nuclear power plant.

The committee conducted the interviews on the condition that what the individuals said would not be publicly disclosed. The identities of those interviewed have not been revealed, although it is known that Masao Yoshida, who was the manager of the Fukushima plant at the time and died of esophageal cancer last year, was one.

The committee has said it would disclose the records of the interviews within necessary limits, but has yet to do so.

"If the government obtains agreements for disclosure (from those interviewed), it will disclose the records within necessary limits based on the stipulations of the information disclosure law," Yoshihide Suga, chief Cabinet secretary, said June 5.

Yuichi Kaido, a lawyer who is representing the group, said media reports based on what Yoshida told the investigation committee suggest that TEPCO's chain-of-command structure had collapsed after the March 2011 triple meltdown.

"Records of interviews not only with Yoshida, but also other people concerned, are indispensable to clarify the cause of the accident and (TEPCO's) responsibility," Kaido said. "The government should decide on rules for disclosure and, in principle, disclose the records."

Kaido criticized the Abe administration and previous ones headed by Naoto Kan and Yoshihiko Noda for concealing the information that has a direct bearing on the cause of the nuclear disaster.

Under the information disclosure law, government agencies and ministries must decide within 30 days whether to reveal information once a request is made.

If the government organization decides not to disclose the information, the individual or group that made the request for disclosure can file a complaint with the organization. However, Kaido's group plans to file an administrative lawsuit immediately if the Cabinet Secretariat decides not to disclose the records of the 772 interviews. The action is intended to clarify in a trial whether the government's nondisclosure stance is appropriate.

The government said that when its investigation committee submitted the records of the interviews in response to a request from the Diet's Fukushima Nuclear Accident Independent Investigation Commission, Yoshida petitioned that the records of his interviews not be disclosed.

Based on Yoshida's request, the government is refusing to disclose his records.

The Asahi Shimbun was the first media organization to obtain a copy of the interviews with Yoshida. In the documents, Yoshida grants the government the right to disclose them.

A member of the government's investigation committee tells Yoshida: "I will be taking records of what you say here. There is a possibility that the records will be made public (in the future). Are you OK with that?"

"I'm OK," Yoshida said in response.

Making interviews public (2)

TEPCO shareholders ask for interview release

http://www3.nhk.or.jp/nhkworld/english/news/20140605_30.html

Shareholders of Tokyo Electric Power Company, or TEPCO, plan to take legal action to get the government to release interviews about the accident at the Fukushima Daiichi nuclear power plant.

A group of shareholders and others filed a request with the government for disclosure of interviews with the plant's former head Masao Yoshida and 771 TEPCO and government officials. A government-appointed investigative panel interviewed them for a report following the 2011 accident. The government has not released any of the interviews.

The group says the interviews are important for examining responsibility for the accident, and that Japanese want to know the truth.

The group says that if the government turns down the request, it will take its case to the Tokyo District Court.

The shareholders have sued TEPCO's management, demanding that it compensate the company for damage caused by the accident.

772 Fukushima No. 1 interviews slated for release

<http://www.japantimes.co.jp/news/2014/06/05/national/772-fukushima-no-1-interviews-slated-for-release/#.U5FuQiji91s>

by Reiji Yoshida
Staff Writer

The government will release the transcripts of interviews with 772 people about the 2011 Fukushima meltdown crisis, provided the subjects agree to the disclosure of their testimony, Chief Cabinet Secretary Yoshihide Suga said Thursday.

Even with the permission of the interviewees, parts of the transcripts will be redacted if it is deemed they would violate the rights or interests of third parties or could harm “the safety of the nation,” Suga said.

“I’ve ordered (staff) to quickly carry out procedures to confirm the intention of (the interview subjects),” he said. “We will disclose the records if they agree, based on the Information Disclosure Law.”

Until now, the government has refused to publicize records of interviews conducted by its investigation panel on the grounds that the subjects — mainly government officials and Tokyo Electric Power Co. employees — spoke on condition that their testimony would not be publicized. The panel granted them this confidentiality to encourage candid answers.

The 772 people were interviewed for a total of 1,479 hours, according to the panel’s final report published in July 2012.

The government has faced pressure in recent weeks to disclose the records after the Asahi Shimbun started publishing what it said were excerpts of the panel’s interviews with Masao Yoshida, who was in charge at Fukushima No. 1 when three reactors suffered meltdowns. Yoshida has been considered a hero for preventing the crisis from escalating into an even worse disaster.

On Thursday, the Asahi reported that a group of Tepco shareholders plans to file a lawsuit seeking disclosure of the interviews with all 772 people.

Release the documents

June 6, 2014

For Kan and former Cabinet members, disclosure of Fukushima testimony a non-issue

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201406060042>

THE ASAHI SHIMBUN

Ten politicians interviewed by a government investigative panel on the cause of the Fukushima nuclear disaster are in favor of their accounts being released to the public, The Asahi Shimbun has found.

The finding will likely add to growing public pressure on the Abe administration to disclose the records.

Among those who gave consent is Naoto Kan, the prime minister who spearheaded the Democratic Party of Japan-led government's response to the March 2011 disaster at the Fukushima No. 1 nuclear power plant.

"I left the decision to disclose the content of the hearings to Yotaro Hatamura and other officials," said Kan, referring to the chairman of the government's Investigation Committee on the Accident at the Fukushima Nuclear Power Stations.

"They should be released to the greatest extent possible unless the current administration decides to handle disclosure in an arbitrary manner."

Of 72 politicians interviewed by The Asahi Shimbun, 11 acknowledged they were questioned by the investigative panel. Of these, 10 concurred on the release in full or with conditions.

Former Chief Cabinet Secretary Yukio Edano was comfortable with disclosure.

"I will not oppose it as long as the records are not made available arbitrarily as a result of political intervention with regard to whose testimonies are subject to disclosure and which portions will be released," Edano said in a statement.

Earlier, the newspaper acquired a copy of the testimony given by the late Masao Yoshida, who was the manager of the plant. It provided a detailed first-hand account of the circumstances as to the scope of the disaster triggered by the Great East Japan Earthquake and tsunami unfolded.

Tetsuro Fukuyama, a former deputy chief Cabinet secretary and one of the 11 interviewees, calls for rules to be drawn up with regard to the release of such materials. He called for consideration to be given to privacy issues and taking steps to prevent arbitrary disclosure.

Yoshihide Suga, the current chief Cabinet secretary and the government's most senior spokesman, told a news conference June 5 that the government "intends to release (the records) to the extent necessary" if those who testified give consent.

Suga has instructed the Cabinet Secretariat's office, where the records are kept, to begin ascertaining the intention of the interviewees about the disclosure

.

The government's committee held hearings with 772 people.

Goshi Hosono and Manabu Terata, special advisers to Kan, were also in favor of the disclosure.

"I strongly hope that the records will be released," Terata said. "I believe that my recollection (of the disaster) is public property."

Motohisa Ikeda, former senior vice minister of the ministry of economy, trade and industry who headed the off-site emergency response center, declined to give an answer.

Toshimi Kitazawa, former defense minister, and Yoshito Sengoku, former deputy chief Cabinet secretary, said they were not interviewed by the committee.

Members of the government's panel agreed before embarking on the interviews in July 2011 that, in principle, hearings will be conducted behind closed doors and with a small number of people.

They also agreed that the panel will disclose the contents of the hearings in an appropriate manner if the interviewees agreed to it.

But successive governments have denied public access to the records and did not name the individuals who were questioned by the panel.

Fukushima radiation still biggest environmental problem for Japan

June 6, 2014

Report: Nuclear accident top environmental problem

http://www3.nhk.or.jp/nhkworld/english/news/20140606_18.html

A government report says the release of radioactive materials following the 2011 Fukushima nuclear accident remains Japan's biggest environmental problem.

The Cabinet approved this year's white paper on the environment on Friday.

The report says building intermediate storage facilities for contaminated soil and other waste is essential to speed up the decontamination work and promote reconstruction.

The government plans to build such facilities near the Fukushima Daiichi nuclear power plant.

The report also says determining amounts of radiation exposure is important for managing the health of residents.

The report points to the need to provide better information to alleviate their concerns. It notes Fukushima Prefecture's efforts to train personnel for health consultations.

The white paper also calls for rapidly moving ahead with environmentally friendly programs to reconstruct the affected areas.

It cites the prefecture's solar power generation program, which solicits funding and other forms of participation by residents.

A village in the prefecture plans to construct renewable energy facilities as a pillar of its community rebuilding efforts.

Jun. 6, 2014 - Updated 03:36 UTC

120 million yen for Tanaka's course at the University of Tokyo

June 7, 2014

Tepco gifted ¥120 million to university course run by NRA nominee

<http://www.japantimes.co.jp/news/2014/06/07/national/tepco-gifted-120-million-to-university-course-run-by-nra-nominee/#.U5NtQSji91s>

JJI

Tokyo Electric Power Co. donated ¥120 million in the four years through fiscal 2011 to a nuclear fuel cycle course taught at the University of Tokyo by a professor who the government has now nominated as a Nuclear Regulation Authority commissioner, it was learned Saturday.

Satoru Tanaka's nomination was submitted to the Diet by the government late last month.

The University of Tokyo's department of nuclear engineering and management launched the course in fiscal 2008 to promote studies on the nuclear fuel cycle and train personnel able to work for programs to recycle spent fuel at nuclear plants.

According to records the university provided to Jiji Press and other sources following a disclosure request, Tepco initially offered to donate a total of ¥150 million to the course over five years through fiscal 2012. The university decided to accept ¥30 million per year, and Tanaka and other faculty members discussed how to use the funds.

The course, however, was terminated in September 2011 after Tepco proposed ending the donations in the aftermath of the triple meltdowns at the Fukushima No. 1 plant.

Of the ¥120 million that had been donated by the utility up to that point, the university that November returned ¥20.36 million it had not used.

A Tepco official explained that the company made the donations in order to support the development of talented people. Tanaka, who has also served as president of the Atomic Energy Society of Japan and as chairman of the Japan Atomic Industrial Forum, did not reply to a request for an interview.

NRA's independence

June 10, 2014

<http://www.reuters.com/article/2014/06/10/japan-nuclear-regulator-idUSL4N00R16X20140610>

Independence of Japan's nuclear regulator questioned after shakeup

Tue Jun 10, 2014 3:38am EDT

- * Post-Fukushima agency's reputation tested as reactor restarts loom
- * New commissioner Tanaka has received nearly \$100,000 in funding from industry
- * Industry funding for academic research in Japan not uncommon
- * Stern critic of nuclear safety practices Shimazaki to exit panel

By Mari Saito and Kentaro Hamada

TOKYO, June 10 (Reuters) - Japanese legislators approved a reshuffle at the nuclear safety regulator including appointing a commissioner who has received nearly \$100,000 from nuclear-related entities over the past decade to fund his academic research.

Among the two commissioners stepping down from the five-member panel at the Nuclear Regulation Authority (NRA), one is a fierce critic of safety practices in the industry.

Opponents said the changes, which were approved on Tuesday, undermined Prime Minister Shinzo Abe's commitment to an independent watchdog at a time when utilities are pushing to restart their idled reactors.

The NRA's independence is under scrutiny as it reviews applications to restart reactors, all 48 of which were shut in the wake of the 2011 Fukushima disaster.

The commission was set up as an independent agency after Fukushima to replace a regulator seen as too close to the industry and to an energy ministry that promoted atomic power. Since then, utilities have pledged more than \$15 billion to upgrade equipment and facilities.

Japan's lower house of parliament, where Abe has a majority, approved his government's nomination of Satoru Tanaka, a nuclear engineering professor at the University of Tokyo and a proponent of nuclear power.

It also approved geologist Akira Ishiwatari, whose candidacy generated little controversy. The upper house is expected to also give them the greenlight.

Industry analysts said any nuclear energy expert in Japan would have received funding from the industry given the decades of close ties between utilities and Japanese academia.

"But it is a matter of the degree of money you receive," said Hideyuki Ban of Citizens' Nuclear Information Center, a non-profit anti-nuclear group.

Tanaka did not respond to e-mailed requests for comment on the donations, which were detailed in financial disclosures and Japanese media. Tokyo University would not provide contact information for him, citing privacy concerns.

"Bringing someone like (Tanaka) on as a regulator changes the fundamental role of the NRA," said Tomoko Abe, an independent anti-nuclear lawmaker not related to the prime minister.

"This nomination could undermine the very role of the regulator."

Chief Cabinet Secretary Yoshihide Suga said last month that the nominees were the "best people for the job, who can fulfil their roles from an independent, scientifically unbiased and fair standpoint".

Akihiro Sawa, a research director at the 21st Century Public Policy Institute, a think tank affiliated with Japan's biggest business lobby Keidanren, defended Tanaka.

"Academic institutions now encourage professors to get research funds and it's very competitive, so his background should not be judged purely on the outside funds he has received," said Sawa.

YEARS OF FUNDING

Tanaka, who was not at parliament on Tuesday, had sought to dispel concerns about his candidacy. He recently told public broadcaster NHK: "If I am approved, I will take into account mistakes from the Fukushima accident and I will do my utmost by utilising all my experience."

Eight months after Fukushima, he was one of the first experts to say it may be safe to consider atomic energy again, according to remarks he made to a government panel on energy.

Between the 2004 and 2010 fiscal years, Tanaka received 6 million yen (\$58,500 at current exchange rates) for research from three firms according to disclosures made by Tokyo University in response to a public information request from Reuters: Electric Power Development Co Ltd, known as J-Power, which is building a nuclear plant in northern Japan; reactor maker Hitachi Ltd's nuclear division; and Hitachi GE Nuclear Energy Ltd.

Japan's Jiji news service said Tanaka also received around 3 million yen over five years to March 31, 2012 from the Tepco Memorial Foundation, an organisation set up by the predecessor company to Fukushima operator Tokyo Electric Power, or Tepco. A foundation spokesman said Tanaka had been paid for judging research grants but declined to give an amount.

Tokyo University said it had no information on any possible payment from the Tepco foundation, as this would be Tanaka's private income.

In disclosures to the NRA in April, Tanaka said he received at least 500,000 yen in the year to March 2012 from the foundation. NRA nominees are only required to disclose funding received in the past three years.

For the year to March 2012, Tanaka told the NRA he also received a total of 1.1 million yen from Hitachi GE Nuclear Energy and Taiheiyo Consultant, an engineering firm.

None of the original NRA commissioners received funds from a utility or nuclear plant operator for their research in the three years leading up to their appointment, according to disclosures made when the NRA was set up.

Commissioner Toyoshi Fuketa received about 1.5 million yen in fiscal 2009-10 from Nuclear Fuel Industries for research he did with Japan's sole producer of nuclear fuel, an NRA filing showed.

CRITICAL VOICE

The NRA's most critical voice, seismologist Kazuhiko Shimazaki, will retire in September after two years as its deputy, a period in which he angered the industry with safety demands that in one case effectively scuttled a reactor restart.

Activists and some NRA officials had hoped Shimazaki would remain, sources with direct knowledge of the matter said. But the government said he and a former Japanese ambassador to the United Nations, Kenzo Oshima, wanted to leave at the end of their two-year terms.

Shimazaki has not spoken publicly about his retirement and the NRA declined to make him available for comment. It's not clear who will be the NRA's new deputy.

"The main objective of this shuffle is to remove commissioner Shimazaki," said Tetsunari Iida, executive director of Japan's Institute for Sustainable Energy Policies, an anti-nuclear group. "The industry would never be satisfied if he wasn't replaced."

An official at a utility who asked not to be identified because of the sensitivity of the topic called Shimazaki's retirement a "small victory" and said utilities hoped restarts would now move ahead quickly.

The first restart, at the Sendai reactor on Japan's island of Kyushu, is expected to be approved in the coming months after the utility resubmitted its application following demands from Shimazaki to upgrade its assumptions over earthquake risk.

The NRA chairman acknowledged the regulator was under pressure "from all different directions". "We have worked together to create the functions and the independence of the regulator," Shunichi Tanaka, who is no relation to the new commissioner, told a recent news conference.

"This is a groundbreaking thing, and we will all work toward protecting it."

(\$1 = 102.52 yen) (Editing by William Mallard and Dean Yates)

Yoshida Testimony (Asahi Shimbun)

The Asahi Shimbun has published a series of articles based on M. Yoshida's testimony after the Fukushima disaster.

Most of these articles have been posted on this blog but here are a few which had escaped my attention.

<http://ajw.asahi.com/tag/Yoshida%20testimony>

EDITORIAL: Fukushima interviews public assets that need to be disclosed

<http://ajw.asahi.com/article/views/editorial/AJ201406060027>

June 06, 2014

Since the government is supposed to be working for the good of the people, important information it has gathered is a valuable asset that belongs to each and every one of us.

After the nuclear catastrophe at the Fukushima No. 1 nuclear power plant in 2011, a government investigative committee interviewed 772 people to try and identify what happened and why. They included Masao Yoshida, who was the manager of the stricken Fukushima plant. Yoshida died of esophageal cancer in 2013.

Since the Investigation Committee on the Accident at the Fukushima Nuclear Power Stations ended its short-lived probe into the disaster, the government has kept the valuable records of those interviews secret. It has not even disclosed the names of those interviewed.

Let us make this argument again: The government should immediately disclose, as much as possible, the records of testimonies about the accident.

On June 5, Chief Cabinet Secretary Yoshihide Suga said, "If the government obtains agreements for disclosure (from those interviewed), it will disclose the records within necessary limits based on the stipulations of the information disclosure law." He then set about learning about the intentions of the interviewees.

But the administration remains unwilling to disclose the testimonies by Yoshida on the grounds that he asked for nondisclosure of the records in a written statement submitted to the committee. This is by no means a convincing argument.

Yoshida was in charge of front-line operations at the crippled plant. He should have given his detailed accounts of the accident in an appropriate public forum, such as in testimony before the Diet. But he was struck down by cancer and died before he could do so.

Now, the document of his testimonies is one of the most valuable public assets. According to the document, at the outset of the interviews, a member of the government's investigation panel informed Yoshida of the possibility that records of his statements could be made public. Yoshida answered, "I'm OK (with that)."

In a written statement he later submitted to the committee, Yoshida voiced concerns about possible lapses in memory. But facts can be clarified by checking his remarks against those of others. Yoshida also spoke candidly about his assessments of other people involved. But this would not cause any problems if proper rules for disclosing the records are established. These concerns do not provide a good justification for keeping all the records enveloped in secrecy.

The document of Yoshida's interviews, a copy of which has been obtained by The Asahi Shimbun, shows that the inquiry panel's analysis of the accident was not satisfactory. The panel's final report referred to Yoshida's comments from the viewpoint of whether Tokyo Electric Power Co., the operator of the Fukushima plant, was considering the evacuation of all its employees from the plant. But the report ignored Yoshida's claim that even TEPCO employees responsible for supervising workers on the front-line temporarily took refuge in the Fukushima No. 2 nuclear power plant, located more than 10 kilometers from the No. 1 plant, in defiance of his instructions and orders.

What actually happened during the nuclear crisis? What kind of judgments did people involved make and how did they act or fail to act?

The investigation committee admitted that its probe had not even come close to revealing the whole picture of the accident and emphatically called for a continued inquiry. The government's decision to effectively call off the investigation prematurely upset public expectations.

Many of the lawmakers in the Democratic Party of Japan who responded to the disaster as members of the Cabinet and other government offices have voiced their willingness to consent to the disclosure of the records of their own interviews.

The government should urge the interviewed witnesses to consent to the disclosure of their statements by stressing the importance of making them public. In particular, the remarks made by people who were deeply involved in responses to the nuclear crisis must be made public.

Making such remarks available to all of us would contribute greatly to the efforts for making in-depth analyses of the harrowing disaster from various viewpoints.

EDITORIAL: Startling Fukushima testimony raises grave questions

<http://ajw.asahi.com/article/views/editorial/AJ201405210015>

May 21, 2014

When faced with a life-threatening crisis, humans do not necessarily behave according to set rules. Some will do anything to save their skins. Without factoring in this possibility, is it ever possible to design something that is guaranteed to be safe?

We raise the issue because of a document that recently came to light. It is a record of statements made by Masao Yoshida, who was the manager of the Fukushima No. 1 nuclear power plant at the time of the March 2011 disaster. Yoshida died last July of esophageal cancer.

This valuable document covers exchanges Yoshida made when he was questioned by the government's Investigation Committee on the Accident at the Fukushima Nuclear Power Stations of Tokyo Electric Power Co.

The document begs a fundamental question: Is it right to entrust operations of nuclear power plants to electric power companies that are private enterprises?

According to the document, Yoshida said that on March 15, four days after the Great East Japan Earthquake and tsunami crippled the Fukushima No. 1 plant, fears were being voiced that the plant's No. 2 reactor containment vessel was damaged or destroyed. At that most critical juncture, according to the document, about 90 percent of plant workers defied Yoshida's orders and fled to the Fukushima No. 2 plant, about 10 kilometers away, to seek temporary refuge.

Doubts have always existed about the efficacy of disaster response measures at nuclear power plants. Would any utility really order its workers to risk their lives and keep performing their duties? How many

workers would the utility be able to continue to secure during an accident? At Fukushima, these questions were no longer just theoretical.

The safety of commercial nuclear power plants today can be maintained only if plant operators deal appropriately with any mishap. The more serious the situation, the more people are needed to contain the crisis. But unlike Self-Defense Forces personnel, police officers and firefighters, who are all special-status government workers, nuclear power plant operators are private-sector workers.

The 50 or so workers who stayed at the Fukushima No. 1 plant while the crisis unfolded came to be called the "Fukushima 50" and were lauded around the world for their heroic dedication. But there is no guarantee such heroism will come into play when the next nuclear crisis occurs. The document raises grave questions.

Yet, Shunichi Tanaka, chairman of the Nuclear Regulation Authority, was reportedly not even aware of the document's existence. We find it extremely hard to understand that the head of this organization, created to prevent a recurrence of nuclear crisis, was not familiar with all the details from the outset of the Fukushima disaster.

The possibility of plant workers deserting en masse during a crisis was not even raised during discussions last year on establishing new regulatory standards for nuclear power plants.

Yotaro Hatamura, an expert in the science of failures and former chairman of the government's investigation committee on the Fukushima accident, stated in the overview of the investigation report: "Whatever may happen will happen. Whatever is thought to never happen will also happen." Has nobody heeded Hatamura's warning?

The government's investigation committee interviewed 772 individuals in connection with the Fukushima disaster. There must be many valuable opinions that have yet to be made public.

TEPCO must reveal every aspect of the mass desertion, and waste no time in doing so. The utility cannot be entrusted with nuclear power plant operations so long as it refuses to face the issue head-on.

For its part, the government should disclose all investigation committee materials to the public and make every effort to ensure that people learn lessons from the Fukushima accident. In the absence of any such effort, we firmly oppose the restart of reactors that are currently off-line.

--The Asahi Shimbun, May 21

VOX POPULI: The other side of the Fukushima story is not so heroic

<http://ajw.asahi.com/article/views/vox/AJ201405210013>

May 21, 2014

Vox Populi, Vox Dei is a daily column that runs on Page 1 of the vernacular Asahi Shimbun.

A few days into the disaster at the Fukushima No. 1 nuclear power plant in March 2011, foreign media began referring to the plant workers who stayed on to contain the unfolding crisis as the "Fukushima 50," even lauding their actions as a "last bastion" of heroism.

But another side of the story has recently come to light. According to a document obtained by The Asahi Shimbun, about 650 plant workers--roughly 90 percent of the total workforce--defied the plant manager's orders and fled to the Fukushima No. 2 nuclear power plant about 10 kilometers away. This mass "desertion" may have stymied efforts to properly handle the crisis at the crippled plant.

The plant manager, Masao Yoshida who died last year, ordered everyone to temporarily evacuate from high-radiation zones but remain on the plant's premises so that they would be able to return to their posts quickly if needed. Given the harrowing situation Yoshida himself and his assistants were forced to struggle through, perhaps those who disobeyed his orders and fled may deserve to be accused of dereliction of duty.

However, I cannot really blame those workers. It is easy to talk of putting one's life on the line, but actually doing so is an entirely different matter. This reminds me once again that nuclear power generation is a technology that forces us to imagine the worst-case scenario and make the ultimate choice between asking some people to risk their lives or letting vast expanses of the nation become an uninhabitable wasteland.

This mass desertion in defiance of Yoshida's orders remained unknown until The Asahi Shimbun reported it on May 20. If the facts are hidden and treated as if they never happened, the Fukushima crisis will never be understood in its entirety, and no real lessons can be learned from the disaster.

"The danger past and God forgotten," goes an old saying. Three years after the crisis, could it be that society is now beginning to embrace a new "myth" that propagates the idea of safe nuclear power generation by simply assuming there will never be another nuclear disaster? In ancient China, advancing

troops were said to have marched to the beating of drums, while retreating troops marched to the clanging of gongs. In our country today, we hear the drums of the government, the bureaucrats and the business leaders that are set on restarting currently idle nuclear reactors. But let us not forget that the gongs of retreat from nuclear power generation are also sounding loud and clear.

--The Asahi Shimbun, May 21

"A de facto revival of the nuclear Safety Commission"

June 11, 2014

Abe picks for NRA 'undermine' nuclear watchdog's independence

Reuters

The Lower House has approved a reshuffle of the Nuclear Regulation Authority, including appointing a commissioner who has received more than ¥10 million from nuclear-related entities over the past decade to fund his academic research.

Among the two commissioners stepping down from the five-member panel at the NRA, one is a fierce critic of safety practices within the industry.

Opponents said the changes, which were approved Tuesday, undermine Prime Minister Shinzo Abe's stated commitment to an independent watchdog at a time when utilities are pushing to restart their idled reactors.

The NRA's independence is under scrutiny as it reviews applications to restart reactors, all 48 of which were shuttered in the wake of the 2011 Fukushima nuclear disaster.

The commission was set up as an independent agency after the disaster to replace a regulator seen as too close to the industry and to an energy ministry that promoted atomic power.

The Lower House, where Abe has a majority, approved his administration's nomination of Satoru Tanaka, a nuclear engineering professor at the University of Tokyo and a proponent of nuclear power.

It also approved geologist Akira Ishiwatari, whose candidacy generated little controversy. The Upper House is expected to also give them the green light.

Industry analysts said any nuclear energy expert in Japan would have received funding from the industry, given the decades of close ties between utilities and academia.

“But it is a matter of the degree of money you receive,” said Hideyuki Ban of Citizens’ Nuclear Information Center, a nonprofit foe of nuclear power.

Tanaka did not respond to emailed requests for comment on the donations, which were detailed in financial disclosures and the media.

“Bringing someone like (Tanaka) on as a regulator changes the fundamental role of the NRA,” said Tomoko Abe, an independent anti-nuclear lawmaker who is not related to the prime minister. “This nomination could undermine the very role of the regulator.”

Chief Cabinet Secretary Yoshihide Suga said last month that the nominees were the “best people for the job, who can fulfill their roles from an independent, scientifically unbiased and fair standpoint.”

Akihiro Sawa, a research director at the 21st Century Public Policy Institute, a think tank affiliated with the Keidanren business lobby, defended Tanaka.

“Academic institutions now encourage professors to get research funds and it’s very competitive, so his background should not be judged purely on the outside funds he has received,” Sawa said.

Tanaka, who was not at the Diet on Tuesday, has sought to dispel concerns about his candidacy.

“If I am approved, I will take into account mistakes from the Fukushima accident and I will do my utmost by utilizing all my experience,” he told NHK recently.

Eight months after the three meltdowns at Fukushima No. 1, he was one of the first experts to say it may be safe to consider atomic energy again, according to remarks he made to a government panel on energy.

Between the 2004 and 2010 fiscal years, Tanaka received ¥6 million for research from three firms, Electric Power Development Co Ltd, known as J-Power, which is building a nuclear plant in northern Japan; reactor maker Hitachi Ltd's nuclear division; and Hitachi GE Nuclear Energy Ltd.

Jiji Press said Tanaka also received around ¥3 million over five years to March 31, 2012, from the Tepco Memorial Foundation. A foundation spokesman said Tanaka had been paid for judging research grants, but gave no amount.

Tokyo University said it had no information on any possible payment from the Tepco foundation, as it would be Tanaka's private income.

In disclosures to the NRA in April, Tanaka said he received at least ¥500,000 in the year to March 2012 from the foundation. NRA nominees are only required to disclose funding received in the past three years.

For the year to March 2012, Tanaka told the NRA he also received a total of ¥1.1 million from Hitachi GE Nuclear Energy and Taiheiyo Consultant, an engineering firm.

None of the original NRA commissioners received funds from a utility or nuclear plant operator for their research in the three years leading up to their appointment, according to disclosures made when the NRA was set up.

The figures exclude a total of ¥120 million Tepco donated during the four years through fiscal 2011 to a nuclear fuel cycle course taught by Tanaka, according to Jiji.

Commissioner Toyoshi Fuketa received about ¥1.5 million in fiscal 2009-2010 from Nuclear Fuel Industries for research that he conducted with Japan's sole producer of nuclear fuel, an NRA filing revealed.

The NRA's most critical voice, seismologist Kazuhiko Shimazaki, will retire in September after two years as its deputy, a period during which he angered the industry with safety demands that in one case effectively scuttled the restart of a reactor.

Activists and some NRA officials had hoped Shimazaki would remain, sources with direct knowledge of the matter said. But the government said he and former Ambassador to the U.N. Kenzo Oshima wanted to leave at the end of their two-year terms.

Shimazaki has not spoken publicly about his retirement and the NRA declined to make him available for comment. It's not clear who will be the NRA's new deputy.

"The main objective of this shuffle is to remove commissioner Shimazaki," said Tetsunari Iida, executive director of Japan's Institute for Sustainable Energy Policies, an anti-nuclear group. "The industry would never be satisfied if he wasn't replaced."

An official at a utility who asked not to be identified because of the sensitivity of the topic called Shimazaki's retirement a "small victory" and said utilities hope restarts will now move ahead quickly.

The first restart, at the Sendai nuclear plant in Kagoshima Prefecture, is expected to be approved in the coming months. The utility resubmitted its application, following demands from Shimazaki to upgrade its assumptions regarding earthquake risks.

NRA Chairman Shunichi Tanaka acknowledged the regulator is under pressure "from all different directions."

"We have worked together to create the functions and the independence of the regulator," Tanaka, who is no relation to the new commissioner, told a recent news conference. "This is a groundbreaking thing, and we will all work toward protecting it."

June 11, 2014

Tohoku Electric seeks reactor restart; praise, anger expressed over NRA changes

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201406110056>

THE ASAHI SHIMBUN

Tohoku Electric Power Co. on June 10 applied to the Nuclear Regulation Authority for safety screenings to restart a reactor that might lie directly above an active fault.

The application for the Higashidori nuclear power plant in Aomori Prefecture was submitted after the government announced plans to replace a NRA commissioner criticized as overly cautious with a pro-nuclear expert. The personnel change has drawn praise from residents around the Higashidori plant and outrage from victims of the Fukushima nuclear disaster.

NRA inspectors have visited the Higashidori plant four times but have yet to reach a conclusion on whether an active fault runs under important equipment at the plant. Under Japanese law, nuclear reactors cannot operate if they lie directly above an active fault.

“All those involved have been irritated with (the NRA’s) slow-moving inspections,” said Yasuo Echizen, the mayor of Higashidori village, adding that he hopes the nuclear plant will be restarted at the earliest possible date.

The NRA was set up in the aftermath of the Fukushima No. 1 nuclear power plant accident to replace two nuclear safety bodies that were criticized for their cozy ties to the nuclear industry. The new nuclear watchdog introduced stricter safety rules for nuclear power plant operations.

Prime Minister Shinzo Abe wants to restart nuclear power plants, but all reactors remain offline in Japan, with some utilities waiting for NRA approval.

Nuclear power plant operators and government officials have largely blamed NRA Commissioner Kunihiko Shimazaki for the delay in giving the green light for the resumption of reactor operations.

The Diet on June 11 approved the Abe administration’s proposed personnel changes that would replace Shimazaki, a seismology expert, with Satoru Tanaka, a nuclear engineering professor at the University of Tokyo and a leading proponent of nuclear energy.

Another NRA commissioner, Kenzo Oshima, will also leave the nuclear watchdog. He will be replaced by Akira Ishiwatari, a professor of geology at Tohoku University, who has only tepid links to the nuclear industry. Some experts expect Ishiwatari to be impartial in judging the safety of nuclear reactors.

Yoichi Suenaga, a former president of Aomori University who is currently chairman of a group of local companies and individuals who discuss nuclear energy and regional development, said he welcomes the changes in the NRA.

“We have had doubts (about the credibility of the NRA) because the body has just been sticking to the problem of a possible active fault,” Suenaga said.

The reaction to the NRA changes was quite different in Fukushima Prefecture, where evacuees from the nuclear accident triggered by the Great East Japan Earthquake and tsunami in March 2011 said they fear that nuclear safety is again taking a back seat to industry interests.

“The personnel replacement is advantageous to those who want to restart reactors, and will render the current nuclear regulations ineffective,” said Hiroaki Kanno, 66, a doctor in Fukushima, who evacuated from Namie, Fukushima Prefecture.

A resident of Tamura, Fukushima Prefecture, said the Abe administration’s latest decision violates personnel shift rules introduced by the previous administration led by the Democratic Party of Japan.

“It is lunacy that the Abe administration is attempting to appoint Tanaka, an obviously ineligible figure, as commissioner,” said Ruiko Muto, a 60-year-old former teacher who is seeking to hold senior officials of Tokyo Electric Power Co., operator of the Fukushima No. 1 plant, criminally responsible for the disaster.

Yayoi Hitomi, 53, a magazine editor in Koriyama in the prefecture, said the government’s move reminded her of the failures of the NRA’s predecessor to properly evaluate the dangers at the Fukushima plant.

“(The commissioner replacement) represents a de facto revival of the Nuclear Safety Commission,” she said.

Shimomura's notes describe Fukushima crisis

June 12, 2014

Insider's notes as Fukushima crisis unfolded describe disinterested TEPCO officials

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201406120061>

THE ASAHI SHIMBUN

Like many government officials dealing with the initial stages of the Fukushima nuclear disaster, Kenichi Shimomura was shocked by the paucity of information available.

As it turns out, updates were pouring in, but Tokyo Electric Power Co., the operator of the stricken plant, was reluctant to turn them over.

Shimomura, the Cabinet Secretariat councilor in charge of public relations, was with Prime Minister Naoto Kan at TEPCO's head office in Tokyo as the Fukushima nuclear disaster was unraveling.

"Until then, I had the impression that we were dealing with someone who was overseas somewhere," Shimomura recalled. "I thought there was nothing we could do if TEPCO headquarters also did not have any information. So it was a major shock for me when I realized TEPCO headquarters had been receiving information but never bothered to pass it on to the prime minister's office which was located so close by."

Early on March 15, 2011, Shimomura entered a room at TEPCO headquarters that had a teleconferencing system connecting the utility's headquarters with six outside locations, including the Fukushima No. 1 nuclear plant, the Fukushima No. 2 nuclear plant and the Fukushima offsite center.

Shimomura kept a notebook handy and sketched the six video monitors of the teleconferencing system at TEPCO headquarters.

He agreed to let Asahi Shimbun reporters see his jottings about the Fukushima nuclear accident triggered by the Great East Japan Earthquake and tsunami four days earlier.

Prior to becoming councilor, he worked as a reporter with Tokyo Broadcasting System Television Inc.

In an entry for March 15, 2011, Shimomura wrote that he went to TEPCO headquarters at 6:07 a.m.

TEPCO would eventually release video of the teleconferences held that day, but the sound was erased, ostensibly for privacy reasons.

As a result, the events of that day when radiation levels at the Fukushima No. 1 plant site reached alarming levels can only be pieced together through the recollections of those who were at the scene.

Prior to going to TEPCO headquarters, Shimomura was napping at the prime minister's office. He was suddenly awoken by a phone call and told: "TEPCO is saying it wants to pull its workers (from the Fukushima No. 1 plant). The prime minister is going to TEPCO headquarters."

Shimomura put on his disaster management uniform and was driven to TEPCO headquarters. He ran up to the second floor where a task force had been set up to deal with the nuclear accident. Someone in the prime minister's office whispered to Shimomura that Kan had just given TEPCO executives a tongue-lashing.

In his notes, Shimomura wrote: "Leaving the plant site will never be allowed. We cannot have the eastern half of Japan covered in nuclear waste!"

He went on to write: "Responsibility will be held from the company president on down. Those 60 and older should be prepared to die here."

DISINTERESTED TEPCO EXECUTIVES

The times Shimomura jotted down in his notebook for the most part match those found in TEPCO internal documents. He also sketched diagrams of technical explanations given by TEPCO officials about the nuclear plant.

The entry for 6:14 a.m. shows that the situation at the plant had changed dramatically for the worse.

Shimomura wrote: "There was a loud noise and (pressure) fell to zero."

Beside the entry, he made a sketch of the reactor containment vessel on the basis of an explanation given by TEPCO officials.

That was when officials at TEPCO headquarters received a report that an explosion had occurred in the vicinity of the No. 2 reactor and the pressure in the suppression chamber had abruptly fallen to zero.

In his notes, Shimomura states that TEPCO officials suspected the bottom of the pressure vessel may have broken off, a catastrophic development.

Shimomura writes that Kan called Chief Cabinet Secretary Yukio Edano and told him, "Something very grave has occurred."

Shortly before 7 a.m., TEPCO officials handed out a document titled "On moving the main office function."

Although there was no indication of where TEPCO wanted to move it to, Shimomura reckoned it meant relocating from the quake-proof control center building where Masao Yoshida, the Fukushima No. 1 plant manager, was working.

In the end, Yoshida did not leave the building, but there were still concerns about the reactor reaching a critical state if there was any let-up in work to pump water into the reactor to cool it.

Shimomura was so concerned about the situation, he admonished TEPCO officials, telling them that rather than simply say "work" they should always be clear they were referring to "water-pumping work."

Recalling that moment, Shimomura said, "I didn't want the water-pumping work to be gradually ignored as the situation unfolded."

Shimomura also felt that the TEPCO executives at the utility's headquarters seemed overly detached. He said it seemed as if they were not directly involved since they were far from the scene of the nuclear accident.

Other government officials who were at TEPCO headquarters also sensed the same thing.

Shimomura records Tetsuya Nishikawa, who was then assistant chief Cabinet secretary, yelling at TEPCO executives, "Don't you ever think that you are all right just because you are here (at TEPCO headquarters)."

Shimomura also jotted down an exchange between Kan and then TEPCO Chairman Tsunehisa Katsumata at around 8 a.m.

Kan: "Don't just work on one thing, but create at least two lines of work and proceed simultaneously."

Katsumata: "Yes, thank you."

Kan: "Don't thank me. Are you saying you cannot do it?"

Shimomura recalled feeling fearful when he learned that fire had been confirmed at the No. 4 reactor at 9:38 a.m. Seventeen minutes later, Shimomura wrote that TEPCO reported: "The fire is out of control."

It was only at about 11 a.m. that the blaze had burned out by itself.

NO RECOLLECTION OF WORKERS LEAVING NO. 1 PLANT

The events at the No. 2 reactor described in Shimomura's notebook match the statements given by Yoshida to the government's Investigation Committee on the Accident at the Fukushima Nuclear Power Stations. The Asahi Shimbun obtained a copy of Yoshida's testimony.

Around 7 a.m. on March 15, while Shimomura was at TEPCO headquarters, about 90 percent of the workers at the Fukushima No. 1 plant temporarily fled to the Fukushima No. 2 plant about 10 kilometers away in direct violation of an order given by Yoshida.

In his testimony, Yoshida said, "In fact, I never told the workers to go (to the No. 2 plant)."

TEPCO internal documents record that Yoshida ordered workers to wait within the No. 1 plant site.

However, the utility maintained that the workers did not ignore Yoshida's instructions. They explained that evacuating temporarily to the No. 2 plant was always an option because Yoshida's order left open the possibility of leaving for the No. 2 plant if "there were no locations at the No. 1 plant where radiation levels were low."

In Shimomura's notes, there is no mention of TEPCO saying workers would temporarily evacuate to the No. 2 plant. At that time, Shimomura was with Kan as he was conferring with TEPCO executives while watching the teleconference.

Shimomura said he never heard talk from TEPCO that it wanted its workers to move to the No. 2 plant or that an order had been given to allow for such a move. He added that he would have noted such an exchange.

Shimomura said he had a different interpretation of the talk about evacuating workers. His sense was that it referred to moving workers at the central control room of the No. 2 reactor to the quake-proof control center building at the No. 1 plant where Yoshida was stationed.

Shimomura did jot down that at around 6:50 a.m. TEPCO staff informed officials in the prime minister's office that workers would return to their tasks about an hour after checking that radiation levels on the plant site had not risen.

Shimomura said, "The image I had was that the workers were at a location that would allow them to return to work immediately after an hour had passed. It never occurred to me that the workers had gone to the No. 2 plant."

Because the earthquake had damaged roads, coupled with the necessity of removing and putting on protective clothing and face masks when entering and leaving the No. 2 plant, workers who had fled there could not possibly return to the No. 1 plant in one hour.

In fact, the earliest that workers returned to the No. 1 plant was about noon.

With regard to the significance of the Yoshida testimony, Shimomura said, "I feel there is a need to read from it the lessons about whether people can pass on information properly when regular communications channels have been destroyed."

Asked why he decided to divulge his own notes on the nuclear accident, Shimomura said: "I kept quiet because I thought that no one would want to listen to someone who was in government at the time. However, I felt the time had come to speak up because the Yoshida testimony was revealed."

Shimomura said he was never questioned by the government investigative panel or asked to submit his notebooks.

Tanaka's defense

June 13, 2014

New NRA member rejects criticism

http://www3.nhk.or.jp/nhkworld/english/news/20140613_30.html

A new member of Japan's Nuclear Regulation Authority has rejected criticism that his ties with the nuclear industry may compromise the watchdog's independence.

University of Tokyo Professor Satoru Tanaka met reporters on Friday. The Diet had approved his nomination two days before.

Tanaka said he has been involved in nuclear energy-related education and research and wants to make the most of his experience when he becomes an NRA commissioner. He also said he fully recognizes that the authority should be independent.

Tanaka said the Fukushima nuclear accident greatly affected people and the environment and should not have happened.

He expressed hope that the authority will draw up regulations by incorporating findings of an investigation into what caused the accident.

Tanaka said he will make judgments while keeping in mind that human knowledge has limits and nuclear energy will always have risks.

Tanaka and another university professor, Akira Ishiwatari, are to replace two of the NRA's five commissioners in September. Ishiwatari is a professor at Tohoku University and a geologist.

Lawmakers said Tanaka should be disqualified because he was a member of an industry lobby, the Japan Atomic Industrial Forum, for two years until June 2012.

Guidelines created by the previous Democrat-led government say people who belonged to industry groups in the past three years cannot become commissioners.

Officials of the government say it did not apply the guidelines when nominating Tanaka.

Fukushima Gov. irked by money remark

June 17, 2014

Japan minister apologises for Fukushima money gaffe

<https://au.news.yahoo.com/world/a/24256691/japan-minister-apologises-for-fukushima-money-gaffe/>

June 17, 2014, 2:22 pm

AFP Japan minister apologises for Fukushima money gaffe

Tokyo (AFP) - A Japanese cabinet minister apologised on Tuesday after appearing to suggest people in nuclear disaster-hit Fukushima could be persuaded to put up with contaminated waste if the government threw cash at them.

Environment minister Nobuteru Ishihara came under fire after saying money would be a decisive factor for local governments and residents being asked to accept plans to build storage facilities for radioactive waste.

The remarks were seen as insensitive to the tens of thousands of people who remain unable to return to homes around the crippled Fukushima nuclear power plant because of persistently high levels of radiation.

Fukushima Governor Yuhei Sato immediately hit back, saying: "It was extremely regrettable. The remarks rode roughshod over the feelings of residents who are longing for their hometowns."

Goshi Hosono, former environment minister and a senior lawmaker of the opposition Democratic Party of Japan, called for Ishihara's resignation, telling reporters: "The remarks -- it's about money -- should never have been made."

Ishihara on Tuesday told reporters "I sincerely apologise to those who were annoyed by my remarks."

He said, however, that as the minister in charge of reconstruction, he would continue exploring proposals for waste-storage facilities, including details of compensation.

Central and local governments have been negotiating for months over the construction of "temporary" storage facilities for soil and other waste contaminated by fallout from the meltdowns at Fukushima following the 2011 tsunami.

Ishihara's gaffe was unusual for a man who has shown himself to be a relatively sure-footed politician, but was redolent of his father, current lawmaker and former Tokyo governor Shintaro Ishihara, who is no stranger to controversy.

Just three days after Japan's northeast was swamped by the huge tsunami, Ishihara senior caused outrage by saying the disaster -- which killed more than 18,000 people -- had been divine punishment for a nation obsessed by materialism.

Ishihara: Money comment was misunderstood

http://www3.nhk.or.jp/nhkworld/english/news/20140617_14.html

Japan's environment minister has apologized for controversial remarks on storing radioactive waste in Fukushima towns.

Nobuteru Ishihara said on Monday that money would ultimately decide what happens to the waste. He made the remarks after briefing the chief cabinet secretary about his meetings with residents of 2 host towns for intermediate storage facilities.

Ishihara tried to clarify the comments on Tuesday. He said in the end, compensation for land and to help rebuild lives and local economies will be the issue.

He said he is sincerely sorry for causing any misunderstanding.

The minister said there was no change to his approach of standing alongside the local people and carefully explaining the situation to them.

The government hopes to build the storage facilities with the approval of Fukushima Prefecture and the host towns. It plans to begin sending contaminated soil and debris to the towns next January.

Jun. 17, 2014 - Updated 02:08 UTC

June 16, 2014

Ishihara: Money ultimate decider for storage plan

http://www3.nhk.or.jp/nhkworld/english/news/20140617_01.html

Japan's Environment Minister has been trying to clarify comments he made about building intermediate storage facilities for radioactive soil and waste in Fukushima towns.

Nobuteru Ishihara appeared to say that money can solve any problems.

Ishihara held meetings with residents of the towns of Futaba and Okuma. They expressed concern about government plans to situate the facilities there, and asked for clarification about how much the government plans to compensate them for their land and buildings.

Ishihara and Chief Cabinet Secretary Yoshihide Suga discussed the meeting at the Prime Minister's office in Tokyo.

Nobuteru Ishihara later told reporters that money will ultimately decide what happens.

But he later said he hadn't meant to imply that it could solve everything. He said the government cannot propose an exact figure until residents accept the plan, but they will discuss the value.

The government hopes to begin sending contaminated soil and debris to the facilities from next January. But the plan needs approval from the host towns and Fukushima Prefecture.

Jun. 16, 2014 - Updated 19:25 UTC

Minister slammed for comments on contaminated soil storage in Fukushima

<http://mainichi.jp/english/english/newsselect/news/20140617p2g00m0dm052000c.html>

TOKYO (Kyodo) -- Environment Minister Nobuteru Ishihara drew criticism from Fukushima officials on Monday for suggesting that money would ultimately decide whether local authorities accept the state's proposal for building facilities in the prefecture to store contaminated soil after the Fukushima Daiichi nuclear disaster.

Ishihara told reporters in Tokyo earlier in the day that the protracted negotiations between the state and local governments in the northeastern prefecture would ultimately be settled by the "monetary value" of accepting the interim storage facilities, such as grants to local authorities hosting them.

Ishihara immediately sought to contain fallout from his remarks, telling a hastily called news conference that he had meant to say details of any compensation for hosting such facilities cannot be explained to local residents until local governments accept the proposal.

Fukushima Gov. Yuhei Sato criticized Ishihara's remarks, calling them regrettable. "The remarks trample on residents' longing for their hometowns. I want to find out what his true intention was," he added.

Futaba Mayor Shiro Izawa, whose town is being considered for hosting storage facilities for top soil and other waste generated through decontamination efforts in the disaster-hit prefecture, said the remarks would lead to "misunderstanding" that local residents are after compensation and damages from the state.

Ishihara's remarks came a day after the state ended its briefing sessions for the residents of Futaba and Okuma, the other town being considered for hosting the facilities. The crippled nuclear power complex straddles both towns.

The sessions drew criticism that the state's explanation about compensation remained vague, prompting the prefectural government and the two municipal authorities to call for a more concrete explanation from the state.

Since last December, the state and the local authorities have been negotiating over the construction of temporary storage facilities for contaminated soil and other waste.

There is a large gap between the state and the local governments over the size of grants to be created as the price of accepting the storage facilities, keeping the negotiations deadlocked, according to a source familiar with the matter.

The state plans to build the interim storage facilities by nationalizing about 16 square kilometers of land around the Tokyo Electric Power Co. plant, seeking to start operating the facilities next January. While the state says the contaminated waste will be moved to a permanent storage site to be built outside of the prefecture, there is little prospect of finding such a permanent site at the moment.

Fukushima governor irked over remark

http://www3.nhk.or.jp/nhkworld/english/news/20140617_19.html

Fukushima Governor Yuhei Sato has expressed displeasure over the environment minister's remarks.

Sato told reporters on Tuesday that the comments were made at a time when local people still haven't agreed to host the facilities.

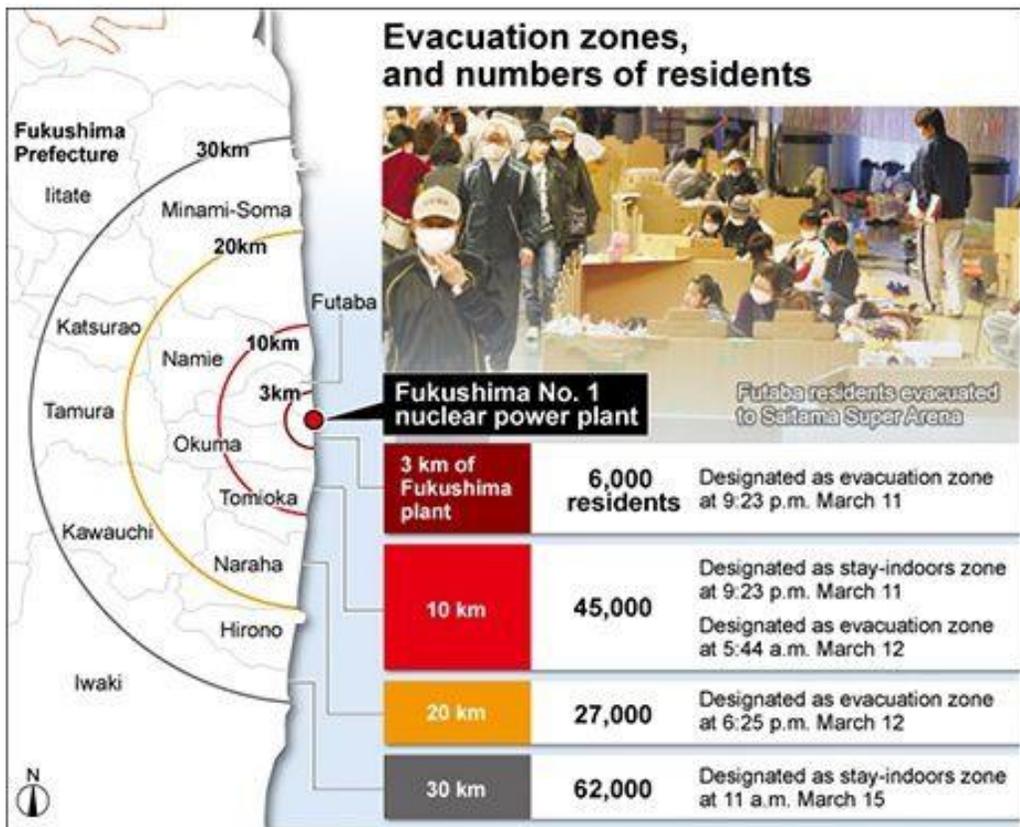

The governor said he wonders whether the minister truly understands how much the people have suffered, having to leave their homes for 3 years and 4 months.

He added he wants to look into the minister's intentions.

Very little information to make crucial decisions

June 17, 2014

Lack of information hampered government's evacuation efforts in Fukushima crisis
<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201406170061>

THE ASAHI SHIMBUN

As the crisis unfurled at the Fukushima No. 1 nuclear power plant in March 2011, the prime minister’s office issued **a series of evacuation orders in reaction to worsening developments without sufficient information and expert knowledge**, according to testimony by a former top government official.

In testimony to the government’s Investigation Committee on the Accident at the Fukushima Nuclear Power Stations, then Deputy Chief Cabinet Secretary Tetsuro Fukuyama, who was in charge of evacuating residents, detailed how government officials were forced to issue evacuation orders in a flurry. The Asahi Shimbun recently obtained a copy of his testimony.

“We only had limited information (on the developing nuclear crisis), but made decisions (to issue evacuation orders) with clear objectives for each of the decisions,” Fukuyama said in a recent interview with The Asahi Shimbun.

“Whether we made the right decisions or not at the time will only be judged by history,” the Democratic Party of Japan Upper House member added.

After the Great East Japan Earthquake and tsunami crippled cooling systems of nuclear reactors at the plant on March 11, 2011, the prime minister's office ordered residents living within a radius of 3 kilometers from the facility to evacuate at 9:23 p.m. that evening.

However, after the failure of a venting system to reduce the pressure in the No. 1 reactor vessel, the government issued an evacuation order for residents living within a 10-km radius at 5:44 a.m. on March 12.

A hydrogen explosion in the No. 1 reactor prompted officials to further expand the evacuation order to cover a 20-km radius from the plant at 6:25 p.m. that day.

Then amid the worsening condition of the No. 2 reactor, the government was forced to order residents living between a 20-km to 30-km radius from the plant to remain indoors at 11 a.m. on March 15.

Asked why the government officials only expanded the evacuation zones in increments, Fukuyama told committee members that it was feared that major traffic jams could ensue if an evacuation order was issued first for residents living away from the plant.

This would have made it difficult for residents living near the plant to promptly evacuate, the lawmaker said.

At the same time, Fukuyama criticized Tokyo Electric Power Co., the plant operator, for failing to provide updates from the worsening crisis, saying it was "frustrating." He also acknowledged his lack of knowledge about the nuclear accident.

Asked why the officials did not issue an evacuation order for people living in a radius of 20 km to 30 km from the plant, Fukuyama suggested they instead were ordered to remain indoors as an emergency response, because it was estimated that it could take four to five days to evacuate all the 140,000 residents living within a 30-km radius of the plant.

On March 25, the government finally issued a voluntary evacuation order for residents living in a 20-km to 30-km radius of the plant. Fukuyama's testimony shows that he apologized for the government's decision for forcing residents in the area to wait inside buildings for as long as 10 days.

According to a survey of evacuees conducted by The Asahi Shimbun and a Fukushima University research team led by professor Akira Imai, more than 80 percent of respondents said they believe the government's evacuation orders were inappropriate.

Even though the government expanded evacuation zones in stages, extensive traffic congestion actually blocked evacuation efforts in many areas. The shortage of sufficient accommodation facilities also surfaced as a major problem during the evacuations.

"I cannot confidently say to what extent our evacuation orders properly reached the residents," Fukuyama said.

A question of money (A blunder?)

June 18, 2014

Environment minister suggests Fukushima residents can be bought

http://ajw.asahi.com/article/behind_news/politics/AJ201406180009

THE ASAHI SHIMBUN

Environment Minister Nobuteru Ishihara apologized on June 17 for suggesting that payments to residents in Fukushima Prefecture would resolve the problem of selecting a site to temporarily store radiation-contaminated soil.

"I would like to express my heartfelt apology to those who experienced unpleasant emotions due to a comment lacking character that I made," Ishihara said.

That comment came the previous day, after Ishihara reported to Chief Cabinet Secretary Yoshihide Suga on the status of the project to construct the interim storage facility in Okuma and Futaba, both near the crippled Fukushima No. 1 nuclear power plant.

"With the conclusion of the explanatory meetings, I talked (with Suga) about the future schedule," Ishihara told reporters June 16. "In the end, it will come down to money. (Suga) did not say anything in particular about the monetary figure (for compensation to local residents) that was presented at the explanatory meetings."

In exchange for hosting the interim storage facility, the central government plans to provide a tax grant to the host municipality and compensation to individuals whose land will be used in the project. The size of the grant and compensation is expected to be a key factor in gaining the consent of the local community.

Under the government's plan, tons of soil removed during decontamination work and currently stored in various locations in Fukushima Prefecture would be transferred to the interim storage facility. That would speed up reconstruction work in locations where the contaminated soil has been removed.

Residents of the candidate sites have been reluctant to host the interim facility, fearing it will end up becoming a permanent fixture in their neighborhood.

Fukushima Governor Yuhei Sato was extremely critical of Ishihara's initial comment.

"The comment had absolutely no thought about the feelings of Fukushima residents toward their hometowns," Sato told reporters on June 17. "As a human, he should never have used the word 'money.' "

Although he apologized for his comment, Ishihara did not retract it on the grounds it was made at an informal gathering with reporters. He also said he could not totally recall what he said.

At the June 17 news conference, Ishihara explained what he was trying to say on the previous day.

"I meant to say that in the end what would be important was presenting the monetary figure to compensate for use of the land, to help rebuild the lives of residents and for the reconstruction of the local community," Ishihara said. "I never said the issue could be resolved through money."

When asked if he planned to apologize to the residents of Fukushima Prefecture, Ishihara only said, "Naturally, I will have many opportunities to visit Fukushima."

What Gov't really thinks of Fukushima

June 18, 2014

Editorial: Ishihara's Fukushima gaffe reflects real feelings of gov't

<http://mainichi.jp/english/english/perspectives/news/20140618p2a00m0na023000c.html>

拡大写真

Environment Minister Nobuteru Ishihara's gaffe over a plan to build interim facilities to store soil and other waste contaminated with radioactive substances from the crippled Fukushima No. 1 Nuclear Power Plant has rubbed local residents the wrong way. His remarks have called into question whether he is qualified as a politician.

Ishihara came under fire for suggesting on June 16 that "monetary value" would ultimately decide whether local authorities accept the central government's proposal to build interim storage facilities. He made the remarks after he reported the plan on the facility to Chief Cabinet Secretary Yoshihide Suga at the prime minister's office on June 16 -- the day following the latest briefing session for local residents on the plan.

Many local residents apparently took his remarks as reflecting the national government's true intentions to try to persuade local bodies in Fukushima to host such facilities by offering financial grants or compensation. It is only natural that Fukushima Gov. Yuhei Sato criticized Ishihara's remarks saying, "Does he understand the severity of the nuclear disaster?"

Ishihara later said he never meant that the matter can be settled with money and apologized for upsetting Fukushima residents. However, Ishihara has never attended any of the 16 briefing sessions for local residents on the plan that the national government has held since late May. He should visit Fukushima Prefecture as early as possible to apologize for and thoroughly explain his remarks.

The national government plans to acquire a land lot about 16 square kilometers in size that stands over the Fukushima Prefecture town of Futaba and Okuma to build an interim storage facility. The government aims to begin to shift contaminated soil and other waste, which is currently stored at temporary storage sites, to the new facility in January next year.

However, central government officials provided only a vague explanation in the briefing sessions on the road map toward the final disposal of contaminated soil outside Fukushima Prefecture and the amount of compensation the government will pay to local authorities when it nationalizes the facility. The

explanation hardly won the understanding of local residents. Such being the case, the government is considering establishing a system to provide grants that can be used to help residents restore their livelihoods and make up for losses caused by harmful rumors against local products.

Ishihara explains that he made the controversial remarks to the effect that it would be important to show the specific amounts of money to buy land for the facility as well as funds to cover local residents' efforts to restore their livelihoods and revitalize the local economy.

However, his explanation reminds the public of the traditional political method of providing massive amounts of grants to local governments hosting nuclear plants in efforts to promote atomic power. On the occasion of Okinawa's Nago mayoral race in January this year in which the pros and cons of a plan to relocate the U.S. military's Air Station Futenma to the city was the point of contention, the national government unveiled measures to revitalize the local economy in a bid to increase the chance of the candidate in favor of the relocation winning the election.

However, the national government's attempt ended in failure and the incumbent mayor who is opposed to hosting a substitute facility for Futenma base was re-elected. The idea of offering a massive amount of money in return for hosting burdensome facilities is outdated.

If Ishihara had truly sympathized with local residents who have been suffering from the nuclear crisis, he would not have said the issue could ultimately be settled by "monetary value." One cannot help but wonder if he ever learned any lessons from another gaffe he had made about the nuclear crisis when he was serving as secretary-general of the now ruling Liberal Democratic Party. At that time, Ishihara compared the crippled atomic power station to a facility of the AUM Shinrikyo cult that carried out deadly nerve gas attacks, using the word, "Satyam," and was later pressed to explain what he really meant by that.

Some people are reportedly searching for their children who went missing after being hit by the tsunami in 2011 near the proposed site for the interim storage facility. The construction of the facility could lead to the loss of land where local residents were born and raised.

Negotiations on the construction of the interim storage facility will never progress unless the national government sincerely listens to what local residents have to say and win their trust.

Censure motion submitted against Ishihara

June 20, 2014

Opposition parties submit censure motion against minister Ishihara

<http://mainichi.jp/english/english/newsselect/news/20140619p2g00m0dm073000c.html>

TOKYO (Kyodo) -- Opposition parties submitted a censure motion against Environment Minister Nobuteru Ishihara for his controversial remarks on the issue of where to store nuclear-contaminated soil from crisis-hit Fukushima.

The parties including the biggest opposition Democratic Party of Japan submitted the motion to the House of Councillors, declaring the minister's apologies and retraction of the comments earlier in the day insufficient.

In a parliamentary session on the day, Ishihara retracted his remarks that suggested money would ultimately decide whether local authorities accept a proposal to build facilities to store soil contaminated with radiation after the Fukushima Daiichi nuclear disaster.

"I retract my comments and apologize for causing misunderstanding" as the remarks were not made in a dignified manner, Ishihara said.

But he made clear he had no intention of resigning, saying he wanted to fulfill his responsibilities as minister.

Ishihara said he will go to Fukushima to offer apologies there shortly after the current Diet session ends on Sunday.

He initially refused to retract them, as the remarks were made at an informal session with reporters, not at a formal news conference.

But he changed his stance under mounting pressure from opposition parties.

Following the joint action by the opposition parties in the upper house, they plan to submit a no-confidence motion against Ishihara to the House of Representatives on Friday.

Commenting on the censure motion on Thursday, Chief Cabinet Secretary Yoshihide Suga said at a press conference it will be rejected "without making a fuss."

Both motions are expected to be voted down as the two houses are controlled by the ruling Liberal Democratic Party and its coalition partner the New Komeito party.

Ishihara apologizes

June 23, 2014

Chastened Ishihara apologizes to Fukushima mayors, governor for 'money' remark

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201406230055>

THE ASAHI SHIMBUN

Embattled Environment Minister Nobuteru Ishihara visited Fukushima Prefecture on June 23 to personally apologize for suggesting last week that buying off locals will pave the way for securing a site to temporarily store radiation-contaminated soil.

Ishihara apologized to prefectural Governor Yuhei Sato and the mayors of Okuma and Futaba, both candidate locations for an intermediate storage facility.

"I would like to deeply apologize for my remarks," Ishihara told Okuma Mayor Toshitsuna Watanabe. "I have caused you much trouble."

Ishihara bowed deeply, together with Shinji Inoue, a senior vice minister, and Parliamentary Vice Minister Tomoko Ukishima, who joined the trip. The meeting was held at Okuma's temporary town hall, set up in Aizu-Wakamatsu.

"It's a fact that our townspeople were not pleased by your remarks, but I will deeply accept your apology you have made in person, in which you have taken responsibility," Watanabe said.

On June 16, Ishihara told reporters after a meeting to update Chief Cabinet Secretary Yoshihide Suga on the progress of selecting a site for temporary storage facilities of the soil contaminated in the Fukushima nuclear crisis, "In the end, it will come down to money."

The government has run into difficulties in finding candidate sites, as many residents near the prospective locations have not been persuaded to have such facilities erected in their hometowns.

Ishihara withdrew his statement three days later, but the controversy lingered, as his words left the impression that he believed only throwing enough money at residents in Fukushima Prefecture would resolve the issue.

"Ishihara's words failed to take into consideration the feelings that Fukushima residents have toward their homeland," Sato said on June 17.

The environment minister's statement is sure to cast a shadow over the decision-making by Fukushima residents in accepting the construction of the facility.

When asked about the effect of Ishihara's remarks on the securing of storage sites, Watanabe replied, "It has already been three years (since the nuclear accident) and further delays in the reconstruction process cannot be allowed."

Minister apologizes for remark on Fukushima nuclear soil storage

<http://mainichi.jp/english/english/newsselect/news/20140623p2g00m0dm027000c.html>

TOKYO (Kyodo) -- Environment Minister Nobuteru Ishihara apologized Monday for a remark suggesting the issue of where to store contaminated soil from the disaster-hit Fukushima Daiichi nuclear power plant was a matter of money.

Ishihara made the apology to Toshitsuna Watanabe, the mayor of the town of Okuma, Fukushima Prefecture, one of the candidate sites for the construction of temporary storage facilities for the waste.

On June 16, Ishihara told reporters that protracted negotiations between the central and local governments would ultimately be settled by the "monetary value" of accepting interim storage facilities, such as grants to local authorities hosting them.

He suggested that money would ultimately decide whether local authorities accept the central government's proposal for building facilities in the prefecture to store contaminated soil after the Fukushima Daiichi nuclear disaster.

Watanabe told Ishihara in Monday's meeting that many residents of the town were hurt by his remark but that the town would accept his apology, noting that the minister came to Fukushima Prefecture to apologize.

The meeting between the minister and the mayor was held in the city of Aizuwakamatsu in the same prefecture, where the town government has established a temporary municipal government office as residents remain evacuated since the Fukushima Daiichi disaster.

Later on Monday, Ishihara is scheduled to meet with the mayor of Futaba, Shiro Izawa, in the city of Iwaki, also in Fukushima Prefecture, and Fukushima Gov. Yuhei Sato in the prefectural government office in the prefectural capital Fukushima City. Futaba is another candidate site for the temporary storage facilities.

After Ishihara made the remark, Gov. Sato criticized the minister, saying his comments damaged residents' feelings about their hometowns.

Following the criticism, Ishihara apologized during a news conference Tuesday last week and retracted his comment during a session Thursday of the House of Councillors Environment Committee.

June 23, 2014(Mainichi Japan)

Minister apologizes for nuclear comment

http://www3.nhk.or.jp/nhkworld/english/news/20140623_32.html

Japan's Environment Minister has apologized to Fukushima officials for saying money will determine whether towns in the prefecture agree to store nuclear waste.

Nobuteru Ishihara retracted the comment at a Diet committee.

He was referring to the plan to build medium-term facilities for storing radioactive waste from the Fukushima Daiichi nuclear accident.

The government is awaiting approval from the towns of Okuma and Futaba to locate the facilities there.

Ishihara separately met with the mayors of Okuma and Futaba as well as Prefectural Governor Yuhei Sato on Monday.

In his meeting with Sato, the minister offered what he called a heartfelt apology to the people of

Fukushima. Ishihara said he deeply regretted his remark.

Governor Sato asked Ishihara to show compassion to residents and quickly respond to their additional requests concerning the building of facilities.

The government wants to obtain approval from the 2 towns and Fukushima prefecture for the construction of the facilities as soon as possible. It hopes to begin sending radioactive waste to facilities there starting in January.

Minister apologizes for nuclear storage comment

http://www3.nhk.or.jp/nhkworld/english/news/20140623_17.html

Japan's environment minister has apologized to a Fukushima mayor for saying money will determine whether towns in the prefecture agree to store nuclear waste.

Nobuteru Ishihara retracted the comment at a Diet committee.

He was referring to the plan to build medium-term facilities for storing radioactive waste from the Fukushima Daiichi nuclear accident.

The government is awaiting approval from the towns of Okuma and Futaba to locate the facilities there.

Ishihara met with Okuma Mayor Toshitsuna Watanabe on Monday. He said he had not meant to imply that money could resolve the issue.

The minister offered what he called a heartfelt apology to local residents. He said the facilities are essential to rebuilding the areas affected by the nuclear accident.

The mayor said the minister's remarks offended many people. But he accepted the apology, calling it a significant move to set things right, and he asked Ishihara to show compassion.

Jun. 23, 2014 - Updated 04:48 UTC

Ishihara to apologize for money comment

http://www3.nhk.or.jp/nhkworld/english/news/20140622_18.html

Japan's environment minister will visit Fukushima Prefecture to apologize for the controversial remarks he made about the planned construction of facilities to store contaminated soil.

Ishihara suggested last Monday that payments to local authorities would ultimately settle the issue of where to store the contaminated soil that accumulated after the nuclear accident in 2011.

He apologized and retracted the remarks during an Upper House committee session on Thursday.

Ishihara will visit Fukushima Prefecture on Monday to apologize to Governor Yuhei Sato and the mayors of Futaba and Okuma, the 2 towns where the government plans to build intermediate storage facilities.

Sato and other officials criticized Ishihara's comments, saying they ignored the feelings of the people of Fukushima.

The government is aiming to build the storage facilities with the agreement of the prefecture and the towns, and will start bringing in contaminated soil in January.

Can't afford to be against nukes

June 24, 2014

Pro-nuclear deputy mayor wins Rokkasho mayoral race

<http://mainichi.jp/english/english/newsselect/news/20140624p2a00m0na007000c.html>

ROKKASHO, Aomori -- The pro-nuclear deputy mayor won the mayoral election in this village on June 22, in a sweeping victory over opponents advocating against the nuclear fuel cycle program in the area.

The mayoral election was the first to be called in the village since the outbreak of the Fukushima No. 1 Nuclear Power Plant disaster in Fukushima Prefecture in March 2011.

Mamoru Toda, 67, won the mayoral race after garnering 95 percent of the vote -- or 5,144 votes -- with the backing of former Mayor Kenji Furukawa and all 18 members of the village assembly. Toda beat three other candidates who are opposed to the area's nuclear fuel cycle program, with the latter three gaining a mere 270 votes altogether. The voter turnout was 62.94 percent.

Behind the election results lies the fact that the nuclear fuel cycle program brings in massive amounts of subsidies and employment to the village. "If you are against the nuclear fuel cycle program, you won't make a living here," said one villager.

"The reason for my victory is that I advocated for coexistence, co-prosperity and promotion of the nuclear fuel cycle program, which won villagers' sympathy," Toda told reporters on the evening of June 22.

The Rokkasho Municipal Government and the Aomori Prefectural Government accepted to host the nuclear fuel cycle program in 1985. Japan Nuclear Fuel Ltd. began trial operations at a spent nuclear fuel reprocessing plant in 2004, but there are no prospects for the plant to be fully operational anytime soon. Up until fiscal 2011, the village had received some 42.3 billion yen in grants under the three power source development laws, after such subsidies fully started in fiscal 1988.

In the 1990s, a mayor called for freezing the nuclear fuel cycle program but the project went ahead regardless. Ryoichi Kimura, professor emeritus at Aomori Chuo Gakuin University, who was involved in the compilation of the village history of Rokkasho, said, "All these twists and turns have left only a handful of opponents (to the nuclear fuel cycle program)." In fact, the number of votes cast for candidates against the nuclear fuel cycle program stood at somewhere between 77 and 374 in the past five elections.

In a survey by the Mainichi Shimbun on June 22, which covered 100 voters at polling stations, 94 of them had voted for Toda. However, only 41 of them said they think the nuclear fuel cycle program is "safe."

A farmer who worked for Toda's camp confessed, "I'm actually opposed (to the nuclear fuel cycle program). It brings nothing good for us. But if we remain against it, we won't be able to make ends meet."

Keiko Kikukawa, 65, who ran in the mayoral race calling for a village without a nuclear fuel cycle program, pointed out the realities faced by the village. "Young people here either leave this village or work in nuclear power-related businesses."

Japan Nuclear Fuel Ltd. and its subsidiaries hire a total of some 5,600 employees in Aomori Prefecture. Many of them are believed to live in Rokkasho, exerting an overwhelming presence in the village that has less than 9,000 eligible voters.

June 24, 2014(Mainichi Japan)

TEPCO "returning to its former arrogant ways"

June 26, 2014

Source : Bloomberg

<http://www.bloomberg.com/news/2014-06-26/tepcu-faces-down-protest-to-press-ahead-with-atomic-restarts.html>

Tepco Faces Down Protest to Press Ahead With Atomic Restarts

By Jacob Adelman and Emi Urabe Jun 26, 2014 6:58 AM GMT+0200

Tokyo Electric Power Co. (9501) pledged to restart reactors at the world's largest atomic plant, rejecting a bid by anti-nuclear shareholders to scrap the units over safety concerns after the 2011 Fukushima disaster.

The company's annual general meeting voted down motions advanced by Greenpeace and other activist groups holding Tokyo Electric shares to decommission the reactors and to revise the company's recovery plan to exclude nuclear power.

The vote comes as Tokyo Electric, or Tepco, pursues a turnaround strategy that hinges on cutting fossil fuel costs by resuming two units at the Kashiwazaki-Kariwa nuclear plant in northwest Japan. Nuclear restarts anywhere in Japan are opposed by 59 percent of those who responded to a poll in March by the Asahi newspaper.

Tepco's board had recommended shareholders reject the measures, arguing the reactors provide an important source of baseload power without which the company can't meet customers' needs.

"We want shareholders to stand on our side, not the irresponsible company's side," Greenpeace campaigner Hisayo Takada said at a rally before the meeting, where activists held banners reading "No nuclear restarts!" and Tepco staff blocked entry to protesters in white-hooded protective coveralls and face masks.

Turnaround Plan

The proposals were among 10 motions advanced by the consortium of anti-nuclear groups calling itself the Nuclear Phaseout Tepco Shareholder's Movement. Others included the appointment of nuclear opponents to Tepco's board, a halt to the construction of two reactors at the Higashidori plant in northern Japan and the improvement of working conditions at nuclear stations. All were rejected.

Tepco won support from the government and its biggest lenders in January for its plan to recover financially from the Fukushima disaster, which assumes the restart of the Kashiwazaki-Kariwa units in Niigata prefecture.

Banks, insurance companies and investment firms own more than 70 percent of Tepco's shares, according to data compiled by Bloomberg. Those majority shareholders would be expected to resist any effort to keep Tepco's nuclear plants shut, since many have also lent the company money under the expectation of a restart, Tom O'Sullivan, the founder of Tokyo-based energy consultant Mathyos, said before the vote.

Bank Support

“There’s no way those guys are going to be voting for that,” he said. “The bank support is predicated on them restarting Kashiwazaki.”

Japan spent 27.4 trillion yen (\$269 billion) on fossil fuels in 2013, up 50 percent from 18.1 trillion yen the year before the Fukushima disaster, according to Trade Ministry data.

About 160,000 people were forced to evacuate because of radiation fallout after the Fukushima accident, leaving Tepco with billions of dollars in compensation and cleanup costs that brought it to the brink of insolvency.

Tepco returned to operating profit last fiscal year, following two years of losses, after raising electricity rates and putting off maintenance at some of its plants

All of Japan’s 48 operable commercial reactors are idled for safety assessments after the accident at the Fukushima plant. Tepco applied for safety checks required for the two restarts at the Kashiwazaki-Kariwa plant in September.

Japan’s Nuclear Regulation Authority said its inspections at the two units would be delayed due to the lack of qualified personnel, the Sankei newspaper reported this month.

Safety Fears

The Kashiwazaki-Kariwa reactors are among seven units that will never be restarted due to local opposition and safety fears, Raymond James & Associates said in a June 19 research note. The governor of Niigata prefecture, who has a say in whether the units can resume, has criticized Tepco’s safety record.

The only reactors likely to start this year are the two units at Kyushu Electric Power Co.’s Sendai plant in southern Japan, according to Raymond James. The NRA said in March that it would prioritize those units for safety checks.

The consortium of anti-nuclear groups at today’s meeting possessed more than the 300 shares needed to propose motions, according to Tepco’s meeting announcement.

Greenpeace holds the minimum number of shares to vote on proposals, spokeswoman Ai Kashiwagi said. That minimum is 100, Tepco spokeswoman Mayumi Yoshida said. Tepco had an average of 1.6 billion shares of common stock outstanding during the year ended March 31, according to its annual report.

The only item approved was the appointment of Tepco's 11 directors. Tepco said 2,150 shareholders attended the meeting, which lasted for 3 hours and 23 minutes, at the Tokyo International Forum. Last year's meeting saw 2,090 attendees.

Japan's utilities reject anti-nuclear demands from shareholders

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201406260062>

By KATSUHEI KAWAMURA/ Staff Writer

All nine electric power companies that operate nuclear plants rejected shareholders' proposals to close down the facilities, citing new safety measures and the need to quickly restart their reactors.

It was the first time anti-nuclear proposals were presented to all nine companies at their shareholders' meetings. Hokuriku Electric Power Co. had until now received no such request.

However, passing such changes requires support representing at least two-thirds of votes from shareholders who took part in the meetings. Large shareholders, such as banks, voted against the proposals.

The utilities all held their annual shareholders' meetings on June 26.

During Tokyo Electric Power Co.'s meeting in the Marunouchi district of the capital, Yui Kimura, 61, a leading member of the Nuclear Phase-out TEPCO Shareholders Movement, demanded the company appoint three well-known anti-nuclear experts as its directors.

"TEPCO is a company that is surviving with taxpayers' money," she said. "It is urgent for the firm to choose directors who can push through in-house reforms."

Kimura also noted that three years have passed since the accident at TEPCO's Fukushima No. 1 nuclear power plant.

"I suspect that TEPCO is returning to its former arrogant ways," she said.

The three names she submitted were: Shigeaki Koga, 58, a former industry ministry bureaucrat; Hiroyuki Kawai, 70, a lawyer representing plaintiffs seeking a nuclear-free Japan; and Tetsunari Iida, 55, director of the Institute for Sustainable Energy Policies.

“Those supporting the promotion of nuclear power generation have grown stronger by overcoming objections (to atomic energy) and by improving their systems (for nuclear power generation),” Koga said. “Anti-nuclear people will be unable to counter them unless they present new ideas, such as showing how economic conditions and livelihoods will improve through the promotion of renewable energies.”

TEPCO President Naomi Hirose said at the meeting that the utility is currently preparing to restart idled reactors at its Kashiwazaki-Kariwa nuclear power plant in Niigata Prefecture.

“We are promoting safety measures, such as construction of sea walls,” Hirose said.

Michiaki Uriu, president of Kyushu Electric Power Co., noted progress in the Nuclear Regulation Authority’s safety screening of two offline reactors at the Sendai nuclear power plant in Kagoshima Prefecture.

“We will make the utmost effort to pass the screening to restart the reactors as early as possible,” he said.

Hokkaido Electric Power Co. is facing financial difficulties due to the suspension of operations at its sole nuclear power plant.

“In the not-so-distant future, we will decide to apply for another hike in electricity bills,” said Katsuhiko Kawai, president of Hokkaido Electric.

TEPCO ignores some of its shareholders

June 26, 2014

Tepco shrugs off activist investors

Beleaguered utility swamped by anti-nuclear proposals at annual shareholders' meeting

by Kazuaki Nagata

Tokyo Electric Power Co. shot down a bevy of anti-nuclear policy proposals lobbed up by irate shareholders at its annual meeting Thursday in Tokyo and vowed instead to restart its idled reactors.

Some 2,150 shareholders attended the meeting in Chiyoda Ward.

Outside, anti-nuclear activists from Greenpeace held a rally, calling on Tepco to adequately compensate victims of the radiation leaked by its meltdown-hit Fukushima No. 1 plant and phase out nuclear energy. Decked out in radiation suits and masks, they held aloft signs that read, "Pay victims, no restart."

Some shareholders proposed that Tepco abandon nuclear power.

One urged Tepco to revise its 10-year business plan, approved in January, to eliminate reactor restarts.

He also questioned the value of restarting reactors 6 and 7 at the Kashiwazaki-Kariwa plant in Niigata Prefecture, which is a critical part of the utility's plans.

"Restarting the two reactors will only add just 2.71 million kw of power. . . . Our firm had more than 59 million kw of capacity at the peak of last summer and was able to easily provide power without nuclear power," the shareholder said.

He called on the utility to turn to energy-efficient, state-of-the-art thermal power plants, which release less carbon dioxide.

Citing the number of faults running under it, another shareholder urged Tepco to shutter the giant Kashiwazaki-Kariwa plant.

Other proposals included halting construction of the Higashidori plant in Aomori Prefecture, to be jointly operated with Tohoku Electric, and ending investment in Japan Nuclear Fuel Ltd., which runs a reprocessing plant in Aomori.

But these proposals were all rejected at the meeting.

Individual shareholders also spoke up for anti-nuclear policies during the question-and-answer session.

"Why doesn't Tepco management flat out say that nuclear power won't make a profit," said one shareholder. "I am really wondering about that. Everyone knows that Tepco has gone down because of nuclear power . . . so it won't do any good to the company if it keeps relying on nuclear power."

Tepco President Naomi Hirose said the utility's mission is to provide a stable power supply to customers as cheaply as possible. Without nuclear power, the utility has to rely on thermal power, which pushes up electricity prices due to the increasing costs of importing fuel to run the plants.

None of Japan's 48 commercial reactors has passed the review needed to restart operations in the wake of the Fukushima accident. All remain offline.

Power companies hold shareholders' meetings

http://www3.nhk.or.jp/nhkworld/english/news/20140626_35.html

Proposals to scrap nuclear reactors have been rejected at shareholders meetings of 9 major power companies in Japan.

The firms held the annual meetings on Thursday.

Shareholders of Tokyo Electric Power Company, or TEPCO, said it's responsible for the Fukushima nuclear accident, and that restarting reactors that are now offline is outrageous. Shareholders also proposed scrapping nuclear reactors.

TEPCO executives responded that nuclear power is an important part of the nation's basic energy plan.

At the meeting of Kyushu Electric Power Company, shareholders proposed scrapping reactors at the Sendai plant in Kagoshima.

Japan's Nuclear Regulation Authority has prioritized a safety screening process for the plant.

Kyushu Electric executives said the company will do its best to improve the plant's safety, and focus on passing the screening.

Shareholders of Kansai Electric Power Company submitted proposals to scrap all of its nuclear plants.

A local district court last month ordered Kansai Electric not to resume operations of two reactors, citing a lack of safety measures.

Jun. 26, 2014 - Updated 09:30 UTC

TEPCO shareholders reject anti-nuclear proposals

http://www3.nhk.or.jp/nhkworld/english/news/20140626_32.html

The operator of the crippled Fukushima Daiichi nuclear power plant has apologized to shareholders about problems involving radioactive wastewater there.

More than 2,100 shareholders of the Tokyo Electric Power Company, or TEPCO, attended their annual meeting in Tokyo on Thursday.

Chairman Fumio Sudo said competition in the electric power industry will become fierce as reform of its structure proceeds. Sudo said the firm will work to fulfill its responsibility to pay damages caused by the nuclear accident at the plant, decommissioning reactors there, and rebuilding Fukushima Prefecture. He said to do this, the company aims to improve its corporate value by drastically changing its management style and business models.

President Naomi Hirose apologized to the people of Fukushima and large parts of society for causing trouble and anxiety over the contaminated water problems.

Some shareholders said it's outrageous that the company responsible for the accident aims to restart reactors that are offline. Others said the firm must not make the same mistake at the Kashiwazaki-Kariwa nuclear plant in Niigata Prefecture.

TEPCO executives responded that nuclear power is an important part of the nation's basic energy plan.

The meeting rejected all 10 proposals by shareholders including those calling for abolishing the

Kashiwazaki-Kariwa and Fukushima Daini nuclear power plants. All proposals submitted by TEPCO's management were approved.

Nuclear renaissance ignores risks and public opposition

June 28, 2014

Abe's nuclear renaissance ignores stiff opposition

<http://www.japantimes.co.jp/opinion/2014/06/28/commentary/abes-nuclear-renaissance-ignores-stiff-opposition/#.U68FGbHi91s>

by Jeff Kingston
Special To The Japan Times

Prime Minister Shinzo Abe's nuclear renaissance involves downplaying risks, restarting reactors, building new ones, and exporting reactor technology and equipment. A number of hurdles remain before he can rev up the reactors, but the summer of 2014 will probably be Japan's last nuclear-free one for decades to come.

On April 11, 2014, Abe's Cabinet approved a new national energy strategy that embraces nuclear power. This is not surprising given that Abe has vigorously promoted bringing idled reactors back online and is pitchman-in-chief for exports of nuclear technology and equipment. The new plan also opens the door to new reactor construction.

Abe's nuclear renaissance has become complicated, however, following the revelation in May 2014 that the government and the Tokyo Electric Power Co. had been hiding the fact that almost all workers and managers at the Fukushima No. 1 nuclear plant bolted the scene and abandoned their posts on the morning of March 15, 2011, as the crisis seemed to be spiraling out of control. Instead of remaining on the plant site as ordered, most workers fled to the Fukushima No. 2 nuclear plant 10 km to the south. While such actions are understandable, the mass exodus raises the question of whether nuclear reactors can be operated safely if those responsible for conducting emergency operations cannot be relied on to carry out their duties.

Doubts about the Nuclear Regulatory Authority's safety reviews are also gathering as the shambolic decommissioning operations at Fukushima undermine its credibility. Why did the NRA allow Tepco to cut corners and compromise safety, leading to extensive radioactive contamination of groundwater now seeping into the ocean? Reports of problems with malfunctioning decontamination equipment, leaky

storage tanks for contaminated water and worker error are emblematic of the endless bungling. Why is Tepco, an exceptionally incompetent institution, being entrusted with such a crucial task?

The NRA's failure to adequately monitor the cleanup raises questions about whether it has the capacity to oversee strict enforcement of new safety guidelines and institutionalize a culture of safety.

"We are not assuming that an accident the operator cannot control will take place," NRA Chairman Tanaka explains, justifying reliance on the nuclear plant operator to manage a nuclear accident. In light of revelations, however, that is not a reassuring assumption.

The prospects for restarts got a shot in the arm when Abe nominated a pronuclear advocate with financial ties to the nuclear industry to become an NRA commissioner. This blatant political meddling damages the already threadbare credibility of the safety review process.

Evacuation zones have been expanded from a 10-km to a 30-km radius around nuclear plants, involving millions more residents and exponentially increasing logistical difficulties, but local authorities and utilities remain woefully unprepared. A March 2014 survey found that authorities in only six of the 16 nuclear plant evacuation zones have prepared the required evacuation plans. Are these existing evacuation plans plausible in a crisis or just paper exercises enabling hosting communities to check off the requisite box?

Chubu Electric simulated an evacuation of the 860,000 residents living within 30 km of the Hamaoka plant that revealed how difficult this would be in an actual emergency, taking so much time in traffic jams (from 32 to 46 hours) that those fleeing an accident would be subject to significant radiation exposure. Simulations conducted in Shimane and Kyushu reported similar snafus.

The evacuation preparedness problem won't go away and an improvised exodus means mayhem. **It is therefore alarming that none of the clusters of towns in any of the designated evacuation zones around the nation's nuclear plants has conducted a live evacuation drill.**

The NRA is reviewing applications to restart 19 nuclear reactors.

The safety screenings involve confirming that they meet new stricter safety standards, but Niigata Gov. Hirohiko Izumida warns that this doesn't mean they are safe to operate. He points out that local authorities are not able to cope with cascading simultaneous disasters as occurred in 2011, a risk the new guidelines do not address.

Perhaps this explains why **a recent Asahi poll finds continued high public opposition to nuclear energy: 77 percent of respondents favor phasing out nuclear energy, while only 14 percent oppose such a policy.**

Are the potential dangers of hosting a reactor an acceptable risk given the alternative of economic decline and depopulation? Many communities in remote coastal areas where Japan's fleet of reactors are sited are grappling with this calculus. Until now the Aomori Prefecture fishing port of Oma has been famous for its bluefin tuna catches, but that is changing due to the town's decision to host a nuclear power plant. Just across the Tsugaru Strait from Oma, the city of Hakodate, Hokkaido, filed a lawsuit earlier this year against the central government and the utility to block construction of the Oma mixed-oxide fuel (MOX) reactor. This is the first lawsuit in Japan of its kind in which a local government is the plaintiff seeking an injunction against building a nuclear plant. The two towns are separated by about 23 km of water, meaning that part of Hakodate, which has a population of 275,000, falls within the newly extended 30-km evacuation zone. The mayor of Hakodate complains that he is being asked to prepare an evacuation plan without adequate information and asserts that the lessons of Fukushima are being ignored as government support for nuclear energy does not include adequate assistance for disaster management, outsourcing it to local communities that lack sufficient capacity.

The possibility of legal entanglements casts a shadow over Abe's nuclear renaissance as local governments and citizens groups mount challenges that could delay restarts and new plant construction. Indeed, in May 2014, the Fukui district court ruled against Kansai Electric Power Co. (Kepco) in a lawsuit filed by citizens who oppose the restart of the utility's Oi reactors. The judge rejected Kepco's claims that the reactors could be operated safely and asserted that the intrinsic dangers of nuclear reactors combined with the unpredictability of earthquakes endanger the fundamental constitutional rights of citizens.

This establishes a precedent that could influence 16 similar cases in the judicial pipeline, but Kepco is appealing the ruling and Abe's spokesperson shrugged it off, insisting that it would have no influence on safety evaluations. His aplomb is understandable as Japan's higher courts are reliably submissive in nuclear energy lawsuits.

Maybe this is why the government rules out a national referendum on nuclear energy because citizens are not so predictably compliant and oppose the vested interests Abe represents

Collection of testimonies for future generations

June 29, 2014

Fukushima evacuee collects memories of those who can never return

http://ajw.asahi.com/article/0311disaster/life_and_death/AJ201406290007

Hidenori Konno, second from right, shows his collection of testimonies on April 9 in Motomiya, Fukushima Prefecture. They were provided by some of those who were forced to flee their homes due to the March 2011 accident at the Fukushima No. 1 nuclear power plant. The other four people are, from right, Yoshimi Saito, Kazuko Konno, Yoichi Konno and Taka Saito. (Mikio Kano)

By MIKIO KANO/ Staff Writer

MOTOMIYA, Fukushima Prefecture--A retired social welfare official who was forced to flee his home in the Tsushima district of the town of Namie after the accident at the Fukushima No. 1 nuclear power plant has found a new mission in life, to record the thoughts of those who once lived there and knew it in happier times.

Hidenori Konno, 66, who lived in the peaceful rural area northwest of the plant, can never return to his hometown because the area is designated a difficult-to-return zone by the government.

After the nuclear accident, triggered by the March 2011 Great East Japan Earthquake and tsunami, Konno, a former official of the Fukushima Ward Council on Social Welfare, evacuated to Motomiya, also in Fukushima Prefecture, where he now lives. It was there that he came up with the idea.

“Though there is no prospect for returning, I wanted to preserve the memories of the people who lived there (for future generations).” So he began to visit elderly people in May 2013 to interview them.

He compiled his “collection of testimonies” by interviewing 16 former residents of the area, all of them aged 70 years or older. That collection eventually became a book titled, “3/11 Aru Hisaichi no Kiroku” (March 11, Records of one affected area).

The Tsushima district is located in a mountainous area about 20 to 30 kilometers from the plant. At the time of the nuclear accident, a total of 1,459 people lived there.

The people there made their living by cultivating fruit such as apples and pears, raising domestic livestock and growing rice. Even if they did not lay pipes for tap water, they were able to secure water through digging wells.

The residents also harvested wild vegetables in the mountains. During the rice-planting season, they practiced the time-honored tradition of “Tae-odori” (the rice-planting dance), passed on by their forefathers.

The people of Tsushima were close to nature, and the bond among those who lived in the area was strong. In compiling his collection, Konno visited not only evacuees living in Fukushima but also those who moved to other prefectures such as Saitama and Ibaraki.

Many of the farmers in the Tsushima district were returnees forced to flee Manchuria at the end of World War II. Japan ruled the area in northeastern China from the early 1930s to 1945. In Manchuria, many were engaged in agriculture despite the extremely cold weather. After the war, they settled in the Tsushima district and engaged in farming once again where they also suffered poor living conditions. Konno included that history in his collection, as well.

DAIRY FARMER FORCED TO KILL CATTLE

The book also describes the degree of suffering that interviewees were forced to endure as a result of the nuclear accident. For example, one dairy farmer was forced to kill his cows because there was no one who

would take care of them. Another man said that he moved from one evacuation center to another seven times with his wife who was wheelchair bound. She had lost her leg in an agricultural accident involving machinery.

However, all of the 16 evacuees had a strong desire to someday return to live in their homes in the district.

One was Yoichi Konno, 73, who has suffered from a kidney disease for more than 30 years. Because of his illness, he was unable to properly work. Therefore, he often spent his time at his hobby--gardening. He also built five fish ponds where he kept carp, goldfish and rainbow trout, which his neighbors enjoyed.

Since the nuclear accident, he has returned to his house several times when allowed to do so. His fish ponds now lie empty. The birds have since eaten all of his fish.

Before the nuclear accident, he also received dialysis treatment three times a week. Immediately after the disaster, however, due to crowded conditions at hospitals that provided the service, he could only get treatment twice a week. The time per treatment was also reduced by one hour. Due to the decrease in his treatments, his health took a turn for the worse. One time at his eldest daughter's house in Sukagawa, Fukushima Prefecture, where he lived at the time, he was so sick that an ambulance was called to take him to hospital.

At present, he is living with his wife, Kazuko, 69, in a temporary housing facility in Nihonmatsu, also in the prefecture. Sometime this summer, they will move to a new house that is being built next to their eldest daughter's house.

Still, Yoichi Konno says, "The scenery (of the Tsushima district) from the land I was born in remains fixed in my head. I want to live there again, even if the radiation levels remain high."

SUFFERING FROM CANCER

Meanwhile, farmer Yoshimi Saito and his wife, Taka, both 83, have been living in a temporary housing facility in Nihonmatsu since September 2011. The facility is the fifth one they have lived in since they evacuated.

Before the nuclear accident, Yoshimi was healthy and had never been hospitalized. However, it was while he was moving from evacuation center to evacuation center that doctors discovered he was suffering from prostate cancer.

Their children proposed they move in with one of them. However, Taka said with a sigh, “We have much baggage. In addition, my husband is suffering from a disease. It is hard to move again.”

Yoshimi also said, “I don’t know whether I can return (to the Tsushima district) while I am alive. But I hope that people from my grandchildren’s generation will be able to return someday.”

More evacuees getting new homes

http://www3.nhk.or.jp/nhkworld/english/news/20140626_05.html

An NHK survey suggests that more and more evacuees are settling down permanently away from their hometowns over 3 years after the nuclear accident at the Fukushima Daiichi plant.

Residents of evacuation zones are entitled to tax reductions if they acquire a new house or land while they have to live elsewhere.

NHK has learned that the tax reduction was given to nearly 1,400 applicants during the fiscal year that ended in March.

That was more than twice the number of cases in the previous year.

About 17,500 households were registered in the high-radiation evacuation zones as of April.

Can mangas avoid politics?

June 29, 2014

Comic books champion debate on Fukushima disaster

Cartoonists broach sensitive topics ignored by media but avoid politics

<http://www.japantimes.co.jp/news/2014/06/29/national/social-issues/comic-books-champion-debate-fukushima-disaster/#.U7ENqrHi91s>

by Elaine Lies
Reuters

Farmers in Fukushima try to convince skeptical visitors that their crops are safe from radiation. Blood trickles from the nose of a reporter who visits the area.

These are two story lines found in manga — those ubiquitous comics for adults and teens — that have taken up Fukushima on an unprecedented scale even as Japanese film largely avoids the topic.

“Ichi Efu,” which centers on workers at the Fukushima No. 1 nuclear plant, has sold 170,000 copies in book form in nearly two months, a rare success for a debut manga. Another comic book set off a furor that sparked angry responses from the government, including Prime Minister Shinzo Abe.

As the world’s worst nuclear accident in 25 years fades from the public spotlight in Japan, publishers say they hope manga will spark debate about uncomfortable topics such as the health impact of the accident, which released radiation over a wide swath of the northeast.

In contrast to the more than 30 manga published since the disaster, there has been only one mass-market film to date on Fukushima — “Homeland,” released in March. Its director was careful to emphasize the human story over any political statements during publicity tours.

The nuclear disaster, set off by a tsunami that tore through the poorly protected Fukushima No. 1 plant and touched off meltdowns, remains a sensitive subject in Japan, especially since roughly 150,000 people still remain in temporary housing and may never go home again.

“Movies take a lot of money and backers tend to flinch away from this topic. . . . Manga are a lot more independent and can go where even news programs might hesitate,” said Kenichiro Shinohara, an editor at popular “Morning,” the manga weekly in which “Ichi Efu” is also published.

There are several hundred manga published each year, ranging from cute to violent and pornographic, in magazine and book form. Most are pure entertainment, but others take up samurai-era history, business strategy or World War II — most notably “Barefoot Gen,” a popular manga about the atomic bombing of Hiroshima that stirred a censorship controversy last year.

The popular media form — more than 10 million copies of manga magazines are sold annually — is afforded unrivaled freedom. This month, a law was passed to ban the possession of child pornography, but

pornographic manga featuring children was excluded after publishers and opposition lawmakers said it could limit free speech.

Fukushima manga run the gamut from “Sobamon,” which promotes the safety of Fukushima produce, to the overtly anti-nuclear “Fighting the Nuclear Demon.” At least one is set in the future.

“Manga are easier to follow than serious journalism or reportage, and of course there is some entertainment value, which makes them easier to pick up,” said Kazuma Yoshimura, head of the Manga Research Center at Kyoto’s Seika University.

“Most disasters have an end point, but the nuclear problem is ongoing. The special aspects of manga, like looking toward the future and fiction, allow tackling the subject on a different level.”

Though manga began trickling out shortly after the disaster took place, it was not until April that most of the nation became aware of them, thanks to a food-related title called “Oishinbo” (The Gourmet) and a series on Fukushima food safety.

In it, several characters suffered nosebleeds they blamed on radiation exposure — a situation that medical experts say is highly unlikely but something they have not ruled out. The manga also said the area would be unlivable for years.

This unleashed a flood of angry comments from Fukushima residents to Abe and other Cabinet ministers, who called for people to use “correct” information, in turn setting off discussions about free speech and government cover-ups.

“Of course manga are written so they’re easy to understand in one glance, which does make it possible for things to be taken wrong and rumors to be born,” Yoshimura said.

The editor of the manga apologized for some of the wording choices but remained unrepentant about running it, citing fading interest in Fukushima and the need for more discussion about the issue.

“In addition, people still aren’t really settled in what they think about Fukushima,” said Kaoru Endo, a sociology professor at Tokyo’s Gakushuin University. “They remain uneasy because they feel that . . . a lot hasn’t yet been revealed.”

· Among the most talked about is “Ichi Efu,” which is drawn by Kazuto Tatsuta (a pseudonym), who worked in the plant himself for roughly a year.

The manga, whose title is the insiders' name for the plant, is drawn in realistic detail and details the life of the workers. It touches on shady hiring practices, the trials of working in anti-radiation gear and getting an itchy nose or needing to use the toilet.

Shinohara, the "Morning" magazine editor, said they took care to ensure the manga did not stray into any sort of political stance. Even so, some other magazines have refused to run advertisements for "Ichi Efu."

"A lot of people have said that it lacks drama, but I think that just showing life at the plant is scary enough — by showing that this kind of workplace has gone on long enough to be normal," he said. "Having somebody collapse is kind of cliché."

Feed-in-tariff risks and drawbacks

June 30, 2014

Editorial: Gov't should adjust proliferation of feed-in-tariff system, burden on consumers

<http://mainichi.jp/english/english/perspectives/news/20140630p2a00m0na013000c.html>

The Economy, Trade and Industry Ministry has come under pressure to achieve a balance between the proliferation of renewable energy and the burden on consumers as the ministry is set to review the so-called feed-in-tariff (FIT) system, under which power companies are required to buy electricity generated by such energy at fixed prices.

The ministry has decided to review the FIT system amid growing concerns that the scheme could cause electric power charges to rise and dampen the economy. How to achieve a balance between expanding the use of renewable energy and limiting the financial burden on consumers needs to be addressed to end Japan's reliance on nuclear power.

The ministry's panel of experts is expected to draw up specific measures to reform the FIT system by the end of this year.

The FIT system was introduced in July 2012 by the previous government led by the Democratic Party of Japan (DPJ), which aimed to end Japan's reliance on atomic power after reflecting on the Fukushima nuclear crisis. Under the system, electric power companies are required to purchase electric power from the operators of solar and wind power generators and other power generation systems using renewable energy at prices fixed by the government. Its costs are passed on to consumers by adding the expenses to electricity charges.

The additional financial burden of the FIT on an average household in Japan comes to 225 yen per month this fiscal year, about 2.6 times that in fiscal 2012. The higher the ratio of renewable energy is, the greater the financial burden that consumers are required to bear. The extra burden is already a serious social problem in advanced countries in terms of renewable energy. In Germany where the average monthly burden of renewable energy on households has amounted to 2,400 yen per month, the country's Parliament is deliberating on bills that would narrow the scope of power generators subject to the FIT system. This move is feared to hinder the spread of renewable energy.

The prices at which utilities are required to buy power generated with renewable energy sources in Japan are subject to review every year because the costs of generating power using such energy are declining with the advancement of relevant technologies. Still, power companies that have been given special certification from the government are allowed to maintain the prices at which they sell green power to major utilities for 10 to 20 years under the system, which is aimed at encouraging newcomers. However, the system has also encouraged unfair companies that receive special certification from the authorities to launch renewable energy businesses after the costs have declined considerably to earn marginal gains.

The combined power generation capacity of companies that have been specially certified by the government from the time of the introduction of the FIT system until the end of March this year surpassed 68 million kilowatts, far above some 20 million kilowatts prior to the introduction of the system. Still, the actual amount of power that these companies are currently generating is only 13 percent of their capacity. In particular, only 10 percent of their planned solar power generation systems -- whose capacity accounts for over 90 percent of their total capacity -- are actually in operation.

The Economy, Trade and Industry Ministry has begun to revoke its certificates of companies as solar power generators that have not begun generating power as planned. However, the ministry should reform the system into a stricter one to prevent such unfair practices.

Another problem is that an overwhelming majority of businesses specially certified by the government are those who generate power with solar power systems. Few operators of wind power generators and geothermal power generators have applied for such certification. This is despite the fact that wind power has been widely viewed as a promising renewable energy source and that Japan has the third largest amount of geothermal energy sources in the world. It is necessary to ensure that electricity from wind power generators across the country is used in extensive areas to disperse risks because their generation

capacity largely depends on weather. It is also essential to prevent the construction of geothermal power stations from adversely affecting the environment and hot spa owners.

The government needs to tackle these tasks that cannot be settled with money to expand the use of renewable energy while gaining public consent.

Gov't calls for energy savings this summer

June 30, 2014

Calls for energy savings as Japan braces for first summer with no running nuke plants

<http://mainichi.jp/english/english/newsselect/news/20140630p2a00m0na010000c.html>

The Japanese government is calling for energy savings to begin from July 1, as the nation faces its first summer since the 2011 Fukushima disaster with no running nuclear plants.

Particularly in regions under the jurisdiction of the Kansai Electric Power Co. and Kyushu Electric Power Co., which both relied heavily on nuclear power prior to the disaster, there is the possibility of energy supplies becoming stretched. Still, the government has, like last year, avoided setting numerical goals.

The energy-saving period covers the time frame from 9 a.m. to 8 p.m. for the whole of the country except for Okinawa Prefecture and runs until Sept. 30, excluding weekends and the period from Aug. 13 through Aug. 15. The government is calling for simple energy reduction measures like setting air conditioners to 28 degrees Celsius or higher.

This summer will be the fourth one in a row where the government is calling for energy saving efforts. The three summers so far have passed without major incident, and with the government pushing a policy of restarting the country's nuclear reactors, this summer's energy performance will come under scrutiny.

According to government estimates put together in April, the highest potential energy demand this August will be about 166.66 million kilowatts, while the highest potential energy supply will be about 174.34 million kilowatts, which would give a safety margin of around 4.6 percent, higher than the minimum desired margin of 3 percent.

However, while the August safety margin for eastern Japan is estimated at 6.1 percent, it is only 3.4 percent for western Japan, and that would be after borrowing power from the east. In September last year, the No. 3 and No. 4 reactors at Kansai Electric's Oi Nuclear Power Plant in Fukui Prefecture were shut down for inspection and remain offline, which has created the tight situation in western Japan.

Some 80 percent of the power supply this summer will come from thermal power plants. Around 20 percent of these thermal plants have been in operation for 40 years or longer, so they carry the risk of malfunction. Furthermore, according to the Japan Meteorological Agency, there is a possibility that a powerful high-pressure zone over the Pacific Ocean will cause higher than average temperatures in western Japan in August. Both equipment failures and extreme temperatures could potentially cause power shortages.

In its estimates for this summer, the government assumed a severe scenario with hot temperatures like in 2010 -- or 2013 for the regions supplied by Chubu, Kansai and Kyushu Electric Power -- and low generation from solar and hydroelectric sources. The government began creating such estimates in the summer of 2011 after the Fukushima nuclear plant disaster, and so far most of the estimates of power supply margins have ended up lower than what actually occurred.

The minimum power supply margin of 3 percent is to protect against momentary rises in demand that are estimated to go as high as 3 percent. During extremely high temperatures, margins of 7 to 8 percent are desired. When the margin is expected to fall beneath 3 percent, calls for power savings are issued and power companies borrow power from each other. When the margin falls within 1 percent, rolling blackouts are initiated.

More on new NRA commissioner

July 5, 2014

New nuclear watchdog commissioner received additional industry payment

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201407050057

By SATOSHI OTANI/ Staff Writer

An incoming commissioner of the Nuclear Regulation Authority received payments from the nuclear industry until last month, raising fresh doubts about his impartiality at the nuclear watchdog, The Asahi Shimbun has found.

Satoru Tanaka, a professor of nuclear engineering at the University of Tokyo, received the unknown amount of money from Japan Nuclear Fuel Ltd., operator of a nuclear fuel recycling program, and Mitsubishi FBR Systems Inc., a nuclear plant maker.

Tanaka, 64, sat on the “advisory committee” of Tokyo-based Mitsubishi FBR Systems between July 2007 and June this year, according to university records obtained by The Asahi Shimbun through the information disclosure law.

He also chaired the panel for evaluating vitrification technology at Japan Nuclear Fuel in Rokkasho, Aomori Prefecture, from May 2009 to March this year.

Tanaka was nominated for the NRA post by the Abe administration in May.

Under the guidelines for nominating NRA commissioners, candidates who received more than 500,000 yen (\$4,900) a year from the nuclear industry within three years are disqualified.

But it is not clear how much Tanaka received from the two companies because the payment entries were blackened out in the university records.

He also did not declare the payment in his report on his association with the nuclear industry that was submitted to the NRA in April, when he became a member of an NRA special committee.

“Since I am now a counselor of the NRA, I am not in a position to talk about the matter,” Tanaka told The Asahi Shimbun.

Both Japan Nuclear Fuel and Mitsubishi FBR Systems also declined to give details about the payment.

Tanaka resigned from the post at Mitsubishi FBR Systems in June, when both Diet chambers approved his nomination as NRA commissioner. He will assume the post in September.

The NRA oversees both Japan Nuclear Fuel, which reprocesses and disposes of spent nuclear fuel, and Mitsubishi FBR Systems, which is developing a fast-breeder nuclear reactor.

The nomination of Tanaka came under fire from critics of nuclear power generation. Both the ruling and opposition camps widely perceive him as a “resident” of the “nuclear village.”

Tanaka, a former president of the Atomic Energy Society of Japan, was also a director of Japan Atomic Industrial Forum, a nuclear industry group, between fiscal 2010 and 2012.

He continued to take a pro-nuclear stance after the Fukushima nuclear disaster unfolded in March 2011. The NRA was established in September 2012 to impose stricter safety standards for nuclear reactors and to help end the cozy relations between the industry and politicians that could compromise safety.

Earlier, Tanaka was found to have received a total of 5.1 million yen in research donations from nuclear power-related companies between fiscal 2006 and fiscal 2011.

He also received more than 500,000 yen from a foundation linked to Tokyo Electric Power Co., operator of the crippled Fukushima No.1 nuclear power plant, in fiscal 2011.

Toyoshi Fuketa, one of the NRA commissioners, reported to the watchdog that he was paid about 460,000 yen by Japan Atomic Power Co., a nuclear power plant operator, for giving lectures and producing texts over three years between fiscal 2009 and 2011.

The former administration led by the Democratic Party of Japan compiled the guidelines for nominating NRA commissioners to ensure impartiality and transparency of NRA safety inspections. The guidelines require disclosure of the amount of donations provided by nuclear power plant operators.

They also dictate that an individual who has served as a director or worked for a nuclear power plant operator within three years of assuming the NRA post is not eligible.

But the current government led by the Liberal Democratic Party apparently has little regard for the guidelines.

“We do not refer to the guidelines set by the DPJ,” Environment Minister Nobuteru Ishihara told the Lower House Environment Committee session in June.

He also said the LDP-led government has no plans to produce new guidelines.

New from the Asahi Shimbun : The Yoshida Testimony

The Yoshida Testimony

The Fukushima accident as told by plant manager Maso Yoshida

http://www.asahi.com/special/yoshida_report/en/

Prologue

The Asahi Shimbun has recently obtained a copy of the transcripts of testimony given before a government investigation panel by Masao Yoshida, who served as general manager of the Fukushima No. 1 nuclear power plant when it succumbed to a Level 7 disaster, the highest on the International Nuclear Events Scale, following the Great East Japan Earthquake and tsunami of March 11, 2011.

The document remains the only available official transcript of the testimony by Yoshida, the on-site commander of efforts to bring the situation under control, who died in July 2013 without having disclosed much to media organizations about the accident at the plant, operated by Tokyo Electric Power Co.

The transcript, not to be released publicly at Yoshida's request, was gathering dust in government offices.

28 hours, 400 pages

The Yoshida testimony report comprises seven parts and contains about 500,000 characters in total. It is printed on more than 400 pages of A4-size paper.

Eleven of the 13 interview sessions with Yoshida were conducted at a Japan Football Association Academy meeting room at the J-Village soccer training facility, 20 kilometers south of the Fukushima No. 1 nuclear plant. The remaining two sessions took place in a quake-proof control center building, Yoshida's workplace, at the Fukushima No. 1 plant.

The government's Investigation Committee on the Accident at the Fukushima Nuclear Power Stations of Tokyo Electric Power Co. interviewed 772 individuals over a total of 1,479 hours. The Yoshida testimony was compiled during that process.

While an interviewee was only questioned for slightly less than two hours on average, Yoshida was interviewed for more than 28 hours, and was asked to respond on how he acted and what he thought at decisive moments. Yotaro Hatamura, chairman of the investigation panel, called the Yoshida testimony "invaluable historic material" because it is Yoshida's only available official transcript.

Anger, Angst, Sense

In the Yoshida testimony, he is not only telling his side of the story.

“Our objective is to build a pool of knowledge that posterity can draw on,” said one member of the government investigation panel in opening the questioning. “We do not aim at pursuing responsibility.”

But the interviews were far from lenient, because prosecutors on loan to the investigation panel secretariat were leading the questioning of Yoshida. The questioning report reproduces the slightest of speech nuances.

The text of the report also shows Yoshida’s seriousness in attending the interviews.

One passage in the report shows Yoshida struggling to come to terms with a painful memory, saying, “I have the hardest time remembering this part.”

Other passages show him furious, as he referred to Masataka Shimizu, president of TEPCO at the time of the disaster, as “that gentleman” and also referred to Naoto Kan, prime minister at the time, or Haruki Madarame, chairman of the now-defunct Nuclear Safety Commission of Japan, (NSC) as “that guy.”

The emotionally open nature of his responses throughout the report indicates that, as a whole, Yoshida was recounting how he really thought and felt.

Yoshida tried to make sure he was distinguishing facts from his feelings and thoughts. He also apparently tried to distinguish what he believed when the disaster began from what he later came to believe as more information became available.

Multiple disaster of unprecedented scale

The Fukushima nuclear disaster, which involved more than one reactor stricken simultaneously, was a multiple disaster that humankind had never experienced.

The No. 1 reactor, where the suspension of water injection for cooling the core was overlooked, was the first to succumb to a hydrogen explosion on the afternoon of March 12, 2011, the day after the quake and

tsunami. Water injection efforts subsequently failed in the No. 3 reactor, which exploded on the morning of March 14. That made it impossible to suppress pressure in the No. 2 reactor's containment vessel, which spewed radioactive substances onto land areas on March 15 at higher levels than at any other time during the Fukushima nuclear crisis.

The No. 4 reactor also exploded on March 15, raising concerns about a potential loss of water from its storage pool for nuclear fuel. A loss of water could have spewed even more radioactive substances.

An audio recording clip from TEPCO's teleconferencing system shows communications exchanges when the No. 3 reactor exploded.

00:00/00:00

Were lessons learned?

Unfortunately, the government investigation panel's final report failed to discuss and review the actions and judgments made by individuals who were leading concerned organizations at the time--the prime minister, industry minister, director-general of the now-defunct Nuclear and Industrial Safety Agency, chairman of the NSC, president of TEPCO and general manager of the Fukushima No. 1 nuclear plant, although it is up to people to stop nuclear plants from running amok and up to people to save residents from nuclear damage.

Although the panel interviewed as many as 772 individuals involved, it failed to dig deep into essential aspects of the disaster because it made it a stated policy that it would not pursue the responsibility of individuals.

It is not too much to say that the government and power utilities are eagerly working toward preparing for restarts of nuclear reactors by adding height to seawalls, installing filter vents and reinforcing other facility components because the government investigation panel limited its analysis and reviews only to phenomenal aspects of the tragedy.

Voices of those who fought the unprecedented nuclear disaster should be engraved in history. History is humankind's common property.

"I would like you to attend our hearing in the understanding that what you are going to tell us could be published almost in their original form," a member of the government investigation panel told Yoshida during the first interview session. The Asahi Shimbun notes that Yoshida replied promptly, "That is OK."

The government later released a written request by Yoshida that his interviews not be publicly disclosed.

Reports in nine installments

This is an English translation of serial feature stories on the Yoshida testimony report that began running online on The Asahi Shimbun Digital on May 20.

The series focuses on the part of human action and judgments, which the government investigation panel questioned Yoshida about but seldom mentioned in its report, and addresses three issues: who is there to halt nuclear reactors; if residents can be evacuated; and if humans can stop a crisis.

In analyzing and reviewing the Yoshida testimony report, The Asahi Shimbun perused TEPCO's teleconference records, a time-series table of events and TEPCO's other in-house documents obtained from sources. The newspaper's reporters also interviewed concerned parties.

The Yoshida Testimony (2)

Table of Contents

Prologue

- The Interview for more than 28 hours

Chapter 1: Who is there to halt nuclear reactors?

- 1. Reality of the 'Fukushima 50' 'I just ordered a temporary retreat but ...'
- 2. The hardest part to remember 'All this could turn into a China syndrome'
- 3. Nobody came to help 'I still hold a big grudge against them'

Chapter 2: Can residents be evacuated?

- 1. Fresh water or seawater? 'Listen, we have run out of water'
- 2. Public relations: who cares? 'A press release: do as you like'

Chapter 3: Can humans stop a crisis?

- 1. In went a 'suicide squad' 'It all has to be done manually in the end'
- 2. 'Limits of wisdom' 'We can only discuss it empirically'

Epilogue

- Water is there!

Investigations by **Tomomi Miyazaki** and **Hideaki Kimura**

Production by **Morihiro Sakuma**, **Shinya Uemura**, **Masayuki Shirai** and **Madoka Kimura** Translations in English by **Taku Tada** and **Roy K. Akagawa**

Media allowed access to icewall

July 8, 2014

Media allowed access to Fukushima frozen wall site

http://www3.nhk.or.jp/nhkworld/english/news/20140709_04.html

The operator of the Fukushima Daiichi nuclear power plant has allowed media access to the construction site of an underground frozen wall, which is designed to reduce the massive volume of radioactive wastewater.

Tokyo Electric Power Company invited the media on Tuesday for the first time to the site near the No.4 reactor building. Workers were digging 30-meter-deep holes to install pipes.

Coolant will circulate in these pipes to freeze the soil and create a wall surrounding the 4 damaged reactors.

TEPCO says workers do their jobs from the late afternoon to the evening so they won't suffer heatstroke.

The operator also says freezing the soil will start next March if everything goes well.

The wall is designed to stop groundwater from flowing into the reactor buildings and mixing with

radioactive wastewater. The huge amount of wastewater is hampering efforts to scrap the crippled plant.

Separately, TEPCO is trying to freeze wastewater in a utility tunnel at the No.2 reactor building to stop it from flowing into the sea. But the water hasn't been fully frozen more than 2 months after the work began.

The Nuclear Regulation Authority has raised concerns that the frozen wall will have the same problem.

The head of the Fukushima Daiichi plant, Akira Ono, says the 2 projects use different methods, and TEPCO has confirmed that the wall will work.

The frozen wall and the tunnel will intersect at one point.

If freezing the water in the tunnel takes longer than planned, it would delay the wall's construction.

NRA should not ignore personnel guidelines

July 8, 2014

EDITORIAL: Nuclear watchdog should stick to strict personnel rules

<http://ajw.asahi.com/article/views/editorial/AJ201407080034>

Two key individuals of the nation's nuclear safety watchdog were in the news last weekend. Neither matter should be overlooked.

One is the revelation that Satoru Tanaka, a University of Tokyo professor slated to become a Nuclear Regulation Authority (NRA) commissioner in September, received payments from Japan Nuclear Fuel Ltd., operator of a nuclear fuel recycling program, and Mitsubishi FBR Systems Inc., a nuclear plant manufacturer, up until March and June, respectively.

The other cause of concern is the personnel affairs decision to transfer Hideka Morimoto, deputy secretary-general of the NRA Secretariat, back to the Environment Ministry, where he worked before his stint at the NRA. Morimoto, the No. 2 bureaucrat at the NRA, assumed the post of minister's secretariat chief July 8.

These two developments raise questions of consistency with certain rules that were established upon lessons learned from the Fukushima nuclear disaster in 2011.

Tanaka, who received money from two companies in the nuclear power industry, does not meet the NRA commissioner selection guidelines created by the previous government led by the Democratic Party of Japan. The guidelines were crafted to secure the NRA's independence from the pro-nuclear camp.

Environment Minister Nobuteru Ishihara, who supervises the NRA, has said, "We do not refer to the guidelines set by the DPJ." But is it wise to simply scrap the guidelines?

Tanaka has refused to reveal how much money he received from the companies, saying, "Since I am now a counselor of the NRA, I am not in a position to talk about the matter." But we can't see why he should not do so.

To secure neutrality, the NRA also requires the members of its expert panels to voluntarily declare any annual remuneration of 500,000 yen (\$4,910) or more that they have received from companies under its regulations.

When he was appointed as an expert panel member in April, Tanaka didn't declare any remuneration from the two firms. That may be because he received less than 500,000 yen from each of the two companies. If that is the case, he should just say so. He should consider how the public will interpret his refusal to offer any explanation.

When he was tapped as a new NRA commissioner, Tanaka's eligibility for the job from the viewpoint of the guidelines was questioned at the Diet. Tanaka served as a director of the Japan Atomic Industrial Forum, a nuclear power industry organization, from 2010 to 2012. This fact prompted some lawmakers to call into question his independence from the industry regulated by the NRA.

Also worrisome is the transfer of Morimoto, the NRA Secretariat's deputy secretary-general, to the Environment Ministry. Morimoto has been serving as the NRA's de facto public face, supervising its public relations events such as news conferences.

There is a "no-return rule," which bans transferring an NRA official back to a government body committed to promoting nuclear power generation. This rule is designed to secure the NRA's independence by allowing its staffers to work without having to worry about the intentions of the organizations they have come from.

While it is true the Environment Ministry is not a government body that promotes nuclear power generation, this personnel change could be a first step toward making the rule a dead letter. We fear that

this personnel affairs decision, in addition to the guidelines issue, will end up being another case of "Danger past and God is forgotten."

Winning the trust of the public is vital for both the NRA and its secretariat. They should not behave in a way that hurts their credibility with the public.

--The Asahi Shimbun, July 8

Suga defends Tanaka

July 8, 2014

Suga defends Tanaka appointment to NRA

http://www3.nhk.or.jp/nhkworld/english/news/20140708_22.html

Chief Cabinet Secretary Yoshihide Suga says the appointment of a new member to Japan's nuclear watchdog poses no problem even though he has received money from power industry groups.

Suga spoke to reporters on Tuesday about the posting of University of Tokyo Professor Satoru Tanaka as a commissioner of the Nuclear Regulation Authority.

The appointment has led to criticism that Tanaka's close ties with the industry could compromise the watchdog's neutrality.

Suga said the government is aware that Tanaka had served on advisory committees to the nuclear power industry and that he was paid for that work.

But Suga said such payments were small and were made for technical advice that Tanaka provided.

The former administration of the Democratic Party set guidelines that said people who received more than about 5,000 dollars a year from the nuclear industry could not become NRA committee members.

Suga said the current administration views such matters according to the relevant laws.

Minami-Soma: "We demand an explanation"

July 15, 2014

Minami-Soma lambastes government, TEPCO for remaining mum on rice contamination

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201407150040>

THE ASAHI SHIMBUN

Residents of Minami-Soma in Fukushima Prefecture expressed anger with the government and Tokyo Electric Power Co. for keeping them in the dark about radiation that contaminated local rice crops.

"We cannot help but distrust the agriculture ministry, which did not promptly let us know of the matter, despite it being a serious issue," said Minami-Soma Mayor Katsunobu Sakurai.

According to the agriculture ministry, cesium levels of rice harvested in mid-August last year in Minami-Soma exceeded the safety standard of 100 becquerels per kilogram.

The ministry had determined that the removal of debris from the Fukushima No. 1 nuclear power plant caused radioactive substances to spread to 14 paddies outside the evacuation zone in Minami-Soma, more than 20 kilometers from the stricken nuclear plant.

The ministry informed TEPCO of the problem in March and ordered the utility to take preventive measures. However, the ministry failed to inform the city of Minami-Soma of the situation.

The ministry plans to hold a meeting on July 18 to brief local farmers.

Sakurai also said TEPCO is at fault and that he wants answers.

"We protest (TEPCO's) irresponsible clearing of rubble that raises concern among farmers," the mayor said. "We demand an explanation."

During a regular news conference in Tokyo on July 14, TEPCO officials apologized for causing trouble in extensive areas. But the officials added that it remains uncertain if the debris clearance work is the cause of the spread of cesium.

Although the debris clearance work is currently on hold, the utility said it will be resumed later in July. When asked if TEPCO will release radiation readings or details of the clearance process, an official said, "We will consider it before restarting the clearance work."

At a July 14 news conference, Chief Cabinet Secretary Yoshihide Suga was asked about the dangers of contaminated rice.

"We inspect every bag of rice when they are shipped," Suga said. "If there is rice with radiation levels exceeding the standards, it won't get shipped to market."

Suga was also asked why the agriculture ministry and TEPCO failed to inform Minami-Soma about the contamination of local rice crops.

"The reasons are unclear," he said. "But I have been informed that investigations will be held soon." Regarding TEPCO's plan to dismantle the No. 1 reactor building still holding debris with high levels of radiation, Suga said, "The Nuclear Regulation Authority secretariat has asked TEPCO to come up with measures to further prevent and survey the dispersal of radioactive materials."

30 days of public hearings

July 16, 2014

Public hearings begin on restarting nuclear plant

http://www3.nhk.or.jp/nhkworld/english/news/20140717_01.html

Japan's nuclear regulator has begun accepting public opinions on a draft safety assessment it has approved for restarting a nuclear power plant in southern Japan.

The Sendai plant in Kagoshima Prefecture could be the first nuclear plant in the country to be given permission to resume operations since the 2011 accident at the Fukushima Daiichi plant.

Officials at the Nuclear Regulation Authority unanimously approved the draft on Wednesday.

They say Kyushu Electric Power Company, which operates the plant, has satisfied safety requirements that were strengthened for nuclear facilities following the accident.

The NRA will now have 30 days of public hearings starting from Thursday before finalizing the draft assessment.

At a news conference after Wednesday's meeting, the head of the NRA, Shunichi Tanaka, warned that meeting the new safety criteria does not automatically mean reducing the probability of accidents to zero.

He urged the utility to strengthen voluntary efforts to ensure the safety of the plant.

He also stressed that restarting the plant depends solely on a consensus of local residents, municipalities, and other parties concerned.

Tanaka suggested that his regulatory body should not be involved in making the decision.

It is now up to the central government and utility to convince residents and municipalities of the need to restart the plant and the appropriateness of safety measures for severe accidents.

Kyushu Electric will also be required to submit the detailed design of equipment at the plant to the NRA for approval, and clear other procedures for a restart.

Even if given the go-ahead, the reactors are not likely to be back on line before October.

Jul. 16, 2014 - Updated 21:23 UT

Too many vital problems unsolved

July 17, 2014

EDITORIAL: Too many vital questions need answering before restarting reactors

<http://ajw.asahi.com/article/views/editorial/AJ201407170031>

The nuclear catastrophe that struck in 2011 raised a wide range of grave issues for Japanese politics and society. But none of them has been answered satisfactorily.

Debate on whether to restart the reactors that have been idled since the harrowing accident at the Fukushima No. 1 nuclear power plant has somehow narrowed to focus only on technical issues concerning the performances of nuclear facilities.

Little progress has been made in efforts to develop effective ways to deal with emergencies, which should clarify how the central and local governments, as well as electric utilities, should respond to a major accident. By the same token, there has been little movement in drawing up plans to evacuate local residents in the event of another nuclear accident.

Under these circumstances, it is utterly reckless to try to bring offline reactors back on stream. Doing so can only be considered as a sign of a grossly irresponsible refusal to learn anything from an accident whose aftermath is still unfolding.

The Nuclear Regulation Authority on July 16 endorsed the draft of a document effectively declaring that the No. 1 and No. 2 reactors of the Sendai nuclear power plant in Kagoshima Prefecture meet its new tougher safety standards.

This is the first time that the nuclear watchdog has given the green light to the restart of a reactor since the new standards were established a year ago.

While some steps still remain to be taken, including soliciting input from the public about the document, the process of the NRA's safety checks of the two reactors has passed the most important stage.

The Abe administration has repeatedly said it will leave decisions on whether specific reactors are ready to be brought back online to the expert judgment of the NRA and promised to only restart reactors that have been recognized as safe.

The administration has made it sound as if the NRA's safety inspection was all that is needed to ensure the safety of a nuclear plant.

But that rhetoric belies the reality. **Too many issues have been left untouched, both within and outside the boundaries of the NRA's power.**

If this situation is allowed to continue, Japan could again find itself heavily dependent on atomic energy, but without having made any policy change except for some minor improvements in nuclear power regulation.

TOO MUCH HYPE

In its basic energy plan, the Abe administration asserts that Japan's new nuclear safety standards are now "the strictest in the world."

Members of his Cabinet and senior lawmakers of his Liberal Democratic Party have also said that reactors will only be restarted if their safety is confirmed under the new standards. They also make the claim that the standards are "the strictest in the world."

This is too much of an exaggeration. Hype of this kind could revive the myth that nuclear power is safe. But this was shattered once and for all by the Fukushima disaster.

To be fair, the new standards demand more vigorous measures to make nuclear facilities better prepared for earthquakes and tsunamis. But these features are but a simple reflection of the fact that Japan is one of the world's most quake-prone nations.

Using a numerical approach to gauge the likelihood of a nuclear accident occurring has been widely adopted in Western industrial nations. But Japan's new standards are not as rigorous as to use this method.

Volcanologists have raised questions about the adequacy of measures to protect the Sendai nuclear power plant from possible volcanic eruptions. But the NRA supported the argument made by the plant operator, Kyushu Electric Power Co., which claims it will be able to deal with the risk by monitoring the volcano's activity.

What is essentially important is that satisfying the new standards doesn't guarantee safety.

NRA Chairman Shunichi Tanaka has been emphasizing that the new standards are based on the assumption that nuclear accidents can occur.

In other words, the chief of the nuclear watchdog has been insisting that not only the NRA but also electric utilities, the central and local governments and residents living around nuclear power plants should all make a determined effort to help develop effective measures to respond to accidents. But many of the necessary measures remain to be taken.

VITAL ISSUES LEFT UNRESOLVED

More than anything else, no realistic plan has been crafted for the evacuation of local residents during emergencies.

Such plans are supposed to be worked out by the local governments by using the NRA's guidelines for dealing with nuclear disasters as a basis. But local governments are at a loss how to tackle this formidable challenge, which has been suddenly thrust upon them.

The central government has asserted that nuclear power generation is a matter of national policy. Then, why does it leave the task of developing crucial evacuation plans entirely to local governments?

The conditions for restarting reactors don't include the existence of an evacuation plan.

If local governments in areas around nuclear power plants readily agree to the restart of reactors without any prospect of crafting a workable evacuation plan, neither they nor the central government can fulfill their responsibility to protect the safety of local residents.

There are many other vital issues that have yet to be addressed.

We need to remember again and again the problems that were highlighted by the accident three years ago.

A catastrophic incident, especially if it happens in an area where many reactors are concentrated, could cause a tremendous number of people to be exposed to radiation and contaminate huge tracts of land with radioactive materials.

Despite this horrifying possibility, however, **the NRA has not discussed in any serious manner the risk posed by multiple reactors located close to each other.**

While the scope of areas that are given priority in the handling of a nuclear crisis has been widened to "roughly within 30 kilometers" of a nuclear plant, only local governments hosting the plant have a say over whether to restart a reactor. Is this reasonable?

Records of remarks made by the late Masao Yoshida, who was the manager of the Fukushima No. 1 nuclear power plant at the onset of the March 2011 accident, revealed that some senior executives of the plant operator, Tokyo Electric Power Co., temporarily fled the plant as the crisis unfolded.

He made the remarks during interviews by the government's accident investigative committee.

Should electric utilities be entrusted with handling a severe accident that is on the cusp of developing into a catastrophe?

MORE IN-DEPTH DEBATE NEEDED

One fundamental problem is that Japanese society has yet to fully absorb the implications of the accident at the Fukushima No. 1 plant.

The individuals and organizations responsible for the disaster have not been held strictly accountable for what happened. Nor have they been given immunity from responsibility to share every scrap of information that can be gleaned to understand how the accident came about.

As symbolized by the fact that the records of Yoshida's testimony have not been officially released, the truth of the accident has not been disclosed to the public.

Three years ago, we proposed in an editorial to set a target of moving Japanese society toward a future without nuclear power generation. Fortunately, the shutdown of all nuclear reactors around the nation has not caused any serious disruption like a large-scale power outage.

The May ruling by the Fukui District Court that ordered Kansai Electric Power Co. not to restart two reactors at its Oi nuclear power plant rejected the argument that suspending nuclear power generation is detrimental to the national interest because it will lead to increasing Japan's trade deficit and drain of national wealth. The ruling said, "National wealth means that people can live lives firmly rooted in rich land."

The energy policy, which also covers nuclear power generation, should not be discussed only from an economic point of view. The question that should be asked is how to secure the safety of both human beings and nature for a long time into the future.

Nuclear reactors must not be restarted without broad and in-depth debate on all key issues, including how to dispose of radioactive waste.

--The Asahi Shimbun, July 17

Lessons from Fukushima have not been learned

July 17, 2014

Editorial: Stop and learn lessons from Fukushima before restarting Sendai reactors

<http://mainichi.jp/english/english/perspectives/news/20140717p2a00m0na009000c.html>

A draft report compiled by the Nuclear Regulation Authority (NRA) effectively signifies that the No. 1 and 2 reactors at Kyushu Electric Power Co.'s Sendai Nuclear Power Plant in Kagoshima Prefecture have cleared new safety standards. Three years and fourth months after the devastating disaster at Tokyo Electric Power Co.'s Fukushima No. 1 Nuclear Power Plant, the restarting of a nuclear plant under the newly established standards has moved a step closer to reality.

The government has labeled the new standards the "world's strictest," and it plans to restart any nuclear reactors that clear these standards. Under current rules, public opinion will now be sought, and if consent is obtained from the relevant areas, it will be possible to restart the reactors.

Following the Fukushima nuclear disaster, Japanese society has moved forward without any nuclear reactors in operation -- a situation that was previously thought impossible. Reactivation of the Sendai nuclear plant under the new standards would signal a turning point for Japan, turning it back into a country that utilizes nuclear power.

We have continued to stress that Japan should do all it can to create a society free from reliance on nuclear power. We don't deny that Japan may reactivate nuclear power plants along the way to produce the minimum necessary level of power. But there are conditions: The government must thoroughly learn from the Fukushima nuclear disaster and prevent another crisis, and it must find a way to protect residents from harm even if an accident does occur. Furthermore, it must map out a path to freedom from reliance on nuclear power, and place the reactivation of nuclear power plants in a position lying within its overall energy policy.

On both of these conditions, reactivation of the Sendai nuclear plant falls short of the mark, raising grave fears that the safety myth that surrounded nuclear power before the Fukushima disaster could be revived. First of all, the government has been slow to announce disaster prevention plans to be implemented in the event of an accident.

The International Atomic Energy Agency (IAEA) lists five levels of defense to protect against a nuclear accident. The first three cover the prevention of serious accidents, the fourth covers the response to such an accident, and the fifth deals with disaster prevention measures in the event of significant external releases of radiation.

After the outbreak of the disaster at the Fukushima No. 1 Nuclear Power Plant, the government expanded the areas requiring nuclear disaster countermeasures to those lying within 30 kilometers of a nuclear power plant -- much wider than the original designation of eight to 10 kilometers. However, under the Basic Law on Disaster Countermeasures, the task of handling the fifth layer of protection stipulated by the IAEA is left up to local bodies, and this is exempt from screening by the NRA.

Under regional disaster prevention plans in Kagoshima Prefecture, where the Sendai Nuclear Power Plant is located, hospitals and nursing facilities within a 30 kilometer radius of the plant have been left to formulate evacuation plans for the people in their care. But in reality, it is necessary for the prefecture to mediate and assist in the search for facilities that can look after these people.

The Kagoshima Prefectural Government has presented an evacuation plan for areas within a 10-kilometer radius of the plant. Gov. Yuichiro Ito has stated, "Evacuation plans for people requiring care within a 30-kilometer radius of a nuclear power plant are not realistic." The reason for this is that in addition to an increase in the number of people requiring care, it is difficult to secure methods of evacuation and facilities to accept these people. And this applies to other areas in the vicinity of nuclear power plants across Japan.

In the United States, emergency plans that include evacuation measures are subject to regulation, and before a nuclear power plant is moved, permission is needed from the U.S. Nuclear Regulatory Commission. The Japanese government, too, should actively support the creation of evacuation plans for local bodies and evaluate how appropriate they are. If effective plans can't be produced, then the government should not allow the nuclear power plant to be reactivated.

In implementing measures against serious accidents, it is important for power companies to maintain a high level of safety awareness, but on this point, too, there are concerns. During safety screening under the new safety standards that went into effect in July last year, we saw power companies trying to downplay the effects that earthquakes and tsunamis would have on their plants. This applied in the case of the Sendai nuclear power plant. It was not until March this year, eight months after it had applied for safety screening of its Sendai plant that Kyushu Electric Power Co. complied with a request from the NRA and ratcheted up the level of seismic motion that the plant could be exposed to during a major quake

A total of 19 reactors at 12 nuclear power plants in Japan are up for safety screening, but it is unclear when screening of nuclear power stations other than the Sendai Nuclear Power Plant will conclude. NRA chairman Shunichi Tanaka has criticized power companies' lack of respect for safety, stating, "They are lacking when it comes to a stance of more solemnly accepting the fact that the Fukushima accident occurred."

The new safety standards incorporate fresh measures to counter terrorist attacks and strengthen measures against natural disasters, such as earthquakes and tsunami. But these standards represent the

minimum line, and power companies need to do more themselves to mitigate the risks posed by a nuclear disaster. We must not forget that after the outbreak of the Fukushima disaster, the stance of thinking, "As long as we meet the standards, that's enough," came under criticism, including from overseas.

An even bigger problem is that while the government has said that it will "reduce reliance on nuclear power as much as possible," it has gone ahead with moves to restart nuclear power plants without showing how that will be accomplished.

Admittedly, if the nation's nuclear power plants are not restarted, then imports of fossil fuels will continue to increase for the time being, and the view that this presents a problem in terms of energy security is likely to emerge. At the same time, electricity prices will go up and carbon emissions will increase.

Yet Japan is a land of earthquakes and volcanoes, and the risks involved with continuing to rely on nuclear power are great.

Power companies are expected to spend roughly 2.2 trillion yen on nuclear safety measures, roughly 1.5 times the figure cited a year ago. If the cost of the cleanup after the Fukushima nuclear disaster and related compensation payments were factored in, this figure would surge even higher.

During the recent election to select a new governor of Shiga Prefecture, a newcomer campaigning on a platform of "graduation from nuclear power" beat a rival backed by the ruling coalition. In opinion polls, it is evident that there are many residents who have doubts about restarting nuclear power plants.

Considering these points, the government has a responsibility to clearly explain to the public the risks of operating nuclear power plants and the risks of not operating them. Seeking understanding for reactivation comes after that.

COMMENTARY: Green light for Sendai plant shows lessons from Fukushima unheeded

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201407170044>

July 17, 2014

By RYUTA KOIKE/ Staff Writer

It clearly hasn't dawned on the central government and Japan's electric power companies that it is impossible to construct a nuclear plant that is 100-percent safe.

That is the only possible conclusion in light of the July 16 decision to resume operations at the Sendai nuclear power plant in Kagoshima Prefecture.

Over the past year while covering the safety screenings conducted by the Nuclear Regulation Authority, one glaring characteristic has stood out: the backward-looking stance of the electric power companies with regard to safety measures at their nuclear facilities.

The utilities have persistently hemmed and hawed when faced with the prospect of having to implement steps that would require a huge investment of time and money.

As if to ignore the March 2011 disaster at the Fukushima No. 1 nuclear power plant, the electric power companies continued to submit understated estimates for possible earthquakes and tsunami. That meant many of those companies had to go back to the drawing board to come up with more realistic estimates.

While those companies have also griped that the safety screening was too strict, most points raised were to be expected in light of the gravity of the Fukushima accident.

The standards established by the NRA are nothing but the minimum level required for safety. If the electric power companies still are unable to comprehend the need to heighten safety, they are not qualified to remain in the business. Nor should they be allowed to seek a resumption of operations at their nuclear plants.

The safety screenings include new confirmation of the procedures to deal with a severe accident in which reactor cores go into meltdown, leading to the release of radioactive materials.

The fundamental point of those procedures is that the electric power companies themselves must bring the situation under control. There is no indication of how the central government would take responsibility should another serious situation occur in Japan.

The problem is that the target of the safety screenings have been limited to within the nuclear plant site. Other important issues, such as evacuation plans in the event of an accident, have been left to local communities.

Local residents who in the past allowed nuclear plants to be constructed in their communities, despite concerns about the technology, now know only too well how unreliable such hypothetical plans can be.

The fallout from a nuclear accident goes well beyond prefectural borders. For this reason, dealing with such accidents should not be left to individual local governments.

Despite that obvious reality, the Abe administration appears to be leaving open the possibility of avoiding responsibility for the resumption of operations at nuclear plants by using the NRA as a possible scapegoat.

What the Fukushima disaster has ingrained in the minds and memories of all of us is that once an accident does occur it will rapidly go beyond what humans can control, and the hometowns and lives of many people will be snatched from them.

Now that Japanese society knows what is involved, does it really want to again use nuclear power?

Allowing nuclear plants to resume operations is intolerable, especially since no effort has been made to gauge public opinion.

Is there a pilot in the plane?

Responsibility for reactor restarts a hot potato

<http://www.japantimes.co.jp/news/2014/07/17/national/responsibility-for-reactor-restarts-a-hot-potato/#.U8i7nrHi91s>

by Reiji Yoshida
Staff Writer

The impending reactivation of reactors shut down following the 2011 nuclear crisis has raised a difficult question: Who will take responsibility for the decision?

On Wednesday, the Nuclear Regulation Authority effectively finished screening the two reactors at the Sendai plant in Kyushu, certifying they meet the new safety standards adopted after the Fukushima meltdowns.

Once they go online, likely in the fall, they will be the only reactors in operation in the nation.

NRA Chairman Shunichi Tanaka, however, is quick to point out that it's not up to his commission to decide whether to restart any of the nation's 48 commercial reactors.

"We won't commit ourselves to making a decision on whether to restart (one) or not," Tanaka said. "It is the utility, local residents and the central government" that make the decision, Tanaka said.

It's not even the NRA's job to say whether a reactor is safe, Tanaka insists.

He says the NRA's sole duty is to determine whether the reactors meet the new safety standards.

This is not how Chief Cabinet Secretary Yoshihide Suga sees things.

"We will leave the judgment to the NRA's expertise as far as safety is concerned," Suga told a news conference Wednesday.

From a legal standpoint, Suga said, it is the power company's responsibility to decide whether to reactivate a reactor that has passed the NRA's inspection.

Even after 3/11, the law remains unchanged on that point.

"We won't make any political decision" to reactivate a reactor, and just follow the legal procedures, Suga added, opening the door to the eventual restart of all the other idled reactors that pass the NRA tests.

Every atomic utility is desperate to bring its reactors back online. The costs of importing fuel for thermal power are growing, exacerbated by the weakened yen, while the reactors they invested so much in to build, maintain and improve generate only losses.

On the surface at least, top government officials are trying to distance themselves from the restart process. But they won't hide their enthusiasm for immediate reactivation once a reactor gets the NRA's blessing.

Prime Minister Shinzo Abe has emphasized Japan is losing as much as ¥4 trillion a year importing additional fuel to make up for the idling of the nuclear plants.

"For businesses to operate (in Japan), stable energy supplies are needed. And costs should be low, too," Suga told the news conference.

"We'd like to promote the reactivation (of the plants) if the NRA conducts scientific and technological evaluations and it is concluded (they are) safe," Abe told reporters Wednesday.

Sendai plant operator Kyushu Electric Power Co. is now ready to reactivate the reactors in the fall — with the consent of the heads of local governments, including Kagoshima Gov. Yuichiro Ito.

Though not required by law to get this consent, it's a practical necessity.

According to an April 11 to 13 telephone poll by the local daily Minami-Nippon Shimbun, 59.5 percent of 1,016 respondents in Kagoshima Prefecture said they are opposed to reactivating the Sendai reactors, while 36.8 percent support the plan.

NRA panel and Diet Commission differ on cause of disaster

July 19, 2014

March 2011 power loss at Fukushima plant caused by tsunami: regulator

<http://mainichi.jp/english/english/newsselect/news/20140718p2g00m0dm059000c.html>

TOKYO (Kyodo) -- The power loss at the Fukushima Daiichi nuclear plant's No. 1 reactor in March 2011 was triggered by tsunami, Japan's nuclear regulator said Friday, denying the possibility raised by the Diet's investigation commission that it could have been caused by the powerful earthquake.

The Nuclear Regulation Authority's interim report on the 2011 nuclear disaster said the power loss -- which led to the failure to cool the reactor and resulted in a meltdown -- and damage to equipment occurred as tsunami waves flooded the plant, citing results of its on-site probe.

Panels of the Diet, the government, plant operator Tokyo Electric Power Co. and the private sector have separately released investigation reports so far, but they differ regarding some issues.

While the reports of the government and TEPCO panels concluded that the power loss was caused by tsunami waves, the Diet-appointed panel noted the possibility of the earthquake as the cause. The possibility raised by the Diet panel implies TEPCO failed to prepare for earthquakes as well as tsunami.

NRA officials said they will continue their investigation.

July 18, 2014

NRA panel: Tsunami led to Fukushima meltdown

http://www3.nhk.or.jp/nhkworld/english/news/20140718_53.html

A panel of experts at Japan's Nuclear Regulation Authority has concluded that the tsunami triggered the meltdown during the 2011 Fukushima nuclear accident.

The panel presented on Friday a draft interim report on its probe into the accident.

The experts' conclusion differs from that of a Diet commission about the loss of an emergency power source at the Number One reactor at the Fukushima Daiichi nuclear power plant.

In its report released in July 2012, the commission suggested the possibility that the massive earthquake caused the reactor to lose power before the tsunami hit the plant.

But the expert panel says data found after the report was issued shows that the arrival of the tsunami coincided with the time the reactor lost power.

The panel rejects the conclusion by the Diet commission that the quake damaged pipes of the reactor and led to the meltdown.

The experts say they will continue their probe and interview former members of the commission before releasing a final report.

Jul. 18, 2014 - Updated 11:21 UTC

A revival of "safety myth" of nukes?

July 18, 2014

More needed than NRA safety nod

<http://www.japantimes.co.jp/opinion/2014/07/18/editorials/more-needed-than-nra-safety-nod/#.U8lnErHi91s>

The Nuclear Regulation Authority has effectively given the safety clearance for restarting Kyushu Electric Power Co.'s idled Sendai Nuclear Power Plant in Kagoshima Prefecture — the first under power plant safety standards updated a year ago.

Prime Minister Shinzo Abe has reiterated that his administration will move to reactivate nuclear reactors that have passed NRA screening, and the power industry hopes that the decision will pave the way for getting back online many other nuclear power plants across Japan that were halted in the wake of the Fukushima nuclear disaster.

However, the NRA's nod covers only some technical aspects of nuclear power generation safety in this natural disaster-prone country. Blind faith in what the Abe administration has billed the world's top-level plant safety standards could lead to a revival of the "safety myth" of nuclear power that was prevalent before the March 2011 triple meltdowns at Tokyo Electric Power Co.'s Fukushima No. 1 plant.

Before restarting any idled plant, the government and the power industry need to stop and consider if they have, in fact, learned the crucial lessons of the Fukushima crisis.

The Nos. 1 and 2 reactors at Kyushu Electric's Sendai plant in the city of Satsumasendai have been fast-tracked for NRA screening among the 19 reactors at 12 power plants across Japan that regional power companies have applied to restart.

The NRA will finalize its report on the Sendai plant after soliciting public comments for a month. It could be reactivated sometime after the fall, pending additional procedures and the consent of local governments hosting the plant.

Under the updated safety standards, power companies are obliged to take countermeasures against possible severe accidents such as reactor core meltdowns as well as terrorist attacks. They are required to ensure that their plants can withstand the strongest quakes and highest tsunami estimated for their locations, and make necessary reinforcements.

The new standards were introduced in light of the lessons learned from the Fukushima plant meltdowns caused by the massive earthquake and tsunami. The standards have been hailed repeatedly by the Abe administration as among the world's toughest for nuclear power plants.

Still, NRA Chairman Shunichi Tanaka said the watchdog's assessment does not guarantee safety at the Sendai plant; it shows only that the plant matches the updated standards. "The plant's safety has improved to a certain extent, but this is not the goal," Tanaka said, adding that Kyushu Electric needs to make further efforts to guard the plant against possible natural disasters whose severity can be exceptionally high in Japan. Questions linger about the validity of the new safety standards, which have been created even before the causes of the Fukushima meltdowns are fully identified.

Achieving absolute safety in nuclear power plants may be pie in the sky. But one of the lessons of Fukushima was that a catastrophic accident can take place because of a series of unforeseen events. What's needed are efforts to minimize the risk of severe accidents through multiple layers of safeguards at the plants, and to ensure the safety of residents in areas that could be hit by radiation fallout in such disasters.

It won't be until fiscal 2015 and 2016 at the earliest, respectively, that the Sendai plant will have an "important anti-seismic building" and a filter to remove radioactive substances from steam released in an accident.

Since the Fukushima disaster, municipalities around nuclear power plants across the country have been called on to prepare evacuation plans for residents within 30 km of the plants. However, nearly 40 percent of such municipalities have reportedly not come up with a plan, even as the power companies seek to restart the idled plants.

Creation of the evacuation plans have been left in the hands of local governments, with no NRA or central government oversight to help ensure that the plans are adequate.

Municipalities around Kyushu Electric's Sendai plant have already drawn up evacuation plans. However, local residents and experts charge that the plans are ineffective because they are often based on implausible scenarios. Last month, more than half the residents of Ichikikushikino, which borders the Sendai plant host city of Satsumasendai, signed a petition opposing restart of the plant, citing the lack of an adequate plan to safely evacuate local residents.

The Kagoshima Prefectural Government in May released an estimate that it would take roughly 29 hours, at most, for 90 percent of some 210,000 residents within 30 km of the Sendai plant to evacuate the area. But doubts were cast on the plausibility of the estimate, especially because it did not take into account the extra time that would be required for evacuating people in need of special care such as hospital inpatients and residents of welfare facilities.

Many such people died during the evacuation of areas around the Fukushima plant in 2011. Kagoshima Gov. Yuichiro Ito says the prefecture will create plans for the evacuation of hospital patients and care facility residents within 10 km of the Sendai plant, but that it would be difficult to prepare a realistic plan to evacuate all such people within the 30-km zone, given the much larger number of institutions and patients.

The Sendai plant is widely considered one of the most vulnerable to volcanic eruptions because of the concentration of calderas in the area. The NRA report said it judged as “appropriate” the assessment by Kyushu Electric — though questioned by many volcanologists — that the risk of a massive eruption that could affect the plant during its life span is “small enough.” The NRA says the power company will monitor crustal movements in the calderas for possible signs of an eruption, and take steps to halt the reactors and move out nuclear fuels — a process that would take years — when such signs emerge. NRA Chairman Tanaka admits that its screening was carried out in the absence of sufficient scientific knowledge on the subject of forecasting volcanic eruptions.

The power industry has its reasons to seek a quick restart of idled nuclear power plants. Since the Fukushima disaster put the nation’s nuclear power plants offline, utility firms have suffered huge losses due to the increased costs of imported fuel to run thermal power plants — costs that have also been passed on to consumers. For Kyushu Electric, which relied on nuclear energy to generate 40 percent of its power before 2011, a restart of the Sendai plant’s Nos. 1 and 2 reactors alone would save it ¥20 billion in fuel costs each month.

The NRA decision comes as a relief for Kyushu Electric and other power companies that hope more reactors will quickly get the go-ahead to restart. However, they and the Abe administration need to reconsider whether adequate steps have been taken to avoid a repeat of the mistakes that led to the Fukushima disaster — and to ensure that shortcuts to safety are not being taken in the drive to restart the idled plants.

Almost certain is not certain

July 19, 2014

NRA blames tsunami for equipment failure at Fukushima plant

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201407190041>

By AKIRA HATANO/ Staff Writer

Japan's nuclear watchdog says the Fukushima nuclear disaster in 2011 was **almost certainly** triggered by towering tsunami generated by the Great East Japan Earthquake.

The Nuclear Regulation Authority said key equipment and emergency power systems at the Fukushima No. 1 nuclear power plant failed due to damage from the tsunami instead of the magnitude-9.0 earthquake that preceded the deluge.

The NRA endorsed the view in an interim report draft on the nuclear disaster released July 18. Its findings are expected to influence the evaluation by the International Atomic Energy Agency due out by the end of the year.

Experts have been divided over whether the massive earthquake was responsible for the failure of key equipment and emergency power sources at the No. 1 reactor building.

Workers at the plant at the time of the disaster reported that water was already leaking on the fourth floor of the No. 1 reactor building before the tsunami inundated the plant.

The fourth floor housed isolation condensers that cool steam from the reactor's pressure vessel and condense the steam into water and return the cooling water into the reactor.

The condensers were supposed to kick in during an emergency even without a power source, but it was discovered that they barely functioned, leading to a meltdown earlier than anticipated.

A Diet investigative committee pointed out the possibility that water leaked because isolation condenser pipes were damaged by the quake. It also said that emergency power sources for the No. 1 reactor could have been lost before the tsunami struck the facility on the basis of its assessment of when the tsunami hit the plant.

The NRA, however, concluded that the leaking water that the workers saw was overflow from the spent fuel storage pool nearby.

It also determined that emergency power sources were lost due to the tsunami, based on data released in May 2013 by the plant operator, Tokyo Electric Power Co., and other sources.

The NRA conducted an on-site inspection at the plant in May 2013 to look into what went wrong at the nuclear complex.

It will compile the final report on the Fukushima disaster after interviewing former members of the Diet's Fukushima Nuclear Accident Independent Investigation Commission.

Whether the isolation condensers were already damaged by the quake is an issue of significant implications, raising the question of the adequacy of anti-quake preparedness measures at the Fukushima plant and other nuclear facilities.

ADR center cheating on victims

July 21, 2014

Nuke disaster center skipping expert opinion, cutting proposed victim compensation

<http://mainichi.jp/english/english/newsselect/news/20140721p2a00m0na010000c.html>

The government alternative dispute resolution (ADR) center tasked with managing compensation claims against Tokyo Electric Power Co. (TEPCO) by victims of the Fukushima nuclear disaster has consistently finalized payouts over deaths while in evacuation and lasting injuries without consulting third-party medical experts, it has been learned.

The Nuclear Damage Claim Dispute Resolution Center has stated that it has forgone soliciting medical opinions to speed up the compensation process. There are, however, multiple cases where the center has pushed aside the medical opinions of the victims' doctors and proposed small compensation amounts.

The ADR center's internal regulations state that "testimony from experts can be heard" during resolution proceedings, which would include statements by third-party doctors. The Mainichi Shimbun has discovered, however, that in three cases of death related to the nuclear disaster and two of injuries leading to permanent disabilities, the ADR center did not admit any expert medical testimony.

In one of these cases, medical opinions from two doctors submitted by a 66-year-old disaster victim from Minamisoma, Fukushima Prefecture, were simply overturned by the ADR center.

Before the meltdowns at the No. 1 plant, the 66-year-old woman did have a history of high blood pressure, but had no other medical problems and had no trouble doing household tasks. She was evacuated from her home on March 12, 2011; the day after the nuclear disaster broke out in the wake of the Great East Japan Earthquake and tsunami. Ten days later, at a gymnasium being used as an evacuation center, she lost consciousness while sitting on the toilet. She was taken by emergency medical transport to a hospital in the city of Fukushima.

There, she was diagnosed with a cerebral hemorrhage, and the damage was severe. After a long rehabilitation process, she is finally able to move her left arm and leg a little, but still has no feeling in either limb. She cannot walk without a cane.

The woman's house is inside the nuclear evacuation zone, so she's living with her second son and three grandkids in a rented apartment. Once when she was trying to cook for the family, she was surprised to see blood gushing from her paralyzed left hand. She had sliced it open with a kitchen knife and hadn't even noticed. Unable to help out around the house, "I've sometimes thought it'd be better if I was dead," she says.

The woman collected the informed medical opinions of three doctors to submit to the ADR center. The doctor who examined her when she'd been rushed to the hospital in Fukushima in 2011 stated that the "impact level" of the nuclear disaster on her condition was "unknown." Her family doctor and another who oversaw her rehabilitation, however, both declared that her hemorrhage had "almost entirely" been due to the stress imposed by the meltdowns.

TEPCO submitted the opinion of another doctor who pegged the disaster's role in the woman's brain hemorrhage at "around 50 percent." The doctor, however, had never examined the woman. Despite this and the conflicting diagnoses, the ADR center never sought a third-party medical opinion. In August 2013, the center declared that the woman's hemorrhage was indeed only 50 percent due to the disaster, and proposed final compensation in the amount of 7 million yen. The center gave no explanation for why it chose the same rate as the TEPCO doctor.

Even so, the woman approved the amount the following October, saying, "I'm already an old woman. I have no choice."

The woman's son, who found out that the ADR center had not sought a third-party medical opinion only after the compensation amount had been finalized, told the Mainichi, "I wish they'd asked an expert about it. If this is how the system works, then there's no point in applying (to the ADR center)."

Hiroshi Noyama, former head of the Education, Culture, Sports, Science and Technology Ministry section that serves as secretariat to the ADR center, told the Mainichi that the center "does not interview experts. If it carefully solicited expert opinion regarding every claimant, it wouldn't be able to complete deliberations for each case at the current pace," which now averages about six months per case.

In other news relating to the Nuclear Damage Claim Dispute Resolution Center, the group has recently set the basic amount of reparations in cases of death below the amount usual for damages suits that go before the courts. Furthermore, the ADR center sets the causal relationship between these deaths and the nuclear

disaster at 50 percent in nearly every instance, and has accordingly cut the proposed compensation amount by half in case after case.

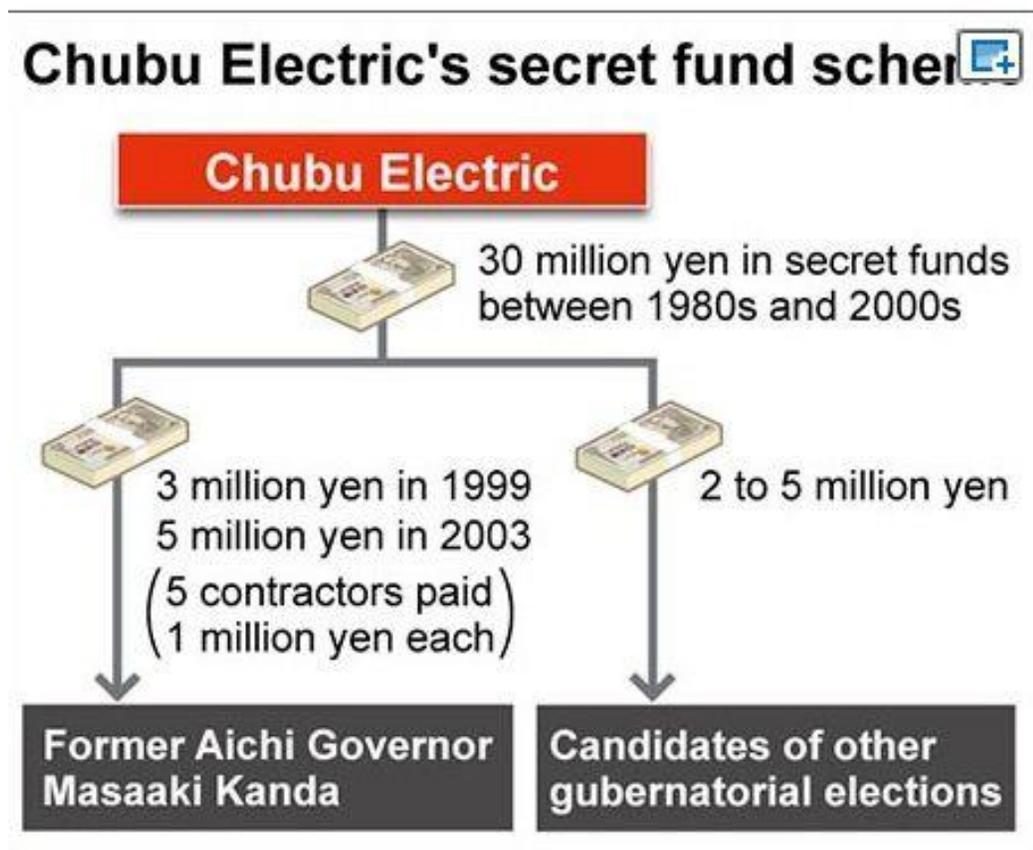

July 21, 2014(Mainichi Japan)

Chubu's slush fund to buy politicians' support

July 21, 2014

Chubu Electric used slush fund for political donation to former Aichi governor

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201407210047

THE ASAHI SHIMBUN

A former director of Chubu Electric Power Co. told The Asahi Shimbun that it paid a total of 30 million yen (\$296,000) from a slush fund to four gubernatorial candidates starting in the 1980s and ending in the 2000s.

Aichi Prefecture's former governor Masaaki Kanda has acknowledged he received a political donation from Chubu Electric, one of several regional utility monopolies.

Kanda, who served as Aichi governor for three terms between 1999 and 2011, admitted that he received funds from the company on at least one occasion in 1999.

Nagoya-based Chubu Electric is suspected of raising 250 million yen in off-the-book funding to buy support from politicians for nuclear power and other utility-related concerns.

The individual said he provided 3 million yen in 1999 and 5 million yen in 2003 to Kanda at his residence shortly before the start of his election campaigns.

Each time the executive said he made an appointment to meet Kanda before visiting his home and handing over cash directly to him.

Although Kanda admitted he received funds from Chubu Electric, he could not recall whether he received money in 2003. The former governor added that officials from the utility never asked him for anything in exchange.

"I remember that I received money once at the time of my first election, but I don't clearly recall whether I received (money) or not at the time of my second election," Kanda said. "I certainly did not provide favors to Chubu Electric, and they did not ask me for any favors, either."

Kanda was a member of a Chubu Electric's panel on utility policies that was comprised of locally influential people.

"Aichi's governor was a member of the panel, so he was of special importance to us compared with governors of other prefectures," the executive said.

For the 5 million yen it paid to the governor in 2003, the utility had five major construction companies contribute 1 million yen each. The executive said he told Kanda the names of the contractors.

To raise 250 million yen for the slush fund, the utility padded the amount it charged for orders that it placed to these companies, the executive said. His revelation raises the possibility that the utility used revenue paid by electricity consumers to buy the support of politicians for utility-related projects.

The executive said that Chubu Electric also paid money from the secret fund to candidates in three other gubernatorial elections during the same time frame beginning in the 1980s.

Each time, the company handed between 2 million yen and 5 million yen to relatives of the candidates or executives on their campaign teams. In some instances, a candidate's side approached Chubu Electric for a monetary contribution, the executive said.

While prefectural governors have no legal authority in the decision-making process over the construction, operation and decommissioning of nuclear power plants, the safety agreements required between power companies and local governments oblige the utilities to gain the approval of prefectural and local governments before they can construct new reactors or restart those that have been idled.

"If we alienate prefectural governors, it will cause us many problems in promoting the utility's projects," said the executive.

A spokesman for Chubu Electric said the company has no record relating to the executive's allegations.

The gubernatorial candidates from the other prefectures and former executives from their campaign teams said they are not aware of the alleged monetary handover or they have no memory of it.

(This article was written by Hiroo Sunaoshi and Hiroyoshi Itabashi.)

July 20, 2014

Chubu Electric built 250 million yen slush fund to win over politicians

http://ajw.asahi.com/article/behind_news/politics/AJ201407200021

THE ASAHI SHIMBUN

A former director of Chubu Electric Power Co. said the regional utility had its contractors pony up 250 million yen (\$2.46 million) over 20 years for a secret fund to buy the support of politicians for nuclear power and other utility-related concerns.

The former executive told The Asahi Shimbun that Chubu Electric padded the amount of orders that it placed to these companies for nuclear power-related projects in exchange for their cooperation with the slush fund.

His revelation points to the possibility that the utility may have used part of the revenues paid by users on their electricity bills to cover the inflated costs of the projects. Under the Electric Utilities Industry Law, a power company can recover all the costs of generating power such as building nuclear power plants and their upkeep as well as distributing electricity by including them in electricity rates.

The man said the secret funds were used to promote nuclear power generation and the electric power business in the prefectures that the Nagoya-based Chubu Electric serves--Aichi, Gifu, Mie, Nagano as well as part of Shizuoka Prefecture.

He decided to reveal the existence of the slush fund following the nuclear disaster at the Fukushima No. 1 nuclear power plant, which unfolded in March 2011 when the powerful Great East Japan Earthquake and tsunami struck the plant.

In connection with a secret fund, the statute of limitations has apparently expired in filing potential criminal charges.

An official at Chubu Electric's publicity section denied the existence of a slush fund to The Asahi Shimbun, saying, "We are not aware that such facts existed."

The former executive said, "Only a limited number of officials at Chubu Electric are aware of what I had handled."

The companies that he claimed were involved in the slush funds did not officially confirm or deny his allegations.

According to the former executive, the utility began receiving funding from a manufacturer of electronics components in Nagoya and two leading general contractors in 1985.

The general contractors continued the practice until 1995, paying 10-15 million yen together annually. The manufacturer contributed 10-20 million yen a year until 2004.

The man also said another large construction company paid 100 million yen and 40 million yen on separate occasions to Chubu Electric in 1993.

He received these funds personally and handled them without entering them in accounting records. The money was “handy” since it did not exist on paper. Without receipts, it left no clues as to its source.

“I knew that managing such money violates the tax laws,” he said.

He distributed some of the funds to governors up for re-election in the jurisdiction Chubu Electric serves and senior officials with their election campaign offices.

The money was given at the governors’ homes, hotel lobbies or elsewhere after he called them in advance to “support them with what they can use at their discretion.”

“It costs a lot of money to run in an election,” he said. “They appreciated the funds, which they could use as they desired. Many of the governors had trouble raising campaign funds, unlike Diet members.”

In return for their cooperation in raising the questionable money, he asked a senior official at the utility’s supplies division, which oversees placing orders for projects, to “inflate the price of orders” for the companies or “let them take part in the projects.”

The former executive was referring to work related to the No. 5 reactor of the Hamaoka plant and other sites.

A former senior official with the Nagoya branch of one of the general contractors confirmed that his company contributed to the off-the-books fund.

“We began providing money around 1970,” he said.

The former official said that his company was willing to comply with the utility's request to pay into the slush fund.

"That Chubu Electric asked for cooperation (in building the slush fund) is evidence that it trusts our company," he said. "There was no reason for us to refuse it."

Chubu Electric's only nuclear plant, the Hamaoka plant in Shizuoka Prefecture, was taken offline in May 2011, two months after the triple meltdown at the Fukushima No. 1 plant at the urging of then Prime Minister Naoto Kan.

The Hamaoka plant, which began operation in 1976, is widely considered the most vulnerable in the nation since it sits in the presumed hypocentral area of a huge quake that is expected to strike the Tokai region within decades.

The Chubu executive's disclosure followed The Asahi Shimbun's report that Tokyo Electric Power Co. requested a construction company to buy land from its secret fund for a spent nuclear fuel storage facility in Aomori Prefecture. The contractor later received a verbal promise from TEPCO for lucrative contracts.

Secondhand tanks at Fukushima Daiichi

July 23, 2014

TEPCO using secondhand tanks to store radioactively contaminated water

<http://mainichi.jp/english/english/newsselect/news/20140723p2a00m0na015000c.html>

Roughly 20 or more of the water tanks holding radioactively contaminated water at the Fukushima No. 1 Nuclear Power Plant are secondhand, it has been learned -- a fact that plant owner Tokyo Electric Power Co. (TEPCO) had not previously disclosed.

In August 2013, highly radioactive water was found leaking from one of the plant's tanks. A TEPCO representative refused to comment on whether that tank was one of the used ones.

The secondhand tanks and the tank that leaked are all types assembled by bolting steel pieces together, known as "flange" models. TEPCO has said flange tanks can be used for five years. When questioned by Mainichi Shimbun, a representative for the utility commented, "We do not believe that used tanks have a shorter usable lifespan."

However, an inside source with a Tokyo company that supplied TEPCO with the tanks told the Mainichi, "We don't guarantee the tanks for five years as a company, and they are not made to be completely leak-proof in the first place."

According to the source, TEPCO ordered tanks from the company in Tokyo's Chuo Ward after the March 2011 Great East Japan Earthquake to store contaminated water, but since it would take too much time to make new ones, in around May 2011, the manufacturer supplied TEPCO with 20 to 30 used flange tanks -- mud-storage tanks that it had been renting out to businesses such as construction firms.

Multiple private investigation firms have said that the tank supplier reported high profits for June 2011 as the nuclear disaster created heavy demand for its water tanks and enabled it to sell off "depreciated" tanks. The reference to the tanks as "depreciated" is believed to indicate that a considerable amount of time had passed since their manufacturing date. The flange tanks provided by the company after this point are thought to have been new ones.

In the August 2013 incident at the Fukushima plant, around 300 tons of contaminated water was found to have leaked from a flange tank. Criticism grew over the fact that this tank had been taken apart, reassembled and moved on the plant grounds before the leak occurred. At a news conference around this time TEPCO said that this tank and two others had been relocated, but it made no mention of secondhand tanks.

Since October 2012, the company has been creating and supplying TEPCO with welded tanks that are more resistant to leaks, but **most of the flange tanks, including the secondhand ones, are still being used at the Fukushima plant.**

It has also been learned from an inside source at the manufacturer that even after TEPCO started to use welded storage tanks, it continued to build new flange tanks for around a year. The source suggests that this was to save money, as it was not until September 2013 that the government decided to apply public funds to the tanks' purchase. According to the source, welded tanks cost anywhere from two to three times as much as flange tanks.

TEPCO reports that as of April 22 this year there were 332 flange tanks and 552 welded tanks at the Fukushima plant. The utility plans to start replacing the flange tanks with welded tanks this coming September to prevent more leaks.

July 23, 2014

Use your vote to dismantle shields that protect nuclear firms from post-Fukushima liability

Special To The Japan Times

To the Japanese public,

On Dec. 6, the contentious state secrets bill was rammed through the House of Councilors. No parties included this law in their manifesto in the last election, and it's highly doubtful that its enforcement reflects the will of yourselves, the voters.

Convincing measures have yet been taken to prevent the arbitrary classification and concealment of valuable information from the public. I believe this new law will reinforce the shields that already protect nuclear power companies such as General Electric (GE), Hitachi and Toshiba.

More than three years have passed since the magnitude-9 quake of March 11, 2011, but nuclear firms deeply involved in the design, construction and operation of the reactors are still not being held accountable. There is a long-running TV series sponsored by Hitachi, "Discovery of the World's Mysteries" ("Hitachi Sekai Fushigi Hakken!"), but the mysteries of nuclear firms themselves are being kept secret.

Six years ago, I left GE Japan. During my six months working in financial planning at the firm in the lead-up to the Lehman Brothers collapse, I came to realize that profit was the highest priority. Skilled managers who would use any means necessary to increase profits were hired from various fields including law, marketing and finance. They have succeeded in fending off any claims of legal responsibility for their actions so far.

Two tenable shields are being created to protect these firms. The first is the state secrets law, which will come into force in December. As The New York Times opined (“Japan’s Dangerous Anachronism,” Dec. 16), “The law is vaguely worded and very broad, and it will allow government to make secret anything that it finds politically inconvenient.”

Recently, the Asahi Shimbun, a brave “mystery hunter” among newspapers, got hold of a series of interviews with the late Masao Yoshida, former manager of the Fukushima No. 1 plant. These interviews startled the public — particularly the revelation that 90 percent of panicked workers fled the Fukushima plant after the 2011 disaster in defiance of Yoshida’s order for them to stay. I’m afraid that this law will allow the government to designate inconvenient truths such as these state secrets in order to prevent any thorough investigation into the responsibilities of nuclear firms.

The second shield is the treaty known as the Convention on Supplementary Compensation for Nuclear Damage. In this column on Dec. 4 (“Japan should shun treaty that will shield nuclear tech suppliers”), Brian Victoria wrote to the foreign minister warning that “After ratifying the treaty, Japan will be unable to hold GE or any other domestic or foreign vendor financially liable, no matter how defective or dangerous the equipment they installed is.” The Shinzo Abe government plans to ratify it by the end of this year, as part of its strategy to support the restart of atomic plants and the export of nuclear technology abroad.

These two shields will not only hinder the revelation of the cause of nuclear accidents but also make it difficult for nuclear firms to be found liable for future nuclear damage. What powerful magical shields these will be for nuclear firms!

Three parties should be responsible for bearing the cost of the Fukushima accident: 1) taxpayers; 2) Tokyo Electric Power Co. (Tepco); and 3) nuclear firms. A total of ¥100 trillion might not be sufficient to compensate for all the damage done, considering the plight of the evacuees; the radiation exposure, damage to agriculture, land and fisheries; decontamination and continued contaminated water leakage; the decommissioning of the power plant, etc. — yet nuclear firms other than Tepco have not paid even a portion of the massive costs.

Is that fair? Greenpeace launched the “They Profit, You Pay” campaign last year and 113,996 people signed the petition. Greenpeace pleaded, “Don’t let General Electric, Hitachi and Toshiba walk away from the Fukushima disaster.”

It makes sense. Even if each firm was obliged to pay several trillion yen for decades, they would not go bankrupt.

If my way of thinking is correct, these companies are responsible for paying all the profits that they have earned from the nuclear business, just as Tepco is. Right now, taxpayers are bearing almost all the costs

through the fees we pay Tepco for electricity. I understand that we have enjoyed the benefits of electricity generated from nuclear plants, but isn't our share of the burden too high?

Finally, there are three major elections in a few years. One is a unified local election in 2015; the others are the elections for both houses of the Diet in 2016. I would like to conclude by sharing with you one crucial way you can penetrate the multi-layered shields protecting nuclear firms: Simply do not vote for the party trying to reinforce these shields.

Confession from ex-KEPCO top official

July 28, 2014

Former Kansai Electric Power executive reveals 18 years of secret payments to prime ministers

http://ajw.asahi.com/article/behind_news/politics/AJ201407280041

THE ASAHI SHIMBUN

A former top official at Kansai Electric Power Co. has come forward to reveal **a nearly 20-year history of doling out "top secret" huge donations to Japanese prime ministers, funded on the backs of ratepayers.**

Chimori Naito, 91, a former KEPCO vice president, said that for 18 years from 1972, seven prime ministers received 20 million yen (about \$200,000 now) annually from Yoshishige Ashihara, who served as both KEPCO president and chairman.

At that time, political donations to individual lawmakers were not illegal. However, in 1974, electric power companies declared a ban on corporate donations to politicians because of strong public opposition to the use of electricity fees to pay for such contributions.

Naito said that "ban" was only a superficial stance taken by the electric power companies. "There is no way those companies could (ban such donations)," he said. "Nothing would have happened if we angered politicians."

Naito had long taken pride in working closely with Ashihara in making the donations as part of efforts to promote nuclear energy and to further develop the electric power industry.

However, the Fukushima nuclear accident in 2011 and the inept handling of that disaster by Tokyo Electric Power Co., the plant operator, politicians and bureaucrats led Naito to have a change of heart.

"As I began to think about my own death, I also recalled the course I had taken in life," Naito said.

"A reporter (from The Asahi Shimbun) came just at the time when I began feeling that I wanted to talk about matters I had never spoken about until now. I thought it would serve as a lesson for future generations."

According to Naito, the prime ministers who were given the money were Kakuei Tanaka, Takeo Miki, Takeo Fukuda, Masayoshi Ohira, Zenko Suzuki, Yasuhiro Nakasone and Noboru Takeshita. Only Nakasone is still alive.

Naito called aides to the prime ministers to arrange meetings twice a year during the traditional Bon period in summer and at the year-end season. Naito accompanied Ashihara to those meetings where the money was directly handed over.

Naito also revealed that other important politicians, including the chief Cabinet secretary and executives of the ruling Liberal Democratic Party as well as the major opposition parties, were given donations according to how much assistance they provided the electric power industry. In total, Kansai Electric doled out several hundreds of millions of yen a year in such donations.

Naito graduated from Kyoto University in 1947 and entered what would later become Kansai Electric. In 1962, he became an aide to Ashihara, who at that time was company president. Ashihara would serve as president until 1970 when he became chairman, a post he held until 1983, the same year Naito became a vice president at Kansai Electric. He left the company in 1987. Ashihara died in 2003 at 102.

Distributing political donations to influential politicians was imperative for Kansai Electric, which depended on nuclear power plants for about half of its total electricity supply before the Fukushima nuclear accident.

Naito agreed to be interviewed by The Asahi Shimbun, and he spoke with reporters for a total of 69 hours over 23 sessions from December 2013 until July 2014.

He said the government's handling of the accident at the Fukushima No. 1 nuclear power plant was unforgivable.

"There was a problem in the relationship created over many years among those in the political, bureaucratic and electric power sectors," he said.

Naito said the money Ashihara distributed to prime ministers and other influential politicians was a "top secret" matter.

Naito said the two major reasons for making the donations was to contribute to the stability of the electric power industry and to promote national prosperity.

"The money was given for the betterment of the nation, and there was no specific objective," he said. "That was simply one way for electric power companies to act toward public authority that had control over approval of business matters. We hoped it would work like Chinese herbal medicine and take effect after prolonged use."

An official with Kansai Electric said the company was not aware of such donations.

Officials at Nakasone's office said aides from the time of the donations had long since died so there was no way of confirming their receipt. Nakasone also did not acknowledge receiving such donations even after repeated questions from The Asahi Shimbun.

Those who knew the other prime ministers named by Naito said they were unaware of such donations.

Takashi Mikuriya, a visiting political science professor at the University of Tokyo who has long conducted oral histories of politicians, praised Naito for coming forward to leave behind testimony as a history of the nation.

"Naito likely felt that the electric power industry had never done anything wrong, but the nuclear accident made him realize that was nothing but **misplaced confidence**," Mikuriya said. "The accident by TEPCO, which for Kansai Electric was the model to strive for and to overcome, likely led to a drastic change in his sense of values that had previously believed his behind-the-scenes work was for the good of the nation."

Ex-TEPCO executives should be indicted

July 31, 2014

Inquest panel calls for indictments against former TEPCO executives

July 31, 2014

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201407310062>

THE ASAHI SHIMBUN

Rejecting a decision by prosecutors, an independent judicial panel of citizens said July 31 that three former executives of Tokyo Electric Power Co. should be indicted over the 2011 Fukushima nuclear disaster.

The Tokyo No. 5 Committee for the Inquest of Prosecution said charges of professional negligence resulting in death and injury are warranted against former TEPCO Chairman Tsunehisa Katsumata and two former vice presidents, Sakae Muto and Ichiro Takekuro.

The Tokyo District Public Prosecutors Office had decided not to indict 42 people, including the three former TEPCO executives.

In response to the inquest committee's decision, however, the prosecutors office will reinvestigate the case to decide whether to indict the three.

If prosecutors again decide not to indict them but the inquest committee maintains its stance that they should be held criminally responsible for the disaster, the three will be indicted mandatorily and stand trial.

After the Great East Japan Earthquake and tsunami led to the triple meltdown at the Fukushima No. 1 nuclear plant in March 2011, residents affected by the accident and citizens groups filed complaints with prosecutors against the 42 people. Those named in the complaints included not only the former TEPCO executives, but also former high-ranking government officials, including Naoto Kan, who was prime minister at the time of the disaster.

The groups said some inpatients died on their way to evacuation centers from hospitals while others were exposed to radiation from the nuclear power plant.

The prosecutors office accepted the complaints in August 2012. But after the investigations wrapped up, they decided in September 2013 not to indict any of the 42 people.

Prosecutors said the size and scale of the magnitude-9.0 earthquake and tsunami could not have been predicted by experts. They also said evidence of negligence among the 42 people was insufficient.

But a group of people, including those affected by the nuclear accident, asked the prosecution inquest committee in October 2013 to examine the evidence against six former TEPCO executives, including Katsumata, Muto and Takekuro.

In the July 31 announcement of its decision, the inquest panel pointed out that before the nuclear accident, TEPCO estimated that a tsunami as high as “15.7 meters” could hit the Fukushima plant, based on a government organization’s forecast.

The actual tsunami was 15.5 meters at the highest point and inundated the reactor buildings that were located 10 meters above sea level.

“Assuming the arrival of such a tsunami, TEPCO should have taken countermeasures, although it is impossible to predict when it would arrive because a tsunami is a natural phenomenon,” the panel said.

Panel: Ex-TEPCO officials should be indicted

http://www3.nhk.or.jp/nhkworld/english/news/20140731_22.html

Jul. 31, 2014 - Updated 05:36 UTC+2

A prosecution inquest panel has decided that 3 former executives of Tokyo Electric Power Company should be indicted for their handling of the March 2011 disaster at Fukushima Daiichi nuclear plant.

Residents of Fukushima Prefecture and others filed criminal complaints in 2012 against more than 30 TEPCO officials.

They claimed the utility's lack of precautions against a massive earthquake and tsunami amounts to

professional negligence resulting in injury.

But prosecutors dismissed the complaints in September last year, saying the officials could not have predicted an earthquake and tsunami of such scale.

The plaintiffs took the issue to a prosecution inquest panel made up of randomly-selected citizens.

They'd narrowed their target to 6 former TEPCO executives, including former chairman Tsunehisa Katsumata.

On Thursday, the panel judged the prosecution wrong and said Katsumata and 2 others should stand trial. For the other 3, the panel judged one of the non-indictments as unjust and the other 2 as appropriate.

The prosecution will now decide whether to indict the 4 who've been judged found trial-worthy.

The panel said that Tokyo Electric Power Company has recognized that the utility will not be able to easily ignore future earthquakes and tsunami projected by a science ministry panel.

The panel said that even though it is uncertain whether natural disasters like earthquakes and tsunami will come or not, TEPCO had to take measures on the basis that such earthquakes and tsunami are likely to hit its Fukushima plant.

If prosecutors decide again not to indict them, the case will automatically go back to the inquest panel. If the panel repeats its judgment, Katsumata and the other 2 will be forced to stand trial.

Regarding former Prime Minister Naoto Kan and other government leaders at the time of the disaster, another inquest panel has already judged as appropriate the decision by prosecutors not to indict them.

Former TEPCO chairman Katsumata has told NHK he is in no position to comment on the panel's judgment.

The plaintiffs' leader, Ruiko Muto, said it's disappointing that not all 6 were judged trial-worthy, but described the decision as honest and proper.

She called for an immediate re-investigation by the prosecution.

Ex-TEPCO execs merit indictment over nuclear crisis: prosecution panel

<http://mainichi.jp/english/english/newsselect/news/20140731p2g00m0dm055000c.html>

TOKYO (Kyodo) -- An independent judicial panel of citizens said Thursday it has decided that three former executives of Tokyo Electric Power Co. merit indictment over the 2011 nuclear disaster at the Fukushima Daiichi power plant.

The Tokyo No. 5 Committee for the Inquest of Prosecution voted in favor of the decision on Tsunehisa Katsumata, chairman of TEPCO at the time of the disaster, and two former vice presidents, Sakae Muto and Ichiro Takekuro.

The panel said the former executives had failed to take sufficient steps to ensure safety despite the possibility that a massive tsunami could trigger an unprecedented accident.

The move comes after Japanese prosecutors decided last September not to indict former leaders of the Fukushima plant operator, citing their lack of criminal responsibility.

With the latest decision, the Tokyo District Public Prosecutors Office is expected to resume investigations into the three former officials. If they decide not to indict them or do not announce a decision within three months, the prosecution inquest panel will discuss the case once again.

Katsumata and the two others will face mandatory indictment should the panel decide again that they merit indictment.

Last September, prosecutors judged it was difficult to foresee the scale of the earthquake and tsunami in March 2011 that triggered the worst nuclear crisis since the 1986 Chernobyl disaster.

But around 5,700 people, including Fukushima residents affected by the nuclear crisis, were dissatisfied with the prosecutors' decision and asked the inquest panel to review the case last October.

Parallels with US Occupation period

July 30, 2014

Not muzzled yet: A protester shouts slogans against the state secrets law outside the Diet building in January. Fukushima disaster colors A-bomb anniversariesput into 5**

Parallels can be drawn between control of information during Occupation and today

<http://www.japantimes.co.jp/community/2014/07/30/voices/fukushima-disaster-colors-bomb-anniversaries/#.U9o0nmPi91s>

by Jason Bartashius
Special To The Japan Times

Over the past three years, the atomic bombing anniversaries in August have increasingly become a time to ask new questions.

How did the only country to experience nuclear bombings come to embrace nuclear power, a decision that ultimately led to the ongoing crisis at the Fukushima No. 1 plant? Does Japan have the capability or political will to create its own nuclear arsenal? Is it morally acceptable to export nuclear technology to countries that are prone to natural disasters or may later decide to manufacture atomic weapons?

And what about censorship? Based in large part on its attempts at withholding or manipulating information related to the Fukushima disaster, the country has seen itself spiral down the Reporters Without Borders Press Freedom Index, falling a staggering 31 places between 2012 and 2013.

The situation can only worsen with the recent passage of the state secrets law. Will the law be used to keep important information regarding radiation and the safety of power plants secret? What impact will it have on anti-nuclear activism? And how do the new law, the overall lack of transparency and the handling of Fukushima compare to U.S. Occupation policies — especially those that squashed discussions of the atomic bombings?

One way history has repeated itself is in the way in which individuals and agencies have rushed to assure the public that radiation levels posed little or no threat to health.

Scholars Robert Jay Lifton and Greg Mitchell note that after a team of scientists toured Hiroshima in September 1945, U.S. Army Maj. Gen. Leslie Groves, the head of the Manhattan Project, “announced to the press that if any Japanese had died from exposure to radiation, ‘the number was very small.’ . . . Vegetation was growing in Hiroshima, and radiation levels were so low, ‘you could live there forever.’ ” The U.S. public image took priority over the reporting of facts.

Skip ahead to 2011: Dr. Shunichi Yamashita, the head of Fukushima Medical University, makes controversial remarks suggesting that an exposure limit of 100 millisieverts per year is acceptable. The comments, which made international headlines, were contested. Referring to the remarks, The Japan Times’ Eric Johnston wrote, “According to a 2006 study by the U.S. National Academy of Science, an exposure of 20 millisieverts will produce 2,270 cancer cases per 1 million people annually.”

Jump to spring 2014: On April 14, the Mainichi Shimbun reports that in an effort to collect data on internal radiation exposure, the Foreign Ministry sent an email to municipalities that “suggested the data could be used to play down the radiation effects from the disaster.” The data was to be used by the International Atomic Energy Agency, but “the email suggested that the IAEA report is expected to evaluate radiation exposure among residents at lower levels than reports by other international organizations.”

Much debate, of course, has taken place regarding the safety of Fukushima since March 2011. I do not cite the above examples to make any claims about the current degree of danger in the area surrounding the No. 1 plant, but merely to draw attention to historical parallels in terms of **irresponsible and misleading communication with the public.**

We see a similar parallel in the ways in which the U.S. Occupation and Japanese governmental bodies have interfered with medical research.

During the U.S. Occupation it was extremely difficult for Japanese medical doctors to conduct and publish research. Monica Braw, a scholar of U.S. Occupation censorship, relays a conversation she had with Dr. Issei Nishimori, who intended to study the effects of the bomb on humans. Nishimori recounted all the difficulties the medical establishment faced: lack of funds, restrictions, being required by the Allied authorities to translate all reports into English, and not having access to autopsy materials that were shipped to the U.S. or the results of research conducted by the Atomic Bomb Casualty Commission set up by the Americans.

Censorship was another factor. Braw informs us that medical journals were censored for various types of undesirable content, such as criticism of the Allied authorities and wartime nationalist propaganda (occurring in material written before the conclusion of the war) as well as any mention of censorship, which itself was supposed to be a secret. Two articles were censored for discussions of the effects of the atomic bombs.

All in all, around 50 reports about the atomic bombings appeared in medical journals between 1945 and 1949, but the bulk of these reports didn't appear until 1947. In 1948 and '49, the last two years of censorship, the number of published articles about the issue dropped significantly.

Academic Sey Nishimura argues that self-censorship was behind the decline: "Voluntary restraint may have played a part, since the year 1947 marked the change from prepublication censorship, when deletions were made at the galley-proof stage, to post-publication censorship, where notification of disapproval occurred after publication."

As for the situation in Fukushima, the government hasn't always been enthusiastic about radiation-related medical research. On Dec. 19, 2012, the Mainichi reported, "The Fukushima prefectural government has tried to kill a proposal by a local assemblyperson to store local children's milk teeth to examine their internal radiation exposure stemming from the Fukushima nuclear disaster, it has been learned." Fortunately, more recently, plans for a large-scale study to test milk teeth for cesium, strontium-90 and other isotopes were revealed to the public. But, understandably, the public has grown very suspicious of government involvement in research.

There are also parallels between the suppression of protests against the use of the atomic bomb by the U.S. and the potential for the state secrecy law to negatively impact upon the anti-nuclear movement.

In September 1945, a Japanese film crew visited Nagasaki with the intention of documenting the destruction and to "appeal against the inhumanity of the bomb to the Red Cross in Geneva." The crew, however, was arrested by U.S. military police and their footage was confiscated. And so began a U.S. effort

to render invisible images of destruction and the victims' suffering in order to protect the official narrative that the bombs were justifiably necessary to end the war swiftly and save American lives. When the Smithsonian was planning an exhibition to commemorate the 50th anniversary of the end of the war in 1995, U.S. veterans protested over what they saw as too much emphasis on Japanese casualties.

How will the Fukushima disaster be remembered? What narratives will be constructed? Archived newspaper articles and footage always play a vital role in the telling of any history. Censorship is needed to construct acceptable presentations of news not only for tomorrow's readers, but also for the students, scholars and general public of the future. Activists challenging the construction of such narratives are deemed dangerous by governments. An indisputably clear case of this is the passage of the state secrecy law, which threatens bureaucrats leaking information to the public and journalists seeking that information with jail time.

The law is primarily concerned with national security. However, skeptics are concerned that information related to nuclear power plants may be classified in the name of preventing terrorism.

Others are worried about what impact the law may have on anti-nuclear activism. Johnston writes, "Receiving less attention is the question of whether ordinary citizens who are involved in anti-nuclear protests might be targeted and investigated under the new law."

Koichi Nakano, professor of political science at Sophia University, is also concerned.

"You find a similar power with the Japanese government as existed during the U.S. Occupation," Nakano said in an interview. "Self-censorship will become more prevalent. Journalists will censor themselves before asking questions. The activists who try to find out information about the nuclear industry may get in trouble, they may not, but they'll worry about what they otherwise wouldn't."

Indict them!

August 1, 2014

Citizen panel pins blame on ex-TEPCO execs for accepting nuclear safety myth

<http://mainichi.jp/english/english/newsselect/news/20140801p2a00m0na007000c.html>

A July 31 judgment by the Tokyo No. 5 Committee for the Inquest of Prosecution that three former executives of Tokyo Electric Power Co. (TEPCO) merit indictment over the 2011 Fukushima nuclear

disaster not only prods prosecutors to review their decision not to indict for their criminal responsibility, but is also a sharp rebuke to TEPCO and regulatory authorities for neglecting safety.

The committee composed of regular citizens voted in favor of indicting former TEPCO Chairman Tsunehisa Katsumata and two former vice presidents, Sakae Muto and Ichiro Takekuro. The recommendation made clear the perception gap between experts and ordinary citizens about nuclear safety as well as the double standards vis-a-vis prosecution concerning decisions to indict or not. "This kind of judgment was possible," a senior prosecutor said.

The citizens' committee strongly denounced TEPCO executives at the time of the nuclear crisis triggered by the March 11, 2011 Great East Japan Earthquake and tsunami, and requested prosecutors to reinvestigate the case. The committee pointed out that electric power companies and regulatory authorities probably shared the view that nuclear power plants were safe. It also stressed that the former TEPCO executives cannot shirk their responsibility for the Fukushima disaster simply because they had held fast to the nuclear safety myth.

What divided opinions between prosecutors and the independent judicial panel was the issue of preparedness for an accident caused by an unpredictable killer tsunami. There is an enormous perception gap between citizens who had sought every preparatory step imaginable, and prosecution and courts with conventional thinking.

The prosecution must substantiate how foreseeable a disaster is if looking to build a case for criminal negligence. It is not enough simply to recognize an abstract danger, but prosecutors are required to prove that the accused could specifically predict the disaster. The former TEPCO executives had maintained that they could not foresee the nuclear disaster because of an unanticipated huge tsunami.

In the course of the prosecution's investigations, the focal point was on how to overturn TEPCO's argument after revealing the state of research on earthquakes and tsunami. They focused on two findings, the first a governmental earthquake study task force announcement in 2002 that tsunami triggered by an earthquake may occur off Fukushima Prefecture; and second, a 2008 TEPCO forecast shows that a tsunami as high as 15.7 meters could strike in a worst case scenario.

Prosecutors determined that researchers for the 2002 study could not imagine a natural disaster comparable to the 2011 Great East Japan Earthquake, and the 2008 forecast outlined the most severe scenario, such that TEPCO could not predict the huge tsunami that devastated the Fukushima No. 1 nuclear plant.

On the other hand, the Tokyo No. 5 Committee for the Inquest of Prosecution said damage from a nuclear plant accident would be heavy and effects from such an accident would be long-lasting. Nuclear power plant operator executives are required to pay extremely careful attention and shoulder personal responsibility for the safety of nuclear power plants, the committee said.

The panel went on to criticize TEPCO for failing to predict a huge tsunami as one requiring preparatory steps and neglecting to follow through on the 2008 forecast. TEPCO could have avoided damage or at least minimized it had the utility installed power generators on higher ground, updated the emergency manual and conducted drills, the panel said.

Prosecutors will question Katsumata and other former TEPCO executives. But a senior prosecutor says the case has been investigated in accordance with standards permitted under previous trials. The prosecution inquest panel, however, is demanding more than that, the prosecution source said, adding the planned reinvestigation would be tough. (By Yu Yoshizumi and Ebo Ishiyama, City News Department)

August 01, 2014(Mainichi Japan)

July 31, 2014

3 ex-TEPCO execs recommended for indictment by citizens' committee**

<http://mainichi.jp/english/english/newsselect/news/20140731p2a00m0na021000c.html>

A committee for the inquest of prosecution announced on July 31 that it had recommended three former executives of Tokyo Electric Power Co. (TEPCO), including its former chairman, be indicted for their criminal responsibility over the Fukushima No. 1 Nuclear Power Plant disaster.

The citizen-composed Tokyo No. 5 Committee for the Inquest of Prosecution said that while it was impossible to predict specifically that a tsunami like the one that struck on March 11, 2011, would hit the plant, the TEPCO executives should have been better prepared for the coming of a tsunami. It said that research done before the Great East Japan Earthquake was scientifically-based, but TEPCO, while knowing that it shouldn't ignore this research, avoided taking disaster-prevention measures due to reasons including their cost.

The recommendation was adopted on July 23. It overrides a former decision by the Tokyo District Public Prosecutors Office not to indict the three former executives on charges that included causing death and injury through professional negligence, and requires them to re-examine the former executives' cases and make a new decision on their indictment. If they again decide not to indict and the committee again decides in favor, indictment will proceed forcibly.

The three former executives are Tsunehisa Katsumata, 74, former TEPCO chairman, and former vice presidents Sakae Muto and Ichiro Takekuro. The committee also decided that two other executives did not merit indictment but that another one should be further investigated.

The committee also said that, as TEPCO's person most in charge, Katsumata "was in a position allowing him to make (company) departments take appropriate countermeasures. He is thought to have come into contact with a report on the possibility of the arrival of a tsunami much greater than had been anticipated until then, so we cannot trust his explanation that he did not know about the important points (of that report.)"

The committee further argued that Muto and Takekuro, having been in charge of the company's nuclear division, received a report in 2008 that a tsunami up to 15.7 meters tall could strike the plant, and were also in a position to enact appropriate countermeasures.

Previously disaster victims and citizens' groups sued Katsumata and other TEPCO executives who were in charge at the time of the disaster, as well as former Prime Minister Naoto Kan and other government officials who handled the government response to the tragedy. In September 2013, the Tokyo District Public Prosecutors Office decided not to indict the former TEPCO executives, Kan or the other government officials, turning down an indictment against the 42 sued people.

In October 2013, an organization of Fukushima Prefecture residents and disaster evacuees narrowed down their targets to the six former TEPCO executives and sought a decision by the committee for the inquest of prosecution, which led to the July 23 decision.

July 31, 2014(Mainichi Japan)

Raising power prices (effects of-)

August 2, 2014

Editorial: Power companies can't ignore problems when raising electricity prices

<http://mainichi.jp/english/english/perspectives/news/20140802p2a00m0na004000c.html>

Hokkaido Electric Power Co. has applied to the Ministry of Economy, Trade and Industry to charge its consumers more for power, as prospects for restarting its Tomari Nuclear Power Plant in Hokkaido remain unclear and its expenditure on other fuels has adversely affected its business performance. If the

company increases its fees, the move may prompt Kansai Electric Power Co. and Tokyo Electric Power Co. to follow suit.

If electricity rate increases are directly linked to rises in fuel costs stemming from the suspension of nuclear power plants, then it will have a major impact on the domestic economy. The government and power companies cannot waste time sidelining problems in anticipation of the restart of nuclear reactors.

Hokkaido Electric Power Co.'s planned price hike follows an increase in September last year. Households face an approximately 17 percent increase, much more than the roughly 7.7 percent implemented last year. Corporate customers for which government authorization of a price hike is not required, meanwhile, face a roughly 22.6 percent increase. Such a drastic price hike, however, will have a major adverse effect on the regional economy. The Ministry of Economy, Trade and Industry is likely to approve a price hike from November, but it needs to urge the utility to step up streamlining of its operations to limit the extent of the increase.

Hokkaido Electric Power Co. should do its utmost to cut costs. It must be noted, though, that a streamlining plan had accompanied the application for the first hike, and the extent of further cost-cutting measures will likely be limited.

It is a problem that the power company has had to apply for a price raise again after just one year. In the wake of the disaster at the Fukushima No. 1 Nuclear Power Plant, the government has revised the way in which electricity rates are calculated, from year-by-year calculations to an average for a three-year period. Government officials apparently expected nuclear reactors would be restarted within three years, leading to reduced fuel costs and modest price hikes. But this was a case of counting their chickens before they had hatched. In effect, they were adopting a lax outlook and putting problems on the backburner.

If Japan's nuclear power plants are not restarted, then business models that had envisaged their operation will crumble. Hokkaido Electric Power Co., which relied heavily on nuclear power, has seen this firsthand. The model is the same for other utilities including Tokyo Electric Power Co., operator of the Kashiwazaki-Kariwa Nuclear Power Plant, and Kansai Electric Power Co., which relies on the Oi and the Takahama nuclear power plants.

It would be simplistic to say that nuclear reactors should be restarted because the companies rely on them. In light of the grave consequences of the Fukushima nuclear disaster, there is evidently a need to reduce reliance on nuclear power as soon as possible. And in that case, we will probably have to accept a degree of price increases. When the electricity supply is not increasing, efforts will also need to be made to conserve power.

Japan's economy cannot stand if the suspension of nuclear power plants is linked directly to price increases. The basic energy plan adopted by the administration of Prime Minister Shinzo Abe has presented a policy of reducing dependence on nuclear power. While confirming that premise, the government and people of Japan must put their heads together to find ways to control electricity prices.

To reduce the costs of power generation through liquefied natural gas, which can replace nuclear power, Japan needs to strengthen its bargaining ability in its negotiations with gas-producing countries. However, it must not rely on relatively cheap coal-fired thermal plants, which run counter to measures against global warming.

Reforms to the power system that aim to diversify services and control prices by introducing principles of competition are also important. We call for the establishment of an effective system for Japan's power industry.

Cheating TEPCO

August 3, 2014

NPO headed by ex-defense chief suspected of defrauding Tepco

<http://www.japantimes.co.jp/news/2014/08/03/national/npo-headed-ex-defense-chief-suspected-defrauding-tepco/#.U94nlGPi91s>

Kyodo

A former employee of a nonprofit organization headed by former Defense Minister Fumio Kyuma was arrested Saturday for allegedly swindling about ¥12 million from Tokyo Electric Power Co. by filing a bogus claim for damages from the Fukushima nuclear disaster, police said.

Kazuaki Shindo, 42, is suspected of conspiring with three others including Shigeko Nemoto, 52, to defraud Tepco by submitting a document claiming that Nemoto's company was forced to cancel a number of events from April to May 2012 due to radiation from the meltdowns, the Metropolitan Police Department said.

The NPO was launched in August 2011 to assist victims of the March 2011 earthquake, tsunami and subsequent nuclear disaster. The police are considering questioning Kyuma, 73, on a voluntary basis, investigative sources said.

According to the police, the NPO represented companies in disaster-hit areas seeking damages from Tepco. The operator of the Fukushima No. 1 nuclear plant has paid more than ¥100 million in compensation to more than 10 companies so far.

Shindo denied the allegation but the other three admitted to the charges, the police said.

NPO members arrested for Fukushima redress fraud

http://www3.nhk.or.jp/nhkworld/english/news/20140802_27.html

Aug. 2, 2014 - Updated 18:38 UTC+2

Tokyo police have arrested 4 people on suspicion of swindling compensation money out of the operator of the damaged Fukushima Daiichi nuclear plant.

Police say that 3 former members of a Tokyo-based non-profit organization and an executive of a staffing agency in Fukushima Prefecture defrauded Tokyo Electric Power Company of about 117,000 dollars.

The 4 suspects allegedly made a false claim in 2012 that the staffing agency suffered a sales drop because it received fewer job orders from hotels in Fukushima after the nuclear accident in the previous year.

Police say the NPO has been contracted to make applications for compensation for people affected by the accident, including local staffing agencies, since it was established 3 years ago.

More than 1 million dollars have been paid based on claims made by the NPO which is represented by former Defense Minister Fumio Kyuma.

Police say 3 of the 4 suspects have admitted to the allegations.

Responsible or not?

August 5, 2014

Responsibility for disaster

<http://www.japantimes.co.jp/opinion/2014/08/05/editorials/responsibility-for-disaster/#.UC7ImPi91s>

Prosecutors need to take a recent decision by a judicial panel of citizens seriously and look hard again at whether Tokyo Electric Power Co.'s former top executives should be held criminally responsible for the

March 2011 disaster at its Fukushima No. 1 nuclear power plant. The government and power companies, meanwhile, need to see the decision by the Tokyo No. 5 Committee for the Inquest of Prosecution as a stern warning from citizens against their moves to restart the nation's idled nuclear power plants before demonstrating they've fully grasped the lessons of the Fukushima nuclear catastrophe.

The prosecution inquest panel on July 31 voted that three former Tepco executives, including ex-chairman Tsunehisa Katsumata, should be indicted on a charge of professional negligence for failing to take appropriate steps to prevent the triple meltdowns at the Fukushima plant.

The panel, comprising 11 randomly selected ordinary citizens, had been reviewing the Tokyo District Public Prosecutors Office's September 2013 decision not to take action against the Tepco management on the grounds that it was difficult for them to foresee the scale of the massive tsunami triggered by the Great East Japan Earthquake on March 11, 2011, which crippled emergency generators that supply power to cool nuclear cores during power outages and led to the meltdowns at three of the plant's nuclear reactors.

If the Tokyo prosecutors decide again not to indict the executives or to take no action within three months, the inquest panel will once again review the case. Katsumata, who was Tepco chairman at the time of the Fukushima disaster, and the other executives will face mandatory indictments if the panel decides for the second time that they should be indicted.

Last year's decision by the prosecutors not to take action against the former Tepco executives is said to have reflected the difficulty in establishing a criminal case against top leaders of a large company like Tepco over what happened at its plant. Court rulings have found individuals guilty of professional negligence only when it is proven that they could have foreseen an accident in question in concrete terms and that the event could have been averted.

Prosecutors tend to follow such court precedents when they decide whether to file charges against company executives. Unlike plant managers or the like, it is rare for top executives of a major firm to be convicted of such a crime.

The prosecutors' decision must have sounded unacceptable to Fukushima residents displaced from their homes due to radiation fallout from the meltdowns, because it meant that nobody would be held criminally responsible for the disaster that had shattered the lives of so many people.

In addition to such public sentiments, it is important to identify who was responsible for what technically went wrong at the Tepco plant — a process that will be crucial for ensuring that the same mistakes are never repeated.

In its decision last week, the inquest panel said executives of utility companies that deal with nuclear power are duty-bound to pay an “extremely high level” of attention to ensure plant safety, and that they need to take safety steps to guard against events that could go beyond their assumption.

In 2008, Tepco estimated that the biggest tsunami that could hit the Fukushima plant would reach as high as 15.7 meters, based on the government’s seismic data, but failed to take action to cope with such a risk because it was thought that such an effort could force the company to halt the operation of the plant, the panel charged.

It is said that on March 11, 2011, a 14-to-15-meter-high tsunami hit the plant, while a government computer simulation puts the tsunami’s height at 13.1 meters.

The panel also determined that Tepco was also aware by 2006 of the risk of the Fukushima plant losing its power supply— which could result in damage to its reactor cores — in the event of a massive tsunami.

As Tepco’s president and then chairman from 2002 to 2012, Katsumata had apparently been informed of the tsunami risk and was in a position to order relevant sections of the company to take preventive actions, the panel said, noting that Katsumata’s explanation that he had not known about key details pertaining to such risks is “not credible.”

The prosecutors need to clarify each of these points in the inquest’s charges. The reinvestigation should include additional interviews of Katsumata and the other executives as well as the examination of Tepco documents if necessary.

The inquest panel’s decision also serves as a reminder on how — more than three years after the Fukushima plant meltdowns — efforts to pin down the causes of the disaster are not making much progress.

Both the government’s and Diet-commissioned investigation panels on the Tepco plant disaster reported in 2012 that many aspects of what happened at the disaster remain a mystery, but there have not been many follow-up probes.

The Diet panel said the Fukushima plant crisis was a “clear man-made disaster” caused by the failure of both Tepco management and the government’s regulatory authorities to take preventive measures due to negligence on their part, which led to the shelving of problems and to decision making that conveniently

fit their own interests. It also did not rule out the possibility that the No. 1 plant suffered critical damage from the quake itself. Tepco, meanwhile, insisted in its report that the plant disaster was caused by the tsunami, which was bigger than its assumptions.

At present, the government and the power companies are pushing to reactivate nuclear power plants that were put offline after the Fukushima disaster, citing the cost burden on the economy of increased fuel imports, which push up electricity rates and cut the profits of utility companies.

The Abe administration says the plants will be safe once they've cleared the Nuclear Regulation Authority's screening under plant design standards updated to "the world's most stringent levels" in the wake of the Tepco plant crisis.

However, the inquest panel's decision shows that from citizens' viewpoint, efforts to identify the factors that caused the Fukushima disaster, including what people at Tepco did or did not do, and to learn its lessons — which should be the prerequisite for restarting nuclear power generation — are far from over.

Doubling the grants to Fukushima

August 9, 2014

Fukushima towns look set to bite on new offer of more money for storage facilities

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201408090038>

THE ASAHI SHIMBUN

The central government has offered to double the amount of grants to be paid if local municipalities in Fukushima Prefecture accept the construction of temporary storage facilities for radioactive debris produced by the 2011 nuclear accident.

In talks Aug. 8 with Fukushima Governor Yuhei Sato and the mayors of Okuma and Futaba towns in the prefectural city of Koriyama, Environment Minister Nobuteru Ishihara and Reconstruction Minister Takumi Nemoto offered to double the grants to 301 billion yen (\$3 billion) if they OK the storage facilities.

In previous closed-door negotiations, the government had pledged grants of 150 billion yen. With a new offer on the table, it would appear that the talks are entering the final stages.

“We want to examine the contents of the proposal in detail (before making a decision),” Sato said.

Earlier negotiations became entangled and triggered a public uproar after Ishihara implied that local residents could be easily bought.

“In the end, it will come down to money,” Ishihara said June 16, angering the local governments and sending the negotiations into a stall.

The triple meltdown at the Fukushima No. 1 nuclear power plant triggered by the March 11, 2011, Great East Japan Earthquake and tsunami produced huge amounts of soil and debris contaminated with radioactive material.

Tons of debris collected during decontamination work is currently stored at makeshift sites across Fukushima Prefecture.

The government plans to store all the debris for 30 years in “intermediate storage facilities” that are planned to be constructed in Okuma and Futaba.

The 301 billion yen will be classified into three categories. The first (150 billion yen) category is for “grants for the intermediate storage facilities.” The second (100 billion yen) is for “grants for reconstruction of Fukushima,” and the third (51 billion yen) is an increase of conventional “grants for areas that host electricity sources.”

The grants in the first category will be mainly paid to the town governments of Okuma and Futaba, but funds will also be provided to the Fukushima prefectural government. The grants will be used for a variety of purposes to help residents rebuild their lives.

For example, grants will be used to cover the cost of visits to graves by residents who will lose their land due to the construction of the intermediate storage facilities.

Funds will also be provided to develop measures to alleviate concerns elsewhere in Japan that farm, forestry and fishery products in Fukushima Prefecture are contaminated with radioactive materials.

The grants of the second category will be used to construct key facilities in reconstruction projects. Funds will also be used by prefectural authorities for prefecture-wide measures to prevent malicious rumors about food safety from circulating.

As for the third category, grants have been given to localities that host nuclear power plants.

So far, 6.7 billion yen has been paid annually to local governments in Fukushima Prefecture.

The plan calls for increasing the annual amount by 1.7 billion yen to lessen the economic blow caused by decommissioning damaged nuclear reactors, and maintaining the yearly payments for 30 years, amounting to 51 billion yen.

The doubling of the total amount of grants signals that the central government is eager to begin the transportation of radioactive soil and debris to the intermediate storage facilities.

It is pushing to get the project under way by January 2015.

The decision to double the amount of grants suggests the negotiations are now starting to move forward.

Subsidies not the answer

August 11, 2014

Editorial: Subsidies not the answer to problem over storage site for radioactive soil

<http://mainichi.jp/english/english/perspectives/news/20140811p2a00m0na009000c.html>

The government has made a drastic decision over the planned construction of an interim storage facility for radioactive soil generated through decontamination work in the wake of the Fukushima No. 1 nuclear power plant disaster, forking out an additional 301 billion yen in regional subsidies.

The subsidies, which will be used for rebuilding local residents' lives and regional development, have gained some credit from the Fukushima prefectural towns of Okuma and Futaba -- the candidate sites for the temporary storage facility -- and the Fukushima Prefectural Government. The move marks a step forward toward the central government's goal of starting partial operation of the facility in January next year.

Local residents' distrust in the central government, however, hasn't been completely dispelled, on the heels of Environment Minister Nobuteru Ishihara's gaffe suggesting the issue of where to build the interim storage facility was a matter of money. The government has yet to reveal the purchase price of land for the storage facility, leaving the fate of the negotiations with candidate towns up in the air. The town assemblies of Okuma and Futaba have asked their mayors not to make hasty decisions over the issue.

The central government is urged not to resort to money in settling the matter but instead to explain repeatedly the necessity and safety of the storage facility and the future path for the host town so as to gain local residents' understanding.

The interim storage facility is intended to store up to around 25.5 million cubic meters -- or the equivalent of filling 20 Tokyo Domes -- of soil and waste contaminated with radiation in Fukushima Prefecture for a duration of up to 30 years. The government had initially planned to nationalize a total of 16 square kilometers of land in Okuma and Futaba -- which host the crippled Fukushima No. 1 nuclear plant -- and develop the land for the construction of the facility. However, the plan met a local backlash out of concern that the interim storage facility could ultimately become a final disposal site, with residents resisting to let go of the land of their ancestral legacy.

In response, the government gave up on the idea of nationalizing the land in its entirety and instead **decided to introduce a maximum 30-year surface right of land so that the government can utilize the premises while landowners retain their property rights.** The government's promise to transfer the contaminated waste from the interim facility to outside Fukushima Prefecture 30 years later for final disposal will also be legislated.

One could call the government's measures appropriate in taking local sentiment into consideration. Nonetheless, talks over the additional subsidies between the central and the Fukushima Prefectural Government have hit a snag, with the former aspiring to keep the amount somewhere around 100 billion yen while the latter demanding roughly 1 trillion yen.

Under the central government's proposal, a total of 250 billion yen in subsidies will be forked out to the Fukushima Prefectural Government and the towns of Okuma and Futaba in lump-sum payments. Aside from this, an annual 1.7 billion yen will be added to government subsidies for municipalities hosting nuclear plants over the 30-year period.

It is a matter of course that Fukushima Prefecture needs generous financial assistance in the aftermath of the gravest damage it has suffered from the nuclear catastrophe. The central government describes the new set of subsidies as "highly discretionary" for the recipient municipality and calls it the "maximum allowance" it could fork out. However, the government hasn't unveiled the basis for calculating the vast trove of subsidies.

Most areas in Okuma and Futaba still fall within the so-called "difficult-to-return" zone due to high levels of radiation. The subsidy funds would not be effectively utilized unless there is a clear picture of reconstruction in those areas. While the Reconstruction Agency explains that it will draw up a basic concept on the recovery of the two towns and work on the future vision of evacuation zones from medium- to long-term and broader perspectives, **budget measures should essentially be worked out in the presence of a clear picture of the future.**

The massive amount of subsidies is to be shouldered by none other than the general members of the public in the forms of electricity charges and taxes. The central government and municipalities concerned should reveal the usage of such subsidies and effectively utilize the funds as resources for achieving the recovery of Fukushima.

TEPCO's intentions

August 13, 2014

TEPCO mulls spinning off hydropower, renewable energy operations

<http://mainichi.jp/english/english/newsselect/news/20140813p2a00m0na008000c.html>

Tokyo Electric Power Co. (TEPCO) is considering spinning off its hydropower and renewable energy operations as part of its plan to adopt a holding company structure in April 2016, it has been learned. The utility had planned to spin off its three business operations -- thermal power generation, power transmission and distribution, and retailing -- and make them independent companies. But it will spin off a total of four business operations after turning its hydropower and renewable energy operations, which are part of its power transmission and distribution operations, into a separate company. TEPCO, the operator of the crippled Fukushima No. 1 Nuclear Power Plant, is looking to secure neutrality for its power transmission and distribution unit and improve the efficiency and profitability of the other three operations as stand-alone business entities.

In its "New Comprehensive Special Business Plan" worked out in January this year, TEPCO adopted a policy of spinning off three business operations -- thermal power generation, power transmission and distribution, and retailing -- under a holding company, starting in fiscal 2016. The hydropower and renewable energy units were included in the new power transmission and distribution company to be established. As for the electricity system reform pursued by the government, major utility companies will be required to separate their power transmission and distribution operations from their power generation and retailing services by around fiscal 2018 to 2020.

Under these circumstances, TEPCO is considering separating its hydropower and renewable energy operations from its power transmission and distribution functions. Apparently, **the plan is also aimed at making it easy for the envisaged new companies to secure funds from private financial institutions as business entities that are independent of the holding company that holds responsibility to pay damages linked to the Fukushima nuclear disaster and decommission the crippled nuclear power complex.**

Promotion of nukes still going strong

August 15, 2014

Utilities still spending consumer fees to run nuclear-promotion centers

<http://ajw.asahi.com/article/business/AJ201408150053>

Seven electric power utilities continue to spend billions of yen to run facilities that promote nuclear power despite dwindling visitor numbers and pressure on the companies to cut costs.

Operating expenses for these public relations centers are covered by consumer payments for electricity, the rates for which were raised after the utilities' nuclear reactors were taken offline following the 2011 Great East Japan Earthquake and tsunami.

The government approved the higher charges on households based on the premise that the companies would take thorough measures to improve efficiency and reduce spending.

The nine utilities in Japan that operate nuclear power plants spent 38 billion yen (\$370 million) in advertising in fiscal 2012, a 56-percent drop from fiscal 2010.

But according to research by The Asahi Shimbun, seven utilities--Hokkaido Electric Power Co., Tohoku Electric Power Co., Tokyo Electric Power Co., Chubu Electric Power Co., Kansai Electric Power Co., Shikoku Electric Power Co. and Kyushu Electric Power Co.--still run 17 promotional facilities.

Six of them revealed they will spend a total of about 3 billion yen in operating expenses this fiscal year for the public relations facilities, most of which are related to nuclear power plants. Chubu Electric declined to provide figures.

Many of the facilities were built near power plants to illustrate the mechanism of nuclear power generation. Models, images and other displays appeal the need for nuclear energy and its safety. Other facilities explain and promote thermal, hydroelectric and geothermal power generation.

The nuclear promotion sites, however, tend to be better equipped. Some offer recreational services, including a pool for residents who live in areas that host nuclear power plants.

Although entry to most of these facilities is free, visitor numbers have fallen in recent years due in part to their inconvenient locations and deteriorating conditions.

In fiscal 2012, 15,000 people visited an exhibition center near Kyushu Electric's Sendai nuclear plant in Satsuma-Sendai, Kagoshima Prefecture, below 20 percent of the peak figure in fiscal 1982. The Sendai nuclear plant is expected to be the first brought back online under stricter new safety standards of the Nuclear Regulation Authority.

TEPCO shut down two facilities related to its two nuclear plants in Fukushima Prefecture that were hit by the tsunami on March 11, 2011. A triple meltdown occurred at the Fukushima No. 1 nuclear plant following the disaster.

They were the only nuclear-promotion facilities to close down.

But TEPCO still runs five facilities related to its nuclear power plants and one facility connected to a different power plant.

Although Kyushu Electric also shut down some public relations centers, it continues to operate two nuclear-related and two other facilities.

Kenichi Oshima, a professor of environmental economics at Ritsumeikan University's College of International Relations, said the utilities may feel they have no choice but to keep running these facilities, despite their tough financial situations.

He said the facilities were established to reassure residents in communities that agreed to host nuclear power plants, so shutting down these sites could give the impression that abandoning nuclear power is OK.

But he said that is no justification for the power companies to continue spending on the facilities.

"The costs lack economic rationality, so they should be reviewed," Oshima said.

TEPCO officials said the company continues to operate nuclear-promotional facilities because they serve as important bases to provide accurate and comprehensible information about the power plants.

Kyushu Electric also said the facilities are indispensable in gaining the public's understanding for its plans to restart nuclear reactors.

The other utilities echoed that sentiment, saying they have no plans to dismantle such necessary promotional facilities.

(This article was written by Makoto Tsuchiya and Kaname Kakuta.)

Ex-Kepeco vice-president admits secret payments to politicians

August 16, 2014

http://www.japantimes.co.jp/news/2014/08/16/national/kepeco-monstrous-500-pound-gorilla-kansai/#.U_DYiGOFnKe

Kepeco: the monstrous 500-pound gorilla of Kansai

Last month, Chimori Naito, a 91-year-old former vice president at Kansai Electric Power Co., admitted what was hardly a secret but which put the utility under intense media scrutiny.

Naito said in a series of interviews with the Asahi Shimbun that he supervised under-the-table cash payments to seven prime ministers and key politicians in the ruling and opposition parties between 1972 and 1990 to ensure favorable policies, especially nuclear power policies. Naito guessed Kepeco's annual payoffs were in the hundreds of millions of yen.

Kepeco got its money's worth. Prior to March 11, 2011, Japan relied on nuclear power for about a third of its electricity needs. But half of Kepeco-supplied electricity came from nuclear power. Fukui Prefecture became home to 11 Kepeco reactors, the largest concentration in the country and, perhaps, the world. And it was Kepeco's two Oi reactors that were switched back on in the summer of 2012 despite massive public opposition.

In terms of local economic presence, Kepeco is the 500-pound gorilla. The company employs more than 22,000 people directly (and, indirectly, thousands more), has nearly 40 affiliated firms, and owns shares in about a dozen local public-relations facilities. These often take the form of "educational museums" that promote nuclear power. It also has small investments in Kansai-area television and radio stations.

All of this makes Kepeco similar to Japan's other utilities. But over the past two decades, as other Kansai firms moved to Tokyo or overseas, Kepeco has consolidated its power and influence over regional politics and policymaking to a degree unprecedented elsewhere, and in ways not always obvious to outsiders or Kansai residents.

Senior Kepeco officials serve as top representatives of hugely influential organizations such as the Kansai Economic Federation, which draws up regional political and economic strategies, and serves as a de facto political lobbying group in Tokyo. A Kepeco chairman has led the federation for 27 of its 68 years, and Shosuke Mori, Kepeco's current chairman, presently heads it. Many of Kansai's failed public works projects funded by Osaka were strongly backed by the federation.

In addition, why was the barely used second runway at Kansai airport constructed despite criticism it was a waste of public funds? You can thank a local airport promotion group headed by Kepeco's chairman.

Given that Kepeco has long provided direct election support, in the form of company "volunteers," to local LDP candidates, the fact Kepeco-favored plans usually become reality is hardly surprising.

Ideas promoted by Kepeco-led organizations have several common traits. First, they tend to result in massive physical structures (buildings, transportation systems) that, obviously, require Kepeco-generated electricity to run and maintain — nuclear-generated electricity, of course, not renewables. Second, they are often based on the "Kepeco School of Management," a mixture of top-down, centralized planning among a select few men over the age of 60 who decide what's best for the local economy — and for themselves. The result of this Kepeco-influenced Kansai economy since the mid-1990s has largely been one of stagnation, an accelerated shift to Tokyo of local money and talent, and a sense the gap between Kansai and other regions in East Asia in particular is growing. This is a major reason why Osaka Mayor Toru Hashimoto hates Kepeco and publicly criticizes it.

But Kansai's 500-pound gorilla remains as strong as ever, and despite the recent media attention, looks set to remain so for years to come. Which makes one wonder: Will we be reading, in 30 years, about how some Kepeco official paid off Liberal Democratic Party officials to help ensure the return of Shinzo Abe and the LDP?

View from Osaka is a monthly column that examines the latest news from a Kansai perspective.

More "donations" from facilities

August 17, 2014

TEPCO, Tohoku Electric to 'donate' 200 million yen more to village hosting nuclear reprocessing complex

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201408170015>

By SATOSHI OTANI/ Staff Writer

Embattled Tokyo Electric Power Co. and Tohoku Electric Power Co. will make a final combined 200 million yen (\$1.95 million) "donation" to a village hosting the nuclear fuel reprocessing plant, despite industry ministry criticism, The Asahi Shimbun has found.

The payment, which the two utilities have made annually since fiscal 2010, will go to assist the local fisheries industry in the village of Rokkasho in Aomori Prefecture.

An Asahi Shimbun investigation into the village's financial data and interviews with local officials showed that the Rokkasho government sent a document requesting financial assistance to TEPCO and Tohoku Electric on July 14.

Tohoku Electric is a utility serving Aomori and other prefectures in the Tohoku region.

Local officials say the money will be spent on renovating port facilities and an operation to prevent the poaching of fish.

The two companies replied in a letter on July 22 that they will comply with the request.

TEPCO is expected to pay 133.4 million yen and Tohoku Electric 66.6 million yen as early as this month, as was requested by the village hall.

The decision comes despite a TEPCO announcement in 2012 that it would end donations in order to come up with funds to pay compensation to those affected by the 2011 triple meltdown at its Fukushima No. 1 nuclear power plant.

The Ministry of Economy, Trade and Industry, which oversees the nuclear industry, concluded in 2012 that such a payment to Rokkasho "is not necessary in terms of operating the business of supplying power and is tantamount to a donation."

The finding means that TEPCO, which has been virtually nationalized after the nuclear accident, will still contribute the funds, despite passing the enormous costs of dealing with the accident onto taxpayers and electricity users.

The payment by the utilities will bring the total paid to Rokkasho to 1 billion yen over five consecutive years.

Such a payment by the companies began in fiscal 2010 under the aim of assisting the fisheries industry in the surrounding area of Higashidori, a village neighboring Rokkasho.

Higashidori hosts a single-unit nuclear plant operated by Tohoku Electric. The utility plans to build a new reactor there. TEPCO also plans on the construction of two reactors in the same area.

After the nuclear disaster, TEPCO received an injection of 5 trillion yen in government assistance to offer compensations to victims.

In addition, the government will spend 47 billion yen in taxpayer money to help the crippled Fukushima plant deal with the hundreds of tons of contaminated water being generated daily on the site.

TEPCO raised its power rates in September 2012, while Tohoku Electric took similar action in September 2013.

Hideyuki Ban, co-director of the Citizens' Nuclear Information Center in Tokyo, criticized TEPCO for making the payment at a time when little progress has been made on bringing the nuclear crisis under control and compensating those affected.

"It is beyond our understanding why TEPCO continues with the payment when it is effectively bankrupt," he said. "That money should be spent to compensate victims."

Both utilities defended the payment, stressing that this will be their last such expenditure.

"We have paid the money because we are convinced that it is indispensable in terms of the construction of a new nuclear plant, and that it is not the same as a donation," said a TEPCO public relations official. "The payment during the current fiscal year is expected to be our last."

A Tohoku Electric official said, "We have made the payment because it is based on an agreement made before the nuclear disaster.

"Our cooperation to help the local fisheries industry will end in the current fiscal year, and we do not plan to continue it."

METI's nuclear committee shows total disregard for disaster lessons

August 20, 2014

Editorial: Nuclear policy committee shows disregard for Fukushima lessons

<http://mainichi.jp/english/english/perspectives/news/20140820p2a00m0na011000c.html>

One of the most important lessons we've learned from the Fukushima No. 1 Nuclear Power Plant disaster is that the closed nature of the nuclear power industry led us to underestimate the dangers of nuclear reactors. The industry tuned out sound criticism from outside sources, largely influencing the government's policy and risk assessment. We must put this lesson to good use by making the policymaking and risk assessment process public and raising information transparency.

The Nuclear Regulation Authority (NRA) -- established after the onset of the Fukushima disaster -- streams video of its meetings and press conferences live, and the footage is also available for viewing online after the events take place. A Ministry of Economy, Trade and Industry (METI) deliberative council that reviewed the government's basic energy policy does the same. Such arrangements not only allow debate to extend to outside experts, it also serves to raise awareness and interest among the general public.

However, the Nuclear Energy Subcommittee of METI's Advisory Committee on Natural Resources and Energy, which has been holding meetings since June, accepts silent observers but does not publicly broadcast its meetings. Some subcommittee members have demanded that the meetings be broadcast, but as of the fourth meeting held Aug. 7, no video had been made available.

The subcommittee was established for the purpose of deliberating specific policies in the nuclear energy field based on the Basic Energy Plan approved by the Cabinet in April. Topics under discussion include reconstruction and revival in Fukushima, reduced dependence on nuclear energy, human resource development and nuclear fuel cycle policy. Such discussions will have a great bearing on what the country decides for its energy mix.

With the subcommittee debating topics that will dictate Japan's nuclear policy, transparency of its discussions is crucial.

Some may argue that allowing silent observers to watch from the visitors' gallery and the release of the minutes are sufficient. But those who can actually attend the meetings comprise a tiny percentage of the general public. Overviews of the meetings are released within a week or so of each meeting, but they do

not indicate who said what. It takes about a month before the minutes are released, by which time the next meeting has already taken place.

This state of affairs prevents the public from closely following the deliberation process. Some have proposed a compromise of providing audio broadcasts of the meetings, but such broadcasts fail to provide a complete picture, since it's difficult to identify who has the floor at any given time.

The subcommittee chair, Itaru Yasui, has cited the uneasiness some members would feel in voicing their views if the meetings were to be broadcast via video. However, nuclear energy policy is an important matter bearing on Japan's post-Fukushima energy policy. It's a matter of great interest to the public. If indeed the subcommittee's members feel they can't be honest if their meetings are broadcast, then perhaps there's a lack of understanding about the significance of the meetings and the importance of their transparency.

At its fourth meeting, the subcommittee recognized the importance of making its meetings public, saying that it would "discuss how to improve the situation." We hope the subcommittee will modify its policy and move ahead with video broadcasts of their meetings.

Local leaders and shareholders seek disclosure of Yoshida's testimony

August 21, 2014

Local leaders seek disclosure of testimony by former nuclear plant chief

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201408210044>

THE ASAHI SHIMBUN

Leaders of local governments near the stricken Fukushima No. 1 nuclear power plant want the testimony given by the plant manager months after the accident to be disclosed.

The Asahi Shimbun ascertained that eight local leaders want full disclosure after seeking the views of the Fukushima governor and heads of 13 cities, towns and villages located within 20 kilometers of the plant and areas outside the 20-km radius where radiation levels were more than 20 millisieverts per year.

Masao Yoshida was plant chief when the March 11, 2011, Great East Japan Earthquake and tsunami set off the nuclear accident.

He gave hours of testimony to the government's Investigation Committee on the Accident at the Fukushima Nuclear Power Stations, and died in July 2013 from esophageal cancer. Tokyo Electric Power Co., operator of the plant, said Yoshida's cancer was not related to radiation exposure.

The survey also revealed that five of the leaders said there would be no problem if their own interviews with the government investigation panel were made public.

After the onset of nuclear crisis, the government's investigation panel interviewed 770 officials and others involved in the disaster.

Although the central government currently plans to publicly disclose part of those records by the end of the year, it will not release the contents of Yoshida's interview, citing Yoshida's request not to disclose his testimony.

The Asahi Shimbun asked Fukushima Governor Yuhei Sato, as well as those who served as leaders of the 13 municipalities at the onset of the disaster, for interviews.

Kawamata Mayor Michio Furukawa, who served on the investigative panel, and former Hirono Mayor Motohoshi Yamada refused to comment on The Asahi Shimbun's inquiries, while Katsuya Endo, former Tomioka mayor, died in July after the newspaper asked for an interview.

Of the 11 local leaders interviewed by The Asahi Shimbun, the mayors of Futaba and Okuma, which host the Fukushima No. 1 plant, as well as leaders in Namie, Minami-Soma, Naraha, Kawauchi, Katsurao and Iwaki, said Yoshida's testimony should be made public. The Fukushima governor and mayors of Tamura and Iitate were undecided.

Six of the 11 leaders said they were interviewed by the government panel, and five of them said they would not mind if their accounts were disclosed.

The central government is trying to ascertain if the hundreds of people who were interviewed mind if their statements are released into the public domain. It has said it will disclose the contents if it gets their approval.

Exceptions will be testimonies whose disclosure could infringe on the rights of third parties or compromise national security, officials said.

Goshi Hosono, who served as minister in charge of the nuclear accident under the Democratic Party of Japan-led administration at the time of the disaster, said he does not mind if his statements are publicly disclosed.

TEPCO shareholders go to court for disclosure of Yoshida testimony on nuclear disaster

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201408210065>

By HIDEAKI KIMURA/ Staff Writer

Shareholders of Tokyo Electric Power Co. filed a lawsuit Aug. 20 for disclosure of testimony about the 2011 nuclear disaster given by the late manager of the stricken Fukushima No. 1 nuclear power plant. "(The government) should make public investigative records of 772 people, including Masao Yoshida (then plant manager), to enable a re-examination of what was wrong and what was correct," said Yui Kimura, who heads the plaintiffs' group.

The 10 TEPCO shareholders and others are calling on the Cabinet Secretariat to disclose records of the government investigation panel's interviews with 772 people involved in the nuclear crisis triggered by the Great East Japan Earthquake and tsunami.

As the Cabinet Secretariat refused their request to make public Yoshida's testimonies, the shareholders filed a suit with the Tokyo District Court, demanding disclosure of the 28-hour-long interviews in Q&A format.

The plaintiffs also plan to file suits for disclosure of other interview records if and when the Cabinet Secretariat refuses to disclose them. The shareholder group has sued the utility's executives for not taking necessary preventive measures against a severe nuclear accident, as well.

The group's written complaints state, "No other materials exist that would allow for direct examination of steps taken by the top official who took command at the accident site."

The group's complaints also describe Yoshida's testimonies as "necessary to figure out the cause of the disaster," and argue that, "The disclosure of (the records) is an extremely high priority in terms of the public benefit."

Many citizens have demanded Yoshida's testimonies be publicly disclosed. But the government has refused, citing Yoshida's written request submitted when the government panel handed his statements to a Diet investigation committee that asks the state not to disclose them.

Yoshida died in July 2013 from esophageal cancer.

A copy of Yoshida's statements obtained by The Asahi Shimbun, however, shows that the late plant manager agreed when told by interviewers that the records could be made public in the future. The TEPCO shareholders also mention the point in their complaints, saying, "Interviews were conducted after gaining his clear consent (for disclosing his interview records)."

August 20, 2014

Lawsuit filed seeking Yoshida interview release

http://www3.nhk.or.jp/nhkworld/english/news/20140820_28.html

Aug. 20, 2014 - Updated 10:08 UTC+2

A Japanese citizens' group has filed a lawsuit seeking the release of interviews with the former head of the crippled Fukushima Daiichi nuclear power plant.

A government-appointed investigative panel interviewed Masao Yoshida, who was then head of the plant, for a report on the March 2011 accident. The government has not released records of the interviews.

Yoshida died in July of last year. The government says before his death he submitted a petition requesting that they not be disclosed to a third party.

A group including shareholders seeking compensation from the plant's operator, Tokyo Electric Power Company, filed a lawsuit with the Tokyo District Court on Wednesday.

The plaintiffs say that the interviews with Yoshida are a public asset that could be key to finding out ways to prevent a similar nuclear disaster.

They say the interviews should be disclosed for analysis by experts.

Yoshida's testimony to be released

August 25, 2014

After leaks, government to release interviews with deceased Fukushima plant boss

Staff Writer

Following months of leaks, criticism and controversy, the government said Monday it will release most of the transcribed testimony of the late Masao Yoshida, who dealt with the 2011 triple meltdown crisis as head of the Fukushima No. 1 nuclear plant.

The interview records will be made available to media outlets next month, with some parts redacted to protect third parties mentioned in the interviews and information related to national security, Chief Cabinet Secretary Yoshihide Suga told a news conference.

"The situation is changing and there will be no problems in disclosing these records," Suga told a regularly scheduled news conference at the prime minister's office.

Asked if the government had obtained the consent of Yoshida's family, Suga declined to comment, saying only that the administration "has made the decision by itself."

Yoshida, who died of esophageal cancer on July 9 of last year, asked the government not to publish the interview transcripts. He said he was concerned that what he discussed during the interviews, which were

conducted from July to November 2011, might include factual errors. He was also worried that the public might take everything said in the interviews as confirmed fact.

Facts about the crisis at the Tokyo Electric Power Co. plant should be gleaned from interviews with other people and other materials, Yoshida argued in a written request submitted to the government in May 2012.

Officials had refused to publish the transcripts despite requests from media outlets, including The Japan Times.

But Suga said Monday that Yoshida's concerns "have already become a reality" with the publication by the Asahi Shimbun and Sankei Shimbun of what they say are the transcripts. At this point Yoshida's original intention would be better served through disclosure, Suga said.

The Asahi claimed in May it had obtained the roughly 400 pages of testimony covering 28 hours of interviews. The paper reported that most plant workers temporarily fled to the nearby Fukushima No. 2 power plant despite Yoshida's order to remain at the No. 1 plant amid the meltdown crisis in March 2011. The Asahi's report, which was published in Japanese and English, caught the attention of media outlets overseas because it went against the image of the plant workers, whom they had praised as the brave "Fukushima 50."

But the Sankei, which said it had later obtained the same transcript of the interviews, caused a stir earlier this month by claiming that the Asahi's report was wrong. Yoshida discussed the apparent confusion in the way his order was conveyed to workers at the crippled plant, but he didn't believe they had acted against his instructions, according to the Sankei.

According to the Asahi, Yoshida said he did not order workers to evacuate to the No. 2 plant, but many went there anyway.

"Actually, I never told them to go to 2F," Yoshida was quoted as saying by the Asahi, referring to the still-functioning Fukushima No. 2.

But according to the Asahi, Yoshida later concluded that the decision of those workers was right, which may have been why the Sankei claimed that Yoshida didn't believe the workers acted against his orders. "I came to believe that going to 2F was by far the right thing to do if only you gave more thought to it," Yoshida said, according to the Asahi.

Meanwhile, the Sankei also reported that Yoshida harshly criticized then-Prime Minister Naoto Kan, who claimed that top Tepco executives were considering withdrawing all of the plant workers, which would have left it deserted at a critical stage in the meltdown crisis.

August 25, 2014

Govt. to issue ex-Fukushima plant chief testimony

Aug. 25, 2014 - Updated 08:49 UTC+2

http://www3.nhk.or.jp/nhkworld/english/news/20140825_25.html

Japan's government is soon to release interviews with the former chief of the Fukushima Daiichi nuclear power plant, Masao Yoshida, who dealt with the 2011 accident.

Chief Cabinet Secretary Yoshihide Suga said on Monday the interviews given to a government panel will be made public at an early date in September.

The government intended to keep the testimony out of the public eye because Yoshida did not want them released, citing concerns about misinterpretation. Yoshida died of an illness in July last year.

Suga said some newspapers have published excerpts of the interviews, and the late plant chief's concerns have become a reality. He said withholding the interviews would run counter to Yoshida's wish.

He added the situation has changed and releasing them will not cause problems.

The government spokesperson also said information that concerns privacy and national security in the interviews will not be disclosed.

Suga said government officials are contacting more than 700 people interviewed by the panel to gain consent for making their interviews public.

He said Yoshida's interviews will be made open with some of those interviews. Suga said the government will disclose the rest of the interviews as soon as it gets approvals and finishes the work by the end of the year.

Gov't to disclose Fukushima nuclear plant chief's testimony in Sept.

<http://mainichi.jp/english/english/newsselect/news/20140825p2g00m0dm051000c.html>

TOKYO (Kyodo) -- The government said Monday it will release in September testimony regarding the nuclear disaster at the Fukushima Daiichi power plant in March 2011 given by then plant chief Masao Yoshida.

"Former plant chief Yoshida did not want his testimony to be made public as he had mentioned concerns about misinterpretation, but the situation has changed," Chief Cabinet Secretary Yoshihide Suga said at a daily press briefing.

In addition to the Yoshida testimony, the content of interviews with others who had key roles in handling the disaster "will be released at the earliest possible date in September, starting with whichever is ready first," Suga said.

The top government spokesman added that information related to privacy and national security will not be disclosed.

The testimony of Yoshida, who died of esophageal cancer in July 2013 at age 58, was compiled by a government panel formed to examine the disaster at the plant northeast of Tokyo.

The panel interviewed Yoshida for more than 20 hours from July to November 2011.

The government had declined to make public Yoshida's testimony, citing a statement Yoshida signed saying he did not want it made available to any third party.

But interest in Yoshida's first-hand account of what transpired in the days immediately after March 11, 2011, when a massive earthquake and tsunami knocked out power to much of the six-reactor power plant, leading to a series of explosions and the worst nuclear disaster since Chernobyl, has been piqued by reports that most staff fled.

The Asahi Shimbun daily reported this past May that 90 percent of workers left despite being ordered by Yoshida to stay, citing his testimony to the government panel.

Another daily, the Sankei Shimbun, also reported the content of the Yoshida testimony earlier this month, while victims of the nuclear accident have filed a lawsuit seeking to make the documents public.

Government to finally release Yoshida testimony on nuke accident in September

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201408250031>

THE ASAHI SHIMBUN

The government will release the testimony on the March 2011 nuclear accident by Masao Yoshida, the late manager of the crippled Fukushima No. 1 nuclear power plant, in September, the government's top spokesperson said Aug. 25.

"We will make public (the testimony) at the earliest possible date in September," Chief Cabinet Secretary Yoshihide Suga told a news conference. He added that the first release of the testimonies of other interviewees would occur at the same time.

Dubbed the "Yoshida Testimony," the government panel's investigative record of Yoshida, who was plant chief at the time of the disaster, gained worldwide attention after The Asahi Shimbun obtained the document and published an article on the content in its May 20 morning edition.

The government has refused releasing the content, saying that Yoshida had written a request asking the state not to disclose his testimony.

But after the Sankei Shimbun began reporting on the document in its Aug. 18 edition, the government changed its stance, saying there is no need to withhold the Yoshida interview now that more than one media company has reported it.

August 23, 2014

Gov't to disclose Fukushima nuclear plant chief's testimony (see article in Japan Times)

<http://mainichi.jp/english/english/newsselect/news/20140823p2g00m0dm001000c.html>

TOKYO (Kyodo) -- The government plans to make public testimony regarding the Fukushima Daiichi nuclear disaster given by plant chief Masao Yoshida, government and other sources said Friday, possibly shedding light on whether Yoshida ordered staff to remain at their posts.

Chief Cabinet Secretary Yoshihide Suga will announce as soon as Monday the decision to release the testimony by mid-September or later, the sources said.

The testimony of Yoshida, who died in July 2013, was compiled by a government panel formed to examine the March 2011 disaster at the nuclear plant northeast of Tokyo.

The panel interviewed Yoshida for more than 20 hours from July to November 2011.

The government has thus far declined to make public Yoshida's testimony, citing a statement Yoshida signed saying he did not want it made available to any third party.

But interest in Yoshida's first-hand account of what transpired in the days immediately after March 11, 2011, when a massive earthquake and tsunami knocked out power to much of the six-reactor Fukushima Daiichi power plant, leading to a series of explosions and the worst nuclear disaster since Chernobyl, has been piqued by reports that most staff fled.

The Asahi Shimbun daily reported this past May that 90 percent of workers left despite being ordered by Yoshida to stay, citing his testimony to the government panel.

Another Japanese daily, the Sankei Shimbun, also reported the content of the Yoshida testimony earlier this month, while victims of the nuclear accident have filed a lawsuit seeking to make the documents public.

August 23, 2014

Yoshida testimony on Fukushima nuclear accident may be disclosed after all

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201408230029>

THE ASAHI SHIMBUN

In an about-turn, the government is weighing full disclosure of testimony about the 2011 nuclear accident given by the late manager of the crippled Fukushima No. 1 nuclear power plant.

The government initially insisted that it would not make public the investigative record of Masao Yoshida, who was plant chief at the time of the disaster, citing "Yoshida's written request submitted asks the state not to disclose them."

However, the government has been forced to re-evaluate its position, as some news outlets have reported on parts of the records written by the government investigation panel.

"The contents (of the testimonies) are in effect circulating in the world," a senior official at the prime minister's office said Aug. 22 in response to the reports by the media. "(That has created) the atmosphere that we, as Japan's government, have no choice but to disclose them."

The Asahi Shimbun reported on contents of the testimonies that the newspaper obtained through its sources in the morning edition of May 20 and on its website. Although the government at that time refused to disclose them, it was compelled to alter its stance after The Sankei Shimbun began covering the testimonies in its Aug. 18 morning edition.

The government said it will consult with Yoshida's bereaved family with regard to the disclosure of more than 400 pages of testimony, which contain 28 hour-long interviews in Q&A format.

Late Fukushima nuclear plant chief's testimony may be made public

http://www.japantimes.co.jp/news/2014/08/23/national/late-fukushima-nuclear-plant-chiefs-testimony-may-made-public/#.U_jqkWOnrIU

Kyodo

The government plans to disclose testimony by Fukushima No. 1 chief Masao Yoshida that could shed light on whether he ordered staff at the stricken power plant to stay at their posts during the triple meltdown crisis, sources revealed Friday.

The decision could be made by mid-September, governmental and other sources said, noting Chief Cabinet Secretary Yoshihide Suga might comment on the leaking testimony on Monday.

Yoshida, who died of cancer in July last year, gave testimony to a government panel that was formed to probe the March 2011 disaster. It interviewed Yoshida for more than 20 hours between July and November 2011.

The government has thus far declined to release Yoshida's testimony because he signed a statement saying he did not want it made available to any third party.

But public interest in Yoshida's first-hand account of what transpired in the days immediately after the March 2011 megaquake and tsunami triggered the worst nuclear disaster since Chernobyl has soared since the testimony was reportedly leaked to the daily Asahi Shimbun.

The disasters knocked out nearly all power to the six-reactor plant, leading to a series of massive explosions that tainted much of east Japan with radiation.

In the midst of the meltdowns, 90 percent of the plant workers fled despite being ordered by Yoshida to stay, the Asahi Shimbun reported in May, citing a copy of his testimony to the panel.

Another daily, the Sankei Shimbun, began reporting on Yoshida's testimony earlier this month.

Those victimized by the nuclear disaster are suing for full disclosure of the Yoshida documents.

Okumura and Naito

August 25, 2014

Political Pulse: Those who accuse, those who are accused

<http://mainichi.jp/english/english/perspectives/news/20140825p2a00m0na008000c.html>

There are people who accuse others of wrongdoing, and people who admit to wrongdoing. Hiroshi Okumura, 84, who specializes in research on private companies, has for decades called into question electric power companies' reliance on nuclear power through their collusion with the political world and the bureaucracy.

Chimori Naito, 91, former vice president of Kansai Electric Power Co. (KEPCO), recently told the Asahi Shimbun daily about the firm's behind-the-scenes efforts to curry favor with the political world and bureaucrats over the promotion of atomic power. He then admitted that the industry's collusion with politicians and bureaucrats was problematic and urged that Japan reconsider its dependence on nuclear power. (The Asahi Shimbun ran a series of 14 stories on the matter in its morning edition beginning on July 28, 2014, and released the video of an interview with Naito.)

Naito, who had ignored Okumura's criticism and actively promoted nuclear power (KEPCO's rate of dependence on atomic power is the largest of all nine major regional utilities), finally changed his mind. Some skeptics speculate that Naito fabricated the story as someone who lost a power struggle within the company, while others speculate that it was just an old man acting delusional. However, fragments of Naito's testimony show an aspect of his dignity as a behind-the-scenes fixer and his convincing personality.

The government's nuclear power policy appears completely unaffected by his testimony on the surface. Still, what he said will likely win sympathy from the public and help reinforce the undercurrent of moves to end Japan's dependence on atomic power.

Okumura and Naito have close connections with each other even though they are not personally acquainted.

The Sept. 12, 1986 issue of the weekly magazine Asahi Journal (which ceased publication in 1992) ran a story headlined, "KEPCO -- a black continent." It was one of the installments in a series on Japanese companies. The article uncovered KEPCO's personnel appointments made behind closed doors through the "reigns of terror" by then honorary president Yoshihige Ashihara (now deceased) and Naito. The article was written by Okumura, who was then professor at Ryukoku University.

How Okumura obtained the information based on which he wrote the story is interesting. He asked KEPCO for an interview, only to be rejected. After he repeatedly contacted the company, he received a phone call from a woman who called herself the wife of a KEPCO employee. The woman told Okumura that Naito was meeting with an influential member of a right-wing organization at a high-class restaurant. She provided him with further detailed information on the matter.

The story based on such specific information was convincing, prompting the KEPCO board to dismiss Ashihara and Naito at a Feb. 26, 1987 meeting.

Naito had kept silent about the scandal, but admitted in the interview with the Asahi that the company paid the ultra-rightist and some antisocial forces to settle the firm's disputes.

Okumura worked as a staff writer at the economic news department of the Sankei Shimbun daily's Osaka office for nine years after graduating from Okayama University's faculty of law and literature in 1953. He reportedly sat just behind Teiichi Fukuda, then associate editor at the paper's cultural news department, who is known as novelist Ryotaro Shiba.

From the time he became a journalist, Okumura was particularly interested in Japan's industrial structure and corporate groups. After working at a think-tank, he became professor at Ryukoku University and then at Chuo University, conducting research on huge private companies.

Okumura says private corporations sped up their expansion in the latter half of the 20th century, particularly after the 1970s. The influence of labor unions has weakened while executives' control

over their companies has strengthened. As a result, uncontrollable and irresponsible giant organizations that place profits above anything else played a central role in capitalism. Okumura views the bailout of General Motors (GM) that relied on U.S. taxpayers' money and the current situation of Tokyo Electric Power Co. (TEPCO) that has failed to bring the Fukushima nuclear crisis under control despite an infusion of public funds as examples of the ailing capitalism that is at the mercy of big business.

"The poor law that originated in Britain is aimed at using taxpayers' money to save the poor. But now, taxpayers' money is being used to bail out GM, TEPCO and commercial banks," Okumura laments.

Okumura insists that TEPCO should be disbanded and split into multiple entities based on economic principles. However, the government has dismissed this suggestion saying, "It's unrealistic, considering the costs of bringing the nuclear crisis under control and paying compensation to those affected by the disaster." Such being the case, **there appears to be an endless effort to maintain the status quo. no end to the nuclear crisis.**

In the interview with the Asahi, Naito said, **"Apart from power companies, the government regulator that gives instructions to them and scholars is also at fault. They think, 'It's best to maintain the status quo.' How can progress be made?"**

Twenty-seven years have passed since Okumura created a stir over Japan's reliance on atomic power and Naito was expelled from KEPCO. These two figures, whose personal history and ideas are completely different, are now insisting on the same thing. (By Takao Yamada, Expert Senior Writer)

11 trillion yen

August 27, 2014

Fukushima nuclear crisis estimated to cost ¥11 trillion: study

http://www.japantimes.co.jp/news/2014/08/27/national/fukushima-nuclear-crisis-estimated-to-cost-%C2%A511-trillion-study/#.U_45HmOnrIU

Kyodo

The Fukushima nuclear accident will cost an estimated ¥11.08 trillion, almost double the government projection made at the end of 2011, according to a recent study by Japanese collehe figure includes ¥4.91 trillion to compensate affected residents, ¥2.48 trillion for radiation cleanup work, ¥2.17 trillion to scrap the Fukushima No. 1 plant and ¥1.06 trillion to temporarily store radioactive soil and other waste generated by decontamination work, according to the study.

Kenichi Oshima, environmental economics professor at Ritsumeikan University in Kyoto, and Masafumi Yokemoto, professor of environmental policy at Osaka City University, calculated the costs based on materials and data released by the government and plant operator Tokyo Electric Power Co.

In December 2011, the government said it would cost at least ¥5.8 trillion, but Oshima and Yokemoto included some expenses that the government then said were difficult to estimate, according to the researchers.

"The costs for the accident are designed to be borne by the people through taxes and utility bills," Oshima said.

The actual cost could be much higher, as the estimated figure does not include costs for the final disposal of radioactive material from cleanup work, while the compensation and plant decommissioning expenses are expected to increase down the road.

A separate estimate puts the cost of decontamination work as high as ¥5 trillion, double the professors' figure.

Tepco is currently paying compensation to those affected by the Fukushima meltdowns using money provided by the Nuclear Damage Compensation and Decommissioning Facilitation Corp. The state-backed fund has raised the limit of its payout from ¥5 trillion to ¥9 trillion.

Tepco is expected to reimburse that money in the future — meaning that electricity consumers will eventually have to bear the cost.

Critics have pointed to the ambiguous responsibilities of the state and the utility, which did not go bankrupt despite the worst nuclear crisis since the 1986 Chernobyl accident thanks to taxpayers' money and increased electricity rates.

The government of Prime Minister Shinzo Abe is pushing to revive the nuclear industry, with Kyushu Electric Power Co.'s Sendai plant in Kyushu possibly allowed to restart in the near future.

"Nuclear plant operators would become less able to make a right business judgment under the situation where the state covers the costs of accidents, as they cannot recognize risks of nuclear power generation," said Oshima.

TEPCO held accountable for evacuee suicide

August 27, 2014

Editorial: Ruling on nuclear evacuee suicide holds TEPCO accountable

<http://mainichi.jp/english/english/perspectives/news/20140827p2a00m0na017000c.html>

The Fukushima District Court ordered Tokyo Electric Power Co. (TEPCO) to pay some 49 million yen in damages to the family of a 58-year-old woman who killed herself after she was forced to evacuate due to the Fukushima nuclear disaster, dealing a hard blow to the utility.

It is not uncommon for accountability for suicide to be contested in the courts. Corporations have faced tough rulings in recent years for suicides induced by overwork. And it is amid such a climate that a Fukushima court tackled head-on and recognized a causal link between the stress of evacuation and suicide.

While the ruling applies to an individual case, it is bound to have a significant impact on other lawsuits and settlement talks regarding the nuclear disaster.

The deceased woman, who had been evacuated from the Fukushima Prefecture town of Kawamata, was at her home for a temporary visit in July 2011 when she killed herself. Her husband and three children brought the damages suit against TEPCO.

The nuclear disaster had forced the woman to leave the town where she'd grown up and live in evacuation facilities. She had to live away from her children, and became unemployed when the chicken farm where she'd worked was shut down. The close ties she had with her neighbors, with whom she used to share vegetables, was also lost. The court ruled that these stressors, which arose in quick succession in a short period of time, had caused the woman's depressive state.

The woman had suffered from insomnia and had been receiving outpatient treatment for psychosomatic disorder since before the disaster. TEPCO cited this fact as an indication of "the individual's fragility," denying responsibility for the woman's suicide.

The court, taking the woman's pre-existing condition into consideration, recognized that 80 percent of her suicide was due to stress caused by the nuclear disaster and calculated the compensation amount accordingly.

The presiding judge also said that TEPCO should have been able to foresee that if radioactive materials spread across a wide area, residents would be forced to evacuate, and that such displaced residents could develop depression or commit suicide from the stress.

Among evacuees, there are those who are susceptible to stress and those who are less so. It is unacceptable to write victims off as "fragile." Understandably, the ruling has shown consideration for those who are especially vulnerable in disasters.

An alternative to lawsuits in resolving conflicts surrounding the nuclear disaster is the dispute resolution process through the government's Nuclear Damage Compensation Dispute Resolution Center. The center pursues TEPCO's accountability not only for suicides but various other cases. There is a wide range of thinking on what constitutes the appropriate range of compensation for the claims of damages raised by residents. Regardless, TEPCO, having caused the disaster, must listen carefully to the voices of disaster victims and compensate amounts comparable to the damage that has been done.

In Fukushima Prefecture, the number of those who have died from suicide and other causes related to the 2011 earthquake, tsunami and nuclear disaster has surpassed 1,670 -- greater than the number of those in the prefecture who died as a direct result of the quake and tsunami. We need further debate on how the families of those people should be compensated.

Halving evacuee compensation: Confirmed

August 30, 2014

Nuclear disaster evacuee compensation halved across board: internal document

<http://mainichi.jp/english/english/newsselect/news/20140830p2a00m0na004000c.html>

The governmental Nuclear Damage Claim Dispute Resolution Center, tasked with reaching out-of-court settlements for individual claims filed over the Fukushima No. 1 nuclear plant meltdowns, has set compensation uniformly at 50 percent, a document obtained by the Mainichi Shimbun has confirmed. The internal document is being circulated among center staff and used in the processing of individual cases -- calling into serious doubt the center's previous denials that the "50 percent rule" had been an official practice.

The center calculates the total amount of damages for pain and suffering in individual settlement proposals by multiplying a base amount by a percentage figure representing the impact of the nuclear accident upon the particular case at hand.

On July 9, the Mainichi Shimbun reported that Hiroshi Noyama, former head of the nuclear damage claim dispute resolution mediation office (the section of the Education, Culture, Sports, Science and Technology Ministry serving as secretariat to the center) had attested during an interview that "the decision had been made to assess the contribution ratio (of the nuclear accident to the deaths) at around 50 percent." It was also reported in the same article that the contribution ratio had indeed been set at 50 percent in numerous cases. Noyama's successor Joji Danto, a former judge, denied Noyama's testimony, however. "I don't know what Noyama said, but there are no rules in place," he stated. Danto also commented on July 14, while attending a regular meeting of several teams of lawyers offering support to survivors of the

nuclear disaster, "We are continually asked by numerous sources whether a '50 percent rule' exists (with respect to the compensation). To this, we say a resolute 'no.'"

The document obtained by the Mainichi Shimbun, however -- four A4-sized pages dated Dec. 26, 2012 -- includes the following statement: "(Compensation) shall be set across the board at 50 percent. Fine adjustments, such as setting the figure at 40 or 60 percent, shall not be made."

The document also states that "the operation (of the 50 percent rule) is in the process of being established at the practical level." The document additionally reveals the possibility for individual settlement proposals to be set at lower amounts, stating, "When it is difficult to ascertain that the 50 percent rule should be applied, it is possible as an exception to set the figure at 10 percent."

The document additionally notes that it is possible to set the base amount of compensation at a lower level than that established for standard lawsuits, and that details such as medical records or opinions from doctors shall not be taken into significant consideration when deciding final compensation amounts - - corroborating previous Mainichi reports.

In addition to the nuclear damage claim dispute resolution mediation office, the center also employs examiners who organize documents submitted by both disaster survivors and Fukushima No. 1 plant operator Tokyo Electric Power Co., as well as mediating officers responsible for drawing up the actual settlement offers -- all of whom are lawyers.

According to a source affiliated with the center, the document obtained by the Mainichi was authored by an employee of the mediation office, and subsequently distributed among several examiners.

An official who previously served as an examiner commented, "I explained the content of the document to the mediating officers," adding, "If it appeared that an individual settlement offer was not going to be in line with the document's guidelines, I pointed it out to the mediating officer" -- thereby revealing that the document has in fact been used as a standard.

Center representatives initially claimed that "no such document exists." They later followed up by saying, "(We found) that such a document did exist," but continued to deny that it served as a standard guideline, saying, "It is possible that it was simply a personal memo."

Yoshida feared catastrophe for Eastern Japan

Fukushima No. 1 chief feared nuclear doom for eastern Japan

<http://www.japantimes.co.jp/news/2014/08/31/national/fukushima-1-chief-feared-catastrophe-eastern-japan/#.VAMUn2Onq1s>

Kyodo

The chief of the Fukushima No. 1 nuclear plant said in testimony before his death that he feared the core meltdowns he was trying to contain in March 2011 would cause catastrophic damage to eastern Japan, government documents show.

“Our image was a catastrophe for eastern Japan,” Masao Yoshida told a government panel probing the Fukushima nuclear crisis. “I thought we were really dead.”

Yoshida wanted his testimony to remain confidential after his death because the account might contain mistakes from the confusion created by the crisis triggered by the massive earthquake and tsunami of March 11. But leaks to two major Japanese dailies prompted the government last week to announce its intent to disclose most of the documents, which detail the drama that took place during the worst nuclear disaster since Chernobyl.

According to documents obtained Saturday, Yoshida rejected the government’s opinion that the plant owner Tokyo Electric Power Co. attempted a “complete withdrawal” of all staff from the plant on March 15. He was also angry with Tepco headquarters and the administration of then-Prime Minister Naoto Kan, which he thought had failed to understand the dire situation his workers were facing on the ground.

“We did not escape,” Yoshida is quoted as saying in the roughly 400 pages of testimony, scheduled to be released next month.

Yoshida's testimony was reflected in the panel's final report in July 2012 along with those of more than 770 other people involved in the disaster. Yoshida died of esophageal cancer the following July at age 58. In May, the daily Asahi Shimbun reported in Japanese and English that 90 percent of the plant's workers left the damaged complex despite being told by Yoshida to stay put, citing his testimony. But Yoshida did not say they were violating his order on purpose.

At one serious point in the crisis, on March 14, 2011, when it looked like the containment vessel of reactor No. 2 was going to fail and pollute the area with high amounts of radiation, Yoshida said he thought he was finished.

"I really don't want to recall this part," he said, because he was bracing for the worst — a total failure in which the fuel melts and breaches both the pressure vessel and the containment vessel.

"All the radioactive materials would go out and be scattered," he said.

But the workers who were failing to inject water into the No. 2 reactor to cool the molten fuel caught a break when the air pressure in the containment vessel dropped, allowing the fire engines to get the water in.

When the Asahi first reported the contents of the testimony, the government said the documents would be kept confidential to honor Yoshida's wishes. But the government has since reversed itself because withholding the documents amid the leaks might actually contradict Yoshida's wishes.

Fukushima nuke plant chief feared catastrophe for eastern Japan

<http://mainichi.jp/english/english/newsselect/news/20140831p2g00m0dm007000c.html>

TOKYO (Kyodo) -- The chief of the disaster-struck Fukushima Daiichi nuclear plant said in testimony before his death that he had feared catastrophic damage to eastern Japan while he was struggling to contain the crisis in March 2011, according to government documents obtained Saturday.

"Our image was a catastrophe for eastern Japan," Masao Yoshida told a government panel that was examining the nuclear meltdowns at the plant about 220 kilometers northeast of Tokyo, triggered by a powerful earthquake and tsunami on March 11, according to his testimony. "I thought we were really dead."

On the government's interpretation that plant operator Tokyo Electric Power Co. was seeking a "complete withdrawal" from the plant on March 15, Yoshida denied such a view, expressing anger at the office of then Prime Minister Naoto Kan and TEPCO headquarters, which he thought had failed to understand the dire situation his workers were facing on the ground.

"We did not escape," Yoshida said, according to his roughly 400-page testimony, which is scheduled to be released by the government next month.

The testimony was reflected in the panel's final report compiled in July 2012 along with testimonies from more than 770 others. Yoshida died of esophageal cancer the following July at age 58.

The Asahi Shimbun daily reported in May that 90 percent of plant workers had left the complex despite Yoshida's order to stay put, citing his testimony to the government panel. But Yoshida did not say there had been a violation of his order.

At the height of the crisis on March 14, 2011, when the No. 2 reactor's containment vessel faced the risk of releasing a massive amount of highly radioactive materials due to the loss of cooling functions, Yoshida said he thought he was really dead.

"I really don't want to recall this part," Yoshida said, because he had been imagining the worst -- nuclear fuel melting down and breaking through the reactor pressure vessel and the outer vessel containing it.

"All the radioactive materials would go out and be scattered", he said.

Workers continued efforts to inject water into the No. 2 reactor to cool the molten-hot nuclear fuel in the reactor core and managed to avert the crisis following a drop in air pressure inside the containment vessel that had kept fire engines from injecting water into the reactor.

Yoshida did not want his testimony to be made public on the grounds he could have misidentified some facts due to the fading of and confusion in his memory and that he feared that all he had said in the testimony would be taken as fact.

When the Asahi newspaper first reported the contents of the testimony, the government said it would keep the testimony from the public according to his wishes.

But more recently, the government has decided to disclose the testimony on the grounds his concerns have already become evident as other media began reporting on it, and that continuing to keep the testimony from the public would actually go against his will.

August 31, 2014(Mainichi Japan)

Full disclosure

September 3, 2014

Editorial: Fully disclose testimonies on Fukushima nuclear disaster

<http://mainichi.jp/english/english/perspectives/news/20140903p2a00m0na017000c.html>

The investigative committees on the Fukushima No. 1 Nuclear Power Plant disaster, set up both at the executive and legislative branches of the government, interviewed a large number of people over the cause of the unprecedented disaster.

To be precise, the government's Investigation Committee on the Accident at the Fukushima Nuclear Power Stations of Tokyo Electric Power Company (TEPCO) interviewed 772 individuals spanning a total of 1,479 hours, and the National Diet of Japan Fukushima Nuclear Accident Independent Investigation Commission (NAIIC) interviewed 1,167 persons, which runs a total of over 900 hours.

These investigation records are extremely priceless resources, which can serve to verify how people responded to the disaster and to prevent a recurrence of any similar accident. These documents must not be monopolized by a limited number of people but should widely be shared by the public -- even by the international community.

Nevertheless, most of the vast volumes of the documents remain closed to the public, though some of them have been quoted in reports and released. While the interviews are said to have been conducted on an off-the-record basis on the grounds that no one should be held personally responsible for the enormous disaster, recent reports on the testimony of Masao Yoshida, the late former plant chief at the Fukushima No. 1 nuclear plant, have catalyzed the move to disclose the government investigation committee records to the public.

The government is now poised to declassify the testimonies of Yoshida as well as those of others who gave consent to their release. We should be able to learn a lot from those materials -- from the cause of the disaster to crisis management -- once experts from all walks of life scrutinize every word in the testimonies of the concerned parties. It is hoped that the move will spark the disclosure of all the other information on the disaster, including the NAIIC records.

The Asahi Shimbun has sparked controversy after it reported in May that 90 percent of workers at the Fukushima No. 1 nuclear plant withdrew to the Fukushima No. 2 nuclear plant in violation of Yoshida's

orders on March 15, 2011 -- just a few days after the outbreak of the nuclear disaster. In his testimony, Yoshida concluded that the plant workers' evacuation to the No. 2 plant was in the end the correct decision though it was different from what he had originally intended. It is likely that the Asahi Shimbun reports highlighting only a portion of his testimony have led to widespread misunderstanding and hindered level-headed discussions over the matter.

That said, the essence of the issue is that orders given amid confusion sometimes fail to get across to workers on site. It is rather important to draw lessons from that incident about how the chain of command should be carried out. One such lesson we should learn is the significance of planning in advance who should evacuate whom to where and who should remain on site in the event of a severe accident.

Yoshida's testimony also underscores once again the lack of ability in the prime minister's office and TEPCO headquarters in Tokyo in providing support to the on-site workers in crisis. It is imperative for the government and power companies -- which are eager to reactivate idled nuclear reactors across Japan -- to thoroughly scrutinize whether these essential challenges have already been resolved.

In the meantime, it is also important to remember Yoshida's testimony is a mere fragment of the whole picture of the nuclear catastrophe. What counts is we should compare all the testimonies by numerous people concerned and documents to re-enact in minute detail what exactly happened. Authorities should make efforts to gain approval of the interviewees in the investigative committee reports to disclose the entire documents to the public as soon as possible.

September 03, 2014(Mainichi Japan)

Yuko Obuchi' appointment - Will this help?

September 6, 2014

LDP star Obuchi to lead nuclear debate

AFP-JIJI

Prime Minister Shinzo Abe may have hoped that Yuko Obuchi, a 40-year-old mother of two with an impeccable political pedigree, will provide an acceptable face for his nuclear power push when he appointed her industry minister last week.

However, say observers, Obuchi will have her work cut out convincing a public still badly scarred by the Fukushima disaster that it is safe to switch the country's 48 atomic reactors back on.

"I, too, am raising children," Obuchi told reporters shortly after being made the country's first female minister of economy, trade and industry. "If people say they are worried, I think it is only natural. If you are a mother, I think it is a kind of feeling that everyone has. The central government must offer a full explanation to these sentiments."

Naming a young mother to the job was "a cunning move by Abe," said Greenpeace Japan's Kazue Suzuki, because the implicit message is that if someone who has children says nuclear power is safe, it sounds more credible.

However, Suzuki said people will not fall for that kind of sleight of hand, and that if Obuchi wants to represent them she should speak out against nuclear restarts.

"When (Obuchi) makes decisions, she should consider the reaction of ordinary women, the majority of whom do not want nuclear power stations reactivated," Suzuki said.

Obuchi, daughter of late Prime Minister Keizo Obuchi, is a rising star in the ruling Liberal Democratic Party, and having first become a minister at the age of 34, holds the record as the youngest woman ever to make the grade. Now, as industry minister, her portfolio includes overseeing the power industry. Ever since the March 2011 nuclear disaster erupted at the Fukushima No. 1 power station, where a tsunami knocked out cooling systems and sent reactors into meltdown, the country's entire nuclear stable has gone offline, taking with it more than a quarter of the electricity supply. That has left Japan reliant on expensive fossil fuel imports, which are playing havoc with its balance of payments and pushing up prices for hard-pressed consumers.

At her inaugural news conference, Obuchi repeated the Abe administration's line that her policy would be "to reduce our reliance on nuclear plants by actively introducing renewable energy and thorough energy saving."

Then she added, "We will restart (nuclear power plants) by making safety our priority."

The new minister highlighted the importance of earning "the understanding of hosting communities" who may be hostile to the prospect of firing up their nearby reactors again, despite beefed up safety rules and — by domestic regulatory standards — a ferocious new watchdog.

Obuchi is expected to visit the crippled Fukushima plant in the coming days, as well as the Sendai nuclear power station in southwestern Kyushu, where two reactors are the most likely to be restarted in the coming months.

The new regulator might confirm that the units are safe as soon as next week. The regulator has received nearly 17,000 public comments since it announced the Sendai plant's re-evaluation in July.

Junichi Takase, a political science professor at Nagoya University of Foreign Affairs, dismissed speculation that Obuchi's appointment was a cynical ploy. Rather, he says, she got the job because she is a capable individual with a bright future.

"Japanese people are no fools, and they know there will be no change in the safety of nuclear plants just because the minister changes," he said.

"At this point (Abe has) no intention to use her politically to make the restart of nuclear reactors easier," he said. "In the future, if she moves near a nuclear plant with her two children and says 'it's safe,' then that would mean her status as a mother would be being politically used. But it's not at this point."

Political talents notwithstanding, Obuchi faces an uphill challenge, said Hikaru Hiranuma, a research fellow at The Tokyo Foundation, a think tank.

"She needs to address several difficult issues: safety at nuclear plants, preparations in case of an accident, such as evacuation schemes and drills, compensation for accident victims and how to dispose of spent nuclear fuel," he said. "It will be difficult for her to justify the government's plan to continue using nuclear as an important source of power, unless she comes up with answers to these challenges."

Testimonies disclosure depends on Gov't

September 11, 2014

Suga: Record disclosure at govt. discretion

http://www3.nhk.or.jp/nhkworld/english/news/20140911_29.html

Sep. 11, 2014 - Updated 12:15 UTC+2

Japan's chief cabinet secretary says the government has decided at its discretion to release interviews with the former head of the crippled Fukushima Daiichi nuclear power plant.

Masao Yoshida, who was in charge of the plant at the time of the 2011 nuclear accident, died in July of last year.

Chief Cabinet Secretary Yoshihide Suga said on Thursday that before his death Yoshida submitted a petition requesting that the interviews not be disclosed to a third party.

Yoshida reportedly said he was afraid his testimony could develop a life of its own and people could believe all he said was true.

Suga said the government has started disclosing interviews with other people after obtaining their consent. He also said that some newspapers have published fragments of Yoshida's interviews.

Suga said this kind of situation was what Yoshida was afraid of. He said the government decided on the release of his testimony based on the changing situation and the intention of his petition, after seeking consent from his family.

The spokesperson noted that **the government will not release testimony of other interviewees if they object to any disclosure.**

He added that the government plans to release other interviews by the end of the year.

What to make of disclosure

September 11, 2014

Govt. panel member reacts to interview release

http://www3.nhk.or.jp/nhkworld/english/news/20140911_28.html

Sep. 11, 2014 - Updated 12:20 UTC+2

A member of the Japanese government panel which investigated the 2011 nuclear accident at the Fukushima Daiichi plant has noted the significance of the release of interviews with people involved.

Non-fiction writer Kunio Yanagida said **the panel interviewed officials of the plant operator, TEPCO, and the government, under the condition that their testimonies would not be disclosed so they would not be held responsible for what they said.**

Yanagida said the government's disclosure of the interviews is significant and would impact investigations if a similar accident were to occur.

He pointed out that **the government needs to give the public a full and logical explanation as to why it released the documents.**

Yanagida criticized the government for not making enough effort to lead the investigation into the accident. The cause of the accident is unclear, even though 3-and-a-half years have passed since the crisis.

He said he hopes the release of the documents will give experts from various fields an opportunity to look into the accident from their own perspectives.

Most of the disclosed documents are testimonies of the government officials who had dealt with the accident.

Yanagida said their testimonies may help provide a look at the nation's risk management, but accounts by engineers and operators who responded to the accident on the site are more important in providing the big picture.

Asahi to retract on Yoshida's testimony

September 11, 2014

Asahi Shimbun admits error in Fukushima plant chief testimony report

<http://mainichi.jp/english/english/newsselect/news/20140911p2g00m0dm042000c.html>
TOKYO (Kyodo) -- The Asahi Shimbun newspaper admitted Thursday its controversial report on the testimony of the late chief of the disaster-hit Fukushima Daiichi nuclear plant contained erroneous information and that it will retract the article.

"We have judged the report was incorrect," President Tadakazu Kimura said at a press conference. "We have significantly hurt our readers' trust."

He was referring to the daily's May 20 report that said 90 percent of plant workers had left the complex despite their boss Masao Yoshida's order to stay put. The report was based on Yoshida's then unpublicized testimony to a government panel.

Kimura added he will decide whether to resign after "paving the way for a drastic reform for revival." He also apologized for its erroneous past reports on "comfort women," after the Asahi retracted last month its articles published in the 1980s and 1990s that reported a Japanese man's statements about women on the South Korean island on Jeju forcibly and violently taken to serve at wartime Japanese military brothels.

"I apologize for publishing the erroneous stories and that the correction was long overdue," he said.

Kimura said the newspaper publisher will set up a third-party panel of experts to review its past reports concerning the comfort women issue.

The Asahi's report on the Fukushima plant, operated by Tokyo Electric Power Co., was cited by a number of overseas media and it has been one of the most controversial points in the process of examining the crisis.

On Thursday, the government released documents including Yoshida's testimony compiled by the government panel that was probing the devastating accident, triggered by a powerful earthquake and tsunami on March 11, 2011.

Asahi to retract article on nuclear plant head

http://www3.nhk.or.jp/nhkworld/english/news/20140911_31.html

Sep. 11, 2014 - Updated 13:05 UTC+2

The Japanese newspaper Asahi Shimbun says it will retract a story about testimony by the former head of the Fukushima Daiichi plant on the 2011 nuclear crisis.

Asahi's President Tadakazu Kimura said at a news conference on Thursday that **the article was incorrect due to insufficient research.**

He said he apologizes to readers and to employees at Tokyo Electric Power Company. Kimura said he will pave the way for an editorial overhaul, and then consider resigning.

The article, carried in the morning edition on May 20th, said it was based on a copy of the account of plant chief Masao Yoshida to a government investigative panel.

The article said that while the nuclear disaster was unfolding, 90 percent of the plant's workers defied Yoshida's order and fled to the Fukushima Daini nuclear plant, 10 kilometers south of the Daiichi plant.

It quoted Yoshida as saying that he never told them to go to the other plant.

Asahi's retraction came on the day the government released the interviews with Yoshida, who died of cancer last year.

In the documents released on Thursday, Yoshida said that after carefully reconsidering the matter, he finds the workers' decision to go to the Daini plant far better.

The Asahi article came under criticism from other media organizations that also obtained a copy before the release. They reported that **Yoshida apparently did not think the workers disobeyed his order.**

Gov't releases transcripts of interviews

September 11, 2014

Yoshida transcripts on Fukushima nuclear crisis released

Staff Writer

Masao Yoshida, chief of the crippled Fukushima No. 1 power plant, had lost hope and was exhausted on the night of March 14, 2011, three days into the nuclear meltdown crisis.

When he saw workers from companies cooperating with Tokyo Electric Power Co. at the plant's emergency headquarters, Yoshida just muttered: "Everyone, please just go home. Just go back home." Yoshida was urging all nonessential workers to leave in case another catastrophe hit the plant, and possibly all of eastern Japan. At the time, both the pressure and temperature were surging inside of quake-hit reactor No. 2, evoking fears of the worst-case scenario.

"All of the nuclear materials could escape and spread. Our image was that of a catastrophe for eastern Japan," he is quoted as saying in the government's formerly top-secret transcripts of its interviews with him, finally released Thursday after leaks.

Any explosion in reactor No. 2 resulting in the release of massive amounts of deadly nuclear material would immediately halt the injection of coolant water into reactors 1 and 3, putting them in the same situation as reactor 2.

“This is the part I really don’t want to recall,” Yoshida said during the interview session, which took place in August 2011.

Prompted by months of media reports based on apparent leaks of the text, as well as formal disclosure requests from the media, including The Japan Times, the government on Thursday released more than 400 pages of the Yoshida transcripts, which cover his testimony from July to November 2011 to its investigative panel on the disaster.

The government initially refused to disclose the transcripts because Yoshida had asked, in a May 2012 written request, that they not be publicized. But after the leaks, the government relented and posted them on its website Thursday.

In the interviews, Yoshida explained in detail how the crisis developed and how he and his team responded. He also stressed that, during the crisis, he and his colleagues never thought of withdrawing everyone from the crippled plant.

Given the lack of information from the plant, the government’s leaders, including Prime Minister Naoto Kan, suspected that Tepco’s top executives in Tokyo were at one point considering pulling everyone out and abandoning the six-reactor station.

“(Tepco’s) head office and the prime minister’s office may have been having absurd discussions (about a withdrawal), but did (the workers) run away? They didn’t,” Yoshida is quoted as saying.

He said that even when he was pondering the worst-case scenario, he thought he would have to keep a skeleton crew on hand, including himself. Nonessential workers, however, would have been urged to leave, he added.

The release of the transcripts has drawn a great deal of public attention because Yoshida, who died of esophageal cancer last year, is viewed as a national hero for containing the crisis and people wanted to know more about the already published accounts of his actions.

But another reason is because some of those accounts seemed to contradict each other.

The Asahi Shimbun, which claimed in May to have the full text of the interviews, published several reports about them. One said that Yoshida on March 15, 2011, ordered workers to find somewhere on the No. 1 plant grounds to avoid radiation, but most didn’t follow that directive and instead fled to the nearby Fukushima No. 2 plant, 10 km to the south.

That report caught the attention of overseas media because it contradicted the story that was perpetuated about the brave “Fukushima 50” who stayed to handle the emergency. Later, the Asahi’s rival, the Sankei Shimbun, claimed that the Asahi’s report was erroneous.

The full text released Thursday, which has the names of some people redacted for privacy, shows that **both reports could be described as at least partially correct: Yoshida said he did not order workers to evacuate to the No. 2 plant, but nonetheless workers went there. But he also said he later concluded the workers’ decision to go to No. 2 was far more appropriate than following his order.**

“Actually, I never told them to go to 2F,” Yoshida is quoted as saying, referring to the still-functioning Fukushima No. 2. “(Later) I came to believe that going to 2F was by far the right thing to do if only you gave more thought to it.”

In the interviews, Yoshida often used blunt language to criticize top Tepco executives and government leaders for intervening in technical decisions that should have been left to the plant chief.

He also alleged that the desperate effort by Self-Defense Forces personnel, firefighters and police officers to get water into the dangerously hot spent-fuel pools “were all meaningless” given the small amount of water they were working with.

An SDF helicopter, dipping a huge bucket in the ocean, flew over the fuel pools and tried to dump the water into them. Water cannon trucks operated by the SDF, firefighters and police also shot water at the pools, and they were all praised as brave heroes.

But Yoshida said much of that water didn't even reach the targets. "Even if all of the (water) had gone into the pools, the amount would have been something like 10 or 20 tons. That would be meaningless," he said. He didn't elaborate, but the spent fuel pool for reactor 4, for example, had the capacity to hold 1,425 tons of water.

Yoshida also sought to defend himself for not preparing for a monster tsunami, despite a 2008 simulation by experts that showed 15.7-meter waves could hit Fukushima No. 1 if a powerful earthquake were to hit off the coast. Yoshida was at that time the head of Tepco's nuclear equipment management department, which is responsible for preparing for potential natural disasters such as quakes and tsunami. In the aftermath of 3/11, media outlets harshly criticized Tepco for ignoring the simulation.

But according to Yoshida, the simulation was fully hypothetical and based on an arbitrary assumption that a mega-quake would take place in the sea off Fukushima, with no scientific studies showing such a possibility.

No one in academia had said such a scenario was likely before the March 11 quake, and no one in the government was seriously considering such a possibility, Yoshida said. With no consensus among quake and tsunami experts, Tepco could not have assumed that such a big tsunami would hit the Tohoku region, Yoshida argued.

"I want to raise a loud voice to say this. This time, (the tsunami-quake disasters) killed 23,000 people. This is not just about issues regarding the safety of a nuclear power plant," Yoshida said. "If you (criticize) us, why didn't you take measures to prevent those people from dying? . . . People just discuss the design of a nuclear power plant."

Govt. releases interviews about nuclear accident

http://www3.nhk.or.jp/nhkworld/english/news/20140911_33.html

Sep. 11, 2014 - Updated 14:56 UTC+2

Japan's government has released transcripts of interviews about the accident at the Fukushima Daiichi nuclear plant.

The government on Thursday disclosed interviews with 19 of 772 government and Tokyo Electric Power Company officials. A government-appointed panel carried out the interviews between 2011 and 2012.

The released interviews include those of former plant manager Masao Yoshida and former prime minister Naoto Kan, who were both in their posts at the time of the 2011 accident.

The government had not disclosed the testimony. But it reversed its initial policy after some media outlets published what they say are transcripts of Yoshida's testimony.

Asked about TEPCO's possible removal of all staff members from the plant at the time of the accident, Yoshida said he spoke over the telephone with Goshi Hosono, an advisor to Kan at that time.

Yoshida said he told Hosono he believed they would need to evacuate those who were not directly involved and that they were preparing to do so.

Hosono said he'd never before worked with such a strong sense of tension, and that he had no memory of

what he said then.

Then-chief cabinet secretary Yukio Edano recalled conversations with then-TEPCO president Masataka Shimizu.

Edano said he had heard from someone that utility officials were talking about withdrawal from the plant. Edano said he then received a telephone call from Shimizu, who said something similar.

Edano said he didn't remember the exact words Shimizu used, but he was sure the president was talking about a full-scale withdrawal. Edano said other government officials received separate phone calls and that he couldn't have misunderstood the nature of the conversation.

Then-prime minister Naoto Kan spoke about his time at the headquarters of the utility after the accident.

Kan said he told TEPCO officials that they were the party in charge and that he urged them to work as if their lives depended on it.

Kan said he told them that there was no way to escape or withdraw. He said he urged the chairman and president to get prepared to have employees over 60 years old go to the accident site.

Kan reportedly said he himself was resolved and that TEPCO would collapse if they decided on withdrawal.

Then-industry minister Banri Kaieda spoke about Shimizu's appearance at the prime minister's office.

Kaieda said cabinet ministers were frustrated with the utility and their sense of distrust was at a peak. He said the ministers felt pressed to summon the president to tell him what to do.

Former plant chief Yoshida said in testimony that he wondered what the ministers were making a fuss about. Yoshida said he wanted to make sure that people were not leaving and that he by no means had told his employees to get away.

The government plans to release testimony by other interviewees subject to their consent by the end of the year.

Asahi retracts article

September 11, 2014

[Asahi retracts article about Yoshida testimony that reported 'workers withdrew against order'](http://ajw.asahi.com/article/behind_news/social_affairs/AJ201409110080)

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201409110080

THE ASAHI SHIMBUN

Tadakazu Kimura, president of The Asahi Shimbun, held a Sept. 11 news conference at which he retracted an article (English translation at AJW) that appeared in the morning edition of May 20, 2014, reporting on the testimony provided by Masao Yoshida, the plant manager of the Fukushima No. 1 nuclear power plant.

The testimony was compiled by the government's Investigation Committee on the Accident at the Fukushima Nuclear Power Stations of Tokyo Electric Power Co.

Kimura also apologized to readers and individuals with ties to TEPCO.

In addition to relieving Nobuyuki Sugiura as executive editor, Kimura said he would decide on whether to resign after he has set the course for reform and revitalization of the daily. He will not receive any remuneration as president during the period.

The Asahi independently obtained the Yoshida testimony at a time when the central government had still not released it. On the front and other pages of its May 20, 2014, edition, the Asahi reported "about 650 TEPCO and other workers, or 90 percent of the total number who were at the Fukushima No. 1 nuclear plant on the morning of March 15, 2011, four days after the Great East Japan Earthquake, went against the order of Yoshida to wait for further instructions and withdrew to the Fukushima No. 2 nuclear plant 10 kilometers to the south."

However, as a result of a detailed internal examination, the judgment was made that there was no corroborating evidence for the headline or article contents related to "withdrawing against the order." It was a mistaken article that gave the impression that many plant workers had fled while knowing about the order given by Yoshida.

The judgment was made that the reasons for this occurrence were that the team of reporters working on the Yoshida testimony made the wrong appraisal in the course of reading and trying to understand the document, and the checking function did not operate sufficiently because only a small number of reporters shared the information due to excessive concerns for protecting the source of the information. The Asahi will continue with its investigation into the course of events that led to the article. But taking into account the seriousness of the situation and from the standpoint of the effects of the article and the problems associated with the information-gathering and reporting, the Asahi has asked the Press and Human Rights Committee, an internal third-party organ, to conduct an examination of the matter.

At the same time, Kimura touched upon the recent decision by the Asahi to retract articles related to testimony judged to be a fabrication by the late Seiji Yoshida about forcibly taking away "comfort women" from Jeju Island, South Korea. The testimony was used in past reporting about comfort women.

"I would like to apologize to the readers for having failed to issue the correction earlier," Kimura said.

Regarding past reporting on comfort women, the Asahi will set up a new third-party organ apart from the Press and Human Rights Committee. The new organ will consist of experts outside of the Asahi, such as lawyers, historians and journalists.

The panel will be asked to conduct a thorough examination, based on the voices of doubt that have been submitted to the Asahi, and look into such issues as the process behind the writing of the past articles and the developments that led to the correction; the appropriateness of the recent special coverage; and the effects that Asahi's reporting on the comfort women had on relations between Japan and South Korea and in the international community.

The Asahi will ask the panel to conduct its examination in a prompt manner, and it will present the results in the pages of the Asahi.

The Asahi will set up a committee centered on the new executive editor to work toward regaining trust and revitalization. The committee will check and examine the problems that have emerged in the course of past information-gathering and reporting as well as consider what is required to regain the trust of readers and use those results in Asahi's future newspaper coverage.

Yoshida first feared worst-case scenario

September 12, 2014

Yoshida feared nuclear 'annihilation' of eastern Japan, testimony shows

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201409120034>

THE ASAHI SHIMBUN

Plant manager Masao Yoshida envisioned catastrophe for eastern Japan in the days following the outbreak of the Fukushima nuclear disaster, according to his testimony, one of 19 released by the government on Sept. 11.

The testimonies of 19 of the people interviewed by the Investigation Committee on the Accident at the Fukushima Nuclear Power Stations of Tokyo Electric Power Co. shed light on the early days of the crisis at the Fukushima No. 1 nuclear power plant and the front-line response.

They include statements from then Prime Minister Naoto Kan and Chief Cabinet Secretary Yukio Edano when the Democratic Party of Japan-led administration was in power.

Explaining why the government decided to disclose the documents, Chief Cabinet Secretary Yoshihide Suga said at a news conference: "Several newspapers have run stories in a piecemeal fashion that cover only part of the hearings of former plant manager Yoshida. As a result, Yoshida's fear that words in his testimony would be misused out of convenience was warranted."

In his testimony, Yoshida described the condition of the No. 2 reactor at the Fukushima plant between the evening of March 14, 2011, and the next morning: "Despite the nuclear fuel being completely exposed, we're unable to reduce pressure. Water can't get in either."

Yoshida recalled the severity of the situation. "If we continue to be unable to get water in, all of the nuclear fuel will melt and escape from the containment vessel, and radioactive substances from the fuel will spread to the outside," he said.

Fearing a worst-case scenario at the time, Yoshida said, "What we envisioned was that the entire eastern part of Japan would be annihilated."

On the morning of March 15, Yoshida instructed all non-essential personnel to evacuate the command center building. While many took refuge in the Fukushima No. 2 nuclear plant, Yoshida said, "In fact, I never told the workers to go to 2F (Fukushima No. 2 nuclear power plant).

"I thought I gave an order to temporarily evacuate to a location where radiation levels were low near the Fukushima No. 1 plant, irrespective of whether it is in the compound of the plant, and await further instructions."

If the workers had evacuated to areas near the No. 1 plant as instructed, however, "all of them would be wearing full-face masks. They would have died within hours of evacuating," Yoshida pointed out. He praised the response of workers who took refuge in the No. 2 plant, saying, "Upon sufficient consideration, I realized it was much more correct to go to 2F."

Asahi retracts article (2)

September 12, 2014

Asahi Shimbun runs front-page apology article over retraction of 'Yoshida testimony'

<http://mainichi.jp/english/english/newsselect/news/20140912p2a00m0na006000c.html>

The Asahi Shimbun newspaper ran an article of apology on the front page of its Sept. 12 morning edition over the retraction of reports on testimony from the late chief of the disaster-hit Fukushima nuclear plant, following a news conference given by Asahi President Tadakazu Kimura on Sept. 11.

The Asahi has retracted a May 20 article on the testimony of Masao Yoshida, chief of the crippled Fukushima nuclear plant at the time of the March 2011 disaster, wherein it reported that some 90 percent of workers who were at the plant withdrew in opposition to his orders to remain at the site.

During the Sept. 11 news conference, Asahi Shimbun President Kimura admitted that the May 20 article included erroneous information, and apologized to readers and individuals associated with the matter.

It is a very rare case for the Asahi Shimbun to run an article on the front page of its newspaper regarding an issue such as the president's apology over a company scandal.

The newspaper carried a total of five pages on the matter in its Sept. 12 morning edition, including reports on self-evaluation wherein the company admitted failures in fact-checking and partially omitting testimony. An explanation was also given as to why the Asahi's apology was delayed after other media outlets pointed out the erroneous reports.

Asahi also posted the English version of the president's apology on its website.

Confusion reigned after disaster

September 12, 2014

Testimony shows confusion at Fukushima plant, chief's anger

<http://mainichi.jp/english/english/newsselect/news/20140912p2a00m0na012000c.html>

The newly released transcripts of testimony by Masao Yoshida, the late chief of the disaster-stricken Fukushima No. 1 Nuclear Power Plant, revealed **not only his leadership qualities to cope with the crisis in the immediate aftermath of the Great East Japan Earthquake and tsunami in 2011 but also the weakness in his preparation for nuclear contingencies.**

"As a result, nobody came to help us. I am still full of resentment and bitterness," Yoshida said in his testimony.

In response to questions from a governmental investigative panel on the Fukushima nuclear disaster, Yoshida expressed anger at the prime minister's office and the headquarters of Tokyo Electric Power Co. (TEPCO), the operator of the nuclear power plant.

The TEPCO head office was supposed to back up Yoshida and his team at the nuclear power plant but did not offer help. Instead, the TEPCO headquarters simply conveyed messages from the prime minister's office, baffling the Yoshida team.

During a meeting on the night of March 12, one day after the huge quake and tsunami struck the Fukushima nuclear power plant, then Prime Minister Naoto Kan asked Haruki Madarame, chairman of the Nuclear Safety Commission at the time, about the possibility of recriticality if seawater were pumped into the plant's No. 1 reactor. But Madarame did not give a clear-cut answer. Ichiro Takekuro, then a fellow and senior adviser to the TEPCO leadership, listened to the dialogue between Kan and Madarame and

telephoned Yoshida to tell him to stop pumping seawater into the reactor. But Yoshida did not heed the advice and kept pumping seawater.

In his testimony, Yoshida said Takekuro ordered him to follow the order without question. He also recalled that he never thought of stopping pumping in the seawater.

When asked about Kan's visit to the stricken nuclear power plant on the early morning of March 12, Yoshida said he had no idea, adding, "He came, sat and left." Meanwhile, Kan harbored a growing sense of frustration over the alleged absence of essential information from the Nuclear and Industrial Safety Agency and TEPCO headquarters. Kan said in his testimony that he decided to visit the Fukushima plant to talk directly with Yoshida and his team in the absence of smooth communications.

Yoshida categorically denied the possibility that he had contemplated a total pullout from the disaster-hit nuclear power plant amid the nuclear crisis. During questioning by the investigative panel, Yoshida was visibly irritated about TEPCO head office's handling of the crisis, heaping scorn on then TEPCO President Masataka Shimizu and calling him "that man."

Tsuneo Futami, former chief of the Fukushima No. 1 Nuclear Power Plant and now professor at Tokyo Institute of Technology, said after reading Yoshida's testimony that TEPCO headquarters should have fully explained their decisions in response to orders and inquiries from the prime minister's office and protected the team.

Responders cowed by explosion at reactor 3 building of Fukushima No. 1

<http://www.japantimes.co.jp/news/2014/09/14/national/responders-cowered-by-explosion-at-no-3-reactor-building/#.VBc3kBanq1s>

Kyodo

FUKUSHIMA – At 9:25 a.m. on March 13, 2011, workers at the Fukushima No. 1 power plant started pumping water into the No. 3 reactor from firetrucks after finding a way to ease the internal pressure more than six hours after it lost its cooling ability and started to overheat.

Despite their efforts, a blast would gut the No. 3 reactor building a little over 24 hours later, blowing off its roof and sides and leaving a towering mushroom cloud overhead. It would be the second hydrogen explosion to rock the plant since it was crippled by tsunami from the magnitude-9.0 earthquake on March 11.

But this one was more powerful. Tokyo Electric Power Co. employee Mitsuhiro Matsumoto, 47, was outside during both explosions. As a member of the restoration team, he was trying to restore power to the reactors by connecting a power truck to a switchboard in the No. 2 reactor's turbine building, which still looked viable after being flooded by the waves.

After the first explosion, Matsumoto was reluctant to go out again, but he knew there was still a lot of work to do after rubble from the previous explosion, at reactor No. 1, damaged the heavy electrical cables he was trying to lay.

The thundering second explosion came at 11:01 a.m. on March 14, just after he had finished checking the switchboard's insulation in the No. 2 turbine building and was walking toward a nearby vehicle.

The explosion kicked up so much dust that he couldn't see anything around him, including his car, which was only about 10 meters away. When finally reached it, he found the driver's seat had been crushed by a concrete block.

"I shuddered at the sight. If I had been inside, I would have been dead," he recalled.

Around the same time, four other workers were trying to connect cables in a corridor between the No. 2 reactor building and its turbine building. After the explosion, banging sounds pelted them over and over again from overhead. They later found out it was chunks of concrete from the No. 3 reactor building, landing on the roof.

The workers felt it was impossible to continue laying cable due to the damage and the climbing radiation.

After the dust settled, Matsumoto ran along the road between reactors 2 and 3 toward the emergency response building. It was hard to breathe with a full face mask, but he kept running anyway. He just wanted to get away from wherever he was as quickly as possible.

When he arrived, a member of his restoration team, Kimio Ikeda, 50, began sobbing.

"You're alive! I'm so glad!" he said upon seeing Matsumoto covered head to toe in dust. But Matsumoto laid into him: "You told us we would be OK. You liar!"

Ikeda, in fact, hadn't given Matsumoto any reassurances. But Matsumoto couldn't help himself — he was incensed.

After the explosions, he was unable to believe anyone or any of the information he received.

"I completely lost my will to fight. I was determined to never go out again," he recalled. The explosion at No. 3 remains a vivid memory in Matsumoto's mind.

"I have heard people in the office saying that after the nuclear accident broke out, they were prepared to die," he said. "But in my case, I wasn't prepared to die, even when I actually came very close to dying. And death was staring me in the face."

Finding time to spare, Ikeda phoned his wife for the first time since the crisis began. His wife started crying over the phone. Ikeda also heard his parents and son rejoicing.

"I cannot believe you are alive even after those explosions. You are alive!" she said.

"Yes, I am alive," he answered, keeping his voice low in consideration of those who hadn't been able to contact their families yet.

About 30 people in charge of the electricity equipment, including Matsumoto and Ikeda, had hardly slept. Many had already absorbed more than 100 millisieverts of radiation — the maximum allowed by Tepco over a five-year period.

After the second explosion, Yumiko Kato, 37, rushed to the emergency care room on the first floor of the emergency response building to help the injured.

A man injured by the rubble was soon brought in on a stretcher. Kato had to send him to the hospital because there were no doctors on hand. Before doing so, she wiped down his body with a wet cloth to remove some of the radiation-tainted dust.

The man moaned, his face distorted by pain.

Another man in the room was uninjured but in a state of panic.

“It’s my fault,” he said, as if he was the one to blame for the explosion.

Those feeling ill were taken to a meeting room on the second floor, next to the emergency response office. But Tepco quickly ran out of mattresses and had to put down cardboard for them to lie on.

Among them was a reactor operator who was in the main control room at the time of the explosion. Kato entered the room to see how he was doing.

But when the door closed behind her, the operator shouted: “Is that an explosion? Again?” He then clasped his arms around his knees and trembled, muttering “I am afraid, afraid, afraid.”

Kato patted him on the back and assured him he was in a safe place, frustrated that she couldn’t do anything else.

Four Tepco employees, three contractors and four Self-Defense Force soldiers were injured by the explosion at No. 3.

Those at the emergency response office were mentally shaken.

“I want to go home,” a young female Tepco employee said as she started to cry. “What are we all doing here? What are we going to do if there is another explosion?”

She then asked Kato to take her away from the plant.

Kato put her arm around her shoulder and said, “Let’s believe in our people, because they are working very hard.”

The situation, however, only got worse, cornering everyone at the plant.

The story about injecting seawater

September 14, 2014

Yoshida's call on seawater kept reactor cool as Tokyo dithered

<http://www.japantimes.co.jp/news/2014/09/14/national/yoshidas-call-seawater-kept-reactor-cool-tokyo-dithered/#.VBc3MBanq1s>

Kyodo

This is the sixth in a series on the Fukushima nuclear catastrophe based on the accounts of people who struggled to contain the crisis in its early stages. Job titles and ages are as of March 2011.

Fukushima — When the No. 1 reactor building exploded at the Fukushima No. 1 nuclear complex on March 12, 2011, blowing its concrete roof high into the sky, the employees were traumatized.

Still, the officials at Tokyo Electric Power Co. knew they had to continue injecting water into its reactor, which had lost all cooling ability after the massive earthquake and tsunami the day before robbed the power plant of all electricity and several backup generators.

At the time, Tepco was running out of fresh water to cool the reactor and had decided to use seawater that had pooled inside a large pit near the No. 3 reactor after the tsunami. Then planned to pump the water all the way over to the No. 1 reactor using three firetrucks.

They needed the help, however, of the Ground Self-Defense Force troops who had arrived at the plant in their own firetrucks. GSDF officer Yuichi Sato, 22, headed over to the pit for a second time later in the evening.

About 90 minutes before, he had been driving toward the pit when the hydrogen blast, set off by gas generated by the reactor's melting nuclear fuel rods, gutted the No. 1 reactor building, hurling tons of debris into the air.

A chunk of steel frame from the building smashed into the passenger-side window of the truck, breaking the arm of Hiroyuki Ogawa, the 50-year-old chief of Tepco's firefighting unit, who was guiding them to the site.

Sato, a member of a GSDF artillery regiment based in the prefecture, said he was afraid that another explosion might take place but knew he had to do his job.

The GSDF firetruck was supposed to pump seawater out of the pit and pass it to another GSDF firetruck, with Tepco's firetruck later injecting it into the overheating reactor.

But heated exchanges broke out between officials from Tepco and one of its affiliates over who would run Tepco's firetruck.

"Are you telling us to go? Can you guarantee our lives will be protected?" an official of affiliate Nanmei Kousan Co. shouted at Tomoyuki Arai, who had taken over as Tepco's firefighting chief after Ogawa was injured. Arai was asking the affiliate to provide more manpower because the job of operating the firetrucks belongs to Nanmei and Tepco employees aren't trained to run them.

Arai said he could not guarantee their safety, but added, "If we don't go, things will get worse."

A team including Arai and a Nanmei employee eventually left for the No. 1 reactor's turbine building. As they approached it, their dosimeters climbed, warning of hazardous amounts of radiation in the area.

After Arai's team replaced the hoses damaged by the hydrogen explosion, the three firetrucks were connected by 300 meters of hoses.

It was 7:04 p.m. when they started pumping the seawater into the reactor. But unknown to Sato and Arai, there was another struggle developing between the plant's emergency response office and members of the prime minister's office in Tokyo.

Given the critical need to inject seawater into the overheating No. 1 reactor, plant chief Masao Yoshida, 56, was in for a surprise when he was ordered over the phone to suspend the operation.

“Stop it immediately,” Ichiro Takekuro, a senior Tepco official who had been dispatched to the prime minister’s office to provide explanations on technical issues, said around 7:20 p.m.

“Why?” asked a defiant Yoshida. The plant was finally in a position to continuously inject water into the reactor and yet Takekuro, who had once been the head of Tepco’s nuclear division and knew better than anyone that the reactors needed to be cooled as soon as possible, was telling him to stop.

“Shut up! The prime minister’s office keeps on pestering me,” Takekuro, 64, said, before hanging up the phone without listening to what Yoshida had to say.

About 20 minutes before the call, Takekuro had explained to Prime Minister Naoto Kan that it would take more than an hour and a half to switch from freshwater to seawater injection at the reactor.

Kan, 64, told Takekuro in the meantime to consider whether there was a possibility of “recriticality” taking place. Kan was referring to a phenomenon in which melted fuel rods resume a chain reaction if seawater is used.

“I wanted him to consider the possibility because I was told that there was time before the seawater injection,” Kan later said.

Takekuro was aware that mixing boric acid with seawater could prevent recriticality, but before telling the prime minister about it, he learned from Yoshida by phone that the seawater injection had already begun.

Thinking that he could not tell Kan that reactor cooling operations with seawater had already commenced, Takekuro ordered Yoshida to stop the operation.

Yoshida was fuming after the telephone conversation. He could not understand why a decision by someone who was not at the site was being given priority. Dissatisfied, he consulted Tepco’s head office in Tokyo through a real-time teleconference.

The head office said the utility had no choice but to follow the order. Yoshida was told he should cease injecting seawater and describe the injections that had already taken place as having been done “on a trial basis.”

Yoshida could not understand what was wrong with seawater injection and turned to Shiro Hikita, 56, his most trusted subordinate, who knew all about the structure and design of the reactors, for a second opinion.

Emboldened by Hikita’s assurance that there was no problem, Yoshida then approached the Tepco employee who was supervising the seawater injection operation and whispered, “I will put on an act. No matter what happens, you must not stop injecting the water.”

Later, at 7:25 p.m., Yoshida said during a teleconference that the “trial” seawater injection would be temporarily halted on the prime minister’s order, but was expected to resume soon because Takekuro was negotiating the issue in Tokyo.

Hundreds of people at the plant’s emergency response office and senior Tepco officials in Tokyo believed the injection had been halted.

At 8:10 p.m., Yoshida declared that the seawater injection would “resume” following approval by the prime minister’s office. **But the operation had never actually been suspended.**

“I felt that, in the end, it had to be my decision. There was just no time for debate,” Yoshida later told a subordinate.

About two months after the nuclear crisis unfolded, media reports quoted government sources as saying Kan ordered the suspension of seawater injection. Opposition lawmakers then criticized Kan for intervening in Tepco’s efforts to contain the crisis.

Kan, however, denied giving such an order.

“I knew that water had to be injected, be it seawater or any kind of water. I was not informed that seawater injection had begun in the first place, so I could not have ordered its halt,” he said.

Economics of ageing reactors

September 14, 2014

Economic realities of old reactors

<http://www.japantimes.co.jp/opinion/2014/09/14/editorials/economic-realities-of-old-reactors/#.VBhIjhanq1s>

Reported moves by power companies to consider decommissioning their older nuclear power reactors indicate that they are beginning to selectively evaluate their nuclear power plants by weighing the costs of meeting safety criteria that has been tightened in the wake of the 2011 disaster at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear power plant.

The government appears ready to facilitate such moves in the hope that terminating the old and more risky nuclear reactors will, in turn, help win public support for reactivating idled reactors that clear safety screening by the nuclear watchdog — the Nuclear Regulation Authority (NRA).

Both the power industry and the government need to take a realistic view of the prospect of nuclear power in this country — where currently all of its 48 nuclear power reactors are idled amid safety concerns following the 2011 disaster.

The Abe administration should follow up on its pledge to reduce “as much as possible” the nation’s dependency on nuclear power to meet its energy needs, and set specific targets, including a timeline, toward that goal so that the utilities can proceed with restructuring their power generation facilities, including scrapping nuclear reactors that will no longer be viable either for economic or safety reasons.

Recent media reports that Kansai Electric Power Co. is moving to scrap the Nos. 1 and 2 reactors at its Mihama nuclear power plant in Fukui Prefecture — both of which began operating in the early 1970s and are more than 40 years old — were followed by a comment by trade minister Yuko Obuchi that the government would promote both the smooth decommissioning of aging reactors and the reactivation of reactors whose safety has been confirmed.

It is obvious that the government has in sight shutting down several nuclear power reactors that have become so old as to require an untenably high cost to meet the safety standards.

Under the new safety regulations introduced after the 2011 triple meltdowns at the Fukushima plant, nuclear reactors are in principle not allowed to operate for more than 40 years. Exceptions are allowed. Companies may be allowed to continue operating for up to 20 more years if they go through special inspections, including detailed checks on the decay status of their equipment such as the reactor pressure vessel — a process likely to require a major overhaul at huge cost, such as replacement of old power cables.

Meanwhile, the aging reactors introduced in the early days of the nuclear power industry typically have much smaller power output capacity than the reactors of subsequent generations, making it unlikely that their continued operation will make profits worth the investments.

Kansai Electric is not alone. In March, Chugoku Electric Power Co. President Tomohide Karita noted the company's "option" of decommissioning the No. 1 reactor at its Shimane nuclear power plant, which began operating in 1974.

Kyushu Electric Power Co. is also reported to be weighing the possibility of not seeking an operating extension of the No. 1 reactor at its Genkai nuclear power plant in Saga Prefecture. Thirty-eight years have passed since it started up; it has the lowest output capacity among the utility's six nuclear reactors. Of the nation's existing 48 nuclear power reactors, 18 are more than 30 years old. Seven reactors either have passed or are nearing the 40-year mark, and their operators need to apply to the NRA for safety screening by July next year if they plan to extend the reactors' operation. The power companies are expected to make a decision as early as yearend on what to do with the seven reactors.

The post-Fukushima regulations require power companies to make additional investments to upgrade their plants' resilience against natural disasters such as big earthquakes and tsunami as well as severe accidents.

Plants that are found to have active faults running under reactor buildings as a result of having the tightened standards applied to them will also face scrapping even if they have operated for fewer than 40 years.

Citing the cost of increased fuel imports to run thermal power plants and the burden of rising electricity charges, the Abe administration has pushed for reactivating idled nuclear reactors once they have been given the NRA's safety nod.

Since July last year, the power companies have applied for NRA screening of a total of 20 reactors. Of these, only two — the Nos. 1 and 2 reactors at the Sendai plant of Kyushu Electric in Kagoshima Prefecture — have so far been approved for the process by the NRA. **It is considered doubtful that the power companies will spend the money and time needed to restart the aging reactors.**

The increased cost of meeting the safety regulations raises doubts about the government's claims of the cost advantages in running nuclear power plants instead of other energy sources. There may be cases where power companies decide to discontinue some reactors even before the 40-year limit.

Trade Obuchi has indicated that the government may consider measures to help the power companies scrap the aging reactors smoothly.

Since discontinuing a nuclear reactor reduces the asset value of the plant facility, its operator would need to report losses from the cut — an additional financial burden on the firms suffering from years of losses due to rising fuel costs. The trade ministry is reportedly mulling changes to accounting standards to ease the burden of the power companies.

But operators of nuclear power plants are supposed to set aside the costs of decommissioning their reactors from the profits gained from power generation at the facilities.

The government should not offer special treatment for the power companies merely because of the massive costs involved, as that would contravene economic principles and become difficult for taxpayers to support.

TEPCO makes arrangements with Chubu

September 18, 2014

TEPCO to tie up with Chubu Electric on thermal power, fuel procurement

<http://mainichi.jp/english/english/newsselect/news/20140918p2a00m0na005000c.html>

Tokyo Electric Power Co. (TEPCO) has decided to grant Chubu Electric Power Co. preferential negotiation rights to form a joint venture aimed at thermal power generation and fuel procurement, it has been learned.

The potential alliance transcends service areas, thereby hinting at a possible realignment of the power industry.

TEPCO made the decision due to its belief that an alliance with Chubu Electric -- which has strengths in operating thermal power plants and procuring liquefied natural gas (LNG) -- would be the best choice for fleshing out its growth strategy in order to cope with the 2016 liberalization of the country's retail electricity market.

TEPCO, the operator of the incapacitated Fukushima No. 1 Nuclear Power Plant, is aiming to form a joint venture with Chubu Electric by the end of the current business year to integrally handle fuel procurement and thermal power generation. An agreement to start negotiations may be signed as early as the end of this month.

The combined total volume of LNG procured annually by the two utilities stands at slightly less than 40 million tons. This is one of the highest levels globally, which is likely to give the joint venture a competitive edge in price negotiations with oil-producing countries and other suppliers. Through the new joint venture, the two utility companies will also aim to replace most of TEPCO's aging thermal power generation facilities around Tokyo Bay -- whose total output is 10 million kilowatts -- with new facilities. TEPCO incorporated a scheme to form a comprehensive partnership on thermal power generation into its "New Comprehensive Special Business Plan," which was approved by the government in January. TEPCO has been negotiating with Chubu Electric, Tokyo Gas Co., Kansai Electric Power Co., and JX Holdings Inc. since June -- sounding them out about jointly rebuilding its aging thermal power stations at three locations in Chiba Prefecture, as well as jointly procuring LNG.

TEPCO and Chubu Electric are in the final stage of the negotiations, which outlines the establishment of a fifty-fifty joint venture. Because TEPCO is facing huge compensation claims stemming from the Fukushima nuclear disaster, Chubu Electric was concerned about the possibility of the new joint venture's profits being partially used for compensation payouts, to an extent exceeding its capital contribution ratio. Chubu Electric also fears that the government, which holds a majority stake in TEPCO, could intervene in the management of the new joint venture. Consequently, the two companies are moving in the direction of stating in their final agreement that the new joint venture will not be held responsible for compensations over the Fukushima nuclear disaster.

TEPCO is eyeing the integration of the two firms' thermal power sections, and is therefore calling on Chubu Electric to transfer its existing thermal power generation facilities and LNG procurement contracts to the new joint venture. As a result, attention will be focused on how much of their assets the two companies will transfer to the new alliance.

Chubu Electric has been importing U.S. shale gas jointly with Osaka Gas, which is enthusiastic about taking part in thermal power generation projects in the Tokyo metropolitan area -- thereby also hinting at a possible three-way partnership between TEPCO, Chubu Electric and Osaka Gas.

Worried about political message

September 18, 2014

Hibakusha group withheld nuclear testing protest photos from exhibition

http://ajw.asahi.com/article/behind_news/politics/AJ201409180048

By ASAKO HANAFUSA/ Staff Writer

A hibakusha group in Tokyo bowed to concerns raised by the Tokyo metropolitan government this summer and withheld photos of protests against nuclear weapons testing from an exhibition. The July 18-23 exhibition was organized by Toyukai (Tokyo Federation of A-Bomb Sufferers Organizations), which will celebrate its 56th anniversary in November. About 4,800 of the 6,000 or so hibakusha living in Tokyo belong to Toyukai.

"We wanted to display the photos to illustrate the activities of our group toward the goal of eliminating nuclear weapons," said 82-year-old Kohei Oiwa, who heads Toyukai. "However, we decided to accept the position of the Tokyo metropolitan government because the atomic bomb exhibition could still go on even without the photos."

Tokyo metropolitan government officials were concerned that foreign visitors to the observatory at the Tokyo Metropolitan Government Building, where the exhibition was held, would be offended by photos showing Japanese protesting against specific nations for conducting nuclear weapons tests.

Exhibitions about the August 1945 atomic bombings of Hiroshima and Nagasaki have been held at the observatory every year since 2009 under the group's auspices.

This year's exhibition was held under the theme, "The actual situation of atomic bomb suffering and Tokyo's hibakusha." About 170 items, including photos, illustrations and tiles that survived the atomic bombings, were displayed. The exhibition also described the radiation damage from the bombings, as well as Toyukai's activities over the years.

About 5,500 visitors took in this year's exhibition.

Toyukai initially planned to display photos of protests held between the late 1990s and early 2000s against nuclear tests conducted by the United States, Britain, France, China and India. The photos showed protesters holding banners that specifically named the nations that conducted the nuclear tests.

The photos were shown to Tokyo metropolitan government officials in charge of the exhibition on July 10. **The officials raised concerns that some people might mistakenly construe that the photos carried a political message.** Toyukai members then decided against displaying the photos.

An official of the Tokyo metropolitan government section that decided whether to support the exhibition said: "Although we are not opposed to the organizing of the atomic bombing exhibition and the anti-nuclear stance of the hibakusha itself, the Tokyo metropolitan government has exchanges with many nations and many foreigners visit the observatory. There was the possibility of offending the feelings of those visitors by displaying contents of opposition to past nuclear tests conducted by specific nations."

The section which manages the observatory also concluded that the photos would fall under the condition of "containing political coloring," which is used to decide against renting out observatory space.

But Masahiro Takasaku, a professor of constitutional law at Kansai University, said **freedom of expression could be threatened if local governments and organizing groups become increasingly hesitant about dealing with controversial topics.**

Let's try and learn

September 17, 2014

[Learn from the 3/11 transcripts](#)

<http://www.japantimes.co.jp/opinion/2014/09/17/editorials/learn-311-transcripts/#.VBsoGxanp1s>

The transcripts of the interviews of 19 people who dealt with the March 2011 triple meltdowns at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear power plant, including the late Masao Yoshida, then chief of the plant, may offer little new information about the worst nuclear disaster since Chernobyl but still provide important lessons that must be learned for management of future crises.

Last week's release of the transcripts had been closely watched, especially due to conflicting reports by some members of the media over the interview of Yoshida, who led the desperate efforts to contain the situation at the crippled plant after the 3/11 tsunami destroyed the emergency generators needed to operate the reactors' cooling system, and an apology by the Asahi Shimbun after the release stating that its earlier report — which alleged that many of the workers at the No. 1 plant had defied Yoshida's orders and fled to the Fukushima No. 2 plant at the height of the crisis — was erroneous.

However, the naming of names should not let us lose sight of what the transcripts tell us about what transpired among people at the plant, the Tepco headquarters in Tokyo and the government as they tried to deal with the crisis — which will be all the more important as the power industry and the Abe administration move to restart nuclear power plants idled in the wake of the 2011 disaster.

The 19 people, including then Prime Minister Naoto Kan and key members of his Cabinet, were among a total of 772 people interviewed for the government's probe into the Tepco plant disaster. Yoshida, who died of esophageal cancer last year, reportedly asked that the transcript not be made public saying that his statements may include erroneous recognition of facts, but the government decided to release his and others' transcripts after media reports gave conflicting accounts of Yoshida's testimony.

In the roughly 400 page transcript, Yoshida gives vivid descriptions in candid words of what he thought and did as he and his men faced the loss of power at the plant. His testimony shows that Tepco had not been prepared for the cutoff of emergency power. Yoshida admits that he did not have an answer ready on how to cool the reactors in such a situation. He repeatedly talks of "death" in the initial days of the crisis as the realization sinks in that the nuclear fuel had already started to melt, and might melt through the reactors' container vessels and release massive amount of radioactive substances.

Yoshida flatly denies that he thought of withdrawing all his men from the plant even as fears rose of the worst-case catastrophe — which Kan and his Cabinet suspected as they heard reports from the power company's top executives. He says he pondered keeping a skeleton crew at hand to manage the crippled reactors but having all other nonessential workers to evacuate. The transcript shows that many workers in fact braved the danger and worked desperately to keep the situation under control.

Still, even the men who Yoshida counted among the nation's most capable engineers with troubleshooting experience were unable to prevent the core meltdowns, which left large areas around the Fukushima No. 1 plant uninhabitable due to the radiation fallout more than three years after the disaster — and likely even much longer.

The safety standards updated in the wake of the Fukushima crisis call for measures to make nuclear power plants resilient against natural disasters, including maximum possible quakes and tsunami forecast on their sites, as well as steps to deal with severe accidents. It still needs to be verified if a system has been established in which workers at each plant will be able to manage situations that have not been foreseen — as happened at the Fukushima plant — in future possible crises. Upgrading plant hardware alone would not be sufficient to manage crises, in which, as Yoshida's accounts show, things may not work out as they are presupposed to.

In his testimony, Yoshida defends Tepco's inaction in response to a 2008 simulation by experts that the No. 1 plant could be hit by a tsunami as high as 15.7 meters if a strong quake hits off Fukushima Prefecture. As head of Tepco's department responsible for managing its nuclear power plant equipment to prepare for natural disasters when he was informed of the scenario, Yoshida says that the power company needed to assess the cost-efficiency of measures to invest money in measures to deal with the hypothetical simulation — which turned out to have rightly gauged the estimated 15.5 meter height of the tsunami that hit on March 11, 2011. It needs to be closely monitored if the power companies still follow the same business logic as they respond to the updated plant safety standards.

The July 2012 report by the government's investigation into the Fukushima nuclear disaster pointed to a shortage of information about events at the plant reaching the prime minister's office. Kan's administration came under criticism that its "meddling" — apparently based on insufficient information — created confusion in the on-site team's fight to contain the situation at the plant. The released transcripts underline the communication failures between the government and Tepco headquarters — and between Tepco's top executives in Tokyo and the Fukushima plant team.

A typical episode is the order by a senior executive at Tepco headquarters to Yoshida on March 12, 2011, to stop the injection of seawater to cool Reactor 1 after the supply of fresh water ran out. The executive, who had reportedly been urged by Kan to look into the possibility of seawater injection causing a nuclear chain reaction known as recriticality, told Yoshida that seawater injection had not yet been approved by the prime minister's office. Yoshida's decision to ignore the executive's order and keep on injecting seawater is credited for preventing the situation from worsening. Kan, in his interview transcript, says he never told Tepco to halt the seawater injection and blames miscommunication and misunderstanding on Tepco's part.

In the part of the transcript where Yoshida recounts the repeated urging from the Tepco headquarters and the government to hasten the venting operations to release radioactive steam from the stricken reactors to reduce the buildup of pressure on the morning of March 12, he says there was a distinct gap between the on-site staff at the plant and the Tokyo headquarters in the recognition of what's going on — which he says was even wider between the plant staff and the prime minister's office.

It remains unclear if the government and power companies have learned from such communication gaps — perhaps other than to blame leaders of the previous DPJ-led administration. The government does not appear to have done much to follow up on its 2012 report to dig deeper into how the Fukushima disaster evolved into a crisis. It needs to use the testimonies of Yoshida and others, including those that remain confidential, to learn what went wrong before and during the events in 2011, and to help avert or contain future crises.

Tanaka vows to secure NRA's independence

September 20, 2014

New regulator vows to secure independence of nuclear safety body

<http://mainichi.jp/english/english/newsselect/news/20140920p2g00m0dm028000c.html>

TOKYO (Kyodo) -- Satoru Tanaka, who became a commissioner of Japan's Nuclear Regulation Authority on Friday, vowed to proceed with safety screenings of nuclear facilities with independence, brushing off criticism he has close ties with nuclear power companies.

Tanaka has come under fire for receiving payments and donations in the past from bodies including one linked to Tokyo Electric Power Co., the operator of the disaster-hit Fukushima Daiichi plant. Critics say the regulator's fairness and independence could be compromised with his addition to the NRA decision-making panel.

A former chairman of the Atomic Energy Society of Japan, Tanaka said at a press conference he will do his job "on the basis of science and technology" and he will show that stance through "my language and behavior."

"All experts engaged in nuclear power should work toward enhancing safety, and any organizations or experts who cannot do that have no rights to engage in nuclear power," Tanaka said.

While all of Japan's 48 commercial reactors currently remain offline amid safety concerns, the regulatory body is assessing the safety of nuclear plants based on a new set of regulations introduced following the March 2011 Fukushima accident, a process necessary for any nuclear units to be allowed to go back online.

The NRA was established in 2012 as a new nuclear safety regulatory body after the Nuclear and Industrial Safety Agency, which used to oversee the nuclear industry, was dismantled following the Fukushima nuclear crisis.

While the NISA was placed under the Economy, Trade and Industry Ministry, a promoter of nuclear power, the NRA is given a high degree of independence, reflecting criticism that the pre-Fukushima regulatory body had failed to function properly.

With the first reshuffle of the five-member NRA decision-making panel since its establishment, geologist Akira Ishiwatari also took up one of the two vacant positions.

Ishiwatari, a former Tohoku University professor, will oversee the assessment of earthquake and tsunami hazards that could affect nuclear plants, replacing Kunihiko Shimazaki, a seismologist who had led rigorous safety screenings during his two-year tenure despite utilities' push for a speedy resumption of idled reactors.

Kenzo Oshima, a former ambassador to the United Nations, also left the post on Thursday.

1954 radiation tests on sailors resurface

September 20, 2014

'Missing' documents reveal 1954 U.S. H-bomb test affected 556 more ships

<http://mainichi.jp/english/english/newsselect/news/20140920p2a00m0na013000c.html>

Recently released government documents reveal that the crews of 556 Japanese ships were tested for radiation exposure in the wake of the United States' 1954 hydrogen bomb tests around the Bikini Atoll -- one of which irradiated the crew of the Daigo Fukuryūmaru tuna boat from Shizuoka Prefecture.

The records were released by the Ministry of Health, Labor and Welfare on Sept. 19 in accordance with the Access to Government Information Act, following a freedom-of-information request by a citizens group in Kochi Prefecture known as the Pacific Ocean Nuclear Disaster Assistance Center and other organizations.

According to representatives from the group and the health ministry, the national and local governments conducted the testing between March and December 1954 on fishing and cargo ship crews from a total of five Japanese ports that had been in waters affected by the U.S. nuclear test in the central Pacific.

The recently released documents included results from tests conducted between March and June that year. The testing, which included Geiger counter measurements of radiation levels among crew members from the 556 ships, revealed that individuals from a total of 12 ships were found to have been exposed to 100 counts of radiation or more per minute.

The highest level of exposure to a single sailor was 988 counts per minute, which would result in a total dose of 1.68 millisieverts if this rate of exposure was kept constant over a two-week period.

International standards say that exposure of 100 millisieverts or more can impact health, prompting health ministry officials to comment, "These were not levels that would have resulted in immediate adverse health impacts."

The Daigo Fukuryūmaru crew allegedly absorbed doses of between 1.6 and 7.1 sieverts.

When a lawmaker made an inquiry about the testing-related document during a 1986 House of Representatives Budget Committee meeting, a top official of the then Ministry of Health and Welfare replied, "**We cannot locate it.**"

The Kochi Prefecture citizens group filed their freedom of information request in July this year, and the document was found in a records storage warehouse in Ibaraki Prefecture.

While a total of 992 fishing vessels are said to have been forced to discard fish due to radiation contamination following the hydrogen bomb tests around the Bikini Atoll, health ministry officials have commented, "We have not found records for any ships beyond the 556" detailed in the recently found document.

A memo that was sent out to prefectures nationwide in 1956 by the then Ministry of Health and Welfare stated that "no cases of radiation sickness were recognized" beyond those found among the Daigo Fukuryūmaru crew.

"Some crew members (from the additional ships) have been dying from leukemia and cancer that is likely due to the effects of radiation," says Masatoshi Yamashita, who heads the Kochi prefectural citizens group. "I'd like to analyze the radiation levels and other aspects of these documents together with an expert."

Clear pro-nuke message from Obuchi

September 21, 2014

Obuchi starts nuclear power pitch

<http://www.japantimes.co.jp/news/2014/09/21/national/politics-diplomacy/obuchi-starts-nuclear-power-pitch/#.VB7qtBanp1s>

AFP-JIJI

New industry minister Yuko Obuchi started to spin a clear pro-nuclear message Sunday, seeking to convince a deeply skeptical public of the upside of atomic power by arguing that the resource-poor Japan should be realistic about meeting its energy needs.

More than three years after the Fukushima disaster, the public remains unconvinced about the safety of nuclear power, and the tricky task of winning them over has fallen to Obuchi, the first woman to head the powerful Ministry of Economy, Trade and Industry.

“It would be very difficult to make the decision not to have nuclear power right now,” Obuchi, who visited the Fukushima No. 1 plant two weeks ago, claimed during a debate broadcast live Sunday by NHK. Nevertheless, Obuchi, appointed during this month’s Cabinet reshuffle, conceded that “it’s an issue that is difficult to explain in short phrases,” and acknowledged that “we have to take seriously the concerns voiced after Fukushima.”

She also made note of Japan’s soaring energy costs, which were exacerbated by the “Abenomics”-weakened yen’s further slide in value last week.

“After the Fukushima accident, the cost of fossil fuel imports jumped by ¥3.6 trillion (\$33 billion), or ¥10 billion (\$92 million) per day,” she said.

Before the March 2011 quake and tsunami crippled the Fukushima No. 1 plant, nuclear power accounted for nearly one-third of Japan’s energy needs. Now Japan’s self-sufficiency rate is just 6 percent, versus 85 percent in the U.S. and 50 percent in France.

The need to reduce carbon dioxide emissions means Japan can’t afford to rely heavily on fossil fuels, she added, noting that electricity supply from solar and wind power remain unsteady.

Obuchi claimed the Nuclear Regulation Authority, an independent nuclear watchdog set up in the aftermath of the meltdowns, has “the world’s strictest safety guidelines.” As a result, she argued, “The government policy is to restart a nuclear plant that has passed these guidelines.” The NRA’s decision-making panel lost its only seismologist last week in a mandatory reshuffle and added a pro-nuclear engineering professor seen as having cozy ties with the industry.

An unsteady supply of electricity from renewable sources such as solar and wind power and the need to reduce carbon dioxide emissions to combat global warming means Japan cannot afford to rely heavily on fossil fuels, Obuchi argued, adding that “after the Fukushima (disaster), the cost of fossil fuel imports jumped by ¥3.6 trillion, or ¥10 billion per day.”

The NRA earlier this month gave the green light to two reactors at Kansai Electric Power Co.’s Mihama nuclear plant in Fukui Prefecture. Hurdles remain, however, in getting the consent of local host communities who may still be scarred by the Fukushima crisis.

All of Japan’s 48 commercial reactors remain offline pending beefed up safety tests.

Widespread anti-nuclear sentiment has simmered ever since the quake and tsunami sparked the worst atomic disaster since Chernobyl.

Tens of thousands of residents had to be evacuated as the Fukushima reactors spewed fallout on their municipalities and the central government imposed a 20-km no-go zone around the plant. Many have not been permitted to return home, and scientists warn that parts of the hot zone might have to be left abandoned forever.

September 21, 2014

Very true

September 25, 2014

Safety net for nuclear power

<http://www.japantimes.co.jp/opinion/2014/09/25/editorials/safety-net-for-nuclear-power/#.VCREbxanp1s>

A new system being considered by the government to guarantee a certain price for electricity generated by nuclear power — even after the retail sale of power is deregulated — **would amount to the subsidization of nuclear energy by consumers.**

It contradicts not only what the government has long touted as the cost advantage of nuclear power over other energy sources but also the government’s pledge in the basic energy plan to reduce as much as possible the nation’s dependence on nuclear power to meet its energy needs.

During a meeting of experts to discuss nuclear energy issues last month, the Ministry of Economy, Trade and Industry proposed creating a new system in which the government and power companies set a standard price on electricity produced by nuclear power plants that reflects the total expenses of power generation, including the costs of future decommissionings of plants and the disposal of spent nuclear fuel. If the market price of electricity falls below the standard, power companies will be allowed to close the gap by increasing utility charges to consumers. If the market price exceeds the standard, the power firms will repay the margin back to consumers. This mechanism ensures that **the power companies will not incur losses from nuclear power generation no matter how much it costs.**

Under Japan’s regional electricity monopoly business model, power companies have set utility charges on households — as authorized by the government — on the basis of the total cost involved in the generation and transmission of power plus their profit margin. This system is to be phased out after the regional monopoly is ended in 2016, and it is hoped the deregulation will push down electricity prices as competing new players enter the market.

The major power firms have complained to the government that decontrol of prices could make it difficult for them to recoup the cost of their investments in nuclear power generation through utility charges.

In the METI’s latest proposal, the government effectively acknowledges that nuclear energy will no longer be an economically competitive source of power when power industry deregulation moves forward.

Even under the regional monopoly, it has long been said that the delivery of nuclear power — despite its supposed advantage over thermal power in terms of fuel and other operational costs — is more expensive when all costs are counted, including the cost of future decommissionings of reactors, disposal of spent fuel, as well as government grants distributed to host municipalities.

The cost of safety steps at nuclear power plants substantially increased under the new standards updated in the wake of the 2011 meltdowns at Tokyo Electric Power Co.’s Fukushima No. 1 plant. It has prompted some power firms to consider decommissioning their aging nuclear power reactors, and the government is reportedly weighing introduction of a new accounting system to ease the impact of the decommissioning cost on their finances.

The government’s first Basic Energy Plan since the 2011 nuclear disaster, adopted in April, calls nuclear power an important base load energy source for Japan. Meanwhile, the Abe administration is pushing to reactivate nuclear power reactors — all of which currently remain idle because of safety concerns following the Fukushima disaster — once they have cleared the Nuclear Regulation Authority’s screening under the updated safety standards.

But the energy plan also obliges the government to try to reduce the nation’s dependence on nuclear energy as much as possible through energy-saving efforts and the introduction of renewable energy sources.

The proposed system apparently would run counter to this goal by enabling the power companies to circumvent the cost problem in running nuclear power plants — and possibly in building new reactors — under the competitive environment envisioned after industry deregulation.

If the government accepts the premise that nuclear power may no longer be economically competitive, it needs to explain to consumers why they would end up paying the added costs of maintaining such an energy source.

Too much clean energy?

October 2, 2014

Clean energy boom challenges power grid

Bloomberg

Four regional utilities stopped signing contracts to buy renewable energy from big solar power plants and other suppliers starting Wednesday, limiting an influx that is testing the nation's electricity grid.

The decision by the utilities serving Shikoku, Hokkaido, Tohoku and Okinawa, and a similar move last week by Kyushu Electric Power Co., threatens to undermine the national push to expand renewable energy supply in the wake of the Fukushima nuclear crisis.

Grid access "has been the largest impediment for clean energy developers in Japan," Mika Obayashi, director of the Tokyo-based Japan Renewable Energy Foundation, said in a statement last week after Kyushu Electric's announcement.

At the heart of efforts by utilities to limit clean energy access is the design of the electricity distribution network and whether it is able to handle the flow of intermittent supplies of power from hundreds of different producers. The grid is being challenged and utilities are starting to balk.

Kyushu Electric, which supplies power to almost 9 million residential and business customers, said Sept. 24 that it will suspend responding to applications by developers seeking access to its grid while it reviews how much more clean energy it can handle.

Shikoku Electric Power Co., Tohoku Electric Power Co., Hokkaido Electric Power Co. and Okinawa Electric Power Co. are also restricting access to varying degrees, as blackouts could occur if all output from renewable energy suppliers is transmitted to the utilities' grids, causing overcapacity.

The moves run counter to the efforts of policymakers to promote and increase the use of renewable energy to alleviate the publicly touted plight of energy-dependent Japan.

Japan introduced incentives to encourage renewable energy development in July 2012, offering some of the world's most attractive rates to developers through the feed-in tariff program, which required utilities to purchase electricity generated from renewable sources at fixed prices. A boom in clean energy projects — particularly in solar — resulted.

"The design of the feed-in tariff program could have included clauses to avoid a situation like this," said Takehiro Kawahara, an analyst for Bloomberg New Energy Finance. "The current design did not take into account any measures on matching renewable energy project development with local electricity demand nor ease of integration of approved projects into the existing grid infrastructure."

A working group will be set up to review Japan's grid, including how much access is available for clean energy and how access can be expanded, the Ministry of Economy, Trade and Industry said Tuesday.

About 72,000 megawatts of clean energy projects have been approved since the feed-in tariff program's inception. The bulk of the approvals, or 96 percent, has been solar. Japan had 31,000 megawatts of renewable energy at the end of 2010, according to Bloomberg New Energy Finance data.

Not all clean energy projects qualifying for incentives have been built, signaling various bottlenecks ranging from the availability of land to the cost of equipment and labor. As of June, METI said that 11,090 megawatts of approved projects had started operating, 15 percent of the total.

Kyushu Electric's decision is already affecting developers and installers with plans in the region.

Sanix Inc., a solar-panel installer with headquarters in Fukuoka, said it may shift workers.

"We will inevitably be affected as we won't be able to install systems in areas covered by Kyushu Electric," the company said in a statement Sept. 25. "We will review our plans for hiring, advertising and adding branches to minimize the impact" of the utility's decision, the company said.

Kyushu Electric's decision may also affect a 430-megawatt solar station under development on Ukujima, an island off Kyushu in Nagasaki Prefecture. The project, touted by developer Kyocera Corp. and its partners as the largest in the world to be built on agricultural land, has yet to secure grid access from Kyushu Electric.

"We want to continue talks with Kyushu Electric while gathering more information and working with our partners," Kyocera spokesman Sanae Iwasaki said Sept. 25 after Kyushu Electric's announcement. Orix Corp. and Germany's Photovolt Development Partners GmbH are among Kyocera's partners in the Ukujima project.

Some industry officials say the surge in feed-in tariff applications overwhelmed expectations, meaning utilities had difficulty estimating how much additional power they could take on. But the same phenomena has been witnessed in other countries.

Developers rushed at the end of the fiscal year for approval before the government lowered tariffs for solar projects. In March, Kyushu Electric received about 70,000 applications for grid access, equaling the amount received in the previous 11 months.

"The way solar expanded so abruptly was something that people in the industry didn't anticipate, including myself," said Hiroshi Takahashi, a research fellow at Fujitsu Research Institute who says the tariffs for solar energy were too high. "The scheme has some problems. Developers rush at the end of fiscal year because the tariffs are only changed once a year."

For the Japan Renewable Energy Foundation's Obayashi, the pushback from Japan's utilities is symptomatic of a larger problem. Besides solar, Japan has installed very little in the way of competing clean energy, such as wind or geothermal.

"The serious problem is little growth in renewables other than solar," Obayashi wrote in a Sept. 5 column in which she looked at the challenges to the incentives program.

For wind power, grid access is proving a particularly troublesome hurdle for developers in Japan, Obayashi wrote.

"Operation of grids by power utilities that own generation facilities is obviously problematic in securing fair management in grid connection," she wrote.

Too much clean energy? (2)

October 4, 2014

EDITORIAL: Measures needed to prevent renewable energy boom from going bust

<http://ajw.asahi.com/article/views/editorial/AJ201410040038>

The positive growth of electricity production using renewable energy powered by the feed-in-tariff (FIT) system is beginning to show signs of losing steam.

Major power utilities are suspending the acceptance of new entries into the FIT program **because the capacity of their transmission lines to take additional electricity has reached its limit in some areas**. Of the 10 big utilities that are legally required to purchase all power generated from renewable energy sources at fixed prices, five, including Kyushu Electric Power Co., have stopped making new FIT contracts in almost all the areas they serve.

This inability by utilities to accept all the electricity produced under the FIT program due to capacity deficiency reflects the strong investment interest in renewable energy and the high expectations for the use of green power.

But solar and wind power has one big drawback. The amount of electricity generated with these energy sources tends to fluctuate wildly due to factors such as weather conditions, time of day and the season. Such fluctuations in power generation, unless they are properly adjusted, can affect the frequency and voltage of the power, causing power failures and malfunctioning equipment.

One solution is to expand transmission lines for integrated operations to wider areas so that the effects of the fluctuations in power generation can be buffered more easily.

Thicker power lines between utilities will allow for the transmission of surplus power generated from renewable energy sources in one area, say Kyushu, to other areas where there is demand.

Decisions on investing in power grids in the past had been left up to the individual utilities.

The situation, however, will change when the scheduled power market reform separates the operation of transmission lines from the business of power generation. This will encourage investment in transmission grids based on a broader perspective that is not restricted by the needs of the individual utilities.

Starting in April next year, a new operational entity will take charge of integrating the transmission lines operated by regional power companies. The new body will be responsible for developing trunk transmission lines and connecting lines between utilities.

This new system will make it easier to expand and enhance transmission grids in response to policy needs and requests from power generation companies.

Some issues remain to be sorted out, such as how the costs should be shared. But it is vital to carry through such power system reforms without delay.

It will take time, however, to build up a large network of transmission lines covering wide areas. There are also problems that need to be solved, including the insufficient capacity of transmission lines at locations where they are connected to power plants.

The Ministry of Economy, Trade and Industry will set up **a working group to study the formula for calculating the maximum amount of green electricity individual utilities can accept**, as well as conditions for such acceptance.

The ministry should consider taking steps to ensure early, preferably ahead-of-schedule, implementation of plans to bolster transformers and storage batteries, instead of leaving utilities to decide when to take these measures.

As for large-scale solar farms, which account for the majority of applications for power sales under the FIT program, the ministry may need to ensure the appropriate scale by using the price mechanism. It can do so, for instance, by reviewing the purchase prices more frequently than the current once a year.

Promoting the use of renewable energy is a global trend. It is important from the viewpoint of developing alternative energy sources that can replace nuclear power and fossil fuels and of tackling global warming.

In its new basic energy supply plan, the government designated about three years from 2013 as a period for “maximum possible acceleration” in the effort to spread the use of renewable energy. It has set a target of increasing the share of clean power as part of the nation’s overall electricity production to more than 20 percent by 2030.

The government should figure out ways to prevent the current renewable energy boom from going bust.

--The Asahi Shimbun, Oct. 4

Too much clean energy? (3)

October 5, 2014

Unprepared for green electricity

<http://www.japantimes.co.jp/opinion/2014/10/05/editorials/unprepared-green-electricity/#.VDFjNxanp1s>

Under the feed-in-tariff system introduced in July 2012 by the then Democratic Party of Japan administration, the nation’s major power companies are required by law to buy, in principle, all the electricity generated by solar, wind, geothermal and medium-to-small-scale hydro-power sources and biomass at fixed prices.

The purchase costs are to be added to electricity charges. It was hoped that the system would help revitalize local economies and reduce Japan’s dependence on nuclear power. Recently, however, one power company after another has announced a decision to stop such purchases.

They say the oversupply of green electricity due to the required purchase of all such power could wreck the stable supply of electricity to businesses and households.

The situation has prompted the trade and industry ministry to prepare for a review of the feed-in-tariff system. Given what has happened, it is clear that the system was not well thought out and needs to be redesigned.

But in the review, the ministry should not use the recent development as an excuse to put a brake on the expansion of power generation through renewable sources and to maintain the weight of nuclear power in the supply of electricity. It should uphold the goal of expanding green power generation, and bring together the accumulated knowledge and technologies of the power and other industries to achieve it.

On Sept. 24, Kyushu Electric Power Co. announced that it would halt the purchase of green electricity in the whole Kyushu region, starting the next day, including putting on hold some 70,000 plans for generation of green power by entities that have applied to Kyushu Electric for contracts to sell the electricity.

Kyushu Electric's decision affected not only the renewable energy businesses but also local governments, including the Kumamoto prefectural government, which had pushed for introduction of green electricity. Okinawa Electric Power Co. had stopped the feed-in purchases in August.

Hokkaido Electric Power Co., Tohoku Electric Power Co. and Shikoku Electric Power Co. followed the Kyushu power firm with a decision to suspend the purchase of green electricity beginning this month. Tokyo Electric Power Co. and Kansai Electric Power Co. have also halted such purchases in some parts of the areas serviced by them.

In making their moves, the power companies have cited a clause in the Law on Special Measures Concerning Procurement of Renewable Electric Energy by Operators of Electric Utilities, which exempts them from the duty to buy green electricity if the purchase of such power poses a danger to stable supply of electricity.

Behind their moves is a rapid increase in the volume of green electricity they have had to agree to buy. Green energy operators rushed to make last-minute applications for electricity sales to the power firms before the government lowered on April 1 the prices at which the utilities must buy power from various renewable energy sources.

The power companies explain that if all the electricity from renewable energy sources is supplied to their transmission grids, the total supply will exceed their capacity, which could lead to stoppage of the power companies' generators.

They also say that the wild ups and downs in the output of solar and wind power due to weather changes will make it extremely difficult for them to adjust the output of their power generators to cope with the fluctuations. If the adjustments fail, it could damage their power grids.

Both cases could result in blackouts.

The government should be blamed for failing to foresee a large number of applications for sale of green electricity to the power companies.

There may be some entities that have applied to the power firms for the electricity purchase contracts without proper investment plans. However, many entities have already carried out necessary investments for power generation through renewable energy sources on the belief that the power firms will fulfill their duty to buy the electricity from them.

The government and the power companies should realize that power from renewable sources accounted for only 2.2 percent of the total electricity generated in fiscal 2013.

Green electricity has the advantages of emitting very little carbon dioxide in the process of power generation. Severe accidents like the one that may happen at a nuclear power plant are unlikely. Green power generation facilities scattered around the country reduce the risk of severe power shortages. It is clear that green electricity's weight in total power generation in this country should be sharply increased. In reviewing the feed-in-tariff system, the trade and industry ministry should not forget this point and should remember that the government's energy basic plan adopted in April calls for reducing Japan's reliance on nuclear power as much as possible as well as for aggressive introduction of renewable energy, citing a government advisory body's document that states that green electricity should account for about 20 percent of the total power generation in 2030.

The Natural Resources and Energy Agency estimates that if all the green energy facilities that have signed feed-in-tariff contracts with power companies and received approval from the government as of the end of May went into operation, their total output in 2030 would top 20 percent of the nation's total power generation.

Development of large-capacity and high-efficiency batteries, an increase in the capacity of the power grids, including building of transmission lines across different service areas, and upgrading of the facilities to

convert the different frequencies of electric currents — 50 Hertz in eastern Japan and 60 Hertz in western Japan — are needed to solve major technical problems inherent to the supply of electricity generated through green sources.

Trillions of yen are estimated to be needed for such projects, and power companies are reluctant to invest. To stimulate such investments, the government should first declare clear percentages as goals in expanding the share of green electricity in the nation's total power generation.

Also important for the government would be to clarify what party or parties should shoulder the cost of such investments — which was left unaddressed when the system was introduced in 2012.

Restart of reactors not based on "scientific" judgement

October 6, 2014

Japan Political Pulse: Scientific uncertainty

<http://mainichi.jp/english/english/perspectives/news/20141006p2a00m0na013000c.html>

Distinguishing between a "scientific judgment" and an "unscientific judgment" can prove difficult at times. The recent eruption of Mount Ontake in central Japan has drawn attention to Kyushu Electric Power Co.'s Sendai Nuclear Power Plant in Satsumasendai, Kagoshima Prefecture. The reason is that the plant is located just 50 kilometers northwest of Mount Sakurajima, a prominent active volcano in Japan.

Nuclear Regulation Authority (NRA) Chairman Shunichi Tanaka, 69, told a news conference on Oct. 1 that it is "unscientific" to discuss Mount Ontake and Mount Sakurajima together. Volcanologists, meanwhile, say the logic behind countermeasures to protect the Sendai Nuclear Power Plant from volcanic eruptions is "unscientific." This gap is at the heart of discussions surrounding volcanic activity and reactivation of the Sendai plant.

Why does the government -- including the NRA -- view it as unscientific to link Mount Sakurajima with Mount Ontake? Confronting experts, we find the following explanation: While the eruption of Mount Ontake resulted in many deaths, it was a phreatic eruption, involving the explosion of steam and rock. No magma was ejected. Meanwhile, the Sendai Nuclear Power Plant is made to withstand an eruption 10,000 times the size of the Mount Ontake eruption.

What's the basis for "10,000 times"? It's actually nothing complicated. The size of an eruption is measured by the amount of ejected matter, and the amount of ejected matter can be roughly determined based on the accumulation of ash and other ejecta.

In the Ontake eruption, the amount of ejected matter was estimated at 1 million tons, an amount comparable to that produced by Mount Sakurajima in a year. At the same time, the 1914 reaction of Sakurajima a century ago produced 100 times the ejecta normally seen in a year. Kyushu Electric Power Co., the operator of the Sendai Nuclear Power Plant, bases its guideline for safety countermeasures on the Sakurajima-Satsuma eruption held to have occurred in the Jomon period roughly 12,800 years ago. The scale of that eruption is believed to be about 100 times bigger than the 1914 eruption.

Multiplying 100 by 100, we get 10,000. If an eruption 10,000 times the size of the Ontake eruption occurred, the pyroclastic flow would not reach the nuclear plant. The amount of ash that would fall on the

Sendai plant would reach an estimated 12.5 centimeters. Since it can withstand up to 15 centimeters, there is no problem.

That's what Kyushu Electric Power Co. has to say, and it's also the reason behind the government's judgment that the Sendai plant's countermeasures for a volcanic eruption are adequate.

We see, then, this is rational and scientific. But there is another point from the volcanologists who maintain this is "unscientific" that gives us cause for concern -- namely, the method of determining the possibility of a catastrophic eruption exceeding the scale of the Sakurajima-Satsuma eruption.

Government data based on Kyushu Electric Power Co.'s explanation says, "The space between periods of activity from catastrophic eruptions is about 90,000 years. The latest such eruption occurred about 30,000 years ago, so the possibility of one occurring while the Sendai Nuclear Power Plant is in operation is sufficiently low."

But doubts remain over this theory that a cycle lasts 90,000 years. The space between major eruptions should be evaluated on each caldera. However, Kyushu Electric Power Co.'s evaluation is based on a combination of the Aira caldera including Sakurajima and four other calderas in the area.

Ryusuke Imura, 50, an associate professor at Kagoshima University and an expert on volcanic geology, comments, "A hotchpotch of estimates cannot be called scientific. In terms of volcanology, it is a very rough discussion, on a level that couldn't pass the peer reviews of academic journals or specialist magazines abroad."

Of course, if there were ever to be a disaster on the scale that destroyed all of southern Kyushu, then it would not be a case of simply having to worry about a nuclear power plant. In the name of science, both the government and Kyushu Electric Power Co. share that clear stance.

But hold on -- we have witnessed one catastrophic eruption not just within the past few tens of thousands of years, but in the 19th century, in Indonesia.

From my various questions to people on the issue, **it does not seem that a scientific judgment will determine whether the nuclear power plant goes back into operation or not. In the end, it's a choice of values.** From Oct. 9 the NRA will start holding meetings to explain its screening results to residents living within 30 kilometers of the Sendai Nuclear Power Plant. (By Takao Yamada, Expert Senior Writer)

Renewables too important to be left to utilities

Editorial: Gov't must not leave promotion of renewable energy to private utilities

<http://mainichi.jp/english/english/perspectives/news/20141007p2a00m0na004000c.html>

A dark shadow has been cast on efforts to spread the use of renewable energy.

Major power companies are suspending new applications for access to the power grid from solar- and wind-power suppliers through the feed-in tariff (FIT) system, because supply has soared at a rate that exceeds the capacity of utilities' transmission lines.

To accelerate the spread of power generated from renewable energy sources, the government must take responsibility for expanding the capacities of utilities to take on energy.

Over 10 million kilowatts of electricity is generated from renewable sources in Japan, and when combined with facilities that already have FIT contracts, the total comes out to over 70 million kilowatts. If all such generators were put into operation, the government's goal, as stated in its basic energy plan, to produce over 20 percent of energy through renewable sources in 2030, would be fulfilled.

Under current circumstances, however, such an accomplishment may become just a pie in the sky. The Kyushu, Hokkaido, Tohoku, Shikoku and Okinawa electric power companies have announced that they are temporarily suspending new entries into the FIT system.

The fixed prices at which utilities are required to purchase renewable energy are re-evaluated every April. In March, shortly before that re-evaluation took place, there was a rush of applications from renewable energy producers hoping to sell power -- primarily solar -- at high prices, before prices dropped. As a result, the supply of energy with certification from the Ministry of Economy, Trade and Industry (METI) exceeded the peak demand of the aforementioned five utilities. That means that even if the power companies stopped all of their power generators, there would still be surplus energy if all the renewable power generators were in operation.

Disruption in the balance between energy supply and demand can put excess strain on the power grid, potentially causing large-scale power outages. The utilities say they will spend several months assessing the capacity of their transmission grids in accepting renewable power. We urge them to make the utmost effort to accept as much clean energy as possible, instead of rejecting it because of supply fluctuations. METI plans to set up a panel of experts to verify the capacities of the five companies' transmission lines. This process is necessary, but that work alone will not solve the fundamental problem of utilities being unable to accept electricity that exceeds peak demand.

Renewable energy farms are mostly located far away from cities, where land is cheap. The current situation of surplus energy could have been predicted when the FIT system was first adopted. The system's design must promptly be reworked.

To expand renewable energy, efforts must be made to strengthen transmission grids across utilities, and allow the buying and selling of power across regions. However, this will cost several trillion yen. At a time when there is no clear vision for the future of energy in Japan, it is too heavy a burden for private power companies to shoulder by themselves. Assistance from the government is indispensable.

Assuming that Japan will continue to use nuclear power, the government estimates that a nuclear fuel cycle program will cost close to 20 trillion yen. At the same time, the expansion of renewable energy projects is essential if we are to reduce our dependence on nuclear energy. Our limited funds should be diverted to the latter.

TEPCO + Chubu Electric

October 7, 2014

TEPCO, Chubu Electric to form comprehensive alliance

<http://ajw.asahi.com/article/business/AJ201410070059>

THE ASAHI SHIMBUN

Tokyo Electric Power Co. and Chubu Electric Power Co. said they had reached a basic agreement to form a **comprehensive alliance covering the entire energy supply chain.**

They said the memorandum of understanding on Oct. 7 covers upstream investments and fuel procurement through power generation.

The companies said they aim to establish a joint venture within the second half of the fiscal year ending March 2015 to ensure a stable supply of energy on an internationally competitive basis.

With LNG procurement on the scale of 35 million to 40 million tons annually, the two utilities said they will work together to expand upstream, transportation and trading businesses.

The two companies will also apply their combined management resources to replace old and energy-inefficient thermal power plants with the latest high-efficiency power generation facilities. This, they said, will result in substantial thermal efficiency improvements that will lead to low-cost power supplies.

What hazard pay?

October 8, 2014

Fukushima No. 1 plant workers kept in the dark over hazard pay

<http://www.japantimes.co.jp/news/2014/10/08/national/nuclear-workers-kept-in-dark-about-fukushima-hazard-pay/#.VDUIhhanp1s>

by Mari Saito and Antoni Slodkowski

Reuters

HIRONO, FUKUSHIMA PREF. – Almost a year after Japan pledged to double hazard pay at the stricken Fukushima No. 1 nuclear plant, workers are still in the dark about how much extra they are getting paid — if anything — for cleaning up the worst nuclear disaster since Chernobyl.

Under pressure to improve working conditions at the crippled Fukushima plant after a series of radioactive water leaks last year, Tokyo Electric Power Co. President Naomi Hirose promised in November to double the hazard pay the utility allocates to its subcontractors for plant workers. That would have increased the amount each worker at the nuclear facility is supposed to earn to about ¥19,000 (\$180) a day in hazard pay.

Only one of the more than three dozen workers interviewed by Reuters from July through September said he received the full hazard pay increase promised by Tepco. Some workers said they got nothing. In cases where pay slips detailed a hazard allowance, the amounts ranged from \$36 to about \$90 a day — at best half of what Hirose promised.

In some instances, workers said they were told they would be paid a hazard bonus based on how much radiation they absorb — an incentive to take additional risks at a dangerous work site.

One worker interviewed by Reuters said he was told he would get an additional \$45 per day every time he was in so-called hot zones near Reactors 1 and 2. Another worker was told he would receive an hourly rate that worked out to about ¥485,000 (\$4,500) extra in hazard pay for being exposed to the radiation limit for the nation's nuclear workers over a five-year period. And a third worker said he was told the payout for that same exposure would be about ¥3.9 million (\$36,000).

Assessing how much Fukushima workers are being paid is complicated by Tepco's insistence that pay is a private matter for its contractors. The power utility, which runs Fukushima No. 1 and has been nationalized, sits at the top of a contracting pyramid that includes construction giants such as Taisei Corp. Tepco has declined to disclose details of any of its legal agreements with its subcontractors.

The top Tepco official at the plant conceded during a July press tour of the complex that he did not know how much of the increase in hazard pay was being disbursed.

"When it comes to the pay rise, I don't have an exact understanding of how much money is getting directly to the workers," said Akira Ono, the Fukushima No. 1 plant manager.

Tepco said in a statement to Reuters that it instructs subcontractors to ensure workers' pay is included in all contracts and it also asks companies working at the plant to submit documentation for all the subcontractors they use. The utility said it had recently begun random checks of some of the smaller contractors to determine how much of the hazard pay is reaching workers. A worker who filled in a Tepco survey told Reuters in September that one of the questions was directly related to hazard pay.

Tepco still relies on **some 800 mostly small contractors** to provide workers for the cleanup after the tsunami that swamped the plant on March 11, 2011, sparking meltdowns at three reactors.

Subcontractors provide almost all of the 6,000 workers now employed at the plant. Tepco employs only about 250 on its own payroll at the facility.

The workforce at the plant has almost doubled over the past year, mostly as part of an effort to protect groundwater from being contaminated and to store water that comes in contact with melted fuel in the reactor buildings.

Some of the workers who arrived recently at the plant have been building bunkers to store highly radioactive sludge, which is a byproduct of the process whereby contaminated water is treated. Others are installing equipment to freeze a ring of earth around four reactors at Fukushima No. 1 to keep groundwater from reaching the melted cores, an unprecedented effort directed by Kajima Corp. that is expected to cost nearly \$300 million.

Kazumitsu Nawata, a professor at the University of Tokyo's department of technology who has researched conditions inside Fukushima No. 1, said that if workers do not receive pay that is commensurate with the risks they are taking, they will ultimately look elsewhere for employment. If more experienced workers leave for safer jobs in Tokyo, where construction projects are accelerating ahead of the 2020 Olympic Games, it will also increase the likelihood of accidents at the plant, Nawata said in an interview.

"Until now, we have relied heavily on the goodwill of workers. But it's already been three years since the accident. This is no longer sustainable," he said.

Like other workers, Koji Sakurada learned about the hazard pay pledge soon after Tepco President Hirose made his announcement last November. News of the promised increase spread by word of mouth and text messages at a crowded break room at the plant.

"I expected one of my (subcontractor) employers to call a meeting to talk about a raise, but there was nothing," Sakurada said. "They completely ignored Tepco's announcement."

By then, Sakurada, 52, had already spent 18 months scanning buses and work vans for radiation as they left the plant. Wearing a protective suit and mask, he worked a nine-hour shift running a Geiger counter over the vehicles in a makeshift tent set up as a decontamination station. He was paid about \$9 an hour.

Sakurada was one of four Fukushima workers who last month filed a lawsuit seeking to hold Tepco responsible for conditions at the plant, even for workers it does not employ directly. It marks the first time Tepco has been sued for a failure to police the employment practices of its subcontractors.

The lawsuit, which was filed in a court in the city of Iwaki, about 60 km (37 miles) south of the nuclear plant, seeks \$600,000 in unpaid wages. It also seeks to have Fukushima workers put on Tepco's payroll or have the utility otherwise take responsibility for their pay.

Tepco said it had not yet received Sakurada's lawsuit.

"If a suit has indeed been filed, we will check the demands and claims and make a sincere effort to deal with it," the company said.

Interviews with 37 current and former workers, almost all of whom spoke on condition of anonymity, revealed **a wide variance in how they were being compensated, particularly for hazard pay.** Six workers employed by different subcontractors for Taisei and who were working side by side in July building concrete bunkers were receiving a hazard allowance that ranged from zero to \$90 a day.

Taisei said it could not comment on the claims without more details about the identity of the workers. The company said it oversees and monitors all the subcontractors it employs.

Only one worker interviewed by Reuters, a crane operator who reports to Raito Kogyo, a large Tokyo-based construction company, said he was receiving the promised hazard allowance of \$180 per day.

Tepco's pledge last November to increase hazard pay came after a nudge from the government, which was seeking to burnish its image in the weeks leading up to Prime Minister Shinzo Abe's pitch last year for Tokyo to host the 2020 Olympics. Abe assembled a previously undisclosed public relations team for this purpose, including officials from the trade and foreign ministries, according to two members of the team. With Fukushima spinning back into crisis as new revelations emerged of radioactive water leaks, the Japanese were concerned that their chances of pulling off a successful Olympic bid might be damaged. Abe's then-trade minister compared Tepco's attempts to control the leaks to a game of "whack-a-mole." In Buenos Aires in early September, Abe told the International Olympic Committee that the water leaks from Fukushima were "under control," a remark that attracted widespread criticism from opposition lawmakers and environmental activists back home.

By late October, after Tokyo was awarded the games, Abe's PR team was battling negative publicity over working conditions at Fukushima, the two team members said. Abuses at the plant were outlined in a report by Reuters that exposed illegal labor practices as well as the involvement of organized crime in providing workers for the cleanup.

The government encouraged Tepco to take action, partly in response to the reports. That led to Hirose's announcement in November to double hazard pay, according to one of the people on the PR team.

Within weeks of the pledge, Tepco was quietly backpedaling. In a letter issued to contractors in late November, first reported in the daily Mainichi Shimbun, the company said **the promise to double the hazard allotment was "aimed at improving pay for workers," but that did not mean each worker would necessarily see a pay increase of that amount.**

In March testimony before the Diet, where he was questioned about hazard pay, Hirose said he wanted to encourage Tepco's contractors to pay "an appropriate wage to each and every worker."

Sakurada moved to Fukushima in May 2012 to be closer to his fiancée in Iwaki. He took a job with a local company because he was promised a place to stay.

TOP, a local firm that supplies workers for construction, only told Sakurada he would be working in the nuclear plant two days before he started. When Sakurada asked for a pay rise to compensate for the increased danger, he said a TOP manager told him it would be unfair to others to pay him more.

By early 2014, Sakurada said he'd seen a 56-year-old worker fired for reaching his radiation limit. He had also watched another middle-aged worker — a man he did not know — die in front of him of an apparent heart attack. None of the other workers knew how to revive him with a defibrillator kept in the break room, he said.

Sakurada quit in May. Unlike the other plaintiffs in the lawsuit, he agreed to be interviewed and identified by name for this report.

TOP's manager did not respond to repeated calls to the company headquarters or faxed questions about Sakurada's claims.

"The whole structure at Fukushima, everything from working hours to radiation levels, needs to be made clear. Like hitting a reset button," Sakurada said.

Household power bills to increase

October 14, 2014

<http://www.japantimes.co.jp/news/2014/10/14/business/corporate-business/hokkaido-electric-wins-government-ok-to-raise-rates/#.VDzYSxanrIU>

Hokkaido Electric wins government OK to raise rates

Kyodo

The government on Tuesday approved Hokkaido Electric Power Co.'s plan to raise household electricity bills by 15.3 percent on average, with the surge in fossil fuel costs weighing on the utility's business in the absence of nuclear power generation following the 2011 Fukushima crisis

Hokkaido Electric increased bills for households by 7.7 percent on average last year. For this hike, it initially sought a 17.03 percent increase, but the industry ministry said that was too much.

Prices are expected to be marked up 12.4 percent for five months from Nov. 1 through next March and 15.3 percent starting next April. The lower markup through March is designed to ease the negative impact on households in view of high electricity demand amid the long and cold Hokkaido winter.

Hokkaido Electric will be the first among major utilities to implement a second electricity bill hike since the 2011 disasters, which has kept the country's nuclear reactors from restarting due to safety concerns. The regional utility owns three reactors at its Tomari nuclear power plant, but none have been online since the No. 3 unit was taken offline for a mandatory regular checkup in May 2012.

Hokkaido Electric claims it will lower electricity bills when it can reactivate the Tomari plant. It seeks to bring the reactors back online by March 2016, but the outlook is uncertain as they have yet to pass the Nuclear Regulation Authority's safety screenings.

Economic and fiscal policy minister Akira Amari told a news conference that if other utilities also seek to raise their rates, it should be allowed only on condition that prices be reduced once nuclear power plants go back online.

For corporate users, the regional utility plans to raise electricity bills by 20.3 percent, a move which does not require government approval, following an 11 percent increase implemented last year.

Iodine scam

October 14, 2014

Official arrested over iodine stockpile failure

http://www3.nhk.or.jp/nhkworld/english/news/20141014_23.html

Oct. 14, 2014 - Updated 08:47 UTC+2

Japanese police have arrested a former prefectural official on suspicion of forging documents to conceal not having purchased iodine tablets to prepare for a possible nuclear accident.

The suspect, Junichi Ito, handled medical and pharmaceutical affairs for the government of Niigata Prefecture in central Japan.

In April, the prefecture was found to have failed to procure more than 1.3 million iodine tablets for over a year. The tablets are said to protect the thyroid gland from radiation exposure.

The prefecture said Ito concealed the failure to make the purchase. It has filed a criminal complaint against him.

Police say Ito cut out supervisors' seals from other documents and used them to create a false purchase reports.

The prefecture quotes him as saying he forged the documents because he was afraid of reprimand.

Niigata Governor Hirohiko Izumida said the prefecture will cooperate with the police investigation and take steps to prevent a recurrence.

State secrets act approval by Cabinet too hasty

October 14, 2014

Lawyers protest state secret standards

http://www3.nhk.or.jp/nhkworld/english/news/20141014_18.html

Oct. 14, 2014 - Updated 06:01 UTC+2

Some lawyers are protesting the Cabinet decision, saying the standards do not reflect public concerns.

More than 20 protestors gathered outside the prime minister's official residence on Tuesday morning.

Among them was attorney Yuichi Kaido who said **the Cabinet approval was hasty as many issues remain unresolved in the standards.**

Public opinions sent to the government have expressed concern that information that would be problematic for the government could be designated as a state secret.

The protestors called for the public's right to know and for information to be made public.

One participant said the date for the law to go into effect should be postponed so the Diet can thoroughly debate the state secrets issue.

Asahi to set panel on nuclear disaster

October 15, 2014

Asahi Shimbun sets up panel to examine coverage of 'comfort women,' nuclear disaster

<http://mainichi.jp/english/english/newsselect/news/20141015p2a00m0na008000c.html>

The Asahi Shimbun newspaper said on Oct. 14 that it has set up a committee to analyze the cause of confusion stemming from its reports on the so-called wartime "comfort women" issue, and **on the testimony of Masao Yoshida, the late chief of the disaster-hit Fukushima No. 1 nuclear power plant.** The eight-member panel which has set a goal of "regaining trust and restoring (the company)," consists of four external experts including journalist Shoko Egawa, and four senior Asahi officials, the daily said. **The panel is set to hold its first meeting behind closed doors on Oct. 18, the Asahi said.** The Asahi says the panel will explore what the company can do to restore itself by discussing not only its editorial department but also the decision-making processes, crisis management, and corporate culture throughout the company. **Another part of the restoration process will involve receiving harsh suggestions from outside.** The Asahi has already set up two separate third-party panels of experts to examine its reports on the so-called "Yoshida testimony" and comfort women, respectively.

State secrets: Insufficient guidelines

October 15, 2014

Editorial: Guidelines on state secrets law insufficient

<http://mainichi.jp/english/english/perspectives/news/20141015p2a00m0na004000c.html>

The Cabinet has approved operational guidelines for the state secrets protection law and a government decree that brings the law into effect on Dec. 10. Yet concerns remain over the new law's bearing on the public's right to know.

The operational standards were drafted in July, but the draft left room for administrative bodies to arbitrarily designate information as state secrets and limited the authority of the law's overseers. When the government solicited public comments, it received a large number of opinions critical of the law, including calls to abolish the legislation altogether.

Under the secrecy law, heads of administrative organs can designate state information on defense, diplomacy and other issues as "special secrets."

Since the law could be abused to cover up information that the government deems inconvenient, we have called for a system to effectively monitor and check the operation of the legislation, and prevent any inappropriate designation of secrets. But the operational guidelines that were approved on Oct. 14 have made only minor revisions to the draft, meriting no credit.

The guidelines stipulate that a new post of "independent public document control officer" will be created to head the "information security oversight office" to be set up within the Cabinet Office. However, even if the control officer encounters inappropriate designation of secrets and requests the disclosure of information and the provision of documents, ministries and agencies can decline the request if they determine that disclosure could be detrimental to national security.

In the United States, the director of the Information Security Oversight Office stands in a highly independent position with authority, and can order administrative bodies to declassify information. However, the "independent public document control officer" to be appointed in Japan wasn't granted greater power when the guidelines were revised. The officer is ranked below the position of director-general, at the councillor level. It is questionable whether a figure in this position can serve as a watchdog.

Since the post is regarded as an independent position, there has been strong opposition to the appointment of officials on loan from other administrative bodies as staff in the information security oversight office. But such views have been brushed aside in the amendment.

There have also been strong calls to improve the whistle-blowing system for public servants to report any illegal or inadequate designation of secrets. However, the guidelines state that civil servants must summarize the content of secrets in reporting any irregularities, which raises questions about the effectiveness of the system.

Furthermore, there is no remedy system for civil servants who receive unfair treatment for whistle-blowing. But there have been no amendments to the guidelines in this regard.

In addition, ministries and agencies can destroy declassified documents if 30 years or less have passed since their classification and the prime minister gives his consent. This could make it impossible to verify documents in later years.

We once again express opposition to enforcement of the law without sufficient respect for the democratic principle of disclosing state information to the public. In the meantime, it bears mentioning that the role of news organizations entrusted with fulfilling the public's right to know remains unchanged even after the law comes into effect.

At the Liberal Democratic Party's General Council meetings last week, many participants pointed out the government's lack of explanations about how to protect the public's right to know and defend freedom of the press and news gathering. Initially adoption of the draft guidelines was postponed, but they were approved at a later meeting, without addressing public concerns.

The draft guidelines should have been put to thorough debate during the Diet deliberations on the bill last year. Lawmakers are urged to exert their efforts in clarifying and reviewing the problems in the secrecy law's operational guidelines during the ongoing extraordinary session of the Diet.

October 15, 2014(Mainichi Japan)

Local assemblies' call for abolition

October 15, 2014

At least 130 local assemblies call for abolition of state secrets protection law

<http://mainichi.jp/english/english/newsselect/news/20141015p2a00m0na012000c.html>

At least 130 prefectural and municipal assemblies across the country have adopted written statements urging the central government to scrap the state secrets protection law since it was enacted in December last year, the Mainichi Shimbun has learned.

The Mainichi compiled data based on written statements that the House of Representatives and House of Councillors have received from local assemblies. Dozens of other local bodies have called for careful administration of the law. It is rare for such a large number of local assemblies to adopt written statements over a specific law.

Five local assemblies submitted their written statements to the Diet this month, about 10 months after the law was enacted, underscoring the fact that deep-seated public distrust of the highly controversial law has not been dispelled. Three of these assemblies -- the Hokkaido prefecture town of Toyako, the Okayama Prefecture town of Kibichuo and the Tokushima Prefecture village of Sanagochi -- submitted statements, calling for the abolition of the law.

The Toride Municipal Assembly in Ibaraki Prefecture expressed strong misgivings about the law, saying in a written statement, "It tramples on the basic principles of Japan's Constitution: the sovereignty of the people, fundamental human rights and pacifism."

The Kameyama Municipal Assembly in Mie Prefecture called for abolition of the law, saying in a written statement, "It covers people's eyes and ears." The Kofu Municipal Assembly in Yamanashi Prefecture expressed its concern over the central government's operation of the law, writing that "It is feared that the scope of designated secrets could be arbitrarily expanded."

The municipal assembly in the Okinawa prefecture town of Kadena, home to the U.S. Air Force's Kadena Air Base -- the biggest air base in the Far East -- urged the central government to scrap the law because officials fear that they would not be able to obtain information on the operations of the U.S. forces and policies on military bases. The assembly wrote in its statement, "We feel concerned as we live in an area which is the most susceptible to the effects of the law. Our residents will not be able to grasp the actual situation to protect their lives and properties on their own."

No assemblies at the prefectural level have adopted statements explicitly demanding the abolition of the law, but the prefectural assemblies in Iwate, Niigata and Tottori prefectures separately adopted written opinions calling on the central government to carefully administer the law.

The Niigata Prefectural Assembly voted down a set of written opinions that called for abolition of and amendments to the law. But it subsequently adopted a written statement which said, "We strongly call on the government to give clear explanations to the people to secure sufficient understanding." An assembly member from the ruling Liberal Democratic Party (LDP) said, "There is no need to abolish or amend the law." But the member went on to say, "There are opposing views among our supporters, so we couldn't simply vote down (the opinions) and leave the issue at that. We thought the assembly needed a declaration of intention in one form or another."

Such written opinions have no legal force toward the government and the Diet, but they are believed to wield a certain influence as local assemblies are allowed to submit such documents to the central government and the Diet under Article 99 of the Local Autonomy Act to have their views reflected in national politics.

At a Cabinet meeting on Oct. 14, the government decided on guidelines for classifying and declassifying state secrets under the law, together with a government decree which sets the enforcement date of the law for Dec. 10 and stipulates that 19 administrative bodies will be allowed to designate state secrets. Although the law stipulates that information falling under 23 categories in four areas -- diplomacy, defense, counterterrorism and counterespionage -- can be designated as state secrets, the operational guidelines further subdivide these into 55 items.

As for oversight functions, the post of a councillor-level "independent public document control officer" and a support unit, referred to as an "intelligence and security observation unit," will be established within the Cabinet Office. A "Cabinet maintenance and oversight committee" consisting of officials from government ministries and agencies at the vice-ministerial level will also be set up within the Cabinet Secretariat.

Cabinet approves guidelines on state secrets law

October 15, 2014

Abe Cabinet gives OK to state secrecy law guidelines

http://ajw.asahi.com/article/behind_news/politics/AJ201410150036

THE ASAHI SHIMBUN

The Cabinet approved guidelines on the handling of state secrets and set Dec. 10 for a controversial secrecy law to take effect amid protests and concerns that the public's right to know is being whittled away.

Under the operating standards decided on Oct. 14, state secrets fall within four broad areas: defense, foreign affairs, counterespionage and preventing terrorism.

The heads of 19 ministries and agencies, such as the National Security Council, Cabinet Secretariat, Nuclear Regulation Authority and Defense Ministry, would have the authority to designate state secrets. Civil servants and employees of private-sector companies contracted to work with the government who deliberately leak state secrets could face up to 10 years imprisonment.

A new post to be established in the Cabinet Office of "independent public document inspector" would check whether the designation of state secrets was being conducted appropriately. The inspector would serve as a liaison for whistle-blowers.

The inspector will have the authority to peruse material to be categorized as state secrets and request it be declassified if it is decided the designation was made inappropriately. However, ministers could still refuse to both submit documents to the inspector and declassify the material.

The central government solicited public comment on the operating guidelines for a one-month period until late August. A total of 23,820 opinions were submitted and that led to 27 revisions in the operating guidelines. One change made was to review the guidelines five years after they take effect.

Despite that input, protests were held in major cities after the Abe Cabinet approved the guidelines.

In Tokyo, about 60 people gathered in front of the Prime Minister's Official Residence on the evening of Oct. 14.

Aya Tanaka, a 28-year-old part-time worker who joined the protest, said, "The Cabinet is simply allowing ministers and bureaucrats to handle information as they please and ignoring the danger of not allowing citizens to decide the pros and cons of such action."

About 50 people who gathered in front of the building housing the Osaka prefectural chapter of the ruling Liberal Democratic Party carried placards with the kanji character for "anger" written in red.

The placard was created and distributed by Kimiko Nanba, a 53-year-old company employee who wanted a memorable symbol to convey her fears about the legislation.

"I will continue speaking out against the state secrets protection law," she said.

Various organizations issued statements on Oct. 14 to denounce the law.

One released in the name of Susumu Murakoshi, president of the Japan Federation of Bar Associations, called for the law to be abolished, saying it jeopardized democracy and the people's right to know.

It said the range of information subject to designation as a state secret was too wide and noted there was no legal guarantee that state secrets would ever be released. The statement said there was insufficient authority and independence of a third-party organ to oversee the designation of state secrets.

The federation had called for giving the independent public document inspector the authority to release all state secrets, but that request was rejected. That led the federation to accuse the central government of not giving sufficient consideration to a structure to prevent the arbitrary designation of state secrets.

The Japan Commercial Broadcasters Association also issued a statement that said major problems remained in key elements of the law and that the concerns of the public and media organizations had not been adequately addressed.

Faulty cameras & sense of responsibility

October 17, 2014

Shimomura criticizes Monju operator

<http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html>

Oct. 17, 2014 - Updated 08:12 UTC+2

Science minister Hakubun Shimomura has criticized the operator of the Monju fast-breeder prototype reactor for its **failure to properly maintain equipment**.

It recently came to light that a number of monitoring cameras at the reactor are not working.

Shimomura told reporters on Friday that it is very regrettable that the operator, the Japan Atomic Energy Agency, **lacks a sense of responsibility**.

More than 50 cameras, or about one-third of those monitoring coolant pipes, were found to be broken when Monju was inspected in September.

Shimomura said reassuring the public about Monju's safety is the minimum requirement for restarting the experimental reactor.

He said the prototype reactor may be stopped forever if the operator's poor management continues.

The Japan Atomic Energy Agency began intensive reform of Monju's management system in October last year, following a series of problems, including inadequate inspections.

The operator initially planned to complete the reforms in one year, but recently extended the deadline by 6 months.

Monju is located on the coast of Fukui Prefecture in central Japan.

Reviewing feed-in tariffs for renewables

October 16, 2014

Gov't eyes drastic review of renewable energy feed-in system

<http://mainichi.jp/english/english/newsselect/news/20141016p2a00m0na015000c.html>

The Ministry of Economy, Trade and Industry has begun considering a fundamental review of the so-called feed-in tariff system which obliges utilities to purchase power generated from renewable sources at fixed prices.

The potential overhaul of the FIT scheme, introduced in July 2012, is being discussed by the New Energy Subcommittee of the ministry's Advisory Committee for Natural Resources and Energy. Renewable energy suppliers were baffled by recent decisions by Kyushu Electric Power Co. and four other utilities to stop signing new contracts to buy renewable energy from solar power suppliers in their service regions. The industry ministry has since come under pressure to deal with the problem swiftly. Meanwhile, measures to hold down power prices for regular consumers have also emerged as a major issue. The government is likely to be tested on whether it is truly serious about boosting renewable energy supplies. At the subcommittee meeting on Oct. 15, a number of committee members called for a review of the FIT system, with some of them saying, "Unless solar power generation is curbed, plans to introduce other renewable energy sources will be adversely affected," and, "To stop accepting renewable energy will undermine the credibility of the (FIT) system."

Five utilities -- Hokkaido Electric Power Co., Tohoku Electric Power Co., Shikoku Electric Power Co., Kyushu Electric Power Co. and Okinawa Electric Power Co. -- have stopped signing new renewable energy purchase contracts. As of June, the industry ministry had certified planned and completed renewable energy facilities with a combined total output of 71.78 million kilowatts -- which would mean oversupplies in the service areas of all five of the above utilities. The electric companies have explained that the excessive renewable supply could destabilize overall power supply and even cause power outage. In order to expand renewable energy supplies, measures should be taken to improve power transmission networks to allow surplus power to be supplied to other regions, store it in batteries, and curb renewable energy output, among other steps. If such measures are taken, utilities will be able to accept renewable energy even if the output of that energy is increased. In fact, Germany, Italy and Spain are even now maintaining stable local supplies by adjusting power generation and transmission throughout Europe as needed. In Germany and Italy, solar and wind power generation accounts for more than 10 percent of total electricity supply, and about 25 percent in Spain.

Nevertheless, the Japanese industry ministry and power companies failed to take measures to deal with the problem ahead of time. An industry ministry study group suggested in 2010 that battery installations and energy transmission and distribution networks must be improved if solar power output exceeds 10 million kilowatts. But the government and utilities did not take any specific action until June this year, when the renewable energy output was certain to vastly exceed 10 million kilowatts.

On the delay in taking action, the industry ministry said, "Because facilities are designed almost exclusively for solar power generation and the (cost) burden on the people could be increased in the future, we were not able to enhance power transmission lines without reviewing the system."

According to the ministry's estimates, if all the facilities certified under the FIT system by June this year were to go into operation, the cost to purchase renewable energy would amount to 2.7 trillion yen per year, forcing the utilities to put a monthly 935 yen surcharge on electricity bills for an average household. If power transmission cables were to be enhanced to expand the renewable energy supply system, the **financial burden on consumers would be increased further.**

Because of all this, a proposal was made at the subcommittee meeting on Oct. 15 that a questionnaire be conducted to **ascertain how much extra cost consumers could tolerate.** The subcommittee will also

consider placing priority on introducing low-cost renewable energy by having a bidding system to hold down purchase prices. The subcommittee also discussed the need to address the overemphasis on solar power by promoting geothermal power generation, which is far less vulnerable to weather conditions. The industry ministry is aiming to make its conclusions by the end of this year, so that it will be able to use them for discussions on purchase prices for next fiscal year. **There has, however, been little progress in the question of the future "energy mix"** -- the ratios of different energy sources in total generating capacity -- because the target for nuclear power output cannot be set until nuclear reactors are actually reactivated, a senior industry ministry official said. **The target for renewable energy output could, in other words, be affected by the ratio of nuclear power output.**

As such, some experts say that it will be difficult to promote renewable energy. At the subcommittee meeting, many panel members voiced opinions against a move to return to the policy of nuclear power dependence, with one saying: "I fear that the problems with the (electricity) system will lead to renewable energy bashing." Another commented, "Nuclear power generation costs money, too."

The decisions by the five utilities to stop signing new renewable energy contracts have caused a stir among renewable energy suppliers and local governments.

October 16, 2014(Mainichi Japan)

Government looks to reassess feed-in tariff system for renewable sources of electricity

Green energy tariffs draw scrutiny

<http://www.japantimes.co.jp/news/2014/10/15/business/green-energy-tariffs-draw-scrutiny/#.VD7Y6BanrIU>

by Eric Johnston
Staff Writer

A committee involved with the nation's energy policy met Wednesday to discuss revisions to the 2-year-old feed-in tariff system for renewable energy.

It will also investigate a utility that recently halted renewable electricity purchases under the system by claiming it didn't have the capacity to handle the large amounts being generated.

Since the feed-in tariff system was introduced in July 2012, obliging utilities to purchase electricity generated from solar, wind, geothermal, mini-hydro and biomass sources for a fixed price over a fixed period, growth in renewable energy has been rapid.

As of April, about 10 gigawatts of renewable energy capacity has been installed and is underway. Of this, about 7 gigawatts, mostly in solar panels, was installed in fiscal 2013.

But expansion has brought problems. Last month, Kyushu Electric Power Co. announced it was suspending talks with renewable energy suppliers, except for residential solar arrays under 10 kilowatts.

The reason, the company said, was that its grid doesn't have the ability to transmit generated power from all of the approved projects if they went online, and that there was a risk of overloading the grid and creating instability in the supply.

A subcommittee of the industry ministry's Advisory Committee for Natural Resources will look into whether Kyushu Electric really can't handle more renewable electricity, and review grid capacity at the other major utilities. The committee may also allow utilities to go more than 30 days without purchasing renewable electricity, as a way of making it easier to balance supply, capacity and demand.

Under the feed-in tariff program, over 90 percent of the projects approved have been for solar projects. **But concerned about over-relying on one source, the government will look at ways to increase the number of other renewable energy projects, especially wind and geothermal.** Kyushu has one of Japan's largest concentrations of geothermal resources, and the government says it wants to prioritize easier grid connections for this power source.

The committee is expected to issue a final report by the end of this year and suggest possible new legislation.

Also to be discussed are proposals for a bid system that gives priority to approval of renewable energy projects that can provide electricity at the cheapest possible rates, and for shortening the period when feed-in tariff rates are revised from once a year to twice a year.

How to promote renewables?

October 18, 2014

Editorial: System to facilitate promotion of renewable energy needed

<http://mainichi.jp/english/english/perspectives/news/20141018p2a00m0na002000c.html>

An advisory council to the Economy, Trade and Industry Ministry has begun reviewing the so-called "feed-in-tariff" (FIT) scheme for renewable energy, where power companies buy electricity generated from renewable energy sources such as solar light, amid rising fears that the balance between power demand and supply could be disturbed due to utilities being flooded with offers in this regard.

Five power suppliers including Kyushu Electric Power Co. have stopped signing new contracts to buy electricity generated from renewable energy sources. However, since such sources account for only about 2 percent of total power used in the country (excluding hydroelectric power), the introduction of renewable energy should not be systematically hindered even if the FIT scheme needs to be reviewed.

Renewable energy sources play a key role in stepping up countermeasures against global warming, while decreasing the country's reliance on nuclear power. From a long-term perspective, therefore, the government should set a high target for introducing renewable energy while achieving a balance between the spread of such energy sources and the burden on consumers.

The FIT scheme was introduced in July 2012. By this past June, the total output of power generation facilities that operated using renewable energy had reached 11 million kilowatts. This was roughly 50 percent more than the amount before the introduction of the system -- thereby highlighting the FIT's effect in promoting the introduction of renewable energy sources.

The problem is that solar light constitutes an overwhelming majority of renewable energy used for power generation. Unlike wind power, solar power generators are easy to introduce insofar as such facilities do not require an environmental assessment by the national government. Power generation facilities using

renewable energy sources, with a total output of some 60 million kilowatts, are not in operation even though they have been approved by the government. A vast majority of these facilities are solar power generators.

The price at which utilities buy electric power generated from renewable energy sources under the FIT scheme is reviewed every April. Since the price charged is that which is in place when the national government approves such facilities, however, power suppliers were flooded with applications for contracts at the end of last fiscal year shortly before the price was lowered this past April.

Under the ministry's plan to revise the scheme, excessive emphasis on solar power would be reconsidered -- and the price to be charged would be that which was in place at the time of the start of operations at such power generators, rather than at the time of government approval. The ministry will also consider setting an upper limit to the burden on consumers, and introducing a market mechanism for the operators of power generation facilities.

A review of the timing for determining the purchase price and promotion of renewable energy sources other than solar lights is appropriate. However, the introduction of the market mechanism needs to be carefully and thoroughly discussed. An extra burden is placed upon consumers since the price of electric power generated from renewable energy sources is added to power charges. On the other hand, renewable energy has drawn attention as a way to revitalize local economies. Certain consideration should be given to such efforts.

If all of the approved power generation facilities using renewable energy are to be in operation, the cost of buying such electricity would amount to 2.7 trillion yen a year, according to an estimate by the Economy, Trade and Industry Ministry. This would increase the extra financial burden on consumers from the current 225 yen to 935 yen per month on average. However, money paid for such electricity will eventually be passed on to regions that host power generators using renewable energy. Therefore, the promotion of renewable energy should be considered from the viewpoint of investing in Japan's future. The Economy, Trade and Industry Ministry has also begun reviewing each utility's capacity to accept power generated from renewable energy. Power grids need to be reinforced across power companies' service areas to significantly increase the amount of electricity generated from renewable energy. Still, utilities can increase their capacity to accept such power by effectively and efficiently using lines that connect different utilities' power grids.

Pumped-storage power generation facilities, which are often built along with nuclear power stations, should be proactively utilized as power storage batteries to adjust the output of power generated from renewable energy sources.

Is Gov't listening to public worries?

October 15, 2014

ANALYSIS: Government fails to address public concerns about state secrets law

http://ajw.asahi.com/article/behind_news/politics/AJ201410150039

By RYOTA KYUKI/ Staff Writer

Public criticism and fears were expressed when the government took steps to listen to the voice of the people after the Diet enacted the state secrets protection law in December 2013.

However, the law's operating guidelines approved by the Abe Cabinet on Oct. 14 have done little to dispel suspicions that the government will use the legislation to conceal "inconvenient" information at the expense of the people's right to know.

The law is now scheduled to take effect in December, yet questions remain over the standards for designating state secrets while doubts persist about the oversight body's authority to check whether state secret designations will be made appropriately.

For example, the guidelines define 55 items that would be considered state secrets. However, the wording for those items is vague, such as "intelligence gathering by the Self Defense Forces" and "securing peace and security for the international community."

Although some information must certainly be designated as secret from a national security standpoint, it will ultimately be the government that decides what specifically constitutes a state secret.

And when the government is making such decisions, the public will be kept in the dark on the process and will not know what was actually designated as a state secret.

The government will appoint an "independent public document inspector" to serve in an oversight role. But the inspector will not be a third-party source. The post will be established within the Cabinet Office, raising doubts about the independence of the inspector.

The inspector's authority is also an issue. Even if the inspector asks a Cabinet minister to submit a state secret for screening, the minister can reject the request by saying the release of the information could cause significant damage to Japan's national security.

Another area of concern is that civil servants and private-sector company employees will be evaluated to determine if they are fit to handle state secrets. The evaluations will look into the psychological problems and criminal records of those individuals.

The Japanese Society of Psychiatry and Neurology submitted a public comment criticizing those evaluations as a violation of human rights. The organization said there is no causal relationship between psychological problems and the likelihood of leaking state secrets.

Those concerns were never taken into consideration in discussions on the law's guidelines.

The government decided the state secrets protection law will go into effect on Dec. 10, keeping with the law's provision that it take effect within a year after promulgation.

The law will impose strict penalties, including prison terms, against individuals who reveal such state secrets and those who solicit such information leaks.

If the law is allowed to take effect as it now stands, there is a danger that the people's right to know and freedom of the press, two foundations of a democratic society, will be violated.

The public must continue monitoring the government on a number of fronts.

One such issue is the type of individual chosen as an independent public document inspector. The public should ask whether the inspector can remain independent of the government and whether a sufficient oversight function is in place to ensure that the people's right to know is not being violated.

Shaking up the power industry

October 21, 2014

New power industry alliances

<http://www.japantimes.co.jp/opinion/2014/10/21/editorials/new-power-industry-alliances/#.VEZNbRanp1s>

The comprehensive alliance struck recently between Tokyo Electric Power Co. and Chubu Electric Power Co. in their thermal power generation business raises expectations of a further shakeup in the power industry — likely involving companies from other sectors — ahead of the full liberalization of the retail sale of electricity in 2016.

While Tepco and Chubu Electric have their own reasons for the accord, it should be a welcome development if the tieup results in cutting electricity costs for consumers.

According to the basic agreement announced Oct. 7, the two companies will create a jointly owned firm that will integrate their liquefied natural gas (LNG) procurement to reduce fuel purchasing cost. The two firms combined buy roughly 40 million tons of LNG annually — or nearly half Japan's total imports of 88 million tons — and they hope the expanded volume will boost their power to negotiate procurement pricing with producing countries.

Through the new firm, Tepco and Chubu Electric will also seek to replace aging thermal power plants with more fuel-efficient plants as well as to increase output from coal-fired plants, which generate power at less than half the fuel costs of LNG-fueled plants. As a first example, the new firm reportedly plans to work with Electric Power Development Co., popularly known as J-Power, to build and run a latest-generation coal-fired power plant at Tepco's Yokosuka thermal power plant in Kanagawa Prefecture.

Tepco, which faces the massive cost of compensation for people affected by the March 2011 triple meltdowns at its Fukushima No.1 nuclear power plant, sees the alliance with Chubu Electric as a key pillar of its financial reconstruction. Tepco needs to improve its earnings to cover the trillions of yen in compensation, which it has been paying by borrowing from a government-backed fund. Since its nuclear power plants remain shut down in the wake of the 2011 disaster — just like other utilities — it is also imperative for Tepco to lower the cost of procuring LNG to run thermal power plants.

Chubu Electric is relatively unscathed from the shutdown of nuclear power plants, which accounted for only 15 percent of its power generation before 2011. Still, it faces the prospect of greater competition on its home turf in central Japan as a decades-old regional monopoly by major power firms is about to be fully dismantled. In 2016, the remaining restrictions on electricity sales to households will be lifted, making it possible for any power-generating entity to service customers anywhere across Japan. The alliance with Tepco will give Chubu Electric access to a power-generation source and a foothold for sales in the lucrative Tepco-serviced areas.

Moves are afoot by the major power firms to tap into demand in regions previously dominated by the others — often involving companies from other sectors such as gas, oil and general trading firms. Before reaching the accord with Chubu Electric, Tepco also explored other firms including Kansai Electric Power Co., Tokyo Gas Co., Osaka Gas Co. and JX Nippon Oil & Energy Corp. as potential partners. It is reported that Osaka Gas may later join the Tepco-Chubu Electric alliance. There is also the possibility that the firms that did not reach agreement with Tepco may explore their own alliance.

There are uncertainties as to how the Tepco-Chubu Electric alliance will evolve. Tepco is said to have urged Chubu Electric to place all of its main thermal power plants under the umbrella of the new jointly funded firm, but they eventually agreed only on the replacement of aging plants and construction of new facilities. They say integrating the operation of their thermal power plants will remain on the agenda of future discussions, and the scope of the alliance will substantially differ if they agree on such arrangements.

Given the uncertainties over reactivating its Kashiwazaki-Kariwa nuclear power plant in Niigata Prefecture, which it counts on in its financial reconstruction plan, Tepco will likely need to make greater efforts to restructure its business. Other regional utilities and companies from different sectors are also eyeing the market thus far dominated by Tepco.

But from a consumer viewpoint, active realignment of the power industry, which has for decades been effectively dominated by the regional monopolies, should be a welcome development if it leads to lower electricity bills.

Arbitration on compensation

October 22, 2014

Evacuees call on TEPCO to accept settlement plans

http://www3.nhk.or.jp/nhkworld/english/news/20141022_27.html

Oct. 22, 2014 - Updated 10:57 UTC+2

Evacuees from the 2011 Fukushima nuclear accident have urged the operator of the crippled Fukushima Daiichi plant to swiftly accept a state arbitration body's compensation proposals.

About 50 people, including evacuees who have filed for arbitration, gathered at a Diet building in Tokyo on Wednesday to press their requests.

The Center for Settlement of Fukushima Nuclear Damage Claims made proposals this year to settle claims filed by groups of residents of Namie Town and Iitate Village, both in Fukushima Prefecture.

But Tokyo Electric Power Company has rejected the proposals, saying blanket compensation without consideration for individual circumstances would not ensure equality.

Participants said they want a quick settlement as they have been forced to live away from their communities or family members for more than 3 years in the wake of the disaster.

A 67-year-old resident from Namie said evacuees suffered a variety of losses. He said compensation for their mental damage is far from sufficient and that the firm should honor the evacuees' claims.

Their lawyers said they will ask the government for a legal revision to oblige the utility to accept the arbitration center's proposals.

Indict Tepco or not?

October 22, 2014

Prosecutors set to decide whether to indict Tepco execs over nuclear disaster

<http://www.japantimes.co.jp/news/2014/10/22/national/crime-legal/prosecutors-set-to-decide-whether-to-indict-tepco-execs-over-nuke-disaster/#.VEezfRanp1s>

Reuters

Prosecutors must decide this week whether to charge Tokyo Electric Power Co. executives over their handling of the Fukushima No. 1 nuclear disaster, in a process that could drag the company into criminal court.

The judicial review is unlikely to see Tepco executives go to prison, legal experts say, but rehashing details of the meltdowns and explosions that followed the March 11, 2011, earthquake and tsunami will cast a harsh light on the struggling utility and will not help Prime Minister Shinzo Abe's unpopular effort to restart the nation's idled reactors.

The Tokyo District Prosecutor's Office declined last year to charge more than 30 Tepco and government officials after investigating a criminal complaint from residents, who said officials ignored the risks to the Fukushima No. 1 plant from natural disasters and failed to respond appropriately when crisis struck. But a special citizens' panel opened another legal front in July, asking prosecutors to consider charges of criminal negligence against three executives over their handling of the disaster.

Under the review system, the prosecutors must respond by Thursday.

If they again decline to take up the case, as some experts expect, the 11-member panel of unidentified citizens can order prosecutors to indict, if eight members vote in favor.

Prosecutorial Review Commissions, made up of citizen appointees, are a rarely used but high-profile feature of the legal system introduced after World War II to curb bureaucratic overreach. In 2009, they were given the power to force prosecutions.

A panel in 2011 forced the prosecution of former opposition leader Ichiro Ozawa over political funding. He was acquitted in 2012.

Tepco already faces a string of civil suits, the decades-long and massively expensive decommissioning of Fukushima No. 1 and a struggle to restart its Kashiwazaki-Kariwa nuclear plant in Niigata Prefecture. All 48 of Japan's reactors have been idle for more than a year under a safety regime that incorporated the lessons of Fukushima, where 160,000 people were forced to flee from a huge plume of radioactive material that left large areas uninhabitable for decades.

Backed by Abe's pro-nuclear administration, Kyushu Electric Power Co. recently won approval from safety regulators to restart the Sendai nuclear plant in Kagoshima Prefecture but faces opposition from some nearby communities.

Nationwide, a majority of people has consistently opposed restarting nuclear power, according to opinion polls.

The citizens' panel said Tsunehisa Katsumata, Tepco chairman at the time of the disaster, and former Executive Vice Presidents Sakae Muto and Ichiro Takekuro failed to take measures to protect Fukushima No. 1 despite warnings it faced big tsunami.

The prosecutors are unlikely to change their minds, said Shin Ushijima, an attorney and former public prosecutor.

"Prosecutors exhaust all means in their investigations and certainly would have in a special case like this, so if they were convinced they could not prosecute Katsumata and the others earlier, they will not reach a decision to indict now," he said.

"There is a 50 percent chance that some or all of the three ex-Tepco executives will be indicted and 99.9 percent chance those indicted will be found not guilty," Ushijima said.

"How can you prove one person, Katsumata for example, is liable or guilty, when such a big organization was behind such a large accident?"

Tepco faces huge compensation claims and has set aside just a fraction of the funds needed to decommission Fukushima No. 1.

A court recently ordered the utility to pay compensation to the family of a woman who killed herself after being forced from her home because of the disaster. A group of Fukushima workers is also suing the company for unpaid wages.

Green power: Review the power system

October 23, 2014

Planting a green power grid

<http://www.japantimes.co.jp/opinion/2014/10/23/editorials/planting-a-green-power-grid/#.VEjr3Banp1s>

The sudden decisions by five power companies to stop purchasing electricity from renewable energy sources under a feed-in-tariff (FIT) system have forced the government to start reviewing the system itself.

The review will include possibly introducing a tender system for green power-generating entities hoping to sell electricity to power firms and increasing the weight of wind and geothermal power in the purchase of green power.

But the government should not forget a more important thing than tinkering with the FIT system — improving the power grid and the related technological basis so that the share of green electricity will greatly increase in Japan's total power output. It also must not use the planned restart of nuclear power plants as an excuse to put a brake on the growth of renewable energy sources.

Backed by a call for greater use of green energy in the wake of the March 2011 meltdowns at Tokyo Electric Power's Fukushima No. 1 nuclear power plant, the then Democratic Party of Japan administration introduced the FIT system in July 2012. The nation's major power companies are required by law to buy, in principle, all the electricity generated by solar, wind, geothermal and medium-to-small-scale hydro-power sources and biomass at fixed prices. But Okinawa Electric Power Co. stopped feed-in purchases in August and last month regional power monopolies in Kyushu, Shikoku, Tohoku and Hokkaido announced they will suspend the purchase of green electricity — a course of action made possible by a clause in the FIT law that exempts the power firms from the duty to buy green electricity if the purchase of such power poses a danger to stable supply of electricity.

Behind their move is a rush of last-minute applications by green energy-generating entities to sell electricity to the power companies before the government lowered purchase prices on April 1. As of the end of June, solar power accounted for 96 percent of green electricity approved for future sale to power companies. The power companies argue that they had to stop accepting the applications because either the anticipated oversupply of green electricity to their power grids could lead to the stoppage of their generators or wide fluctuations in the output of solar and wind power due to weather changes will make adjusting their generators extremely difficult. Both cases, it is feared, could lead to blackouts.

The power companies have failed to provide detailed information to back up their arguments. For example, they have not disclosed how much electricity their power transmission lines can send to, or receive from, other power companies; to what extent their power plants — such as thermal power plants using natural gas whose outputs are easily adjustable — can cope with fluctuations of green supplies; and how much excess electricity supplied from renewable sources could be used by pump-storage hydroelectric plants to pump up water during the day to generate power at night.

It is imperative that the power companies make public these figures and other relevant information. This will enable experts and ordinary citizens alike to determine whether the power companies are making sufficient efforts to buy electricity from renewable sources. Only then can there be a discussion of what concrete steps should be taken, including how much to increase the capacity of transmission lines and the specifications for developing more efficient batteries.

Increasing competition in the transmission and distribution of electricity will also help increase the capacity to handle green electricity supplies. The government should speed up the process of separating power transmission and distribution sections from the major power companies, originally scheduled for 2018 or later, and consider the merits of completely shielding new transmission and distribution entities from the control of power companies.

Green electricity, except large-scale hydraulic power, accounted for a mere 2.2 percent of total electricity generated in Japan in 2013. This volume is too small. Given the inherent risks involved in nuclear power generation and the ethical and environmental problems that semi-permanent storage of high-level nuclear waste will cause for future generations, it is logical that Japan should make concrete efforts to greatly increase the percentage of green energy by setting a clearly defined goals while aiming eventually for ending reliance on nuclear power.

TEPCO demands compensation back

October 23, 2014

Woman urged to repay nuke disaster compensation after she enters college outside Fukushima

<http://mainichi.jp/english/english/newsselect/news/20141023p2a00m0na013000c.html>

Tokyo Electric Power Co. (TEPCO) has demanded that a 21-year-old woman repay roughly 9 million yen of the 16 million yen in compensation she received over the Fukushima nuclear disaster, which left her family home in an off-limits zone, it has been learned.

TEPCO is demanding the woman return the amount she received after she entered a college outside Fukushima Prefecture and changed her residential address. The woman has resisted the demand.

"I have no prospects of being able to return home, and my psychological pain continues," she said.

TEPCO has not released concrete guidelines for compensation. It is feared that the finances of other nuclear evacuees could be thrown into disarray if TEPCO were to suddenly demand that they repay large amounts of compensation they have already received.

Under interim guidelines from the Dispute Reconciliation Committee for Nuclear Damage Compensation, a body operating under the Ministry of Education, Culture, Sports, Science and Technology, people who are forced to evacuate from their homes for long periods are eligible for compensation for mental suffering.

TEPCO makes decisions on compensation based on the requests it receives.

The case of the 21-year-old woman marks the first time that TEPCO has demanded repayment of compensation from someone other than its own employees. Roughly 80,000 people are eligible for compensation for mental suffering, and it is possible the company's move could affect other evacuees who change their addresses when entering academic institutions, getting married or job transfers. The company is therefore likely to face calls to clarify its guidelines for compensation.

The family of the 21-year-old woman, who agreed to speak to the Mainichi Shimbun, said that in December 2010, when she was a third-year student at a high school in the Futaba district of Fukushima Prefecture, she was accepted into a three-year nursing college in the Kanto region. After the outbreak of

the nuclear disaster in March 2011, her family evacuated from one place to another within the prefecture. In early April that year, she started living by herself in an apartment near the college. She graduated this spring and started working at a hospital in the Kanto region.

When her family visited a TEPCO counter to discuss compensation in June this year, they explained how she had entered the college. Then in early September, a bill from TEPCO arrived. It stated that the amount she had received differed from what she was supposed to have been paid. TEPCO said that she had decided to enter the college before the nuclear accident, and that her period of evacuation ended when she changed her address to attend college.

Specifically, TEPCO demanded that the woman repay the 7.3 million yen she had received for mental suffering (covering six years and one month worth of payments at 100,000 yen per month), in addition to 480,000 yen in compensation for her evacuation from the no-go zone, and about 1.28 million yen in compensation for household effects.

The woman had sought compensation from TEPCO for household effects because she had purchased new items, not having taken anything from her home after the outbreak of the nuclear disaster. However, TEPCO asked her to repay the amount on the grounds that she had purchased the items in line with her entry into college.

The woman's family remains unhappy with TEPCO's demand.

"People from the zones where return has been deemed difficult are unable to return to their homes for a long time. She did enter college, she hasn't become financially independent, and her life as an evacuee hasn't finished. TEPCO hasn't publicly released its payment guidelines, and we can't agree with its decision," a family member said.

A representative of TEPCO's head office for Fukushima restoration told the Mainichi Shimbun, "We can't comment on individual cases, but decisions are not made on academic advancement alone. We will continue with compensation in the future while checking individual circumstances."

According to the Fukushima Prefecture Board of Education, roughly 1,000 high school students from evacuation zones graduated in the spring of 2011, as the woman did. If it turns out they decided to change their address to areas outside evacuation zones before the outbreak of the nuclear disaster, then they could face demands from the company to return their payments.

The education ministry's office on measures for compensation for nuclear damage takes the view that in general terms, if a person can't return home, then their period of evacuation does not end simply because of academic advancement. However, the nuclear damage response office within the Agency for Natural Resources and Energy under the Ministry of Economy, Trade and Industry, has seen this as a borderline situation in determining whether or not compensation should be paid.

Earlier, when several TEPCO employees changed their address to locations outside the zones that were off-limits, the company judged that their period of evacuation had ended, and demanded that they repay compensation for mental anguish. The bill that one employee faced was in the range of millions of yen. There have been other cases in which TEPCO has cut off compensation payments. When a woman in her 30s married a man outside the evacuation zone in October 2011, TEPCO judged that the woman's livelihood had been established, and cut off her payments for mental suffering. The woman argued that her mental suffering had not ended, and filed for mediation through the central government's Nuclear Damage Compensation Dispute Resolution Center. The Agency for Natural Resources and Energy informed TEPCO that it was not right to cut off compensation using marriage as a reason, and payments subsequently resumed.

October 23, 2014(Mainichi Japan)

Investigating 3 former TEPCO chiefs

October 24, 2014

Prosecutors extend probe into ex-TEPCO chiefs

<http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html>

Oct. 24, 2014 - Updated 12:21 UTC+2

Prosecutors have extended their investigation into 3 former chiefs of Tokyo Electric Power Company, or TEPCO, over the accident at the Fukushima Daiichi nuclear power plant.

The Tokyo District Prosecutors' Office announced this on Friday to an inquest panel of randomly chosen citizens.

The office launched the probe after the panel decided in July that the 3 people, including former chairman Tsunehisa Katsumata, should face charges.

The prosecutors were due to decide this month whether to file charges.

But they say **they're unlikely to do so because interviewing former top TEPCO officials and experts takes time.**

In September last year, the prosecutors dismissed a criminal complaint filed by a citizens' group against roughly 30 former TEPCO executives, including the 3.

The investigators argued that it was difficult to predict the scale of the earthquake and tsunami that hit the plant in March 2011.

The group narrowed down its target and filed another complaint with the panel. It concluded the 3 should be indicted.

The prosecutors are to decide by early February whether to do so.

Japan ready to join international convention

October 22, 2014

Japan to ratify international convention on nuclear accident compensation pact

http://ajw.asahi.com/article/behind_news/politics/AJ201410240041

THE ASAHI SHIMBUN

Japan intends to ratify an international convention that sets a global uniform standard for compensating victims of nuclear accidents.

The move is in line with fears of an increasing risk of a nuclear accident abroad with developing nations accelerating their efforts to construct nuclear power plants.

The convention limits responsibility for nuclear accidents to the operator of the nuclear plant, meaning companies that manufacture nuclear plant equipment would not be liable. That provision would make it easier for Japanese manufacturers to export nuclear technology.

However, critics charge that Japan has not yet adequately assessed the reasons for the catastrophic triple meltdown at the Fukushima No. 1 nuclear power plant in 2011 and that it is wrong to join a convention that would promote nuclear technology exports.

The Abe administration will submit a bill to the extraordinary Diet session now in progress to ratify the Convention on Supplementary Compensation for Nuclear Damage (CSC). Currently, five nations, including the United States, have ratified the treaty, which was adopted in 1997.

However, the treaty has still not entered into force because one provision has not been met--that the total installed nuclear capacity of the ratifying nations be at least 400,000 megawatts.

If Japan ratified the convention, that provision would be cleared. The United States has been lobbying Japan to join the pact. The treaty would take effect 90 days after the Diet ratified the convention.

Convention signatory nations would share in the compensation burden when a nuclear accident occurred.

Along with the convention, the Abe Cabinet will also submit relevant legislation to allow for implementation of the convention.

Japan had not joined the convention because it placed excessive faith in the "safety myth" surrounding nuclear power plants.

The Fukushima nuclear disaster put paid to that way of thinking. Moves by developing nations in Asia and elsewhere to construct nuclear power plants were another reason for joining the convention.

The CSC requires nations to provide a minimum yen equivalent of 47 billion (\$438 million) in compensation. If the total amount of compensation required exceeds that amount, signatory nations would be **required to share part of the additional burden.**

A Foreign Ministry official said, "The convention will encourage developing nations to pass legislation related to nuclear power plants."

The additional shared amount to be contributed by each nation would be calculated based on the capacity of nuclear power generation. If Japan joined the convention, it would have to come up with about 4 billion yen to deal with a potential accident abroad. **The government plans to ask electric power companies to set aside funds annually to shore up the compensation sharing package.**

Like domestic laws in nations that have installed nuclear power plants, the CSC limits responsibility for nuclear accidents to the operator of the plants, mainly electric power or fuel companies.

For that reason, companies that manufacture nuclear plant equipment or construct nuclear plants would not be held responsible for accidents that occurred in signatory nations.

A Japanese government source said U.S. officials lobbied Japan to join the CSC because it was becoming difficult for companies in the United States to export nuclear plant equipment to developing nations until the convention took effect.

An executive with a major Japanese manufacturer said, "With it looking close to impossible to construct a new plant in Japan, we would appreciate a convention that encouraged the export of nuclear plants."

However, in August, the Japan Federation of Bar Associations issued a statement opposing ratification of the CSC on the grounds **it would create a moral hazard for manufacturers, who would likely not feel obliged to deal seriously with measures to prevent nuclear accidents.**

Mie Asaoka, a vice president with the JFBA, said: "The convention encourages developing nations to pass legislation so nuclear plants can be exported to them. Can Japan claim to have fulfilled its international responsibility for having caused the accident at Fukushima?"

Kansai's fears about new state secret law

October 26, 2014

Kansai's fears of new law no state secret

by Eric Johnston

<http://www.japantimes.co.jp/news/2014/10/26/national/politics-diplomacy/kansais-fears-of-new-law-no-state-secret/#.VE0BTRZ5B1s>

Staff Writer

With less than two months to go until the new designated state secrets law comes into force, how, exactly, it will work in practice is the subject of extensive debate and concern. **Much of the commentary focuses on how the fundamental rights of individuals will be affected.**

Municipal and prefectural governments, especially in Kansai, are also concerned about what the new law might mean for local autonomy and access to central government information, and whether that will have repercussions for their residents.

Nationwide, nearly 200 local cities and towns have passed statements condemning the new law. As of September, at least a half dozen assemblies in Kyoto, Nara and Osaka prefectures had voiced their opposition.

One of the largest bodies in Kansai to oppose the new law was Ikoma, in Nara. Ikoma is the main city in the electoral district of Internal Affairs and Communications Minister Sanae Takaichi, a close ally of Prime Minister Shinzo Abe.

"What, precisely, is to be designated as secret is not clear, leading to a situation of 'what will become secret is secret.' Because of this, even in cases of arrests and prosecutions that are connected to law, it won't be clear as to why the accused is being arrested or prosecuted because the lawyers won't be able to reveal the evidence in court," the city assembly said in June.

Muko, a small city in Kyoto, expressed similar concerns but added that the vague law could also be used to punish public servants who unknowingly release "secret" information, and that not only the mass media but also scholars, researchers, elected representatives, legal professionals and ordinary citizens would be unable to freely collect information under such constraints.

Taro Yamada, a House of Councilors member from Your Party, said that while police departments may be able to get information classified, prefectural governors and assemblies will not have the same privilege. This has created two concerns in Kansai.

The first has to do with **information sharing between the local and central governments.**

Kyoto and Osaka in particular host international summits and the like, which require coordination between local authorities and the Prime Minister's Office, the Foreign Ministry, the National Police Agency, and other central government organs. Communication between Kansai and national officials can

be difficult because too often local authorities are given only the minimum of information by central government officials,” said one Kyoto municipal official, who spoke on condition of anonymity.

“Under the new law, the central government now has an excuse and can say, ‘Sorry, that’s a state secret’ if local officials get angry about being left out of the loop,” the official said.

The second cause of concern in Kansai has to do with nuclear power.

Fukui Prefecture’s 13 commercial reactors, including 11 operated by Kansai Electric Power Co., provide electricity to the region. But Kyoto and Osaka are also home to groups of anti-nuclear protesters who are well-organized and tenacious compared with other parts of the country.

At anti-nuclear rallies in both cities, police keep close tabs on those participating. **Under the secrets law, such demonstrations might be considered a threat to national security.** Anti-nuclear groups in Kansai and nationwide fear that official harassment will grow against anyone who speaks out against atomic power, and that the officials and their minions will then hide behind the law if and when they are sued in the Osaka or Kyoto district courts.

Additionally, though not the issue it is elsewhere, some Kansai leaders have expressed **concern about what the new law means for keeping tabs on Self-Defense Forces or U.S. military activity in the region.**

As both countries deepen cooperation under the new collective self-defense stance adopted by the Cabinet in July, there is local concern that obtaining information on U.S. military operations, one of the main areas targeted by the state secrets law, will become more difficult.

“At a military base in Kyotango, Kyoto Prefecture, the United States has installed X-band radar for tracking ballistic missiles. But what the effect of radio waves from the radar might be is unknown. Even if we ask, the government won’t provide the information under the new law,” said Ryoichi Hattori, an Osaka-based activist who opposes the secrets law.

The town of Sennan, Osaka Prefecture, near Kansai airport, has already expressed opposition to any attempt by the U.S. military to use it. Any plans by Tokyo or Washington to operate more radar installations in Kansai is sure to be met by local opposition not only from traditional anti-base activists, but also from residents whose attitude is “not in my backyard.”

But if information on plans for joint training exercises turns out to be designated a state secret, Tokyo and Washington may find that even those national politicians and political parties who back the security alliance in public may constantly urge caution when it comes to specific operational plans that run the risk of further inflaming residents, and local assemblies, in Kansai or anywhere else.

Especially if they are already angry because the plans can’t be made public.

At present, most Kansai politicians in the Liberal Democratic Party-Komeito ruling coalition and their corporate backers support the state secrets law. At the same time, the region’s traditional attitude of independence from Tokyo, combined with fierce local pride, mean that towns, cities and leaders, regardless of party ties, are less likely to simply accept excuses about national security if the information local residents want is not made available.

Kansai Perspective appears on the fourth Monday of each month, focusing on Kansai-area developments and events of national importance with a Kansai connection.

130 billion yen pretax profit for TESCO

October 25, 2014

Tepco projects ¥130 billion pretax profit for year

<http://www.japantimes.co.jp/news/2014/10/25/business/tepcoprojects-%C2%A5130-billion-pretax-profit-for-year/#.VEvmhRanp1s>

Kyodo

Tokyo Electric Power Co., manager of the disaster-struck Fukushima No. 1 nuclear plant is expecting to log a group pretax profit of ¥130 billion for the business year through March 2015, even without restarting the giant Kashiwazaki-Kariwa plant or hiking rates again, sources familiar with the matter said Friday. Tepco, as the utility is known, was effectively nationalized in the wake of the 2011 core meltdowns in Fukushima Prefecture. It is expected to post a profit in excess of ¥100 billion for the second year straight, thanks to cost-cutting efforts, a decline in crude oil prices, and reduced demand for power caused by cooler temperatures last summer, the sources said.

The last factor meant that Tepco needed to produce less electricity from thermal plants fueled by imported fossil fuels, which have soared in cost because of the Bank of Japan's weakening of yen against the dollar.

According to the utility's turnaround plan, pretax profit was initially projected to reach ¥167.7 billion this year if the Kashiwazaki-Kariwa nuclear plant on the coast of the Sea of Japan in Niigata Prefecture resumed operating in July.

In fiscal 2013 ended in March, Tepco posted a group net profit of ¥438.65 billion, reversing a ¥685.29 billion loss the previous year. It logged a group pretax profit of ¥101.42 billion against a loss of ¥326.96 billion the previous year.

All of Japan's 48 commercial nuclear reactors, including those at the Kashiwazaki-Kariwa complex, the world's largest, are currently offline for new safety tests drafted in response to the Fukushima disaster.

Withholding minutes and refusing to disclose names

October 25, 2014

Ministry withholds minutes from nuclear accident compensation resolution meetings

<http://mainichi.jp/english/english/newsselect/news/20141025p2a00m0na012000c.html>

The Education, Culture, Sports, Science and Technology Ministry is withholding minutes from meetings held by the top decision-making panel of the Nuclear Damage Compensation Dispute Resolution Center, which is the government-backed body handling alternative dispute resolution (ADR) for the Fukushima nuclear disaster.

Moreover, the ministry has also refused to disclose all of the names of the mediating attorneys who are working out settlement proposals on behalf of the panel.

It earlier came to light that the ADR had compiled an internal document stating that the causal relationship between the Fukushima nuclear crisis and the deaths of those who evacuated from areas hit by the disaster should be set at a uniform 50 percent when calculating the amount of compensation to be paid to bereaved families.

Experts in government information disclosure have pointed out that the ministry's refusal to disclose the details of the meetings is an extremely abnormal response.

The nuclear accident ADR top decision-making body is comprised of three members: Chairman Yoshio Otani, who previously served as a judge; Isomi Suzuki, a lawyer; and Kazuhiko Yamamoto, a professor at Hitotsubashi University.

The panel has worked out comprehensive standards for compensation to victims of the Fukushima nuclear disaster. However, since the only information disclosed was the outline of standards and the date of their compilation, the Mainichi Shimbun asked the ministry for full access to the minutes of the panel's meetings under the government's freedom-of-information system in order to assess the process of working out the standards.

In response, the ministry admitted that the minutes of the panel's sessions are preserved at the center, but refused to disclose the documents. Consequently, it is not possible to verify what the three panel members said during the meetings, the themes of the sessions, the dates and places of the gatherings, or whether the meetings were actually held.

With regard to the reasons for withholding the minutes, the ministry explained that disclosure of the information would hinder the frank exchange of opinions among the panel members, compromise the panel's neutrality in making decisions, cause confusion among the public, and adversely affect the panel's execution of its duties.

The Mainichi Shimbun also asked the ministry to disclose the identities of mediating attorneys in an effort to see if they have a vital interest in Tokyo Electric Power Co. (TEPCO), the operator of the crippled Fukushima No. 1 Nuclear Power Plant. Citing the need to protect the mediators' personal information, however, the ministry released the list of the mediators with their names and personal history blacked out.

While the Nuclear Damage Compensation Dispute Resolution Center discloses the names of 202 mediators in its reports on specific cases that have been settled, information regarding the 80 others remains withheld.

There are six government-backed organizations that handle ADR across the country, including the Nuclear Damage Compensation Dispute Resolution Center. The five other organizations have disclosed the identities of all their mediators on their respective websites. Two of the five bodies have also disclosed minutes from meetings of their top decision-making panels on their websites, while the three others responded that they will consider disclosing such information if requested under the freedom of information system.

October 25, 2014(Mainichi Japan)

3 months-delay for ex-TEPCO chiefs' charges

October 25, 2014

3/11 charges for Tepco execs delayed by three months

Reuters, Kyodo

Prosecutors have delayed for three months a decision on whether to charge three former executives of Tokyo Electric Power Co. for their handling of the 2011 Fukushima disaster, an official with a panel that requested the indictments said Friday.

Tokyo District Prosecutor's Office had been re-investigating the case after an independent judicial panel of citizens ruled in July that three former Tepco executives, including then-chairman Tsunehisa Katsumata, should be indicted over their handling of the world's worst nuclear disaster since the 1986 Chernobyl explosion.

Prosecutors on Friday informed the Committee for the Inquest of Prosecution of its decision to extend the probe by three months through the end of January, saying it was too difficult to reach a decision by the end-of-October deadline.

By law, prosecutors can extend investigations for up to three months.

Prosecutors decided in September last year not to indict the former Tepco executives, including Katsumata, saying it had been beyond the company's imagination to foresee the scale of the earthquake and tsunami in March 2011 that triggered the nuclear crisis.

Residents had accused more than 30 Tepco and government officials of ignoring the risks of a natural disaster and failing to respond appropriately when crisis struck.

Not a conflict of interests?

October 25, 2014

Suga downplays conflict involving new trade chief's Tepco stake

Staff Writer

Chief Cabinet Secretary Yoshihide Suga brushed aside concerns Friday about the new trade and industry minister's 600-share stake in Tokyo Electric Power Co. and said that the government guidelines in place to protect Cabinet ministers from conflicts of interest would be followed.

Miyazawa's stake is worth about ¥200,000, Suga said. Tepco, as the beleaguered utility is known, had a market capitalization of ¥544.8 billion as of Friday afternoon. "There is no problem at all," Suga told reporters.

Miyazawa was suddenly appointed METI chief on Monday within a day of predecessor Yuko Obuchi's shock resignation. His role gives him oversight of nuclear energy policy and the rehabilitation of Tepco, which is still reeling from the core meltdowns at the Fukushima No. 1 power plant in 2011.

The daily Tokyo Shimbun and other media outlets have reported that a conflict of interest might develop in the Cabinet if the minister overseeing Tepco fails to separate his personal interest in the utility from his power to oversee it.

Miyazawa's financial assets are under particular scrutiny after it was revealed Thursday that his political fund management body paid ¥18,230 to a sadomasochism sex show bar in Hiroshima in 2010.

Miyazawa said that he never visited the bar but that one of his staffers had and, for some reason, logged the expense in Miyazawa's official political funds report.

"It came right out of the blue," Miyazawa told reporters later Thursday. "I swear I didn't go there . . . I've never even heard of the bar's name."

Guidelines adopted by the Cabinet in 2001 urge ministers to refrain from trading securities, including stocks and real estate, while in office. The rules require incoming ministers to place any stocks they hold when entering office into a trust bank.

Miyazawa reportedly owned 588 shares of Tepco in 2010, when he was elected to the Upper House for the time. He bought another 12 in 2013.

Miyazawa is a former Finance Ministry official and a nephew of the late Prime Minister Kiichi Miyazawa, a noted financial expert.

New Governor in Fukushima Prefecture

October 27, 2014

Fukushima elects new governor in first election since 2011 disasters

<http://www.japantimes.co.jp/news/2014/10/27/national/politics-diplomacy/ex-vice-governor-likely-win-fukushima-gubernatorial-election/#.VE4k1xZ5B1s>

Kyodo

FUKUSHIMA – Former Fukushima Vice Gov. Masao Uchibori was elected governor in a landslide Sunday in the prefecture’s first gubernatorial campaign since the 2011 natural and nuclear disasters.

Reconstruction from the Great East Japan Earthquake and tsunami as well as nuclear policy were the main issues in the election involving around 1.6 million voters, but there was a lack of in-depth discussion as both ruling and opposition parties threw their support behind the 50-year-old Uchibori.

Asked Monday morning about priorities once he takes office, Uchibori said: “I want to rebuild the worst-hit parts of the evacuation zone, and then rebuild all of Fukushima (Prefecture). I’m reminding myself anew of the heavy responsibility. We must do whatever it takes to reconstruct Fukushima.”

Uchibori has declined to comment on whether he believes reactors around the rest of the country should be reactivated. Therefore the administration of Prime Minister Shinzo Abe is expected to face no challenge from him as it continues procedures to restart idled nuclear plants.

Furthermore, the ruling coalition of Abe’s Liberal Democratic Party and Komeito managed to stave off defeat — which it suffered in the Shiga gubernatorial race in July.

The focus now shifts to the governor race next month in Okinawa, where issues related to U.S. military bases are likely to dominate.

Uchibori got 490,384 votes, while runner-up Yoshihiro Kumasaka received 129,455.

Kumasaka, 62, a former mayor of Miyako, Iwate Prefecture, had the backing of the Japanese Communist Party and Shinto Kaikaku (New Renaissance Party).

Fewer than 30,000 votes went to four other candidates.

Voter turnout was 45.85 percent, up 3.43 point from the previous election but the second lowest on record.

Uchibori ran nominally as an independent but was supported by the local chapters of the LDP and Komeito as well as the opposition Democratic Party of Japan and the Social Democratic Party.

“I will put my heart and soul into the reconstruction of Fukushima,” said Uchibori, who will succeed outgoing Gov. Yuhei Sato. “I will first put my efforts into reconstructing evacuated areas and revitalizing the prefecture.”

Sato, who served two four-year terms, said he wants his successor to be “someone who can carry out my will and continue reconstruction work, and who knows the prefecture very well.”

During the campaign, Uchibori pledged to “make utmost efforts to bring recovery to Fukushima as early as possible.” He underscored his readiness to serve as governor after having supported Sato as vice governor from 2006.

Uchibori resigned from the vice governorship last month to run in the election.

Although the number of candidates was a record high for the prefecture, all of them agreed that reactors in the prefecture should be decommissioned and pledged to reconstruct the region devastated by the March 2011 disasters.

While the other contenders opposed reactivating nuclear reactors in other parts of Japan, Uchibori refrained from expressing a view on the matter, apparently in deference to the central government.

The prefecture has already demanded that the central government and Tokyo Electric Power Co. decommission the four reactors at the Fukushima No. 2 nuclear plant in addition to the six at crippled Fukushima No. 1.

The other contenders were Katsutaka Idogawa, a 68-year-old former mayor of the town of Futaba, which hosts the Fukushima No. 1 plant, Yoshitaka Ikarashi, a 36-year-old pastor, Akiko Iseki, 59, a convenience store manager, and Yoshinao Kaneko, 58, president of a construction company.

Former vice governor takes Fukushima gubernatorial election in landslide

http://ajw.asahi.com/article/behind_news/politics/AJ201410270033

October 27, 2014

THE ASAHI SHIMBUN

Backed by four parties in both the ruling and opposition camps, former Fukushima Vice Governor Masao Uchibori was elected governor on Oct. 26 in **a campaign where the future of the nation's nuclear policy was placed on the back burner.**

It was Fukushima Prefecture's first gubernatorial election since the March 2011 Great East Japan Earthquake and tsunami triggered the nuclear crisis at the Fukushima No. 1 nuclear power plant.

Uchibori was elected in a landslide victory over five other independent newcomers. He garnered 490,384 votes, more than three times as many as the runner-up.

With voter turnout at 45.85 percent, it was the second lowest turnout on record after the last gubernatorial election, where only 42.42 percent of eligible voters showed up at the polls.

There was little difference in the platforms of the six candidates, all of whom called for decommissioning all nuclear power plants in the prefecture. Other issues, such as the rebuilding of residents' lives and communities, failed to motivate voters as well.

Touting himself as the successor to Fukushima Governor Yuhei Sato, Uchibori, 50, the outgoing governor's deputy for eight years, campaigned on a platform of succeeding and further promoting his policies.

As a result, the stay-the-course approach earned Uchibori broad support from not only supporters of major political parties but also local municipal leaders and industry organizations.

Backing Uchibori were the ruling Liberal Democratic Party, its junior coalition partner, New Komeito, the opposition Democratic Party of Japan and the Social Democratic Party.

The Abe administration, which hopes to restart many of the nuclear reactors across Japan that were taken offline in the aftermath of the Fukushima crisis, backed Uchibori, who was supported by the opposition parties. **The administration did so in order to prevent the issue on whether to phase out nuclear power from becoming a key point of contention.**

Uchibori's opponents included Yoshihiro Kumasaka, 62, a doctor who was supported by the Japanese Communist Party and the New Renaissance Party. He campaigned on abandoning nuclear power in and outside the prefecture. Also opposing Uchibori was Katsutaka Idogawa, 68, the former mayor of Futaba, Fukushima Prefecture. Neither were able to garner wide support.

The world's attention is now on the new governor who has a mountain of issues to tackle related to the nuclear disaster in order to pave the way for the prefecture's recovery.

US and Russia join forces against nuke safety

U.S. Said to Join Russia in Blocking Nuclear Safety Moves

<http://www.bloomberg.com/news/2014-10-23/u-s-said-to-join-russia-in-blocking-nuclear-safety-moves.html>

By Jonathan Tirone Oct 23, 2014 2:57 PM GMT+0200

Photographer: Koji Sasahara/Pool via Bloomberg

The U.S. and Russia are joining forces to block a European plan to raise the protection of nuclear reactors against natural disasters after the meltdowns at Japan's Fukushima Dai-Ichi power plant, diplomats say. Envoys from both countries are trying to derail a Swiss-led initiative that would force nuclear operators to invest more on safety, undermining attempts to harmonize global safety regulation, according to eight European and U.S. diplomats who attended meetings in Vienna last week. All asked not to be named in line with rules kept by the Convention on Nuclear Safety, the legal body overseeing the talks.

Even as relations between Russia and the U.S. have sunk to a post-Cold War low over the crisis in Ukraine, the two powers have come together to press their shared interest in resisting more stringent safety guidelines, said the diplomats. The U.S. is the world's biggest nuclear-power generator, while Russia exports more reactors than anyone else.

"Switzerland, as the initiator of the proposal, will continue to collaborate with all delegations and do everything to find a solution that is acceptable to all of us," Georg Schwarz, deputy director general of the Swiss nuclear-safety regulator, ENSI, said in an e-mailed reply to questions.

Nuclear Secrecy

The U.S.-Russia collaboration reflects a nuclear-safety convention whose secrecy is laid bare in documents obtained by Bloomberg News under a Freedom of Information Act request.

It also underscores the **high stakes for an industry trying to bounce back after the Fukushima accident**. European attempts to impose higher safety standards would make nuclear power more costly just as plant operators come under price pressure from cheaper natural gas.

Atomic Power Looking Better and Worse

Prompted by the March 2011 Fukushima incident, European regulators are seeking to rewrite international standards to ensure nuclear operators not only prevent accidents but mitigate consequences if they occur, by installing costly new structures built to survive natural disasters. The meltdown caused by a tsunami forced 160,000 people to flee radioactive contamination and led to the shutdown of all of Japan's nuclear plants.

The European attempt became public in April during the previous Convention on Nuclear Safety meeting in Vienna. Switzerland consulted with engineers, regulators and diplomats from more than 50 countries before proposing the new rules. The stricter requirements were in line with a European Union directive issued three months later that required nuclear operators to bolster infrastructure at existing plants.

Less Stringent

U.S. regulators aren't requiring the same stringent modifications, according to Edwin Lyman of the Cambridge, Massachusetts-based Union of Concerned Scientists, an advocacy group. European utilities pay as much as five times more to fit out plants to withstand earthquakes and floods as a result, he said.

Electricite de France SA is spending about 10 billion euros (\$13 billion) on additional safety features for its 59 reactors, according to its regulator, the Autorite de Surete Nucleaire. U.S. utilities will spend about \$3 billion on portable generators and cooling reserves for about 100 reactors, FirstEnergy Corp. (FE) President Pete Sena said in July 31 testimony to the Nuclear Regulatory Commission.

'Hardened Core'

French costs are higher because operators have to build a "hardened core" around their reactors that will be able to contain fallout if an accident occurs, its regulatory chief, Jean-Christophe Niel, said in July testimony to the NRC in Rockville, Maryland. Engineers are designing reinforced bunkers for back-up power and installing emergency cooling systems to contain a meltdown. The country is also reinforcing the concrete bases of its oldest reactors and creating elite teams of emergency responders.

At last week's meeting, convened at the International Atomic Energy Agency's headquarters, Russian envoy Oleg Postnikov offered praise for his American counterpart, Eliot Kang, after the U.S. argued against the European initiative, people who attended the meeting said. U.S. officials confirmed that their delegation fell into an uneasy alliance with Russia.

The U.S. State Department declined to comment on the record. Russian diplomats accredited to the IAEA didn't respond to written requests and phone calls seeking comment.

'Shocking' Secrecy

Created in response to the 1986 Chernobyl nuclear reactor meltdown in Ukraine, the convention has struggled to broaden safety standards. The group's own secrecy has often undermined its intents. One former French envoy, Jean-Pierre Clausner, said that the opacity of the organization was "shocking," according to the documents obtained under the Freedom of Information request.

"The whole process needs to be reviewed and significant changes should be introduced if the contracting parties are willing to maintain the usefulness of the convention," Clausner wrote in 2005, the first year that the body allowed notes taken from its meeting to be preserved.

While nuclear meltdowns are considered cross-border incidents because of the radioactive fallout that can result, no international authority exists to compel countries to adopt safety standards. Instead, regulators from around the world routinely review each other's practices to figure out which works best. Laggards face peer criticism that can make them look bad in forums like the convention.

Falsified Data

At the convention's 2008 meeting -- the last before Fukushima -- Japan was criticized by peers for being slow to overhaul a reporting system that had been caught using "falsified inspection data," the documents show. Participants also urged Japan, then the world's third-largest nuclear-power generator, to review how safe its reactors were against earthquakes.

Countries like China and India, where companies are building new reactors to cover growing electricity demand, have given some support to the European initiative, according to the diplomats. The safety-upgrade costs to new reactors aren't as burdensome as retrofitting existing infrastructure, they said. The U.S. said that the Europeans bushwhacked their delegation earlier this year by calling a vote to consider the safety amendment. **The country's nuclear industry would suffer if the European measure were to be adopted because it would create an international perception that the U.S. took safety less seriously.**

"The nuclear industry in the U.S. is under great pressure from lower natural gas prices," said Lyman from Vienna, where he is attending an IAEA meeting. "At the same time, the potential for capital upgrades to deal with post-Fukushima requirements was a worry that it could push them over the edge."

Argentina's IAEA envoy, Rafael Mariano Grossi, will convene the next safety meeting Feb. 9 to 13, when countries will decide on the Swiss measure.

The biggest challenge for the U.S. and Russia may not be convincing enough countries to vote against the measure, according to an official who organized last week's talks. Their real test, he said, will be to come up with something better.

Don't move out evacuation zone to study

October 28, 2014

TEPCO guidelines say evacuees entering college not eligible for compensation

<http://mainichi.jp/english/english/newsselect/news/20141028p2a00m0na017000c.html>

Tokyo Electric Power Co. (TEPCO) has set in-house standards for compensation that require evacuees who have moved out of evacuation zones to attend university or college to repay some of the compensation they have already received, the Mainichi Shimbun has learned.

A TEPCO document obtained by the Mainichi Shimbun says that if a tenant agreement between an evacuee and a landlord had been signed before the outbreak of the Fukushima nuclear disaster in March 2011, it is considered that the decision to move was made before the disaster, and that their evacuation was over after they moved into the new place. TEPCO is believed to use the guidelines when interviewing evacuees about requests for compensation.

According to the Fukushima Prefectural Board of Education and other concerned parties, however, there are no universities or two-year colleges in areas that have been designated as evacuation zones, where residents are entitled to 100,000 yen in compensation monthly for their mental distress. It means that under the TEPCO standard, all evacuees who moved out of evacuation zones to enter university or college, regardless of the location of the institutions, will be subject to TEPCO's demand for repayment.

While TEPCO has not disclosed how many people are subject to such a rule, the prefectural education board said there were some 1,000 students in off-limits zones who graduated from high school in the spring of 2011.

A 21-year-old woman from a difficult-to-return zone, who is being urged to return some 9 million yen to TEPCO, was accepted into a three-year nursing college in the Kanto region in December 2010. She signed a rental contract for an apartment near the school in January 2011 and moved there in the beginning of April. In June this year, TEPCO requested the woman's family to send a copy of the rental contract to TEPCO's head office in Tokyo, and sent back a note in September with the amount of repayment the woman needs to pay, claiming that she ended her evacuation when she moved into the apartment.

A representative of TEPCO's head office for Fukushima restoration told the Mainichi Shimbun, "We make decisions on compensation after checking individual circumstances," but added that the company cannot release payment guidelines.

Attorney Naoto Sasayama, who takes part in nuclear disaster compensation claims, said, "As disaster compensation is funded by the government, operation transparency and fair payment guidelines are indispensable. If TEPCO demands evacuees repay some of the compensation, the company needs to disclose the payment standards."

Promises

October 28, 2014

Industry minister says he will sell off TEPCO shares when term ends

<http://mainichi.jp/english/english/newsselect/news/20141028p2g00m0dm060000c.html>

TOKYO (Kyodo) -- Japan's new industry minister Yoichi Miyazawa said Tuesday he intends to sell off shares of Tokyo Electric Power Co. he possesses when he ends his term, as the opposition camp increases pressure on the minister over a series of scandals.

Miyazawa, who took office just a week ago, has come under fire following the revelation he holds 600 shares in TEPCO, the operator of the crippled Fukushima Daiichi nuclear plant, raising questions about the independence of the minister in charge of overseeing the power sector.

"After my term ends, I would like to dispose of all TEPCO shares I possess, and donate all the money to contribute to the revival of Fukushima," Miyazawa told a session of the House of Councillors Committee on Economy, Trade and Industry.

Under the guidelines for ministers adopted by the Cabinet in 2001, ministers are supposed to refrain from stock trading while in office. Miyazawa said he has already entrusted the TEPCO shares to a bank.

Miyazawa also said at a press conference that he will visit the crippled Fukushima plant this Saturday.

Miyazawa became industry minister Oct. 21 after his predecessor Yuko Obuchi stepped down over a money scandal less than two months after she assumed the post.

In just a week in office, Miyazawa has come under fire as his fund management body was found to have booked an outlay at a bar featuring S&M performances as expenses related to political activities, and the political party chapter he headed when he was a lower house member has received from a foreign-owned firm donations banned under the political funds control law.

TEPCO's profits

November 1, 2014

Tepco posts solid first-half profit sans reactors, rate hikes

<http://www.japantimes.co.jp/news/2014/11/01/business/corporate-business/tepco-posts-solid-first-half-profit-sans-reactors-rate-hikes/#.VFYo-sl5B1s>

AFP-JIJI

The operator of the crippled Fukushima No. 1 nuclear power plant posted a solid first-half pretax profit Friday, despite not restarting any of its idled reactors or hiking electricity rates.

Tokyo Electric Power Co. (Tepco) refrained from making full-year projections, saying it is difficult to do so while its workhorse nuclear plant remains offline following the March 2011 earthquake and tsunami.

Tepco, which was effectively nationalized in the wake of the crisis, said it chalked up a group pretax profit of ¥242.8 billion (\$2.23 billion) in the April-September half, up 71.4 percent from a year earlier. It attributed the solid result to postponed construction of power plants and cuts in manpower and materials costs.

Its revenue rose 3.7 percent to ¥3.334 trillion despite a decline in electricity sales caused by cooler summer temperatures.

Tepco was forecast to book a pretax profit of ¥130 billion for the full year, topping ¥100 billion for a second straight year, Kyodo News said last week.

In the year to March 2014, Tepco posted a pretax profit of ¥101.42 billion against a loss of ¥326.96 billion the previous year.

Hokkaido Electric's 12% price hike

November 2, 2014

Hokkaido Electric hikes prices 12%, joining nation's most expensive utilities

<http://www.japantimes.co.jp/news/2014/11/02/business/hokkaido-electric-jacks-household-electricity-prices-by-12/#.VFYpKsl5B1s>

JJI

SAPPORO – Hokkaido Electric Power Co. raised prices for households by an average of 12.43 percent on Saturday, the first of the nation's major utilities to carry out a second full rate hike since March 2011.

Hokkaido Electric obtained government approval to raise so-called small-lot power charges by 15.33 percent on average starting in November, but will keep the hike to 12.43 percent until the end of March 2015 as a one-off measure to soften the blow to households.

Hokkaido used to be among the regions with the lowest electricity charges in Japan, but the utility's charges are now among the highest, nearly on a par with Tokyo Electric Power Co. and Okinawa Electric Power Co.

Power rates for large-lot users, mainly businesses, rose by an average of 16.48 percent starting Saturday and will last through the end of March 2015. The full rate hike of 20.32 percent will then take force in April.

The full-fledged rate change is different from the monthly power rate reviews, or adjustments, often conducted to reflect changes in oil and natural gas prices and do not require government permission to execute.

In November, the monthly power rate for a standard household is projected to reach ¥8,198, incorporating the impact of the monthly review, up ¥856 from the previous month. Without the temporary measure, the cost would be ¥8,380.

The power industry is facing expanded costs for procuring fossil fuels for thermal power generation because all nuclear power plants remain suspended in the wake of the March 2011 meltdowns at Tokyo Electric Power Co.'s Fukushima No. 1 power station.

Struggling Japan Atomic Power co makes secret donations

November 2, 2014

Cash-strapped nuclear power company secretly donates 1.54 billion yen to city

November 02, 2014

THE ASAHI SHIMBUN

Japan Atomic Power Co., struggling financially while its nuclear reactors remain offline, still donated 1.54 billion yen (\$13.7 million) to a city government and asked that the funds be kept secret, officials said Nov. 1.

The money used for the donations came from fees paid by other power companies, who are under contract to buy electricity from Japan Atomic Power.

Japan Atomic Power has not produced any electricity from its three nuclear reactors since they were shut down following the March 2011 nuclear accident at the Fukushima No. 1 nuclear plant. **The company's requests for secrecy came after criticism arose over why it was still receiving money from the industry for nonexistent electricity.**

The city government of Tsuruga, Fukui Prefecture, which hosts Japan Atomic Power's two-reactor Tsuruga nuclear plant, started receiving donations from the company in 2009, mainly for use in road construction. The city had listed the donations, totaling 440 million yen, on official documents and shown them to the city assembly until March 2012.

At the end of March 2013, Japan Atomic Power donated 850 million yen to Tsuruga city. On May 31 that year, it asked the city not to list the donation on official documents.

The Tokyo-based company also donated 670 million yen in December 2013 and 19 million yen in March 2014. Again, Japan Atomic Power requested secrecy from the city government.

The city complied with the requests.

"We judged that it is not necessary (for the city government) to describe our donations on the official documents," said an official at Japan Atomic Power.

The Tsuruga government said the city has generally followed donors' requests that their names not appear on official documents.

Harumi Kondaiji, a Tsuruga city assemblywoman, said such nondisclosure was unacceptable.

"It is unforgivable for the city government not to show its citizens where the financial sources of its public works projects come from," she said.

Japan Atomic Power, which specializes in nuclear power generation, was set up in 1957 with capital mainly from major electric power companies. Aside from the Tsuruga plant, the company operates one reactor at its Tokai No. 2 nuclear power plant in Ibaraki Prefecture.

Five power companies, including Tokyo Electric Power Co. and Kansai Electric Power Co., are currently under contract to pay more than 100 billion yen a year in total as "basic fees" for electricity generated by Japan Atomic Power.

The central government in May 2012 started studying TEPCO's request to raise its electricity charges and began similar examinations in December that year on a rate-hike request from Kansai Electric.

During the process, members of an advisory council to the industry minister criticized Japan Atomic Power for receiving more than 100 billion yen from the five electric power companies despite being unable to generate any electricity to sell.

But the basic fees to Japan Atomic Power have continued even though its reactors--its only source of revenue--have remained shut down. Those fees, in turn, were used for the company's donations to Tsuruga city.

Household and corporate customers of TEPCO and Kansai Electric were eventually forced to pay higher electricity charges.

The industry ministry now prohibits electric power companies from including donations to local governments that host nuclear plants as part of their costs when they calculate electricity charges.

Japan Atomic Power has told the Tsuruga city government that it will stop providing donations starting in 2015.

The company has applied to the Nuclear Regulation Authority for safety screening to resume operations at the Tokai No. 2 nuclear plant. But concerns have arisen about the age of the reactor--35 years--and the damage to the plant caused by the March 2011 earthquake and tsunami.

In addition, the NRA concluded in May 2013 that an active fault runs below the No. 2 reactor of the company's Tsuruga nuclear power plant, putting in doubt any early restart of the plant.

Japan Atomic Power's management situation is so serious that it is receiving debt guarantees from the electric power industry.

"The company probably wants to conceal the fact that it is making donations (to Tsuruga city) despite its serious financial situation," said a high-ranking official of the city government.

Changes ahead on feed-in tariff system

November 3, 2014

METI to overhaul rules on feed-in tariff program

<http://www.japantimes.co.jp/news/2014/11/03/business/meti-to-overhaul-rules-on-feed-in-tariff-program/#.VFdSe8l5B1s>

Jiji

The Ministry of Economy, Trade and Industry intends to **eliminate companies from the feed-in tariff system that have promised to sell electricity but have no plans to generate renewable energy themselves**, sources say.

At an experts' meeting to be held Wednesday, METI will suggest proceeding with detailed discussions on the matter, the sources said Sunday.

Under the feed-in tariff program, power suppliers that use renewable energy sign contracts with major power companies after being certified by the central government.

The program allows smaller power suppliers to obtain informal agreements from purchasers before signing contracts, providing them with a degree of security so they can begin raising funds and building facilities.

But **some companies obtain government certification under the program with the intention of selling facility sites for profit, instead of carrying through with building power generation facilities themselves**.

Canceling informal electricity purchase agreements will cause trouble, a senior METI official said. The ministry will thus aim to set clear criteria for the cancellation of electricity purchases that major power companies have already agreed to, the sources said.

Since electricity purchase prices are set when would-be suppliers apply to major power companies for contracts, they tend not to begin power generation immediately, choosing to instead wait until technological advances help lower equipment costs such as for solar panels, boosting their profit margin. To fix that problem, METI is considering having purchase prices set when would-be power suppliers conclude contracts with major power utilities as well as lowering rates under the program, the sources said.

40 NGOs demand revision of latest UNSCEAR report

October 29, 2014

<http://hrn.or.jp/eng/news/2014/10/29/japanese-civil-society-and-that-from-7-other-countries-request-the-reports-of-the-united-nations-scientific-committee-on-fukushima-to-be-revised/>

Japanese civil society and that from 7 other countries request the reports of the United Nations Scientific Committee on Fukushima to be revised

Joint Statement

Civil Society groups request revision of the recent United Nations Scientific Committee on the Effects of Atomic Radiation (UNSCEAR) Report: “Levels and effects of radiation exposure due to the nuclear accident after the 2011 Great East-Japan Earthquake and tsunami.”

Human Rights Now, along with 40 civil society organizations from Japan, USA, Tunisia, Azerbaijan, Netherlands, Germany, France, and Ireland has issued a statement requesting UNSCEAR, and the General Assembly Fourth Committee to revise the report and its finding from a human rights perspective. Please find the actual statement from below.

PDF version is available here: Letter to UNSCEAR2014

Date: 24 October 2014

**To: Members of the Fourth Committee of the UN General Assembly 69th Session,
Members of UNSCEAR, and**

Members of the UN General Assembly:

Re: Civil Society groups request revision of the recent United Nations Scientific Committee on the Effects of Atomic Radiation (UNSCEAR) Report: “Levels and effects of radiation exposure due to the nuclear accident after the 2011 Great East-Japan Earthquake and tsunami.”

The 2011 Fukushima disaster made UN oversight of the adverse effects of ionizing radiation an issue of utmost global importance. The goals and criteria of oversight should be the protection and promotion of the human right to health and well-being, which encompasses an environment as free from exposure to man-made ionizing radiation as possible. We, the undersigned, urge the 4th Committee to examine critically both the scientific conclusions in the UNSCEAR report and the scientific evidence omitted from the report.

Physicians from 19 national affiliates of the International Physicians for the Prevention of Nuclear War (IPPNW), including Physicians for Social Responsibility (USA) and IPPNW Germany, have authored/issued/published a Critique of the UNSCEAR report which calls into question the presumptions and data used by UNSCEAR, and the consequent interpretations and conclusions. This Critique demonstrates how UNSCEAR systematically underestimates and downplays the health effects of the Fukushima disaster.

We appreciate the significant efforts made by UNSCEAR committee members to evaluate the extensive and complex data concerning the Fukushima nuclear catastrophe. However, their conclusion that there is “no discernable effect”, now or in the future, defies common sense and undermines the credibility of UNSCEAR. The Critique notes that based on the UNSCEAR report itself, it can be expected that about 1,000 excess cases of thyroid cancer and between 4,300 and 16,800 other excess cancer cases would occur in Japan due to Fukushima radioactive fallout. We believe that these are very discernable effects for the individuals, families and communities experiencing these cancers, as well as those individuals who will experience other form(s) of radiation induced illness.

Furthermore, the conclusion by UNSCEAR of 'no discernible health effect' is misleading the Japanese government to not implement countermeasures for individuals to avoid additional exposure and to have thorough monitoring of health effects, thereby causing serious human rights violations.

This catastrophe was not a singular event that has come to an end, but rather it is an unfolding event with an unknown endpoint. Radioactive elements continue to leak into the biosphere and individuals continue to be exposed to ionizing radiation because they live in contaminated areas, consume contaminated food and water and inhale contaminated air. Additionally, most of the health effects from Fukushima will take decades or generations to be expressed. Thus the UNSCEAR report at hand should be considered a preliminary or initial assessment of the health effects of Fukushima. Ongoing and improved monitoring and updating of the assessment is required for a long time to come. The 2014 UNSCEAR report is a beginning, not an end.

We ask that the Fourth Committee take two actions regarding the UNSCEAR report:

1) Return the report to UNSCEAR for revision based on the Critique, taking into consideration the points of concern raised in the Critique, and that UNSCEAR broaden the composition of the committee to include as full-fledged members scientists who are critical of nuclear activities.

2) We also ask that the Fourth Committee urge the General Assembly to pass a new resolution reframing the 1955 UNSCEAR founding mandate to ensure that the UNSCEAR's primary scientific mission is to promote and protect public health and the right to health of the most vulnerable individuals. The Precautionary Principle should be employed to address the short-term and long-term effects of ionizing radiation upon present and future generations as well as the environment. Likewise, the Precautionary Principle should be employed when determining exposure, cleanup and decontamination regulations and activities after a nuclear disaster, educational measures to minimize and mitigate the risk of individual exposure, and the long-term monitoring of contaminated sites. A new UN mandate is critical for UNSCEAR Committee members to be able to fully utilize their expertise for the purpose of protecting the lives and health of the global community.

Japan to build nukes in Wales

November 5, 2014

Wales minister says nuclear power remains a good investment

<http://www.japantimes.co.jp/news/2014/11/05/business/wales-minister-says-nuclear-power-remains-good-investment/#.VFtTh8l5B1u>

by Kazuaki Nagata

Staff Writer

While the nation debates the wisdom of restarting its nuclear power plants, the energy source remains central to some nations' investments for tomorrow. The process to construct a new two-reactor facility in Wales has been going as planned, the British province's economy minister said.

There's a confidence that the plant will be delivered, that it will work well, and that it will do good for the local community in terms of employment opportunities," said Edwina Hart, economy minister of the

National Assembly for Wales. She was speaking to The Japan Times last week during a working visit to Japan.

Horizon Nuclear Power, which is wholly owned by Hitachi Ltd., plans to build two advanced boiling water reactors on Anglesey Island.

Known as the Wylfa Newydd project, **the program is currently at the community consultation phase.** This involves soliciting opinions of local residents and authorities.

“People need to understand what things look like, how they look and everything,” said Hart.

“This type of engagement is very important,” she said.

When it comes to safety, prime responsibility lies with the operator. The U.K. government oversees the industry and the role of the Welsh Assembly is to get local companies involved in the supply chain and to provide a skilled workforce, she said.

Horizon says the community consultation is a pre-application process. It plans to submit an application for a development consent order in 2017, with completion and operation of the reactors anticipated in the mid-2020s.

“It’s a very long process. This is the issue. But the point is that it is a process that is proceeding as we would expect,” Hart said.

The firm says construction will create up to 8,500 jobs, while operation of the plant will require 900 to 1,000 new jobs.

Hart also visited Japan last year on a trade mission and tried to encourage Japanese companies to invest in Wales.

It apparently paid off, as she said Friday that Calby Inc., Japan’s biggest snack maker, had picked Wales as the location of its first investment in Europe.

The new facility will be a site for manufacturing and distribution, as well as research and development. Wales hosted 50 Japanese firms as of 2012, including Sony and Toyota.

Another target for Wales is Japanese tourists.

For the past few years, Japanese visitors to the U.K. have numbered 220,000 to 245,000 annually.

They “tend to fly into Heathrow (airport), go into London, nip to the Lake District, the Cotswolds and up to Scotland, and go back down to Heathrow. So, we wanted them to make that journey further west into Wales. We do think there is a market and potential there,” said Hart, adding that she has met people in the travel industry and asked what appeals to Japanese tourists.

She said Wales offers a wide range of attractions, such as gardens, castles and coastal sites.

As for Scotland’s independence referendum in September, Hart said she was watching with interest because “what the Scots do affects all of us in terms of our respected devolution settlements.”

She said opinion polls show there is little support for independence in Wales, but people want to see further powers devolved to Wales from the U.K. government.

For instance, the Welsh government does not have power over railways and energy, she said.

Hart said while the Welsh government supported Scotland’s continued membership of the U.K., the independence movement has triggered discussion of devolution settlements across the U.K.

"Drastic reform" needed

November 6, 2014

As I See It: Total picture needed for future electric power system

<http://mainichi.jp/english/english/perspectives/news/20141106p2a00m0na005000c.html>

Five utilities including Kyushu Electric Power Co. have suspended signing new contracts to buy power generated with renewable energy, such as solar power and wind power, under a system in which major electricity suppliers are required to buy such power at a fixed price. This is because these firms were not fully prepared to accept renewable energy, highlighting the inadequacy of the government's institutional program.

The government, which is now reviewing the system, should proactively and patiently work on drastic reform of the electric power generation and supply system.

The system was launched in July 2012 largely out of reflection of the crisis at the tsunami-hit Fukushima No. 1 Nuclear Power Plant that broke out in March 2011. The spread of renewable energy is effective in preventing global warming and power generation using such energy sources has a low risk of accidents. Since businesses that use renewable energy to generate electricity do not have their own power grids, the government requires major power companies to purchase power generated by designated businesses using renewable energy for up to 20 years.

The system is modeled after one in Germany that is an advanced country in terms of the use of renewable energy. However, the five utilities stopped signing new contracts to purchase power generated with renewable energy on the grounds that the amount of such power is likely to exceed their capacity. No wonder the system, which Japan introduced by imitating one in Europe despite power companies not being prepared to accept such power, hit a snag.

To ensure a stable power supply, a demand-supply balance that is perfect must be achieved at all times, according to industry sources. If the supply of power surpasses or dips below demand, it would destabilize the frequency and voltage, which could trigger a power blackout.

However, most renewable energy that utilities are supposed to buy is solar power, which is unstable because the generated amount of such power depends largely on weather conditions. Such being the case, the amount of power could surpass demand on a sunny day, which could cause power outages.

Surplus power should be sold to other utilities that have enough capacity to accept electricity. However, it is technically impossible under the current system. **The capacity of power cables connecting power grids owned by different utilities is limited.** Therefore, solar power and electricity generated with other renewable energy sources cannot be supplied to these cables in principle because the generating amount cannot be predicted. This is because **major power companies have enjoyed regional monopolies and seldom supply surplus power to other firms or receive such electricity from other companies, while the government approved such monopolies.**

The service area of Tokyo Electric Power Co. fell seriously short of power following the Fukushima No. 1 plant accident, highlighting the need for power interchange between electric power companies. The government has finally begun to reform the system and set up an organization that will play a leading role in controlling the power interchange next spring. However, the establishment of a broad power interchange system will come later.

A senior official of the Economy, Trade and Industry Ministry admitted that many officials knew that the current system under which power companies are required to buy power generated with renewable energy at a fixed price would be deadlocked sooner or later. **Numerous solar power generation companies were set up one after another for the sole purpose of making profits, contributing to the confusion.**

Three years have already passed since the law regulating the power purchase system came into force. Nevertheless, the government failed to take any action while being aware of problems with the system, nor did it set a numerical target for expanding the use of renewable energy for power generation. **It highlights the irresponsibility of the government while the administration of Prime Minister Shinzo Abe is enthusiastic about restarting nuclear power stations.**

The Fukushima Prefectural Government, which regards the spread of renewable energy as the pillar of its disaster recovery efforts, has solicited solar power generation companies to set up power stations in the prefecture. Therefore, an official of the prefectural government expressed concern that the five major utilities' suspension of signing new contracts to purchase renewable energy could adversely affect the prefecture's recovery plans.

Japan lags behind many other countries in the introduction of renewable energy. According to the International Energy Agency, the ratio of renewable energy to the total power generation amount is high among European countries -- 20.9 percent in Germany and 26.4 percent in Spain. The figure comes to 6.2 percent in the United States, but **in Japan it is a mere 2.2 percent. The ratio has doubled from the pre-nuclear disaster period, but still remains low.** Therefore, Japan needs a system under which utilities are required to buy renewable energy at a fixed price.

Japan should learn from European countries' efforts to expand the use of renewable energy. The power grids of European countries are connected with each other by cables with sufficient capacity, allowing these countries to supply surplus electricity generated with renewable energy to others within the region. European countries are introducing a system to predict the amount of power that can be generated with renewable energy based on meteorological observations and a device to automatically limit the amount of power generated with such energy sources if the supply of electricity is likely to reach a surplus.

The costs of establishing such systems pose a challenge. A study group within the Economy, Trade and Industry Ministry estimates that it will cost 4 to 6 trillion yen to improve power grids owned by utilities to prevent blackouts if the amount of solar power is increased to 53 million kilowatts -- almost equal to power generated by nuclear plants before the outbreak of the Fukushima crisis -- by 2030. The costs of buying renewable energy are added to utility fees consumers pay. As such, if power grids are reinforced, it will further increase the financial burden on consumers. This is one of the reasons why the government has not reviewed the system under which utilities must buy renewable energy at a fixed price.

However, **power companies are expected to spend a combined amount of over 2 trillion yen on safety measures in preparation to reactivate idled nuclear plants. If utilities are prepared to pay such a huge amount of money, they should trim the financial burden of renewable energy on consumers.**

In the German electric power system, top priority is placed on the use of renewable energy while thermal power is used to make up for fluctuations in generation amounts at power stations using renewable energy.

In contrast, Japan puts priority on nuclear and thermal power while pushing renewable energy to the sidelines. In reviewing the system, it is necessary to rectify Japan's excessive reliance on solar energy among various renewable energy sources. However, efforts to spread renewable energy sources must not be dampened. **The government and the electric power industry should present a total picture of the future of Japan's electric power generation and supply system in which renewable energy will play a key role.**

Uranium mining stocks jump as Japan clears way to reactors restart

<http://www.japantimes.co.jp/news/2014/11/08/business/uranium-mining-stocks-jump-as-japan-clears-way-to-reactors-restart/#.VF-le8l5B1s>

Bloomberg

VANCOUVER – Uranium prices and producers' shares soared after Japan cleared the way for restart of the first of the nuclear reactors shut after the March 2011 earthquake and tsunami.

Cameco Corp., Canada's largest uranium producer, increased 11 percent, the biggest gain since August 2010. Denison Mines Corp. climbed 20 percent and explorer Fission Uranium Corp. rose 18 percent in Toronto.

Kyushu Electric Power Co. on Friday received final local approval to resume power generation at its Sendai nuclear plant in Kagoshima Prefecture. All reactors in Japan have been shut since the March 2011 meltdowns crisis at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear plant.

"We have been waiting for this moment for a long time," David Sadowski, a Vancouver-based analyst at Raymond James Financial Inc., wrote Friday in a note to clients. "Restarts in Japan will reduce the threat that Japan's utilities will dump their uranium inventories into the market."

Sendai's two reactors are in position to be the first in Japan to resume operations under more stringent safety rules set by the Nuclear Regulation Authority, the industry watchdog. Officials in Satsumasendai, which hosts the Sendai plant, last month voted in favor of allowing restart. Final reviews of construction and safety rules must still be completed.

The Solactive Global Uranium Total Return Index, which tracks 21 companies in the uranium mining industry, rose the most since December 2008. The index is still down 80 percent from its highest closing price in 2011.

The price of U3O8, a tradable form of uranium, rose 4.3 percent to \$39.50 a pound on Friday, the biggest gain since March 2011, data compiled by Bloomberg show. The metal traded as high as \$73 in January 2011.

"We are hearing that several utilities are in the market looking for supply," Sadowski said.

Minamata group says safety takes back seat again

November 9, 2014

Minamata disease group opposes restart of Sendai nuclear plant

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201411090008>

By YASUSHI SAITO/ Staff Writer

MINAMATA, Kumamoto Prefecture--Minamata disease victims and supporters have joined the protest against the restart of nuclear reactors in Kumamoto Prefecture, saying **safety again is taking a back seat in the drive for economic growth.**

“If they miss the danger of nuclear plants because of economic priorities, they have not learned the lessons from Minamata disease,” said Koichiro Matsunaga, who heads the group “Stop restarting nuclear plants Minamata.”

Formed in September by eight members, including three Minamata disease patients, the group plans to collaborate with local organizations to oppose the resumption of operations at the Sendai nuclear power plant in Satsuma-Sendai, Kagoshima Prefecture.

Kagoshima Governor Yuichiro Ito on Nov. 7 approved the plant’s restart, the first such green light under stricter safety standards that were established following the Fukushima nuclear disaster in March 2011.

The city of Minamata is about 40 kilometers from the plant at the shortest distance.

Minamata disease, a sometimes fatal neurological disorder that causes numbness and vision problems, was officially recognized as a health hazard 58 years ago. Caused by consumption of marine products contaminated by mercury discharged into the sea by a chemical factory, **the disease remains a negative symbol of Japan’s period of high economic growth.**

Matsunaga said he sees similarities between the Sendai plant’s restart and Minamata disease.

“While human lives should take priority, the priority has been placed on corporate profits,” Matsunaga said. “(The government) has not learned lessons from Minamata and Fukushima.

Matsunaga, 51, visited Iitate in Fukushima Prefecture in February 2013. Many residents of the mountain village, whose center is about 40 km from the crippled Fukushima No. 1 nuclear power plant, remain in evacuation because of the high levels of radiation around their homes.

Matsunaga said that when he saw the Iitate village office, the vacant houses in the central area and temporary housing, he thought: “Residents cannot return home even if they wanted to.

“The Fukushima nuclear power plant has been tormenting people who were born and brought up in this village. There is no guarantee that Minamata can avoid the same fate.”

He cited two problems with restarting the reactors at the Sendai plant: inadequate evacuation plans in the event of a disaster and a lack of trust in the government.

Matsunaga noted that the central government said it would take responsibility for the resumption of operations at the nuclear plant.

“But it did not take responsibility for Minamata disease, either,” Matsunaga said.

The mayor of Satsuma-Sendai and the city assembly approved the reactor restarts earlier, on Oct. 28.

Matsunaga’s group urged the Minamata assembly to adopt a written statement opposing the reactor restarts, but the assembly rejected it.

“Despite Minamata disease, a public hazard, economic priorities always come first,” said Kenji Nagamoto, a 55-year-old Minamata disease patient. “I am disappointed we were not understood.”

Minamata city plans to accept 6,645 evacuees from Izumi, Kagoshima Prefecture, if a serious accident occurs at the Sendai nuclear plant.

“With evacuation plans insufficient, to what extent can the central government assure the people’s security?” Matsunaga asked.

Minamata Mayor Hiroshi Nishida on Nov. 8 also expressed concerns about the aftermath of a potential nuclear accident.

“We hope the central government will give a sufficient explanation to eliminate the anxieties of Minamata citizens who will accept evacuees, as well as resolve the problem responsibly and with sincerity,” Nishida said in a statement.

Another Minamata-based group involved in possible evacuation procedures asked the Kagoshima governor in May to oppose the resumption of the plant. The group’s view was not reflected in his decision.

"If a serious accident occurs, Minamata will also be subjected to evacuation," said Takafumi Nagano, head of the group. "I feel angry that Kagoshima Prefecture made the judgment (to resume operations) alone." Nagano also said the central government's assurances cannot be trusted. "Industry minister Yoichi Miyazawa said he will stand at the forefront to assume responsibility. But I cannot believe what he said when containment of the Fukushima plant accident is still not evident," Nagano said. **"They only seem to be rushing to restart** operations of the (Sendai) plant."

Evacuees won't have to pay back compensation

November 11, 2014

TEPCO to refrain from taking legal action over repayment of nuclear compensation

<http://mainichi.jp/english/english/newsselect/news/20141111p2a00m0na010000c.html>

Tokyo Electric Power Co. (TEPCO) has decided it will not take legal action over its desire for the repayment of some compensation paid to evacuees of the crippled Fukushima No. 1 Nuclear Power Plant after the Mainichi Shimbun reported on a case of an evacuee who had been asked by the company to pay back some of the compensation she had already received.

TEPCO demanded a 21-year-old woman whose family home was located in a difficult-to-return zone -- an area within 20 kilometers of the nuclear plant -- pay back some 9 million yen because she had moved out of the evacuation zone to go to a college outside of Fukushima Prefecture. The woman was told by the utility in September that her evacuation ended when she moved out of the family home in April 2011 because she had decided to enter a college outside of Fukushima before the disaster.

After the Mainichi Shimbun reported on the story in October, evacuees in a similar situation consulted with the nuclear damage response office of the Natural Resources and Energy Agency that supervises nuclear disaster compensation issues. As a result, the office moved to check with TEPCO on its compensation guidelines.

According to the nuclear damage response office, TEPCO concluded that it will not proceed with cases further when evacuees have already received compensation, that it will not take legal action against evacuees who are subject to requests for compensation repayment and that it will not offset the amount of compensation without the consent of evacuees. TEPCO has notified the woman and other subjects for compensation repayment about the company's decision.

Despite confusion and criticism about its policies, TEPCO is still reluctant to release its in-house compensation guidelines for defining the end of evacuation.

Govt releases more post-accident transcripts

November 12, 2014

More post-nuclear accident interviews released

http://www3.nhk.or.jp/nhkworld/english/news/20141112_40.html

Nov. 12, 2014 - Updated 13:19 UTC+1

Japan's government has released more transcripts of interviews with people connected to the accident at the Fukushima Daiichi nuclear plant.

The government on Wednesday disclosed interviews with 56 of 772 government and Tokyo Electric Power Company officials. The transcripts follow 19 testimonies published in September.

Among the newly released interviews is one with Manabu Terata, an advisor to then-Prime Minister Naoto Kan.

Terata recalled the day after the accident, when he visited the troubled plant with Kan.

Terata said he believed that Kan felt compelled to talk in person with the people working at the site.

Terata said he thought this action was in keeping with the prime minister's character. But Terata noted he was also worried about what impact Kan's visit would have during the unprecedented disaster.

He added he would be lying if he said he wasn't afraid at the time.

Terata also said Japan had placed too much faith in the safety of its nuclear power plants. He said the country surely knew about the dangers of nuclear power but paid far less heed to the risks than other countries.

The interviews released in September included those with former plant manager Masao Yoshida and former Prime Minister Kan.

Asahi will return to basic principles of journalism

November 13, 2014

Asahi will return to basic principle of news reporting

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201411130039

By YOICHI NISHIMURA/ Executive Editor, The Asahi Shimbun

The Press and Human Rights Committee (PRC) has issued a report that said regarding Asahi Shimbun coverage "there were deficiencies in using imagination to think about the perspective of readers as well as in the stance of seeking fair and accurate reporting." That is a serious point that goes to the fundamentals of a media organization.

We are keenly aware of the responsibility we must bear for causing serious errors.

The Asahi Shimbun sincerely accepts those views, and I would like to extend my deepest apology once again to everyone, beginning with those who were and are working at the Fukushima No. 1 nuclear power plant, which is operated by Tokyo Electric Power Co.

Coverage of the "Yoshida testimony" was conducted as part of our investigative reporting efforts. The main focus was to transmit just how difficult it was to respond to a severe accident at a nuclear plant. However, the first article in that coverage had at its core that "90 percent of workers withdrew in violation of the plant manager's order." For that reason, a mistaken perception was spread both in Japan and abroad.

Accurate and fair articles are the lifeline of news reporting. We cannot make a new departure without acknowledging an error as an error.

That is the thinking behind our decision made on Sept. 11 to retract the articles and to publish today the full text of the views of the PRC.

We can only close in on the truth by humbly facing the facts and accumulating those facts one by one. Facts must be separated from commentary, and imagination must be utilized in thinking about how our readers and those who are the subject of our news-gathering will feel.

We are now in the process of making efforts to deliver articles on a daily basis by returning once again to that basic principle of news-gathering and reporting.

The PRC pointed out that although many doubts were raised about the headlines and contents of the articles from within the Asahi, no revisions were made. That deficiency in sharing of information should never have occurred.

We will strive for thoroughness in mutual criticism and checking so that various voices from within the Asahi can be transmitted to those involved in the editing process.

The PRC also pointed to a misplaced sense of overconfidence as well as a lack of humility. It also touched upon the Asahi's nature to not reflect on the opinions, criticism and doubts from people outside the company as well as a lack of awareness about crisis management within the upper echelons of the company regarding the response after the matter came to light.

We have already begun various measures, such as dialogue meetings with our readers. After also considering the forthcoming results of the examination by another third-party committee into such issues as the Asahi coverage of the "comfort women" issue and the decision to hold off publication of a column by the journalist Akira Ikegami, we would like to compile as soon as possible a rehabilitation plan for the Asahi while carefully listening to the voices of those outside the company and creating a structure that will make use of such voices in producing our newspaper.

The report from the PRC valued the Asahi's obtaining the Yoshida testimony and calling for the central government to release the results of the questioning as well as shedding light on the problems that existed in dealing with the accident.

At the same time, we also received a proposal about investigative reporting that suggests it should move in a direction in which it is conducted "in a more systematic manner." **We are resolved to further strengthen our investigative reporting, which is an essential role of journalism, in order to dig up hidden facts through our independent news-gathering without relying on announcements by the authorities.**

Investigative reporting will not be possible without the trust in the Asahi by all of you. I pledge that all Asahi employees will make every effort to regain that trust.

By YOICHI NISHIMURA/ Executive Editor, The Asahi Shimbun

Panel finds Asahi report on Fukushima plant as having 'major errors'

<http://mainichi.jp/english/english/newsselect/news/20141113p2g00m0dm038000c.html>

TOKYO (Kyodo) -- A panel appointed by The Asahi Shimbun to review its reporting concluded on Wednesday that the newspaper's May scoop on testimony by the late chief of the disaster-hit Fukushima nuclear plant contained "major errors," endorsing the daily's retraction of the report earlier.

The major Japanese daily issued an apology to workers of Tokyo Electric Power Co.'s Fukushima Daiichi power plant in Fukushima Prefecture and other people, and said it will take disciplinary action against those responsible for the report within this month.

Based on the then classified testimony by Masao Yoshida, who was heading the plant when the six-reactor facility was crippled by the March 2011 earthquake and tsunami, the newspaper reported in a May 20 scoop that 90 percent of workers had withdrawn from the damaged plant by violating his order for them to stay put.

But on Sept. 11, the newspaper retracted the report after concluding that it misinterpreted the plant chief's testimony, which had been compiled for a government panel examining the Fukushima meltdowns, noting that the testimony showed Yoshida had not seen the workers' action as a violation of his order. The daily's Press and Human Rights Committee, consisting of a university professor, a former Supreme Court justice and a former executive of public broadcaster NHK, said "no fact existed to make the evaluation that workers were 'violating plant manager order'" and that no news gathering was pursued to corroborate such an evaluation.

The panel criticized the report for lacking Yoshida's comment in the same testimony that he had felt after all that the workers were right about deciding to move to another nuclear power plant nearby that had escaped severe damage.

The omission amounted to a failure on the part of the newspaper, whose mission is to provide readers with fair and accurate information, it said.

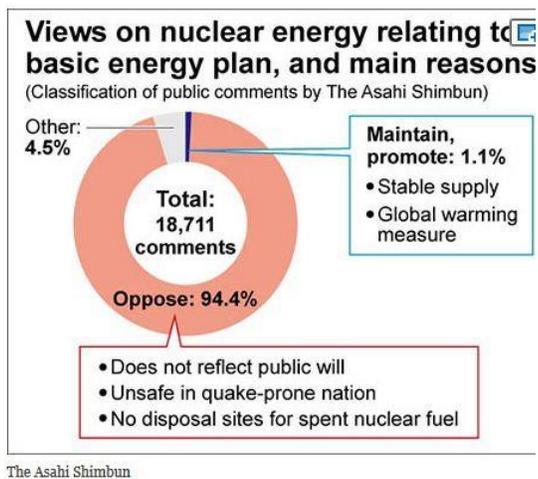

The panel also said the report contained a conjecture by the writer who wrote it, and that only two reporters had read the testimony just before the report was published.

As to the newspaper's failure to respond to growing criticism and questions raised about the report in the following weeks and months, the panel said a "lack of a sense of crisis" led to no proper or immediate response and resulted in a loss of trust in the newspaper.

Tadakazu Kimura, president of The Asahi Shimbun, suggested at a press conference in September that he would resign from the post to take responsibility for the scandal. He has since indicated that he would announce his resignation in the middle of this month.

Yoshida's 400-page testimony was reflected in the final panel report compiled in July 2012 along with testimonies from more than 770 others. Yoshida died of esophageal cancer in July 2013 at age 58.

Listening to the public?

November 12, 2014

Energy plan overlooked flat-out opposition to nuclear power, analysis shows

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201411120044>

By ATSUSHI KOMORI/ Senior Staff Writer

The government's compilation of its basic energy plan ignored an overwhelming call from the public to move away from nuclear energy, according to an analysis by The Asahi Shimbun.

More than 90 percent of the comments submitted to the Ministry of Economy, Trade and Industry in response to the government's proposed plan were against nuclear power, the analysis showed.

Yet nuclear energy was described as an "important base-load electricity source" in the plan approved by the Abe Cabinet in April.

The Asahi received a total of 18,711 comments from the ministry after submitting an information disclosure request.

Among them, 17,665, or 94.4 percent of the total, expressed opposition to restarting operations at nuclear power plants or called for decommissioning them.

Only 213 comments, or 1.1 percent, were in favor of maintaining or further promoting nuclear energy.

In about 833 cases, or 4.5 percent, it was difficult to judge what position was being taken. These comments were classified as "other."

Among the comments calling for a move away from nuclear power generation, the major reasons were "the draft (of the plan) does not reflect the public will," and "there are no disposal sites for spent nuclear fuel."

Among the comments in favor of nuclear energy, the main reasons given were the need for a stable electricity supply and the need for nuclear energy to deal with global warming.

The ministry disclosed 2,109 of the comments in May, with the remainder made available to the Asahi.

The industry ministry presented its draft of the energy plan on Dec. 6, 2013. Over the next month, it received public comments through fax or e-mail.

In February 2014, the ministry disclosed the main opinions it collected but did not classify them according to whether they were in favor of or opposed to nuclear energy.

Explaining why such a classification was not made, one ministry official said: "The opinion of an organization and that of an individual count as one comment. So we organized (the comments) not based on numbers but rather on their content."

Understandably, it may be difficult to compile an accurate count of the opinions because the names attached to the comments were deleted for privacy reasons. Some individuals apparently sent in the same comment more than once. Several dozen faxes had similar wording in an opinion calling for a move away from nuclear power generation.

In 2012, when the Democratic Party of Japan held the reins of government, it called for a national debate on what rate of power generation nuclear energy should account for in 2030.

About 89,000 public comments were received, with about 90 percent of them in favor of a move away from nuclear energy.

Bus companies' battle for compensation

November 15, 2014

Bus companies face uphill battle over nuclear disaster compensation

<http://mainichi.jp/english/english/newsselect/news/20141115p2a00m0na006000c.html>

A group of charter bus companies must submit documentary proof for each cancellation attributed to the Fukushima nuclear crisis to receive compensation for profits lost due to the disaster, the companies have been told by the nuclear damage claim dispute resolution center.

Sixteen charter bus companies in Tokyo and Kanagawa Prefecture filed an out-of-court alternative dispute resolution (ADR) claim with the government-backed dispute resolution center. Each of the companies received numerous reservation cancellations following the March 2011 Fukushima No. 1 nuclear plant meltdowns, with some seeing their profits plunge more than 50 percent.

The companies submitted the group compensation claim in October 2012. Their claim compared operating profits for a one-year period following the nuclear accident against the average profit for the several years prior -- demanding the difference between the two figures.

During the first scheduled hearing in December 2012, the mediating lawyer from the center who was responsible for drawing up the settlement proposal told the bus companies that they had to submit documents specifying how they knew that the nuclear accident had been the reason for each individual reservation cancellation. One of the 16 companies succeeded in preparing the documentation as it had asked their clients the reason for each cancellation, but the other 15 were unable to comply with this requirement.

The bus companies emphasized that the demand for them to prepare such documentation was "too severe." Meanwhile, the center pressured the 15 firms on numerous occasions to drop their compensation claim.

During a subsequent meeting held in December 2013, the center produced a settlement proposal for the single firm that had complied with the documentation requirement, while telling the other 15 companies that they were being dropped from any further negotiations.

Calling the decision unjust, two of the bus companies have resubmitted their claim -- while several other firms among the 15 are presently preparing to do likewise.

According to the guidelines for the scope and amount of compensation that were established by the Dispute Reconciliation Committee for Nuclear Damage Compensation, which oversees the center, there are only 10 prefectures nationwide -- including Fukushima Prefecture -- where companies in the tourist industry are eligible for compensation for domestic reservation cancellations.

In the 10 designated prefectures, the guidelines specify that it is sufficient to submit documentation such as financial statements that prove a discrepancy in total sales before and after the nuclear disaster.

Compensation would then be calculated based on consideration of past profits.

Apparently because the 16 companies submitting the group compensation claim are not based in the 10 designated prefectures, however, they were required to submit additional documentation.

Center representatives declined a request for an interview, saying that they were "unable to discuss individual cases."

One major bus company reported that reservation cancellations numbered around 10,000 in 2011 alone. A company insider commented, "It was not appropriate for us to be asking our clients (at that time) whether or not the nuclear accident was the reason for the cancellations." The firm added that the center's attitude in requiring the companies to submit the additional documentation was "exceedingly cruel."

"Many bus companies are not on an equal footing with tour companies," commented Isamu Mitsuhashi, president of the Japan Academic Society of Tourism and professor of tourism at Shumei University.

"Particularly in the case of small bus companies, determining the reason for reservation cancellations would be a difficult undertaking.

"What the center is asking these companies to do is not realistic," Professor Mitsuhashi added. "Tourist-related firms are the first to suffer the impact of disasters. The center should take the situation of these companies into serious consideration when processing their claims."

November 15, 2014(Mainichi Japan)

Taxing offline reactors?

November 14, 2014

Shimane Prefecture to tax idled nuclear reactors

<http://www.japantimes.co.jp/news/2014/11/14/national/shimane-prefecture-to-tax-idled-nuclear-reactors/#.VGct3Ml5B1s>

JJI

MATSUE, SHIMANE PREF. – The Shimane Prefectural Government said Friday that it plans to introduce a new tax on nuclear reactors based on their output capacities.

Revenue from the tax is estimated to total ¥3 billion for five years from next April, regardless of whether the No. 1 and No. 2 reactors at Chugoku Electric Power Co.'s Shimane nuclear power station remain offline, according to the prefectural government.

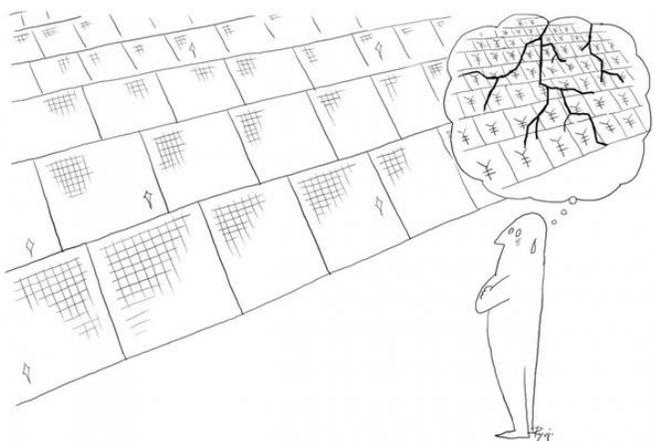

Since both reactors were halted in fiscal 2011, the prefecture has had no revenue from the existing nuclear fuel tax that is imposed at a rate of 13 percent on the value of nuclear fuel used in the reactors.

The Shimane government will submit to the prefectural assembly an ordinance proposal later this month that calls for lowering the fuel tax rate to 8.5 percent while collecting a tax of ¥41,100 per kilowatt in reactor capacity every three months.

As the new tax is roughly equal to an 8.5 percent nuclear fuel tax, the effective tax rate on the reactors will rise to 17 percent, prefectural officials said.

Using revenue from the new tax, the prefectural government is considering creating a new subsidy program for nuclear disaster response covering the city of Matsue, which hosts the Shimane nuclear plant, and three other municipalities within 30 kilometers of the plant.

Japan & green energy

A losing bet on green energy

<http://www.japantimes.co.jp/opinion/2014/11/25/commentary/japan-commentary/a-losing-bet-on-green-energy/#.VHSXIM15B1s>

“What if our company goes bankrupt?” shouted an official of a company seeking to generate electric power with solar photovoltaics at a meeting on Oct. 3 at which Kyushu Electric Power Co. explained its decision to suspend receiving applications for sale of electricity from renewable energy sources to the power firm. Under a scheme known as feed-in tariffs (FIT) that the government instituted in 2011, power utilities are required to purchase at fixed prices electric power generated by other entities by using renewable energy sources. But the scheme has proved to be unworkable as Kyushu Electric’s action was followed by Tohoku, Shikoku, Okinawa and Hokkaido Electric Power companies.

The utilities’ actions have dealt a serious blow to entities planning to build solar power generating facilities and manufacturers of solar panels. Moreover, entities that have already entered into contract with the utilities for green power sales also fear that the deals might prove unworkable.

When the Diet passed the law to create the FIT scheme, the lawmakers failed to learn from the experiences of Germany, where a similar scheme introduced earlier only was causing heavy burdens on both households and businesses. The most ardent proponent of FIT at the time was then Prime Minister Naoto Kan, who was so enthused about spread of green energy that he made the Diet’s passage of the FIT legislation a condition for his resignation.

The current trouble “could have been prevented even after the introduction of the system, had the purchase prices of electricity generated through renewable energy sources been kept at reasonable levels,” comments a newspaper reporter who specializes in energy issues.

Kazuhiro Ueta, a Kyoto University economics professor who argues that Japan should free itself from nuclear power and that a broader use of renewable energy sources is key to solving energy problems, served as head of a committee responsible for determining the prices and duration for the purchase by power companies of electricity generated through renewable energy sources. Ueta set the purchase price for electricity from solar panels at ¥42 per kilowatt hour for the initial year of 2012. He contended that by 2030, electricity coming from renewable energy sources should account for 20 percent of the nation’s total electricity. But that price was very high compared with the ¥30 per kilowatt hour that was being contemplated by those who were thinking of entering into the solar power generating business. The high purchase price quickly caused bubbles of solar panel installation plans.

Ueta insisted that Japan can’t hope to attain a broad use of green energy unless suppliers of such energy are given favorable treatment for the first three years. He said that this would not place a financial burden on citizens because the purchase price will be lowered commensurate with technological progress. His words now sound like a joke as the scheme has hit a snag halfway through the third year of its existence.

During the past two years, the per kilowatt-hour purchase price of electricity from solar panels was lowered to ¥36 and further to ¥32. But the utilities were flooded with applications from those seeking to sell them electricity from solar panels since the prices of solar panels also fell. As of April, there were solar power facilities with a combined capacity of 71 million kilowatts nationwide. This staggering number came as a surprise even for a high official of the Ministry of Economy, Trade and Industry, which is in charge of the FIT system.

The sudden action on the part of the utilities to suspend acceptance of power-sale applications under FIT has hit the market hard. A company in Miyagi Prefecture had bought property adjacent to its stocking yard in preparation for building a giant solar power generating facility. Its executive says, “We bought the land

because we thought that it would have been cheaper than paying rents for the next 20 years. But our project has come to naught.”

In Kyushu, there was a boom of building houses equipped with solar panels that can generate more than 10 kilowatts — the upper limit for ordinary households. Their major selling point was that excess power generated by the panels could be sold to Kyushu Electric Power, thus generating money to pay back housing loans. Following the utility’s change of course, many troubles are said to have surfaced with customers’ refusal to accept such houses or demand for canceling the contracts.

An example of a large corporation hard hit by the latest change on the part of the power utilities is found in Sanix, Inc., whose stock is listed on the First Section of the Tokyo Stock Exchange. The main line of business for this Fukuoka-based company is termite extermination. Participation in the FIT scheme was to serve as a shot in the arm for Sanix, whose balance sheets had remained in the red for nine consecutive years before returning to black in March 2012. In the 12 months through last March, the company reported a record ¥84.2 billion in sales and an operating profit of ¥4.5 billion.

But Sanix started facing financial problems after Kyushu Electric Power stopped receiving new applications for electricity sales under the FIT scheme. Sanix is said to have been forced to ask banks for new loans and have fallen into arrears in its payments to other companies, while its stock price, which exceeded ¥1,600 in May, has fallen to a third of that level. Sanix has thus been pushed into an inferno as the banks that know its past history are reluctant to provide new loans, according to an official of a business research company.

Those who made exorbitant profits in the bubbles created by the FIT scheme were not limited to corporations selling and installing solar panels. Leasing companies made contracts for solar panels throughout the country to the point of forming a bubble.

But should a company like Sanix falter, disasters would fall on those leasing companies because they can only claim ownership of the solar power generating facilities. If the landowners of the property on which such facilities were installed demand that the land be returned to its original condition, leasing companies would have no other choice but to dispose of the facilities.

In the case of solar panels with an expected power-sale period of 20 years, many of the leasing contracts were made valid for an unusually long period of 15 years on the assumption that the purchase by power companies of electricity generated by the solar panels is guaranteed and that the market values of the panels are unlikely to depreciate much.

But with the recent change of attitude by the utilities, there has emerged an oversupply of solar panels on the market. There is also a risk of the market values of the panels being pushed down further because no one has confirmed that they will last 20 years.

Uncertainties confronting leasing companies have been aggravated as they themselves have started entering into the solar power generation business on their own. A high-ranking official of a major leasing firm says that Orix Corp., the leader in the leasing business, has committed to solar power projects in a scale exceeding ¥200 billion while other major leasing firms each have committed in a scale of about ¥100 billion. Although an official in charge of credit control of a certain leasing company warned about the risk, the top management did not listen.

A high-ranking executive of a leading leasing company has been quoted as saying at a board meeting, “We will no longer be here when any problem arises.” His statement is irresponsible but he apparently does not notice the imminent dangers.

The about-face by the utilities has shocked many of those who jumped at the solar power business. And there is no prospect at all for the situation to turn better.

This is an abridged translation of an article from the November issue of Sentaku, a monthly magazine covering political, social and economic issues.

Antinuclear candidates wanted!

November 23, 2014

LDP incumbents look to have electoral lock on nation's nuclear heartland

Staff Writer

OSAKA – Political decisions over the fate of Fukui's aging reactors have long been in the hands of powerful pro-nuclear Diet members who represent the prefecture.

The Dec. 14 poll is not expected to change that, although it will be the first in which only two Fukui Lower House members are up for re-election. The loss of one seat stems from electoral district reforms that went into effect last year. Currently, the prefecture has three districts.

The No. 1 district, which mostly encompasses the city of Fukui in the north of the prefecture, is represented by Tomomi Inada, a right-wing Liberal Democratic Party policy chief and close ideological confidant of Prime Minister Shinzo Abe.

The No. 2 district includes the inland town of Ono on the eastern flank of the prefecture, as well as municipalities just north of the city of Fukui on the border with Ishikawa. It's represented by Taku Yamamoto, also of the LDP and the husband of internal affairs minister Sanae Takaichi, another close right-wing Abe confidant.

Fukui No. 3 is the nuclear power district. It includes the towns of Tsuruga, home to two reactors, one of which is 44 years old; Mihama, which hosts three reactors, two of them over 40 years old; Oi, where there are four reactors, two in excess of 35 years old; and Akahama, two of whose four reactors are, or soon will be, 40 years old. The No. 3 district is represented by the LDP's Tsuyoshi Takagi, who appears to be less of an ideologue than Inada, although he once lent his support to a film denying the occurrence of the Rape of Nanking.

But more importantly for local pro-nuclear voters and Kansai Electric Power Co., which operates the above reactors, Takagi has always been a fierce supporter of atomic energy and played an influential Diet role in getting two of the Oi reactors restarted in 2012 despite nationwide opposition. Those units were shut down for inspection last year.

For the coming election, however, Fukui will have only two districts. The first is a nonnuclear zone, incorporating the city of Fukui and the towns in the north. The other covers the middle and southern part of the prefecture, where all of the nuclear plants are located, near the borders of Shiga and Kyoto prefectures.

The LDP has been weighing a plan to field Inada in the first district, Takagi in the second, and Yamamoto as a proportional representation candidate. As of late last week, discussions were ongoing.

At the moment, none of the opposition parties has announced any candidates. In the 2012 Lower House election, Takagi won the No. 3 district by nearly 50,000 votes against his Democratic Party of Japan rival, who ran on a mildly anti-nuclear platform. How Takagi will fare under the revised districts is uncertain.

But unless strong anti-nuclear candidates emerge in the coming days, it appears Takagi, Inada and Yamamoto will continue to represent Fukui in Diet deliberations over the prefecture's old atomic plants for years to come.

Don't forget state secrets law

November 26, 2014

Don't forget secrecy law, reactor restarts, DPJ's Kaieda urges voters

<http://www.japantimes.co.jp/news/2014/11/26/national/politics-diplomacy/dont-forget-secrecy-law-reactor-restarts-dpjs-kaieda-urges-voters/#.VHX2Lcl5Cot>

Jiji

Banri Kaieda, head of the opposition Democratic Party of Japan, is determined to prevent the ruling Liberal Democratic Party and its coalition partner, Komeito, from returning to the Lower House with a combined majority.

"I want voters to judge from what (Prime Minister Shinzo) Abe and his LDP have done for the two years since they returned to power," Kaieda said in an interview on Tuesday.

The government's economic policies, dubbed "Abenomics," will be a big campaign issue. But Kaieda said **voters should also cast judgment on the state secrecy law** and the Cabinet's decision to allow Japan to exercise the right to collective self-defense.

Furthermore, he said, **the Abe administration has been promoting energy policies including a reliance on nuclear power "as if nothing happened on March 11, 2011."** That was the date of the magnitude-9.0 earthquake and tsunami which triggered the triple meltdown at Tokyo Electric Power Co.'s Fukushima No. 1 power plant, a nuclear disaster which is still resonating 3½ years later.

On the economic front, the opposition leader said that unlike Abenomics his party focuses on middle-income people, reinforcing nursing and medical services and stepping up support for small- and medium-sized businesses in order to achieve growth in the medium to long term.

On the issue of collective self-defense, Kaieda said the DPJ wants to keep national security exclusively defensive.

"We will never allow Japan to exercise the right to collective self-defense as envisaged by Abe, because cases cited by Abe where the Self-Defense Forces can fight for another country indicate the possibility of the scope of self-defense expanding limitlessly," he said.

Kaieda offered the view that there could be a realignment of opposition forces after the Dec. 14 poll, saying the Diet should be divided by two political forces: one led by the LDP and the other by the DPJ. But he also said his party will not pursue consolidating the opposition camp right after the poll.

Kaieda said the DPJ has so far reduced the number of candidates it will field in the Lower House election to between 170 and 180, because the party wants to leave room for election cooperation with other parties.

Pass on the cost of decommissioning

November 27, 2014

Gov't eyes system for power firms to tack reactor decommissioning costs to power bills

<http://mainichi.jp/english/english/newsselect/news/20141127p2a00m0na014000c.html>

The Ministry of Economy, Trade and Industry has started to consider introducing a system in which major power companies can tack costs of decommissioning their nuclear reactors onto power bills for consumers even after the full liberalization of electricity retailing fees scheduled for 2018 to 2020, it has been learned.

An idea has emerged that major power companies pass the costs of decommissioning their nuclear reactors onto the usage fees for those companies that are to transmit and distribute electricity produced by the utilities to households and business establishments after the power generation business is separated from power transmission and distribution operations. The industry ministry intends to pave the way for the major utilities to decommission their nuclear reactors early by letting them recover decommissioning expenses without being affected by price competition that is expected to emerge after the deregulation of the electric power industry.

The major power companies that have nuclear plants have been posting the costs of decommissioning their reactors every fiscal year in installments and tacking the costs onto power bills. In July 2013, the government decided to limit the life of nuclear reactors to 40 years in principle. Thus, the power companies, which had planned to operate their reactors beyond 40 years, are forced to decommission their ageing reactors earlier than planned and move up the schedule for posting the decommissioning costs. Under such circumstances, the power companies could incur huge losses.

The industry ministry estimates that if seven reactors are decommissioned in July 2016 after 40 years in operation, there will be a loss of about 21 billion yen for each reactor. Those power companies, whose finances are deteriorating due to a delay in restarting their reactors, are cautious about posting huge losses, raising concerns that the decommissioning of reactors might not go smoothly. For this reason, the ministry plans to allow the power companies to post costs of nuclear facilities, including decommissioning expenses, in installments over multiple business years so as to prevent their finances from deteriorating quickly.

The ministry is rushing to consider a new system because electricity fees will be fully liberalized around 2018 to 2020 and the current rate system in which power companies are allowed to tack decommissioning costs onto utility bills will be scrapped accordingly. If decommissioning costs are to be tacked onto power bills only from major utility companies after the full liberalization of the electricity retailing market in 2016, emerging start-up electricity retail companies will have advantages in setting electricity fees. If that is the case, the major power companies will lose their customers, making it difficult for them to recover decommissioning costs. The industry ministry will help the major power companies to decommission their reactors as originally planned by resolving such concerns.

November 27, 2014(Mainichi Japan)

Will nuclear emergencies be classified?

November 28, 2014

Concerns simmer over access to nuclear info as enforcement of secrets law nears

<http://mainichi.jp/english/english/newsselect/news/20141128p2a00m0na016000c.html>

On March 25, 2011, two weeks after the Great East Japan Earthquake and the outbreak of the Fukushima nuclear crisis, a senior government official showed Minamisoma Mayor Katsunobu Sakurai a map. "I'd never seen anything like it," Sakurai says, adding that he still remembers how shocked and angry he became as the information hit him. It was a map of radiation levels around the Fukushima No. 1 Nuclear Power Plant. And though he was responsible for the safety of a city just up the coast from the power station, it was the first time he'd been told that the neighboring town of Namie and village of Iitate -- both at least partially outside the 30-kilometer evacuation zone around the plant -- were badly contaminated. The southern section of Minamisoma was inside the zone, and many residents there had evacuated -- some of them to areas this bureaucrat was now telling him were highly radioactive.

"Vital information like this needs to be given to the people who live here," Sakurai snapped at the official. The March 2011 earthquake and consequent nuclear disaster were, for Japan, part of the same emergency. When the triple earthquake-tsunami-meltdown disaster struck, the Japanese government deployed over 100,000 Self-Defense Forces personnel, while the United States also came to the rescue with a fleet of about 20 U.S. Navy vessels (including an aircraft carrier), some 160 aircraft and more than 20,000 troops in the massive Operation Tomodachi. This vast mobilization got help to most of the disaster survivors. The Japanese government shared data on radiation distribution from its System for Prediction of Environmental Emergency Dose Information (SPEEDI) with the U.S. military on March 14, three days after the triple-meltdown at the Fukushima plant. **The data, however, was kept from the Japanese people until March 23**, inviting a storm of criticism that the government had needlessly exposed people to radiation. On Dec. 10, four days before the House of Representatives election, the special state secrets protection law will go into effect. The law prescribes a prison term of up to 10 years for those who spill designated secrets in four categories: defense, diplomacy, counterespionage, and counterterrorism.

In fact, none of Japan's political parties -- including the largest ruling Liberal Democratic Party (LDP) -- had ever publicly promised to implement a secrets law in the past. The idea initially popped up during Shinzo Abe's first term as prime minister in 2007. That year, Japan and the U.S. signed an intelligence-sharing pact, and Japan effectively promised its powerful ally that it would prepare a law to protect secret information.

A secrets bill remained under consideration during the subsequent Fukuda and Aso administrations, and was interrupted by the 2009 election that brought the opposition Democratic Party of Japan (DPJ) to power. The Cabinet of the last DPJ Prime Minister Yasuhiko Noda began preparing a bill, but it never reached the Diet. In 2012 came the second Abe Cabinet, which set to work on a bill that was submitted to the Diet in October 2013.

During the intense debate on the special state secrets bill, discussion turned to what effect it would have on nuclear power. Masako Mori, the minister in charge of shepherding the legislation into law, and other government figures stressed that information on nuclear disasters would not be classified as state secrets by any means. **Nuclear reactors, however, could be a terrorist target, and as such, there's no guarantee that information about nuclear plants vital to the safety of the Japanese people won't be classified.**

The fact is the government quickly ended up lagging behind events in the Fukushima nuclear disaster, and both Fukushima's prefectural and municipal leaders and many of their citizens are deeply distrustful of the special states secrets law. The Fukushima Prefectural Assembly voted unanimously in October last year to submit a letter to the national government demanding the bill be handled carefully. At a public hearing on the bill held by the House of Representatives in the city of Fukushima in November last year, all five locals who spoke said they were worried about it.

One of those five was Tamotsu Baba, mayor of Namie, who said, "The main principle here is not the protection of secrets, but the release of information" to the people. At a public address a short time earlier, Baba had stated that SPEEDI and other information "was hidden from us. They (the central government) told us that they didn't know how accurate the information was, and that they kept it under wraps to prevent a panic. Well, human lives are far more important than all that. This is a basic issue that comes even before any discussion about whether such information would be classified secret" under the new law.

Just a day after the public hearing in Fukushima, the special state secrets protection bill was railroaded through the special lower house committee considering it, and then whisked through the House of Councillors after only a week of debate.

The Act on Access to Information Held by Administrative Organs, which governs the release of government documents to the public, came into force in 2001. In 2011, the then DPJ-led administration submitted revisions to this act to the Diet that would reduce the discretion that government organs had over what to release and what to keep locked up; make access to documents free of charge; and effectively shorten the waiting period for information access requests to three weeks. The bill, however, died before it could become law.

On the possibility that information on nuclear accidents and "nuclear emergencies" could be kept secret, Sakurai says, "I'm worried about that. We'd be in trouble if that ever happened."

November 28, 2014(Mainichi Japan)

Baverstock on UNSCEAR report: does not qualify as "scientific"

December 1, 2014

British researcher blasts U.N. report on Fukushima cancer risk as unscientific

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201412010036>

By MASAKAZU HONDA/ Staff Writer

A British scientist who studied the health effects of the 1986 Chernobyl disaster panned a United Nations report that virtually dismissed the possibility of higher cancer rates caused by the 2011 Fukushima nuclear crisis.

Keith Baverstock, 73, made the comments during a visit to Tokyo at the invitation of a citizens group related to the Fukushima disaster.

In response to questions from The Asahi Shimbun, Baverstock said a report released in April by the U.N. Scientific Committee on the Effects of Atomic Radiation (UNSCEAR) was "not qualified to be called 'scientific'" because it **lacked transparency and independent verification**. He added that the committee should be disbanded.

The U.N. report said any increase in overall cancer rates among residents of Fukushima Prefecture due to fallout from the accident was unlikely.

However, Baverstock, former head of the radiation-protection program at the World Health Organization's Regional Office for Europe, said **radiation levels shown in the report were enough to cause a spike in cancer rates.**

For example, the report said nearly 10,000 workers at the crippled Fukushima No. 1 nuclear plant were exposed to radiation levels exceeding 10 millisieverts over about 18 months following the outbreak of the crisis in March 2011.

Baverstock said such an exposure level was enough to cause an increase in cancer among about 50 of the workers.

After studying the health effects from the Chernobyl nuclear disaster, Baverstock was the first to point out an increase in thyroid cancer among residents of areas hit by radioactive fallout.

He also questioned UNSCEAR's neutrality, given that members are nominated by nations that have a vested interest in nuclear power. He noted that such nations provide funds to the committee.

Baverstock also suggested a conflict of interest, as committee members are not required to disclose their history working in the nuclear industry or sign pledges stating that no conflict of interest exists in evaluating radiation risks.

Baverstock said that when he was working for the WHO, he felt constant pressure from the International Atomic Energy Agency, a major promoter of nuclear power. He also questioned why it took more than three years for UNSCEAR to release its Fukushima report.

Referring to what he called inside information, Baverstock raised the possibility that the delay was caused by criticism about the report's conclusion and the influence of other U.N. agencies, such as the IAEA.

Nuclear Hotseat

November 21, 2014

NUCLEAR HOTSEAT

<http://www.nuclearhotseat.com/2200/> (last 2/3 of the programme)

INTERVIEW:

Arnie Gundersen of Fairewinds Energy Education (Fairewinds.com), Nuclear Hotseat's favorite nuclear engineer, gives a concise, clear interpretation of **what's behind TEPCO's recent announcements** regarding water radiation levels, the removal of fuel rods from the fuel pool at Unit 4, and the hole in the roof of Unit 1; **manipulation of Japanese doctors** to eliminate evidence of radiation-related diseases in Fukushima's survivors; and **an elegantly brilliant way to deprive the nuclear industry of its peak energy profits,** thus hastening its demise.

Tanigaki: Nuke restart "necessary"

December 2, 2014

LDP bigwig Tanigaki stresses benefits of 'Abenomics,' says nuke power 'necessary'

<http://mainichi.jp/english/english/newsselect/news/20141202p2a00m0na030000c.html>

The 12-day campaign period for the Dec. 14 House of Representatives election has officially kicked off.

The Mainichi Shimbun recently talked to leaders of Japan's political parties on their basic policies and will

carry a series of special articles based on their interviews during the campaign period. Below is an outline of comments from ruling Liberal Democratic Party (LDP) Secretary-General Sadakazu Tanigaki.

--

Our party has been pushing Prime Minister Shinzo Abe's key economic policies, dubbed "Abenomics," to stop decade-long deflation and create a positive growth cycle. Since the LDP returned to power, jobs have been created for some 1 million people. The ratio of job offers to job seekers has improved in all 47 prefectures of the country, and the average wage growth topped 2 percent at annual labor-management negotiations this past spring. Many companies have enjoyed record-high profits. We are promoting Abenomics as the only way towards economic recovery.

Some say this election does not have a cause, but Prime Minister Abe decided to postpone the sales tax increase from the current 8 percent to 10 percent, which would have a significant impact on Japan's economy and fiscal policies. Therefore, it's right for a prime minister to seek consent from the public as policies will not be carried out as planned. I take this matter very personally as I was the LDP president at the time of the three-party agreement among the LDP, Komeito and Democratic Party of Japan on the tax hike.

Stable supply of energy is also an important issue. We have to mull over what would be the "best mix" (of power sources). We have not changed our goal to reduce Japan's dependence on nuclear power while seeking the possibility of renewable energy, but such a goal cannot be achieved right away. **It is necessary to restart nuclear power plants that have passed safety checkups while we work to win support from local residents.**

On national security, our predecessors had paid special attention not to be a threat to neighboring nations since the end of the war. Some countries, however, want Japan to do what is possible to protect regional peace and security. We look to establish a seamless security system while reinterpreting the Constitution to exercise the right to collective self-defense.

Voters tell us they want a stable government. Winning a combined majority (with Komeito) is a must; the challenge is how to win additional seats. Our goal is to have all LDP official candidates and party-backed candidates to win seats. (Interview by Tetsuya Kageyama, Political News Department)

December 02, 2014(Mainichi Japan)

100th year of power transfer between Fukushima and Tokyo

December 3, 2014

Power lines connecting Fukushima and Tokyo mark centennial

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201412030053

By TOSHIHIDE UEDA/ Senior Staff Writer

AIZU-WAKAMATSU, Fukushima Prefecture--With over 300 transmission towers originally erected still in use, the direct transfer of electric power generated in Fukushima Prefecture to Tokyo entered its 100th year of operation on Dec. 3.

The power lines, known as the Inawashiro Kyu-Kansen (old main line of Inawashiro), were built in 1914 by Inawashiro Suiryoku Denki (Inawashiro hydropower), an electric power company that operated during the Meiji (1868-1912) and Taisho (1912-1926) eras.

The utility built the power lines after it established the Inawashiro No. 1 power plant, a hydroelectricity station in Aizu-wakamatsu, Fukushima Prefecture, just north of Lake Inawashiroko. The lines sent electricity generated at the power plant to the Tabata substation in northern Tokyo.

According to Tokyo Electric Power Co., which acquired the Inawashiro Kyu-Kansen after World War II, the entire route connecting the power plant and the substation extended for 225 kilometers and transmitted a total of 115,000 volts, which made it the longest and most powerful system in Japan at the time.

Today, all that remains of the original Inawashiro Kyu-Kansen structures are 335 pylons stretching 89 km that connect the western bank of Lake Inawashiroko with the Nasuno substation in Nasu-Shiobara, Tochigi Prefecture, before the line extends to Tokyo.

Under the guidance of American and British technical advisers, Japanese technicians originally erected 443 transmission towers in this segment of the route. The steel pylons were imported from the United States, and the 335 towers still standing are stamped with markings of Andrew Carnegie's steel company. Over time, a number of hydroelectric plants, thermal power stations and nuclear reactors were built within Fukushima Prefecture, generating 24 million kilowatts in total.

The residents of Fukushima Prefecture only use about 2 million kilowatts, so the majority of the prefecture's power facilities continue to produce electricity mainly for the Tokyo metropolitan area.

"For the past 100 years, the power lines within the prefecture have not actually belonged to its residents," said an official of the prefectural government.

What's happening to the debate on nukes?

December 7, 2014 Debating nuclear energy

<http://www.japantimes.co.jp/opinion/2014/12/03/editorials/debating-nuclear-energy/#.VH8aJcl5Cos>

Nuclear energy remains a divisive issue more than three years after the March 2011 triple meltdowns at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear power plant. Prime Minister Shinzo Abe's administration has reversed its predecessor's policy of seeking a phaseout of nuclear power and is pushing to restart nuclear reactors that have been idled in the wake of the 2011 disaster, even as media surveys show a majority of the public remains opposed to reactivating the plants.

The Dec. 14 Lower House election provides voters with a chance to have their say in the nation's energy policy, which not only affects their everyday lives but will have broad long-term social and economic repercussions. The candidates and their parties in the race are urged to clarify their positions and voters should not hesitate to make their voices heard.

The administration's energy policy sounds self-contradictory. Abe pledges to reduce the nation's energy dependency on nuclear power "as much as possible" — without setting specific targets or a timetable — through energy-saving efforts and introduction of renewable energy. But his government's basic energy plan adopted in April — the first since the Fukushima disaster — calls nuclear power an "important baseload source" of the nation's electricity supply. The prime minister is also leading efforts to promote the sale of Japan's nuclear power technology overseas.

While the same plan calls for maximum efforts in the three years from 2013 to increase Japan's supply of renewable energy, the administration has begun reviewing the feed-in tariff system — introduced in 2012 to promote renewable energy — after power companies stopped buying solar power under the system on the grounds that increased purchase of such energy could disrupt the stability of the power supply. At the same time it is pursuing the liberalization of a power industry long dominated by regional monopolies, the administration is reportedly weighing measures to help the utilities maintain their nuclear power plants after they're exposed to greater price competition through the deregulation. Which direction the administration is headed in its policy on nuclear energy remains unclear.

Today, all of the nation's 48 nuclear power reactors remain offline. Power companies have applied for the Nuclear Regulation Authority's screening of their plans to restart 20 of them — under the safety standards updated in the wake of the 2011 disaster — and Kyushu Electric Power Co. has cleared the NRA screening and obtained local governments' nod to restart the Nos. 1 and 2 reactors at its Sendai nuclear power plant in Kagoshima Prefecture.

The Liberal Democratic Party, which promised in the 2012 election to "seek to establish a socio-economic structure that does not need to rely on nuclear power," says this time that it will push for reactivating plants that have been approved by the NRA under what Abe once touted as the world's most stringent safety regulations.

The power firms seek to restart the idled reactors as they face the heavy cost of imported fuel to increase output at thermal power plants to compensate for the shutdown of nuclear power plants. Restarting a single nuclear reactor will save them an estimated ¥10 billion to ¥15 billion a month in fuel expenses. Abe has argued that the nation is losing trillions of yen each year because of the added fuel imports, whose cost has also been exacerbated by the yen's fall against the dollar. The business sector also decries the higher cost of electricity and calls for the restart of nuclear reactors.

The process is being pushed forward while more than 120,000 people in Fukushima remain displaced from their homes due to radiation fallout from the 2011 meltdowns at the No. 1 plant and as Tepco continues to struggle in its bid to clean up the mess. The blind faith in the safety of nuclear power has been shattered by the Fukushima disaster, and the much-touted cost advantage of nuclear energy over other sources appear to be in doubt.

The administration has not provided convincing answers to various key questions posed over nuclear power, including the doubts over its policy of seeking a nuclear fuel cycle or the pending issue of permanent disposal of highly radioactive nuclear waste. The opinions expressed in media polls show that a large part of the public is still not convinced of the safety of nuclear energy.

When the DPJ-led government decided in 2012 to seek phasing out nuclear power in Japan by the 2030s, it took the unusual step of sounding out popular opinion on the issue through surveys and public gatherings. After taking power from the DPJ two years ago, **the Abe administration reverted to the old**

ways of discussing nuclear energy issues in a closed circuit of interested groups and reversed the nuclear phaseout policy without setting a clear direction on what role nuclear power should play in the nation's long-term energy plan.

Japan's energy policy also shapes its actions on climate change, because the energy sector accounts for a major portion of the nation's emissions of global warming gases such as carbon dioxide. The government came under international criticism last year when it replaced its plan for cuts to emissions by 2020, because its new "tentative" plan represented a net increase in emissions from the Kyoto Protocol base year of 1990. Officials said the plan was the best they could offer while the future of idled nuclear power plants remains uncertain.

Japan's carbon emissions have in fact increased as the nation relied more on thermal power output after the Fukushima meltdowns. But the uncertainty over nuclear power, which does not emit carbon dioxide in power generation, should not be used as an excuse for inaction on efforts to reduce the emission of greenhouse gases. Nor should Japan's climate policy rely on nuclear energy, since it would be unrealistic to expect a return to the condition before 2011, when nuclear energy accounted for 30 percent of the nation's electricity supply. **Lawmakers and parties need to lay out energy plans that include measures to reduce emissions.**

Kepeco mulling second price hike

December 7, 2014

Kepeco plans second price hike for households, companies next spring

JJI

OSAKA – Kansai Electric Power Co. is considering an additional electricity rate hike of more than 10 percent for households next spring, it was learned Saturday.

The company will file an application for approval by the Ministry of Economy, Trade and Industry as early as this month, informed sources said.

It also plans to raise its electricity rates for corporate customers, for which ministry approval is not required.

The rate hikes under consideration are designed to prevent further deterioration of earnings amid uncertainty over when the nuclear reactors owned by the company will be able to be brought back online under the stricter safety standards that were adopted after the March 2011 meltdowns crippled Tokyo Electric Power Co.'s Fukushima No. 1 plant and displaced thousands of people.

If the application is approved, Kansai Electric will be the second power utility after Hokkaido Electric Power Co. to raise electricity rates for a second time since the nuclear crisis began.

In spring 2013, Kansai Electric raised prices by 9.75 percent for households and 17.26 percent for corporate users.

But its earnings have since fallen because the utility has been unable to gain regulatory approval to reactivate reactors 3 and 4 at the Oi nuclear plant and units 3 and 4 at its Takahama nuclear plant, both in Fukui Prefecture.

The margins of the last rate hikes were based on the assumption that the reactors would be restarted soon.

“We can’t avoid raising rates if it is hard for our company to survive without it,” President Makoto Yagi said last month.

The company is expected to suffer a loss for the fourth straight year for fiscal 2014 ending March 31. Kansai Electric aims to stop posting losses by raising rates from the beginning of fiscal 2015 starting April 1.

The company apparently believes it will be able to mollify customers if it promises to lower the rates once the reactors are restarted.

Increased fuel costs force KEPCO to mull household electricity hike of 10 percent

<http://ajw.asahi.com/article/business/AJ201412070027>

THE ASAHI SHIMBUN

Amid its failure to restart idled nuclear reactors, Kansai Electric Power Co. is considering raising household electricity rates again by around 10 percent due to the increased fuel costs for thermal power generation, the second such hike in two years.

The utility plans to apply for industry ministry approval to increase the utility tariff by year-end at the earliest.

If the ministry gives the green light, household electricity rates can be increased next spring, depending on how KEPCO proceeds with the tariff hike procedures.

The company is also considering raising the rate for corporate electricity customers at a percentage higher than the hike for household customers.

KEPCO raised the household electricity rate by an average of 9.75 percent in May 2013. The increase was calculated under the scenario that the utility’s four idled nuclear reactors would be restarted after the summer of 2013.

But the company has been unable to receive clearance to restart its reactors so far. The increased fuel costs for thermal power generation has kept KEPCO operating in the red since its reactors were shut down in the wake of the 2011 Fukushima nuclear disaster. The utility is likely to register a loss for the fourth consecutive year in fiscal 2014, which ends March 2015.

The utility said it may be able to reduce electricity rates once it can restart some of its idled reactors at the Takahama and Oi nuclear power plants in Fukui Prefecture.

Among the regional utilities, Hokkaido Electric Power Co. raised household electricity rates by an average of 15.33 percent in November. Tokyo Electric Power Co., the embattled operator of the crippled Fukushima No. 1 nuclear power plant, currently has no plans to increase the utility tariff.

Protests against state secrecy law continue

December 8, 2014

Overseas work, study seen as negative point for anyone handling state secrets

<http://www.japantimes.co.jp/news/2014/12/08/national/overseas-work-study-seen-negative-point-anyone-handling-state-secrets/#.VIXfec15Cos>

Kyodo

The Cabinet Intelligence and Research Office has warned government offices before the new state secrecy law takes effect Wednesday that people who have studied or worked abroad have a higher risk of leaking secrets.

According to the 2011 documents obtained at the request of Kyodo News, the Cabinet Secretariat, the office that will supervise the controversial law with tougher penalties for leaking state secrets, pointed to the need to check educational and employment records in examining which public servants are deemed eligible to handle sensitive information.

Under the secrecy law, which was enacted in December last year, civil servants and others who leak sensitive information on foreign policy, defense, counterterrorism and counterespionage face up to 10 years in prison.

The legislation has drawn criticism over the possibility of arbitrary classification of state secrets that will undermine the people's right to information.

The government plans to screen those who may be given access to state secrets, including public servants and defense industry workers.

Their background, links to spying or terrorism, mental condition, criminal records, drug use, drinking habits and debts will be checked. Only those who are believed to have no risk of leaking secrets will be approved to handle classified information.

Those being vetted will be asked about their educational history from high school and employment record over the past 10 years.

The documents presented by the intelligence and research office at a meeting with other government bodies in November 2011 state that the experience of attending schools overseas or foreign schools in Japan as well as working abroad or working for foreign companies "could be an opportunity to nurture a special feeling about foreign countries."

The papers said **such people "tend to be influenced by" approaches from foreign countries and there is a "risk" that they "prioritize the benefits of foreign countries and voluntarily leak secrets."**

The office of the Cabinet Secretariat said that academic and employment backgrounds are just "one of the check points" and will not solely decide who is deemed capable of dealing with classified information.

The office said the view of overseas experience was presented as part of a free exchange of opinions with other government entities to create an effective system to control state secrets.

Masahiro Usaki, a professor at Dokkyo Law School who is familiar with the secrecy law, said that **"the government has been encouraging young people to go abroad amid the trend of globalization. So it doesn't make sense that it will now judge (overseas experience) as a negative factor."**

"From the viewpoint of the right to privacy, research (on people's background) should be minimum,"

Usaki added, adding that checking only final educational status would be sufficient. He also said the period of 10 years covering past employment records is too long.

December 7, 2014

Protesters vow to continue fight to scrap controversial secrecy law

<http://mainichi.jp/english/english/newsselect/news/20141207p2a00m0na007000c.html>

TOKYO (Kyodo) -- Protesters against a controversial secrecy law that was enacted exactly a year ago vowed Saturday to continue their fight to have it scrapped, amid concern the legislation undermines the public's right to know.

With the law that will toughen penalties on leakers of state secrets set to take effect Wednesday, about 1,600 people gathered in Tokyo's Hibiya Park and later marched in the Ginza district, while around 700 demonstrators took to the streets of Nagoya.

Lawyer Yuichi Kaido, an organizer of the Tokyo rally, said civic groups must remain vigilant as the secrecy law enters into force to ensure activities continue to be monitored at military bases and nuclear power plants in Japan.

"We will not cower and will keep fighting for the abolition of the law," Kaido said.

The law provides for imprisonment of up to 10 years for leaking information related to defense, foreign policy, counterespionage and counterterrorism that is deemed to cause considerable damage to Japan's national security.

Shinji Suzuki, a 22-year-old university student who joined the protest, said he is worried that only a small number of young people took part. "I'd like to tell my friends what I experienced at an occasion like this and continue the opposition movement," he said.

In Nagoya, Takahiko Ido, 68, said he will not give up on seeking the repeal of the legislation. "We should not make society dark by allowing the suppression of people's right to know and freedom of speech," he said.

Mami Nonogaki, 53, said the secrecy law should be discussed as a major issue in the upcoming Dec. 14 House of Representatives election.

In Hiroshima, lawyer Hajime Kawaguchi told a rally that when he requested the disclosure of information related to the Self-Defense Forces' activities, only documents with sections blacked out were released.

"When the law takes effect, even these documents cannot be released, making it impossible for us to verify" the SDF's activities, he said. "It will be a dangerous situation because irresponsible decisions can be made with regard to SDF dispatches overseas."

In Fukuoka, lawyer Akiko Maruyama pointed out that Japanese embassies could limit the disclosure of information concerning public safety in conflict areas, citing diplomatic confidentiality. "The overseas activities (of Japanese civic groups) may be scaled down," she said.

State secrets law causes protests and outrage

December 10, 2014

ANALYSIS: Secrecy law in force after scant effort to alleviate public concerns

http://ajw.asahi.com/article/behind_news/politics/AJ201412100059

THE ASAHI SHIMBUN

After the Abe administration sought public opinion about the state secrets protection law, concerns, complaints and outrage poured in.

Some feared authorities would abuse their power to conceal inconvenient information. Others cited potential invasions of privacy. And one common complaint from the people was that they had no idea what specific information could land them in prison.

But if Prime Minister Shinzo Abe and his government have done anything to alleviate those concerns in the year since the law was enacted, those measures must have been kept secret from the public. About the only noticeable change is the inclusion in operating guidelines that "the right to know will be respected." Amid public protests and persistent concerns about the future of Japan's democracy, the state secrets protection law went into effect on Dec. 10.

Now, people who leak state secrets in four broad areas--defense, foreign affairs, counterespionage and preventing terrorism--face stiffer punishments.

Civil servants and employees of private-sector companies contracted by the government could be imprisoned for up to 10 years for leaking state secrets. The maximum prison term for journalists and even citizens is five years if they are convicted of encouraging “in an inappropriate manner” those handling such secrets to leak the documents.

The vague standards used in designating state secrets in 55 areas were cited as a big problem with the law. Those areas include “training and military exercises by the Self-Defense Forces” and “protection of the lives and bodies of the public.”

Documents can be designated as state secrets for up to 60 years, but the period can be further extended for encrypted information.

Another sticking point was the weakness of the oversight function in checking if state secrets are being designated appropriately.

An individual who served as a prosecutor is expected to fill the post of “independent public document inspector” set up under the Cabinet Office.

The leaders of administrative bodies can designate state secrets. But the inspector will not have the authority to force the administrative bodies to submit information related to such designations.

The public raised an obvious question: How can an inspector decide if state secret designations are being conducted in an appropriate manner if the inspector lacks access to such information?

An association of psychiatrists raised concerns about another aspect of the law: the mandatory evaluations for all people who handle state secrets. The evaluations will look into the criminal records, psychological problems, drinking habits and loan situation of those individuals. In addition, the names, nationalities and addresses of family members and those living with the individuals will be checked. The association said looking into the psychological background of individuals could constitute an invasion of privacy and other rights.

The law was enacted last year through the support of the ruling Liberal Democratic Party and junior coalition partner Komeito.

Abe has effectively asked the public to trust the government to do the right thing. He emphasized the law is needed to protect Japan and its people.

However, his LDP and Komeito have not touched upon the law in their campaign platforms for the Dec. 14 Lower House election.

The opposition Democratic Party of Japan has pointed to the insufficient oversight of the state secret designation process by the Diet and other bodies.

The Japanese Communist Party and Social Democratic Party have called for abolishing the law.

(Ryota Kyuki contributed to this article.)

Protest statements issued as state secrets law takes effect

http://ajw.asahi.com/article/behind_news/politics/AJ201412100049

THE ASAHI SHIMBUN

Organizations representing journalists, legal experts and the entertainment industry issued statements calling for the abolishment of the state secrets protection law that they say will trample on the people’s right to know.

The law, which took effect Dec. 10 and carries prison terms for people involved in leaking secret information, has also been the target of public protests.

Prime Minister Shinzo Abe has said the law is needed to protect national security and interests. However, critics say the vaguely worded law leaves open the definition of what specifically constitutes a state secret and also lacks proper oversight to prevent abuse from authorities.

The Japan Congress of Journalists' statement issued on Dec. 9 said the law would "cover the people's eyes, ears and mouth and usurp their freedom of the press and speech."

The statement listed a number of problems with the law: the range of documents classified as state secrets could expand without limit; the government can continually extend the period a document is classified as a state secret; and journalists and human rights activists could be punished under the law.

The Japan Civil Liberties Union, consisting of lawyers and legal scholars, issued a statement on Dec. 8 protesting the law because "it inappropriately restricts citizens' right to know."

Under the law, the heads of administrative bodies effectively designate what they think should be state secrets. The union's statement said the law lacks sufficient functions to ensure that such information is appropriate for classification as a state secret. The statement also criticized the law's stipulation that citizens can be punished if they abet in the leaking of state secrets.

A group of individuals connected with the movie industry, including directors Yoji Yamada and Isao Takahata, also issued a statement Dec. 9 calling for the law's annulment.

"Rather than a society where state secrets expand in number, we hope for a Japan in which the spirit of democracy can thrive through information disclosure," the statement said.

The statement also touched upon the history of the movie industry before and during World War II when the government forced the production of movies that supported Japan's war effort.

The statement was made "from a strong feeling of creating a society that never again goes to war and to never again be complicit in the production of movies that stir up war sentiment."

Others in the entertainment business, including musicians and actors such as Sayuri Yoshinaga, joined the group.

The Japan Federation of Commercial Broadcast Workers' Unions issued a statement on Dec. 10 that calls for abolishing the law because of concerns it could lead to major barriers to reporting. The statement described the law as "an anachronistic attempt at press control."

State secrecy law takes effect amid protests, concerns over press freedom

<http://www.japantimes.co.jp/news/2014/12/10/national/japans-secrecy-law-takes-effect-amid-concern-arbitrary-info-withholding-lack-oversight/#.VIg4WXt1AW4>

Kyodo, Bloomberg

Japan's controversial state secrets law came into effect Wednesday as hundreds of demonstrators took to the streets, saying the measure undermines the public's right to know and demanding that it be scrapped. More than 300 protesters, including roughly 100 journalists, gathered in front of the prime minister's office in Tokyo's Chiyoda Ward, chanting slogans like "We oppose the secrecy law for going to war" and "Information belongs to citizens."

"We've seen more and more pressure on media organizations that are critical of the administration," said Seigo Arasaki, who heads the Japan Federation of Newspaper Workers Unions, known as Shimbun Roren. "We will monitor how the law will be applied, and raise questions,"

Under the law that cleared the Diet in December 2013, the heads of 19 government ministries and agencies can now designate as state secrets information deemed to be sensitive in the areas of diplomacy, defense, counterterrorism and counterespionage.

A recent Kyodo News survey covering the 19 government offices showed the number of state secrets will likely be around 460,000.

Civil servants or others who leak the secrets will face up to 10 years in prison, and those who instigate leaks, including journalists, will be subject to a prison term of up to five years.

Prime Minister Shinzo Abe, who established the National Security Council to speed up decision-making on diplomacy and defense, has said the law will help Japan to promote exchanges of sensitive information with other countries and forge closer ties with them.

State secrets are defined in 55 categories, including information about the development of submarines, aircraft, weapons and ammunition. Intelligence and images obtained via radio waves and satellites and provided by foreign governments and international organizations could be withheld from the public.

The initial five-year-designation period for a state secret can be extended for up to 30 years. But state secrets can be classified for a maximum 60 years if approved by the Cabinet for security reasons.

The law takes effect just as Abe appears to be seeking greater influence over the nation's media, according to Koichi Nakano, a professor of political science at Sophia University in Tokyo.

The LDP sent a letter to Japan's five biggest broadcasters last month to demand "neutral" reporting on the election. Abe told reporters on Dec. 1 he didn't order the party to send the letter, though he hoped the election would be covered "fairly and impartially."

The Japanese Federation of Bar Associations said on its website the new act opens the door to the government arbitrarily designating secrets.

"The definition of secret is very vague, and people, including myself, are wary of misuse," said Kaori Hayashi, a professor at Tokyo University's Graduate School of Interdisciplinary Information Studies.

The Japan Newspaper Publishers and Editors Association said in a Dec. 8 statement the maximum sentence for leaks was too harsh and could damage reporting activities and the public's "right to know." Criticism has also been directed at the absence of an independent watchdog, as oversight entities will be placed under government control.

To ease such public concerns, the Cabinet approved guidelines on the handling of state secrets, pledging that it will keep "the minimum amount of information as secrets for the shortest period of time possible" as the public's right to know should be "greatly respected" in a democratic society.

"We will make sure that the people's right to know will not be hurt," Chief Cabinet Secretary Yoshihide Suga said on Tuesday.

It has been revealed, meanwhile, that the Cabinet Intelligence and Research Office, which holds jurisdiction over the secrecy law, had warned government offices in 2011 that people who have studied or worked abroad have a higher risk of leaking state secrets.

Under the secrecy law, security clearance is required for officials to handle state secrets, and the government will set up hotlines so officials can report suspicions about arbitrary classification or declassification of state secrets.

The prime minister is also required to make an annual report to the Diet on the designation, safeguarding and disclosure of state secrets.

After the passage of the secrecy bill last year, Japan fell six places to 59th out of 180 nations in Reporters Without Borders' 2014 World Press Freedom Index, below such nations as Serbia and Botswana.

"Investigative journalism, public interest and the confidentiality of journalists' sources are all being sacrificed by legislators bent on ensuring that their country's image is spared embarrassing revelations," the group said.

State secrets law - Independent supervisor?

December 11, 2014

News Navigator: What is the position created for supervision of the state secrecy law?

<http://mainichi.jp/english/english/perspectives/news/20141211p2a00m0na011000c.html>

A new independent post at the deputy vice-ministerial level has been established for managing public documents as the controversial Act on the Specially Designated Secrets came into effect on Dec. 10. The Mainichi Shimbun answers some common questions readers may have about the new position.

Question: What is this new administrative position all about?

Answer: It's an independent position at the Cabinet Office for managing public documents, called independent public records management secretary. "Special state secrets" will be designated from a certain area of information, but what becomes secret and what doesn't cannot always be clear-cut. Government agencies may hide information they don't want to disclose. Such an issue was brought up at a Diet session last fall, and right before the enactment of the state secrets protection bill, Prime Minister Shinzo Abe said the government would set up in-house watchdog organizations.

One of the supervisory bodies, the Information Security Oversight Division, made up of 20 staff members, was set up at the Cabinet Office, and the post of public records management secretary was established as the supervisor for the division.

Q: What are the roles of the secretary for managing public documents?

A: The appointed person is in charge of making sure that special state secrets do not include information that should not be kept secret. The Information Security Oversight Division will receive summary lists on state secrets from ministries and agencies to check, and the public records secretary will have the authority to request classified documents, demand declassification and conduct on-site investigations at ministries and agencies if necessary.

In addition, each ministry and agency will report to the secretary on the number of classified and declassified documents once a year. The public records secretary can investigate ministries and agencies in response to whistle-blowing.

Q: What are some concerns about the function of the information oversight system?

A: Questions remain about whether the public records secretary will have the opportunity to conduct investigations. The summary lists will have data such as the designation date and the designation term of state secrets, but will not include contents of classified documents. Furthermore, even if the secretary demands ministries and agencies present documents, they may refuse to comply if they decide that such information may pose a major threat to national security.

Q: Who was appointed to the new post?

A: A 52-year-old bureaucrat from the Justice Ministry has been assigned as the first public records management secretary. Experts believe that the person who is appointed to the secretary position is best not to return to their ministry or agency to maintain job independence. Some sources in the judicial circles have voiced concerns about the appointment, however, as the bureaucrat still have some time until his retirement age, and he might hold back his authority against the Justice Ministry or investigative agencies.

Why should Japanese pay for corporate negligence?

December 10, 2014

Question of negligence hangs over nuclear firms in U.S. case over Fukushima fallout

<http://www.japantimes.co.jp/community/2014/12/10/voices/question-negligence-hangs-nuclear-firms-u-s-case-fukushima-fallout/#.Vli973t1AW4>

Dear Minister of Economy, Trade and Industry Yoichi Miyazawa,

As you may be aware, a federal judge in the U.S. recently ruled that a class-action lawsuit filed by about 200 U.S. Navy sailors can proceed against Tokyo Electric Power Co. and other defendants they blame for a variety of ailments caused by radiation exposure following the nuclear reactor meltdowns at Fukushima No. 1.

The sailors allege that Tepco knowingly and negligently gave false and misleading information concerning the true condition of the Fukushima No. 1 nuclear power plant to the public, including the U.S. military. They further allege that Tepco knew the sailors on board the USS Ronald Reagan would be exposed to unsafe levels of radiation because Tepco was aware three nuclear reactors at the site had already melted down.

In this connection, the lawsuit notes that on Dec. 14, 2013, Naoto Kan, Japan's prime minister at the time of the disaster, told a gathering of journalists regarding the first meltdown: "People think it was March 12 but the first meltdown occurred five hours after the earthquake."

The sailors in question were participating in Operation Tomodachi, providing humanitarian relief in response to the Japanese government's calls for assistance. In accordance with the U.S.-Japan Security Treaty, **these sailors literally risked their lives to aid and protect the people of Japan.**

The sailors accuse Tepco of negligence, failure to warn of the dangers, and design defects in the construction and installation of the reactors, among a total of nine claims for damages. To date, the sailors have experienced such illnesses as leukemia, ulcers, brain cancer, brain tumors, testicular cancer, dysfunctional uterine bleeding, thyroid illnesses, stomach ailments and a host of other complaints unusual in such young adults.

One of the major questions to be decided by the lawsuit is **who will pay for the military members' ongoing and possibly lifelong medical treatment. In addition to addressing specific illnesses, funding will be required for future medical monitoring for themselves and their children,**

including monitoring for possible radiation-induced genetic mutations. Some of the radiological particles inhaled by these service personnel have long half-lives, from six to 50 or even 100 years. Needless to say, the Japanese government has a wealth of information about what actually happened, and when, at Fukushima No. 1. Thus it would seem legally as well as morally appropriate for the government to share its Fukushima-related knowledge with the Federal Court in the Southern District of California. This could be done, for example, in the form of an amicus curiae brief — that is, a brief submitted by someone not a party to a case who nevertheless possesses relevant information that may assist the court. My first question to you, Minister Miyazawa, is: Are you and the Japanese government willing to submit such a brief?

It is significant that the builders of the Fukushima No. 1 reactors — General Electric, EBASCO, Toshiba and Hitachi — are also defendants. This is because the reactors for Units 1, 2 and 6 were supplied by General Electric, those for Units 3 and 5 by Toshiba, and Unit 4 by Hitachi. General Electric, however, designed all six reactors, and the architectural plans were done by EBASCO.

In particular, GE knew decades ago that the design of its Mark I reactors installed at Fukushima No. 1 was faulty. Thirty-five years ago, Dale G. Bridenbaugh and two of his colleagues at General Electric resigned from their jobs after becoming convinced that the Mark I's design was so flawed it could lead to a devastating accident. They publicly testified before the U.S. Congress on the inability of the Mark I to handle the immense pressures that would result if the reactor lost cooling power.

Their concerns proved all too accurate at Fukushima No. 1, a disaster that has yet to end given the continued massive radioactive contamination of the ocean.

In light of this, Minister Miyazawa, I end this message with one final question: Why hasn't the Japanese government, like the American sailors, filed its own lawsuits against these same companies to determine their legal liability? In other words, **why are the Japanese people being forced to pay for the possibly negligent actions of some of the world's largest corporations?**

Lingering doubts about state secrets law

December 11, 2014

Worries about secrets law linger

Top officials reiterate that the state secrets law, which took effect this week a year after it was enacted, will not infringe on the people's right to know. Prime Minister Shinzo Abe, who defied widespread public protests last year against ramming the legislation through the Diet, says the law is aimed at dealing with "terrorists and spies" and "basically has nothing to do with people at large."

Such a statement by the prime minister appears to illustrate how the Abe administration turns a deaf ear to lingering public concerns about the controversial law, which mandates prison sentences of up to 10 years for government officials and defense industry employees who leak information designated as state secrets, sentences of up to five years for those who conspire to leak or instigate the leaking of such information and sentences of up to 10 years for those who obtain designated secrets through illicit means.

Whether the law infringes on the people's right to know depends on whether the process of designating government information — considered public property in a democracy — as secrets is appropriate and whether there is a valid safeguard in place to stop government officials from improperly classifying secrets at their discretion. The law clearly fails to meet these criteria, due primarily to the absence of independent third-party oversight.

The law enables the heads of 19 government ministries and agencies to designate sensitive information in the fields of diplomacy, defense, counterterrorism and counterespionage as state secrets for up to 30 years. The classification period can be extended to 60 years with the Cabinet's approval if the extension is deemed necessary for security reasons. Certain secrets in seven categories, such as information that could compromise Japan's position in dealing with foreign governments and international organizations, can remain classified even longer as exceptions.

The Abe administration has explained that Japan needs the law to tighten control of government secrets for it to be able to exchange sensitive information with the United States and other governments. Along with the enactment of the secrets law, the National Security Council was established to serve as the nation's command center in foreign and defense policy. It will share security information with Japan's allies.

It is natural for any government to have a mechanism for protecting information that pertains to national security. Problems arise when the system leaves room for abuse by those who handle the secrets.

Criticism abounds that the law's definition of the information that can be designated as secret is so vague and wide-ranging that it allows government officials to use their discretion to withhold inconvenient or damaging information that the public should know. The law also fails to provide for penalties against officials who improperly designate information as secret.

It must also be ensured that the information will be made open for public scrutiny once it no longer merits classification. But under the law, the government can extend the classification period merely through an internal decision.

Members of the Abe administration say that in setting the rules for implementing the law, mechanisms for ensuring the system's appropriate use and banning the classification of government information for cover-up purposes have been established. A supervisory committee of vice minister level bureaucrats from each ministry, to be headed by the chief Cabinet secretary, is being set up at the Cabinet secretariat. And on Wednesday, a Justice Ministry bureaucrat was tapped to head a new panel at the Cabinet Office to oversee the classification process.

Neither body, however, has the power to enforce the declassification of secrets, and their existence does not change the fact that the designation of secrets by government officials will be monitored only by fellow officials. Independent third parties remain excluded from verifying if the government's information classifications are appropriate. It is also unclear whether enough manpower will exist to properly check each part of the estimated 460,000 potential state secrets.

The text of the law calls for "consideration" for the people's right to know and freedom of the press. Going into the campaign for Sunday's Lower House election, Abe declared that he will quit as prime minister if instances arise of media activities being suppressed by the law. But the law does not prevent members of the press or civic groups from becoming targets of punishment for "instigating" leaks of designated secrets by government officials. Officials handling designated secrets will be punished for leaking the information — regardless of who receives the information.

The law's rules of implementation require such officials to report to their superiors when they are urged by others — likely including journalists or civic group members — to disclose the classified information.

The protection of people who blow the whistle on wrongful designations of secrets is also insufficient. The law provides for creating hot lines for government officials who suspect an inappropriate classification has taken place, but these officials are prohibited from disclosing the information itself. They are allowed only to summarize the secret parts, and they could be charged with "leaking" the information if their summaries are judged to have included crucial or a large amount of information. It's as if the system is intended to discourage officials from revealing wrongful acts.

As the law finally takes effect a year after it was enacted, most of the concerns that many people had about the legislation remain unaddressed. The implementation of the law needs to be constantly monitored, and the public should apply pressure on the government to correct its deficiencies, or to abolish it.

The secrecy issue is not just about terrorists and spies; it also concerns the people's right to know what their government is doing.

December 9, 2014

Even bureaucrats question the need for secrecy law

<http://mainichi.jp/english/english/newsselect/news/20141209p2a00m0na013000c.html>

A controversial secrecy law to toughen penalties on leakers of state secrets is set to take effect on Dec. 10, but even government bureaucrats have been raising questions about the need for such legislation.

One bureaucrat said, "I wonder if we need that in the first place?" At a time when the government was considering whether to draft secrecy legislation, the Cabinet Legislation Bureau pointed out that the "need (for the law) is small." Even some government bureaucrats are saying, "It is hard to handle specified secrets."

"Concerns have been raised over whether everything will be designated as a specified secret, but that's impossible," said a senior government official. The official added, "Specified secrets will be strictly managed and there will be restrictions on people who can handle them. If such secrets are increased excessively, we cannot get our work done."

Under the National Public Safety Commission's rules, specified secret documents must be kept in strictly controlled storage sites, restrictions must be placed on people in charge of handling them and on reading places for such documents, and such items must be put in double envelopes when being transferred, among other detailed instructions for handling them. Other government ministries and agencies will apparently adopt similar rules.

Government ministries and agencies have had "top secrets" and "secrets" defined by detailed in-house rules, which will remain effective even after the secrecy law takes effect. The aforementioned senior government official said, "I believe that many pieces of information that cannot be disclosed will be handled as secrets the same way as before."

Yukiko Miki, head of the nonprofit organization Access-Info Clearinghouse Japan, said, "As whether to designate information as secrets and declassify them is decided at the discretion of each ministry or agency except for specified secrets, they could be disposed of and remain as secrets. It is necessary to work out rules for such secrets."

According to documents the Cabinet Information Research Office disclosed in response to an information disclosure request from the Mainichi Shimbun, the Cabinet Legislation Bureau said in September 2011 in reference to a preliminary draft of state secrets protection legislation prepared by the Cabinet Information Research Office, "It seems to be weak in legislative facts." Legislative facts refer to facts that show clear reasons for the need for specific legislation.

The Self-Defense Forces Act was revised in 2001 to punish Self-Defense Forces personnel and others with a prison term of up to five years for leaking defense secrets. But the act has been applied to only one case

so far. In that particular case, an Air Self-Defense Force colonel was suspected of leaking information, but his indictment was subsequently suspended. Based on that case, the Cabinet Legislation Bureau insisted that it was difficult to provide a basis for toughening penalties through new legislation.

Those government bureaucrats and politicians who are engaged in collecting information on foreign and security policies say that the state secrets protection law will make it easier for them to obtain information from foreign intelligence agencies. Kaoru Yosano, who had served as chief Cabinet secretary during Shinzo Abe's first stint as prime minister, told the Mainichi Shimbun, "Do we need this law today when nothing to threaten Japan's security is taking place? When I was chief Cabinet secretary, I did not hear about such legislation."

The Nuclear Regulation Authority decided as of Dec. 8 not to designate any information it held as specified secrets as it said it had no information that would meet conditions for being classified as such.

The Japan Newspaper Publishers and Editors Association submitted a written statement to Justice Minister Yoko Kamikawa on Dec. 8, calling on the government to properly administer the state secrets protection law. The association said in the statement, "It is hard to say that the government has fully dispelled concerns that the law could inhibit the people's right to know and the freedom of reporting and news gathering."

The Japan P.E.N. Club also issued a statement on Dec. 8, raising an alarm over the secrecy law, the government's decision to allow Japan to exercise the right to collective self-defense and the government's policy of promoting nuclear power.

December 09, 2014(Mainichi Japan)

Abe keen to boost nuclear energy

December 15, 2014

With election over, Abe ready to boost reactor restarts

<http://www.japantimes.co.jp/news/2014/12/15/national/abe-set-boost-efforts-revive-nuclear-power-election/#.VJBeWnt1Cic>

Kyodo

With the Liberal Democratic Party's sweeping election victory Sunday, Prime Minister Shinzo Abe is expected to increase his efforts to revive nuclear power despite persistent public opposition.

Although polls show that most people are against restarting reactors idled following the 2011 Fukushima crisis, Abe has continued to promote nuclear as a key source of energy, arguing its use is necessary to maintain stable and cheap electricity in resource-poor Japan.

Abe hopes early next year to restart two reactors at Kyushu Electric Power Co.'s nuclear plant in Satsumasendai, Kagoshima Prefecture, which in September became the first to meet tighter, post-Fukushima safety regulations.

Another two reactors at Kansai Electric Power Co.'s Takahama power station in Fukui Prefecture, currently in the final phase of the Nuclear Regulation Authority's screening process, could also go back online within 2015.

However, as restarting nuclear plants did not take center stage in the election, partly because Abe avoided focusing on the contentious issue, critics say the LDP's victory cannot be taken as a vote of confidence regarding this issue.

In a rare mention during the campaign, Abe delivered a speech in Kagoshima Prefecture last Thursday arguing that nuclear power is necessary to protect jobs.

Local leaders in Kagoshima have already given the green light to restarting the power plant, but residents doubt that sufficient discussions have been held.

"I feel frustrated that there was no debate on the nuclear issue" during the election, a 44-year-old company employee who did not want to give his name said after voting.

With the election already in its rear view mirror, the LDP faces the task of deciding the nation's long-term energy policy, another issue Abe was reluctant to discuss during the campaign.

The process of deciding the country's energy mix, including the percentages of electricity to be generated by nuclear power and renewable sources, could be further delayed amid uncertainty over how many reactors will resume operations down the road, while Komeito, the coalition's junior member, has pledged to completely phase out nuclear power in the future.

Kepeco eyeing second price rise

December 17, 2014

Citing idled nuclear reactors, Kansai Electric eyes another price hike

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201412170043>

THE ASAHI SHIMBUN

With all of its reactors offline, Kansai Electric Power Co. is moving to raise household electricity rates **for the second time** after the 2011 Fukushima nuclear disaster to cover higher fuel costs from thermal power generation.

The utility said Dec. 17 it will apply to the industry ministry for approval to raise the household electricity rate in April after it decides on the extent of increase.

"It is a tough decision, but we have no other choice," Kansai Electric President Makoto Yagi told a news conference.

The company is expected to post a fourth consecutive loss for the year ending next March. Before the Fukushima disaster, the utility depended on nuclear power for 45 percent of the electricity it generated.

The company will also increase the rate for corporate users in April, a move that does not require government approval.

If the ministry approves the hike, Kansai Electric will be the second regional power company to increase electricity rates twice since the triple meltdown at the Fukushima No. 1 nuclear power plant.

Kansai Electric raised its household electricity rate in May 2013 for the first time in 33 years by an average of 9.75 percent. The increase was calculated based on the assumption that the utility's four idled nuclear reactors would be restarted after summer 2013.

Although the Nuclear Regulation Authority gave provisional safety clearance on Dec. 17 to two reactors at the company's Takahama nuclear power plant in Fukui Prefecture, the utility decided the rate hike was necessary because of the slow progress in restarting all four reactors.

In November, Hokkaido Electric Power Co. raised household electricity rates by an average of 15.33 percent, its second rate increase since the disaster.

TEPCO: More cost cuts

Tepco's net income set to rise 19%

<http://www.japantimes.co.jp/news/2014/12/17/business/corporate-business/tepcos-net-income-set-rise-19/#.VJGgVf-cJA>

Bloomberg

Tokyo Electric Power Co. said net income will rise 19 percent this fiscal year and that **it will put off an increase in electricity rates in favor of more cost cuts.**

The country's biggest electricity utility is projecting net income of ¥521 billion (\$4.4 billion) from ¥438.6 billion last year. It said it will reduce costs by ¥873 billion, **including job cuts**, in the fiscal year ending March 31, according to a statement on Wednesday.

Tepco and other power companies are under pressure to reduce overheads as all of the nation's 48 reactors have been shut following the Fukushima atomic disaster more than 3½ years ago. That's forced them to import more oil, gas and coal for other power plants, causing a surge in fuel bills.

The government estimates regional power companies paid ¥3.6 trillion (\$30.7 billion) more in fuel costs in fiscal 2013 compared with fiscal 2010 before Fukushima.

Even as the country's nuclear regulator is gradually approving tougher safety standards on some reactors, Tepco's units are not yet among them. The company is the operator of the crippled Fukushima plant.

Tepco had expected to restart two reactors at its Kashiwazaki Kariwa nuclear plant, the world's biggest, as early as July this year in the turnaround plan released in January. That's since been pushed back to July next year or later.

Restarting the Kashiwazaki plant is "essential" for the company's business, according to the statement. **Tepco, which serves 29 million customers in Tokyo and surrounding areas, raised electricity rates for households by about 8.5 percent in September 2012.**

Who will pay the costs of decommissioning?

December 17, 2014

Power rates to reflect decommissioning costs even after deregulation

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201412170064>

By TOMOYOSHI OTSU/ Staff Writer

Regional utilities will be allowed to pass on costs to consumers for decommissioning nuclear power plants even after the retail sale of electricity to households is liberalized in 2016, according to sources.

The move proposed by the industry ministry reflects concerns that it could be difficult for the utilities to raise funds for decommissioning work if the liberalization produces fierce competition among electricity suppliers, the sources said.

However, the ministry could find itself being criticized for giving favorable treatment to regional electric power companies that have nuclear power plants even though its intention is to make decommissioning go smoothly, the sources added.

Costs for decommissioning nuclear power plants are already added to electricity bills. This is set to continue because liberalization of the market in 2016 will ramp up competition among electricity suppliers, and this could make it difficult for the major electric power companies to generate sufficient profits to carry out decommissioning work.

Companies that will spin off from the major electric power companies between 2018 and 2020 to specialize in transmitting electricity will collect costs for decommissioning work.

These companies, which will still be under the umbrellas of the regional utilities, will add decommissioning costs to electric cable use fees paid by electricity sales companies, which collect electricity bills from individual households.

While the ministry wants all electricity sales companies to shoulder the burden of costs for decommissioning, some of the new firms may decide to specialize in sales of electricity from renewable energy sources to consumers who are opposed to nuclear power generation.

In that event, those companies would sharply oppose being required to bear some of costs for decommissioning work.

To get round the problem, the ministry may decide that only firms selling electricity from nuclear power plants will shoulder the burden.

In the case of a midsized reactor that can generate 800 megawatts of electricity, the costs for decommissioning range from 44 billion yen to 62 billion yen (\$377 million to \$532 million). The costs include plant dismantlement and radioactive waste disposal.

Evacuees file new suit against TEPCO

December 19, 2014

Nuclear disaster evacuees sue TEPCO

<http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html>

Dec. 19, 2014 - Updated 11:49 UTC+1

People who were evacuated from **Minami-soma** City in northeastern Japan have sued Tokyo Electric Power Company. Damages of more than 6.8 billion yen, or 57 million dollars, are sought for being forced to leave their hometown due to the 2011 nuclear accident.

The city in Fukushima Prefecture is located about 20 kilometers from the damaged plant.

On Friday, 340 residents of the city's Odaka district filed suit with the Tokyo District Court against TEPCO. The entire district is designated as a no-entry zone and residents still must live elsewhere three years and nine months after the accident.

The damages the evacuees are demanding include a doubling of the monthly evacuation compensation per capita of around 1,700 dollars and about 84,000 dollars per head for destruction of the basis for living conditions.

They claim they have been deprived of their ancestral land and history and that residents' bonds have been totally severed.

Isao Enei, who heads the plaintiffs' group, told reporters that the nuclear accident has deprived them of their hometowns, prevented family gatherings, and undermined even their lives. He also said evacuees are under greater stress.

TEPCO said in a statement that the utility will deal with the suit in earnest after hearing the plaintiffs' claims in court.

Possible forgery of official documents

December 19, 2014

TEPCO staff probed over document forgeries

<http://mainichi.jp/english/english/newsselect/news/20141219p2a00m0na018000c.html>

Three branches of Tokyo Electric Power Co. (TEPCO) carried out cable construction work without permission from authorities, sparking a police investigation into possible forgery of official documents. TEPCO announced on Dec. 18 that its branches in the Saitama Prefecture city of Kasukabe, the Kanagawa Prefecture city of Kawasaki and the Shizuoka Prefecture city of Mishima conducted **11 construction jobs including burial and installation of electric cables between July last year and September this year without permission from the national and local governments.**

The utility said three male employees in their 20s through their 50s falsified application documents and permissions for occupancy of public roads. The three were responsible for making these applications, and apparently fabricated the documents for in-house use. Saitama Prefectural Police and other law enforcers are questioning those concerned on suspicion of possible falsification of official documents and sealed private documents.

According to TEPCO, the accused employees fabricated the documents by using permission numbers issued for separate construction projects that had already been completed. The irregularities were uncovered after local governments reported to TEPCO that they had confirmed unauthorized construction work was under way.

TEPCO denied the possibility of any systematic involvement in the cases, saying, "We believe the irregularities were committed by the respective employees in their attempts to prevent a delay in their work schedule." The unauthorized work took place on public roads and at parks in the Saitama Prefecture city of Saitama, the Ibaraki Prefecture town of Goka, Kawasaki's Kawasaki Ward, and the Shizuoka Prefecture city of Numazu.

TEPCO slapped the employee in his 20s at the Kasukabe branch with a five-day suspension and reprimanded his three supervisors. The company is planning to punish the other accused employees at the Kawasaki and Mishima branches.

The utility will also investigate whether there were any similar irregularities at its 45 branches, which carried out a total of some 78,000 works over the one-year period up to November this year.

"We deeply apologize for the trouble we have caused. We will work to prevent a recurrence," commented a TEPCO representative.

December 19, 2014(Mainichi Japan)

Surrounding municipalities have "legitimate concerns"

December 22, 2014

A broader say in reactor restarts

<http://www.japantimes.co.jp/opinion/2014/12/22/editorials/a-broader-say-in-reactor-restarts/>

The Abe administration is pushing to restart idled nuclear power plants that have cleared safety screening by the Nuclear Regulation Authority, pending the consent of local municipalities. But the definition of "local" and whose consent is required remains a question that must be addressed as Kansai Electric Power Co. moves to bring its Takahama Nuclear Power Plant in Fukui Prefecture back online. **This case will test whether the government and power companies are ready to listen to the safety concerns of people who could be affected by a nuclear disaster.**

The NRA said last week that safety measures taken by Kansai Electric at reactors Nos. 3 and 4 of the Takahama plant against potential natural disaster hazards and severe accidents meet the regulations tightened in the wake of the March 2011 triple meltdowns at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear power plant. The NRA's draft assessment — likely to be formalized a month later after soliciting public comments — and some additional procedures will allow the utility firm to go ahead with reactivating the two reactors once it obtains "local" consent.

The plant is located in the Fukui Prefecture town of Takahama. But within 30 km of the plant also lie parts of Kyoto and Shiga prefectures. Since the Fukushima nuclear disaster demonstrated that radiation fallout from a severe accident can affect a wide range of areas, the government has required municipalities within 30 km of a nuclear power plant to prepare evacuation plans for their residents.

The governors of Kyoto and Shiga say the restart of the Takahama plant is unacceptable unless Kansai Electric agrees to conclude agreements with them to give them a say in the safety of the plant's operation.

Power companies have so far concluded such agreements with the prefectures and municipalities that host their nuclear power plants. Based on such agreements, they have sought the approval of the local government hosting the facility in the process of restarting plants that had been put offline. Kansai Electric has an agreement on the Takahama plant with Fukui Prefecture and the Takahama municipal government. But given the serious consequences of the Fukushima disaster, **a growing number of local governments near nuclear power plants also demand that they have a say in their operations.**

Power companies are reluctant to extend the number of local governments with which they need to consult before resuming the operation of their offline nuclear power plants. Prefectures and municipalities that host plants receive national government grants; their economies often rely heavily on the plants in terms of tax revenue and related businesses. **Bringing other prefectures and municipalities in surrounding areas into the mix would undoubtedly complicate matters for the power firms.**

While pushing for the restart of idled reactors, the Abe administration takes no clear position on which local governments should be involved in the approval process. When the NRA earlier gave the safety

clearance for restarting Kyushu Electric Power Co.'s Sendai nuclear power plant, the administration left the question up to Kagoshima Prefecture, where the plant is located.

Kagoshima Gov. Yuichiro Ito said the approvals of the prefecture and the host city Satsumasendai were sufficient, dismissing the safety concerns of municipalities and the residents also within 30 km of the plant. The Abe administration apparently hopes this scenario will repeat itself in the process of reactivating other idled plants.

Kyoto and Shiga prefectures have a valid point. Their residents would certainly be affected in case of a severe accident at the Takahama plant. While some 55,000 people in Fukui live within 30 km of the plant, the number of Kyoto Prefecture residents within the zone is 128,000. Part of the Kyoto Prefecture city of Maizuru lies within 5 km of the Takahama plant. It would be irrational for the government and Kansai Electric to ignore the legitimate concerns of the surrounding municipalities and their residents.

One way to silence local resistance

December 22, 2014

Abe administration may up local subsidies to get reactors back online

<http://www.japantimes.co.jp/news/2014/12/22/national/abe-administration-may-up-local-subsidies-to-get-reactors-back-online/#.VJlMIf-cJA>

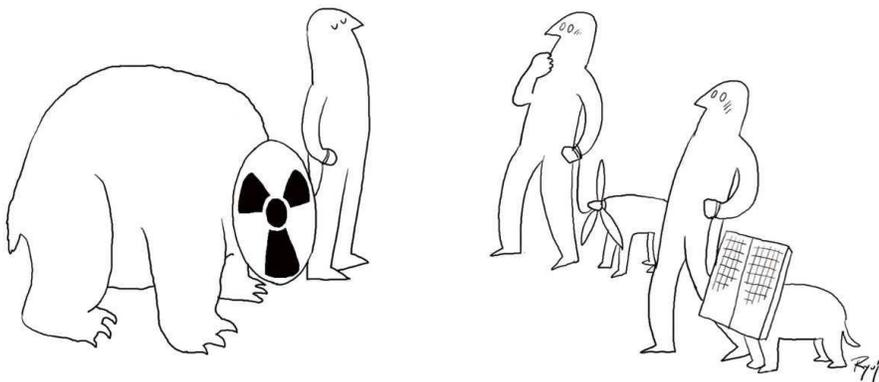

Kyodo

The Abe administration is considering boosting the subsidies that municipalities receive for hosting live nuclear plants in a bid to overcome local resistance to reactor restarts, sources said Monday.

The government is currently paying the cash even though all 48 of the nation's reactors remain offline. The new policy would be a departure from uniform disbursement. The Ministry of Economy, Trade and Industry is expected to present the idea during an expert panel meeting Wednesday with the goal of putting it into practice in fiscal 2016, the sources said.

The subsidies system dates from 1974. It was designed to promote the construction of power plants — both nuclear and conventional. It involves the central government taxing utilities based on their sales of electricity and distributing that to local governments.

Nukes "low in both safety and economic efficiency"

December 22, 2014

Real costs of nuclear power

http://www.japantimes.co.jp/opinion/2014/12/22/commentary/japan-commentary/real-costs-nuclear-power/#.VJhdL_-cJA

Public opinion in Japan is split down the middle over whether the government should permit power companies to restart idled nuclear power plants.

At issue is which should be given priority — plant safety or economic efficiency.

Since new safety standards were introduced following the disaster at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear plant triggered by the March 2011 earthquake and tsunami, the Sendai nuclear power plant in Kagoshima Prefecture of Kyushu Electric Power Co. has become the first of 13 nuclear power plants nationwide undergoing screening by the Nuclear Regulation Authority to get the go-ahead for restart after consent was given by Gov. Yuichiro Ito on Nov. 7.

Ito told reporters that the restart is unavoidable in view of prevailing circumstances. Without doubt, one of those circumstances is the fees that consumers have to pay for electricity.

Indeed, after learning of Ito's decision, one government official expressed his hope that the restart of the Sendai plant will serve to reduce reliance on costly thermal power generation and put an end to a series of rate hikes adopted by power companies in the aftermath of the stoppage of their nuclear power plants.

But will things turn out that way?

Recently a fact has surfaced that contradicts the myth of low power generating costs by nuclear power.

More surprisingly, the fact originated from the power industry itself.

At a press conference in September, Makoto Yagi, chairman of the Federation of Electric Power Companies of Japan (FEPC), who also heads Kansai Electric Power Co., said that in order for private corporations to be able to operate nuclear power plants, it is essential that all costs are recovered without fail. For that purpose, he added, his industry would like to seek assistance from the public sector.

The FEPC is particularly anxious for introduction of the "Contract for Difference" (CfD) scheme. The CfD system has already been introduced in Britain. It is similar to the feed-in tariffs (FIT) scheme in Japan under which power companies are required to purchase electricity generated by renewable energy sources at fixed prices.

But there is a difference between the FIT scheme and the CfD scheme. Under the CfD system for nuclear power, the standard price of electricity would be determined by taking into consideration not only the normal cost of power generation but also the future costs of disposing of spent nuclear fuel and decommissioning reactors.

The difference between the actual power rates and this standard price would be collected from consumers and diverted to the utilities.

An official of the Ministry of Economics, Trade and Industry says this system is fair because in the event of the standard price becoming lower than the actual power rates, the utilities would pay the difference to consumers.

Until now, both the power industry and the government have been emphasizing the "low costs" of generating electricity with nuclear power.

If what they have been saying is true, theoretically consumers should be able to expect that their electricity bills, which have gone up after thermal power generation assumed greater proportions, to come down with the restart of nuclear power stations, whose costs for power generation have been touted as low. But a surprising fact has come to the fore.

It's the news that the standard CfD price envisaged for the Hinkley Point nuclear power plant in England, being expanded by Electricite de France, a French utility company, for completion in 2023, would be equivalent to ¥15.7 per kilowatt-hour, which would lead to doubling the prevailing power rate. According to a journalist specializing in the power industry, that price is ¥0.4 higher than the price at which Japanese power companies are required to purchase electricity generated by wind power under the current FIT scheme, and only ¥1 cheaper than the FIT price for electricity from solar power generation. Moreover, he says, the standard price for the Hinkley Point plant is guaranteed for 35 years, which is longer than the period set for purchase of power generated by renewable energy sources. This means that the financial burden on consumers will become greater.

Even business circles in Japan, which have longed for an expansion of nuclear power generation, are opposed to the introduction of the CfD scheme. A high-ranking official of a major manufacturing company has said that restarting nuclear power plants will have no merit if it leads to higher electricity prices, and that if the CfD system is adopted his company will have no choice but to drastically increase power generation on its own.

In a statement issued in May 2014, Japan's three major business organizations — the Japan Business Federation, the Japan Chamber of Commerce and Industry, and the Japan Association of Corporate Executives — said restarting nuclear power plants should be accelerated because the incremental fuel cost burdens resulting from reliance on thermal power instead of nuclear power had already reached ¥3.6 trillion annually.

At the same time, however, the three bodies called for a thorough review of the FIT system under which utilities have to buy power generated by renewable energy sources at fixed prices. The scheme had brought the total amount of money paid by the utilities to about ¥650 billion during the third year of the system's implementation.

They also warned that the burdens on ordinary citizens would continue to rise rapidly and the heavy burden would stay for a long period of time.

A research fellow at a think tank well versed in energy issues says that if the CfD formula is applied to existing nuclear power plants, the annual payout by the power companies will exceed ¥3 trillion, which is about the same as the current incremental costs arising from the use of alternative fuels.

If that happens, he says, the utilities won't have to lower power rates for consumers after restarting nuclear stations and will have a good excuse for maintaining the present high electricity rates.

Should this be the case, the restart of nuclear power plants will not lead to lowering of the power rates as ardently hoped for by business circles, and this in turn will create a major conflict among them as to whether those power plants should be retained.

The new development means that the FEPC has virtually admitted that it is extremely costly to run nuclear power plants if the expenses needed for disposal of spent nuclear fuel and decommissioning of reactors are taken into account; therefore, the power rates should be set higher.

The think tank researcher says, "We are beginning to see the true costs of nuclear power generation."

The aforementioned executive of the manufacturing firm accuses the utilities of claiming at first that nuclear power generation will ensure an inexpensive and stable supply of electricity but then reversing the position by admitting that costs turned out to be much higher.

A high-ranking official of an electric power company counters that the utilities have supplied power inexpensively based on a tacit understanding that the costs of decommissioning reactors would be borne by the government and that, therefore, it is utterly unreasonable now to be told to bear such costs on their own by setting aside large sums of money as reserves.

Behind this statement is a history of the government taking the initiative in building nuclear power plants from the national security point of view — making sure that Japan can meet its own energy needs and asserting implicitly that it could produce nuclear weapons.

The utility executive has confided that even though his company insisted it had such a large capacity that it would not need nuclear power plants, it was forced by the government to build them in line with the national policy.

Power companies have become increasingly distrustful of the government after Tepco was placed under state control and given additional responsibilities, including shouldering more than ¥1 trillion in costs for decommissioning reactors in the aftermath of the Fukushima nuclear disaster. They fear that they might someday face the same fate.

A business magazine editor who is well informed about FEPC says that if a utility is to bear the costs of reactor decommissioning and spent fuel disposal, the money necessary for those purposes will have to come from the CfD scheme. The federation is of the view that, absent such an arrangement, nuclear power plants would lead to power companies' bankruptcy, according to the editor.

Whether decommissioning is financed by the government with taxpayer money or by higher power rates under the CfD system, the ultimate burden would fall on ordinary citizens.

It is no longer a choice between safety and economic efficiency of nuclear power plants. It is clearly unreasonable to rely on nuclear power generation that the utilities themselves have admitted is low in both safety and economic efficiency.

It is high time that all citizens overcame the emotional confrontation between the proponents and opponents of nuclear power generation and faced the reality.

This is an abridged translation of an article from the December issue of Sentaku, a monthly magazine covering political, social and economic scenes.

Too expensive to keep them running

December 24, 2014

Utilities to announce scrapping of 5 old reactors

<http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html>

Dec. 24, 2014 - Updated 00:16 UTC+1

<image: C:\Users\Odile\AppData\Local\Temp\msohtmlclip1\01\clip_image001.jpg>

Several Japanese nuclear power plant operators are expected to consider announcing plans to scrap reactors that are about 40 years old.

The operators are making the move as the Ministry of Economy, Trade and Industry is set to file an interim report on Wednesday on steps that would make it easier to scrap aging reactors.

The report will include an expansion of the special accounting measures for decommissioning work.

New regulations for nuclear plants introduced last year set the lifespan for reactors at 40 years. Extending their lifespan will require special inspections.

Four operators are considering announcing by next March that they will scrap 5 reactors.

Three of them are in Fukui Prefecture. One is operated by the Japan Atomic Power Company and 2 are run by Kansai Electric Power Company.

A fourth is operated by Chugoku Electric Power Company in Shimane Prefecture and the fifth one is run by Kyushu Electric Power Company in Saga Prefecture.

These reactors have a relatively small output. The utilities apparently think it will not be cost-effective to spend huge amounts on the safety measures needed to keep them running.

Kansai Electric Power Company has 2 other reactors that have been in operation for 39 to 40 years. Their output is large and the utility has started a special inspection to extend their lifespan.

Kansai: New rate hike

December 24, 2014

Kansai Electric applies for fresh utilities rate hike

<http://mainichi.jp/english/english/newsselect/news/20141224p2g00m0bu048000c.html>

OSAKA (Kyodo) -- Kansai Electric Power Co. applied Wednesday with the government for a fresh electricity rate hike, seeking to increase bills for households by 10.23 percent on average from April amid higher fossil fuel costs after its nuclear reactors were idled.

The utility, which had relied heavily on atomic power generation before the 2011 Fukushima nuclear accident, last raised household bills in May 2013. It also plans to increase bills for corporate customers and factories, for which it does not require government approval, by 13.93 percent.

The industry ministry will discuss whether the hike proposed by Kansai Electric, which serves the Kansai region in western Japan, is reasonable before deciding whether to approve the move.

The margin of the markup could still be trimmed in the course of scrutiny by the Economy, Trade and Industry Ministry. At the proposed rate, the electricity bill for an average household is projected to increase by 744 yen per month to 8,355 yen.

All of Japan's 48 commercial nuclear reactors were gradually taken offline following the nuclear meltdowns in March 2011, which heightened concerns over nuclear power. At least four of them, including two Kansai Electric units, may go back online next year, but the outlook for most of the other reactors remains uncertain.

Kansai Electric is expected to record a group net loss in fiscal 2014 through March for the fourth straight year. The company expects to post 126 billion yen in its latest loss and a consolidated operating loss of 100 billion yen, on sales of 3.44 trillion yen, according to its full-year earnings projection released Wednesday.

President Makoto Yagi said last week the firm is expected to remain in the red in fiscal 2015 without an electricity markup.

But since the last rate hike, Kansai Electric's electricity power sales have been on the wane as large-lot customers have switched to independent power suppliers that offer lower electricity rates.

More info on 3/11 released

December 25, 2014

Govt. releases more accounts of Fukushima disaster

http://www3.nhk.or.jp/nhkworld/english/news/20141226_03.html

Dec. 25, 2014 - Updated 21:08 UTC+1

The Japanese government has released more interview accounts of the 2011 nuclear accident.

772 interviews were conducted in 2011 and 2012 by a government committee that investigated the disaster.

The testimonies came mainly from government officials and staff from Tokyo Electric Power Company, which operates the crippled Fukushima Daiichi plant.

Some testimonies including those from then prime minister Naoto Kan, and then plant chief Masao Yoshida have already been released.

An additional 127 were made public on Thursday after receiving consent from interviewees.

Among those newly released is one from a worker at Tokyo Electric headquarters. He analyzed conditions inside the reactors in early April 2011 when the effects of the disaster began to unfold.

The official said he thought the upper half of the nuclear fuel rods at the No.1 reactor core must have completely melted. Cooling water was covering only the lower half of the rods.

But the employee added he remembered his company refrained from using the word "meltdown" in news briefings as much as possible. He said he heard TEPCO feared that a misunderstanding could occur as there was no exact definition for the term.

Nuclear fuel melted at the No.1, 2 and 3 reactors. But Tokyo Electric admitted the possibility of meltdowns only in May 2011.

Lack of communication, late evacuation orders

December 26, 2014

Fukushima ex-governor slams government for tardy radiation evacuation orders

<http://www.japantimes.co.jp/news/2014/12/26/national/fukushima-ex-governor-slams-government-tardy-radiation-evacuation-orders/#.VJ0isP-cJA>

JJI

Former Fukushima Gov. Yuhei Sato had criticized the central government for failing to issue evacuation orders in a timely manner in March 2011 after the Fukushima No. 1 nuclear plant suffered three reactor core meltdowns and spewed radioactive fallout, according to records disclosed Thursday.

The central government at first did not provide any information about the meltdowns at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear plant, the records quoted Sato as saying.

"Because we received various information from local communities, I decided to issue an evacuation order," Sato said.

The prefectural government issued an evacuation order on its own to people living within 2 km of the plant soon after the disaster started.

"An evacuation order from the central government came afterward," the records quoted Sato as saying.

The records were taken by a government panel that interviewed many people, including Sato, as part of its investigation into the nuclear debacle.

Sato also said that Tepco should have released its estimate about the possibility of the plant being hit by huge tsunami based on evidence left by a massive earthquake that struck in 869, according to the records. This is the third time that the government has disclosed records about the investigative panel's interviews.

The newly disclosed records include interviews with senior industry ministry officials and officials at affected municipalities as well as employees of nuclear plant maker Hitachi Ltd.

December 25, 2014

Lack of communication in Fukushima disaster

http://www3.nhk.or.jp/nhkworld/english/news/20141226_11.html

Dec. 26, 2014 - Updated 04:49 UTC+1

Newly released testimony points to a failure to share key information during the disaster at the Fukushima Daiichi nuclear plant in March 2011.

The Japanese government on Thursday released another set of accounts of the disaster, containing testimony from government officials and staff at Tokyo Electric Power Company, or TEPCO, who dealt with the disaster.

The accounts reveal that not all workers and officials knew that an emergency cooling system for the No.1 reactor had been manually shut down following the earthquake and tsunami.

Fuel rods at the No.1 reactor melted down later that day and a hydrogen explosion the next day damaged the reactor further.

In one account, a member of the TEPCO task force said he didn't know that the cooling system was unable to work due to a loss of power. He added that before the arrival of the tsunami, he was only informed by the shift head at the No.1 reactor that the team was trying to adjust the internal pressure of the reactor by using the cooling system.

Workers at the No.1 reactor later confirmed that the cooling system was off and they tried to turn it on by opening a valve. They failed to open the valve and closed it again.

The task force official said it was true that he had been informed the workers opened the valve and turned on the cooling system.

But he said there is no record that the valve was later closed, and he does not remember receiving information from the shift head about closing the valve.

Nuclear fuel also subsequently melted at the No.2 and No.3 reactors.

Some experts say the delayed response to the problems at the No.1 reactor worsened the situation at the plant.

More information disclosed about 3:11 (2)

December 26, 2014

127 more 'secret' interviews on Fukushima crisis disclosed

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201412260050>

THE ASAHI SHIMBUN

The central government on Dec. 25 released dozens more closed-door accounts by people closely connected to the Fukushima nuclear disaster in response to a public outcry about secrecy.

The latest batch involves accounts by 127 officials, workers at the Fukushima No. 1 nuclear power plant and other parties caught up in the crisis triggered by the March 11, 2011, Great East Japan Earthquake and tsunami.

They include accounts by former Fukushima Governor Yuhei Sato, Toshitsuna Watanabe, the mayor of Fukushima Prefecture's Okuma town, and Eiji Hiraoka, vice director-general of the now-dissolved Nuclear and Industrial Safety Agency.

It brings to 202, the number of records released to date.

Bowing to calls for greater openness on the issue, the Abe administration in September made public its records of remarks by 19 people, including the late Masao Yoshida, who was the manager of the nuclear facility at the onset of the disaster, and Naoto Kan, the prime minister at the time.

It followed up with records of interviews with an additional 56 people in November.

A government investigation committee held closed-door questioning sessions with about 770 related officials and others in connection with the accident.

Records for Sato, governor of a prefecture with a population of 2 million, show that local officials had to make decisions under extreme pressure.

According to Sato's remarks, although the central government declared a state of nuclear emergency after the earthquake, the prefecture was given few details about what was happening.

For this reason, **Sato and his subordinates tried to glean details by watching television.**

"Everyone had their eyes glued to the TV (to learn what was happening at the disaster site)," the governor said in his hearing.

At 8:50 p.m. on March 11, Sato issued an evacuation order for residents within a 2-kilometer radius of the Fukushima plant.

Although a separate report by the national investigation committee reveals data on the likely spread of radioactive substances was e-mailed to the prefectural government from March 12, Sato admitted that the information was not shared with a sufficient number of people.

He blamed that on the confusion that prevailed at the time.

As the situation deteriorated day by day, Fukushima residents were ordered by the central government to flee farther away from the power plant. Some residents apparently were advised by local municipalities to flee in the direction in which contaminated materials were predicted to spread.

During the interview with the investigation committee, Sato cited the case of a resident who tried nine times to flee to safety. He said it reflected "the very reality of nuclear disaster evacuation."

Employees of Tokyo Electric Power Co., the operator of the Fukushima plant, were also among the 127 interviewees.

A group manager at the facility said an iron door connecting two buildings buckled in the disaster, cutting off access and making it difficult to restore the power supply.

According to the employee's testimony, TEPCO officials were instructed to take shelter at the nearby Fukushima No. 2 plant on March 15 but later asked to return.

"Although team leaders and other veteran workers returned (to the No. 1 plant), the number of workers there halved (after the temporary evacuation)," the group manager said during the interview.

Another TEPCO employee involved in safety assessments testified that the official believed the upper portion of nuclear fuel had melted at the No. 1 reactor, resulting in some dropping to the bottom of the reactor.

This was the situation as of April 10, although TEPCO did not acknowledge then that a meltdown had occurred.

The Abe administration has been working since June to make public interview records on the Fukushima crisis, but only after gaining the consent of those interviewed.

The government originally planned to complete the disclosure process by the end of the year. But TEPCO executives and others have not agreed to have their statements made public. For this reason, the government has decided to continue working on the project next year.

End of compensation to businesses by Feb 2016?

December 27, 2014

Ministry, TEPCO seek to end compensation for Fukushima businesses in Feb. 2016

<http://mainichi.jp/english/english/newsselect/news/20141227p2a00m0na007000c.html>

The government and Tokyo Electric Power Co. (TEPCO) have proposed to Fukushima Prefecture's commerce and industry federation a plan to end nuclear disaster compensation for businesses in February 2016, it has been learned.

The Ministry of Economy, Trade and Industry and TEPCO presented the plan to the Fukushima Federation of Societies of Commerce and Industry on Dec. 25. The ministry and the utility told the federation that they plan to end compensation payments to all businesses, **except for those in the agricultural, forestry and fisheries sectors**, in February 2016. Ministry and utility officials explained that they would map out future policies after hearing claims from business owners.

The federation's secretary-general, Hideki Endo, however, criticized the proposal.

"Fukushima business owners face different situations depending on their evacuation statuses and their business categories," he said. "While we understand the need to draw the line somewhere, we cannot accept the end of compensation payments within a year and a few months from now when the nuclear disaster has still not been brought to a conclusion and there are no prospects that harmful rumors will end in the foreseeable future."

Self-employed residents affected by the nuclear disaster, as well as mid- and small-businesses in 11 municipalities located within evacuation zones are eligible to receive compensation.

It was earlier decided that businesses eligible for compensation payments would receive the payments until February 2015 regardless of their business conditions. The compensation payments for those

outside of the evacuation zones whose businesses had suffered from harmful rumors were to continue without a particular deadline, according to the level of damage.

As the compensation policy from March 2015 onward for businesses not in the agricultural, forestry or fisheries industries remained unclear, the Fukushima Prefectural Government and other related parties had been urging the economy ministry and TEPCO to outline a policy direction at an early stage. Compensation guidelines compiled by the Education, Culture, Sports, Science and Technology Ministry's Dispute Reconciliation Committee for Nuclear Damage Compensation in December 2013 said that **it is reasonable to end compensation payments to business owners when they are able to operate their businesses in pre-disaster conditions.**

According to TEPCO, from September 2011, when the nuclear disaster compensation program began accepting applications, to November 2014, a total of 1.694 trillion yen had been paid as business compensation and compensation for damage caused by harmful rumors, including to businesses in the agricultural, forestry and fisheries industries.

An executive of local inspection firm Tohoku Ekkususen, which is based in the town of Namie, whose residents remain evacuated, says the company will have to close down if its compensation payments are withdrawn. Before the disaster, the company employed some 100 workers. It set up a temporary office in the city of Fukushima after the 2011 disaster, but as a result of evacuation, less than 20 employees remained. Its profit has dropped to one-tenth of pre-disaster levels, as there are no more orders for nuclear plant-related jobs.

"We doubt that our business will be back in shape by February 2016. **TEPCO and the economy ministry need to consider individual cases,**" the company executive said.

December 27, 2014(Mainichi Japan)

Special advisor to TEPCO

Press Releases 2014

http://www.tepco.co.jp/en/press/corp-com/release/2014/1246826_5892.html

Press Release (Dec 26, 2014)

Appointment of a special advisor

TEPCO announced today that it has invited Mr. Susumu Uchikawa (Honorary Advisor of Toyota Motor East Japan, Inc), who has been involved in the improvement of manufacturing sites for decades, as special advisor (tentative). TEPCO has been tackling initiatives to double its productivity and to win in the competitive environment as well as fulfilling its commitment towards Fukushima revitalization. The company hopes to learn from Mr. Uchikawa's knowledge and experience in improving workplace productivity.

Mr. Uchikawa will be visiting the sites from January 2015, cooperating closely with the board members, and will be constantly offering guidance towards doubling productivity.

Accordingly, a "Kaizen" (continuous improvement) activity team will be set up with members from the Power Grid Company and the Fuel and Power Company which will work under Mr. Uchikawa, deploying his instructions at the front line.

Another example of sloppy management of workers' safety

December 31, 2014

TEPCO's sloppy handling of suppressant led to spread of radioactive dust in 2013

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201412310025>

By MIKI AOKI/ Staff Writer

Tokyo Electric Power Co. diluted a dust suppressant that rendered it ineffective and allowed the spread of radioactive materials that contaminated 12 workers at the Fukushima No. 1 nuclear plant in summer 2013, officials said.

The suppressant is supposed to prevent radioactive dust from getting into the air and spreading. However, TEPCO not only diluted the suppressant to levels well below the manufacturers' recommended standard, but **it also did not use the suppressant on a daily basis when removing rubble at the stricken nuclear plant.**

The sloppy use of the dust suppressant continued for about a year.

"As a result, the effectiveness of the suppressant decreased and likely led to the spewing of radioactive materials in the summer of 2013," an official with the Secretariat of the Nuclear Regulation Authority said. The NRA Secretariat issued administrative guidance to TEPCO, instructing the utility to use the suppressant in a safe manner.

According to an official with a dust suppressant manufacturer, the product is an alkaline liquid that solidifies after a few hours. It is mainly used to prevent the spread of asbestos.

The company recommends that when removing asbestos, the dust suppressant should be used as is or diluted in 10 parts water. It should also be sprayed daily throughout the removal process.

According to TEPCO officials, when workers were removing rubble from the No. 4 reactor at the Fukushima No. 1 plant, the dust suppressant was sprayed on the day before work and right before the removal of the rubble. The suppressant was either undiluted or diluted in 10 parts water.

However, from August 2012, when rubble removal began at the No. 3 reactor, the suppressant was diluted in 100 parts water, and it was used only once every several days or even once every several weeks, the officials said.

In summer 2013, when the spread of radioactive dust came to light, the suppressant had been used at the No. 3 reactor only twice, in mid-June and on Aug. 13.

"Dilution in 100 parts water produces the same result as using only water," said an official at a dust suppressant manufacturer. "Because work should, in principle, only be conducted when the dust has been moistened with the suppressant, not using the suppressant for several days will naturally lead to the spewing of radioactive dust."

In fact, on Aug. 12 and 19, 2013, when rubble was being removed, alarms went off at the Fukushima No. 1 plant because the spread of radioactive dust raised the radiation levels there. Twelve workers were confirmed to have been contaminated by radioactive materials.

On Aug. 19, the volume of radioactive materials released was 6,700 times normal levels, according to an estimate made by the NRA Secretariat.

On one occasion, airborne radiation levels increased at a location 3 kilometers from the Fukushima No. 1 plant.

TEPCO officials admitted that was likely caused by the spewing of radioactive dust after the improper spraying of the dust suppressant.

“When the dust suppressant was mixed in the nuclear fuel storage pool, the level of alkalinity increased, and there were concerns about the effect on equipment,” a TEPCO official said. “While we were aware there was no problem with the effectiveness of the suppressant, our actions in the end were insufficient.” The utility returned to using suppressant diluted in 10 parts water from October 2013, and the liquid was sprayed daily before and after work to remove rubble.

TEPCO did conduct an experiment to find out if dust solidified when the suppressant was diluted by 100 parts water, but no tests were done on the duration of that effect.

“The thinking toward safety management was extremely sloppy,” said Hiroyuki Mori, a professor of public policy at Ritsumeikan University who has conducted studies on the spread of asbestos at disaster-stricken areas. “The work should have been conducted while thinking foremost about the safety of the workers and local residents.”

An official with the NRA Secretariat’s office dealing with the accident at the Fukushima No. 1 plant said: “Initially, we did not check the concentration of the dust suppressant or the frequency with which it was used. We have since strengthened monitoring.”

FIT revision just an excuse for turning nukes back on?

January 2, 2015

Nuclear motive suspected in feed-in tariff reforms

<http://www.japantimes.co.jp/news/2015/01/02/national/nuclear-motive-suspected-in-feed-in-tariff-reforms/#.VKbDiXt1Cic>

by Eric Johnston
Staff Writer

Recent revisions to the feed-in tariff system have been welcomed by utilities as much-needed government intervention that will ensure safe and stable supply of all forms of electricity by helping to prevent renewable energy from overloading the grid and causing blackouts.

But critics say the move by an agency under the Ministry of Economy, Trade, and Industry does little to solve the basic electricity transmission issues, and hint that the real purpose of the changes is to limit the

amount of renewable energy generated so there is enough grid capacity to handle nuclear power once the reactors are turned back on.

The controversy began in September, when Kyushu Electric Power Co. announced it would no longer sign contracts with most companies that were supplying renewable energy. The reason, the utility said, was that its transmission network would be overloaded if it actually purchased electricity from all of the renewable energy suppliers it had signed contracts with.

Since the advent of the July 2012 feed-in tariff system, which obligates Japan's 10 utilities to purchase electricity made from solar, wind, geothermal, mini-hydro and biomass sources from private firms, there had been something of a gold rush mentality. Firms large and small rushed to take advantage of the tariff, which guaranteed a fixed price per kilowatt hour, and the latest figures show the central government had approved nearly 1.5 million different projects.

About half of these were for solar projects generating under 10 kilowatts, and are primarily rooftop solar panels for homes and small businesses. On the other end of the scale, a total of 1,265 projects had been approved for solar projects generating more than 2,000 kilowatts. Many are "megasolar" projects that generate tens of thousands of kilowatts.

But the larger than expected — by officials at least — number of entrants led Kyushu Electric to announce it would suspend applications from renewable energy suppliers. Four others, including Shikoku Electric Power Co., Hokkaido Electric Power Co., Tohoku Electric Power Co., and Okinawa Electric Power Co., quickly followed suit, sending a shock wave through the industry and sparking warnings that Japan's nascent moves toward renewable energy were in danger.

In response to the panic, METI looked into the issue. In mid-December, the Agency for Natural Resources and Energy, as part of a general review of the feed-in tariff program, issued a new set of rules for both renewable energy suppliers and distributors (the utilities).

Lax standards in terms of project deadlines meant that, as long as approval for a project had been granted under one tariff price over a fixed period, firms could delay construction by waiting for costs to fall, thus widening their profit margin between the guaranteed price per kilowatt hour they would receive (the tariff price) and the actual generation cost per kilowatt hour.

Under the new rules, however, once project approval is granted, firms are given deadlines for completing construction and connecting to the grid. Missing the deadlines could mean losing the right to grid access. Also, utilities could previously limit output of renewable-generated electricity for up to 30 days annually, under the assumption the time would be calculated on a daily basis. The basic unit has been changed to hours, which means they can now limit the amount of solar project output by 360 hours annually, and wind power output by 720 hours annually.

This is being done to increase the efficient grid use of renewable energy, the government said.

"By **controlling output on an hourly basis**, the amount of available capacity can be increased," the agency said in announcing the rule changes.

A METI study found that seven utilities — Hokkaido Electric, Tohoku Electric, Hokuriku Electric, Chugoku Electric, Shikoku Electric, Kyushu Electric and Okinawa Electric — only accept about 58 percent of the total solar power renewable-energy firms can, or plan to, generate due to grid limitations.

However, renewable energy advocates say the latest decision by the energy agency under pro-nuclear METI fails to address a number of concerns and was based on assumptions about the future of nuclear power in Japan that are, to nuclear opponents, optimistic at best.

"In the basic energy plan approved by the government in April, it states that the fundamental goal is to reduce the reliance on nuclear power as much as possible. But (the agency's) calculations for the new rules are based on the premise that all of Japan's nuclear reactors, including those that are 40 years old,

will be in operation. The result is nuclear power accounting for between 50 and 60 percent of the supply at Hokkaido Electric and Kyushu Electric during minimum load demand times, and the reduction of available renewable energy,” the Japan Renewable Energy Foundation, a think tank set up by billionaire entrepreneur Masayoshi Son, said in a report released just after the agency’s announcement.

Anti-nuclear activists in Kyushu have questioned the timing of Kyushu Electric’s September announcement that it would not purchase most of the renewable energy generated. Only days before, the Nuclear Regulation Authority had given approval for two Kyushu Electric reactors at its Sendai plant in Kagoshima Prefecture to restart.

“Kyushu Electric says they stopped purchasing renewables to maintain a demand and supply balance, but I really wonder if this is the case”, said Yoshitaka Mukohara, a Kagoshima-based anti-nuclear activist.

All of the utilities have agreed to the new rules. Kyushu Electric is expected to resume purchasing renewable energy this month, but under certain conditions.

But given the ardent efforts of pro-nuclear Prime Minister Shinzo Abe and the ruling coalition, as well as a pro-nuclear lobby that consists of most local politicians, utilities and METI, to restart all safe reactors as soon as possible, it’s clear that renewable energy faces a bumpy road due not only to technical and financial issues, but also political and bureaucratic hostility that makes overcoming the other issues all the more difficult.

Utilities in no hurry to switch to dry storage

Spent nuclear fuel is kept in a dry cask for storage at the Tokai No. 2 nuclear power plant in Tokai in Ibaraki Prefecture. (Asahi Shimbun file photo)

January 4, 2014

Utilities balk at safer storage of spent nuclear fuel to avoid 'wasted investment'

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201501040021>

THE ASAHI SHIMBUN

Power companies have resisted government calls to construct safer storage facilities for spent nuclear fuel and are instead waiting for a fuel reprocessing plant to finally start running after nearly two decades of delays.

The utilities say that building dry storage facilities, which hold spent nuclear fuel encased in metal or concrete casks, could prove **a waste of money if the Rokkasho reprocessing plant in Aomori Prefecture begins operations and takes all the spent fuel off their hands.**

They also cite concerns in communities that host nuclear reactors that dry storage facilities could lead to permanent storage there.

Under Japan's basic energy plan approved by the Cabinet in April last year, the central government promotes the construction and use of dry storage facilities.

Shunichi Tanaka, chairman of the Nuclear Regulation Authority, has repeatedly referred to the importance of such facilities, which are deemed safer and less expensive to operate than the traditional method of keeping spent nuclear fuel submerged in storage pools at nuclear plant.

Spent fuel pools are usually located next to reactors for swift transport because the fuel rods continue to be highly radioactive and emit heat after use.

The risk of using storage pools was exposed when all power sources were lost at the Fukushima No. 1 nuclear plant after the Great East Japan Earthquake and tsunami struck on March 11, 2011.

Tokyo Electric Power Co., operator of the plant, not only had to deal with three reactor meltdowns, but it was also forced to take measures to prevent the release of radiation from spent fuel storage pools at the site.

Under the dry storage method, the encased spent fuel is cooled with circulating air at a facility built separate from the reactor building. Dry storage is mainly used for spent fuel whose radioactive decay heat has already dropped to a certain level.

One big advantage that dry storage has over storage pools is that it can continue to cool spent fuel even after a power failure in the event of a nuclear accident or natural disaster.

In fact, spent fuel in a dry storage facility at the Fukushima No. 1 nuclear plant did not suffer any major damage in the 2011 disaster, according to TEPCO. [???]

The only other nuclear power station currently equipped with a dry storage facility within its plant site is Japan Atomic Power Co.'s Tokai No. 2 nuclear power plant in Ibaraki Prefecture.

Chubu Electric Power Co. plans to set up a dry storage facility at its Hamaoka nuclear plant in Shizuoka Prefecture in fiscal 2018. That plan was hatched before the Fukushima nuclear disaster.

But no other utility in Japan has moved in that direction despite the government's urging.

"At present, we are not considering it," said an official at Hokuriku Electric Power Co.

Hokuriku Electric operates relatively new nuclear reactors that have more storage capacity for spent fuel than utilities that have run the same reactors for decades.

But power companies whose storage space for spent fuel is nearing capacity are also not showing a sense of urgency in constructing dry storage facilities.

Kyushu Electric Power Co. and Shikoku Electric Power Co say they are still at the stage of weighing whether they should build such facilities.

Reports show that **spent fuel has already filled up 70 percent of the overall storage capacity of the nation's nuclear power plants.**

The biggest reason the utilities are hesitant to build dry storage facilities is that the government has kept alive the Rokkasho nuclear fuel reprocessing plant project, despite its many problems.

According to the project, the Rokkasho plant will take in the utilities' spent nuclear fuel and reprocess it for reuse at nuclear reactors around Japan.

The Rokkasho plant was originally scheduled to open in 1997. However, the start of operations has been delayed 21 times because of technical glitches, human error and safety issues.

Japan Nuclear Fuel Ltd., operator of the Rokkasho plant, has postponed the completion date to March 2016.

Still, electric power companies do not want to spend on dry storage facilities now because they believe the plant will start running and alleviate them of their spent fuel problems.

"Even if we build a dry storage facility, it would likely be a wasted investment," said an official in the nuclear power industry, alluding to the Rokkasho plant.

The utilities say they are also concerned that building dry storage facilities could stoke fears among nearby residents and local officials that hazardous spent fuel would remain in their neighborhoods for a prolonged period.

Fukui Prefecture is home to 13 nuclear reactors, the most in the nation. The prefectural government demands that spent fuel removed from nuclear power stations in the prefecture be stored at an interim facility outside the prefecture.

"We see it as a problem that (spent fuel) could be kept here until the end of time," said a prefectural official overseeing nuclear plant issues.

Tadahiro Katsuta, associate professor of nuclear energy policy at Meiji University, said the central government should provide incentives to spur utilities to shift to dry storage facilities.

"When the safety of a nuclear plant is at issue, it is obvious that dry storage is more reliable (than pools) since it does not require emergency measures to safeguard the facility in the event of an accident," Katsuta said. "Financial benefits and setting a limit on the storage period should be considered."

People's views & decision-making

January 6, 2015

EDITORIAL: Consensus-building process needed for nuclear policy decisions

Nearly four years have passed since the 2011 Great East Japan Earthquake and tsunami triggered the disaster at the Fukushima No. 1 nuclear power plant.

Signs are that 2015 will be remembered as the year when Japan restarted nuclear power generation.

The No. 1 and No. 2 reactors at Kyushu Electric Power Co.'s Sendai nuclear power plant in Kagoshima Prefecture, which have passed the Nuclear Regulation Authority's safety screenings in line with stricter regulations, are expected to resume operation as early as this spring. The nuclear safety watchdog has

also given the green light to a plan to restart the No. 3 and No. 4 reactors at Kansai Electric Power Co.'s Takahama plant in Fukui Prefecture.

Applications for the NRA's safety reviews have also been submitted for 17 other reactors at 12 nuclear power stations. These reactors are waiting in the wings for the NRA's approval.

DIVIDED PUBLIC OPINION

To bring an offline reactor on stream again, the operator also needs to win the consent of the prefecture and municipalities where the reactor is located.

In the case of the Sendai plant, the local assemblies of Kagoshima Prefecture and the city of Satsumasendai voted last autumn to support the plan to restart the reactors. The Kagoshima governor and the mayor of the city have also decided to approve it. The will of the local communities concerned has been made clear according to formal procedures.

But the will of the nation as a whole concerning the issue is different.

In a survey The Asahi Shimbun conducted in November, 56 percent of the respondents expressed opposition to restarting reactors, against 28 percent who supported the move. We have been asking similar questions since our survey in June 2013, and all the polls showed that a majority of the people were cautious about the idea of bringing reactors back online.

The opinions of the local governments concerned represent the popular will, as do the results of opinion polls.

If the will of the people concerning other reactor restarts is represented in the same way as in the case of the Sendai plant, the desire of many Japanese to see an end to nuclear power generation in this nation could be ignored as the NRA accelerates its safety screenings of the reactors. Is that acceptable?

Since the Fukushima nuclear disaster, public opinion has remained sharply divided over various related issues, such as evacuation plans, damage caused by radiation and hikes in electricity rates.

The situation requires the government to rethink the way it makes nuclear policy decisions.

The nation clearly needs a system to integrate widely different popular views about nuclear power generation into policies.

In many Western nations, systems are designed to allow citizens to take part in policy debate to refine and visualize public opinion.

CITIZENS' PARTICIPATION IS CRUCIAL

Denmark was a pioneer in this area by creating a system to incorporate public opinions into the policymaking process through "consensus conferences."

Since the late 1980s, the system has been actively used to make decisions on key science and technology policy issues, such as the application of genetic engineering.

Under this system, a dozen or so citizens are chosen from among those who have responded to the government's invitations to participate in debate on a certain issue. They spend several days asking experts related questions and studying and discussing the issue as a panel. Then, working on their own, the citizens prepare and publish a written opinion about the issue.

Lawmakers and media are invited to be present when the citizens publish the document.

Similar systems have been used in various ways by countries and areas. They are all designed as "dialogue-oriented" plans to build consensus among the public while respecting different opinions.

In summer 2012, the government led by the Democratic Party of Japan attempted to adopt a similar approach when it initiated "national debate" on nuclear power policy decisions.

In addition to introducing a public comment system and holding public hearings in various parts of the nation, the DPJ-led government conducted what is known as a "deliberative opinion poll" for the first time in Japan.

About 300 citizens, selected randomly from the nearly 7,000 people who had responded to a survey, engaged in a discussion meeting that ran two days with an overnight stay. A total of three surveys, including the ones conducted before and after the meeting, were held to find out changes in their opinions. The participants were chosen at random to ensure that the sample would represent the entire population demographically and vocationally. It was an attempt to create a more thought-out public opinion regarding nuclear power through in-depth discussions.

As a result of this process, the government concluded that many Japanese wanted to see their society abandon nuclear power generation.

Some problems arose with the survey method and the way the government made its policy decisions accordingly. But it was nevertheless a welcome attempt to accurately grasp the will of the people. Such an approach should be used more for debate on nuclear power policy issues.

MANY ISSUES DEMAND BROAD CONSENSUS

The division of public opinion over nuclear energy is not limited to the one between the will of the nation as a whole versus the will of local governments concerned.

Since the Fukushima disaster, there have been disagreements among local governments over the scope of “local communities” that should be involved in the decision-making process on such issues as whether to approve construction of a nuclear power plant and a restart of an offline reactor.

In April last year, Hakodate, Hokkaido, sued the state and Electric Power Development Co., or J-Power, to halt construction of the Oma nuclear power plant in Oma, Aomori Prefecture, which is located across the Tsugaru Strait.

Hakodate is located within 30 kilometers of the plant, and its citizens would be exposed to serious threats to their health if a severe accident were to occur there.

Hakodate’s legal action is based on the notion that its vicinity to the nuclear plant should qualify it for involvement in decisions on whether to approve construction.

A heap of issues related to nuclear power generation should be settled through broad consensus and agreement. They include the program to provide state subsidies to local governments hosting nuclear plants, storage of spent nuclear fuel and disposal of radioactive waste.

Public opinion will be divided in various ways over all these issues. If there is no effective system to build consensus on such contentious issues by overcoming wide disagreements, the government will have to repeat the futile choice of either forcibly executing or postponing its decisions.

The administration of Prime Minister Shinzo Abe is seeking to revive nuclear power generation in this nation.

But the government’s new basic energy supply plan, which the Abe Cabinet endorsed in April last year, contains the following passage: “The government will consider attempts to allow diverse parties to engage in discussions on various energy-related challenges and study together to deepen their understanding for the sake of progress in policy efforts.”

The government plans to hold policy debate on the future share of nuclear power in Japan’s overall power supply with an eye to making the decision by summer.

If the government is concerned that the traditional approach to policymaking may not work with this challenge, it should change the way it makes decisions now.

What is the best way to measure people’s views and opinions and integrate them into the decision-making process? The issue of nuclear power generation raises this fundamental question about the way policy decisions are made.

--The Asahi Shimbun, Jan. 6

Second group lawsuit over Fukushima disaster

January 13, 2015

Group files fresh complaint over Fukushima nuclear disaster

<http://mainichi.jp/english/english/newsselect/news/20150113p2g00m0dm077000c.html>

TOKYO (Kyodo) -- A group of citizens including some from Fukushima Prefecture on Tuesday filed a second criminal complaint against a former nuclear safety official and eight others, arguing they failed to take necessary preventive measures in the Fukushima nuclear crisis.

It follows one filed in June 2012 against Tokyo Electric Power Co.'s then Chairman Tsunehisa Katsumata and others for causing the disaster at the utility's Fukushima Daiichi nuclear plant in March 2011.

Among the accused this time were Yoshinori Moriyama, a former official in charge of nuclear disaster countermeasures at the now-defunct Nuclear and Industrial Safety Agency, officials at TEPCO and others. In the written complaint filed with the Tokyo District Public Prosecutors Office, **the group said the nine were responsible for a number of citizens' exposure to radiation in the Fukushima crisis by neglecting to take countermeasures for possible severe accidents.**

The prosecutors' office is continuing its investigation into the first case after an independent judicial panel of citizens decided last year that Katsumata and two other TEPCO officials merit indictment in the wake of the prosecutors' decision not to indict them.

"Raising eyebrows"

January 14, 2015

Kagoshima assemblymen on nuke safety body tied to firms with Kyushu Electric contracts

<http://mainichi.jp/english/english/newsselect/news/20150114p2a00m0na006000c.html>

KAGOSHIMA -- Two members of a 15-person Kagoshima Prefectural Assembly committee that approved the restart of Sendai Nuclear Power Plant have close family ties to firms hired by plant operator Kyushu Electric Power Co. to do construction work at that very power station, it has been learned.

Liberal Democratic Party (LDP) assembly members Katsuzo Hokazono and Kaneoki Obata also both received "consulting" and "advisory" fees from these family firms. The companies have received at least 10 orders worth a total of some 170 million yen from Kyushu Electric since the March 2011 meltdowns at the Fukushima No. 1 nuclear plant.

According to construction records submitted to the prefecture and other sources, from May 2011 to March last year, Kyushu Electric contracted two construction companies run by Hokazono's son and nephew to do six jobs at the Sendai plant, including building a parking lot and waterproofing the area around sea water pumps. The firms, directly hired once and five times as subcontractors, were paid a total

of 78.58 million yen. They were also hired by the utility to do work unrelated to nuclear power plants. According to income statements, Hokazono received consulting income from both firms until autumn 2011.

A construction company owned by relatives of Obata, meanwhile, took four work orders at the Sendai plant between January 2012 and June 2013, including jobs related to bringing safety measures up to new government standards for restart. All four jobs were contracted directly by Kyushu Electric, with a total value of 96.27 million yen. Obata was a paid adviser to the construction firm at the time.

The special prefectural assembly committee on nuclear safety approved Kyushu Electric's application to restart the Sendai plant reactors by a vote of 11 to 3 in November last year. Both Obata and Hokazono voted in favor, while Hokazono also argued stridently for the restarts during proceedings.

Kagoshima Prefectural Assembly political ethics guidelines state that sitting members "will not serve as executives at firms taking construction orders from the prefecture," but there are no rules regarding private companies like Kyushu Electric. The head of the prefectural ombudsman, however, stated that "for a company related to a prefectural assembly member, who must as a representative of the local government fairly consider nuclear restarts, to take construction orders (from the utility) must absolutely be viewed as a problem. This kind of behavior should be restricted by regulations."

When asked for comment, Hokazono told the Mainichi, "Construction work is completely unrelated to assembly deliberations."

January 13, 2015

Assembly members' family ties to contracts given at Sendai nuclear plant raise eyebrows

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201501130073

By SATOSHI OTANI/ Staff Writer

Concerns over a potential conflict of interest have been raised in connection to **two Kagoshima prefectural lawmakers whose family members run companies that have been given contracts at the Sendai nuclear plant**, although no laws have been broken.

Katsuzo Hokazono and Kaneoki Obata were serving on the Kagoshima prefectural assembly's special 15-member nuclear energy safety measures committee that approved a petition in November 2014 calling for the resumption of operations at the plant in Satsuma-Sendai, Kagoshima Prefecture.

Eleven committee members voted in favor of the petition, while three voted against it. Hokazono and Obata, who voted in support of a restart, have relatives who operate construction companies that received contracts from Kyushu Electric Power Co. for work at the Sendai plant and elsewhere in the three years since the 2011 Fukushima No. 1 nuclear power plant disaster. **Four companies with links to the two prefectural assembly members received a total of 26 contracts worth 290 million yen (\$2.5 million).**

Hokazono has been a strong proponent of resuming operations at the Sendai plant, saying on one occasion during a Kagoshima prefectural assembly session, "We must push forward with resumption of operations **for the sake of national interests.**"

The two belong to the Liberal Democratic Party and are veteran assembly members, with Hokazono having won four terms and Obata five. Hokazono and Obata received remuneration from the companies in question.

The Kagoshima prefectural assembly has ethics guidelines that prohibit members from becoming executives at companies that win contracts for work commissioned by the prefectural government. However, because Kyushu Electric is a private-sector company, those guidelines do not apply. Moreover, Hokazono and Obata serve as advisers to the four companies, which are not considered executive positions.

The two said their family relationships and the work contracts did not factor into their deliberations and decisions on safety issues concerning the Sendai plant.

According to documents submitted to the Kagoshima and Miyagi prefectural governments, one of the firms is a construction company based in Satsuma-Sendai that is headed by Hokazono's older brother and nephew. Another company based in the same city is also headed by the older brother and Hokazono's son. Those two companies received six contracts for work at the Sendai plant and another 14 contracts for work at other facilities operated either by Kyushu Electric or affiliated companies.

According to income reports and other documents, Hokazono served as an adviser to the two companies until autumn 2011, receiving remuneration.

In addition, in July 2012, Hokazono established and became the president of a construction company in Iwanuma, Miyagi Prefecture, about 1,200 kilometers from the Sendai plant. Hokazono receives about 350,000 yen a month in salary. That company received one contract from a Kyushu Electric subsidiary. It has also been involved in rebuilding projects in the Tohoku region that was devastated by the 2011 Great East Japan Earthquake and tsunami.

The three companies with links to Hokazono received a total of 190 million yen in orders from Kyushu Electric or affiliated companies.

A relative of Obata also heads a construction company based in Satsuma-Sendai. Kyushu Electric gave five contracts to the company for work at the Sendai plant. The contracts were worth a total of 100 million yen.

Income reports and other documents showed that Obata served as an adviser to the company, where he also received remuneration.

The companies were involved in work at the Sendai plant such as replacing equipment and improving the facilities grounds. Some of the work was geared toward helping the Sendai plant meet the new safety screening standards established by the Nuclear Regulation Authority in the wake of the Fukushima nuclear accident.

The Sendai plant was the first in the nation to receive approval from the NRA for a restart after meeting the tougher screening standards. The Kagoshima prefectural governor and prefectural assembly along with the Satsuma-Sendai mayor and municipal assembly have all given their consent to the resumption of operations.

Nukes and their real cost

POINT OF VIEW/ Eiji Oguma: Planned protective measures show real cost of nuclear power

<http://ajw.asahi.com/article/views/column/AJ201501150006>

SPECIAL TO THE ASAHI SHIMBUN

The industry ministry is discussing a new protective measure for nuclear power plants: the contract for difference (CfD) system.

The CfD, introduced in Britain, guarantees that electricity will be purchased at a fixed rate over a certain period of time.

The purchase price is calculated in consideration of the plant's total cost, including future expenses, such as those for disposing of spent nuclear fuel and decommissioning reactors.

An agreement has been reached to apply the system to one nuclear power plant in Britain, with the reference purchase price set at 8.95 pence (around 15 yen or \$0.13) per kilowatt-hour. That is higher than the corresponding price for a land-based wind farm, and comes with a longer guarantee period of 35 years.

A nuclear plant requires so much initial investment that there is no guarantee the cost will be recovered under the market economy. That is why the CfD and other protective measures for nuclear plants are being discussed in Japan ahead of the liberalization of the power retail market slated for 2016.

But various objections have been raised to the introduction of such measures.

First, **the purchase price will likely be reflected in electricity rates, increasing the financial burden on consumers.**

An article on the "real cost of nuclear power" that appeared in the December issue of the Sentaku monthly magazine introduces an expert's view: "Calculations show that applying the nuclear CfD to existing nuclear plants (in Japan) would result in total annual dues of more than 3 trillion yen, which is worth **about the same as payments for alternative fuels within the current electricity rates.**"

"Alternative fuels" refer to fossil fuels for thermal power plants that have substituted nuclear plants idled after the Fukushima nuclear disaster in 2011.

The article also quoted a senior official of a major manufacturer as saying: "There would be no advantage in resuming nuclear power generation if the rates were to be higher, although I don't know about companies involved in building nuclear reactors.

"We would have no choice but to sharply increase in-house power generation if the CfD were to be introduced."

Second, **the decision process is not transparent.**

Representatives of power utilities and nuclear industry sit as "expert members" on the Nuclear Energy Subcommittee, where the discussions are being held. The panel falls under the Ministry of Economy, Trade and Industry's Advisory Committee for Natural Resources and Energy.

According to environmental economist Kenichi Oshima's article in the December issue of the Sekai monthly magazine, live video broadcasts of panel meetings, which were available in the aftermath of the 2011 Fukushima nuclear disaster, are no longer shown, and records of the first six meetings have never been released, even in audio format.

Audio records alone have been released for the seventh and subsequent meetings, but they are designated for "temporary availability until the minutes are published."

The article said the chairman of the Nuclear Energy Subcommittee said the meetings are not broadcast live because "some members say such a setting would not help them express their opinions."

Third, **such measures would give an advantage to power utilities that fail to reform their operations.**

According to a special feature on power industry realignment in the Oct. 11 issue of Shukan Diamond weekly magazine, Chubu Electric Power Co. has long sought to enhance the efficiency of thermal power generation, and Tokyo Electric Power Co. also “decided to define thermal power operations as a pillar of growth” following the disaster at its Fukushima No. 1 nuclear plant.

Both utilities are seeking to integrate their fuel procurement operations to reduce their international procurement prices for liquefied natural gas.

The special feature said Kansai Electric Power Co., on the other hand, adheres to its traditional focus on nuclear power operations as if to “commit a double suicide with nuclear power.”

Policy measures that favor an old guard management policy and fail to reward efforts to meet the demands of current times would not help to open up a new future for energy.

Nontransparent protective measures that lack consensus would only create dependence and harm sound efforts.

Tatsuya Murakami, former mayor of the village of Tokai, Ibaraki Prefecture, known for having hosted nuclear plants, says “everybody stops making efforts” and “other industries stop growing” once a community hosts a nuclear plant.

In an interview published in the Feb. 6 edition of Diamond Online (<http://diamond.jp/articles/-/48302>), he said, “Clothing shops, for example, are not looking toward the village residents. They can get along by just buying in and selling work clothes and shoes for nuclear plant workers.

Murakami said the same can be said of inns.

“They are intended for nuclear plant workers, so you sleep crowded together and use a joint bath,” he said. “I used to say they have to remodel their rooms, say, into private rooms, but nobody has come forward to do so. Everybody says, ‘I don’t care about remodeling. Workers are coming, after all.’”

Prime Minister Shinzo Abe took part in a debate of political party leaders on Dec. 1, the day before the official start of the campaign for the Lower House election.

According to the Dec. 2 issue of The Asahi Shimbun, the prime minister said: “It is all too natural for the public to feel they are fed up with nuclear power. At the same time, we have the responsibility to provide a stable supply of inexpensive energy.”

I want Abe to explain if nuclear plants need to be protected, given that power utilities and the industry ministry have virtually admitted that nuclear power is anything but “inexpensive.”

New subsidies to accelerate restarts

January 15, 2015

New subsidy system designed to expedite restarts of nuclear reactors

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201501150078>

The Sendai nuclear power plant in Satsuma-Sendai, Kagoshima Prefecture, is expected to resume operations this spring at the earliest. (Asahi Shimbun file photo)

THE ASAHI SHIMBUN

The Abe administration has earmarked 1.5 billion yen (\$12.75 million) for a **new subsidy system designed to accelerate restarts of idled nuclear reactors and to convince residents that nuclear plants are safe.**

The figure was included in the draft budget for fiscal 2015, which was finalized on Jan. 14.

The fiscal 2015 draft budget also includes 91.2 billion yen for an existing annual grant system that targets regions hosting nuclear power facilities. These subsidies are provided to local governments based on power production at each nuclear plant they host.

Under the new system, prefectural governments that host nuclear reactors will receive grant money when the reactors resume operations or are later stopped so that the negative impact on local economies can be alleviated.

Although the local governments will be able to decide how to spend the funds, **the subsidies are expected to be used, for example, to conduct monitoring surveys to prevent the spread of groundless rumors about nuclear power. The central government also wants prefectural authorities to use the funds to hold explanatory sessions to convince residents of the safety of nuclear plants.**

All of the nation's reactors are currently offline in light of stricter safety standards introduced after the Great East Japan Earthquake and tsunami triggered the Fukushima nuclear crisis in March 2011. The administration decided on the figure for the existing subsidy system based on the assumption that all reactors are operating at 81 percent of capacity.

The Abe administration will revise the estimate for fiscal 2016 so that local governments that host restarted reactors will be able to receive larger amounts than other regions.

For Fukushima citizens, an outrageous decision

January 22, 2015

Prosecutors not to indict ex-TEPCO execs again over Fukushima nuclear disaster

<http://mainichi.jp/english/english/newsselect/news/20150122p2a00m0na001000c.html>

The Tokyo District Public Prosecutors Office is set to decide soon not to indict three former executives of Tokyo Electric Power Co., including then Chairman Tsunehisa Katsumata, on charges of professional negligence resulting in death and injury over the 2011 Fukushima nuclear disaster, it has been learned. In September 2013, Tokyo prosecutors made their initial decision not to file charges against three former TEPCO executives, including 74-year-old Katsumata. But investigators at the Tokyo District Public Prosecutors Office are currently reinvestigating the three former TEPCO executives after a judicial panel of citizens decided last July that the three should be indicted.

Sources said that prosecutors will make a formal decision soon not to indict them after experts on tsunami, plant engineering and other fields explained in the reinvestigation process that there was little they could do. "There is a high possibility that even if they had taken anti-tsunami measures, they would not have been able to prevent the accident," said the experts.

Following prosecutors' latest decision, the Committee for the Inquest of Prosecution is to re-examine the case. If the committee decides again that the three men should be indicted, the Tokyo District Court will pick lawyers to serve as prosecutors and file an indictment against the three.

In 2008, TEPCO estimated that a tsunami as high as 15.7 meters could hit the Fukushima No. 1 Nuclear Power Plant. After its initial investigation, the Tokyo District Public Prosecutors Office decided not to indict the three men, saying, "The estimate was based on the severest conditions and it is difficult to acknowledge that it was possible to predict the accident."

In response to prosecutors' decision, the Committee for the Inquest of Prosecution decided in July 2014 that the three men should be indicted, arguing that they could have avoided or mitigated the accident if they had taken steps such as: installing switch boards and power generators on higher ground; and making buildings waterproof.

In its reinvestigation of the case, the Tokyo District Public Prosecutors Office interviewed experts on tsunami, plant engineering and other fields in addition to the former TEPCO executives. Prosecutors have apparently come to a conclusion that it is highly possible that even if the aforementioned anti-disaster measures had been taken, the damage caused by tsunami could not have been avoided.

Fukushima citizens group expresses outrage

http://www3.nhk.or.jp/nhkworld/english/news/20150122_33.html

Jan. 22, 2015 - Updated 13:12 UTC+1

The leader of a group of citizens from Fukushima and other areas has expressed outrage over the prosecutors' decision not to indict the former officials.

Ruiko Muto leads the group that filed the criminal complaint.

Muto said at a news conference on Thursday that the prosecutors' decision totally ignores the judgment by the inquest panel, which she said served to express opinions of the public.

She said the victims of the accident sincerely hope that justice will be served concerning those

responsible for the accident.

The group's lawyer Hiroyuki Kawai said it's unreasonable that the prosecutors decided not to indict the 3 even though they had done nothing to prepare for a tsunami.

Kawai said the group hopes the panel will decide to indict the former officials so that they will be held accountable.

Complaint against ex-TEPCO officials again dropped

http://www3.nhk.or.jp/nhkworld/english/news/20150122_31.html

Jan. 22, 2015 - Updated 12:09 UTC+1

Prosecutors have again dismissed a criminal complaint against 3 former executives of Tokyo Electric Power Company over the 2011 nuclear accident at the Fukushima Daiichi plant.

Tokyo prosecutors made the decision following a reinvestigation into the case in response to a judgment by a prosecutor inquest panel last July.

The judiciary panel at that time said the utility's former chairman Tsunehisa Katsumata and 2 others should stand trial over their handling of the accident.

That's despite prosecutors' initial conclusion 2 years ago that it would be difficult to indict the 3 former executives.

In the reinvestigation, prosecutors have been hearing from experts on nuclear engineering and tsunami. They did not change their decision.

The prosecutors explained that Tokyo Electric in 2008 estimated the effect of a tsunami as high as the one that hit in 2011. But they said that since reactor buildings were submerged in water several times deeper than they'd estimated, it's hard to say the executives should have predicted the risk.

The case now automatically goes back to the inquest panel. If it repeats its judgment, the 3 former officials will have to stand trial according to judicial procedures.

"Once again, no indictments"

January 23, 2015

Once again, no indictments against former TEPCO execs over Fukushima disaster

THE ASAHI SHIMBUN

Prosecutors again decided not to indict three former executives of Tokyo Electric Power Co. over the triple meltdown at the Fukushima No. 1 nuclear plant, essentially saying that the disaster was unpreventable.

The Jan. 22 decision by the Tokyo District Public Prosecutors Office rejected the stance of an independent judicial panel of citizens that former TEPCO Chairman Tsunehisa Katsumata and two former vice presidents, Sakae Muto and Ichiro Takekuro, should be indicted on charges of professional negligence resulting in death and injury.

The citizens panel, called the Tokyo No. 5 Committee for the Inquest of Prosecution, plans to re-examine the case. If it again decides that charges are warranted, the three former TEPCO executives will be indicted mandatorily and stand trial.

A group of residents, disaster victims and lawyers initially filed a criminal complaint against the former TEPCO executives, saying the company failed to take appropriate measures against the tsunami that hammered the plant and caused the meltdown after the March 11 Great East Japan Earthquake. But prosecutors decided not to indict them in September 2013, saying experts did not predict an earthquake and tsunami of the scale of the magnitude-9.0 Great East Japan Earthquake and subsequent waves.

The group took the case to the citizens panel.

In July 2014, the panel concluded that TEPCO had in fact predicted a tsunami as high as 15.7 meters based on a government organization's forecast in 2008. The panel said that if the utility had taken measures based on that prediction, it could have prevented the nuclear disaster. It concluded that the three former executives should be indicted.

Prosecutors reinvestigated the case and solicited opinions from other experts.

While acknowledging the prediction of a 15.7-meter-high tsunami, prosecutors said the reliability of the forecast was low because it was based on calculation methods that were not officially recognized in those days.

Prosecutors also said the probability of the Fukushima plant being hit by a 15.7-meter-high tsunami was "once in a million years to 10 million years."

"It cannot be said that it was a duty for TEPCO to take measures (against tsunami of that height)," the prosecutors office said.

The tsunami that inundated the Fukushima plant was 11.5 meters to 15.5 meters high.

However, prosecutors said the width of the tsunami was five times longer than the width predicted by TEPCO. Therefore, the utility could not have prepared for such a huge volume of water at the nuclear plant, they said.

"It cannot be said that TEPCO could have predicted a tsunami (of such a large scale)," the office said.

They also addressed the citizens panel's assertion that measures taken against a 15.7-meter-high tsunami could have prevented the nuclear accident.

They concluded that even if TEPCO had started constructing sea walls in response to the 2008 prediction, they would not have been completed by March 2011.

If TEPCO had taken waterproofing measures for the reactor buildings, the equipment would have been destroyed by rubble thrown about by the tsunami.

"It is difficult to recognize that the nuclear accident could have been prevented," the prosecutors office said.

Members of the group that filed the initial complaint expressed outrage.

"It is an unfair judgment with a foregone conclusion," one of the members said at a news conference in Tokyo. "We hope the citizens panel will again decide that the three should be indicted and stand trial."

Group members plan to submit to the panel a report about why they are opposed to the prosecutors' latest decision.

All a question of priorities

Up in arms

Japan's military budget swells to its largest since the second world war

Jan 19th 2015 | TOKYO | Asia

<http://www.economist.com/news/asia/21640007-japans-military-budget-swells-its-largest-second-world-war-up-arms?fsrc=nlw|newe|20-01-2015>

SHINZO Abe, Japan's prime minister, returned to power in 2012 vowing to reverse years of decline in military spending. He has, for the third year running, kept that pledge. Last week his government passed a record defence package worth **¥4.98 trillion (\$42 billion)**, topping the previous peak set in 2002 and marking Japan's third straight annual rise.

The military shopping list includes 30 amphibious vehicles, three unmanned reconnaissance aircraft and six high-tech F-35A stealth fighters. Japan's defence minister, Gen Nakatani, cited the "changing situation around Japan" as the reason for the hike—now familiar shorthand for the turbo-charged rise of China. Defence officials say they are **playing catch-up with China's military budget**, which has multiplied 30 times over the past decade, while Japan's spending has shrunk. The new hardware will help beef up defences on Japan's remote outlying islands, including the Senkakus, claimed by China, which calls them the Diaoyu islands.

The budget tags money for a radar base on the tiny frontier island of Yonaguni too, the closest Japanese territory to mainland China. The defence ministry also wants to build up an amphibious assault force, modelled on that of America's marines, to retake remote territory from enemy hands in the event of an attack—part of a strategic shift to Japan's south and south-west.

But one of the centrepieces of this strategy could unravel there too, in Okinawa prefecture. A thousand miles southwest of Tokyo, its main island hosts three-quarters of the American army's footprint in Japan. Takashi Onaga, the prefecture's new governor, has tapped into a rich vein of resentment against this heavy presence by promising to block construction of an American military base backed by the governments of Japan and America. Resentment is focused on the Futenma air base, sat on a big chunk of land right in the centre of crowded Ginowan city.

The facility has generated decades of complaints about noise and crime. In 2006 the two governments agreed to close the aging facility and build a new base near the sleepy fishing village of Henoko, in Okinawa's less-populated north. But the agreement has proved controversial. Opponents insist Futenma be moved out of Okinawa, part of a bigger demand that Japan's mainland share the burden of the country's military alliance with America. Local opinion polls suggest four-fifths oppose building it off Henoko. Elderly activists have begun blocking trucks from entering the construction site.

Mr Abe's latest budget cut general spending to Okinawa by ¥16 billion, while allocating ¥147 billion to pay for the Futenma relocation and other projects linked to America's army. That is a sign that he intends to face down opposition to the new base and reinforce Japan's ties with its American ally, which plans to shift over half its navy to the Pacific by 2020. Mr Onaga, for his part, is under growing pressure to align

himself with the protesters. Opponents of the Yonaguni base will vote in a referendum on February 22nd. It could be the last gasp of Okinawa's ageing pacifists, or the start of something more serious for Mr Abe.

One way to find money

January 27, 2015

Kansai Electric aims to cut retirement benefits, in bid to raise prices again

<http://www.japantimes.co.jp/news/2015/01/27/business/corporate-business/kansai-electric-aims-cut-retirement-benefits-bid-raise-prices/#.VMifFS51Cot>

JJI

OSAKA – Kansai Electric Power Co. has asked its labor union to accept cuts in retirement allowances as the firm tries to repair its balance sheet, according to informed sources.

The utility also asked Monday for the union to agree to a **suspension in housing allowances from fiscal 2015.**

The company hopes the cost-cutting moves will help it secure government approval for another hike in domestic power prices, the sources said.

Reduced retirement benefits would affect around 18,000 rank-and-file employees. After reaching an agreement with the union, the company plans to apply the cuts also to some 2,700 employees in managerial posts, the sources said.

Specifically, the company plans to review its retirement benefits system from fiscal 2015 by raising the proportion of defined-contribution pension funds that are managed by employees, the sources said. The employees would get lower retirement allowances if investments underperform.

In May 2013, Kansai Electric raised its electricity rates for households by 9.75 percent on average. In exchange for the hike, the company conducted a 60 percent cut in executive pay, reduced monthly salaries of employees by 5 percent and skipped their bonuses.

The company's earnings deteriorated further last year as the nation's fleet of commercial nuclear plants remained idle, which forced it to incur imported fossil fuel costs. **In December, it applied for government approval for another full-scale household electricity rate hike of 10.23 percent.**

Kansai Electric has already imposed another 5 percent cut in executive pay, but it faces pressure to cut costs further.

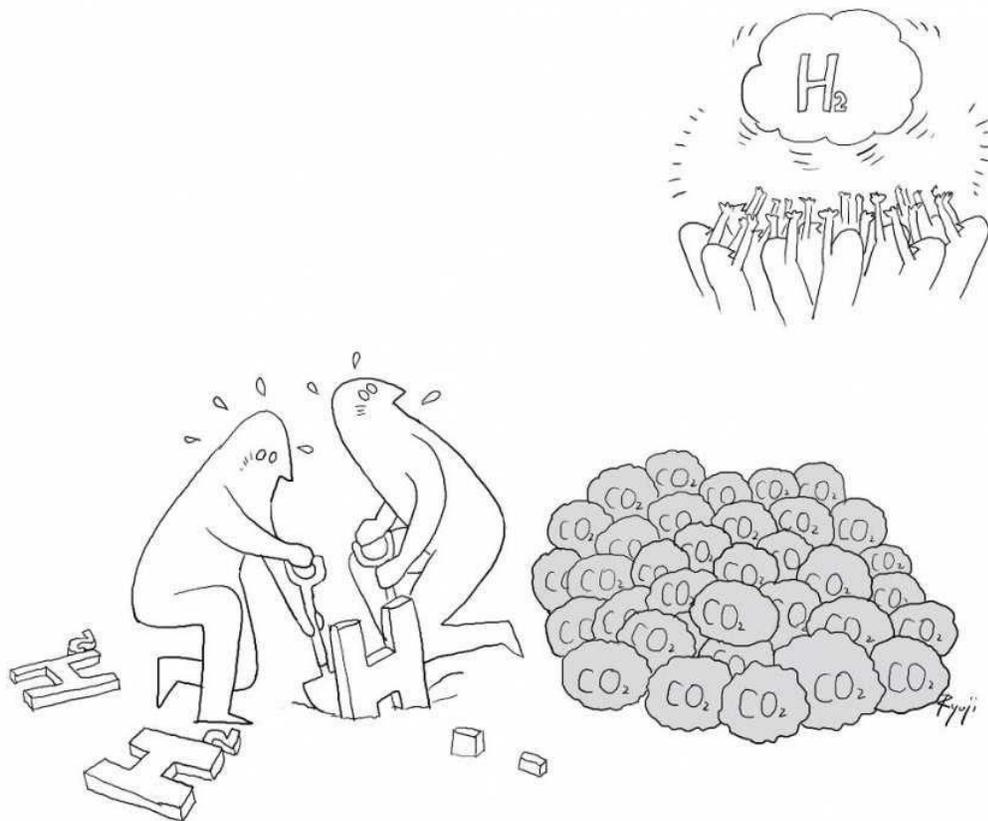

Hokkaido Electric Power Co., which faces a similar situation, hiked its household electricity rates again last November, becoming the first power supplier to conduct a second full-scale hike since the 2011 triple meltdown at Tepco's Fukushima No. 1 plant.

Hydrogen future: exaggeration and fabrication

January 27, 2015

Japan's hydrogen energy hype

<http://www.japantimes.co.jp/opinion/2015/01/27/commentary/japan-commentary/japans-hydrogen-energy-hype/#.VMoNBS51Cos>

Much excitement is permeating within the industrial segments related to hydrogen energy, following the government's announcement in June 2014 of the "Strategic Road Map for Hydrogen and Fuel Cells." It calls for creation of a "hydrogen-based society" as a **trump card to prevent a further global warming** and designates 2015 as the "first year" of the age of hydrogen.

In reality, however, the clean image of hydrogen-based energy and its economic viability are much exaggerated.

The government and business enterprises are rushing to building a hydrogen society in order to create huge public works largely funded by government subsidies, and gain rights and interests from them.

Creating demand for a hydrogen fuel and distributing it would require infrastructure preparations of enormous scales like mass-marketing of fuel cell-powered automobiles, building networks of hydrogen supply stations, construction of hydrogen liquefaction plants and creation of transport systems for liquefied hydrogen.

In contrast, the popularization of electric vehicles would not require large investments. Although battery cars represent another candidate for the next generation of motor vehicles, they can rely on facilities

already existing throughout the country to generate and transmit electricity and, besides, quick recharging stations can be built for only around ¥5 million each.

As **the infrastructure needed for a broad use of hydrogen is virtually non-existent**, hundreds of billions of yen would have to be invested in construction of new hydrogen plants throughout the country. In addition, ¥600 million will be needed to build one hydrogen station to supply hydrogen to fuel cell vehicles — 120 times more than the cost of setting up a quick charging station for battery cars.

With an eye on making the 2020 Tokyo Summer Olympic Games an arena to showcase Japan's hydrogen energy technologies, the government is working on plans to run fuel cell buses around the sports facilities and expanding networks of hydrogen fuel supply stations in the four metropolises of Tokyo, Nagoya, Osaka and Fukuoka.

Under the plans, the number of hydrogen stations will increase to 1,000 by 2025 nationwide from 100 in 2015, with the government bearing one half of the costs. This alone would represent splashing more than ¥300 billion in the taxpayer money.

In support of the plans, rosy statistics have been released by the government and think tanks. One corporation estimates, for example, that by 2020, the size of the fuel cell auto market will expand to the scale of ¥500 billion while the market for electric power generation using hydrogen will reach ¥900 billion.

Similarly, Deloitte Tohmatsu Consulting Co. forecasts that the sale of fuel cell cars will expand so rapidly that in 2025, 850,000 such cars will be sold in the United States, another 710,000 in Europe and 200,000 in Japan.

Lots of efforts are being made to drive home to the public the clean image of hydrogen as an energy source. The government is feverishly publicizing that hydrogen is the “ultimate clean energy source.” Hydrogen may appear to be the most appropriate substance to be touted as capable playing the principal role in building a carbon-free society because when it reacts with oxygen, only water is emitted. Moreover, some experts claim that if the exhaust heat is utilized in an energy supply system, the overall energy conversion efficiency could reach 90 percent, far surpassing 40 percent for thermal power generation.

These views would be correct if hydrogen was a primary energy source existing independently in nature. But hydrogen is a secondary energy source that must be obtained by reforming the composition and characteristics of hydrocarbons, which are the main components of natural gas and kerosene.

Since carbon dioxide is emitted in the process of producing this secondary energy source, it becomes clear that the government's claim that hydrogen is the “ultimate clean energy source” is fishy.

Furthermore, hydrogen will have to be liquefied and refrigerated at 253 C below zero in order to be transported. This process would consume large amounts of energy and generate carbon dioxide. Thus it is no exaggeration to say that the claim of hydrogen being carbon free is a sheer fabrication.

Studies are being conducted on directly combusting hydrogen to power cars and generate electricity, rather than using it for fuel cells. Although no carbon dioxide is emitted in this process, **nitrogen oxides**, which form when nitrogen in the atmosphere combines with oxygen, are emitted, as in the case of gasoline-powered automobiles and thermal power stations.

Another shortcoming is the small size of the hydrogen molecule and a technological solution has yet to be found to prevent hydrogen leakage from pipe seams.

The aforementioned rosy statistics about the impact of the use of hydrogen on the economy are a pie in the sky because they are based on an optimistic assumption that all problems related to technologies and

costs would be resolved easily. In other words, it represents a wishful thinking of those hoping to make windfall profits from colossal investments.

Some people say that even from a geopolitical standpoint, Japan is not fit to become a hydrogen society. European countries, for example, have closely meshed networks of pipelines that supply natural gas from Russia and they can easily obtain hydrogen with a simple method of reforming natural gas. The abundance of facilities to generate electricity through renewable energy sources, like solar and wind power, will make it possible to obtain hydrogen by using excess electricity to electrolyze water almost free of cost.

These processes are not feasible in **Japan, which doesn't have gas pipelines or excess electricity. As a result, it faces the high costs of obtaining hydrogen by reforming expensive liquefied natural gas and liquefied petroleum gas imported from the Middle East.** There is no prospect in sight of the costs of producing hydrogen dramatically falling.

The recent fall in crude oil prices has reduced the cost competitiveness of hydrogen as an energy source. Moreover, hydrogen cars costing ¥7 million each cannot be expected to be sold in large volumes in the most competitive, Asian auto market.

If the present trends continue, fuel cell automobiles made in Japan may survive solely with large subsidies provided by the government and may be sold and used only in Japan.

In the long run, it is essential to continue research on fuel cells. Development of an alternative material to platinum, which is used as catalyst in the production of hydrogen but is the cause of the high costs, is necessary.

While a number of domestic organizations are engaged in such research projects, **the government appears to be making the foolish move of providing subsidies to spread immature technologies that have not yet reached the level of practical use.** This could turn out to be a repeat of a similar folly the government committed in the promotion of solar power generation.

Politicians, bureaucrats and business circles are all rushing to the hydrogen-related projects, for which huge investments will be made, on the pretext of "reducing reliance on Middle Eastern oil" and "creating a low carbon society."

Ultimately, the taxpayers would have to pick up the bill for the public works projects the government will undertake blindly without assurance for their economic viability.

This is an abridged translation of an article from the January issue of Sentaku, a monthly magazine covering political, social and economic scenes.

TEPCO & Chubu Electric to merge

February 8, 2015

Tepco, Chubu Electric to merge existing thermal power plants

<http://www.japantimes.co.jp/news/2015/02/08/business/corporate-business/tepc-co-chubu-electric-merge-existing-thermal-power-plants/#.VNeDly51Cos>

Kyodo

Tokyo Electric Power Co. and Chubu Electric Power Co. will transfer operations of their existing thermal power plants to a new joint venture, creating a huge thermal power company with a dominating market share.

Under their agreement, to be finalized Monday, their thermal power generation operations will be transferred in several years to the fifty-fifty joint venture to be established in April, sources close to the matter said Saturday.

In October, the two utilities reached a basic agreement on a tie-up including joint procurement of liquefied natural gas and replacement of aging thermal power generation facilities, but they had continued to discuss what to do with their existing plants.

In their talks, Tepco called on Chubu Electric to transfer its existing facilities to the new venture, while Chubu Electric was concerned that spinning off its core thermal power business could impair its management autonomy, the sources said.

But Chubu Electric apparently agreed to Tepco's proposal of expanding the operation of the new venture, as the utility is likely to face a severe business environment with the full liberalization of Japan's retail electricity market in 2016.

The combined output capacity of their existing thermal power plants was nearly 70 million kilowatts as of March 2014 — **more than half of the total thermal power generation capacity of Japan's 10 regional electric companies.**

The joint operation will allow **a significant cut in fuel and other costs**, the sources said. The utilities are also expected to realize economies of scale in repair and maintenance work.

The timing of merging the existing thermal power operations could be delayed depending on how smoothly their comprehensive tie-up proceeds.

The tie-up agreement is the pillar of Tepco's rehabilitation plan approved by the government in January last year following the 2011 Fukushima No. 1 nuclear power plant disaster.

"Politically motivated resistance"

February 10, 2015

10.02.2015_No32 / News

Failure Of Swiss Safety Initiative Blamed on 'Politically Motivated Resistance'

<http://www.nucnet.org/all-the-news/2015/02/10/failure-of-swiss-safety-initiative-blamed-on-politically-motivated-resistance>

10 Feb (NucNet): A Swiss-led initiative to further strengthen global nuclear safety by amending an international treaty has failed because of "politically motivated resistance" by some nations, Switzerland's chief nuclear regulator has said.

Representatives from 77 countries adopted the **non-binding** 'Vienna Declaration on Nuclear Safety' at a conference in Vienna yesterday, rather than voting on a proposed Swiss amendment aimed at imposing stricter rules under the Convention on Nuclear Safety (CNS).

"Without the readiness of major nuclear energy producing countries to support our initiative, the goal of improving nuclear safety worldwide wasn't achieved," said Hans Wanner of the Swiss Nuclear Safety Inspectorate (ENSI) in an online statement. "The resistance was mainly politically motivated."

The French nuclear safety authority ASN (Autorité de Sûreté Nucléaire) also issued a strongly worded statement, saying the conclusions of the conference were limited to “a non-binding political statement which does not strengthen the legal obligations of the signatory states”.

“The general objectives [approved yesterday] remain below the legally-binding dispositions of the European Directive on Nuclear Safety revised in 2014,” ASN said. “This situation might lead to a two-tier nuclear safety system in the world, which would eventually be detrimental to all countries.

“The outcome of the negotiations does not live up to the issues at stake, recalled by the Fukushima-Daiichi accident.”

But ENSI also said the adopted principles differ little from Switzerland’s original amendment. “The result is a success for Switzerland and for the world,” Mr Wanner said. “The international community has committed to continuously improving the safety of nuclear power plants around the world,” ENSI said.

ENSI said all participating countries agreed on a statement and the statement has security principles resulting from Switzerland’s initial proposal.

ENSI said key principles had been agreed including that new nuclear stations should be designed and constructed according to most recent safety standards and the latest technologies with the aim of avoiding accidents. However, if an accident were to occur, its consequences must be mitigated and significant releases of radioactive material must be prevented at an early stage.

The safety of existing nuclear facilities must be systematically and regularly reassessed. These reassessments should be used as a reference value “for the timely implementation of safety improvements achievable in a reasonable manner”.

Yesterday’s conference was initially called to consider the proposal by Switzerland to amend Article 18 of the CNS, related to the design and construction of nuclear installations.

The proposal was to add a paragraph that said: “Nuclear power plants shall be designed and constructed with the objectives of preventing accidents and, should an accident occur, mitigating its effects and avoiding releases of radionuclides causing long-term off-site contamination. In order to identify and implement appropriate safety improvements, these objectives shall also be applied to existing plants.”

The IAEA said the contracting parties had thoroughly considered the Swiss proposal and concluded it would not be possible to reach consensus on the amendment. Instead, in order to reach the same objective as the proposed amendment, parties unanimously recommended for adoption the Vienna Declaration on Nuclear Safety including principles for the implementation of the convention to prevent accidents and mitigate radiological consequences.

The declaration contains a series of principles to guide countries in the implementation of the objectives of the CNS.

While the declaration says that “reasonably practicable or achievable safety improvements are to be implemented in a timely manner,” it falls short of the original Swiss goal of requiring operators to implement back-up systems to contain radioactive contamination in the event of an accident.

The objective of the CNS, which entered into force on 24 October 1996, is to achieve and maintain a high level of nuclear safety worldwide through the improvement of national measures and international cooperation.

The IAEA said obligations for the 77 contracting parties under the CNS include submitting national reports on the implementation of their obligations under the CNS for peer review in meetings held every three years. The last review meeting took place in Vienna from 24 March to 4 April 2014, with more than 800 participants from 69 contracting parties attending.

TEPCO & Japan Atomic Power

February 11, 2015

Tepco offers to keep contract with Japan Atomic Power

<http://www.japantimes.co.jp/news/2015/02/11/national/tepcos-offers-to-keep-contract-with-japan-atomic-power/#.VNt6EC51Cos>

Jiji

Tokyo Electric Power Co. plans to keep its business contract with Japan Atomic Power Co. in place if the nuclear power firm helps Tepco decommission its crippled Fukushima No. 1 nuclear plant, informed sources said Wednesday.

Japan Atomic Power relies on basic fees it receives from Tepco and four other power suppliers to keep it afloat, as all three of its nuclear reactors remain offline. The fees are paid under contracts that are up for renewal every year.

Japan Atomic Power plans to draw up a reconstruction plan by the end of this month to win approval from the five electricity firms to keep their contracts in place. Tepco is the largest shareholder of Japan Atomic Power.

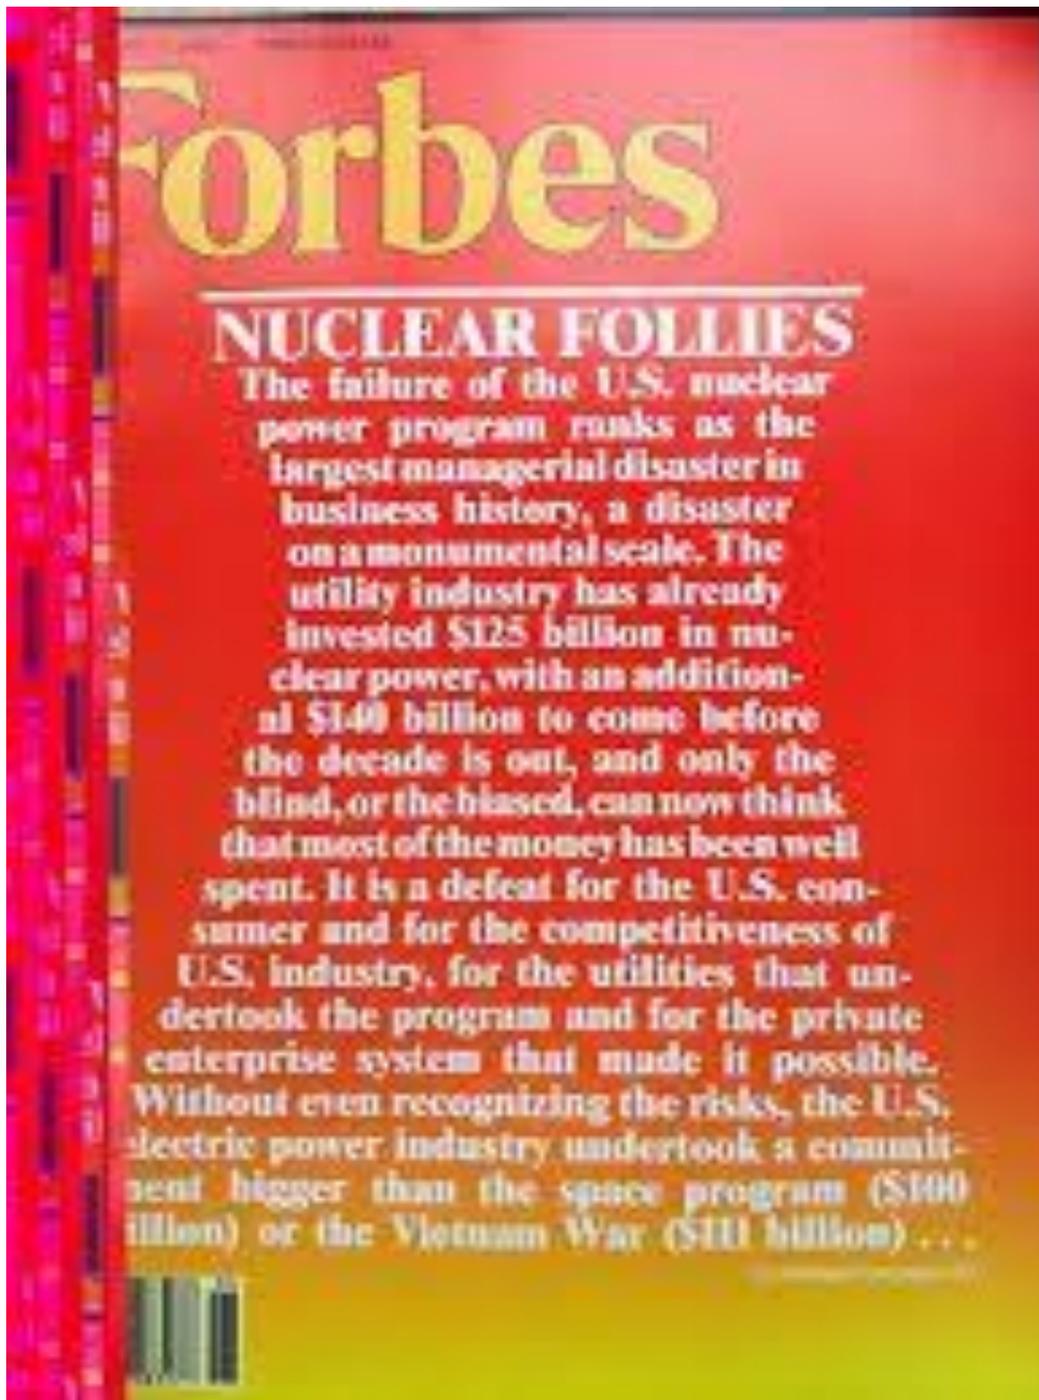

If Japan Atomic Power agrees to fully cooperate with Tepco to decommission the Fukushima No. 1 nuclear plant, Tepco can win understanding of its own shareholders, including the government, to continue paying the fees, senior Tepco executives said. Tepco plans to make a decision by the end of the month.

The Tepco executives also said Japan Atomic Power should present a vision for its future in the reconstruction plan.

Japan Atomic Power, which started operating the country's first commercial nuclear power reactor in 1966, owns one pressurized water reactor and two boiling water reactors.

Tepco has been proposing splitting Japan Atomic Power into two smaller firms — one in charge of the pressurized water reactor and the other for the boiling water reactors, the executives said.

"Nuclear Follies" in Forbes magazine

Nuclear power's "managerial disaster" still true 30-years later

<http://www.beyondnuclear.org/home/2015/2/11/nuclear-powers-managerial-disaster-still-true-30-years-later.html>

Forbes magazine's February 11, 1985 cover story headlined "Nuclear Follies." The business investment journal wrote "The failure of the U.S. nuclear power program ranks as the largest managerial disaster in business history, a disaster on a monumental scale... only the blind or the biased can now think that the money has been well spent."

Fast forward thirty years, we see the nuclear industry still imploding. The "blind or biased" now include industry front groups like "Nuclear Matters" arguing that American taxpayers and ratepayers should still be bailing out the teetering industry at any cost. Ex-Environmental Protection Agency head Carol Browner and former New Hampshire Senator Judd Gregg were recently stumping in Northern Ohio on behalf of industry to keep the deteriorating nuclear power plant there from closing. However, their effort to spin the continued demise of dirty, dangerous and expensive nuclear power as a critical missed opportunity completely ignores the historic context that *Forbes* benchmarked decades ago for the business investment community. Nuclear power is fundamentally uneconomical. It has failed in the U.S. market economy and continues to fail worldwide.

Browner and Gregg's snapshot of the remaining 99 U.S. reactors being down from 104 units needs to be put into an accurate historical context. In fact, the remaining 99 reactors are down from the 133 units originally licensed to commercially operate, which are down from 227 units that applied for construction permits and down again from 253 units ordered by the U.S. industry. This steady retreat is actually down from the 1,000 reactors that President Nixon's "Project Independence" said would be operational by the year 2000.

In fact, what Browner, Gregg and their cohorts are suggesting is that the American people invest even more to prop up what *Forbes* then cautioned investors "is a defeat for the U.S. consumer and the competitiveness of U.S. industry, for the utilities that undertook the program and for the private enterprise system that made it possible."

The nuclear industry is being priced out of the energy service market and at the same time becoming increasingly dangerous as a result of financial shortcuts and regulatory capture. The good news is that nuclear power is being replaced by rapidly growing solar and wind energy industries, energy efficiency and conservation. No surprise that *Nuclear Matters*, which is funded by the nuclear giant Exelon Corporation, would have the American consumers put the brakes on a 21st Century of affordable and renewable energy competition and instead stay the course with a rerun of *Forbes'* 1985 warning.

Cheating: Nothing new

Corporations suspected of rigging bids for pavement projects since before 3/11

<http://mainichi.jp/english/english/newsselect/news/20150214p2a00m0na012000c.html>

Corporations suspected of banding together to rig bids for pavement projects in the aftermath of the Great East Japan Earthquake of March 2011 are strongly suspected of having been doing so for years before the quake as well, it has been learned.

When construction costs were raised due to a shortage of personnel and other resources after the earthquake disaster, the corporations worked together to push up the prices that they would do the jobs for, it is alleged. Now, it has been learned that this conspiring is thought to have continued for over five years for a period stretching both before and after the quake disaster.

On Jan. 28 and 29 this year, the commission searched the offices of 20 companies including major construction firm Nippo Corp. on suspicion of breaking the anti-monopoly law by illicitly restricting others' transactions. The companies are accused with regard to auctions for 12 expressway paving projects that were ordered by East Nippon Expressway Co.'s Tohoku branch in August and September of 2011.

According to the source, one or more of the businesses has admitted to the allegations that corporations conspired together to rig the 12 auctions, telling the commission, "Such conspiring was taking place from at least a few years prior to the earthquake."

"Multiple large corporations acted as 'organizers,' distributing the construction jobs to each of the companies (who were in on it)," the source says that the commission was told.

According to the recorded results of auctions for the Tohoku branch's 11 paving projects from April 2010 through November 2010, the average winning bid constituted 80.23 percent of the maximum limit. By contrast, the average winning bid was 94.77 percent of the limit for the 12 post-quake auctions alleged to have been manipulated -- a jump of around 14 percentage points. The commission holds that the conspiring companies made their bids at these high levels in order to cover the raised expenses caused by personnel and material shortages after the quake.

The companies are thought to have collaborated not only on manipulating the bids for paving contracts from the East Nippon Expressway Co., but also on those from the Ministry of Land, Infrastructure, Transport and Tourism's Tohoku Regional Bureau. The committee appears to believe that these started some years before the Great East Japan Earthquake as well.

East Nippon Expressway Co. was founded in October 2005 together with the privatization of four public corporations, such as the Japan Highway Public Corp. It handles management of expressways and road construction in eastern Japan, and the national government provides over half of its funds. The company recorded around 859 billion yen in sales for the 2013 fiscal year.

The Japan Fair Trade Commission is continuing to look into the matter.

Press freedom and state secrets law

Report: Japan's press freedom deteriorates under state secrets law

http://ajw.asahi.com/article/behind_news/politics/AJ201502130073

By HIDEKI AOTA/ Correspondent

PARIS--Japan's press freedom ranking dropped two notches to No. 61 in an annual survey on freedom of information in 180 countries and regions.

Released Feb. 12 by international nongovernmental organization Reporters Without Borders, the World Press Freedom Index 2015 report cited the enforcement of the state secrets protection law in December 2014.

Under the law, reporters can be imprisoned for obtaining information that the government deems a “state secret.”

The report did not cover the Japanese government’s confiscation of the passport of a freelance photojournalist who planned to go to war-torn Syria later this month.

But Benjamin Ismail, head of the Asia-Pacific desk of the Paris-based NGO, said the Feb. 7 confiscation infringed on press freedom. He added that the decision to go to certain places for news coverage is up to journalists, not the government.

Overall, media freedom deteriorated throughout the world in 2014, according to the report.

The report showed that Northern European countries continued to hold the highest ranking in terms of press freedom. Finland took the top position, followed by Norway and Denmark.

North Korea and China remained in the cellar of the rankings, standing at 179 and 176, respectively. Syria was 177th.

The report also criticized the Islamic State extremist group for its attacks against journalists. The report said the militants are mercilessly killing reporters whom it regards as enemies.

The report also expressed anxieties over recent anti-terror measures taken by France and Britain. France eased procedures to monitor certain individuals, while Britain has gathered personal information on certain reporters.

TEPCO to sell gas and electricity throughout Japan

February 16, 2015

TEPCO plans to expand business across Japan from 2016

<http://ajw.asahi.com/article/business/AJ201502160023>

THE ASAHI SHIMBUN

Tokyo Electric Power Co., recipient of a government bailout to deal with the crisis at its crippled Fukushima No. 1 nuclear power plant, now plans to expand its power distribution network across Japan, according to President Naomi Hirose.

“We will **expand to regions where we have no market share**,” Hirose said in a recent interview with The Asahi Shimbun.

Although only a single utility is currently allowed to supply electricity in each region, power companies will be allowed to provide electricity to households outside its own assigned area from April 2016.
