For entry into areas TEPCO does not serve, Hirose said the utility is considering working with mobile phone carriers and other telecommunication companies that have nationwide customer networks.

TEPCO will announce the outline of new services by the end of fiscal 2015.

According to the president, **TEPCO intends to boost its share in new markets by offering a discount to customers who use services of both TEPCO and its partner telecommunication firms as a package.**

It will also commission alliance companies to collect electricity bills.

As of the end of fiscal 2013, TEPCO covers 27.01 million households mainly in the Tokyo metropolitan area.

As utilities are expected to be allowed to provide gas for households across Japan from 2017, **TEPCO also plans to sell electricity and gas as a package throughout the country in the future.**

TEPCO struggled financially in the aftermath of the Fukushima nuclear crisis, triggered by the Great East Japan Earthquake and tsunami on March 11, 2011.

It was forced to accept financial assistance from the government to provide compensation to victims of the accident and to deal with the disaster. The utility also raised electricity rates for household and corporate customers.

Raising power rates again?

February 16, 2015

Tepco to mull rate hike if it can't restart Niigata nuclear complex

<http://www.japantimes.co.jp/news/2015/02/16/business/tepco-mull-rate-increase-hike-cant-restart-niigata-nuclear-complex/#.VOGt8i51Cos>

Bloomberg

Tokyo Electric Power Co. said it will need to consider raising electricity rates for the first time since 2012 unless it can restart the world's biggest nuclear plant.

Resumption of the Kashiwazaki Kariwa station in Niigata Prefecture is essential for sustaining profits,

Tepco President Naomi Hirose said in a Saturday interview at the utility's headquarters in Tokyo. Tepco cannot continue to prop up earnings by postponing repairs and taking other cost-cutting measures, he said.

The operator of the crippled Fukushima No. 1 plant had expected to start two reactors at Kashiwazaki-Kariwa in July as part of its turnaround plan released in January last year. Tepco, which serves about 29 million customers in the Tokyo metropolitan area, pledged earlier this month to keep electricity rates unchanged at least this year even as inactive nuclear reactors pressure Japanese utilities to increase prices.

"Even as Kashiwazaki-Kariwa remains offline, we posted a profit last year and can probably do so again this year," Hirose said. "I wouldn't say there won't be the third time, but we cannot expect it can last forever."

The station, 220 km (137 miles) northwest of Tokyo, was idled for maintenance in March 2012. It consists of seven reactor units.

All of Japan's 48 reactors remain idled as the Nuclear Regulation Authority's safety checks and other restart processes have taken longer than expected. In addition, the majority of Japan's public remain opposed to restarting nuclear reactors after the triple meltdown at Tepco's Fukushima No. 1 plant, according to opinion polls.

Hirose said Tepco "must devote ceaseless effort" to gain understanding of the governor of Niigata prefecture, Hirohiko Izumida, a vocal critic of the utility, and of local communities on restarting the Kashiwazaki-Kariwa station.

Tepco returned to profit last fiscal year, ending three consecutive years of losses after the Fukushima disaster left it with massive liabilities. The utility forecasts a net income of ¥521 billion (\$4.4 billion) for the year ending March 31, up from ¥438.6 billion profit in the previous period, according to its latest earnings report in January.

Tepco's nonconsolidated pretax profit for the year ending March 2016 may be about ¥13 billion if the Kashiwazaki-Kariwa plant remains idled until December, the Nikkei newspaper reported Saturday, citing the utility's forecast presented to lenders.

Pretax profit may be ¥65 billion if the station is restarted in October, while a resumption as early as in July is likely to help post a ¥199 billion profit in the same year, the newspaper said.

The best way to spend money in Tohoku?

February 13, 2015

Tokyo Gov. Masuzoe wants to use disaster recovery funds for Olympic events in Tohoku

<http://mainichi.jp/english/english/newsselect/news/20150213p2a00m0na016000c.html>

Tokyo Gov. Yoichi Masuzoe says he will ask the central government to use part of the Tohoku tsunami disaster reconstruction budget to cover the costs of staging some events for the 2020 Tokyo Olympics and Paralympics in areas that were severely affected by the 2011 disaster.

In an interview with the Mainichi Shimbun on Feb. 12, about a year after he was elected governor, Masuzoe emphasized that allocating the reconstruction budget to hold events in the Tohoku region would be the best way to spend the money.

Regarding policies laid out by the International Olympic Committee at the end of last year, which said the committee would approve of holding Olympic events in different cities to reduce the financial burden placed on the host city, Masuzoe was enthusiastic about staging events in Tohoku. He said that the cost of holding such competitions could be covered by the disaster reconstruction budget if the public agreed. However, reconstruction minister Wataru Takeshita expressed opposition to Masuzoe's plan last year, saying, "The reconstruction budget should be directly used for projects related to disaster recovery, and I believe the cost of hosting the Olympics can be covered from elsewhere," adding that the organizing committee for the Games is responsible for holding events in disaster-affected areas.

The use of the disaster reconstruction budget has come into question after it was discovered that only 0.7 percent of timber supplies planned to be provided to Fukushima, Miyagi and Iwate prefectures for Forestry Agency projects had been provided to the prefectural governments. Consequently, the Board of Audit requested the government to improve the use of the budget last year.

In response to Takeshita's comment, Masuzoe said, "Remarks like that should be made after the government reflects on the issue and sees that the budget has not been spent (for Tohoku). No project is more suited for the reconstruction budget than to show the world how much Japan has recovered from the disaster."

There is a rough road ahead for Masuzoe's plan, however, as some Tohoku residents say that spending the reconstruction budget on the Olympics will not win support from the local community.

Masuzoe also told the Mainichi that the Tokyo Metropolitan Government is moving toward making a hydrogen fuel cell energy-based society and plans to start experimental projects in Chuo Ward's Harumi district, which will host the Olympic Village during the 2020 Games. "We can start city planning from scratch at the planned athletes' village, and the site is suited for experimental projects," Masuzoe commented.

February 13, 2015(Mainichi Japan)

Concerns about NRA's future independence

February 19, 2015

Foreign advisers fear for loss of nuclear regulator's independence

<http://www.japantimes.co.jp/news/2015/02/19/national/foreign-advisers-fear-for-loss-of-nuclear-regulators-independence/#.VOYHvS51Cos>

Reuters

International advisers to the Nuclear Regulation Authority are worried that a mandatory review of its performance could lead to a loss of independence for the body, created in the wake of the 2011 Fukushima nuclear disaster.

A lack of independent regulatory oversight of Tokyo Electric Power Co. and the Fukushima No. 1 nuclear plant was to blame for three meltdowns there after the March 2011 quake and tsunami, an official inquiry into the disaster found.

After the disaster, the NRA was launched under the Environment Ministry with more autonomy, but **legislation provides for a review after three years of operation with a proviso to consider placing it under the Cabinet Office, involving closer political oversight.**

While welcoming a review of the NRA, the advisers, who include the chairman of the International Atomic Energy Agency's International Nuclear Safety Group, **Richard Meserve**, are **concerned about political interference**, they said in a document dated Wednesday and posted on the regulator's website.

"We . . . are concerned about any transfer of authority that would serve to compromise the regulator's independence," the document says.

"Indeed, given the problems associated with the previous regulatory structure, we suspect **the maintenance of a clearly independent regulator is likely to be essential to the restoration of public confidence in nuclear power.**" The review of NRA operations started in September, but no decisions have been made on whether the Cabinet Office will assume oversight.

"We welcome the points raised by the international advisers and will take them into consideration," NRA Chairman Shunichi Tanaka said at a meeting on Wednesday that was broadcast live on the Internet.

The Cabinet Office coordinates planning and policy on issues of crucial national importance and works as the "place of wisdom" in support of the prime minister and Cabinet, according to its website.

Prime Minister Shinzo Abe is a strong proponent of nuclear power and wants to restart reactors that pass the new safety regime.

All of Japan's reactors were shut down gradually in the wake of the Fukushima triple meltdown, the worst nuclear disaster since Chernobyl in 1986.

The other international advisers to the NRA are **Andre-Claude Lacoste**, a former chairman of France's Nuclear Safety Authority, and **Michael Weightman**, a former executive head of the British Office for Nuclear Regulation.

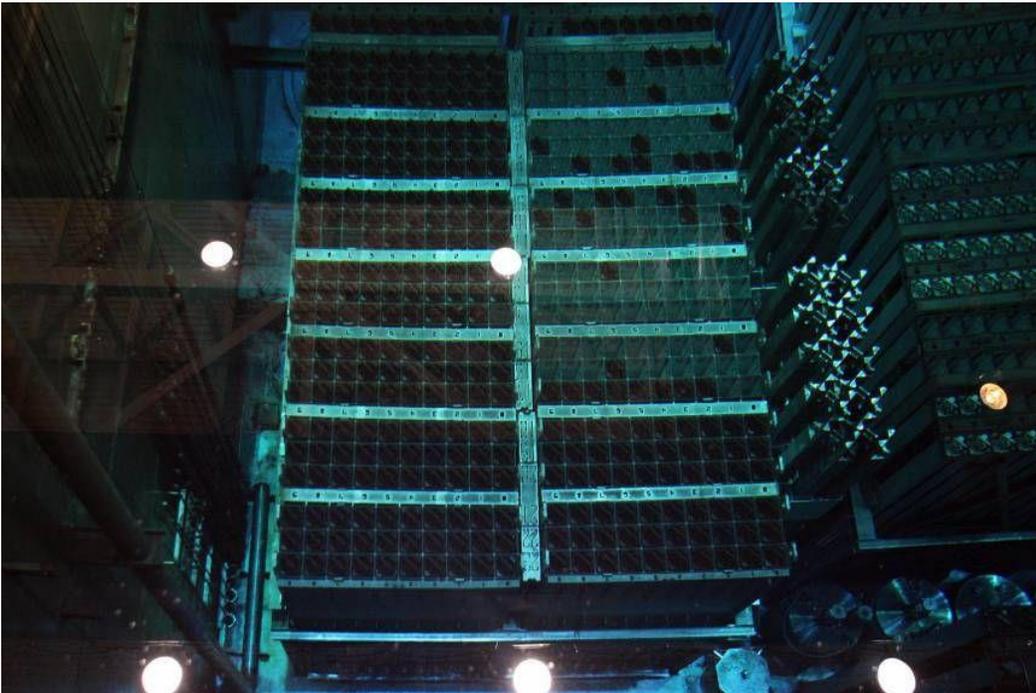

The earthquake and tsunami of March 11, 2011, destroyed the Fukushima No. 1 plant. The nuclear disaster forced more than 160,000 residents to flee nearby towns and contaminated water, food and the atmosphere.

MOX enormously expensive

February 22, 2015

MOX imports have cost at least ¥99.4 billion, much higher than uranium fuel

<http://www.japantimes.co.jp/news/2015/02/22/national/mox-imports-have-cost-at-least-%C2%A599-4-billion-much-higher-than-uranium-fuel/#.VOmX1i51Cot>

Channel boxes containing fuel rods with plutonium-uranium mixed oxide (MOX) lie in a pool in the building housing the No. 3 reactor at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear power station in the town of Okuma in August 2010. | BLOOMBERG

Jiji

Five nuclear plant operators have spent at least ¥99.4 billion on imports of plutonium-containing mixed oxide (MOX) fuel since it was first shipped to Japan in 1999, Jiji Press learned on Saturday.

Some of the imports cost nine times more than conventional uranium fuel. The MOX expenses are partly reflected in monthly electricity bills.

The MOX fuel, a mixture of plutonium extracted from spent nuclear fuel and uranium, is a core component of Japan's nuclear fuel cycle. But the use of the fuel has drawn criticism for its high costs.

Japanese power companies that use or plan to use the MOX fuel commission the fuel's production from companies in France and elsewhere.

The five that imported MOX fuel are **Tokyo Electric Power Co., Chubu Electric Power Co., Kansai Electric Power Co., Shikoku Electric Power Co. and Kyushu Electric Power Co.**, according to the Federation of Electric Power Companies of Japan.

Of the five, Kansai Electric, Shikoku Electric and Kyushu Electric have revised their monthly power rates to reflect the cost of using MOX fuel.

Since 1999, MOX fuel has been shipped to six of the five companies' nuclear power stations. Trade statistics compiled by the Finance Ministry and other data show that **the imports since that time have totaled ¥99.437 billion**, including the costs of transportation and insurance.

In June 2013, Kansai Electric imported 20 units of MOX fuel assemblies from France for ¥18.514 billion for use at the No. 3 and No. 4 reactors at the Takahama power station in Fukui Prefecture.

The average cost per unit stood at ¥925 million, compared with the average of around ¥103 million for 60 units of conventional uranium fuel that Kansai Electric imported from the United States between October and November that year, also for use at the two reactors.

All five power companies declined to disclose MOX fuel costs, citing **confidentiality of MOX fuel procurement contracts**.

Japanese power companies use MOX fuel by mixing it with conventional uranium fuel. The share of the MOX fuel in the total fuel used has been limited to around 30 percent so far. The Oma nuclear power station of the Electric Power Development Co. (J-Power), which is under construction, will be the first one that will rely entirely on MOX fuel.

The use of MOX fuel in Japan is being halted because all commercial reactors still remain idle nearly four years after the nuclear disaster at Tepco's Fukushima No. 1 power station began in March 2011. The federation planned to have MOX fuel used at 16 to 18 reactors across Japan by fiscal 2015, but the plan was put off.

No measures taken for radioactive water leak

<http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html>

Feb. 25, 2015 - Updated 01:42 UTC+1

The operator of the Fukushima Daiichi nuclear plant **did not take any measures to prevent radioactive water that accumulated on the roof of one of the reactor buildings from flowing into the Pacific Ocean.**

Tokyo Electric Power Company said on Tuesday that **rainwater with relatively high levels of radioactive substances has collected on the roof of the No. 2 reactor building.**

It said the contaminated water may have flowed into a drainage channel whenever it rained and could have spilled into the Pacific Ocean beyond the plant's port.

TEPCO was aware of these rises in the concentration of radioactive substances in the drainage channel as long ago as April last year.

But it did not make the information public or take any measures to stop the water from spilling into the ocean.

TEPCO has not installed floodgates or equipment in the drainage channel that would warn of rising concentrations of radioactive substances. **The utility says there are no radioactive standards for the rainwater it is allowed to discharge into the ocean and it does not plan to install any devices in the channel.**

The operator says no major changes have been observed in the levels of radioactive substances in nearby seawater.

But local residents, including workers in the fishing industry, may react sharply to the news. The drainage channel flows into the sea beyond the port. **TEPCO had earlier explained that the contaminated water only affected the port area.**

Tepco admits it failed to disclose cesium-tainted water leaks since April

<http://www.japantimes.co.jp/news/2015/02/25/national/tepcO-admits-failed-disclose-cesium-tainted-water-leaks-since-april/#.VO17iS51Cos>

JJI

Tokyo Electric Power Co. said Tuesday it has failed to disclose leaks into the sea of rainwater containing radioactive substances from a drainage ditch linked to a building at its stricken Fukushima No. 1 nuclear power plant although it became aware of the leaks in April last year.

The building is highly contaminated with radioactive substances such as cesium that have been released from the plant since it was damaged in the March 2011 earthquake and tsunami.

As the drainage ditch in question is connected to the roof of the reactor 2 building, **29,400 becquerels of radioactive cesium per liter were detected from water accumulated on the rooftop**, Tepco said.

The water also contained 52,000 becquerels of beta ray-emitting radioactive substances such as strontium-90.

The drainage ditch is linked to the Pacific Ocean. Some 1,050 becquerels of radioactive cesium and 1,500 becquerels of beta ray-emitting radioactive materials per liter were detected near an outlet leading to the sea.

Tepco said that there have been no major changes in the amount of radioactive substances detected in seawater collected from an area about 1 km from the drainage outlet.

The company saw water contaminated with high levels of radiation flowing to the plant's port through another drainage ditch Sunday.

Shocked fishermen feel betrayed

February 25, 2015

Shocked' at silence over water leak at wrecked Fukushima No. 1 plant

<http://www.japantimes.co.jp/news/2015/02/25/national/tepcos-admits-failed-disclose-cesium-tainted-water-leaks-since-april/#.VO3IYy51Cos>

Kyodo, JIJL, Staff Report

Fishermen in Fukushima Prefecture slammed Tokyo Electric Power Co. on Wednesday after it emerged that water containing cesium and other radioactive isotopes has been draining into the Pacific near the Fukushima No. 1 plant and that Tepco did nothing to prevent it despite learning of the leak last May.

"I don't understand why (Tepco) kept silent even though they knew about it. Fishery operators are absolutely shocked," Masakazu Yabuki, chief of the Iwaki fisheries cooperative, said at a meeting with Tepco officials.

Local fishermen have already given Tepco approval to dump groundwater into the ocean before it becomes tainted, to reduce the volume of water stored in tanks at the site. The operator is now doing this, pumping water from wells, monitoring it and piping it into the ocean.

The latest incident threatens to delay a second round of approval that Tepco wants the fishermen to provide.

The utility admitted Tuesday it failed to disclose leaks of rainwater containing radioactive substances from a drainage ditch at the stricken plant even though it was aware of high radiation in the water last spring.

The ditch receives runoff from the roof of the No. 2 reactor building, which is highly contaminated with radioactive substances such as cesium.

Tepco has said it recorded 29,400 becquerels of radioactive cesium per liter in water pooled on the rooftop.

The water also contained 52,000 becquerels of beta-ray-emitting radioactive substances such as strontium-90. It also detected some 1,050 becquerels of radioactive cesium and 1,500 becquerels of beta ray-emitting radioactive materials per liter near an outlet leading to the sea.

Tepco said there is no major change in the concentration of radioactive substances in seawater it sampled about 1 km from the drainage outlet.

Meanwhile on Sunday, Tepco reported water contaminated with high levels of radiation was flowing into the ocean at the plant's port through another drainage ditch.

Yuji Moriyama, a Tepco spokesman said the utility did not disclose the information because there is no evidence of environmental impact.

"We were aware that the levels of radioactive materials around the drainage ditch were higher than other places," Moriyama said, adding that they have been investigating the sources of contamination since last spring.

Fishermen accuse TEPCO of betrayal

http://www3.nhk.or.jp/nhkworld/english/news/20150225_24.html

Feb. 25, 2015 - Updated 08:03 UTC+1

Fishermen are accusing the operator of the crippled Fukushima Daiichi nuclear power plant of betraying their trust. The power company has admitted it did not take steps to prevent some contaminated rainwater from spilling into the Pacific Ocean.

Tokyo Electric Power Company officials said on Tuesday the water had accumulated on the roof of the No.2 reactor building. They said the water contained relatively high levels of radioactive substances, and that it may have leaked into the sea through a drainage channel.

TEPCO officials said they were aware last April that the density of radioactive substances in the channel rose when it rained. But they did not make that information public, or take steps to prevent the water from leaking into the sea.

A TEPCO official on Wednesday apologized for the spill at a meeting of the heads of local fisheries cooperatives. But he said the company found no major changes in the level of radioactive substances in the sea near the plant. He said radiation levels in the drainage channel were lower than those in the water on the roof.

Some fisheries chiefs said they felt betrayed after working with TEPCO to settle the problem.

They said the firm's repeated concealment of information has helped fuel the rumors that are hurting the local fishing industry.

Worrying: Media self-restraint

February 25, 2015

Under Abe's reign, media self-censorship in Japan is rising

<http://www.japantimes.co.jp/news/2015/02/25/national/media-national/japanese-media-self-censorship-seen-growing-abes-reign/#.VO17-S51Cos>

by Linda Sieg

Reuters

Worries are growing in Japan about a trend toward media self-censorship as journalists and experts say news organizations are toning down criticism of Prime Minister Shinzo Abe's government for fear of sparking ire and losing access to sources.

No one is accusing Abe's administration of overt meddling in specific news coverage, but media insiders and analysts say the government's message is getting through.

"The media did, in recent years, play a much more positive role in . . . making people in power squirm. In the Abe era, they have begun pulling back," said Jeffrey Kingston, director of Asian studies at Temple University's Japan campus.

"There is a chilling atmosphere that encourages media organizations to exercise self-restraint."

The conservative Abe, who returned to office in 2012, had fraught media ties during his first term, which ended when he quit in 2007 after a year of scandals and ill health.

This time, Abe wants to avoid the same mistake, experts say.

His appointee as chairman of NHK, Katsuto Momii, raised doubts about the respected broadcaster's independence when he told his first news conference in early 2014: "We cannot say left when the government says right."

Late last year, a ruling party aide to Abe wrote to television broadcasters ahead of an election demanding fair coverage. Many journalists took the letter as a signal they should dampen criticism or risk losing access to officials.

"There have been cases of media self-restraint in the past, but they usually involved the Imperial family, or, as after the 2011 tsunami and nuclear disaster, when media adopted a sober tone," said Shinichi Hisadome, a foreign news editor at the Tokyo Shimbun, a feisty metropolitan daily regarded in media circles as less submissive than national media.

"I think this is the first time that criticism of the government itself has been so restrained," Hisadome said. Experts say the result is a far friendlier tone toward the government even among media that previously were critical.

"Criticism of the government has dropped sharply," said Kozo Nagata, a former NHK producer and now a professor of media studies at Musashi University.

In one example of the climate, a producer of TV Asahi's "Hodo Station," a nightly news show known for not pulling punches, will be shifted to a new post from April because she would not heed internal warnings not to criticize Abe's government, two sources said.

An outspoken guest commentator will also be replaced, the sources said. Former trade ministry official Shigeaki Koga, who sparked a flap last month by criticizing Abe over a hostage crisis that ended with the killing of two Japanese captives by Islamic State militants, told Reuters he had been told he would not be asked to appear as a guest on the show after March.

TV Asahi told Reuters nothing had been decided regarding personnel or guest commentators.

Chief Cabinet Secretary Yoshihide Suga told reporters on Tuesday the government fully respected press freedom. Referring to criticism of Abe on television over the hostage crisis that he said misrepresented facts, he added: "Seeing that, don't you think freedom truly is guaranteed in Japan?"

Journalists and experts, though, say the trend toward self-censorship has worsened since the hostage crisis. **Nearly 3,000 people, including journalists and scholars, signed a statement this month raising concern about freedom of expression.**

“We’ve reached the stage where even without the government doing anything, mass media produce articles that cozy up to authorities or refrain from criticism,” Koga said.

“The public is not getting the right information to make decisions.

TEPCO reveals another leak (NHK video)

It has taken TEPCO almost a year to make this information public...

NRA criticizes TEPCO for not tackling problems properly

February 28, 2015

Nuclear watchdog takes TEPCO to task for delay in leakage report

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201502280036>

THE ASAHI SHIMBUN

The nation's nuclear watchdog body slammed Tokyo Electric Power Co. on Feb. 27 over its failure to disclose information on the leakage of radioactive rainwater into the sea from the crippled Fukushima No. 1 nuclear power plant.

Plant operator TEPCO disclosed many months later that a drainage ditch near the wrecked reactors showed high concentrations of radiation and rainwater had leaked into the sea outside the enclosed harbor.

“TEPCO must reflect seriously (on the delay). We are concerned that the company's efforts to secure a safe environment will be unable to obtain trust (from the people),” said NRA Chairman Shunichi Tanaka during a meeting in Tokyo that TEPCO President Naomi Hirose attended.

Hirose apologized profusely, saying, “We are extremely sorry for adding to the anxieties of fishermen and local citizens.”

This latest setback prompted local fishermen to dig in their heels over plans by TEPCO to release treated water. On Feb. 27, the Soma-Futaba fishery cooperative association and the Iwaki fishery cooperative association agreed to put talks on hold with the utility with regard to its “subdrain plan,” a key measure to reduce contaminated water in the nuclear plant.

TEPCO plans to pump up contaminated groundwater that has accumulated in the plant compound and remove radioactive materials so it can release the water into the sea. The utility has been seeking approval from local fishermen of the plan.

TEPCO became aware more than a year ago that the concentration of radioactive materials in the water flowing in the drainage ditch was high. The utility explained the situation to an NRA working group meeting held in January 2014.

The NRA that February instructed TEPCO to take countermeasures by the end of March 2015. At that time, however, the cause of the high concentration was unclear.

In April 2014, TEPCO started taking regular measurements. It suspected that the contaminated water was draining from slopes near reactor buildings. The utility covered the slopes and cleaned the drainage ditch. However, the concentration level did not decline. It reported the failure to determine the cause to the NRA in December.

Meanwhile, TEPCO continued to conceal details, including the fact that the concentration became high whenever it rained. It was only on Feb. 24 this year that it provided a detailed report to the NRA. TEPCO explained accumulated rainwater on the roof of a service entrance for large equipment that connects to the No. 2 reactor building was the cause of the high concentration.

The compound of the nuclear plant is contaminated with radioactive materials due to the March 2011 accident there. That explains the presence of contaminated rainwater that accumulates in drainage ditches and elsewhere on the site. However, **TEPCO had decided long ago there was no need to monitor rainwater for radioactive materials.**

Water that flows in drainage ditches around tanks storing contaminated water was able to drain directly into the harbor, which has been sealed off from the open sea. **Alarm devices were installed there, but TEPCO did not take special measures for the drainage ditch where the highest concentration of radioactive materials that emit beta rays was about 1,500 becquerels per liter when it rained.**

Even on days when it was not raining, the concentration level was about 100 becquerels.

In drawing up the subdrain plan, TEPCO explained to fishermen it would reduce the concentration level of contaminated water to less than three becquerels before releasing it into the sea.

In 2013, contaminated water leaked from faulty tanks one after another. At that time, concentration levels were more than 10,000 times higher than the latest incidence of leaks. Because of that, a TEPCO official said, "We put too low a priority on the situation."

Yoichi Miyazawa, minister of economy, trade and industry, accused TEPCO of dealing inappropriately with the situation.

"TEPCO should have paid more attention to the issue," he said.

An NRA official handling the matter said, "We should have pushed TEPCO much more strongly to tackle the issue."

Is TEPCO to be trusted?

February 26, 2015

Yoroku: TEPCO must not fear telling the truth on Fukushima plant leaks

<http://mainichi.jp/english/english/perspectives/news/20150226p2a00m0na013000c.html>

There's a Japanese saying that goes, "A leak is more frightening than tigers and wolves." According to an Edo period dictionary, it means, "People's mouths are scarier than those of wild beasts, because saying

things that should not leak out causes disasters. It is a warning that what comes out of our own mouths is to be feared more than the jaws of beasts."

There might be some people who thought the expression in fact came from the old folktale "Furuya no mori" (The leaky old house), in which an old house that leaks in the rain is more scary than tigers and wolves. That literal "leak," too, is almost certainly covered by this saying, and the Edo dictionary quoted above also states that its warning against spilling secrets has been shifted to mean actual leaky roofs. It seems there are some who say the meaning shifted in the opposite direction.

It has been nearly four years since the triple meltdown at the Fukushima No. 1 nuclear plant, and almost as long since plant operator Tokyo Electric Power Co. (TEPCO) declared the disaster "under control." This was and is an exaggeration, as we can see with the ongoing battle to deal with repeated radioactively contaminated water leaks.

Following news on Feb. 22 that water with concentrations of radioactive material 70 times higher than normal was being discharged into the plant's harbor from a drainage ditch, we learned yesterday that this contaminated water was also escaping into the open sea. What's more, TEPCO now says it had known this water -- which collects atop the No. 2 reactor building before running down drain spouts to the ditch -- was heavily contaminated since spring 2014, but made no public announcement until now. The utility hadn't even reported the situation to the government.

This terribly managed contaminated water problem is certainly scarier than tigers and wolves. **What's truly deplorable, however, is how insensitive, how clumsy TEPCO is when it comes to releasing information. Because of the company's reticence, it is bound to be suspected of trying to hide the inconvenient fact of the leak. Both local fishing cooperatives and Fukushima Prefecture, too, are wondering openly if they can trust TEPCO.**

Without the trust of the locals, TEPCO will find it well-nigh impossible to make progress on contaminated water disposal and the eventual decommissioning of the ruined Fukushima reactors. This radioactive water leak is unacceptable, but so is misreading what we need to fear most. ("Yoroku," a front-page column in the Mainichi Shimbun)

No hope outside nukes?

March 4, 2015

Many see reactor restarts as only option to revive 'Nuclear Ginza' region

<http://mainichi.jp/english/english/newsselect/news/20150304p2a00m0na003000c.html>

TSURUGA, Fukui -- The reactivation of halted nuclear reactors is expected to be among the main issues of contention in the coming nationwide local election in April. But in this city, which has suffered a huge economic blow from the halted reactors, reactivation is unlikely to emerge as a point of dispute.

Elections will be held in Tsuruga, the largest city in the Wakasa Gulf Coast region -- dubbed "Nuclear Ginza" as it is home to 14 nuclear reactors -- for a new mayor and city assembly members. With the local economy in sharp decline, residents worried about making a living see no real option besides restarting the nuclear reactors.

"Money doesn't circulate when the reactors aren't in operation," lamented Riichi Tsutsumi, 65, who runs a company in Tsuruga that manufactures aluminum building materials. "It's suffocating." Prior to the March 2011 triple disasters, orders related to the nuclear power plants -- including materials for rebuilding The Japan Atomic Power Company (JAPC) employee housing facilities and replacement parts for automatic doors at the plants -- constituted 30 to 50 percent of his company's annual sales. Now such orders are virtually gone. Other clients based in Tsuruga have also scaled back on capital spending, bringing total sales of Tsutsumi's company down to less than half of what they were four years ago.

Tsuruga is host to the No. 1 and No. 2 reactors of JAPC's Tsuruga Nuclear Power Plant and the Japan Atomic Energy Agency (JAEA)'s Monju prototype fast-breeder reactor facility, neither of which have any clear prospects for reactivation. Moreover, there has been a profound drop in personal consumption in the city. Tsutsumi warned an acquaintance against opening a restaurant in the city's entertainment district after the 2011 disasters, saying it would quickly go out of business. The acquaintance went ahead with the plans anyway and opened an establishment in November 2013. Unable to attract customers even during the high year-end and new-year party season, however, the business shut down after just four months.

According to the Tsuruga Municipal Government, approximately 4,700 people worked at nuclear plants in the city -- including on scheduled inspections -- as of March 2010. The number dropped to approximately 3,300 by January 2015. According to a national government estimate, money that workers dispatched for scheduled inspections at the nuclear plants spent on accommodations and meals in Tsuruga and the neighboring town of Mihama in fiscal 2012 dropped by around 580 million yen from fiscal 2010.

Meanwhile, the central government's plan for the "revitalization of local economies" still lacks any specific policies. With about 70 percent of the city's workers in the service sector, Tsuruga faces a grave challenge for which reactivated reactors would offer an immediate solution.

Almost none of the expected candidates in the mayoral or city assembly elections in Tsuruga are anti-nuclear advocates. Harumi Kondaiji, 64, a city assembly member who has taken a clear stance against nuclear power since the 2011 city assembly election, says she's been approached by local residents who say, tongue-in-cheek, that everyone in the city is connected to nuclear power plants. "We need to get them moving soon," they tell her. Kondaiji won at least 10 percent fewer votes in the 2011 election than in the previous one in 2007.

According to a public opinion poll taken by the Fukui Shimbun newspaper last December prior to the general election, around 25 percent of voters in the Fukui No. 2 district, which includes Tsuruga, said that all reactors should be decommissioned. There are no signs, however, that reactivation will become a controversial topic in the upcoming local election.

"People are worried about their livelihoods, so even if they question (the wisdom of reactivating reactors), that's probably not reflected in how they vote," Kondaiji suggested.

Chairman of the All Japan Council of Local Governments with Atomic Power Stations and Tsuruga Mayor Kazuharu Kawase, who will step down at the end of his current term, told the Mainichi Shimbun, "An election that does not allow us to see the public's will, including how many people are critical of nuclear power, is problematic. It would be natural for an anti-nuclear candidate to run, too, under the circumstances, so hopefully that will happen."

March 04, 2015(Mainichi Japan)

Compensation for Fukushima firms

March 3, 2015

Gov't, TEPCO to put off plan to end compensation payments to Fukushima firms

<http://mainichi.jp/english/english/newsselect/news/20150303p2a00m0na009000c.html>

The central government and Tokyo Electric Power Co. (TEPCO) have decided not to abide by a draft plan for the time being to stop paying damages to business operators mainly in evacuation zones in Fukushima Prefecture, it has been learned.

The draft plan stipulated that the government and TEPCO, the operator of the crippled Fukushima No. 1 Nuclear Power Plant, will stop paying compensation for business damages caused by the 2011 nuclear disaster to the business operators in February 2016. The government and TEPCO have decided to postpone the original plan because it has been pointed out that many business operators will be forced out of business if they discontinue compensation payments.

The government and TEPCO will also shelve their plan to terminate compensation payments one year later to business operators outside the evacuation zones for damages caused by harmful rumors related to the nuclear disaster.

The business operators that are subject to compensation for business damages are those in 13 municipalities that were designated as evacuation or restricted zones in Fukushima Prefecture in the wake of the outbreak of the nuclear disaster. In the case of nuclear evacuation zones, not only those business operators that have been closed for business but also those that have moved out to resume business elsewhere and those that have gone out of business are also subject to the compensation scheme. A total of 458.1 billion yen had been paid to those business operators as of the end of January 2015. With respect to the draft compensation plan, a senior official of the Ministry of Economy, Trade and Industry said, "The guidelines for the government's Dispute Reconciliation Committee for Nuclear Damage Compensation stipulate that there is a 'certain limit' to the compensation period. Paying damages for an extended period of time will not lead to reconstruction."

Nevertheless, the government and TEPCO have decided to put off the termination plan for the time being because when they presented the draft proposal in December 2014, they met furious opposition from the business community and others who said that business operators continued to suffer damage, among other complaints.

As for compensation payments made for four years through February 2015, TEPCO had responded to requests for lump-sum payments or installments for every three months. But the government and TEPCO are now studying how to make payments for March and onward, sources say.

Meanwhile, compensation for damages caused by harmful rumors stemming from the nuclear disaster had been paid mainly to tour operators and other businesses. Total compensation payments, including those caused by shipment restrictions for agricultural, forestry and marine products, made as of the end of

January 2015, totaled 1.3 trillion yen. According to the draft plan, the government and TEPCO had proposed to discontinue compensation payments to business operators such as tour operators in February 2016, although they planned to continue to pay damages to business operators in the agriculture, forestry and fisheries industry who were greatly affected by the nuclear accident. TEPCO's compensation scheme covers a broad range of categories such as payments to individuals for psychological damage (100,000 yen per person per month) and compensation payments to individuals for their "incapacity" to work or for their decreased incomes as a result of their evacuation. Such compensation payments made so far amount to about 4.71 trillion yen.

It was already decided that compensation payments for psychological damage would be discontinued one year after evacuation orders were lifted, while payments for incapacity damage were terminated at the end of February 2015. While the framework of a compensation scheme for individuals has been decided, no decisive solutions to building a consensus for compensation to business operators have been found nearly four years after the outbreak of the nuclear disaster.

March 03, 2015(Mainichi Japan)

Fukushima towns protest over TEPCO's handling of leaks

March 5, 2015

Towns protest over nuclear plant water leak

http://www3.nhk.or.jp/nhkworld/english/news/20150305_29.html

Mar. 5, 2015 - Updated 08:01 UTC+1

Towns hosting nuclear plants in Fukushima have lodged a protest with the operator of the plants over failing to disclose some radioactive water leaks from Fukushima Daiichi into the sea.

Tokyo Electric Power Company is facing heavy criticism over its handling of tainted water that collected on the rooftop of the No.2 reactor building at the Daiichi plant. The water is believed to have been spilling into the sea through a drainage channel.

Tokyo Electric was aware that the levels of radioactive substances in the channel rise whenever it rains. But it didn't make the information public until last month.

Naraha Town Mayor Yukiei Matsumoto, who is also the representative of the 4 towns hosting the Fukushima Daiichi and Daini plants, visited Tokyo Electric's head office on Thursday.

Matsumoto told the utility's president Naomi Hirose it's extremely regrettable that the latest development has profoundly undermined trust in the company among locals.

Matsumoto said securing the overall safety of the nuclear plants, including the issue of contaminated water, is the first step in efforts to rebuild from the 2011 nuclear accident.

He handed Hirose a letter of protest, in which the municipalities demand the company swiftly disclose information and enhance the awareness of its employees.

Hirose offered his apologies for repeatedly causing concerns among local people. He vowed the company will take thorough measures to prevent a recurrence.

End of "intensive reconstruction period"?

March 5, 2015

Gov't considering having local gov'ts shoulder post-disaster reconstruction costs

<http://mainichi.jp/english/english/newsselect/news/20150305p2a00m0na016000c.html>

Reconstruction Minister Wataru Takeshita has said that the government will consider having local governments in disaster-hit regions shoulder some of post-disaster reconstruction expenses in fiscal 2016 and thereafter.

The government planned to foot all the bills to rebuild Japan's northeast, which was hit by the March 11, 2011 Great East Japan Earthquake, ensuing tsunami and the Fukushima nuclear accident, during the so-called "intensive reconstruction period" between the 2011 and 2015 fiscal years. As to what should be done after the intensive reconstruction period ends, Takeshita said, "It will be difficult to continue the rebuilding projects (solely on government funding)."

With respect to government-led decontamination work in the "difficult-to-return zones" where yearly radiation levels are above 50 millisieverts due to the outbreak of the crisis at the Fukushima No. 1 Nuclear Power Plant, Takeshita said that the government will place priority on decontaminating those areas with important infrastructure. On whether to decontaminate the entire "difficult-to-return" zones, he said, "That's impossible."

Takeshita revealed the plans during an interview with the Mainichi Shimbun and other media outlets ahead of the fourth anniversary on March 11 of the triple disasters.

The government set the overall reconstruction period for 10 years through fiscal 2020, and is shouldering all expenses for reconstruction projects during the intensive reconstruction period -- the first half of the 10-year-reconstruction period -- out of consideration for the scale of the earthquake disaster as well as the fact that many local governments in the affected regions are on weak fiscal footing. Takeshita characterized this as "the most extraordinary of extraordinary measures." Regarding principal reconstruction projects such as land development and building disaster restoration housing and embankments, he said, "There is sufficient meaning in doing these projects (completely at government expense)."

Meanwhile, Takeshita said the government would hold talks with local governments in the disaster-stricken regions on ways of distributing expenses and securing financial resources because it would be difficult for the government to cover costs for all projects in fiscal 2016 and thereafter. In light of the harsh fiscal conditions, **the government is apparently aiming to streamline reconstruction projects by**

asking local governments to shoulder some of the costs. But the talks are expected to run into rough waters as Miyagi, Fukushima and Iwate prefectures are seeking that the central government continue to foot the bill for all reconstruction projects.

TEPCO promises transparency...again

March 6, 2015

TEPCO to change disclosure rules

Mar. 6, 2015 - Updated 10:30 UTC+1

http://www3.nhk.or.jp/nhkworld/english/news/20150306_30.html

The operator of the Fukushima Daiichi nuclear plant says it will swiftly release any radioactivity data that could affect the external environment.

Tokyo Electric Power Company announced Friday it will set up a third-party panel to examine information disclosure.

The move comes after the utility faced a barrage of criticism from the fishing industry and local residents over a radioactive leak that was undisclosed for months.

TEPCO failed to announce until recently that contaminated rooftop water at the No.2 reactor building had been spilling into the sea via a drainage channel. Employees knew about the problem since last April.

TEPCO says it will now promptly release all data that could pose a risk to the plant's surrounds. Examples include the radioactivity densities in groundwater and airborne dust in the plant, regardless of their levels.

Current information disclosure is limited to underground tunnels and channels linked to the sea, and other areas of the plant site that have previously posted high radiation levels.

The utility says the third-party panel will establish why the rooftop water leak was not publicized earlier, in addition to reviewing disclosure rules.

A report into the latest leakage will be released this month. TEPCO says it will also create a new organization to make regular checks on the adequacy of information disclosure.

Open discussion?

March 10, 2015

Nuclear experts in Japan call for open discussion

<http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html>

Mar. 10, 2015 - Updated 09:55 UTC+1

The head of a nuclear energy expert group in Japan has called for more openness in the industry on the eve of the 4th anniversary of the Fukushima Daiichi accident.

The president of the Atomic Energy Society of Japan, Reiko Fujita, was speaking to reporters on Tuesday.

Fujita referred to the industry's closed nature before the accident, and said the lack of frank acknowledgment of issues and open, vigorous debate was a serious problem.

Fujita stressed that her academic society's role is to bring more transparency to the industry.

Fujita said her group of nuclear researchers and experts wants to sincerely reflect on the accident. She said the members will continue doing their utmost to ensure an accident like Fukushima Daiichi never happens again.

The society last year set up a committee to study the decommissioning of reactors at Fukushima Daiichi. It plans to make independent proposals on ways to decommission the plant, and improve the safety of nuclear power generation.

"Returning to pre-disaster days of complacency"

March 10, 2015

FOUR YEARS AFTER: Ex-panel chief says Japan still hasn't learned lessons from Fukushima crisis

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201503100048>

THE ASAHI SHIMBUN

The Abe administration is recklessly trying to restart nuclear reactors across Japan without learning lessons from the Fukushima crisis and failing to prepare effective countermeasures against another potential disaster, a former accident panel chief said.

Yotaro Hatamura, former chairman of a government panel that investigated the accident at the Fukushima No. 1 nuclear plant, said in a recent interview with The Asahi Shimbun that the atmosphere surrounding nuclear power is returning to the pre-disaster days of complacency.

"Sufficient investigations have not been conducted," Hatamura, professor emeritus of mechanical engineering at the University of Tokyo, said of the Fukushima nuclear accident.

In its final report submitted in July 2012, the panel led by Hatamura called on the government to continue efforts to determine the cause of the nuclear disaster.

“Almost none of (our proposals) have been reflected” in recent government actions, he said. Tougher safety standards for nuclear facilities were introduced after the Great East Japan Earthquake and tsunami on March 11, 2011, led to the triple meltdown at the Fukushima No. 1 nuclear plant. But with the exception of this “regulatory hurdle,” he said, “the situation seems unchanged from before the accident.” “It does not appear that organizations to watch (government actions) are working properly,” he said in the interview.

Hatamura also said that people once again believe that nuclear plants are safe although the problems related to these facilities have only been addressed superficially.

“There could always be lapses in oversight in safety assessments, and an accident will surely happen again,” Hatamura said.

Among the countermeasures needed, he said, are effective evacuation plans for residents living near nuclear plants throughout the country. He said the feasibility of current evacuation plans is doubtful because they were compiled without fully reflecting on the Fukushima accident.

“The restarts of reactors should be declared only after sufficient preparations are made, such as conducting evacuation drills covering all residents living within 30 kilometers of each plant based on developed evacuation plans,” he said.

According to Hatamura, Japanese citizens need to prepare for future nuclear disasters if the nation continues nuclear power generation.

“Even before the Fukushima disaster, I thought it was inappropriate to state that an accident would never occur,” Hatamura said. “And the Fukushima crisis, in fact, did happen.”

Most people in Japanese society did not view the issue of nuclear plants as their problem and had only looked at the benefits of nuclear energy until the Fukushima disaster, he said.

“They believed what they wanted to believe--nuclear plants were safe just because there had been no severe accidents and those facilities had undergone safety screenings,” Hatamura said. “It is wrong to end the problem by passing the buck to someone else when an accident occurs.”

UN Conference in Sendai

March 7, 2015

Japan set to share lessons of 2011 disasters at U.N. forum in Sendai

<http://www.japantimes.co.jp/news/2015/03/07/national/japan-set-share-lessons-2011-disasters-u-n-forum-sendai/#.VPtU7eF1Cot>

by Kayo Mimizuka

Kyodo

Japan is set to share the lessons it has learned from the March 2011 earthquake and tsunami when delegates and activists from across the globe gather in Sendai next weekend for a U.N. disaster risk reduction conference.

More than 5,000 participants, including leaders and ministers from national governments, are expected to attend the conference on disaster management from March 14 to 18.

A key outcome of the international gathering in the Tohoku region, which took severe damage, is expected to be a new framework, now under negotiation, to replace the 10-year Hyogo Framework for Action adopted at a previous U.N. conference in 2005. The new framework is expected to reflect calamities that have occurred in the past decade, including in Japan.

Apart from quakes, tsunami and other hazards, the world is also focusing more on nuclear disasters in the wake of the man-made crisis at the Fukushima No. 1 nuclear plant that was triggered by the 2011 quake and tsunami.

“One area that definitely will be of great interest ... is how you rehabilitate an area after it’s been exposed to an accident at a nuclear plant,” Margareta Wahlstroem, special representative of the U.N. secretary-general for disaster risk reduction, said in a news conference in Tokyo.

“There is a great deal of interest from other countries that also have nuclear plants. They are looking into, if something like this (the Fukushima disaster) happens to us, what it is that we can learn from Japan,” Wahlstroem said.

There will be a working session to discuss nuclear disasters in the context of technical hazards, among other events.

The third U.N. World Conference on Disaster Risk Reduction will involve many of the world’s leaders as well as private-sector businesses, and is seen as a significant opportunity to bring more attention to the importance of disaster risk reduction in the context of economic growth and development.

Foreign Minister Fumio Kishida said in late February that leaders from about 30 countries and ministers from over 70 are expected to participate. Prime Minister Shinzo Abe will also attend the meeting and is expected to announce additional support for developing economies in the form of funds and technologies on disaster management, according to government officials.

U.N. Secretary-General Ban Ki-moon will also attend Sendai the event.

While many ministerial sessions and other high-level dialogue are being planned, the focus is also on a number of events that will take place outside the meeting rooms, officials in Tokyo said.

On the sidelines of the five-day meeting, more than 25 study tours are being scheduled so participants can visit places across Tohoku affected by the mega-quake, tsunami and subsequent nuclear crisis, and see how people are trying to recover and rebuild their devastated communities.

The tours include one to the crippled Fukushima No. 1 and others to wrecked schools, fishery ports and markets.

“As this conference will take place in the disaster-affected area, I hope that participants will not only engage in discussions inside meeting rooms but also learn first-hand about reconstruction, and deepen their debates in light of what they see,” said Kaoru Saito, director at the disaster management bureau of the Cabinet Office.

The government and the city of Sendai are also planning to hold 10 forums on such topics as disaster prevention measures, medical support and disaster prevention education for children, while some 350 symposiums and seminars will be organized by international nongovernmental organizations and other entities.

Between 2000 and 2012, some 1.2 million people were killed and 2.9 billion affected by natural calamities around the world. The damage is estimated at \$1.7 trillion, highlighting the necessity of putting more global efforts into disaster risk reduction to realize sustainable growth, according to the Abe government. The U.N. conference on disaster management was held in Yokohama in 1994 and in Kobe in 2005.

Fukushima lessons can't be erased

March 11, 2015

NRA chief: Never let Fukushima lessons fade away

http://www3.nhk.or.jp/nhkworld/english/news/20150311_25.html

Mar. 11, 2015 - Updated 09:46 UTC+1

The chief of Japan's nuclear regulator has told his staff never to forget the lessons of the 2011 Fukushima nuclear crisis in fulfilling their mission to ensure safety.

Nuclear Regulation Authority Chairman Shunichi Tanaka was speaking before officials of the NRA secretariat on Wednesday to mark the 4th anniversary of the Fukushima Daiichi plant accident.

Tanaka said there's no erasing the fact that the accident worsened the tragic damage of the March 11th earthquake and tsunami.

He said regulators must never let the lessons of Fukushima fade away even though others may tend to do so some 4 years on.

Tanaka also urged his staff to do their best to reduce risks. He said serious accidents completely change life for local residents, and that restoring it is difficult. He stressed that such situations should never be allowed.

The authority and its secretariat were established in 2012 after their predecessors were criticized for failing to cope with the Fukushima crisis.

Govt. officials urged to learn Fukushima lessons

http://www3.nhk.or.jp/nhkworld/english/news/20150311_17.html

Mar. 11, 2015 - Updated 05:56 UTC+1

A Japanese Cabinet Minister has instructed government officials to learn from the lessons of the 2011 Fukushima nuclear disaster. He has asked them to do so when helping municipalities around nuclear plants make evacuation plans for future accidents.

Nuclear Emergency Preparedness Minister Yoshio Mochizuki spoke to about 50 officials on Wednesday, the 4th anniversary of the March 11 disaster. The officials belong to a Cabinet Office section that was established in October.

Mochizuki, who is also Environment Minister, said the officials should reflect on the fact that effective disaster-response measures had not been in place at the time of the Fukushima accident.

He said they should draw concrete lessons from the experience and rethink the response to the accident. He said this should be reflected in new countermeasures.

All commercial nuclear reactors in Japan are currently offline. But utilities have applied for permission to restart 21 of them.

Municipalities within a radius of 30 kilometers of a nuclear power plant are now required to make plans to evacuate residents. But many problems with the plans have been raised.

The Cabinet Office intends to help verify the effectiveness of the plans by reviewing evacuation drills run by the relevant prefectures.

Message from US Regulatory Commission

March 10, 2015

Burns: Fukushima accident has key lessons for US

http://www3.nhk.or.jp/nhkworld/english/news/20150311_05.html

Mar. 10, 2015 - Updated 23:43 UTC+1

The head of the US Nuclear Regulatory Commission says the 2011 Fukushima nuclear accident has key lessons for American nuclear policy.

Stephen Burns made the comment in a speech on Tuesday near Washington.

He said the NRC is trying to complete safety measures for the spent nuclear fuel stored in pools at all power plants in the US by the end of 2016.

Burns later told reporters that the challenges after the accident have been taken very seriously by the Japanese government and the country has made a lot of progress.

Burns said he will visit Fukushima in early April to observe the decommissioning of the crippled plant.

He also said he is planning to meet his Japanese counterparts to discuss the safety measures for other plants. All of the nation's nuclear reactors remain offline.

Japanese regulators are screening the safety steps for those plants using the stricter requirements that were adopted after the 2011 Fukushima accident.

Update! Fukushima at four

http://www.beyondnuclear.org/storage/publications/OnLine_Thunderbird_BeyondNuclear_March2015.pdf

What is new at the stricken Fukushima site since the March 11, 2011 nuclear disaster there began? What really happened? And what are the health implications, both in Japan and for the U.S. if a similar nuclear disaster happened here? The newly released spring edition of the Beyond Nuclear newsletter, The Thunderbird, looks at these issues and more. Free to download and distribute widely.

Abe and Merkel don't see eye to eye on nukes

March 10, 2015

On nuclear energy, Abe and Merkel remain far apart

http://ajw.asahi.com/article/behind_news/politics/AJ201503100068

THE ASAHI SHIMBUN

German Chancellor Angela Merkel agreed on a number of things during her talks with Prime Minister Shinzo Abe, but where the two leaders parted company was on the issue of nuclear energy.

Merkel explained her decision to cancel Germany's dependence on nuclear power plants was a direct result of the Fukushima disaster in Japan four years ago.

Abe, on the other hand, was at pains to state that Japan must continue to rely on nuclear energy as a cheap and stable source of power.

At a joint news conference following their March 9 meeting, Abe was asked by a German reporter why Japan was still thinking about resuming operations at nuclear power plants when Germany had decided to move away from nuclear energy by 2022 following the triple meltdown at the Fukushima No. 1 nuclear power plant in 2011.

"Japan depends on nuclear plants for one-third of its energy source," Abe said. "Suspension of operations at those plants has forced us to depend more on fossil fuels, such as petroleum. We have to fulfill our responsibility of providing an inexpensive and stable supply of energy. We hope to resume operations at nuclear plants that have been judged by the Nuclear Regulation Authority to have passed safety standards."

The Abe administration has made clear its intention to resume operations at nuclear plants. Moves are already under way to resume operations at the No. 3 and No. 4 reactors of the Takahama nuclear plant in Fukui Prefecture operated by Kansai Electric Power Co. and the No. 1 and No. 2 reactors of the Sendai nuclear plant in Kagoshima Prefecture, operated by Kyushu Electric Power Co.

Those reactors could come back online before the end of 2015.

For her part, Merkel staked out an energy policy that is sharply at odds with the direction Japan is taking. In a video message released shortly before her arrival, Merkel said she Japan should join Germany in promoting renewable energy sources as a way of moving away from a dependence on nuclear energy. Trained as a physicist, Merkel gave a detailed explanation of her decision to move away from nuclear energy during a lecture she gave prior to her meeting with Abe.

Saying that the Fukushima nuclear accident had played a major role in affecting the change in her thinking, Merkel said: "One reason is because the accident occurred in a nation like Japan, which has a high level of technology. It clearly showed that even in such a nation, there are risks such accidents can happen. I came to realize there are risks for events which we thought would never happen."

She went on to explain that for many years she had supported the peaceful use of nuclear energy, but added: "The era of the peaceful use of nuclear energy in Germany is ending. Now we have to construct our energy structures based on the decision."

With courage and the political will, Merkel suggested that any nation could follow Germany's example in moving away from a dependence on nuclear energy.

Because of their obvious differences on energy policy, Abe and Merkel did not discuss nuclear energy during their talks, according to Japanese government officials who briefed reporters.

Merkel also toned down her rhetoric at the joint news conference. She did not directly mention nuclear energy, but only said that Germany and Japan "are working closely on energy efficiency and the stable supply of energy."

But has TEPCO learned anything?

March 13, 2015

It's time to punish Tepco

<http://www.japantimes.co.jp/opinion/2015/03/13/commentary/japan-commentary/its-time-to-punish-tepco/#.VQM0seF1Cov>

by William Pesek

Fishermen trawling the waters off Japan's eastern coast have been alleging for a while that radioactive water is again spilling into the Pacific from the Fukushima power plant that melted down after a massive earthquake in 2011. On Feb. 24, Tokyo Electric Power Co., which is responsible for the site, admitted those suspicions were justified.

And it turns out that Tepco knew about this latest radioactive leak since last May — **and the giant utility said nothing for almost a year.**

In the 15 days since Tepco finally confessed, have investigators raided its Tokyo headquarters? Have regulators demanded that heads roll? Has Prime Minister Shinzo Abe used his bully pulpit to demand accountability from the company that gave the world its worst nuclear crisis since Chernobyl?

In any other major democracy, those steps would have been obvious. But none have occurred in Japan. And **that raises troubling questions not just about Tepco's corporate governance, but the rampant cronyism enabling it.**

When he took office in December 2012, Abe pledged to make corporate executives more accountable to international codes of conduct. In August 2013, he had a perfect chance to show his mettle. At the time, Tepco was still the butt of international criticism for its handling of the aftermath at Fukushima. Abe —

concerned that the bad press would affect Tokyo's campaign to host the 2020 Olympics — declared his government would push Tepco aside and handle the cleanup efforts directly.

It was all for show. **Abe's government never intervened, and Tepco stayed in charge.** Four years to the day since the earthquake, Fukushima is still leaking; 120,000 people remain displaced; and Tepco's opacity and incompetence are unchanged.

The company's obfuscations "tell us all we need to know about its resilient corporate culture of irresponsibility," says Jeff Kingston, director of Asian Studies at Temple University in Tokyo. "It has not changed its stripes. The decommissioning efforts have been shambolic, it's still incompetent and negligent and has a very deep hole to climb out of in trying to regain any public trust."

How does Tepco get away with it?

It is protected from on high by the "nuclear village," Tokyo's answer to the military-industrial complex that is said to hold sway in Washington. This alliance of pro-nuclear politicians, bureaucrats and power companies promotes reactors over safer forms of energy like solar, wind or geothermal, and works to shield utilities from competition and global standards. (That's how Tepco got away with consistently doctoring its maintenance reports for Fukushima and putting all of its backup generators underground in a tsunami-prone area.)

Even after the Fukushima disaster, national nuclear regulators seemed more concerned about restarting Japan's 48 remaining reactors (all of which have been shut down in the interim) than neutralizing the one contaminating the northeast of the country.

Tokyo was a scary place to be in March 2011 amid Fukushima's triple meltdown. Most frightening, though, was the utter lack of transparency from the authorities. Tepco's then-President Masataka Shimizu gave maddeningly contradictory accounts of events at Fukushima. Two months later, Shimizu took the fall for Tepco's sending radiation clouds Tokyo's way. Tepco's idea of a new start was to replace him with a 36-year company veteran.

Four years on, it's still not clear whether Tepco has learned anything.

"I find it galling that not only was Tepco never punished for constructing reactors well below the tsunami warning markers, thereby worsening the effects of the quake and tidal wave, but was even allowed to raise its rates to make the consumer pay for the cleanup costs," says Robert Whiting, author of "Tokyo Underworld."

Even in the context of Japanese cronyism, it's astounding that nobody at Tepco has gone to jail. Criminal proceedings against Japan's business titans aren't unprecedented.

Executives of the optics manufacturer Olympus were arrested over a 2011 fraud scandal.

Internet entrepreneur Takafumi Horie and fund manager Yoshiaki Murakami got locked up for insider trading.

Yet, Tepco's executives continue to enjoy a get-out-jail-free card, courtesy of the Tokyo establishment.

At the very least, Tepco's senior management should be fired without pensions and face charges from prosecutors. The company should also be nationalized. (Taxpayers are bearing the costs of Tepco's negligence anyway.)

Abe's desire to eliminate the cronyism endemic to Japan Inc. is laudable. It would make the economy more vibrant, productive and attractive to overseas investors. He should start by bringing the most egregious offender to justice. I'm sure the Fukushima fishermen will be happy to testify.

William Pesek is a Bloomberg View columnist based in Tokyo who writes on economics, markets and politics in the Asia-Pacific region..

TEPCO considering tie-ups with other industries

March 13, 2015

Tepco in talks with mobile carriers to form partnership: sources

<http://www.japantimes.co.jp/news/2015/03/13/business/corporate-business/tepcos-in-talks-with-mobile-carriers-to-form-partnership-sources/#.VQRTeOF1Cos>

Kyodo

Tokyo Electric Power Co. is currently in talks with three major Japanese mobile carriers to find a partner for joint marketing, as the planned liberalization of the retail electricity market next year is expected to boost competition, informed sources said Friday.

The utility will choose its partner from among NTT Docomo Inc., KDDI Corp. and SoftBank Corp. and will reach a basic agreement by the end of April, the sources said.

Tepco, whose regional monopoly in Tokyo and surrounding areas will end with the April 2016 deregulation, aims to use the tie-up **to keep subscribers by offering a package deal for electricity supply and mobile phone services at reduced rates**, they said.

The move would also provide the utility with a nationwide sales network.

To help increase business, Tepco is also considering tie-ups with companies in other industries including a home builder and an insurance company, the sources said.

Tepco is expected to face intense competition from other utilities and new entrants seeking to supply electricity in its lucrative service area, which encompasses nine prefectures in eastern Japan.

What about the Fukushima disaster, Mr.Abe?

March 15, 2015

Abe mum on Fukushima at U.N. disaster risk confab

<http://www.japantimes.co.jp/news/2015/03/15/national/abe-mum-on-fukushima-at-u-n-disaster-risk-confab/#.VQV8nuF1Cov>

Kyodo, JIJI, Staff Report

SENDAI – Prime Minister Shinzo Abe had little to say on the tsunami-triggered core meltdowns in Fukushima as representatives from across the globe met at a U.N. conference on disaster risk reduction Sunday to underscore the urgent need to address climate change and reduce disaster impacts.

On the second day of the U.N. World Conference on Disaster Risk Reduction in Sendai, French Minister of State for Development and Francophony Annick Girardin said climate change is responsible for over 80 percent of the damage caused by natural disasters.

The Sendai conference is “above all a call for lucidity, because it is no longer possible to ignore climate chaos” in the context of disaster risk mitigation, Girardin told the gathering, which began Saturday.

Meanwhile, in a speech Saturday at the conference, Prime Minister Shinzo Abe had few words on the triple core meltdown at the Fukushima No. 1 power plant. The disaster in Fukushima Prefecture erupted after a massive quake on March 11, 2011, spawned huge tsunami that took out the plant's cooling systems. Abe's speech was strongly criticized by Tamotsu Baba, mayor of the town of Namie.

"(Abe's speech) was no good at all. He may not have wanted to give negative impressions (of Japan) because world leaders have gathered here," Baba told reporters Saturday.

Namie is close to the plant, and about 21,000 of its residents were still living outside the town as of the end of February after losing their homes to radioactive fallout.

Speculation has been rife that Abe was attempting to avoid discussion about the Fukushima disaster because the No. 1 plant is plagued radioactive water woes, including operator Tokyo Electric Power Co.'s failure to disclose the extent of the tainted water flowing into the Pacific.

Tests on samples of seawater and fish from sites close to the plant have shown no alarming signs for human health, apparently as the contaminated water is being diluted by the sea. This has prompted Abe to claim that, despite the continuing water woes and the harm that they are causing to local fishermen, the situation is "under control."

During a session Sunday, Cabinet members from about 40 nations discussed post-disaster efforts to build more disaster-resistant communities.

"Japan has assumed the largest (possible) quake may hit the country, and has been preparing evacuation routes and strengthened (disaster) monitoring systems," land minister Akihiro Ota said.

Japan also has taken steps to make houses and schools earthquake-proof since the Great Hanshin Earthquake struck the Kobe area in 1995, Ota said.

He said the nation will provide as much support as possible to Vanuatu, which was devastated by a massive cyclone over the weekend.

Meanwhile, Abe underlined the importance of female leadership in anti-disaster efforts.

"Women's leadership is indeed essential in order to stand up to disasters," Abe said in a dialogue session at the conference.

Because women's perspectives have not been fully utilized in disaster prevention, Abe said, there is a need to consider measures that are friendly to women, who are more likely to face tougher situations than men when natural disasters hit.

In the Dialogue on Mobilizing Women's Leadership in Disaster Risk Reduction, cochaired by internal affairs minister Sanae Takaichi, former Finnish President Tarja Halonen called for improving a disaster warning system to allow women in rural areas to obtain evacuation information promptly.

TEPCO to balance "responsibility" and "competitiveness"

Press Releases 2015

Press Release (Mar 17,2015)TEPCO announces the establishment of in-house companies ahead of its transition to a holding company system

http://www.tepco.co.jp/en/press/corp-com/release/2015/1248790_6844.html

Tokyo Electric Power is announcing today that it will establish three new in-house companies on April 1, 2015 **ahead of the introduction of a holding company system from April 2016.**

The new companies, together with the Fukushima Daiichi Decontamination & Decommissioning Engineering Company, will exist within the holding company system after the transition and will be responsible for the balance of payments, results and quality of each of their businesses.

The company is committed to making continuous efforts in order to establish a management structure which enables TEPCO to balance both "responsibility" and "competitiveness" as we engage in our business.

- Renewable power company

Hydroelectric power and new energy power generation businesses are currently managed by Power Grid Company (PGC). As we look toward the third stage of the electricity system reforms which will legally separate power transmission and distribution, we will separate these businesses from the PGC and establish them as a new in-house company. (The operation and maintenance of the power plants will continue to be managed by PGC.)

This company will aim to increase sales profit by developing new renewable energy sources, cutting generation costs and repowering hydroelectricity.

- TEPCO Research Institute

Technological development, Intellectual property management, and construction / architecture technology related functions, which are shared by each business, will be brought together to maintain and strengthen technological capabilities. The institute will aim to create and deploy new competitive technologies, and provide solutions arising from the field. It will also aim to become a new model for how research and development is conducted by a utility company by providing research on business and technological strategies linked to market liberalization as well as analysis and advisory on energy policies.

- Business Solution Company

Specialist and general business administration functions such as general affairs, personnel, training, accounting and internal systems which are common to each new business company will be integrated as a shared service company to provide effective and high quality solution services to improve the productivity of TEPCO's group companies.

Shutting down research reactors means no more hands-on training

March 11, 2015

FOUR YEARS AFTER: There's a price to pay for university research reactor shutdowns

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201503110041>

By TATSUYUKI KOBORI and AKIYOSHI ABE

University research reactors were not exempt from the shutdowns of nuclear reactors that the central government ordered after the 2011 earthquake and tsunami that triggered the nuclear crisis in Fukushima Prefecture.

University research reactors exist at only two locations in Japan. The shutdowns mean that students are still unable to practice hands-on operations.

This could have repercussions for experiments on decommissioning nuclear reactors and radiation therapy. For this reason, some universities have begun organizing training programs overseas.

Those involved in the programs have called for a prompt restart of the research reactors, but there are no signs that any decision will be made anytime soon.

Ten or so students from Kinki University, Nagoya University and Kyushu University had the opportunity last July to work with a 10-watt nuclear reactor at Kyung Hee University in South Korea.

They conducted experiments relating to nuclear reactor physics, radiation readings and other areas.

Tetsuo Ito, who heads the Kinki University Atomic Energy Research Institute, said, "This was the first time for us to do practical training at a nuclear reactor overseas."

The institute intends to continue the program this year as well.

Kinki University has a 1-watt research reactor in Higashi-Osaka, Osaka Prefecture. The university applied to the Nuclear Regulation Authority (NRA) last October to restart it. The goal was for a restart in or around spring 2015, but as yet there are no indications this will happen.

There are no changes to room temperature and pressure when the reactor is operating.

Since there is no need to counter large amounts of heat, the reactor requires no cooling equipment. A Kinki University faculty member said with bewilderment, "It is structurally impossible for a big accident like the one at Fukushima to occur at the Kinki University reactor."

Aside from the two research facilities belonging to Kinki University and Kyoto University, Japan has 11 other research reactors.

After the accident at the Fukushima No. 1 nuclear power plant operated by Tokyo Electric Power Co. in March 2011, new regulatory standards were drawn up to cover not only commercial reactors, but also the 14 owned by universities and private companies.

One of two research reactors operated by Kyoto University generates 100 watts. It has been used for practical training since 1975, and more than 3,000 graduate students from Japan and abroad have worked on it.

Prior to the nuclear disaster, the university's 5,000-kilowatt reactor was used for 200 or so joint research projects by researchers from across Japan every year. Ken Nakajima, a professor of nuclear engineering at the Kyoto University Research Reactor Institute, says, "We want to somehow restart sometime in the upcoming academic year" that begins on April 1.

On Feb. 25, during a regular meeting of the NRA, chairman Shunichi Tanaka was at pains to point out that a research reactor is quite different from a normal nuclear reactor. He called on experts to "also think a little bit about pushing the screenings forward" while basing their decisions on safety considerations.

EDUCATION IN THE FIELD CANNOT BE IGNORED

The University of Tokyo, Rikkyo University and other institutions also used to operate research reactors, but they were decommissioned because of maintenance costs and aging equipment. The number of research reactors owned by companies and other non-utilities also looks set to decline.

In 2013, a subcommittee of the Science Council of Japan compiled a document that proposed Japan "should begin considering replacements for research reactors" so that aspiring workers in the field can get the proper training.

Computers that simulate the inner workings of a nuclear reactor are, of course, another option. But Shinsuke Yamanaka, a professor of nuclear fuel engineering at Osaka University, says, "It can't be a substitute for the tension of handling the real thing."

Yamanaka added this plea: "Even if we adopt a policy of not promoting nuclear power, universities will still need to produce graduates who work with nuclear energy. I'd like the NRA to conduct its screening with this reality in mind."

In the meantime, efforts are under way to build new research reactors.

In November, Fukui Governor Issei Nishikawa declared in the prefectural assembly that he would begin working with the national government, universities, corporate entities and other sources of funding to consider taking on the project of building a new research reactor.

As there are no university reactors in the prefecture, the University of Fukui and Fukui University of Technology had used Kinki University's nuclear reactor for hands-on training. Some assembly members questioned the need for such a facility in Fukui Prefecture.

Prefectural government officials explained that the intention was to "consider this issue because universities have expressed a sense of crisis."

They said the prefecture will not be involved in attracting such facilities.

30 years to recoup compensation funds

March 23, 2015

Nuclear compensation recovery could take 30 years

<http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html>

Mar. 23, 2015 - Updated 11:14 UTC+1

Japan's Board of Audit says it could take the government up to 30 years to recoup the funds it provided to help compensate victims of the Fukushima Daiichi nuclear accident.

The government issued bonds worth nine trillion yen, or about 75 billion dollars, to help the plant's operator, Tokyo Electric Power Company, or TEPCO, pay compensation. The money is mainly intended to help those who have been forced to evacuate and to cover the costs of decontamination work.

The funds were given to TEPCO through the government-backed Nuclear Damage Compensation and Decommissioning Facilitation Corporation.

The government plans to recover the funds through an annual pay-back by TEPCO as well as contributions from other power companies, and gains on the sale of TEPCO shares owned by the government-backed organization.

The Board of Audit says that if TEPCO pays back about 416 million dollars a year, the same amount as fiscal 2014, recovery would take up to 30 years, or until fiscal 2044. It says the earliest would be in 21 years, or in fiscal 2035.

The board says that even if TEPCO pays the government half of its current profits every year, recovery of the funds will take until fiscal 2032 at the earliest.

The board says the interest that must be paid by the government for borrowing the funds may amount to as much as 1.04 billion dollars, increasing the financial burden.

The Board of Audit says that, depending on the amount the utilities pay and the gains from the sale of shares, recovery of the funds could require more time and add a fiscal burden to the government.

Professor Kenichi Oshima of Ritsumeikan University, an expert on TEPCO's management, says the utility will face the additional costs of disposing of the waste generated by the decontamination work, and the total costs could exceed the nine trillion yen.

He says it will be necessary to study and disclose the details of the sharing of the financial burden and the recovery of the funds, because the contributions from other utilities include the base cost consumers pay for electricity.

Land prices affected by disaster risks

March 19, 2015

Disaster risks affect land prices in wake of quake disaster, typhoon

<http://mainichi.jp/english/english/newsselect/news/20150319p2a00m0na007000c.html>

Land prices have been fluctuating across Japan on the heels of the 2011 Great East Japan Earthquake and other natural disasters, pushing down prices in areas that are vulnerable to tsunami and liquefaction while driving up prices inland.

According to official land prices released on March 18, land prices for the Chiba Prefecture city of Abiko significantly dropped apparently because the area suffered damage from liquefaction in the Great East Japan Earthquake and from a major typhoon. Meanwhile, land prices for the Shizuoka Prefecture city of Fujieda spiked, after the inland area was recognized to be less vulnerable to tsunami.

Among residential areas, land prices for the Fusatorimachi district of Abiko saw the country's largest decline rate at 10.9 percent. "I have almost no customers now. After the Great East Japan Earthquake and flooding, no one moved in here," said a 70-year-old barber in the district.

The Fusa district, which encompasses Fusatorimachi, suffered major liquefaction damage in the March 2011 quake disaster, with about 120 residences destroyed. The disaster was followed by flooding brought by Typhoon No. 26 in October 2013. A downpour with record rainfall totaling 282 millimeters pounded areas that had already suffered extensive ground sinking in the quake disaster, flooding some 400 homes. The area is now dotted with vacant lots where damaged houses were torn down, and many of the residents who moved out of the district following the disasters have no intention of returning.

In order to cope with flood damage, a pump station with a processing capacity of 7.6 times previous levels is set to go online later this month. However, measures to prevent additional liquefaction by strengthening the ground were not implemented due to opposition from residents concerned with financial burdens.

"We used to get to sell land if we lowered the prices, but we find no buyers nowadays," said a local realtor. An official with the city's taxation division said, "From a long-term perspective, our revenues from fixed property taxes will plummet, adversely affecting the city's finances."

Meanwhile, the city of Fujieda -- an inland commuter town within a 20 minute train ride from the city of Shizuoka -- saw its land prices rise by 0.2 percent, thanks to an influx of the population from coastal areas susceptible to tsunami. High-rise condominiums have popped up in areas around JR Fujieda Station, while further construction work is under way. Between 2011, the year when the Great East Japan Earthquake hit the country, and February this year, the city's population increased by at least 1,500 to some 146,500 - - though the population growth had continued since before that period.

A local realtor in Fujieda, however, gives a cautious view, saying, "The demand for land may dwindle after the population inflow from coastal areas slows down." Meanwhile, the Fujieda Municipal Government is aspiring to promote an influx of child-rearing generations into the city by developing libraries and parks near Fujieda Station.

March 19, 2015(Mainichi Japan)

189 billion yen spent so far on decommissioning Fukushima No.1

March 23, 2015

¥189 billion in public money spent on Fukushima cleanup so far

<http://www.japantimes.co.jp/news/2015/03/23/national/%C2%A5189-billion-in-public-money-spent-on-fukushima-cleanup-so-far/#.VRALa-F1Cos>

Kyodo

A total of ¥189.2 billion in taxpayers' money has been spent since fiscal 2011 on decommissioning the crippled Fukushima No. 1 nuclear plant and dealing with the buildup of radioactive water there, according to the Board of Audit.

The board also said Monday that Tokyo Electric Power Co. has allocated a massive amount of money for radioactive water treatment facilities and tanks that functioned only for a short period of time, with the amount totaling around ¥68.6 billion.

Tepco has spent some ¥32.1 billion on equipment to remove radioactive cesium from tainted water at the crippled plant, but the facilities stopped operating three months after the start of operations in June 2011, due mainly to equipment failure.

The utility also spent ¥16 billion to build more than 100 tanks for storing radioactive water at the plant. But Tepco is now replacing the bolt-joint tanks with more reliable containers after around 300 tons of highly tainted water was found to have leaked from one of the tanks in 2013.

The Board of Audit said it will take up to 30 years through fiscal 2044 for the government to recover ¥9 trillion it may provide to Tepco to help with compensation payments related to the nuclear crisis.

The government is raising funds to support Tepco from financial institutions by issuing bonds. Taxpayers will effectively need to shoulder ¥126.4 billion in interest payments, the board said.

The ceiling on interest-free loans to Tepco, provided through a government-backed bailout fund, has been raised to ¥9 trillion from ¥5 trillion amid the growing cost of the crisis.

By the end of 2014, Tepco had received around ¥4.5 trillion from the government-backed Nuclear Damage Compensation and Decommissioning Facilitation Corp., or NDF.

Of the ¥9 trillion, the government plans to recover an estimated ¥2.5 trillion in costs for radiation cleanup work by selling Tepco shares currently owned by NDF.

But the Board of Audit said the plan can't be realized unless Tepco's stock price more than doubles from the current level to ¥1,050 per share.

Tepco's share price has dropped amid uncertainty over its business outlook. Although the company sought to bring back online its Kashiwazaki-Kariwa nuclear complex in Niigata Prefecture last July as key to its business turnaround plan, it remains uncertain when the company can restart it.

"The government should give sufficient consideration to ensuring the recovery of the state funds and boosting Tepco's corporate value" to reduce the burden on taxpayers, the board said, urging Tepco to make further cost-cutting efforts.

Fukushima disaster: How much?

March 23, 2015

Estimated costs of Fukushima nuclear accident

http://www3.nhk.or.jp/nhkworld/english/news/20150323_33.html

Mar. 23, 2015 - Updated 12:17 UTC+1

Here are the estimates of compensation costs for victims of the Fukushima Daiichi nuclear plant accident as well as the costs of decontaminating and decommissioning the reactors.

As of the end of January, Tokyo Electric Power Company, or TEPCO, says compensation costs for the victims would come to 5.62 trillion yen, or about 46.8 billion dollars. This would cover their evacuation expenses and emotional suffering.

An Environment Ministry estimate puts the cost of decontamination and building initial storage sites for soil and other waste generated from the decontamination work at around 17.5 billion dollars.

The disposal of contaminated waste will require 4.4 billion dollars, and the construction of intermediate storage facilities will be another 8.8 billion dollars.

These figures do not include the costs of decontaminating the evacuation zones in which decisions on conducting a full-scale decontamination have not yet been made. The costs of final-stage disposal outside Fukushima Prefecture of soil and waste stored at intermediate storage facilities are also excluded.

TEPCO estimates that as of the end of January, about 8 billion dollars will be necessary to decommission the reactors and deal with contaminated water. About 3.7 billion dollars will be required to inspect and maintain related facilities until fiscal 2022.

Separately, the Japanese government has provided 1.57 billion dollars until fiscal 2015 to cover research and development costs for decommissioning reactors and dealing with contaminated water.

This includes the costs of conducting experiments in a project to freeze the soil around the damaged reactor buildings to create an underground wall of ice to keep groundwater out of the plant.

TEPCO says it will do all it can to achieve these goals in its business plan through further cost-cutting efforts.

Fukushima disaster: How much? (2)

March 24, 2015

Costs in problem-plagued struggle at Fukushima plant near 600 billion yen

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201503240035>

THE ASAHI SHIMBUN

Tokyo Electric Power Co. and the government have spent 590 billion yen (\$4.93 billion) battling the Fukushima nuclear disaster, but problems persist and taxpayers could lose if the situation doesn't improve, the Board of Audit said.

TEPCO initially estimated that the entire process of decommissioning the No. 1, 2, 3 and 4 reactors at the stricken Fukushima No. 1 nuclear plant and taking measures against the daily accumulation of contaminated water would cost 1 trillion yen.

The plant operator had already used 400 billion yen by the end of fiscal 2013. But the numerous water leaks, errors and mishaps at the plant prompted the government to appropriate 189 billion yen to the utility by the end of fiscal 2014.

In addition, the government will cover up to 9 trillion yen of TEPCO's expenses for compensating victims of the disaster and decontaminating areas around the plant. Under that plan, TEPCO and other electric power companies will eventually pay back most of these costs.

However, a Board of Audit official indicated that the return of taxpayer money would hinge on progress at the Fukushima nuclear plant.

"If the decommissioning process and the measures against the buildup of contaminated water are not carried out smoothly, it could affect the government's plans to recover the expenses," the official said.

Four years after the Great East Japan Earthquake and tsunami caused the triple meltdown at the plant, TEPCO continues facing difficulties, particularly dealing with the groundwater that keeps entering reactor buildings and becoming contaminated with radiation.

As of January, about 600,000 tons of contaminated water was stored in tanks on the plant grounds. But water purification systems, which cost tens of billions of yen in investments, have experienced a series of malfunctions.

In addition, 40.7 billion yen, including 31.9 billion yen from a government fund, was earmarked to create a frozen wall of soil to divert clean groundwater away from the plant and into the ocean. That project started in June 2014, but progress has been slow, and doubts remain about the efficacy of the plan.

As for the actual decommissioning of the reactors, radiation levels are so high in some areas of the plant that workers cannot even approach to determine the extent of the damage to the nuclear fuel.

“We still estimate the costs to deal with the decommissioning process and the buildup of contaminated water at about 1 trillion yen,” a TEPCO public relations officer said. “We plan to add another trillion yen to the budget to avoid a shortage of funds, and we hope to avoid affecting the government’s plans to recover the expenses.”

At least 20% nukes, says business lobby

March 25, 2015

Business leaders says 20% nuclear power needed

<http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html>

Mar. 25, 2015 - Updated 06:12 UTC+1

A group of business leaders in Japan is proposing that nuclear power supply at least 20 percent of the country's energy needs by 2030.

The nuclear accident at Fukushima four years ago has prompted Japan to reconsider how it produces electricity.

Government officials, politicians and business leaders, as well as academics and civic groups, are working on the problem. They are trying to figure out what mix of energy sources could meet the country's needs.

Officials with the Japan Association of Corporate Executives say nuclear power will be needed as a base-load energy source for some time to come.

They say it's unlikely that renewable resources such as wind and solar power will supply more than 30 percent of energy needs by 2030.

They say Japan will probably have to rely on nuclear power for 20 percent or more of its energy needs.

Before the 2011 accident, nuclear power supplied 28 percent.

All of Japan's nuclear power plants are currently off line.

Business lobby calls for minimum 20% dependence on nuclear energy

<http://ajw.asahi.com/article/business/AJ201503250024>

By KIYOHIDE INADA/ Staff Writer

An influential business organization called on the central government to maintain at least a 20-percent dependence on nuclear energy, citing expected limits on expanding the use of renewable energy sources. Keizai Doyukai (Japan Association of Corporate Executives) also proposed extending the operating life of nuclear reactors beyond the 40-year period set by the central government.

The organization's recommendations on energy policy released on March 24 came as the government is discussing Japan's "energy mix" for power generation. A key element of that mix is having nuclear energy account for between 15 and 25 percent of the nation's electricity in 2030.

Keizai Doyukai urged the government "to set a minimum level of about 20 percent" as a "realistic" target for that year.

The proposal foresees continuing to use nuclear reactors beyond 2030 and calls on the central government to consider rebuilding reactors or constructing new ones.

The business group cited the limits of renewable energy sources and the benefits of nuclear energy for consumers and the economy.

Reflecting on the suspension of operations at nuclear power plants following the 2011 accident at the Fukushima No. 1 nuclear power plant, the proposal said, "We should not forget the serious effects on the daily lives of the people and economic activity brought about by increasing electricity rates."

In 2011, Keizai Doyukai issued a proposal to reduce dependence on nuclear energy in the medium to long term by seeking out alternative renewable energy sources.

Teruo Asada, chairman of trading company Marubeni Corp. who also serves as chairman of Keizai Doyukai's Committee for Environment and Energy, denied the business organization has switched its policy.

"We never said that the ultimate goal should be zero nuclear plants," Asada said at a March 24 news conference. "The latest recommendations do not represent any change in our thinking."

A big waste of (taxpayer) money!

March 24, 2015

Board of Audit: Billions of yen wasted in Fukushima No. 1 cleanup

<http://www.japantimes.co.jp/news/2015/03/24/national/board-of-audit-billions-of-yen-wasted-in-fukushima-no-1-cleanup/#.VRKC8uF1Cos>

by Mari Yamaguchi

AP

Government auditors say **Tepco has wasted more than a third of the ¥190 billion in taxpayer money allocated for cleaning up Fukushima No. 1.**

A Board of Audit report describes various expensive machines and untested measures that ended in failure. It also says the cleanup work has been dominated by one group of utility, construction and electronics giants despite repeated calls for more transparency and greater access for international bidders.

Tokyo Electric Power Co. spokesman Teruaki Kobayashi said all of the equipment contributed to stabilizing the plant, even though some operated only briefly.

Some of the failures cited in the report:

French import: Among the costliest failures was a ¥32 billion machine made by French nuclear giant Areva SA to remove radioactive cesium from water leaking from the three wrecked reactors.

The trouble-plagued machine lasted just three months and treated only 77,000 tons of water, a tiny fraction of the volume leaking every day. It has since been replaced with Japanese and American machines.

Salt removal: Sea water was used early in the crisis to cool the reactors after the normal cooling systems failed.

Machines costing ¥18.4 billion from several companies, including Hitachi GE Nuclear Energy, Toshiba Corp. and Areva were supposed to remove the salt from the contaminated water at the plant.

One of the machines functioned only five days, and the longest lasted just six weeks.

Shoddy tanks: Tepco hurriedly built dozens of storage tanks for the contaminated water at a cost of ¥16 billion.

The shoddy tanks, using rubber seals and assembled by unskilled workers, began leaking and some water seeped into the ground and then into the ocean. The tanks are now being replaced with more durable welded ones.

Giant underground pools: A total of ¥2.1 billion was spent on seven huge underground pools built by Maeda Corp. to store the contaminated water. They leaked within weeks, and the water had to be transferred to steel tanks.

Unfrozen trench: A ¥100 million project to contain highly contaminated water in a maintenance tunnel by freezing it failed because the water never completely froze.

Tepco subsidiary Tokyo Power Technology even threw in chunks of ice, but eventually had to pour in cement to seal the trench.

Fukushima crisis compared to Tower of Babel

March 25, 2015

Pope cites Fukushima nuclear crisis as a modern-day Tower of Babel

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201503250073

By YUKIE YAMAOKA/ Correspondent

ROME--Pope Francis warned against the dangers of arrogance in comparing the Fukushima No. 1 nuclear power plant crisis to the biblical Tower of Babel, in a talk held with Japanese bishops in the Vatican.

"Mankind can become arrogant and create a society convenient to them, driven by an egotistical motive," Francis told members of the Bishops of Japan on March 20, according to Takeo Okada, archbishop of Tokyo. "Acts thought to help mankind are ending up destroying themselves."

The pope also warned that the production and export of arms is the most destructive threat to civilization, stating that "the problem lies in how massive wealth is created through them."

The Japanese bishops issued a message in February to commemorate the 70th anniversary of the end of World War II, in which they expressed concern over groups that deny wartime atrocities and the Abe administration's efforts to alter Article 9 of Japan's pacifist Constitution to allow the nation to exercise the right to collective self-defense.

The Japanese clerics discussed this message, along with issues regarding Article 9, in a meeting with Vatican Secretary of State Pietro Parolin.

Parolin urged the group to submit the message to the Japanese government.

"You must encourage them in order to have them resolve the issues through dialogue," Parolin told the Japanese bishops.

Active faults a heavy blow to nuclear operators

March 26, 2015

Nuclear watchdog's decision on active faults a serious blow to reactor operators

<http://mainichi.jp/english/english/newsselect/news/20150326p2a00m0na009000c.html>

The Nuclear Regulation Authority (NRA) decision to accept reports stating that active faults run directly beneath two reactors in Fukui and Aomori prefectures may prove a heavy blow to nuclear plant operators.

Japan Atomic Power Co., which operates the Tsuruga nuclear station in Fukui Prefecture, will be more seriously affected by the NRA move, as the company relies solely on its nuclear plant business. The No. 2 reactor at the Tsuruga station will likely have to be scrapped after an NRA expert committee reported that it stands right above an active fault. This reactor is 28 years old and is the newest operated by the utility. The active fault is likely to be confirmed again during an upcoming safety inspection of the area required to restart the reactor. Japan Atomic Power decided this month to scrap the No. 1 reactor at the Tsuruga plant. **It manages one more nuclear station in Ibaraki Prefecture, but restarting the Tokai No. 2 plant there faces strong local opposition.**

Japan Atomic Power has continued to make profits while all its reactors remain off-line as the five utilities with capital investments in the firm are required to pay basic fees regardless of whether any electricity is flowing from the plants. It made a 1.6 billion yen net profit for the year ending March 2014.

It's not clear, however, that this business model can continue. Tokyo Electric Power Co. (TEPCO), Japan Atomic Power's largest shareholder, is seeing persistent internal opposition to continuing basic fee payments while the plant operator's reactor restart plans remain up in the air. A TEPCO representative says the utility would not be able to give an acceptable explanation to consumers and shareholders if it continued paying large sums for nothing.

Japan Atomic Power announced earlier this month that it will convert into a holding company by the end of fiscal 2017 and establish affiliate firms that focus on nuclear reactor decommissioning work and overseas operations. It looks to secure future profit by helping other utilities decommission reactors, including TEPCO's Fukushima No. 1 nuclear plant, and introducing nuclear power abroad. As the plan to restart its own reactors has become unrealistic, reshaping its business structure is an urgent issue.

Meanwhile, **Tohoku Electric Power Co., operator of Higashidori nuclear plant in Aomori Prefecture, is also facing a tough situation.** While the utility plans to counter that the fault under the No. 1 reactor at the Higashidori plant is not active in a planned safety screening, a prolonged process is unavoidable.

The utility calculates that the restart of the nuclear reactor can bring down the cost of fuel by 5 billion yen a month, but there is no prospect for actually reaching that figure. It is also possible that the utility will be forced to undertake additional earthquake resistance construction if the NRA concludes that the fault under the Higashidori reactor is indeed active, saddling the company with ballooning operational costs.

March 21, 2015

Survey by Fukushima students seeks to address radiation fears

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201503210039>

By YURI OIWA/ Staff Writer

A group of Fukushima students will head to France in the coming week to present results of a study showing **minimal differences in radiation levels between local communities in Japan and locations in three other countries.**

Five students attending Fukushima High School embarked on the survey to clarify their situation for people outside Japan. They said they were baffled when foreign teenagers they have chatted with online since 2012 expressed disbelief that **life was back to normal** following the triple meltdown at the Fukushima No. 1 nuclear power plant in March 2011.

About 220 teachers and students living at a combined total of 30 sites in Japan, France, Belarus and Poland participated in the study.

The foreign participants used the same type of dosimeters as the students, and annual radiation exposure for individuals at each site was calculated based on readings over a two-week period between June and October last year.

The results showed that the median figure for the annual radiation exposure in Fukushima Prefecture was between 0.63 millisievert and 0.97 millisievert.

Meanwhile, figures for locations in France, Belarus and Poland were between 0.51 millisievert and 1.17 millisieverts.

The reading for Fukushima was 0.86 millisievert, while the figures for Nihonmatsu and Iwaki, both in Fukushima Prefecture, were 0.97 millisievert and 0.69 millisievert, respectively.

Figures in the more-distant Yokohama and Ena, Gifu Prefecture, were 0.59 millisievert and 0.87 millisievert, respectively.

“The difference (in annual radiation dosage levels) between municipalities outside the nuclear disaster zone in the prefecture and those overseas was insignificant,” said Haruka Onodera, a second-year student at the school. She will discuss the results at the International Radiation Protection Workshop for High School Students in France, which starts from March 23.

TEPCO has only paid 2% of decontamination work so far

March 30, 2015

Tepco refusing to pay fallout-hit municipalities for most decontamination work

Kyodo

<http://www.japantimes.co.jp/news/2015/03/30/national/tepc-refusing-pay-fallout-hit-municipalities-decontamination-work/#.VRg7BeHwmot>

Tokyo Electric Power Co. has only covered 2 percent of the ¥76.1 billion (\$638.8 million) municipalities have spent on decontamination work since the Fukushima nuclear crisis began in 2011, Environment Ministry officials said Sunday.

The operator of the crisis-hit Fukushima No. 1 nuclear power plant has effectively refused to cover the costs of removing tainted soil and other debris accrued by the fallout-hit governments, saying it is confirming whether such payments are required by law.

The central government has paid for the cleanup work on behalf of the utility better known as Tepco, but if the utility continues to balk, more taxpayers' money will be spent to cover interest payments.

Tepco has so far basically paid for decontamination work conducted directly by the central government in areas close to the nuclear plant, but treated decontamination work carried out by local governments in other areas designated by the government as needing cleanup, in a different manner.

Under the current scheme, municipal governments have been authorized to conduct decontamination in designated areas. The central government pays them first and has Tepco reimburse it for the expenses later.

A law enacted in August 2011 stipulates that Tepco bears the responsibility to pay for the decontamination work. The central government had earmarked a total of ¥1.4 trillion in this regard, including around ¥630 billion for work done by local municipality offices, by the end of fiscal 2014. The Environment Ministry has requested that Tepco pay back ¥76.1 billion by the end of February to cover work for which costs have been finalized. But Tepco has only paid ¥1.5 billion.

Asked about the issue, a Tepco official said, "It takes time for us to confirm if they were decontamination operations for which we are obliged to pay the costs."

In response, an Environment Ministry official said, "All of our requests to Tokyo Electric Power have been made based on the law and we will continue to urge the company to pay back all the money."

Tepco posted its first pretax profit in three years in the business year ended in March 2014 after plunging into financial difficulties following the triple core meltdowns in March 2011.

The utility is projecting a group pretax profit of ¥227 billion for the current business year ending next Tuesday.

TEPCO: More promises of transparency

March 30, 2015

TEPCO to issue all radiation data at damaged plant

<http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html>

Mar. 30, 2015 - Updated 12:41 UTC+2

Tokyo Electric Power Company says it will release all radiation data taken at the Fukushima Daiichi nuclear power plant to improve information disclosure.

TEPCO made the announcement on Monday after mounting criticism about its handling of tainted rainwater leaking into the sea.

Its workers had been aware since April last year that radiation levels in a drainage channel at the No.2 reactor building rose every time it rained. But it did not make the problem public for months.

The workers were worried that it might impact talks with local farmers about a plan to discharge treated groundwater into the sea.

TEPCO will name an executive officer posted to the plant who is responsible for communicating information to the public.

President Naomi Hirose said his company will implement measures that take into account the public's viewpoint.

TEPCO to disclose all data on radiation

March 31, 2015

TEPCO to come clean on radiation levels, allow checks by outside experts

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201503310040>

By HIROMI KUMAI/ Staff Writer

Embattled Tokyo Electric Power Co. pledged to disclose all data on radiation levels at its stricken Fukushima No. 1 nuclear power plant after it was taken to task for delaying by nearly a year in reporting the state of contaminated rainwater.

Responding to criticism from outside experts about its failure to reveal variations in levels of radioactivity in a drainage ditch at the crippled plant, TEPCO said March 30 the information could be available on its website as early as April.

“The willingness to disclose information has yet to permeate the entire organization (of the utility),” stated a report from the experts, who had been tasked with investigating the leakage of radioactive water from the facility into the sea outside the enclosed harbor.

The utility will appoint John Crofts, a former executive of the British Atomic Energy Authority, as one of its directors on April 1 to strengthen nuclear safety and information disclosure. As part of its new openness, TEPCO will also allow regular checks from outside experts.

It also issued strict warnings to three employees, including Naohiro Masuda, head of an in-house organization to promote decommissioning of the nuclear plant. The three were linked to delays in disclosing information.

The utility started to measure radioactivity in the drainage ditch at the facility in April 2014. Later, it found that the concentration of radiation became higher whenever it rained. However, it did not reveal this fact until February.

During the intervening period, TEPCO employees did not even investigate whether it was necessary to disclose the data. They also failed to submit the data to an in-house division in charge of releasing information to the public.

As the concentration of radiation was lower than that in other contaminated water, the employees did not think the data was important.

“Unconsciously, (TEPCO employees) held a different view from that of regular people in society,” said the report.

After failing to report tainted rainwater leak, Tepco vows to release all radiation data

<http://www.japantimes.co.jp/news/2015/03/31/national/failing-report-tainted-rainwater-leak-tepco-vows-release-radiation-data/#.VRpUMeHwmos>

JJI

Tokyo Electric Power Co. said Monday it will release all available radiation data associated with its Fukushima No. 1 nuclear power plant, in response to criticism over its failure to swiftly announce leaks of radioactive rainwater into the sea.

According to Tepco, the company had a policy of disclosing radiation information for contaminated water stored at the plant facilities if there is a risk of the water leaking into the sea. But this policy was not applied to radioactive rainwater that may leak into the sea via drainage ditches.

The power utility has been criticized for not promptly releasing information about radioactive rainwater when it had data confirming leaks into the sea.

At a press conference Monday, Managing Executive Officer Takafumi Anegawa said that the additional disclosures will include aerial radiation levels at the decommissioning work sites and contamination levels around plant buildings.

The volume of such data is likely to be larger than that of the already disclosed, he said.

The company did not specify when it will start releasing the additional data.

On the same day, Tepco said it will appoint John Crofts, the head of the company's internal regulatory organization, known as the Nuclear Safety Oversight Office, to the post of managing executive officer, effective Wednesday.

Crofts, former director for safety assurance at Britain's Atomic Energy Authority, will be the first non-Japanese to serve as managing executive officer of Tepco.

TEPCO to disclose all data on radiation at Fukushima nuclear plant

<http://mainichi.jp/english/english/newsselect/news/20150331p2g00m0dm029000c.html>

TOKYO (Kyodo) -- Tokyo Electric Power Co. said Monday it will disclose all data on radiation levels measured at the crippled Fukushima Daiichi nuclear plant to enhance transparency, doubling the amount of data made public.

The decision follows harsh criticism last month when it was revealed that the utility had not disclosed immediately the possibility that highly radioactive rainwater was leaking into the ocean through a gutter, even though it had learned of the risk last May.

TEPCO plans to release the data on its website, including that related to radiation levels of water running through and soil at the plant. It also plans to have the data evaluated regularly by a third party.

TEPCO President Naomi Hirose told a press conference that the company will start disclosing all data "as soon as they become available" for release, as the utility aims to "break away from our tendency of covering up" information.

Hirose took the helm of the company in 2012 to play a leading role in restoring the utility, which is still grappling with the disaster at the Fukushima plant triggered by the March 2011 earthquake and tsunami. Takafumi Anegawa, director of the company, said the amount of data it plans to release will be around double the current level.

Fukushima residents suing government for lifting evacuation advisories

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201504010062>

By MASAKAZU HONDA/ Staff Writer

MINAMI-SOMA, Fukushima Prefecture--Hundreds of residents here plan to sue the central government for lifting evacuation advisories near the crippled Fukushima nuclear plant, **saying the decision endangered their lives because radiation levels remained high around their homes.**

In the lawsuit that will be filed with the Tokyo District Court, **the 535 plaintiffs from 132 households in the city just north of the nuclear plant will demand that the government retract its decision to lift the advisories and pay 100,000 yen (\$837) in compensation to each plaintiff.**

According to the plaintiffs, the government's cancellation of the advisories goes against the Law on Special Measures Concerning Nuclear Emergency Preparedness, which states that its purpose is to "protect the lives, bodies and properties of citizens from a nuclear disaster."

After the crisis started at the Fukushima No. 1 nuclear power plant in March 2011, the government issued evacuation orders for areas within 20 kilometers of the plant. The plaintiffs' homes are in areas that were issued evacuation advisories and surrounding neighborhoods.

During the decontamination process for areas around the plant, the government initially wanted to lower annual radiation exposure doses to 1 millisievert. After that goal proved impossible, the target became 20 millisieverts.

“The government has selfishly raised the limit on annual public radiation exposure from 1 millisievert set before the nuclear crisis to 20 millisieverts, having residents return to their homes still exposed to high doses of radiation,” said Kenji Fukuda, an attorney representing the plaintiffs. **“This is an illegal act that violates the residents’ right to a healthy environment guaranteed by the Constitution and international human rights laws.”**

A public relations official at the government’s nuclear disaster response headquarters denied the government had put residents in danger.

“Annual radiation exposure levels in all areas that were previously issued the advisories have fallen below 20 millisieverts following decontamination procedures,” the official said. “With the radiation levels unlikely to have a significant effect on the residents’ health, we have called off the advisories by going through legal procedures.”

The government issued the advisories to households starting in June 2011, urging pregnant women and children in particular to evacuate their homes.

The advisories, issued to 281 households in Fukushima Prefecture, were all lifted by the end of last year. But many of the 152 households that were issued advisories in Minami-Soma opposed the government’s decision.

“The woodlands and farmlands of the surrounding areas are still contaminated, leaving many of the radiation levels unreduced,” said Shuichi Kanno, the 74-year-old chief of a ward in Minami-Soma who heads the plaintiffs. “Radiation levels have even increased in some areas. There is no way our children and grandchildren will be returning to their homes like this.”

Translation firm leaks NRA documents

April 1, 2015

Nuclear watchdog's in-house documents leaked online via translation agency

<http://mainichi.jp/english/english/newsselect/news/20150401p2a00m0na009000c.html>

The Secretariat of the Nuclear Regulation Authority (NRA) is mulling barring a translation company from participating in bids for the agency after in-house documents it commissioned the firm to translate were found to have been leaked online.

The NRA secretariat disclosed the finding during a regular press conference on March 31. The agency had outsourced the translation of internal documents to be used in the training of new employees to Tokyo-based translation service firm Erklaren -- though none of the documents contained confidential information.

Erklaren had accepted the nuclear watchdog's order for the translation of 55 sets of documents from Japanese into English and subtitling for approximately 40 million yen in November last year.

After the NRA secretariat was informed of the leakage of the documents on the Internet on March 30, it started investigations into the case and subsequently identified Erklaren as the source of leaked information. Although the leaked documents did not contain confidential information, they were classified as "Level 2" in the agency's confidentiality scale of 3 because they "could obstruct clerical work if leaked to outsiders," according to the agency.

The leaked documents -- spanning 50 pages on A4-sized paper -- carried the outlines and safety regulations of the Rokkasho Reprocessing Plant in Aomori Prefecture and other nuclear fuel reprocessing

facilities at home and abroad. The documents were credited to the NRA and bore the names of officials who produced the documents.

Aside from the documents leaked online, the translation agency is also suspected to have leaked other documents to outsiders by outsourcing the translation work to third parties. The company had posted on an online job offer site a request reading, "Subtitling in English on power point slides related to nuclear power," and sent out relevant documents.

The NRA secretariat is considering punishing the firm through measures including suspending it from participating in bids for the agency.

April 01, 2015(Mainichi Japan)

Translation firm leaked classified document, NRA says

<http://www.japantimes.co.jp/news/2015/04/01/national/translation-firm-leaked-classified-nra-document-onto-internet-secretariat/#.VRvt-eHwmos>

Kyodo

A translation company under contract with the Nuclear Regulation Authority has leaked an internal, classified document online from the nuclear watchdog, its secretariat said.

The document does not contain confidential information but is marked "Classified 2," one of three levels of classification by the government, the secretariat said Tuesday.

The document contains information on how spent nuclear fuel is reprocessed, regulations on reprocessing, and details about nuclear power plants.

The NRA secretariat suspects the source of the leak is Erklaren, a Tokyo-based company it hired to have Japanese documents translated into English. The company sent the document, without password protection, to a job applicant, according to the secretariat. Erklaren solicited translators who would double-check its translations via a private-sector online bulletin board.

Kenichi Fujita, head of the international affairs office at the NRA secretariat, insisted the document is not confidential, saying it is part of "materials compiled from information that is already known."

The information leak was discovered through a tip that the secretariat received that the translation company was urgently looking for people to translate the NRA document via the online bulletin board. Translation companies hired by the NRA secretariat are prohibited from outsourcing their work or revealing such content to a third party, official Hitoshi Kometani said, adding that Erklaren has violated that policy.

The translation company undertook the work for ¥40 million. The secretariat is considering whether to pay the firm and whether to blacklist the it from bidding on future contracts.

Working without being notified of risks

April 3, 2015

100 people worked near Fukushima nuclear plant without radiation knowledge

A man holds a copy of his radiation control notebook, which does not mention his radiation dose from his work as a traffic patrol worker. (Mainichi)

<http://mainichi.jp/english/english/newsselect/news/20150403p2a00m0na015000c.html>

Roughly 100 people worked in a former no-go zone near the crippled Fukushima No. 1 Nuclear Power Plant between December 2012 and March 2013 without knowledge that their work was subject to a special radiation dose limit, it has been learned.

The workers were employed by a contractor that secured jobs for them under a deal with the central government's Cabinet Office to monitor passing vehicles. Labor standards authorities ordered the contractor to correct its practices after the problem came to light.

The contractor says it had only about two weeks to begin work after winning the government contract, and did not have much time to check pertinent laws. **The case highlights the central government's hasty approach in requesting such work -- without a sufficient preparatory period or explanation.**

The Health, Labor and Welfare Ministry has asked both contractors and outsourcers to comply with legal requirements.

According to the Cabinet Office and other sources, the deal called on the contractor to assign 20 regular cars to the former no-go zone within 20 kilometers of the nuclear plant run by Tokyo Electric Power Co. to direct and monitor other motor vehicles. The Cabinet Office hastily asked a local taxi company to do the job after local governments were given permission to issue passes to local government officials and reconstruction workers in December 2012.

The taxi company, which had handled requests from local residents for temporary homecomings, procured regular vehicles and temporary workers to do the job.

However, the Tomioka Labor Standards Inspection Office was alerted by third parties about a possible violation of regulations for jobs other than decontamination work that are subject to special radiation limits. It launched an investigation and ordered the contractor in August last year to rectify the situation,

pointing out that the job fell under the category of work in which people would be exposed to an air dose of over 2.5 microsieverts per hour.

Although the contractor independently monitored the traffic patrol workers' radiation exposure through their dosimeters, it did not check their respective radiation exposure records, conduct an 150-minute course on radiation effects on the human body and measurement methods, carry out advance research on air doses or issue dose records.

The contractor sent workers their radiation dose records after receiving the improvement order from the labor standards inspection office, but some of the records returned unopened because the workers had changed their addresses.

The Cabinet Office says the traffic patrol work has changed somewhat in content since April 2013, and another contractor is now engaged in tasks subject to the special radiation dose limit.

The health ministry's guidelines for jobs subject to the radiation limit say that an outsourcer can place an order after confirming that a contractor has in place a system to secure enough workers who have been educated to carry out the assignment.

The taxi company's president told the Mainichi Shimbun that his company barely managed to secure enough people and cars. The company, he said, is a novice when it comes to nuclear radiation. He said that the firm might have checked the special radiation dose regulations if there had been a longer preparatory period. The Cabinet Office says it has no clear-cut recollection of its request, but acknowledged that the request was urgent. It added it was not required to explain whether or not the job was subject to the special radiation dose limit because the contractor was primarily responsible for making judgments.

The health ministry declined comment on the specific case other than to say that it has urged outsourcers including the Cabinet Office and contractors to honor pertinent regulations.

A 63-year-old man who was a member of the vehicle patrol team says the central government should care more for people working in no-go zones.

The man was recruited after a suspension of decontamination work. He and other prospective workers assembled at an izakaya restaurant in Iwaki, Fukushima Prefecture, and were briefed in December 2012. They received explanations about granting motor vehicles passes and reporting suspicious vehicles, but were not notified about outdoor radiation levels.

On the evening of the following day, the man and another man got into a used car and set up four checkpoints along National Route 6 in the onetime no-go zone and checked passing vehicles from their car. The closest checkpoint was less than 2 kilometers from the nuclear plant, and they were scared as their dosimeters showed high levels of radiation.

The man learned about the special radiation dose limit last year and inquired with the Cabinet Office. He was told that the contractor said the job was not subject to radiation dose limits. He wanted to know his overall radiation dose because he had engaged in decontamination work in the past.

After the labor standards inspection office issued its order, he received his radiation dose record for his traffic patrol duty. It said his dosage was less than 1 millisievert.

"It's wrong to continue to work without advance notification of the risks," he said.

April 03, 2015(Mainichi Japan)

Who should be accountable for the disaster?

April 4, 2015

Gov't reluctant to charge TEPCO over rent money for voluntary Fukushima evacuees

<http://mainichi.jp/english/english/newsselect/news/20150404p2a00m0na014000c.html>

The government has been covering the rent for apartments provided for evacuees from Fukushima Prefecture, while not demanding payment for this purpose from Tokyo Electric Power Co. (TEPCO) -- the operator of the crippled Fukushima No. 1 Nuclear Power Plant -- it has been learned.

While TEPCO is ready to pay the rent costs for those who have been forced to evacuate from their hometowns due to government evacuation orders, **the utility is reluctant to do the same for evacuees who left their homes voluntarily**. The Economy, Trade and Industry Ministry has fallen in line with TEPCO on the matter, while the decision on which party is to charge TEPCO -- the national government or Fukushima Prefecture -- is still also up in the air.

Since the Disaster Relief Act has applied to the entirety of Fukushima Prefecture following the 2011 nuclear crisis, local residents -- whether forced or voluntary evacuees -- have all been provided rent-free apartments as temporary shelters. Prefectural governments that have taken in Fukushima evacuees initially submit the housing charges to the Fukushima Prefectural Government, which compiles data -- but **the central government has effectively been covering the entire cost**.

According to the Cabinet Office, which holds jurisdiction over the Disaster Relief Act, the aid money spent on disaster relief measures in Fukushima Prefecture totaled 31.7 billion yen in fiscal 2013 and 28.7 billion yen in 2014, based on the fiscal budget. **Much of the aid money is believed to have gone to cover apartment rental costs, meaning that taxpayers' money is going into something that should be covered by TEPCO**.

For the cost of government-led decontamination work on the radioactively contaminated areas, meanwhile, the Environment Ministry and other related parties have been charging TEPCO 229.1 billion yen since 2012. The utility has paid 121.7 billion yen for the decontamination work, including areas outside the designated evacuation zones.

According to sources close to the matter, the Health, Labor and Welfare Ministry began consulting with TEPCO and the industry ministry over the housing provision during the spring of 2012, at which time the health ministry was overseeing the Disaster Relief Act. In August of that year, the health ministry and TEPCO notified the Fukushima Prefectural Government that the utility was to cover rent costs for evacuees from no-entry zones. They agreed that the utility should pay for the rent shouldered by the central government.

TEPCO and the industry ministry show reluctance, on the other hand, in shouldering the rent costs of voluntary evacuees.

The government's dispute reconciliation committee for nuclear damage has proposed to pay a monthly 100,000 yen fee for each forced evacuee as compensation for psychological damages, while setting the amount at 120,000 yen in total for voluntary evacuees (except for children and pregnant women, who are offered a total of 720,000 yen). Following the committee's decision, the industry ministry and the utility seem to reject the idea of dealing with the two types of evacuees equally.

Furthermore, the central and Fukushima prefectural governments have failed to settle which party is to charge TEPCO for the rent money. Since the Ibaraki Prefectural Government demanded that private businesses pay rescue costs for a 1999 accident at the JCO nuclear material processing plant in the prefectural town of Tokai, the health ministry sought to establish measures that enabled the Fukushima Prefectural Government and municipal governments in the prefecture to charge TEPCO over the rent

money. However, **the Fukushima government has claimed that the central government should take responsibility for demanding that TEPCO pay the housing fees, since the latter has been shouldering the cost.**

A Cabinet Office representative told the Mainichi Shimbun that the government cannot demand that TEPCO pay for something the utility refuses to pay -- suggesting the government's plan to exempt TEPCO from covering rent payment compensation for voluntary evacuees.

Masafumi Yokemoto, a professor of environmental policy at Osaka City University, points out that **a reason why the central government and other related parties haven't charged TEPCO over the rent money for voluntary evacuees is because they don't want to admit that those people are victims of the nuclear meltdown.**

"The issue clearly shows how the government and TEPCO try to avoid responsibility for clarifying accountability for the disaster," Yokemoto added.

April 04, 2015(Mainichi Japan)

Oversight committees too weak to help

April 5, 2015

Oversight for secrets too weak

<http://www.japantimes.co.jp/opinion/2015/04/04/editorials/oversight-secrets-weak/#.VSDyy5Pwmos>

Committees in both chambers of the Diet overseeing government operations under the state secrets law held their first meetings last week. But their powers are so weak they may not be able to compel the government to reverse improper designations of state secrets. The Diet should earnestly search for ways to strengthen these committees.

The launch of the committees was delayed even after the law took effect on Dec. 10 due to a tug of war between the ruling and opposition forces over their membership and the setup of their secretariats. The eight-member committee in each house will receive a report annually from the government on its operations under the state secrets law. Their meetings will be held behind closed doors and committee members who leak state secrets will be punished.

The committees' first task will be to check 382 items that the government designated as state secrets last year. But the report will only feature lists that summarize the contents of these secrets. The descriptions of some listed items, disclosed at the request of the Democratic Party of Japan, are fairly concrete — such as “information on North Korea’s nuclear and missile development,” and “information on territory preservation and protection of interests in the air and the ocean in the East China Sea.” But descriptions of other items are too vague and each item can include a large number of secrets — such as “information provided by foreign governments,” “plans and methods for cooperation with foreign governments in the field of information on security” and “conclusions of National Security Council meetings in 2013 and 2014.”

This is problematic in at least two ways. First, committee members will have no clue as to what bits of information have actually been designated as secrets. Second, by using vague and catch-all designations, government ministries and agencies may designate as secrets a vast amount of information that does not merit such classification and should instead be made public.

In theory, the committees have the power to compel the government to submit state secrets to it for examination, and if necessary recommend that the government declassify specific secrets or improve its handling of them. But the committees' request for submission of state secrets has no binding power because the government can turn it down if it deems the disclosure would greatly aggravate the nation's security. In addition, the panels' recommendations have no binding power.

The composition of the committees' members are decided in accordance with the number of seats held by the parties in each chamber. The Lower House committee will be composed of five lawmakers from the Liberal Democratic Party and one each from the DPJ, Ishin no To (Japan Innovation Party) and the LDP's coalition partner Komeito. The Upper House committee will be made up of four LDP members, two DPJ members and one each from Ishin no To and Komeito.

Committee members from the ruling camp have been quoted as saying that they in principle trust what the government does. Such an attitude risks turning the Diet panels into bodies whose function is to simply rubber-stamp the government's designations of secrets.

To help ensure the committees function properly, the Diet should make changes to the way they operate. Receiving a report just once a year from the government is not enough. Such reports should be provided to the committees more frequently. The description of items on government lists need to be more concrete and detailed. Experts on information management, security and diplomacy should be assigned to the committees to help the members examine the government's reports and make recommendations. More importantly, the committees each should have a section that government workers can report to when they believe information has been unjustly classified as a secret. The Diet should develop effective measures to protect such whistle-blowers.

Even if these measures are implemented, the state secrets law can hide information that the Diet and public may need to scrutinize the actions of the government since it gives discretionary powers to government ministries and agencies to classify information related to security, diplomacy and anti-terrorism policies almost without limits. At the very least, these deficiencies in the law must be corrected.

Japanese-French consortium to build nuclear plant in Turkey

April 4, 2015

<http://www.balkans.com/open-news.php?uniquenumber=202484>

Turkish Parliament approved the construction of second nuclear plant from Japan

Balkans.com Correspondent - 02.04.2015

Parliament's General Assembly accepted in the early hours of April 1 an international agreement between Turkey and Japan for the construction of Turkey's second planned nuclear plant. With the approval, the legal framework for the construction of the plant has been laid.

Turkey's second planned nuclear plant was awarded to a **Japanese-French consortium** in May 2013, to be constructed in the northern province of Sinop.

Japan's Mitsubishi Heavy Industries Ltd (MHE) and Itochu Corporation, with France's GDF Suez, will build

the **4,800 MW plant at an estimated cost of \$22 billion**. The plant will be operative with **ATMEA1** reactors developed by MHE and the French company of **Areva**.

Turkey's first nuclear power plant will be built by the Russian Rosatom in the southern province of Mersin. hurriyetdailynews

Japan's "withering" democracy

VOX POPULI: Japan's democracy withering like old cherry trees

<http://ajw.asahi.com/article/views/vox/AJ201504060012>

Vox Populi, Vox Dei is a daily column that runs on Page 1 of The Asahi Shimbun.

An old poem reads, "It often becomes windy and rainy after flowers blossom." As it implies, a huge number of cherry blossom petals have been blown away by the wind and rain in areas west of the Kanto region over the past several days.

While being disturbed by the falling blossoms, we are also worried about whether some cherry trees have been felled by strong winds.

Many "somei-yoshino" cherry trees across the nation are aging. This species is said to have a lifespan of 60 to 80 years.

The cherry trees planted around the country soon after the end of World War II are now in this age range. A cherry tree is believed to be in danger if mushrooms are growing on the base or the trunk. If a tree produces an odd sound when it is hit by a wooden hammer, experts say, there is the possibility that the trunk is rotting and hollowing inside.

If tree trunks were "local elections," what sound would they produce if struck?

These trees should have spread thick branches and leaves to all parts of the nation. Sadly, however, these trees have cut a rather miserable figure.

In 41 prefectural assembly elections, 321 constituencies, or one-third of all constituencies, were uncontested. As a result, 501 candidates won their seats without any competition.

This column once quoted an American aphorism warning about abstention from voting: "Bad politicians are sent to Washington by good people who don't vote."

In Japan, however, many people can't vote even if they want to because there are no contests in their electoral districts. That means many candidates are elected simply because they have run.

Part of the blame should be placed on the pathetic Democratic Party of Japan, which has sharply reduced the number of its candidates. But there seems to be more deep-rooted problems behind the deplorable situation.

Sixty-eight years have passed since the first unified local elections were held in postwar Japan. This nation's democracy is now as endangered as the old cherry trees.

Voter turnouts in various elections have been generally low in recent years. This clearly indicates a disturbing tendency among Japanese voters to leave policymaking to politicians and bureaucrats.

There has been a series of scandals involving unseemly conduct by members of the Diet and local assemblies. That's partly because of the lack of serious tension between politicians and voters.

The same is true for the administration's arrogance.

We need some good tree doctors who can breathe new life into our precious trees.

Meltdowns, victims and hydrogen explosions: 1984 simulation never published

April 8, 2015

Government withheld report of a simulated attack on a nuclear power plant

1984 ministry document addresses a Fukushima-like scenario

<http://www.japantimes.co.jp/news/2015/04/08/national/1984-report-warned-attack-nuclear-power-plant/#.VSZTn5Pwmos>

by Reiji Yoshida

Staff Writer

The Foreign Ministry secretly conducted a simulation in **1984** to assess damage from a hypothetical attack on a nuclear power plant in a war and concluded that up to 18,000 people would be killed with acute symptoms from radiation exposure, it emerged Wednesday.

The previously secret report **also mentioned the possibility of a hydrogen explosion that could follow the meltdown of fuel rods in a nuclear power plant, the exact phenomenon that happened during the 2011 Fukushima crisis.**

Anti-nuclear activists slammed the ministry for not publicizing the report earlier, allegedly out of fear that the warnings could fan anti-nuclear sentiment among the public.

"The report should have not been held secret. (The government) should publicize it and consider how it can protect" nuclear power plants, said Hideyuki Ban of the Citizens' Nuclear Information Center.

The content of the document was first reported Wednesday by the Tokyo Shimbun, which obtained a copy of the 63-page report through the information disclosure law.

The Japan Times confirmed the outline and key conclusions of the report with a senior Foreign Ministry official.

According to Yasushi Noguchi, head of the ministry's arms control and disarmament division, the ministry asked the Japan Institute of International Affairs, an affiliate of the ministry, to draw up the report **after Israel staged an airstrike and destroyed a reactor under construction in Iraq in 1981.**

Noguchi said **the report concluded that up to 18,000 people would die in the worst-case scenario if the primary containment vessel of a 1 million kilowatt-class reactor in Japan was severely damaged and local residents did not evacuate immediately.**

In another scenario, **the report also warned that if all power supplies were cut and critical cooling functions lost, fuel rods would melt down. The hydrogen generated from metals used for fuel assembly cladding could then potentially cause an explosion.**

This type of hydrogen explosion actually happened and aggravated the meltdown crisis at the Fukushima No. 1 power plant after the massive tsunami of March 11, 2011, knocked out the power supply, killing the critical cooling operation.

Few plant workers and nuclear experts anticipated a hydrogen explosion until one actually ripped through the No. 3 reactor building.

The Tokyo Shimbun alleged the Foreign Ministry did not publish the report because it feared it would fan anti-nuclear sentiment while the government was trying to build more nuclear power plants in the 1980s.

Noguchi said it was not published because it was intended as an internal reference for Foreign Ministry officials.

Ban claimed nuclear plants in Japan are not designed to be robust enough to withstand missile attacks or a suicide airplane crash such as the 9/11 terrorist attacks in New York in 2001.

The Nuclear Regulation Authority now requires that reactor buildings be robust enough to withstand the “intentional crash of a large aircraft” and other terrorist attacks.

But the NRA declines to disclose any more details of the safety regulations, saying they should be kept secret for security reasons.

IAEA's unabated support for nukes

IAEA chief stresses nuclear power

<http://www.japantimes.co.jp/news/2015/04/13/business/iaea-chief-stresses-nuclear-power/#.VSvOKpPwILM>

Kyodo

International Atomic Energy Agency Director-General Yukiya Amano on Monday underscored the importance of nuclear power generation, saying it contributes to stable electricity supply and economic growth.

“Nuclear power supports the economy as it ensures stable energy supply, and bolsters a nation’s competitiveness,” Amano said in a speech during an annual event in Tokyo organized by the Japan Atomic Industrial Forum, which promotes nuclear power.

The chief of the U.N. nuclear watchdog also said: “It is a misunderstanding that (international society) is pressed to choose either nuclear power or renewable energy” as they are “complementary to each other.”

Following the Fukushima No. 1 nuclear disaster triggered by a huge earthquake and tsunami in March 2011, the majority of the public in Japan remain opposed to restarting nuclear reactors amid safety concerns.

Editorial: Court ban on restarting Takahama nuclear plant serves as serious warning

<http://mainichi.jp/english/english/perspectives/news/20150415p2a00m0na003000c.html>

The judicial branch of the government sounded an alarm bell when the Fukui District Court banned Kansai Electric Power Co. (KEPCO) from restarting two idled reactors at the utility's Takahama Nuclear Power Plant in Fukui Prefecture.

KEPCO attempted to resume operations at the power station's No. 3 and 4 reactors that have passed safety inspections by the government's Nuclear Regulation Authority (NRA). However, the court issued a provisional injunction on April 14 ordering KEPCO not to reactivate these reactors, pointing out that the new standards for inspections are too lax.

We have insisted that Japan should eliminate nuclear power as early as possible by expanding the use of renewable energy, promoting energy-saving measures and abiding by the government's rules that nuclear reactors should be shut down after 40 years in operation. Based on this idea, we believe that the minimum necessary reactivation of idled nuclear plants should be permitted

However, the court appears to be of the view that the safety of residents in areas that host atomic power stations cannot be protected unless the danger posed by nuclear plants is completely eliminated or restarting nuclear plants is totally banned in this quake-prone country.

If an accident is to occur at a nuclear plant, it would threaten the lives, livelihoods and assets of residents of extensive areas around the power station over an extended period. Considering these risks, we should take seriously the judicial branch's warning that current moves to hastily restart idled nuclear plants without sufficient debate would lead to the revival of the myth of nuclear plants' infallible safety.

In its latest decision, the district court pointed to the need to stiffen safety standards to guarantee that absolutely no accidents will occur at nuclear reactors that meet the standards. In other words, the court deemed that no risk should be permitted in restarting nuclear reactors.

After applying to the NRA for safety inspections, KEPCO upgraded its prediction of the maximum shaking of an earthquake that could hit the area hosting the Takahama plant from 550 gals to 700 gals and that of the maximum tsunami from 5.7 meters to 6.2 meters and emphasized that the measure has enhanced the safety of the power station.

However, noting that five earthquakes with stronger vibrations than assumed have hit areas that host atomic power stations over the past decade, the district court said the possibility cannot be ruled out that a more powerful temblor than KEPCO predicts could hit Takahama. The court concluded that such a quake could destroy the plant's facilities and damage reactor cores.

The court then pointed out that these risks cannot be completely eliminated unless the prediction of the shaking of possible quakes hitting the plant is significantly raised. It also cited the need to fundamentally reinforce facilities and equipment, such as external power sources and the coolant water supply system, to

increase their quake-resistance to the maximum level, as well as erect walls around pools for used nuclear fuel.

KEPCO had intended to go through necessary procedures with an eye to restarting the reactors in November this year, but the court's provisional injunction will force the company to review its schedule. The views that the court expressed in its latest decision also apply to many other nuclear plants that their operators are aiming to restart. The injunction was handed down by the same presiding judge that also banned KEPCO in May last year from restarting the No. 3 and 4 reactors at its Oi Nuclear Power Plants. The judge apparently handed down these decisions based on his common ideas on safety of nuclear plants.

The pros and cons of restarting idled nuclear reactors have a huge impact on people's livelihoods and economic activities. It would be too excessive if the restart of any nuclear plant were disapproved to pursue zero risk. However, the court's warning that nuclear reactors should not be restarted without addressing numerous problems should be taken seriously.

Injunction on reactors seen as victory by some, blip on road to restarts by others

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201504150089>

THE ASAHI SHIMBUN

Anti-nuclear activists rejoiced, Kansai Electric Power Co. expressed some jitters and the government appeared unconcerned about the Fukui District Court's injunction that prevents the utility from restarting two nuclear reactors.

The court ruled April 14 that the new safety regulations of the Nuclear Regulation Authority are "too lenient" and would not guarantee the safety of the No. 3 and No. 4 reactors at Kansai Electric's Takahama nuclear power plant in Fukui Prefecture.

The injunction took effect immediately.

It was a rare court decision that went against the government and electric power industry. The ruling doubted the efficacy of what the government has described as "the world's toughest safety standards."

The two reactors have cleared the key part of the NRA's regulations and were effectively approved for a resumption of their operations.

Hiroyuki Kawai, a lawyer representing the nine plaintiffs who live in an area 50 to 100 kilometers from the Takahama plant, hailed the court's decision as tantamount to banning the restarts of all nuclear reactors in Japan.

"It clearly described the inadequacies of the new safety standards and declared that the regulations are invalid," he said.

Kansai Electric, which was seeking to restart the reactors in November, was not surprised by the decision, considering the judge in the case had made a similar decision last year.

The Osaka-based utility is expected to appeal the injunction at the district court and later at the Kanazawa branch of the Nagoya High Court if the initial motion is rejected. The procedure could take months to complete and affect the company's profits.

"We expect the ruling to be overturned at a high court with a different judge in charge," a senior Kansai Electric official said.

A senior official of the industry ministry, which oversees the nuclear power sector, was equally optimistic, saying, "We do not have to nervously react to one court ruling."

Chief Cabinet Secretary Yoshihide Suga told a news conference on April 14 that the government will take a wait-and-see strategy toward the issue.

"Things are still in the stage of a court injunction," he said. "So we will closely watch how the parties involved will react."

But the top government spokesman emphasized that the Abe administration's policy is to allow reactors to resume operations as long as they are cleared by the NRA.

Hitoshi Kometani, director of the general affairs division with the NRA secretariat, also dismissed the negative impact of the Fukui ruling, which called his organization's standards subpar.

Komentani told reporters on April 14 that the NRA will proceed with its safety screenings for reactor restarts as usual.

Presiding Judge Hideaki Higuchi of the Fukui District Court took issue with safety features of the Takahama plant related to quake-resistance levels and the pools for storing spent nuclear fuel.

Utilities estimate the largest possible shock of an earthquake at their nuclear plants based on data on active seismic faults in the surrounding areas and earthquakes that have struck other parts of the nation. Higuchi disputed the method of evaluating earthquake ground motions under the NRA regulations. Kansai Electric's anti-seismic features at its nuclear facilities are based on this method.

The court noted that since 2005, five earthquakes have caused ground motions exceeding the maximum expected levels at four nuclear power plants, including the now-stricken Fukushima No. 1 nuclear power plant.

Higuchi said Kansai Electric underestimated the possible ground motion level near the Takahama plant, thereby failing to significantly bolster its ability to withstand earthquakes.

Kansai Electric's assessment of the plant's safety was still based on "an assumption that a severe accident will rarely occur," according to the court. The judge pointed to the 2011 disaster at the Fukushima No. 1 nuclear plant, on which the NRA regulations were based.

The court also noted that NRA regulations do not require pools of spent nuclear fuel to be protected by a sturdy building. In addition, the ruling criticized the NRA for allowing a moratorium on construction of anti-quake emergency response centers where plant operators can deal with severe accidents.

Higuchi concluded that despite the NRA's approval of Kansai Electric's safety reports on the two reactors, its regulations lack rationality and do not ensure safety.

He said that given the inadequacies of the NRA's regulations, restarting the reactors at the Takahama plant could infringe on the plaintiffs' constitutional right to live a peaceful life.

In a similar case and based on similar reasoning, Higuchi in May last year ordered a halt to operations of two reactors at Kansai Electric's Oi nuclear power plant in Oi, Fukui Prefecture. The case is still pending at a high court.

A court ruling is expected on April 22 in legal action seeking an injunction to stop the restarts of two reactors at Kyushu Electric Power Co.'s Sendai power plant in Kagoshima Prefecture.

The two reactors of Kyushu Electric have also been cleared by the NRA. They are expected to be the first in Japan to be restarted under the NRA's safety regulations.

"If the court rules against the Sendai plant, similar to the Takahama plant, it could jolt the entire electric power industry," a senior official with Kansai Electric said.

Before the Fukushima disaster, Kansai Electric depended on nuclear energy for half of its overall power generation, the highest ratio among Japanese utilities.

But with the continuing shutdown of all nuclear reactors in Japan, the company has projected a pretax loss for fiscal 2014, which ended March, for the fourth straight year.

Restarting the reactors was seen as indispensable in turning around the company's business performance.

"We are at a loss over how long it will take us to overturn the court's decision," a senior Kansai Electric official said. "It could be six months, one year or even two years."

Hitoshi Yoshioka, a professor of science history at Kyushu University, welcomed the court's decision as "one that took into account citizens' concerns."

"If a nuclear accident takes place, it can cause tremendous damage," said Yoshioka, who leads the think tank Citizens' Commission on Nuclear Energy. "The court took an approach that reactors should fulfill particularly stringent requirements. The court's decision is clear-cut and persuasive."

But Akihiro Sawa, head of the International Environmental Economic Institute, criticized the district court for setting the safety bar too high.

"The ruling calls for extremely vigorous regulations so that a severe accident would never ever occur," he said. "But by global standards, safety regulations are crafted to minimize the risks after weighing the frequency of accidents and expected damage in a comprehensive manner."

He said the ruling effectively set different standards in judiciary from those of the public administration and brought about confusion in the nuclear industry and the public.

April 15, 2015

Court decision on Takahama reactors throws cold water on gov't nuclear policy

<http://mainichi.jp/english/english/perspectives/news/20150415p2a00m0na002000c.html>

The injunction issued by the Fukui District Court on April 14 to prevent the restart of two reactors at the Takahama Nuclear Power Plant has poured cold water on the government's efforts to return to atomic energy.

Officials of Kansai Electric Power Co. (KEPCO), the operator of the Takahama plant in Fukui Prefecture, were shocked and disappointed to learn of the court decision, with one senior official saying, "We have plunged into an uncertain extended game."

For KEPCO, which had relied on nuclear reactors for about 50 percent of its total power generation before the Fukushima nuclear crisis, the restart of the No. 3 and 4 reactors at the power station was a trump card to pull the utility out of the red. In December last year, KEPCO applied to the Ministry of Economy, Trade and Industry for approval to raise its electricity rates for households by an average of 10.23 percent -- its second rate increase since the outbreak of the Fukushima nuclear crisis.

The utility had developed a scenario in which it would move into the black in fiscal 2015 by raising its electricity rates again in the first half of fiscal 2015 and restarting the Takahama nuclear reactors as early as November this year. The 10.23 percent increase in electricity rates for households was based on the assumption that the Takahama reactors would be reactivated as planned. The temporary injunction order issued by the Fukui District Court has made it difficult to foresee whether the reactors will be restarted in the future, quickly blurring the utility's scenario to achieve profitability.

KEPCO is expected to post its fourth consecutive deficit in fiscal 2014 due to the prolonged shutdown of its reactors. Its total debt for the four-year period is forecast to reach over 700 billion yen. If the utility continues to post a deficit in fiscal 2015, concerns would grow about the possibility of the company falling into a state of insolvency with its debts exceeding its assets. KEPCO President Makoto Yagi said, "It is a situation that shakes the continued existence of our company."

A senior KEPCO official said, "We want to manage to secure a surplus by cutting costs and other means." But Kansai Electric's banks could harden their stance toward lending, forcing the utility to move ahead with recapitalization and raise its electricity rates over and over again.

The latest court decision has also poured cold water on the government which has been pushing for the early restart of the country's nuclear plants in a bid to return to atomic energy.

Seven major utilities in the country raised their electricity rates as fuel costs for thermal power generation increased due to the prolonged shutdown of their nuclear reactors. The electricity rates for industrial use have risen 30 percent since the outbreak of the Fukushima nuclear crisis, while those for households have increased 20 percent. The government had thought that it would need to ensure economic recovery by keeping electricity rates low through the early reactivation of nuclear reactors. As part of the scenario, the government called attention to the safety of nuclear power generation by describing the Nuclear Regulation Authority's new regulation standards as the "world's highest level" and laid the groundwork for the early reactivation of nuclear reactors.

One year and nine months have passed since the NRA started screening reactors for restart, and the No. 1 and 2 reactors at the Sendai Nuclear Power Plant operated by Kyushu Electric Power Co. are expected to be reactivated as early as this summer. However, a court decision is scheduled to be made on April 22 on whether to issue an injunction order to ban the utility from restarting the two reactors. Kyushu Electric is also aiming to avert its fifth consecutive deficit by restarting its reactors. A Kyushu Electric official said, "We hope the Fukui District Court's decision to issue the injunction will not affect us."

The government maintains its stance to press for the early restart of the country's nuclear reactors, as Chief Cabinet Secretary Yoshihide Suga said the latest court decision was nothing but a "provisional ruling." But applications for injunction orders are expected to be filed one after another by citizens to prevent nuclear reactors across the country from being restarted. A senior industry ministry official said, "Economic recovery will be hampered if a restart of nuclear reactors is delayed by judicial rulings."

Nevertheless, the problem seems to lie in the fact that the government has been reluctant to take measures swiftly to break with nuclear power generation.

Takahama nuclear restart injunction polarizing

http://www.japantimes.co.jp/news/2015/04/16/national/takahama-nuclear-restart-injunction-polarizing/#.VS_q0ZPwLM

by Eric Johnston

Staff Writer

A provisional injunction handed down Tuesday by the Fukui District Court against the restarting of Kansai Electric Power Co.'s Takahama No. 3 and 4 reactors is a boost to opponents of nuclear power, even as the decision draws criticism from senior politicians, nuclear regulators, Kepco, and pro-nuclear Japanese media.

A panel of three judges led by Hideaki Higuchi handed down a provisional injunction banning the restart of the two Takahama reactors, saying that the earthquake-risk prediction method used by the Nuclear Regulation Authority in approving the reactors' restart was flawed.

"It is hard to find, for a nuclear power station that must be prepared for a remotely possible accident, the rationale for establishing a basic earthquake ground motion that is based upon the foundation of the image of a mean earthquake," the ruling said.

"This signifies that basic earthquake ground motion has lost its reliability (as an assessment method) not only based upon the track record but also, logic."

The text was welcomed widely by the anti-nuclear camp.

"The great thing about the Fukui court's ruling is that it's written in relatively easy-to-understand Japanese. The NRA and Kepco are saying they don't understand the ruling, but the fact that they don't understand is strange," said Yuji Kano, a lawyer who supported those seeking the provisional injunction. The question now is whether the decision will influence efforts to block the restart of reactors elsewhere. Whether it becomes an important precedent rests on two factors, one political and one legal.

While not legally required, precedent demands that the utilities seek the "understanding" of local governments hosting the reactors before any restart. Fukui's local governments are pro-nuclear and anxious to have the reactors restart for economic reasons, but some other localities greeted the news about the provisional injunction with more caution.

In Hokkaido, where Hokkaido Electric is seeking the restart the Tomari nuclear plant, Gov. Harumi Takahashi, who was re-elected on April 12 and has indicated she favored a restart, said Wednesday that she was now unsure if the Fukui decision would effect Tomari.

Those involved in seeking the provisional injunction of the Takahama reactors said Friday that they hoped the decision would spur local governments to think more seriously about evaluating the safety of nuclear plants in their midst rather than just waiting for experts in Tokyo to tell them what to do.

"Here in Kansai, the (seven prefecture, four city) Union of Kansai Governments has said that as far as the safety of nuclear reactors is concerned, not only specialists from the central government but also local safety specialists appointed by local governments should be relied upon to evaluate a broad range of issues like local evacuation plans and to talk about problems related to the overall safety issues affecting the restart of reactors," said Hidenori Takahashi, one of those involved in seeking the court injunction.

But the legal issue starts with how other courts hearing appeals for provisional injunctions might rule.

Tadashi Matsuda, also one of the nine plaintiffs, said he worries the Fukui court ruling could be the exception rather than the precedent.

“The Fukui court judge’s ruling was based on the people’s right to human dignity. But the government and probably most Japanese are living lives based on economic values, and making judgments based on economics,” he said.

“Even if we don’t want judges elsewhere to rule on reactor restarts based on economic values, there’s a possibility the results will be influenced by a priority on economics,” Matsuda said.

KEPCO appeals court decision

April 18, 2015

Kansai Electric appeals reactor restart injunction, cites economic impact

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201504180031

Kansai Electric Power Co. filed an objection on April 17 seeking revocation of a court ruling that banned the restart of two reactors at its Takahama nuclear power plant in Fukui Prefecture.

The utility also requested that the Fukui District Court suspend the temporary injunction it issued on April 14, saying the order could cause “major economic loss” to the company.

The injunction, which residents in the prefecture and elsewhere had sought over safety concerns, legally bans Kansai Electric from bringing the No. 3 and 4 reactors at the plant back online.

Even if the two reactors pass the remaining safety screenings by the Nuclear Regulation Authority and the utility obtains permission from local governments to restart, it cannot do so unless the injunction is suspended or reversed.

If the district court upholds the decision, the utility plans to appeal it to the Kanazawa branch of Nagoya High Court.

Kansai Electric President Makoto Yagi said at a news conference in Tokyo on April 17 that the company will seek revocation of the injunction as early as possible while making every effort to prove the plant is safe.

Given the stoppage in nuclear power generation across the nation and the increase in imported fuel costs for thermal power plants, Kansai Electric has applied for a second time to the industry ministry for approval to raise household electricity rates.

The price increase was calculated on the premise that the two reactors at the Takahama plant will be brought back online in November.

Kansai Electric appeals court decision to ban nuclear restart

<http://mainichi.jp/english/english/newsselect/news/20150418p2g00m0dm011000c.html>

FUKUI, Japan (Kyodo) -- Kansai Electric Power Co. filed an objection Friday seeking revocation of a recent court decision that banned the utility from restarting two nuclear reactors at its Takahama nuclear plant in western Japan.

The utility serving Osaka and neighboring areas is not allowed to switch the reactors back online unless the Fukui District Court undoes the temporary injunction it issued Tuesday as sought by a group of residents in Fukui Prefecture and elsewhere.

The court decision dealt a blow to the government's plan to revive nuclear power generation, suspended following the 2011 Fukushima meltdowns. Kansai Electric hoped to restart the two units in November after it obtained safety clearance from the regulator in February based on post-Fukushima regulations. The court said the safety of the Takahama plant is not secured despite the Nuclear Regulation Authority safety approval, saying the new regulations -- which the government has touted as "the world's toughest" -- are "too loose" and "lacking rationality."

Kansai Electric President Makoto Yagi said at a press conference Friday he believes there are "factual errors" in the content of the court decision.

Aiming to restart its reactors as soon as possible, the utility has spent a massive amount of money to boost their safety as required by the regulations.

Amid an increase in imported fuel costs for thermal power generation in the absence of atomic power, Kansai Electric expects a fourth straight yearly loss in the business year that ended in March.

Kepeco appeals injunction blocking restart of Takahama reactors

AFP-JIJI, JIJI

FUKUI – The operator of a Japanese nuclear plant whose restart was blocked this week by a court injunction said Friday it would appeal the ruling.

Kansai Electric Power has submitted “a motion of complaint to Fukui district court” over Tuesday’s injunction banning the refiring of the Takahama nuclear plant’s No. 3 and 4 reactors, a company spokesman said.

In its ruling, the court said the safety of the reactors at Takahama had not been proved, despite a green light from the Nuclear Regulation Authority, whose guidelines, the court said, were “too loose” and “lacking in rationality.”

“We genuinely regret that the court did not understand our argument,” the spokesman said, adding that the temporary court order “includes significant factual errors.”

Kepeco also warned of huge economic damage if the reactors are not restarted.

The utility had been aiming to begin operating the facilities as early as November, but it cannot restart them unless the ban is removed or suspended.

The nuclear issue is a highly sensitive one in Japan, which remains deeply scarred by the triple meltdown disaster at the Fukushima No. 1 atomic plant in 2011.

The worst atomic accident in a generation forced tens of thousands of people from their homes, with some still displaced and scientists warning that tracts of land might be uninhabitable for decades.

The nation’s entire stable of reactors — which once provided more than a quarter of the country’s electricity — was gradually switched off following the disaster.

Activists are also seeking an injunction to prevent the restart of reactors at the Sendai plant in Satsumasendai, Kagoshima Prefecture, with a court expected to rule that issue April 22.

But pro-nuclear power Prime Minister Shinzo Abe has backed an industry push to return to fire up the stalled reactors, with the country's manufacturers complaining over the high cost of electricity produced from dollar-denominated fossil fuels.

What future for 'voluntary' evacuees?

April 17, 2015

'Voluntary' evacuees of Fukushima nuclear disaster face unclear future

<http://mainichi.jp/english/english/newsselect/news/20150417p2a00m0na006000c.html>

The approaching deadline for an announcement on whether the provision of emergency temporary housing will be extended has turned the spotlight on those whose evacuations from Fukushima Prefecture are considered "voluntary."

Immediately after the outbreak of the Fukushima No. 1 Nuclear Power Plant disaster, the Disaster Relief Act was applied to the entirety of Fukushima Prefecture, making emergency temporary housing facilities available to all Fukushima prefectural residents. Soon afterward, however, evacuation designations for individual municipalities were put into place, and residents were classified into those whose homes were within designated "no-go zones," referred to as "mandatory evacuees," and those whose homes were not in designated "no-go zones," referred to as "voluntary evacuees." In other words, this differentiation between so-called mandatory and voluntary evacuees was made after the residents had already fled their homes.

There are two main types of emergency temporary housing: prefabricated facilities built within Fukushima Prefecture, and public housing and rentals in and outside the prefecture appropriated for use as emergency temporary housing. Because the Fukushima Prefectural Government for the most part made housing within the prefecture available to mandatory evacuees only, many voluntary evacuees live in appropriated housing outside of Fukushima.

Under the Disaster Relief Act and related laws, emergency temporary housing is provided for two years, except for in extreme disasters, in which lease terms can be extended up to a year at a time. In the case of the 1995 Great Hanshin Earthquake, the provision of such housing went on for just over four years. The central and Fukushima prefectural governments have heretofore announced yearlong extensions three times between late April and late May each year. The expiration for the current extension is late March of 2016.

If the provision of emergency temporary housing were to be discontinued, mandatory evacuees have several options to choose from, including moving to disaster recovery public housing. Voluntary evacuees, meanwhile, do not meet the requirements for moving into such facilities, although many of them are reluctant to return home out of concerns over radiation exposure. Termination of the emergency temporary housing program would thus lead directly to unclear prospects for so-called voluntary evacuees.

Asked about appropriated temporary housing facilities during a House of Councilors Budget Committee meeting April 9, Prime Minister Shinzo Abe expressed enthusiasm for continuing the program, saying, "I'd like to handle the issue in a way that puts residents at ease."

Why are extensions capped at a year at a time in the first place? The laws cite the durability of prefabricated facilities as the rationale for this rule.

According to the Disaster Relief Act and related regulations, the durability of prefabricated constructions dictates the initial term for the provision of emergency temporary housing as two years. The one-year extensions are made only after the structural durability of the facilities has been confirmed. Public housing and rentals appropriated as emergency temporary housing have longer-term durability than prefabricated housing, but the reasoning, according to a Cabinet Office official, is that the terms are made the same in both types of housing for the sake of fairness.

The evacuees, meanwhile, live in a constant state of uncertainty. A 43-year-old woman who has evacuated to Saitama Prefecture with her husband and two children in junior high and high school, respectively, longs for more stability. "Instead of one-year extensions, which don't allow us long-term prospects, we want to be able to live where we are for several more years until our children graduate from school," she said.

Susumu Tsukui, an attorney well-versed in residential issues surrounding evacuees, is critical of the current system. "It's wrong to set a time frame for emergency housing based on the durability of prefabricated housing," he said. "Instead of trying to cram the current situation into a pre-existing framework, we should be thinking about what needs to be done so that evacuees can live at ease."

Voluntary evacuees living in appropriated emergency temporary housing face other disadvantages, too. In the spring of 2012, the municipal governments of the Fukushima Prefecture towns of Namie and Futaba -- both of which were wholly designated as no-go zones -- sought approval from the central government to allow evacuees to relocate to new appropriated housing facilities inside and outside the prefecture, a plea that was commonly heard among many evacuees. That August, the Ministry of Health, Labor and Welfare, which at the time had jurisdiction over the Disaster Relief Act, and Fukushima plant operator Tokyo Electric Power Co. sent a notice to the Fukushima Prefectural Government that while they would not permit evacuees to relocate from one appropriated housing to another, evacuees would be able to receive compensation for rental fees of homes they move into after leaving temporary housing. In effect, this was an approval for mandatory evacuees to relocate but does not cover the relocation of voluntary evacuees. The authorities' stance toward voluntary evacuation has been made clear by how it has tried to pass off the burden of rental fees for appropriated housing -- currently covered entirely by the national government -- to TEPCO.

Internal government documents obtained by the Mainichi Shimbun through a freedom of information request show that the Ministry of Health, Labor and Welfare and the Reconstruction Agency summoned officials from Fukushima, Iwate and Miyagi, the three prefectures hit hardest by the 2011 disasters, as well as officials from Yamagata, Niigata, Tochigi and Saitama Prefectures, which have hosted large populations of voluntary evacuees, to the Fukushima Regional Bureau of Reconstruction in the Fukushima capital on May 24, 2013.

According to inside sources, a Ministry of Health, Labor and Welfare official at the meeting proposed that each prefecture bill TEPCO directly for rental fees incurred by nuclear disaster evacuees, pointing to the example of the 1999 JCO nuclear incident in Tokaimura, Ibaraki Prefecture, in which Ibaraki prefectural authorities received disaster relief funds from the plant operator. The proposal was abandoned, however, after prefectural officials objected, demanding why the prefectural governments and not the central government -- which had heretofore shouldered all the costs -- should have to charge the utility. TEPCO has expressed reluctance to cover the rental fees of voluntary evacuees, and the government has deliberated the possibility of initially billing the power company for the rental fees incurred by mandatory evacuees, but a final decision has yet to be made. If the government ultimately decides not to charge

TEPCO for the rental fees of voluntary evacuees, it would imply that TEPCO bears no responsibility for the evacuation of those people. Whoever eventually charges TEPCO for evacuation costs -- a role which prefectural and central government officials tried to foist onto each other in May 2013 -- will have to decide how voluntary evacuees are treated and explain the rationale behind the decision.

As one central government official said, "It all comes down to the fact that no one wants to be held accountable."

Majority of Japanese against nukes

April 22, 2015

Survey shows strong opposition, concern over nuclear power

<http://mainichi.jp/english/english/newsselect/news/20150422p2a00m0na015000c.html>

Seventy percent of Japanese are against restarting the country's nuclear reactors, and 90 percent believe nuclear disaster evacuation plans in their municipality are insufficient, according to a recent survey.

Tokyo Woman's Christian University professor emeritus Hirotsugu Hirose conducted the opinion survey about Japan's nuclear power plants March 4-16. To eliminate weighting the results towards certain demographics, polltakers were sent to homes in 200 locales across Japan. A total of 1,200 people between the ages of 15 and 79 responded.

Asked about the possibility of an incident at a nuclear power plant as severe as the Fukushima nuclear crisis, 22 percent of the pollees said they thought such an incident would occur, and another 52 percent said that such an incident was likely to occur. Meanwhile, only 1 percent told the survey that such an incident would not happen, while another 24 percent said such an incident was unlikely to occur.

When asked if they thought evacuation plans mapped out by municipal governments were sufficient, 37 percent of respondents said "absolutely insufficient" and another 50 percent said they were "somewhat insufficient."

Asked about restarting currently idled nuclear reactors, 45 percent said they were "somewhat opposed" and another 26 percent said they were "absolutely opposed." Twenty-four percent of respondents said that they supported restarting reactors "to some extent," while only 4 percent "strongly" supported reactivation.

In addition, 85 percent of the pollees said that permission for restarts should be obtained from all municipalities within 30 kilometers of a nuclear plant, not just from host municipalities as is currently the case. Just 10 percent said the decision to back reactor reactivations should be made solely within host municipalities. Furthermore, 53 percent said that use of nuclear energy should be reduced in phases while approving reactor restarts for the time being.

Hirose says the survey shows that people's sense of danger over nuclear power has not faded in the four years since the Fukushima nuclear crisis began, citing insufficient measures from authorities to prevent future disasters.

Frugality not always synonymous with security

April 21, 2015

Tepco's frugality rapped after 48,000 PCs found running Windows XP

<http://www.japantimes.co.jp/news/2015/04/21/national/tepcos-frugality-rapped-after-48000-pcs-found-running-windows-xp/#.VTeDTJPwmot>

AFP-JIJI

Embattled Tokyo Electric Power Co. has been slammed by an independent auditing watchdog for **skipping on its computer network, which still uses the Windows XP operating system.**

Facing multi-billion dollar cleanup and compensation bills from the March 2011 nuclear crisis, Tepco figured it could save a few yen by delaying an upgrade.

But the independent watchdog — which usually on the lookout for wasteful spending — warned the nation's biggest electric utility about its frugality, saying it must replace the outdated computer system because of **security concerns.**

Tepco — effectively nationalized through a government bailout after the triple meltdown at the Fukushima No. 1 nuclear power plant in March 2011 — **was hoping to save ¥3.6 billion (\$30 million) by continuing to run about 48,000 computers on Windows XP until 2018.**

Microsoft stopped providing security updates and technical support for Windows XP last year, aggravating concerns about cybersecurity.

"The company decided, on its own initiative, to move up the deadline to update the software due to system security concerns," a Tepco spokesman said Tuesday.

In a report last month, the Board of Audit warned the company not to be so stingy.

"Upgrading the operating system must be done as swiftly as possible, and the firm must not push it back, given the security risks," the board said.

Fukushima still needs money in years to come

April 21, 2015

Fukushima reconstruction bill estimated at ¥3.57 trillion once intensive period ends

<http://www.japantimes.co.jp/news/2015/04/21/national/fukushima-reconstruction-bill-estimated-at-%C2%A53-57-trillion-once-intensive-period-ends/#.VTeDlpPwmos>

JJI

FUKUSHIMA – At least ¥3.57 trillion will be needed to rebuild Fukushima over a five-year period starting in fiscal 2016 after the “intensive period” for post-disaster reconstruction, set by the government, ends in fiscal 2015, the prefectural government said Tuesday.

The estimate was unveiled at the daily meeting of the prefecture’s headquarters for promoting reconstruction. In light of the estimate, the prefectural government plans to seek financial support from the central government.

During the intensive period, the central government is to cover the cost of all reconstruction projects in the prefecture and all other areas damaged by the March 2011 Great East Japan Earthquake and tsunami, which triggered the Fukushima nuclear disaster.

“Reconstruction of disaster-hit areas will enter a crucial stage from now,” Fukushima Gov. Masao Uchibori said at the meeting, adding that his prefecture will work to **secure reconstruction funds in a stable manner over the long term.**

Fukushima is considering asking the central government to shoulder ¥2.49 trillion of the ¥3.57 trillion, excluding decontamination expenses, which the prefecture plans to charge to Tepco, and costs to be covered by reserve funds.

Back to profits

April 28, 2015

Tepco returns to profit amid lower global energy prices

<http://www.japantimes.co.jp/news/2015/04/28/business/corporate-business/tepco-returns-to-profit-amid-lower-global-energy-prices/#.VUHPXZPwmos>

Bloomberg

Tokyo Electric Power Co. returned to profit in the fourth quarter, as lower energy prices helped offset a weaker yen and one-off gains boosted net income.

Tepco, the country’s biggest power utility, posted operating profit of ¥17.3 billion (\$145 million) in the three months ended March 31, rebounding from an operating loss of ¥40 billion a year earlier, according to Bloomberg calculations based on full-year results released Tuesday.

Full-year operating profit of ¥316.5 billion fell short of expectations and the company said it couldn’t give profit or sales forecasts for the year while the restart of nuclear power in Japan remains uncertain.

The operator of the wrecked Fukushima No. 1 plant said full-year net income was ¥451.5 billion, up 2.9 percent on the year and benefiting from net gains in government payments to the company that will be disbursed as compensation for the Fukushima disaster.

A more than 50 percent plunge in crude oil prices last year has helped Japanese utilities offset the impact of a weaker yen that makes imports more expensive. Tokyo Electric, or Tepco, has also embarked on a cost-cutting campaign to help rein in operating expenses.

Japan’s regional power utilities have endured several years of mounting losses after turning off nuclear power since the Fukushima disaster began in March 2011. All of Japan’s operable reactors remain shuttered pending safety reviews and approvals.

The most cost-effective?

April 28, 2015

Nuclear energy cheapest power source due to reduced disaster risks, ministry says

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201504280045>

By TOMOYOSHI OTSU/ Staff Writer

Nuclear power is the most cost-effective method of generating electricity, even when factoring in increased safety fees, accident compensation and other related expenses following the 2011 nuclear disaster, the industry ministry said.

The government's new estimates were based on the assumption that the probability of a major nuclear disaster occurring has been reduced following the introduction of new safety screening standards, meaning that the costs of dealing with such accidents would be spread out.

A ministry report assessing electricity generation costs said nuclear power generation will cost a minimum of 10.1 yen (8.5 cents) per kilowatt hour in 2030. A 2011 analysis had estimated the minimum cost as 8.9 yen per kilowatt hour. Even so, nuclear power remains particularly cost-effective because the other methods, including renewable energy and thermal energy, have also risen in cost.

The report was released during an April 27 session of the ministry's Power Generation Cost Verification Working Group and approved in principle.

The ministry plans to use its analysis to draw up a proposal for Japan's energy mix for 2030, in which it plans to have 20 to 22 percent of the nation's electricity produced by nuclear power.

The latest assessment was to be presented at an expert panel meeting on April 28.

Using the same method as the 2011 analysis, the cost of nuclear power generation was determined by taking into account expenses such as compensation to be paid in the event of accidents, subsidies to municipalities in the vicinity of power plants. Increased safety fees were also taken into account this year. However, the cost for dealing with nuclear disasters was reduced on the back of stricter safety standards that the government insists has cut the probability of large-scale accidents by half.

In the 2011 assessment, the minimum generation costs for 2030 for renewable energy sources, such as land and offshore wind turbines, had been below that of nuclear power plants at around 8.8 yen per kilowatt hour.

These power sources were estimated to be more costly in the latest report because fees to fund government research projects on renewable energy were also included as expenses.

Nuclear power, on the other hand, is relatively cheap only in the sense of its minimum cost, not taking into account that compensation and fees to deal with nuclear disasters could see exponential growth.

"Nuclear power plants will become a power source with high risks and high costs after the deregulation of the electric power industry," an industry expert said.

An iodine filter to reduce the release of radioactive materials in event of an accident is installed at the Shimane nuclear power plant in Matsue, Shimane Prefecture, on April 27. (Ryo Isshiki)

Fukushima hasn't changed Gov't energy policy

April 29, 2015

Editorial: Returning Japan to bad old days of nuclear dependence a major blunder

<http://mainichi.jp/english/english/perspectives/news/20150429p2a00m0na010000c.html>

Japan is about to go right back to where it started before the triple-meltdown at the Fukushima No. 1 nuclear plant triggered by the Great East Japan Earthquake and tsunami. In a recently released Ministry of Economy, Trade and Industry energy mix plan for the year 2030, nuclear power still takes up 20-22 percent of Japan's power generation capacity, with renewables slated for a 22-24 percent share. In the post-3.11 era, it's very difficult indeed to call this an appropriate mix.

Before the Fukushima nuclear disaster, nuclear power made up just under 30 percent of Japan's generating capacity, and the government had planned to push that to more than 50 percent by 2030. Renewables including hydro accounted for about 10 percent, and were penciled in for a 20 percent or so share in the future.

Then came 3.11 and the nuclear catastrophe in Fukushima, which ought to have prompted the government to rethink its energy strategy. Under the energy policy approved by Cabinet decision last year, "the introduction of renewable energy sources will be sped up to the greatest degree possible. Furthermore, by adopting renewables and energy-saving systems, as well as by increasing the efficiency of thermal power generation, we will reduce (Japan's) dependence on nuclear power to the greatest possible extent."

The majority of the Japanese people, too, desire a "non-nuclear dependent society," and supported a radical denuclearization policy agenda. That support is now going unrecognized, those desires ignored. After the meltdowns, new regulations came into force dictating that no reactor could be in service for more than 40 years. If this remains in force, then even if every currently idled reactor is restarted, and every reactor now under construction goes on line, by 2030 nuclear power will cover only around 15 percent of Japan's energy needs.

As such, that "20-22 percent" target in the economy ministry energy plan means extending the operational lives of or replacing old reactors, or building new ones. In other words, it is an outright declaration of dependence on nuclear energy. By the same token, the 22-24 percent of the energy mix assigned to renewables is a far, far cry from using green energy to the "greatest degree possible."

Lowballing renewable energy is just one more example of the "reactors first" policy and its broader impact.

We at the Mainichi Shimbun have long maintained that the risks of nuclear power far outweigh the benefits in this earthquake-prone nation of Japan, and that we should do away with atomic energy as soon as possible. **We do not deny there is an argument for keeping nuclear power from the perspective of economic risk and energy security, but if one considers that nuclear waste will continue to build up inside Japan as long as there are reactors in operation, atomic energy cannot be considered a sustainable energy source for this country.**

We can hardly discuss the country's energy mix without considering whether it is right to keep pushing the nuclear waste problem onto future generations, thinking only of present-day economic prosperity. And yet the economy ministry has pushed that very problem to the side, insisting on preserving nuclear energy regardless. We cannot agree with this.

We must also take issue with the assumptions that form the basis of energy mix figures and valuations. The government says that renewable energy cannot be expanded because costs -- such as the rates paid under the feed-in tariff system and the expansion of power transmission networks -- are simply too high to make it practical. Of course, no one can ignore a rising electricity bill, but surely we can all bear somewhat higher energy prices for the sake of reducing our nuclear power dependency. **There also needs to be a debate on who should pay for electricity transmission network expansion.**

Furthermore, far more than expanding transmission networks, what needs to be tackled first is reforming the daunting regulatory framework for getting renewable energy sources on line. **Surely freeing up network capacity by decommissioning reactors, as well as emphasizing local generation and consumption -- which puts little load on the grid -- leaves a lot of room to expand green energy generation.**

New energy cost calculations released by the government put the lower limit of nuclear energy costs at the cheapest they have ever been. **We have to wonder, however, if the costs of implementing new safety measures and accident response funds have been properly reflected in the figures.** Not everyone should agree, too, with the government assumption that the frequency of accidents will be halved due to the extra safety measures. We would like to see the government query a far larger range of experts and explain the issue exhaustively to the public to obtain their consent.

Even if the government wishes to guarantee 20 percent or more of the energy market to atomic power, it must open its eyes to the fact that it won't be easy.

If there is a move to extend the lives of old reactors, then there will be extra safety measure costs. Getting the consent of host municipalities and their residents will also be difficult. As such, we'll likely see utilities shuttering older nuclear reactors purely for business reasons. What's more, even if a utility could keep a reactor going past the 40-year limit, chances of some sort of mishap would increase, and there would be no guarantee of smooth, trouble-free power generation.

So it seems likely that some quarters will argue for building new reactors, new plants. But then again, construction mishaps and holdups can delay a new reactor for years, swelling costs. There is more than one example of this overseas. What's more, if the electricity market is opened up to true competition, nuclear energy may very well be driven to extinction by free market forces.

What will happen, then, if the government shuts its eyes to all this and sticks to its well-crafted figures and tables, all pointing to continued reliance on "cheap" nuclear power? It would blunt the society-wide drive to reduce carbon dioxide emissions through green energy and electricity saving. And then, when nuclear energy generation fell short we would, in the end, fall back on fossil fuels. This is an all-too likely scenario, one in which Japan's CO2 emissions rise once more and we are forced to buy fuel from foreign lands to keep the lights on.

Essentially, the failure of the economy ministry to produce an energy policy that can pass the public's sniff test is down to this: government policy formulation has not changed a whit from before the Fukushima meltdowns. **The committee considering Japan's energy mix is still composed almost entirely of people pushing for the continuation -- or even the expansion -- of nuclear power in this country.** We must question a decision-making process that seemed to begin with setting aside a large share of the future energy market for atomic power.

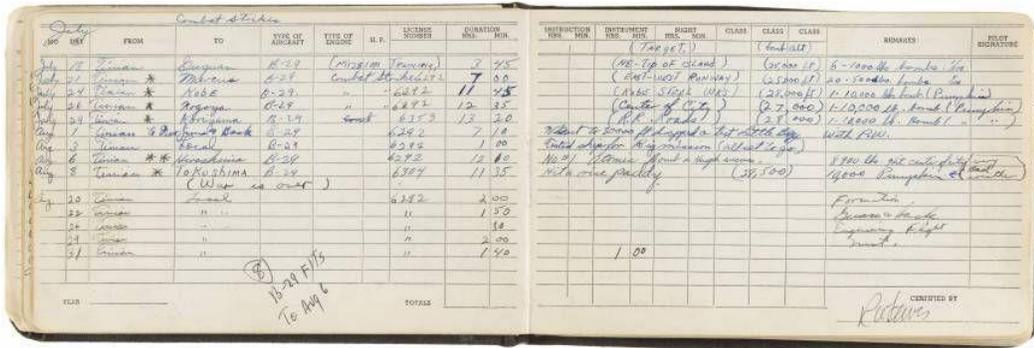

This way of doing business looks more than likely to lose the trust and cooperation of the Japanese people. The government must state clearly and absolutely that it is committed to freeing Japan from nuclear dependence, and then think on an energy mix policy that will get us there.

Enola Gay log copy sold in auction

April 30, 2015

Moving Enola Gay pilot's log copy fetches \$50,000 at N.Y. auction

<http://www.japantimes.co.jp/news/2015/04/30/world/moving-enola-gay-pilots-log-copy-fetches-50000-n-y-auction/#.VUH07JPwmos>

AFP-JIJI

NEW YORK – A copy of a deeply moving pilot’s log, written during the top-secret Enola Gay mission that dropped the first atomic bomb on Japan, was auctioned in New York on Wednesday for \$50,000.

Robert Lewis, co-pilot of the B-29 bomber, made the copy in 1945 at the request of the then-science editor at The New York Times, and it includes a pencil sketch of the mushroom cloud, Bonhams auction house said.

Lewis wrote the original log on Aug. 6, 1945, as he flew to and from Hiroshima, disguised as a letter to “Mom and Dad” because as there was to be no official account of the top-secret mission, Bonhams said. “I am certain the entire crew felt this experience was more than anyone human had ever thought possible,” Lewis wrote in the log. “It just seems impossible to comprehend. Just how many Japs did we kill? “I honestly have the feeling of groping for words to explain this... My God what have we done,” he wrote. The original was sold at auction for \$391,000 in 2002 by Christie’s.

The same World War II memorabilia auction also sold Lewis’s hand-drawn plan for dropping the bomb for \$37,500, Bonhams said.

The single sheet of graph paper shows a pencil and ink drawing of the Enola Gay approaching Hiroshima and on dropping the bomb, turning 150 degrees to the right to avoid the shock waves of the explosion. The atomic bombing of the city had claimed 140,000 lives by December 1945. When Lewis saw the huge mushroom cloud, he uttered the famous remark “My God, what have we done?”

Japan surrendered on Aug. 15, 1945, after the Americans dropped a second atomic bomb on the city of Nagasaki.

But two top lots at the auction failed to sell: a 1945 German surrender order and two of Lewis’s log books, which were valued at \$150,000-\$200,000.

A spokeswoman for Bonhams said that many buyers around the world had expressed interest and that it was “quite common” for post-sale offers to emerge later.

The surrender order, valued at \$20,000 to \$30,000, was sent by Karl Doenitz, the last leader of the Third Reich to the head of the Luftwaffe, Field Marshal Robert von Greim on the evening of May 8, 1945.

It said all hostilities would cease at 1:00 am on May 9.

Von Greim received the telegram at 10:40 pm on May 8. He fled Germany but was arrested by U.S. forces outside Prague and later committed suicide.

10,000 plaintiffs against TEPCO

May 5, 2015

Plaintiffs soon to exceed 10,000 in lawsuits against TEPCO seeking extra compensation

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201505050033>

By ATSUSHI KOMORI/ Senior Staff Writer

Dissatisfied with government-orchestrated compensation, the number of local residents and others affected by the Fukushima nuclear crisis who have sued Tokyo Electric Power Co. is expected to soon top 10,000 plaintiffs.

According to a lawyers' group supporting the plaintiffs, a total of 9,992 people, including those who lived in evacuation zones or voluntarily fled their homes, have joined 25 lawsuits filed with 20 district courts and court branches across Japan, including Sapporo and Fukuoka, by the end of April in the four years since the disaster.

The first such case was brought to court in December 2012 by evacuees from Futaba, Fukushima Prefecture, and elsewhere.

The plaintiffs are demanding that TEPCO, operator of the wrecked Fukushima No. 1 nuclear power plant, pay additional compensation and bring down radiation levels near the facility to pre-disaster conditions. Because 900 people have joined the suits since January, the number of plaintiffs seeking compensation for damages related to the nuclear disaster triggered by the Great East Japan Earthquake and tsunami in March 2011 will most likely exceed 10,000 in the not-too-distant future, the lawyers' group said.

Most of the plaintiffs are also seeking compensation from the central government based on the state redress law. In another massive litigation, more than 20,000 residents living near the U.S. Kadena Air Base in Okinawa Prefecture in 2011 called for compensation for damages caused by aircraft noise in the third lawsuit related to the military base.

Based on guidelines compiled by the national Dispute Reconciliation Committee for Nuclear Damage Compensation, TEPCO has been paying compensation to those forced to evacuate from their hometowns after the nuclear crisis. The utility is also compensating local business operators for losses associated with the disaster.

But the plaintiffs are arguing the payments are insufficient and demanding that TEPCO pay additional compensation until the radiation readings return to pre-disaster levels, and that the utility compensate the victims for the "loss of their hometowns."

TEPCO refuses to submit simulation documents

May 5, 2015

TEPCO refuses to reveal tsunami simulation results in nuclear disaster suit

<http://mainichi.jp/english/english/newsselect/news/20150505p2a00m0na016000c.html>

KOBE -- Tokyo Electric Power Co. (TEPCO) will not allow plaintiffs in a nuclear disaster damages suit to see the results of a tsunami simulation the utility conducted before the March 2011 disasters, the Mainichi has learned.

Sources familiar with the lawsuit told the Mainichi Shimbun that the plaintiffs -- all nuclear disaster refugees now living in Hyogo Prefecture -- had requested the documents from TEPCO, but that the utility

had refused. The plaintiffs are suing TEPCO and the government of Japan for damages in the Kobe District Court. The power company is not under any legal obligation to divulge the simulation documents, but "they are records vital to finding out if TEPCO could have actually predicted this terrible disaster," representatives for the plaintiffs stated. The utilities actions "are obstructing the pursuit of the truth," claim the plaintiffs.

The 92 plaintiffs (from 34 households) are demanding a total of 790 million yen in compensation from TEPCO and the government for uprooting their lives due to the radioactive contamination from the nuclear disaster.

They are seeking documents related to a 2008 simulation, in which TEPCO modeled tsunami generated by a theoretical major earthquake off the coast of Fukushima Prefecture, based on historical accounts of an 1898 temblor of the magnitude 8.0 level in the same region and other data.

TEPCO, however, did not report the results of this simulation to the former Nuclear and Industrial Safety Agency (under the Ministry of Economy, Trade and Industry) until March 7, 2011 -- just four days before the Great East Japan Earthquake and tsunami that caused the triple meltdown at the Fukushima No. 1 plant. The utility released part of the report revealing it knew a tsunami more than 10 meters high was possible, but not until around five months after the disaster.

The plaintiffs assert that TEPCO and the government should have been aware that a disaster severe enough to knock out all power at the Fukushima No. 1 plant was possible. They asked the Kobe court in March this year to order TEPCO to divulge the simulation documents. On April 9, TEPCO attorneys submitted a counterargument declaring that "the documents are neither related to nor necessary for the plaintiffs' claims. The hearings of the trial should focus on whether there is a causal relationship between the (nuclear) accident and damage to the plaintiffs."

On May 1, the plaintiffs filed a rebuttal stating, "TEPCO has revealed only one part of its tsunami simulation estimates. The details of the (simulation report) remain entirely obscured."

"As the offending company, TEPCO is being called on to find out the entire truth of what caused the nuclear accident," commented Hiroki Tatsumi, chief secretariat of the defense counsel. "I cannot understand the company's refusal" to release the simulation documents.

A TEPCO public relations representative, meanwhile, told the Mainichi, "Regarding the lawsuit, we would like to respond sincerely based on a detailed inquiry into the plaintiffs' demands and assertions."

Responsibility of employers in disasters

May 10, 2015

Company executives' attitude and judgment can mean life or death for employees in disasters

<http://mainichi.jp/english/english/newsselect/news/20150510p2a00m0na002000c.html>

Since over 2,400 people were killed by the Great East Japan Earthquake and ensuing tsunami on March 11, 2011 while at work or in transit to or from work, some employers have faced court orders to pay damages to bereaved families. All employers, meanwhile, face the great challenge of protecting the lives of their employees and customers from disasters in the future.

At 2:46 p.m. on March 11, 2011, Kenji Saito, the executive director of confectioner Saito Seika, was at the company's head office in Ofunato, Iwate Prefecture, when files fell from the shelves and everything began to shake. The temblor registered a lower 6 on the Japanese seismic intensity scale. In the spur of the moment he yelled, "Get out, there's going to be a tsunami! Turn off the power. Evacuate!"

As soon as the shaking subsided, the 35 employees who had been at the head office -- located some 100 meters from the ocean -- headed for their designated evacuation site on higher ground about 270 meters away. They arrived at the site shortly before 3 p.m., and a tsunami over 8 meters high struck some 20 minutes later. The company headquarters were completely destroyed, but no one was hurt.

From the time he was a child, Saito had been told repeatedly by his father, who had survived the tsunami that hit following the 1933 Sanriku Earthquake by climbing up an electric pole, to evacuate empty-handed if a large earthquake were to strike. There were numerous posters saying "It's an earthquake, there's going to be a tsunami, evacuate now!" on the walls of the Saito Seika office, and in evacuation drills held twice a year, members of the company followed their designated route to higher ground.

On March 9, 2011, just two days before the massive quake and tsunami hit, there had been a temblor in the city with a seismic intensity of 3, followed by a tsunami measuring 60 centimeters. On the morning of March 11, 2011, the company had just reviewed its tsunami evacuation manual, and reminded its employees to evacuate to higher ground in the case of a tsunami warning. This procedure review contributed to the smooth evacuation.

In March 2013, Saito, along with local volunteers, founded the Ofunato Tsunami Denshokan (Pass on tsunami lore to the next generation) -- a facility dedicated to passing down history and information on tsunami in the local area -- on the grounds of the company headquarters that had been rebuilt on higher ground.

The message Saito wants to convey is simple. **"Whether or not employees survive depend on their leaders' judgment,"** Saito says. **"The top executives of companies with operations in coastal areas must be able to tell their employees to evacuate even if it means abandoning the workplace."**

The Ministry of Health, Labor and Welfare says that as of the end of March 2015, there have been 2,172 cases across 14 prefectures in which the families of those who were killed in the earthquake and tsunami while at work were awarded workers' compensation. According to the Fund for Local Government Employees' Accident Compensation and the National Personnel Authority, as of the end of March 2015, 297 civil servants were certified as having died while carrying out public duties. This means that at least 2,469 people died from the 2011 disasters during work.

Despite the unprecedented magnitude of the disasters, there have been cases of surviving families suing employers over the deaths of employees, resulting in companies paying vast amounts of money, either because of court rulings or settlements. What has separated employers who are found responsible for such payments from those who are not is whether they were seen to have made the effort to gather disaster-related information and to instruct evacuation based on that information.

In the case of a damages suit brought against the operator of Joban-Yamamoto driving school in Yamamoto, Miyagi Prefecture by the family members of 25 students and one staff member there, the Sendai District Court ruled in January that the operator had allowed the shuttle to take students from the school on its regular route despite hearing tsunami warnings issued from fire trucks, and ordered the payment of more than 1.9 billion yen in total. The school, located 750 meters from the ocean, did not have a disaster manual, nor had it carried out any evacuation drills.

In a case involving employees of Shichijushichi Bank's Onagawa branch in Onagawa, Miyagi Prefecture, who were killed by tsunami despite having evacuated to the roof of the bank some 10 meters high, the Sendai High Court on April 22 denied the bank's legal responsibility. The presiding judge added, however,

"In order to prevent the loss of human life under current circumstances in which we cannot reliably predict tsunami heights, it is necessary to be prepared for unforeseen tsunami and to make the effort to evacuate people to safe places immediately after an earthquake."

Some companies, meanwhile, have taken the lessons learned from the 2011 disasters to implement clear measures that put lives first.

At Yakuodo Co., which is based in the Iwate Prefecture town of Yahaba and operates drugstores in five Tohoku region prefectures, nine employees were killed from the disasters on March 11, 2011.

Subsequently, the company installed satellite cell phones at its eight coastal drugstores to allow communication with employees in the case of an emergency. Each of its stores is required to come up with emergency action checklists, which must be reported to headquarters on the 11th of every month.

In November 2011, the convenience store chain Circle K Sunkus Co., headquartered in Tokyo, installed an alarm system that it says "will help protect both employees and customers." Whenever a tsunami warning or mudslide warning is issued, it is transmitted to the cash register terminal aurally and visually.

In order to minimize losses in times of disaster, business continuity planning (BCP) -- a practice that clarifies the methods through which damage surveys will be carried out, as well as how resources, equipment, and production means will be secured after a disaster that began in the United States in the wake of the September 11, 2001 terrorist attacks -- have gained momentum in Japan since the 2011 disasters.

According to a survey of around 5,000 companies nationwide carried out by the Cabinet Office in January 2014, of the 2,196 companies that responded, 53 percent of major companies said they had finished compiling BCPs, as opposed to 27 percent in fiscal 2009; while 25 percent of mid-sized companies said the same, as opposed to 12 percent in fiscal 2009.

Furthermore, an increasing number of corporations have begun to incorporate safety measures into their BCPs. At one production hub in Iwate Prefecture, the guidelines for handling major disasters is condensed into one sheet of paper, which is distributed to all workers; they clearly stipulate that workers "save their lives before equipment and facilities." Meanwhile, a waste disposal operator in Sendai, Miyagi Prefecture, established its first BCP in 2012, which instructs workers who encounter a disaster at a client's office to evacuate, even if the client says that it's safe, if the conditions do not meet the company's own conditions for safety.

"It's the small to mid-sized companies that face huge management risks when they lose personnel," says Osamu Yamaguchi, a senior consultant at InterRisk Research Institute & Consulting, Inc., "so it's important to delineate the respective roles people should play in the initial stages after a disaster, and to conduct numerous drills."

A mid-sized seafood processing company in Minamisanriku, Miyagi Prefecture, lost 90 percent of its assets, including a factory, in the 2011 disasters. It has resumed its operations further inland, however, and credits the fact that all its employees survived as the reason it was able to bounce back. The company's president says, "**Even if you've lost property, as long as you have your people, you can stay positive.**"

Where are the manuals for nuke disaster compensation?

May 11, 2015

6 power companies lack manuals for nuclear disaster compensation

<http://mainichi.jp/english/english/newsselect/news/20150511p2a00m0na008000c.html>

Six of 12 power companies surveyed by the Mainichi Shimbun have still not created manuals for compensating victims of nuclear disasters, despite the government urging them to do so for more than five years, it has been learned.

Furthermore, out of the six companies that have manuals, only one created or updated it after the Fukushima nuclear disaster. This shows that as the government's review of the compensation system fails to make progress, work on compensation manuals by power companies has also stalled.

After the 1999 JCO criticality accident in Tokai, Ibaraki Prefecture, the Ministry of Education, Culture, Sports, Science and Technology created an operation manual for nuclear compensation in December 2009. It includes the steps taken between a nuclear disaster and agreements on compensation, and informs nuclear companies that they are expected to be in communication with parties relevant to compensation even before a disaster has happened. The manual was distributed to power companies, and in March 2010 a briefing was held for them.

The ministry manual calls on each power company to create its own compensation manual. "Organize the system, procedure, document style and other details for compensation procedures to allow it to be done properly, and share this information across your organization in a form like a manual," the ministry manual says.

It also reads, "It is desirable to have the manual updated after a regular period like two to three years." It says the technology ministry will "provide support for creating the manuals."

The Mainichi Shimbun surveyed 12 businesses including nine major power companies with nuclear power plants and received answers from all of them by this April. The companies that said they had created manuals were Tohoku, Kansai, Shikoku, and Kyushu Electric Power Co., The Japan Atomic Power Co. and Japan Atomic Energy Agency. Tokyo Electric Power Co. responded that the Great East Japan Earthquake occurred while it was putting together its manual, and it has been dealing with compensation for the disaster without a manual.

While a Diet decision on the Nuclear Damage Compensation Facilitation Corporation Act of August 2011 called for an utter renewal of the nuclear accident compensation system in about a year's time, serious discussions have yet to begin. In January this year, it was finally decided that the Japan Atomic Energy Commission would be the site of the discussions.

Among companies that had not created a manual yet, Chubu Electric Power Co. said, "We will consider it, while taking into account factors like the national government's policy," while Kyushu Electric Power Co., which had created a manual, said, "We recognize the need to reflect the (Fukushima) disaster in our manual, but the national government has not organized its policy."

Meanwhile, this year Shikoku Electric Power Co. created a compensation manual without waiting for the national government to review the compensation system. In response to the Mainichi Shimbun survey, it said, "Taking into account the Fukushima disaster, we defined that compensation procedures should account for the scale of a disaster's damage and the situation under which it occurred, and work for the convenience of disaster victims."

Kansai Electric Power Co. responded to the survey but did not answer whether it has updated its compensation manual.

The technology ministry's department on nuclear disaster compensation said it did not have a complete understanding of the state of power companies' compensation manuals. A representative said, however,

"We do not consider the review of the compensation system and the restarting of nuclear power plants to be related."

Mos Burger

May 6, 2015

Mos Burger denies speculation its foods use radiation-tainted sauces

By Stephanie Chao, The China Post

May 6, 2015, 12:03 am TWN

<http://www.chinapost.com.tw/taiwan/national/national-news/2015/05/06/435318/Mos-Burger.htm>

TAIPEI, Taiwan -- Mos Burger announced yesterday that their chili sauce powder and spice mix meat sauce both originate from Saitama Prefecture (埼玉縣) and Tokyo, respectively, shooting down media speculation that the popular Japanese fast-food chain has been importing sauces from radiation-stricken areas.

In response to the findings of a Ministry of Health and Welfare (MHW, 衛福部) investigation, and subsequent media reports, Mos Burger said that the two sauces were handled by an affiliate, Magic Food Mos Food Industry (Magic Food, 魔術食品). It imported Mos Burger's chili sauce powder from Green Spice Seasoning in Saitama, while the spice mix meat sauce was produced at the Tokyo-based Maruta Food System.

The popular fast-food chain stated that the sauces were not imported from radiation-stricken areas. Mos Burger's statement also claimed the company had always adhered to the MHW's Food Sanitation and Safety standards when inspecting its suppliers.

The MHW's Food and Drugs Administration (FDA, 食藥署) said that Magic Food had been importing its "No Brand Sauce" from at least one of the five radiation-stricken Japanese prefectures last month. 504 kilograms of goods were stopped at customs and did not make it onto shelves, according to the FDA's report.

The FDA's report into food products that breach safety regulations said that Magic Food has been importing the two sauces, which were produced by Kohbai Foods (紅梅食品工業). While Kohbai Foods labeled its products as "Originating in Tokyo," FDA officials discovered that the factory is actually located in Tochigi Prefecture (栃木縣), one of the prefectures restricted by Taiwan.

Health officials deemed that Magic Foods had provided false customs declarations, and have to decided to impose a fine on the company, which they said will range between NT\$30,000 and NT\$3 million.

The FDA also announced that all Japanese food imports will need to include official origin statements starting from May 15. This is in response to a previous food scandal, when Japanese food products were found to have been imported from radiation-stricken areas in the Fukushima Daiichi nuclear disaster.

Nuclear still the cheapest, according to METI

May 11, 2015

Nuclear remains cheapest power source despite Fukushima meltdowns: government

Kyodo

A panel of nuclear experts on Monday largely approved a government report saying that atomic power remains the cheapest source of electricity despite the rising safety costs triggered by the 2011 Fukushima core meltdowns.

Despite an expected glut in solar power, the government is looking to make nuclear power account for 20 to 22 percent of Japan's electricity supply by 2030, underscoring its policy of sticking with atomic power even though the majority of the public remains opposed to restarting its idled reactors.

According to the latest estimate of power generation costs by the Ministry of Economy, Trade and Industry, atomic power would cost at least ¥10.3 per kilowatt-hour in 2030 — cheaper than power derived from fossil fuels, natural gas, wind and solar energy.

That's higher than the ¥8.9 projected in 2011 and is based on a projection that costs for plant decommissioning and compensation from a severe accident would jump to ¥9.1 trillion from the ¥5.8 trillion estimated in 2011, reflecting the Fukushima nuclear crisis.

METI also said additional safety measures required to run a nuclear reactor would cost an average of ¥60.1 billion.

But the increase in overall generation costs is limited because the probability of a nuclear accident would decrease after utilities complete their safety measures, it said.

In the report, the ministry also estimates that coal-fired power will cost ¥12.9 per kwh and liquefied natural gas ¥13.4 per kwh, compared with earlier projections of ¥10.3 and ¥10.9, respectively.

Wind power would cost up to ¥34.7, solar power up to ¥16.4, geothermal power ¥16.8, and hydropower up to ¥27.1 per kwh, the report said.

In its national energy policy adopted last year, the government of Prime Minister Shinzo Abe pledged to reduce reliance on nuclear power and promote renewable energy as much as possible, while standing by nuclear as a key power source, citing the importance of a stable electricity supply to economic growth.

Japan is expecting a glut in solar power because utilities refuse to upgrade their power grids to purchase all the energy as mandated under the feed-in tariff system. A study has found that seven of the nation's utilities lack the transmission network capacity to accept all of the solar power energy that suppliers plan to generate, METI says.

Combined, they can only accept 58 percent of the total, METI said. METI began looking into their transmission capacities after five utilities decided to cap their clean energy intake, revolting against the government's plan to increase generation of renewable energy in light of the Fukushima disaster.

Under the feed-in tariff system, utilities are obliged to purchase all electricity generated from such sources as solar, wind and geothermal power at fixed rates for a set period.

But the system ran into a roadblock after new suppliers flooded the solar power business, prompting the utilities to suspend signing power-purchasing contracts in September amid fears that overcapacity could cause blackouts.

Currently, all of Japan's commercial nuclear reactors remain offline to pass a beefed-up safety screenings based on new, more stringent regulations drafted after the Fukushima meltdowns. The government is planning to restart reactors that have met the post-Fukushima safety requirements.

KEPCO wants to raise the price of electricity

May 12, 2015

Kepeco to raise household electricity rate by 8.36%

<http://www.japantimes.co.jp/news/2015/05/12/business/economy-business/kepeco-raise-household-electricity-rate-8-36/#.VVIM6pPwmic>

Kyodo

Kansai Electric Power Co. will raise the amount it charges households for electricity by an average of 8.36 percent starting June 1, industry minister Yoichi Miyazawa said Tuesday.

Higher imported fossil fuel costs are weighing on the firm's earnings in the absence of nuclear power following the 2011 triple meltdown at Tepco's crippled Fukushima No. 1 plant, Miyazawa said.

The Economy, Trade and Industry Ministry has judged the margin of the markup should be trimmed from the average 10.23 percent rise originally sought by the utility, reflecting recent drops in crude oil prices and other factors.

Miyazawa added the rate will be set at 4.62 percent during the four months through September to ease the burden on households. To keep the bill hike smaller than initially proposed, Kansai Electric will slash executive compensation and boost efforts to streamline business.

The ministry is expected to approve the rate hike soon.

Kansai Electric, which relied heavily on nuclear power to generate electricity before the Fukushima crisis, initially sought to raise prices starting in April. But its plan was delayed as discussions within the government dragged out on whether the proposed hike was appropriate.

All of Japan's commercial reactors were offline by September 2013 amid heightened safety concerns in the wake of the meltdowns at the Fukushima No. 1 plant. They remain idled pending the nuclear regulator's safety review, based on more stringent requirements.

Kansai Electric President Makoto Yagi told a press conference in Osaka the company plans to lower the rate when its nuclear plants go back online.

The utility, which serves Osaka and neighboring areas, last raised prices for household electricity by 9.75 percent in May 2013.

Hokkaido Electric Power Co. also raised its electricity prices last year.

Kepeco's commitment to reducing costs questioned

May 14, 2015

EDITORIAL: We need to hear Kansai Electric's vision for future power sources

<http://ajw.asahi.com/article/views/editorial/AJ201505140039>

Kansai Electric Power Co. will raise its electricity rates for households in June. The standard monthly rate of 8,058 yen will go up to 8,220 yen.

The increase comes only two years after the last increase. In May 2013, the utility jacked up its power charges by nearly 10 percent.

Kansai Electric attributed the increase to swelling fuel costs due to the expansion of thermal power generation forced by the continued shutdown of its nuclear power plants.

But **how much has the company done to cut costs to avoid a rate hike during this period?**

The utility, during the government's review of the rate hike plan and public hearings over the issue, failed to provide persuasive arguments that it was committed to cost reductions.

One aspect of the company's operations that has cast doubt over its seriousness to cut costs concerns executive pay.

At the time of the previous increase, the government asked the utility to lower the average annual remuneration of the board members to 18 million yen. But Kansai Electric kept it at 21 million yen until the end of last year. After being criticized for failing to cut its executive salaries, President Makoto Yagi promised on May 12 to lower the average to 16 million yen.

The utility initially hoped to raise its power charges by more than 10 percent in April. But the government limited the hike to 8.36 percent, saying the company could do more to boost its cost efficiency.

An increase in electricity rates has a direct impact on people's livelihoods. The utility needs to demonstrate that it has made every effort to slash costs. That is a basic premise.

Since the catastrophic accident at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear power plant, which led to a shutdown of all nuclear reactors in Japan, it has been impossible to resume nuclear power generation at pre-disaster levels.

Nuclear power accounted for half of Kansai Electric's overall power output before the accident. **The utility now should make more serious efforts to wean itself from its dependence on atomic energy.**

In spite of this, the company has said it will keep using nine of the 11 reactors it owns.

It appears that Kansai Electric is proverbially **waiting for the storm to pass** by pinning its hopes for earnings recovery on eventual restarts of its reactors.

Last month, the Fukui District Court issued an injunction to prevent restarts of two reactors at Kansai Electric's Takahama nuclear power plant in Fukui Prefecture. The court cited safety concerns in issuing the injunction in response to a request from local residents.

There is strong opposition to plans to bring offline reactors back on stream, especially in areas around Fukui Prefecture.

The utility should take more seriously the changes in the social environment caused by the Fukushima triple meltdown.

Kansai Electric's latest business plan also calls for greater efforts to build state-of-the-art thermal power plants with higher fuel efficiency and introduce renewable energy sources for power generation.

If it is serious about pursuing these goals, we suggest the company lay out a vision for its future power sources before the government's policy debate on the nation's future energy mix is concluded.

In its long-term growth strategy unveiled in 2010, the company pledged to raise the share of non-fossil fuel power sources, mainly nuclear energy, to a level of 60 to 70 percent in 2030. The target must now be reconsidered as a result of the disaster that unfolded in March 2011.

If the company sets clear numerical targets for lowering its dependence on nuclear power in 10 or 20 years, more constructive debate on its business plans will be possible.

The power retail market is slated to be fully deregulated next spring, which will allow households to freely choose their suppliers of electricity.

As the power market for industrial consumers has already been liberalized, more than 5,000 companies and local governments terminated their contracts with Kansai Electric, which raised the rates, and switched to new power suppliers by the end of March.

Unless it is willing to reform its management policy and structure in response to the changes of the times, Kansai Electric could lose many more customers.

--The Asahi Shimbun, May 14

Another lawsuit against TEPCO from "difficult to return" zone residents

May 14, 2015

'Difficult-to-return zone' residents to bring class-action suit against TEPCO, gov't

<http://mainichi.jp/english/english/newsselect/news/20150514p2a00m0na010000c.html>

FUKUSHIMA -- Residents of a Fukushima town district designated as a "difficult-to-return zone" due to high levels of radiation from the ongoing disaster at the Fukushima No. 1 nuclear plant are set to file a class-action lawsuit against the government and plant operator Tokyo Electric Power Co. (TEPCO).

The lawsuit will be the first class-action suit brought by residents of a difficult-to-return area, defined as an area with a yearly cumulative radiation dosage of over 50 millisieverts.

Around 100 residents of the Tsushima district of Namie, Fukushima Prefecture, are preparing to sue the national government and TEPCO for failing to lay down a plan for decontamination and robbing the residents of their hometown. Although it has yet to be decided how much in damages the plaintiffs will demand, the lawsuit is set to be filed with the Iwaki branch of the Fukushima District Court as early as this summer.

Tsushima district is a forested, mountainous area some 30 kilometers northwest of the Fukushima No. 1 plant, where rice and tobacco cultivation, forestry and dairy farming were common and some 1,400 people lived prior to the disaster.

By filing the lawsuit, **the plaintiffs hope to show that the farmland, local traditions, and community bonds they'd nurtured over generations have been ripped away from them and not been recovered. They will seek damages for the emotional suffering they've experienced and demand decontamination to return their hometown to its pre-disaster state.**

Failure to see significant progress from the alternative dispute resolution (ADR) system -- set up as a system through which Fukushima nuclear disaster victims can settle out of court with TEPCO -- is one of the reasons Tsushima residents decided to file the suit. In March 2014, the ADR center suggested a compromise in which the monthly 100,000 yen per person TEPCO pays to victims of the disaster for emotional pain is raised to 150,000 yen. However, the ADR center's reconciliation recommendations are not legally binding, and TEPCO has refused to comply with the proposal on the grounds that it would be unfair to residents of other municipalities.

"My distrust of the government has grown as it continues to turn a blind eye to TEPCO's rejection of the proposed compromise," says a Tsushima district resident who plans to join the lawsuit. "I decided to

participate in the suit in order to make (TEPCO and the government) take responsibility, including the responsibility to decontaminate."

The Ministry of the Environment still has not announced a plan for decontamination in difficult-to-return zones.

According to a lawyer for the plaintiffs, another class-action lawsuit has been filed by some 340 residents of the Miyakoji district of Tamura, Fukushima Prefecture, located 20 to 30 kilometers from the stricken nuclear plant and once designated as a "zone preparing for evacuation in case of emergency," demanding 3.7 billion yen in damages for destroying the community. The upcoming Tsushima case, however, is the first to be brought by residents of a difficult-to-return zone.

May 14, 2015(Mainichi Japan)

Kepeco's price hike approved by Govt.

May 15, 2015

Government approves 8.36% price hike for Kepeco

<http://www.japantimes.co.jp/news/2015/05/15/business/corporate-business/government-approves-8-36-price-hike-kepeco/#.VVdD9pPwmic>

JJI

The government on Friday approved hiking electricity rates for Kansai Electric Power Co.'s household subscribers by an average of 8.36 percent, effective June 1.

Kansai Electric will, however, limit the hikes to 4.62 percent on average for the first four months to lessen the burden on customers during the summer, when air conditioners cause electricity bills to swell.

Kansai Electric will become the second utility after Hokkaido Electric Power Co. to carry out a second round of full-fledged rate hikes since the March 2011 nuclear crisis began at Tepco's crippled Fukushima No. 1 plant, leading to a prolonged spell without atomic energy.

Kansai's first round of hikes, in May 2013, averaged 9.75 percent. It then applied for government approval for another set of increases last December, saying its earnings had deteriorated mainly because of delays in the restart of the No. 3 and No. 4 reactors at its Takahama nuclear power plant in Fukui Prefecture.

The government will call on the regional power supplier to cut the rates in the event that idled reactors are restarted, officials said.

Let's worry about it before it's too late

May 16, 2015

Are forces of darkness gathering in Japan?

<http://www.japantimes.co.jp/opinion/2015/05/16/commentary/forces-darkness-gathering-japan/#.VVhLq5Pwmif>

by Jeff Kingston

Special To The Japan Times

Certainly it's worse in China, South Korean security recently beat demonstrators and Spain faces a blanket gag rule, but are concerns about the anti-democratic forces of darkness in Japan unduly alarmist? How bad can it be if protestors in Hibiya Park can carry placards depicting Prime Minister Shinzo Abe as Adolf Hitler?

Bad enough, alas. New York Times Tokyo bureau chief Martin Fackler, among others, recently implicated Team Abe in getting Shigeaki Koga, a prominent Abe critic, axed from Asahi TV's "Hodo Station" program. "I am afraid that media organizations' self-restraint is spreading and, as a result, accurate information is not reaching the public," Koga said at a press conference, claiming he was the victim of a political vendetta and corporate media timidity.

Mindful of the orchestrated attacks on the Asahi's news organs and fearful of right-wing reprisals, self-censorship is a growing problem. Columbia University's Gerald Curtis told me about the recent cancellation of a planned television interview that was to take place in New York. The local correspondent informed him that the Japanese network's management in Tokyo nixed the interview because it was going to assess how Abe has handled the 70th anniversary of the end of World War II, and this topic was deemed too sensitive.

Curtis says the worrying lesson here is that "the government doesn't have to muzzle the press if the press takes it upon itself to do the muzzling."

But the government is taking no chances.

Conservative Abe cronies were appointed to NHK's top management last year, and Katsuto Momii, a man without any media experience, was named chairman. He later declared to the press, "When the government is saying 'Right' we can't say 'Left.'"

Since Momii began promoting this curious vision at NHK, staff have complained that managers are strictly insisting on wording that hues to government views on controversial topics such as Yasukuni Shrine, disputed territories and the "comfort women." To ensure conformity, NHK now publishes an internal censorship manual, called the "Orange Book," banning the use of the term "sex slaves" and other phrases identified as problematic. NHK insiders told me that some recalcitrant staff suffered career derailments because they didn't toe the line, including a group that openly called on Momii to step down.

There is no smoking gun, and it could be a routine staff rotation, but an apparent casualty of the purge is NHK's "News Watch 9" anchor Kensuke Okoshi, who has spoken out against nuclear power and committed other "transgressions."

Controversy erupted last summer when Naoki Hyakuta, a best-selling writer and conservative on history issues, was handpicked by Abe to serve on NHK's board of governors. Hyakuta criticized Okoshi's on-air comments about ethnic Korean residents in Japan that were aired July 17, 2014. Okoshi said: "The first-generation Korean residents were those who were forcibly brought to Japan or moved to the country to seek jobs after the annexation of Korea in 1910. They had a lot of difficulties establishing their foundations for living."

At the subsequent NHK board of governors meeting, Hyakuta reportedly asked: "Is it acceptable to say ethnic Korean residents are those who were forcibly taken by Japan? That is wrong."

The acting chair informed Hyakuta that as a governor, comments about the content of an individual program violated the broadcasting law. Hyakuta has since resigned his position, complaining he wasn't able to have any impact, but one can imagine that NHK staff felt his presence, and indeed Okoshi is no longer a newscaster despite being one of the most respected in the business.

"The systematic suppression of the press and freedom of speech by the Abe government and its functionaries is very, very disturbing in terms of its effects on the future course of Japan and its democracy," says Ayako Doi, a journalist based in the United States who is currently an associate fellow of the Asia Society. In her view, things have gotten significantly worse under Abe. She cites the Liberal Democratic Party's summons of Japanese media executives, the Japanese consul general in Frankfurt's visit to the editors of the Frankfurter Allgemeine Zeitung, and a Foreign Ministry official's visit to publisher McGraw-Hill in New York to ask for changes in the descriptions of Japan's comfort women system of sexual slavery written in a U.S. history textbook.

"They have become more numerous, blatant and unapologetic," she says, adding that the government is targeting both Japanese and non-Japanese critics alike.

Japan Times columnist Gregory Clark says the atmosphere of intimidation has become exceptionally "ugly," attributing it to a "right-wing rebound and revenge."

"Something strange is going on," he says, citing recent attacks on progressive media. "Particularly given that Tokyo keeps talking about its value identification with the West."

Well-placed sources in Washington previously told me that even overseas the Japanese government actively disparages Abe's critics, something that Doi isn't surprised by.

"It seems that under the Abe government, efforts to silence critics of his policies and interpretation of history have become systematic," she says. "It now appears to be a concerted effort orchestrated by Kantei (the prime minister's office)."

Japan's right-wing media also engages in trans-Pacific intimidation. For example, a rightwing pundit slammed the National Bureau of Asian Research's Japan-U.S. Discussion Forum, making groundless accusations about an anti-Japan bias. He also attacked the Japan Foundation's Center for Global Partnership for sponsoring a research project regarding Sino-Japanese relations and history issues. This research project was deemed a waste of Japanese taxpayers' money and some of the researchers were subject to defamatory attacks on their professional integrity. But it would be a sad day for Japanese democracy if the right wing gets to set the research agenda, pick the scholars and decide what they should conclude.

Clark himself was publicly defamed for his alleged anti-Japanese views because he raised some questions about government and media representations concerning the North Korean abductions of Japanese nationals. Following that, he says his university employer received a cascade of threatening letters demanding he be sacked.

"Requests to write articles for the magazines and newspapers I had long known dried up," Clark says. "Invitations to give talks on Japan's lively lecture circuit died overnight. One of Japan's largest trading companies abruptly canceled my already-announced appointment as outside board director with the vague excuse of wanting to avoid controversy."

Lamentably, he added, "You cannot expect anyone to come to your aid once the nationalistic right-wing mood creators, now on the rise, decide to attack you. Freedom of speech and opinion is being whittled away relentlessly."

Exposing such orchestrated attacks and highlighting the dangers of self-censorship are all the more important in contemporary Japan because, as Doi puts it, media freedom is “sliding down a slippery slope” and it’s important to “speak out before the momentum becomes unstoppable.”

Jeff Kingston is the director of Asian Studies, Temple University Japan.

Looks like intimidation

from the blog "Nuclear-free by 2045?"

May 19, 2015

The Asahi Shimbun Goes Soft on the Nuclear Village

http://nf2045.blogspot.fr/2015/05/the-asahi-shimbun-goes-soft-on-nuclear.html?utm_source=feedburner&utm_medium=email&utm_campaign=Feed:+NuclearFreeBy2045+%28Nuclear+Free+by+2045?%29

Former high-level Japanese bureaucrat Shigeaki Koga has gained notoriety for his courageous criticisms of the chilling atmosphere that has come over the Japanese media since Shinzo Abe returned to power and proclaimed to the world in 2012 that “Japan is back.” From where? Going where? No one could tell what this ridiculous statement meant, but it now seems clear it means that Japan is heading in the direction of the recent changes observed in *The Asahi Shimbun* and *TV Asahi*. These and other media outlets have been intimidated by government officials, and by third parties doing their bidding, into toning down their coverage of policy changes that the Abe government is trying to implement—such things as revising the constitution, passing the TPP free trade agreement, and restarting nuclear power plants.

The effect of this intimidation seemed to be on display in a recent *Asahi Shimbun* news report that really functions as an editorial because of the way it frames the issue it covers. *The Asahi* used to be known for running critical reports that held TEPCO and the government to account, but now it has produced a report which, right from the headline, sets up a biased and false premise. The headline reads: Proponents, foes of nuclear energy content with preaching to the converted.

The article sets out with the seeming intent to be fair and balanced, with some mild jabs at nuclear proponents, but the balancing act itself leaves the reporting completely neutered. The writer has nothing newsworthy to say about energy policy or the problems of nuclear energy. All we have here is the unproven and misleading allegation in the headline that proponents and foes of nuclear energy are content with preaching to the converted their “versions of the truth.” There is no truth here. It’s all relative, don’t ya see?

Later in the article, the writer states, “... all the two sides had in common was their unwillingness to discuss the issue of nuclear energy with the other camp,” which is true enough, but it was odd to see this journalist implying that there was something unusual or wrong with this situation. Throughout the article, he completely misses the point that the two sides exist to convey their message not to “the converted” nor to “the other camp” but to the public, the vast majority of whom don’t identify with either side too strongly.

Both sides are engaged in a public information campaign, and they would only be defeating their own purposes if they invited the opposite side to their information meetings. It would be like Toyota giving

Honda half of its time on television commercials. The nuclear issue is not a publicly subsidized election campaign with candidates obliged to participate in debates with opponents. Besides, debates seldom happen in Japan during political campaigns anyway, so why suggest that specific interest groups have a duty to offer the public the same?

The writer might have noted the imbalance of power that was obvious in what he wrote about the financing of the two sides' information campaigns. The pro-nuclear side has been given \$376,000 by the nuclear lobby, not a huge sum compared to what is spent in a day to deal with the Fukushima Daiichi ruins, but it is \$376,000 more than what was given to the anti-nuclear lobby. There should be a very clear message evident in the very fact that one side needs to be given public funds to convince the public of its worth, while the other side is financed by volunteers and stirred into action without needing to be hired propagandists.

This disparity just makes it more absurd to suggest that the anti-nuclear lobby has some obligation to debate with the other side and work out some kind of compromise. There have been, in fact, many instances of nuclear opponents showing up at public information meetings, but as soon as their numbers grew too large or their objections too vocal, they were barred from participating. These information meetings are known as *setsumeikai*, or explanatory sessions. Information is designed to flow in one direction only, so the public, and anti-nuclear groups, are not meant to have any input.

In addition to these flaws in the report, the writer quotes some ridiculous illogic from the pro-nuclear side, but fails to question the absurdity of it. For example, a quote from a 1999 JCO report (JCO runs nuclear fuel facilities) on the Tokaimura criticality accident stated:

While attitudes toward nuclear energy have hardened due to the accident that resulted in two deaths, there is also an imbalance because there is societal acceptance of car accidents that result in 10,000 fatalities a year," the report said. General magazines will very rarely publish articles promoting nuclear energy.

Equating other kinds of risk assumption to the risks imposed by nuclear energy is an obvious red herring (distracting and irrelevant analogy), but what is much more amusing is the suggestion that magazines should feel obliged to publish articles promoting nuclear energy. The very word "promotion" suggests a message which must be paid for in some way. There is no eager community of readers and writers who would volunteer to enthusiastically share stories about the wonders of nuclear energy. Nuclear energy is not like surfing or hip-hop music. It is not a hobby that people devote their free time to. Promotion of nuclear energy can be done only by paid propagandists. The suggestion that one kind of private enterprise should voluntarily promote another kind of enterprise is evidence of the sort of narcissistic thinking that nucleocrats engage in: "we know our shit is wonderful, so why do we have to spend all this money to get people to sing our praises?"

In any case, if one is anti-nuclear, there is no compromise possible in which one would say it's alright to have a little bit of nuclear. There is absolutely no reason to hope for anything to come from public discussions with the pro-nuclear lobby. There is this demand that they be "mature and reasonable" by coming to the table to work out a compromise, but this demand itself is an insidious tactic that aims to legitimize that which should not be allowed.

Thus, it was delusional of this journalist to write an opinion piece claiming that opponents of nuclear energy are obliged to engage in debates with the nuclear industry. If a gang of thugs moves into a town and sets up casinos, opium dens and brothels, and manages to convince a segment of the population that the economic stimulus is worth the social disruption, then the people opposed to this intrusion are under no obligation to debate the legitimacy of what has been imposed on them. For them, the whole enterprise is reprehensible, so the act of debating the right of the intruders to be there is the beginning of making

their presence legitimate. And I'm not making this point as an exaggerated comparison. When people allow a radioactive waste factory (often falsely referred to as a "power plant" or an "energy center") into their communities, they are permitting an environmental crime.

The final blow delivered by the author came in the insinuation that a nuclear opponent (not named in the article) who gave a lecture was unreliable because he "admitted that he had no experience in specialized research on radiation." He was quoted as saying, "Even an ordinary citizen like myself can understand that something fearful is occurring just by studying a little," but these words are framed in a way that suggests he should be dismissed as an amateur. The act of asking whether he had done specialized research on radiation was a way of suggesting that ordinary citizens should just leave everything to the state-sanctioned experts, that they could never educate themselves enough to have a say in these matters. The more I thought about this report, the more perplexed I became, but then it occurred to me that maybe there is something going on here that I didn't see at first. Perhaps this is an elaborate act of inter-textual communication, an appeasement of critics and a satire of the sort of news reporting that they like. It is so bad that it could also be seen as a cry for assistance, a coded message from the Asahi Shimbun that tells the world, "Help. We are being held hostage. This is what government and right-wing pressure tactics have led us to write."

Tepco: More bid-rigging?

May 19, 2015

Five companies raided over alleged bid-rigging for Tepco contracts

http://www.japantimes.co.jp/news/2015/05/19/business/corporate-business/five-companies-raided-alleged-bid-rigging-tepco-contracts/#.VVw_pEbwmic

JJI

The Fair Trade Commission raided the offices of five companies on Tuesday, including NEC Corp. and Fujitsu Ltd., amid allegations they rigged bids for maintenance contracts with Tokyo Electric Power Co. The firms, which also include Fuso Dentsu Co. and Oi Electric Co., are suspected of breaching Japan's anti-monopoly laws by colluding to drive up the price of telecommunications equipment maintenance contracts to unreasonable levels, sources familiar with the matter said.

The result was increased electricity fees paid by Tepco customers.

In 2013, the commission issued a cease-and-desist order to more than 40 companies involved in bid-rigging for power cable installation projects.

However, the move appears to have done little to prevent further breaches, with sources saying Tepco faced criticism for failing to adequately address the issue.

In the latest case, the five companies are suspected of having held a number of secret meetings to decide their respective bids and successful bidders for maintenance contracts for Tepco's internal communications networks over the past few years, the sources said.

The market for such contracts is estimated at several billion yen annually.

It is understood the internal communications networks are used by power generation facilities and substations to help ensure stable electricity supply. Network equipment including wireless antennas require regular maintenance work to withstand natural disasters.

Officials at NEC, Fujitsu and Oi Electric said the companies would cooperate with the commission's investigation. An official at Fuso Dentsu confirmed a raid has been carried out.

May 19, 2015

NEC, 4 others suspected of rigging bids for TEPCO orders

<http://mainichi.jp/english/english/newsselect/news/20150519p2g00m0dm071000c.html>

TOKYO (Kyodo) -- Japan's antitrust watchdog on Tuesday raided offices of NEC Corp., Fujitsu Ltd. and three other companies over suspected rigging of bids for orders from Tokyo Electric Power Co., sources close to the matter said.

The Japan Fair Trade Commission alleges the five companies selected the lowest bidder and fixed bid prices before tendering bids over several years for TEPCO orders for electric power security communication equipment to check for power supply troubles, the sources said.

In a past bid-rigging scandal involving TEPCO, the watchdog ordered 36 companies in December 2013 to pay a total 740 million yen (\$6.17 million) in fines for rigging bids for power transmission cable.

Extend compensation to businesses?

May 20, 2015

TEPCO may have to pay nuclear compensation to businesses longer

http://www.japantimes.co.jp/news/2015/05/20/national/tepc-may-have-to-pay-nuclear-compensation-to-businesses-longer/#.VVw_D0bwmic

JJI

The Abe administration and the ruling coalition are working to extend compensation payments by Tokyo Electric Power Co. to businesses affected by the March 2011 nuclear disaster at the Fukushima No. 1 plant by one year, according to officials.

In response to strong pressure from the firms affected, the end of compensation payments to businesses that were hit by falling sales or that were forced to suspend operations will be February 2017, instead of the February 2016 limit planned by Tepco, the officials said Tuesday.

This will be included in a set of proposals from the ruling Liberal Democratic Party's task force for accelerating reconstruction of the areas struck by the March 2011 earthquake and tsunami, which will be compiled by the end of this month at the earliest.

The administration is then expected to decide formally on the extension by the end of June.

As of the end of March, Tepco was due to pay a total of ¥465.5 billion in compensation to businesses affected by the nuclear crisis.

Late last year, the program's termination was extended by one year from the initial date of February 2015. Attention has been focused on whether a further extension will be approved to support reconstruction in disaster-hit areas.

TEPCO has over 17,000 tons of uranium. Sell some?

May 19, 2015

Tepco looking to sell some uranium stockpiles to cut costs

<http://www.japantimes.co.jp/news/2015/05/19/business/corporate-business/tepcos-looking-sell-uranium-stockpiles-cut-costs/#.VVw9nEbwmic>

Kyodo

Tokyo Electric Power Co. is planning to sell part of its uranium stockpiles for nuclear power generation in the current business year to cut costs amid uncertainty over the restart of idled nuclear plants, a company document obtained by Kyodo News showed Monday.

Tepco has not consumed uranium since the 2011 nuclear crisis started at its Fukushima No. 1 complex that eventually resulted in all of Japan's nuclear reactors being taken offline amid safety concerns. By reducing the stockpiles, the utility is seeking to slash costs for managing them as it faces funding difficulties stemming from the nuclear crisis.

According to the document, Tepco aims to reduce the amount of uranium to levels prior to the Fukushima disaster by the end of fiscal 2015 through March. The company estimated in the paper it can secure ¥12.3 billion (\$103.13 million) by selling around half of the planned amount.

The utility is hoping to restart by October its Kashiwazaki-Kariwa nuclear plant, located on the Sea of Japan coast in Niigata Prefecture, but the outlook remains unclear due to the ongoing process for safety screening by the regulator and local reluctance to give approval for the resumption.

Major utilities including Tepco procure uranium, which could be diverted to military use, under long-term contracts from overseas suppliers in Canada and elsewhere.

As of the end of March, Tepco had a total of 17,570 tons of uranium (tU), equivalent to the amount used at the Kashiwazaki-Kariwa plant for 10 years, compared with 16,805 tU at the time of the nuclear disaster in March 2011.

The amount would increase to 19,317 tU in fiscal 2015 if the company does not sell some of the stockpile. The utility will likely return it to the suppliers or pay for the costs of uranium enrichment in kind, while it will also consider terminating uranium purchase contracts and reducing purchase volumes to streamline its business, according to the document.

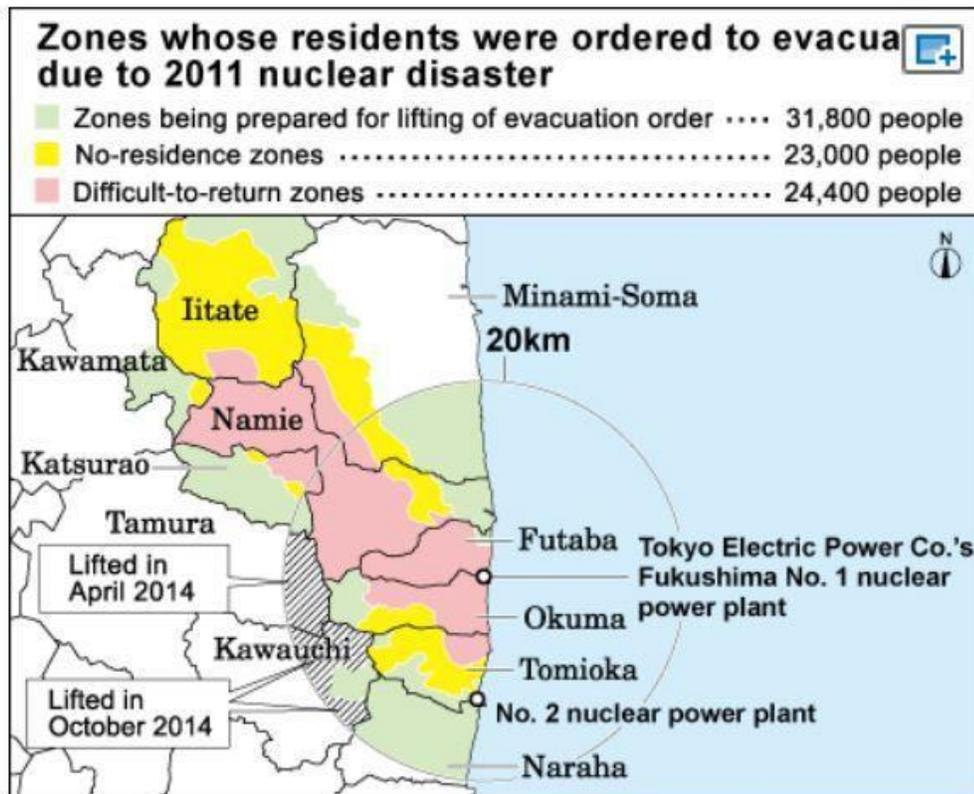

Japan Atomic Power Co. has also taken the rare step of selling some of its uranium, apparently to raise money to repay loans amid its faltering business conditions.

Stopping TEPCO compensation for 55,000 evacuees

May 19, 2015

Ministry plans to end TEPCO compensation to 55,000 Fukushima evacuees in 2018

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201505190055>

The Asahi Shimbun

THE ASAHI SHIMBUN

The government will instruct Tokyo Electric Power Co. to terminate compensation payments to 54,800 evacuees from the Fukushima nuclear disaster in March 2018, regardless of radiation levels in their hometowns, sources said.

The new compensation plan of the Ministry of Economy, Trade and Industry is based on the assumption that decontamination work will lower radiation levels and enable the government to lift evacuation orders in those areas, the sources said May 18.

Currently, the homes of about 80,000 evacuees are located in three zones designated by the government in terms of severity of radiation contamination.

Around 31,800 evacuees' homes are in "zones being prepared for the lifting of evacuation order," while 23,000 people have fled their homes in what are now "no-residence zones."

TEPCO currently pays each of these 54,800 evacuees 100,000 yen (about \$834) in compensation a month.

The new plan will affect evacuees from these two zones.

The remaining 24,400 people have homes located in “difficult-to-return zones,” where there are no prospects of lifting the evacuation orders. TEPCO has paid a total of 14.5 million yen to each of these evacuees.

The government’s current guidelines on compensation stipulate that payments should end one year after evacuation orders are lifted.

Under the new plan, the government and ruling parties assume that the evacuation period for people in the first two zones will end “six years after the March 2011 nuclear accident.” That assumption is based on another assumption that decontamination work will be completed by March 2017 and evacuation orders can be called off by that time.

As a result, compensation payments for people from the two zones will end in March 2018. Each of the evacuees will have received a total of 8.4 million yen during the seven years since the accident started at the Fukushima No. 1 nuclear plant.

The current compensation system allows evacuees to receive additional compensation payments if their evacuation periods are extended. Some critics say evacuees are hoping for a continuation of evacuation orders so that they can receive more money.

But the new plan will terminate compensation payments for the two zones in 2018 without exception. If the evacuation order is lifted five years after the nuclear accident, the evacuees from the area can still receive compensation for two more years, even though they are qualified for only one additional year under the current system.

Adoption of the new plan will make it easier for the government to work out support measures for people who return to their hometowns in the two zones, the sources said.

“The lifting of evacuation orders will proceed,” a government official said. “We will be able to construct houses and attract plants and firms (to the areas) more positively.”

However, it is not clear whether radiation levels will drop as expected by March 2018.

Even if evacuation orders remain in place because of delays in decontamination work, the compensation payments will still end in 2018 for the two zones, the sources said.

Venting system apparently failed

May 21, 2015

TEPCO robot finds Fukushima No. 2 reactor pressure venting system failure

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201505210037>

The Asahi Shimbun

By MASANOBU HIGASHIYAMA/ Staff Writer

The venting system designed to release pressure inside the containment vessel of the No. 2 reactor at the Fukushima No. 1 nuclear power plant likely failed during the 2011 disaster, the operator of the facility said May 20.

The discovery was made by a robot deployed last October by Tokyo Electric Power Co. to a room in the plant where the venting pipes from the reactor pass.

The magnitude-9.0 Great East Japan Earthquake that triggered towering tsunami struck on March 11. On March 13 and 14, as the pressure inside the No. 2 reactor was rising, workers at the plant opened valves in its venting system. When the valves are opened, the pressure is supposed to rupture a special disc farther down the pipes that allows it to vent.

TEPCO, until now, was never able to confirm whether the effort was successful.

The robot revealed that the radiation levels around the rupture disc were relatively low, between 0.08 and 0.30 millisievert per hour. Similarly, radiation levels around the valve near the containment vessel were also low, between 0.15 and 0.70 millisievert per hour.

However, a significant amount of radioactive material was found to have been directly released from the damaged containment vessel.

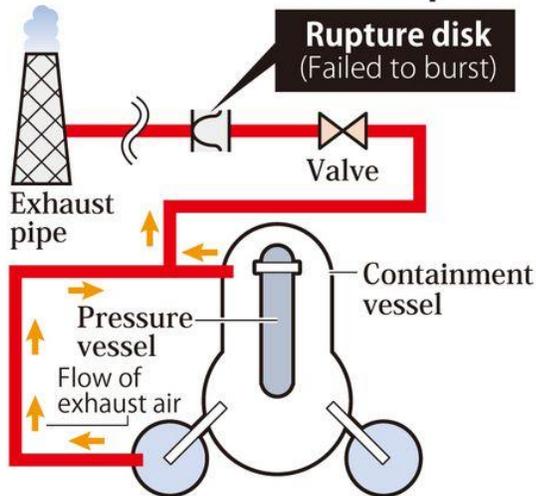

By contrast, strong radiation levels higher than 10 sieverts per hour were detected in areas around the exhaust tower where the pipes of the venting systems for both the No. 1 and No. 2 reactors release their pressure. The readings confirm that the No. 1 reactor's venting system performed as designed.

TEPCO believes that the pressure inside the containment vessel of the No. 2 reactor was not high enough to break the rupture disc when the workers opened the valves, thus the pressure never exited through the exhaust tower.

The company suspects the hydrogen explosion at the No. 3 reactor building caused some of the valves in the No. 2 reactor to close, causing the failure.

Faulty part may have caused Fukushima nuke plant venting failure

Venting at No. 2 reactor at Fukushima No. 1 nuclear plant

<http://mainichi.jp/english/english/newsselect/news/20150520p2a00m0na011000c.html>

Venting of the No. 2 reactor at the Fukushima No. 1 Nuclear Power Plant may have failed due to a part inside the pipes failing to operate, it was learned from the results of an investigation by Tokyo Electric Power Co. (TEPCO) on May 19.

During the March 2011 disaster at the Fukushima plant, the No. 2 reactor no longer had power for its cooling system and pressure inside it rose to abnormally high levels. Plant operator TEPCO attempted to vent the reactor to lower the pressure, but the venting did not go smoothly. The company has been investigating what went wrong with the venting in order to clear up the cause of the disaster.

The part that may have failed to operate was a "rupture disk," located inside a pipe leading from the nuclear reactor's containment vessel to an exhaust pipe. Meant to keep radiation from leaking outside, the disk is supposed to break after a certain level of pressure is applied to it. However, in its investigation TEPCO found no evidence of radioactive contamination inside the pipe around the rupture disk, suggesting that the disk did not rupture and the vented gas was trapped in front of it.

Radioactive gas is thought to have leaked directly from the No. 2 reactor's containment vessel, and it is estimated as having leaked the most radiation out of the No. 1 through 3 reactors.

More Fukushima disaster findings revealed

http://www3.nhk.or.jp/nhkworld/english/news/20150520_20.html

May 20, 2015 - Updated 07:22 UTC+2

Tokyo Electric Power Company says it is highly likely it had failed to vent a vessel containing one of the reactors at its Fukushima Daiichi plant in the days after the March 2011 disaster.

TEPCO attempted to vent the Number 2 reactor container to release water vapor and radioactive materials and prevent it from being damaged.

The reactor suffered damage 4 days after the accident, as the pressure inside did not drop. The damage is thought to have caused the release of a massive amount of radioactive materials, forcing most plant workers to temporarily evacuate.

TEPCO has been investigating the accident, focusing on dozens of points that had remained unconfirmed. The finding on the venting of the Number 2 reactor is one of the 4 points the utility revealed on Wednesday.

TEPCO now says the venting procedure may have failed because in its investigation no high levels of radiation were detected in piping connected to a device called a "rupture disk". Water vapor and radioactive materials were to pass through the disk after venting.

This was the first time for the likelihood of the venting having failed to be substantiated by the actual situation at the site.

TEPCO says it will continue to investigate how the radioactive release occurred at the Number 2 reactor. It also says it will continue on-site investigations and find out the details of the situation more closely, and use the findings to secure the safe decommissioning of the reactors.

Japan appeals to WTO

May 22, 2015

Japan takes South Korea to WTO over Fukushima-related food import restrictions

<http://ajw.asahi.com/article/business/AJ201505220017>

REUTERS

GENEVA--Japan launched a trade complaint at the World Trade Organization on May 21 to challenge South Korea's import bans and additional testing requirements for Japanese food after the 2011 Fukushima nuclear disaster.

South Korea expressed regret at Japan's action and said its ban on some Japanese seafood was necessary and reflected safety concerns.

Japan says several measures taken by South Korea violate the WTO's sanitary and phyto-sanitary (SPS) agreement and Seoul has failed to justify its trade restrictions as required, the WTO said in a statement.

Under WTO rules, South Korea has 60 days in which to deal with Japan's concerns in bilateral talks. After that, Japan could ask the WTO to adjudicate on the matter.

"In upcoming talks with Japan, we plan to explain fully that the import ban is necessary for people's safety, and actively deal with Japan over the issue they raised based upon WTO's dispute settlement procedures," South Korea's trade, agriculture, foreign affairs and other related ministries said in a joint statement. Details of Japan's complaint were not immediately available, but Japan has repeatedly raised the issue in committee meetings at the WTO, where it has also voiced concerns about Fukushima-related trade restrictions imposed by Taiwan and China.

Japan's representative told the WTO's SPS committee in March that radioactive levels in Japanese food had declined substantially since the accident. It noted that the United States, Australia, the European Union, Singapore and Vietnam had all lifted or eased their Fukushima-related restrictions.

South Korea extended its ban on Japanese fishery imports in September 2013 to cover imports from eight Japanese prefectures, including Fukushima.

Last October, the Japanese representative at the WTO committee said contamination levels in more than 99 percent of food items were below standard limits, and strict measures prevented the sale or export of any food exceeding those limits.

South Korea's representative told the same meeting that its restrictions were in line with the WTO rules, but Japan had not provided it with sufficient data for an objective and science-based risk assessment.

Japan's representative also cited an assessment from the International Atomic Energy Agency in September 2014, which found its measures to deal with contamination were appropriate, according to minutes of the WTO committee.

The average annual value of South Korean imports of Japanese fish and seafood was \$96 million in 2012-2014, less than half the average of \$213 million in 2006-2010, according from data from the International Trade Centre in Geneva.

Concerns about contaminated food

May 21, 2015

Japan food exports to Taiwan contain cesium

<http://www.beyondnuclear.org/food/2015/5/21/japan-food-exports-to-taiwan-contain-cesium.html>

May 21, 2015

In the wake of the continuing Fukushima catastrophe, countries such as Korea and China are concerned that contaminated food is being exported from Japan. In a recent report by SimplyInfo.org, data from Taiwan showing food imports (primarily green tea) from Japan have contained radioactive cesium levels below Taiwan's limit of 370 Bq/kg, but above Japan's limit of 100 Bq/kg. The monitoring program in Taiwan is spot-checking these imports, so this contaminated tea was discovered in only a fraction of food coming from Japan, meaning additionally contaminated food could have been missed. In addition, Taiwan had already banned food from areas in Japan considered most contaminated, so this food was imported from areas in Japan considered "safe". Taiwan tested teas that were harvested after the Fukushima catastrophe began. However, in 2011 and 2012, the US Food Drug Administration only tested tea varieties that would have been harvested in 2010, thereby having escaped contamination, making the FDA tea tests completely meaningless.

This unsettling discovery demonstrates that **people in other countries are being sold food that is contaminated above Japan's allowable limit, but below that of the receiving country**—a concern that has been expressed time-and-again by Fukushima Fallout Awareness Network (FFAN) of which Beyond Nuclear is a coalition partner. While the allowable limit of radioactive cesium in Japan is 100 Bq/kg, in Taiwan it is 370 Bq/kg, and in the U.S. it is 1200 Bq/kg with **no real explanation as to why, say, a pregnant woman in the U.S. should be allowed to ingest 12 times the radioactive poison of a pregnant woman in Japan.** These inconsistent limits may not make biological sense, but they do make sense when taken in cont ext of this statement by ICRP (International Commission on Radiological Protection--the body which generates statements governments rely on to set radiation exposure standards.) **“There may be a situation where a sustainable agricultural economy is not possible without placing contaminated food on the market. As such foods will be subject to market forces, this will necessitate an effective communication strategy to overcome the negative reactions from consumers outside the affected areas.”** This is the price of the continued use and catastrophic meltdowns of nuclear power.

Japan has filed a complaint with the WTO over Korean Fukushima-related import bans and additional testing requirements, demonstrating that **countries trying to protect themselves from contaminated food could be facing international adjudication through the WTO.** Japan told the WTO in October 2014 “more than 99 percent of food items were below standard limits, and strict measures prevented the sale or export of any food exceeding those limits.” But since **measurement of food is so spotty**, both from the importer and exporter, a statement like this is not only meaningless, but deceptive. Further, **if every country's contamination limits are different, in reality, there are no standard limits, no matter what the WTO or Japan contends.**

If the Trans-Pacific Partnership is approved, these penalties could get a lot worse (link to Part 1 of a 5 part FFAN series on the TPP and contaminated food from Japan) and could include taxpayer compensation for corporate lost revenue due to such disputes.

But the radioisotope cesium isn't the only concern. **There is also strontium.** Strontium-90 is much more difficult to measure than cesium-137. To avoid this inconvenience, strontium is often assumed or calculated to be in a ratio with cesium-137 such that a certain amount of measurable cesium would have a known accompanying smaller amount of strontium-90. Originally for contamination in Japan, strontium content was thought to be 10% of whatever the cesium-137 content was. However, after testing food in Japan, researchers have discovered that the initial ratio of strontium to cesium-137 is *more than two times* the amount of cesium-137. More importantly, it also means that the various country limits set for radioactive cesium in food may no longer protect from the increased health impact of the strontium-90 that may be lurking in imports from Japan.

Premature lifting of evacuation orders

May 22, 2015

LDP wants to let evacuees move back to areas tainted with 50 millisieverts or less by March 2017

JJI

A team from the ruling Liberal Democratic Party is requesting that Fukushima's nuclear evacuees be allowed to return to parts of the prefecture **where the annual radiation dose is 50 millisieverts or less by March 2017.**

The proposal to prematurely lift the nuclear evacuation orders was made Thursday by the LDP's Headquarters for Accelerating Reconstruction after the Great East Japan Earthquake. The conservative party will submit this and other related measures to its leader, Prime Minister Shinzo Abe, later this month after consulting with coalition partner Komeito.

The LDP's proposal covers two of the three restricted areas around the Fukushima No. 1 power plant, which tainted much of the prefecture during the three core meltdowns triggered by the March 2011 earthquake and tsunami.

One of the areas has an estimated annual radiation dose of 20 millisieverts or less. It has been designated as an area where residents can prepare for evacuation orders to be lifted.

The other has an estimated annual radiation dose of between 20 and 50 millisieverts.

The 55,000 or so registered residents in the two areas are only allowed entry for a handful of activities, including short visits and business.

The third restricted area, which won't see its evacuation status lifted by March 2017, is the most heavily polluted and is estimated to have an annual radiation dose beyond 50 millisieverts. The area, which has about 22,000 registered residents, remains a no-go zone.

The LDP team said the government should take steps to pave the way for a smooth transition in the two less-polluted areas by **accelerating decontamination work and rebuilding infrastructure.**

Tokyo Electric Power Co. is paying ¥100,000 in consolation money to each displaced resident in the two areas every month. **The payments are to be terminated one year after the evacuation orders are lifted.**

The LDP team proposed that Tepco continue making the payments until March 2018, regardless of when the evacuation orders are lifted for the two areas.

Last year, Japan lifted evacuation orders in parts of Tamura and the village of Kawauchi that had been included in the least-polluted of the three areas. The proposed uniform expiration rules for the consolation payments should also apply to Tamura and Kawauchi residents, said key headquarters official Shinji Inoue, former state minister of the environment.

The LDP team also said the two years through fiscal 2016 should be designated as a period of intensive assistance to help residents restore their independence in their hometowns.

The government should create a new assistance organization for that purpose, the team said, urging the government to instruct Tepco to compensate a wider range of businesses damaged by the nuclear disaster.

The team also said disaster-affected municipalities should cover a portion of the costs for some reconstruction projects. **So far, the central government, which had placed responsibility for both promoting nuclear energy and overseeing the industry under the same ministry for decades, has been footing the entire bill.**

No place for complacency, says IAEA

May 25, 2015

IAEA report on Fukushima slams lack of tsunami preparedness despite awareness of threat

<http://www.japantimes.co.jp/news/2015/05/25/national/iaea-report-fukushima-debacle-slams-lack-tsunami-preparedness-despite-awareness-threat/#.VWLTDObwmic>

Kyodo

VIENNA – The International Atomic Energy Agency criticized Tokyo Electric Power Co. and Japanese regulatory authorities for their failure to prevent the 2011 Fukushima No. 1 nuclear plant disaster despite knowing the risk of large tsunami hitting the facility, according to a copy of an IAEA report.

The U.N. nuclear watchdog said in the final report on the nuclear disaster triggered by a huge earthquake and tsunami in March 2011, obtained Sunday, that “the Fukushima Daiichi NPP (nuclear power plant) had some weaknesses which were not fully evaluated by a probabilistic safety assessment, as recommended by the IAEA safety standards.”

The paper, compiled by around 180 experts from 42 countries, is set to be submitted to the IAEA’s annual meeting in September after its board examines the 240-page summary in June.

The report addressing the causes and consequences of the Fukushima disaster as well as lessons learned is expected to serve as a reference for nuclear safety measures worldwide.

The IAEA said a new approach applied between 2007 and 2009 postulated a magnitude-8.3 quake off the coast of Fukushima that could lead to tsunami of around 15 meters hitting the No. 1 plant and inundating the main buildings.

Despite the analysis, Tepco, the old Nuclear and Industrial Safety Agency, which oversaw Japan’s nuclear industry at that time, and other organizations did not act, deciding instead that “further studies and investigations were needed.”

“Tepco did not take interim compensatory measures in response to these increased estimates of tsunami height, nor did NISA require Tepco to act promptly on these results,” the report says.

Prior to the accident, there was not sufficient consideration of low probability, high consequence external events which remained undetected. This was in part because of the basic assumption in Japan, reinforced over many decades, that the robustness of the technical design of the nuclear plants would provide sufficient protection against postulated risks,” it says.

As a result, Tepco did not implement a sufficient safety assessment as recommended by the IAEA and lacked protection for the emergency diesel generators, battery rooms and other vital systems against tsunami-caused flooding, the paper adds.

“The operators were not fully prepared for the multiunit loss of power and the loss of cooling caused by the tsunami. Although Tepco had developed severe accident management guidelines, they did not cover such an unlikely combination of events,” the report says, also pointing to the lack of appropriate training for workers at the plant.

The IAEA called on countries that use, or plan to use, nuclear power to make continuous efforts to improve safety based on new findings and to be prepared to cope with natural disasters more severe than those predicted when nuclear power plants were designed.

“There can be no grounds for complacency about nuclear safety in any country. Some of the factors that contributed to the Fukushima Daiichi accident were not unique to Japan,” the report warns.

New president for Japan Atomic Agency

May 27, 2015

New atomic agency chief grilled

http://www3.nhk.or.jp/nhkworld/english/news/20150527_14.html

May 27, 2015 - Updated 00:32 UTC+2

The new president of the Japan Atomic Energy Agency has been grilled on nuclear plant management.

Toshio Kodama, **a former vice president of Mitsubishi Heavy Industries**, took up the post of agency president in April. He met with the commissioners of Japan's Nuclear Regulation Authority, or NRA, on Tuesday.

NRA Chairman Shunichi Tanaka referred to the troubled Monju fast-breeder reactor the agency operates in Fukui Prefecture.

The authority has effectively banned test runs at Monju since May 2013, following a series of problems, including missed safety checks, at the reactor.

Tanaka noted there's still no prospect of lifting the ban. He asked Kodama whether agency officials understand the Monju reactor has many security issues that differ from those affecting light-water reactors. He suggested the agency should overhaul its management practices.

He also spoke about the agency's delayed efforts to make plutonium and other highly radioactive waste solid and more stable at a spent nuclear fuel-reprocessing plant in Ibaraki Prefecture, north of Tokyo.

An NRA commissioner said agency officials should seriously consider how best to dispose of nuclear waste and decommission nuclear facilities after 20 or 30 years.

Kodama told reporters the authority's assessment was tough but understandable. **He said his organization must follow the NRA's recommendations.**

High costs fo renewables as an excuse for nukes

May 27, 2015

Nuclear power crucial as renewable energy too costly, ministry says

http://ajw.asahi.com/article/behind_news/politics/AJ201505270040

THE ASAHI SHIMBUN

The high cost of renewable energy means Japan has no choice but to rely on nuclear power to provide between 20 and 22 percent of its energy by 2030, according to an industry ministry report. That would be a small drop in the reliance on nuclear power from the levels before the 2011 Fukushima nuclear disaster.

The shift away from nuclear energy to renewables, including solar power, will generate “pressure for drastic rise in energy cost,” stated the report released May 26. The ministry, a staunch supporter of nuclear energy, concluded it is the least expensive method of power generation.

While nuclear energy should provide between 20 and 22 percent of Japan's electricity, renewable energy should account for 22 to 24 percent in fiscal 2030.

About 27 percent of Japan's electricity was provided by nuclear power on a yearly average in the decade up to the 2011 Fukushima nuclear disaster.

The proposal also said that nuclear power was required to keep power costs at a manageable level for corporations and households and also to enable Japan to reduce greenhouse gases to levels set by advanced economies in the West.

The draft report was released by an expert committee at the Natural Resources and Energy Agency headed by Masahiro Sakane, a senior adviser at Komatsu Ltd. It will be finalized at a meeting of the committee in early June and adopted as the government's official energy-mix plan in July at the earliest after going through a public-comment phase.

All the nation's reactors were shut down after the disaster, and hurdles remain high for the government to restart many of them due to strong public opposition and safety concerns of local governments.

In its Strategic Energy Plan released in April 2014, the government underscored its intention to push for reactor restarts but said “dependency on nuclear power generation will be lowered to the extent possible.”

At a news conference April 26, the industry minister Yoichi Miyazawa said that high energy costs and other concerns “will be all solved by increasing the ratio of nuclear power.”

The minister emphasized that the 20-22 percentage scenario was the minimum possible reliance on nuclear energy.

While the Strategic Energy Plan projected that renewable energy must account for far more than 20 percent of Japan's future plan, the draft report pointed out that solar and wind power output are particularly unstable.

The proposal states that Japan should rely on just 7 percent of energy from solar power and 1.7 percent from wind power.

During the committee sessions, Yukari Takamura, a professor of international law at Nagoya University, and two other members submitted opinion papers that asserted the discussions at the committee do not fully address the need to reduce nuclear energy and increase dependency on renewable energy.

But the figures in the draft proposal are likely to be approved in the committee's next meeting in early June.

IAEA blames TEPCO and Japanese government

May 29, 2015

IAEA blames TEPCO's poor preparations for Fukushima disaster

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201505290052>

THE ASAHI SHIMBUN

The U.N. nuclear watchdog squarely puts the blame for the Fukushima nuclear crisis on the plant operator's inadequate preparations against natural disasters and severe accidents.

Tokyo Electric Power Co. failed to carefully consider the risks of an earthquake and tsunami in advance, the International Atomic Energy Agency states in its latest report.

Although it had been estimated before the accident that a possible magnitude-8.3 quake off Fukushima would spawn a 15-meter tsunami, for example, TEPCO had not taken any steps to protect against such an event. In fact, the utility had estimated the highest possible tsunami at just 5.7 meters.

On March 11, 2011, towering tsunami waves measuring up to 15.5 meters smashed into the Fukushima No. 1 nuclear power plant following the magnitude-9.0 Great East Japan Earthquake.

The IAEA will hold a meeting in June on the report, which was compiled by about 180 experts from 42 countries. It is then expected to formally present the document to its members at its plenary session in September.

The report begins with IAEA Director-General Yukiya Amano pointing out TEPCO had insufficiently prepared for a major earthquake leading to a nuclear accident.

He also notes that some factors behind the nuclear crisis are not unique to Japan, and that learning lessons from the Fukushima crisis and patiently ironing out problems is the key to a better safety culture.

The report also criticizes the now-dissolved Nuclear and Industrial Safety Agency, which told TEPCO to take protective measures against a massive tsunami in the future and not immediately.

As the Fukushima crisis progressed, meltdowns occurred at the No. 1, No. 2 and No. 3 reactors at the plant. TEPCO had not considered a scenario in which the power supply and cooling functions would be lost simultaneously at more than one reactor, according to the report.

Also, while TEPCO had created a manual on how to respond to a severe accident, the company had not given workers proper training that would have enabled them to address the situation worsening over time. In addition, inadequate equipment was in place to deal with emergencies.

The report also lays into the Japanese government as its standards and policies in safety assessments and responses to severe accidents were at a lower level than in other countries.

And it says Japan had failed to formulate a plan to protect evacuating residents from radiation if a nuclear accident and a major natural disaster occurred simultaneously.

IAEA report on Fukushima slams lack of tsunami preparedness despite awareness of threat

<http://www.japantimes.co.jp/news/2015/05/25/national/iaea-report-fukushima-debacle-slams-lack-tsunami-preparedness-despite-awareness-threat/#.VWLTDObwmic>

Kyodo

VIENNA – The International Atomic Energy Agency criticized Tokyo Electric Power Co. and Japanese regulatory authorities for their failure to prevent the 2011 Fukushima No. 1 nuclear plant disaster despite knowing the risk of large tsunami hitting the facility, according to a copy of an IAEA report.

The U.N. nuclear watchdog said in the final report on the nuclear disaster triggered by a huge earthquake and tsunami in March 2011, obtained Sunday, that “the Fukushima Daiichi NPP (nuclear power plant) had some weaknesses which were not fully evaluated by a probabilistic safety assessment, as recommended by the IAEA safety standards.”

The paper, compiled by around 180 experts from 42 countries, is set to be submitted to the IAEA’s annual meeting in September after its board examines the 240-page summary in June.

The report addressing the causes and consequences of the Fukushima disaster as well as lessons learned is expected **to serve as a reference for nuclear safety measures worldwide.**

The IAEA said a new approach applied between 2007 and 2009 postulated a magnitude-8.3 quake off the coast of Fukushima that could lead to tsunami of around 15 meters hitting the No. 1 plant and inundating the main buildings.

Despite the analysis, Tepco, the old Nuclear and Industrial Safety Agency, which oversaw Japan’s nuclear industry at that time, and other organizations did not act, deciding instead that “further studies and investigations were needed.”

“Tepco did not take interim compensatory measures in response to these increased estimates of tsunami height, nor did NISA require Tepco to act promptly on these results,” the report says.

Prior to the accident, there was not sufficient consideration of low probability, high consequence external events which remained undetected. This was in part because of the basic assumption in Japan, reinforced over many decades, that the robustness of the technical design of the nuclear plants would provide sufficient protection against postulated risks,” it says.

As a result, **Tepco did not implement a sufficient safety assessment as recommended by the IAEA and lacked protection for the emergency diesel generators, battery rooms and other vital systems against tsunami-caused flooding,** the paper adds.

“The operators were not fully prepared for the multiunit loss of power and the loss of cooling caused by the tsunami. Although Tepco had developed severe accident management guidelines, they did not cover such an unlikely combination of events,” the report says, also pointing to the lack of appropriate training for workers at the plant.

The IAEA called on countries that use, or plan to use, nuclear power to make continuous efforts to improve safety based on new findings and to be prepared to cope with natural disasters more severe than those predicted when nuclear power plants were designed.

“There can be no grounds for complacency about nuclear safety in any country. **Some of the factors that contributed to the Fukushima Daiichi accident were not unique to Japan,**” the report warns.

About Japan's energy mix draft

June 1, 2015

Some experts demanded less use of nuke power

http://www3.nhk.or.jp/nhkworld/english/news/20150601_26.html

Jun. 1, 2015 - Updated 10:58 UTC+2

In a discussion about the final draft plan on Japan's future energy sources, several experts have called for using less nuclear power.

The 14-member panel endorsed on Monday the draft for Japan's energy plan for fiscal 2030. It aims to set the country's nuclear power dependence at 20 to 22 percent of total energy.

Earlier, three of the panel members lodged a written objection against the panel's draft plan. They said it failed to meet Japan's policy to reduce as much as possible its reliance on atomic energy.

Their paper said the ratio is based on the scenario the operational lifespan of Japan's nuclear reactors will be extended beyond their standard of 40 years.

The experts said the use of renewable energy, set at 22 to 24 percent in the draft, should be raised to at least 30 percent by introducing more solar and wind power.

During Monday's meeting, some members proposed that renewable energy be available for use when nuclear plants cannot provide sufficient energy.

Others said the use of nuclear power should be reduced to meet public expectations. They said **priority should be attached to safety**, and existing power plants be replaced by new state-of-the-art nuclear facilities.

Industry ministry officials overseeing the panel said that **no plan is in place to build new nuclear reactors or replace old ones with new ones.**

They said some of the plants will be put into use beyond the operational lifespan, but with greater safety levels and higher operating rates.

The plan was ultimately endorsed by the panel members. The final draft proposes that once the plan is officially adopted it **be reviewed every 3 years.**

Govt. panel endorses energy mix draft plan

http://www3.nhk.or.jp/nhkworld/english/news/20150601_24.html

Jun. 1, 2015 - Updated 09:33 UTC+2

A panel of experts on Monday endorsed the final draft plan submitted by industry ministry officials on Japan's electricity needs in the future.

The key issue is the balance of nuclear power, fossil fuels and renewables.

The plan indicates nuclear power should contribute 20 to 22 percent of total energy by fiscal 2030. The figure was about 28 percent before the Fukushima nuclear accident in 2011.

The plan also calls for Japan to more than double its reliance on renewable energy sources to up to 24 percent.

Renewables accounted for about 10 percent of total supply in fiscal 2013.

Ministry officials say they will collect comments from the public. They will officially decide on the energy plan as early as July.

Greenpeace on IAEA's report of Fukushima accident

Greenpeace releases confidential IAEA Fukushima-Daiichi accident report

Blogpost by Justin McKeating - 1 June, 2015 at 13:30 Add comment

The International Atomic Energy Agency report fails to accurately reflect the scale and consequences of the Fukushima disaster.

The International Atomic Energy Agency's Board of Governors meets on June the 8th to discuss its confidential Fukushima-Daiichi Accident Summary Report. The report describes itself as 'an assessment of the causes and consequences of the accident at the Fukushima Daiichi nuclear power plant in Japan that began on 11 March 2011.'

Greenpeace has received a copy of the report and we made it public last week. We've also conducted an initial analysis of the report and our findings are not good.

Yukiya Amano, the IAEA Director General says the report is 'an authoritative, factual and balanced assessment, addressing the causes and consequences of the accident, as well as lessons learned.'

Yet our experts find it to be full of inaccuracies, uncertainties, and that it fails to address several highly important issues. We've sent our findings to Mr Amano.

Here are some examples.

- The IAEA admits that radiation monitoring was not working properly in the days immediately after the Fukushima disaster began.
- Despite this uncertainty, the report downplays the health risks to the disaster's many victims.
- This means that the estimates of the levels of radiation the people of Fukushima were exposed to cannot be trusted.
- The IAEA's analysis of the new safety regulations in Japan are superficial at best, and they offer no evidence in the report that the Japanese nuclear industry is operating to the global highest standards of nuclear safety.
- The reality is that there are major flaws in nuclear regulation in Japan with seismic and other threats to nuclear plants safety ignored or underestimated.
- The report dismisses the environmental impact of the disaster on animal life despite scientific investigations finding measurable effects on the region's fauna.
- The report fails to acknowledge the uncertainties that still surround the causes of the disaster. Much of the critical systems inside the reactors that melted down have not yet been inspected.

These are just some of our initial findings. There are more to come.

(You can read our full analysis of the report here. The five part IAEA report is here: part one, part two, part three, part four, part five.)

So we see, as we saw in the aftermath of the Chernobyl nuclear disaster, the IAEA trying to create a narrative that minimizes the health and environmental impacts of Fukushima, while emphasizing that lessons are being learned, including in making nuclear safety regulation more effective.

In short, the IAEA is moving to protect the nuclear industry instead of the people whose lives have been destroyed by the Fukushima disaster and those who may be affected by future nuclear accidents.

This is not a surprise, a central role of the IAEA is to promote the global expansion of nuclear power. The fact that all commercial nuclear reactors in Japan – 43 in total – remain shutdown is a direct challenge to the IAEA's mission. That is the context in which the IAEA report must be seen.

After four years, the disaster in Fukushima is still unfolding and will take many decades to address. If the work to clean up the massive damage done is to be carried out effectively and future accidents avoided as much as possible, the IAEA must demonstrate that it can change the way it operates and quickly.

The IAEA at present serves only the interests of the nuclear industry and its drive for profit at the expense of the people who have pay the ultimate price for nuclear power's failures.

Greenpeace is calling on Mr Amano and the IAEA to suspend their consideration of the report's findings. An open and transparent process must be established that considers the views of the people of Japan, as well as independent scientists. We stand ready to meet with representatives of the IAEA to discuss our serious concerns.

Justin McKeating is a nuclear blogger for Greenpeace International, based in the UK.

Durability in doubt but hose not replaced

June 2, 2015

Hose leaking radioactive water not replaced

http://www3.nhk.or.jp/nhkworld/english/news/20150602_13.html

Jun. 2, 2015 - Updated 02:46 UTC+2

Officials at the Fukushima Daiichi nuclear plant say a hose that leaked radioactive water was left untended **even though its durability was in doubt.**

The leak of highly radioactive wastewater was detected on Friday. Tokyo Electric Power Company, or TEPCO, estimates that **7 to 15 tons of water leaked from a crack in the hose, some into the plant's port.**

Water sampled from 4 locations inside the port turned up the highest levels of radioactive substances since monitoring began 2 years ago.

Company officials say the crack in the hose was caused by stress from excessive bending that went beyond the permissible level set by its maker.

TEPCO had been replacing the same type of hose at other parts of the plant due to doubts about its durability.

But the one that leaked was left untouched since it was placed at a site where workers were busy building a wall of frozen soil around the nuclear complex to keep groundwater from seeping into the reactor buildings.

No clear rules for patrols were in place at the site. **A worker passing by happened to notice the leak.**

TEPCO plans to speed up work to replace the hoses with stronger ones. It also plans to draw up a new manual to ensure proper monitoring when the hoses are used.

Will South Korea lift the ban?

June 2, 2015

S.Korea agrees to talks over food import ban

Jun. 2, 2015 - Updated 05:53 UTC+2

http://www3.nhk.or.jp/nhkworld/english/news/20150602_20.html

Japan's fisheries minister has expressed hope that South Korea will lift its ban on fishery imports from areas affected by the 2011 nuclear accident at the Fukushima Daiichi power plant.

South Korea has banned all imports of fishery products from 8 Japanese prefectures, including Fukushima, since September 2013.

On Tuesday, Agriculture, Forestry and Fisheries Minister Yoshimasa Hayashi told reporters that South Korea informed Japan last Friday that it will agree to bilateral talks in Geneva, Switzerland, based on a World Trade Organization agreement. Japan requested the meeting last month.

Hayashi said under the WTO rules, negotiations should start within 30 days of a request.

He added that the government will step up efforts to get South Korea to lift the ban, even as a date for the talks is being arranged.

TEPCO lies again on wastewater handling

June 3, 2015

NRA not informed of tainted water transfer

<http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html>

Jun. 3, 2015 - Updated 13:53 UTC+2

The operator of the damaged Fukushima Daiichi nuclear plant is facing censure for transferring wastewater that was possibly more radioactive than it originally stated. The company failed to notify Japan's nuclear regulator of the change.

In May, officials found that water sampled at 4 sites at the plant's port briefly exceeded levels of radioactivity seen previously in the 2 years since monitoring began.

It's believed the contaminated water came from a cracked and leaking hose inside the plant. The water from the hose flowed into a channel that led to the port.

Initially, Tokyo Electric Power Company said the hose contained wastewater that was a byproduct of treating contaminated rainwater.

But on Wednesday it was revealed at a meeting of the Nuclear Regulation Authority that **the utility had begun adding other highly radioactive wastewater to the water since mid-May.**

TEPCO says that as a result the wastewater in the hose was likely more radioactive than it initially declared.

Some of the water in the hose was groundwater mixed with extremely highly contaminated water that had pooled in the plant's basement.

The hose cracked from being bent beyond the operational limit set by the maker. The utility had also failed to replace the hose despite questions about its durability.

NRA Chairman Shunichi Tanaka condemned the utility for its utter failure to control the wastewater. He ordered the company to continue monitoring and reporting on its handling of wastewater.

NRA rebukes TEPCO for failure to contain radioactive Fukushima water

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201506040105>

Rows of tanks holding contaminated water at the Fukushima No. 1 nuclear power plant (Asahi Shimbun file photo)

THE ASAHI SHIMBUN

Japan's nuclear watchdog had harsh words for Tokyo Electric Power Co. over its failure to implement a comprehensive strategy to plug leaks of contaminated water at its crippled Fukushima No. 1 nuclear power plant.

"(TEPCO) has failed to manage (contaminated water) properly," said Shunichi Tanaka, chairman of the Nuclear Regulation Authority, at a regularly scheduled meeting on June 3. "It lacks a strategic approach in addressing the contaminated water issue."

Tanaka's remarks followed the recent revelation that an estimated 7 to 15 tons of highly radioactive water leaked from a hose that was used to transfer contaminated water from storage tanks to a treatment facility. The leak was discovered on May 29.

The incident was just the latest in a spate of similar mishaps that have plagued the plant.

TEPCO announced on June 1 that the escaped water contained 1.1 million becquerels of beta ray-emitting radioactive materials per liter. The radioactive water apparently made its way to the sea through a ditch, according to the company.

The leak likely occurred because the condition of the hose had deteriorated. In the part where the water escaped, the hose was bent at a far sharper angle than is allowed under regulations, the company said. TEPCO said it did not replace the hose with a more durable one even though it was aware of the potential danger that could result from aging. **It had not checked the hose since installing it in October 2013.** Tanaka rebuked the utility for failing to replace it, saying, "(TEPCO) should be held deeply responsible." An official with the NRA who investigated the incident also revealed at the meeting that **TEPCO had failed to notify the authorities before the leak that the tanks holding water that was scheduled for treatment included highly contaminated water.**

The heavy contamination resulted from tons of groundwater making contact with melted nuclear fuel in the reactor buildings.

Utilities and NRA at odds over faults

June 4, 2015

Nuclear watchdog, plant operators wide apart on risks of faults

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201506040129>

THE ASAHI SHIMBUN

Electric utilities and the nation's nuclear watchdog are at odds over the "science" used to calculate the risks of underground faults at nuclear power plants.

The Nuclear Regulation Authority sticks to the principle that has been applied since before the 2011 Fukushima nuclear disaster: Faults should be considered "active" unless they are scientifically confirmed to be inactive.

Utilities are banned from operating or constructing reactor buildings and other important facilities directly above active faults.

But the companies, which have applied for NRA approval to restart reactors across the country, say the NRA's methods are "unscientific" and have provided no solid evidence to back its claims about active faults. The utilities said the authority should listen to the opinions of other experts.

Indeed, the limited amount of reliable data in surveying faults beneath nuclear power facilities has prolonged the periods for the NRA's safety screenings of the idle reactors.

But a senior NRA official said the utilities tend to deny the existence of active faults and underestimate the effects of such structures.

"They are still trying to only gather data favorable to them and present to authorities the minimum possible impact," the official said.

In May, an expert panel of the NRA said the possibility of the Shika nuclear power plant in Ishikawa Prefecture standing directly above active faults was real.

The judgment effectively bans Hokuriku Electric Power Co. from restarting the No. 1 reactor at the plant. If the company cannot overturn the NRA's decision, it will have to decommission the reactor.

Under stricter safety standards introduced in July 2013, faults that have possibly shifted during the past 120,000 to 130,000 years are defined as active, the same as in the older criteria.

The new regulations also require utilities to estimate the largest possible shaking that could hit their facilities based on data concerning active faults and other geological features, and reflect the results in their earthquake-resistance measures.

But there is no clear proof that the geological faults beneath the Shika plant are active. The four panel members said it is most "reasonable" to consider the faults as active.

The committee is expected to soon compile its draft report.

One focus of the debate surrounded a sketch of the geological structure under the nuclear plant made at the time of its construction.

The NRA noted that the cross-section of the underground soil shows a wavy stratum on bedrock--a structure typical of an active fault.

The panel attempted to examine whether newer strata were affected by the fault to make a more accurate decision. But the newer layers were scraped away for the construction of the plant. And a photo taken before they were removed was too blurry to be of much help.

The committee examined the geologic formation around the removed layers but could not find any strata clearly showing when the fault moved.

Hokuriku Electric is arguing that the drawing provides zero evidence of the existence of an active fault. For Tohoku Electric Power Co.'s Higashidori nuclear power plant in Aomori Prefecture, a report by an expert panel of the NRA said it is impossible to make a clear judgment on whether some faults running under the plant are active.

The NRA also said in its draft report released in May that faults beneath the Mihama plant in Fukui Prefecture, operated by Kansai Electric Power Co., are highly likely inactive. But the NRA said it will continue studying the relation between the faults under the facility and nearby active faults, as well as other factors.

The authority worked out a draft examination report in May concerning the safety screening of Shikoku Electric Power Co.'s Ikata power plant in Ehime Prefecture.

The Median tectonic line, a huge active fault, runs near the facility. A 480-kilometer section of the line would likely affect the nuclear plant during seismic activity, experts say. But there is no established method to estimate the effects of such a huge active fault.

Before compiling the draft report, the NRA and Shikoku Electric spent more than a year discussing the likely impact on the nuclear plant in a possible earthquake based on two scenarios: smaller faults move separately or they shift as a large, single structure.

Kazuki Koketsu, a seismology professor at the University of Tokyo's Earthquake Research Institute who used to be involved in safety screenings of nuclear facilities, said that making a definitive decision on the activeness of faults is a tricky business.

"There are many factors that make it difficult to accurately estimate fault activities, so a prediction could later prove wrong," Koketsu said. "The related parties should recognize that meeting the minimum standards does not ensure safety."

Pro-nuke Aomori Governor re-elected

June 7, 2015

Aomori's pro-nuclear Gov. Shingo Mimura returned for fourth term

<http://www.japantimes.co.jp/news/2015/06/07/national/politics-diplomacy/aomoris-pro-nuclear-gov-shingo-mimura-returned-for-fourth-term/#.VXRfBkbwmos>

Kyodo

AOMORI – Aomori Gov. Shingo Mimura cruised to a fourth term in office Sunday by defeating a candidate backed by the Japanese Communist Party and the Social Democratic Party, according to Kyodo News projections.

Mimura, 59, supported by the local chapter of the ruling Liberal Democratic Party and Komeito, the LDP's junior coalition partner, secured **broad support in the prefecture, including from labor unions in the power industry.**

During his campaign, the governor signaled that he would adhere to the existing nuclear policy in the prefecture, which hosts a fuel reprocessing plant and other nuclear facilities.

Mimura also promised to battle the prefecture's depopulation woes by creating jobs and expanding welfare. Aomori has the second-highest rate of population decline in the nation.

His challenger, doctor Susumu Otake, 64, campaigned for closing all nuclear facilities in Aomori, saying the prefecture, famous for its apples, should withdraw from the nuclear power and nuclear fuel reprocessing businesses altogether.

A nuclear fuel-reprocessing plant in the village of Rokkasho plays a key role in the nation's plans to recycle its hoard of spent nuclear fuel.

Not passing on savings from reactors to be decommissioned to customers

June 7, 2015

Five utilities still booking costs for retired reactors

<http://www.japantimes.co.jp/news/2015/06/07/national/five-utilities-still-booking-costs-for-retired-reactors/#.VXRfk0bwmos>

JJI

Five of the nation's major power utilities are still factoring in expenditures for reactors due to be decommissioned when calculating their prices, and delaying the return of savings to customers, Jiji Press has found.

Thus, **the electricity bills issued by Tokyo Electric Power Co. and its counterparts in the Chubu, Hokuriku, Chugoku and Kyushu regions include fees for idle nuclear reactors, including maintenance,** sources said.

In contrast, Kansai Electric Power Co. narrowed the size of its price hike to account for a drop in reactor-related costs.

According to Tepco, which decided in January last year to scrap the No. 5 and No. 6 reactors at the crippled Fukushima No. 1 plant, its power rates are based partly on nonexistent costs, such as those related to the two scrapped units.

Reducing costs allows a utility to cut rates if it reports them to the industry ministry, though Tepco has no plan to do so now, officials said.

Chubu Electric, which in March saw the No. 1 reactor at Japan Atomic Power Co.'s Tsuruga plant in Fukui Prefecture slated for decommissioning, has seen its payments for buying electricity from the reactor fall. **Chubu Electric, however, also has no immediate plans to pass the savings on to customers**, the utility said. Hokuriku Electric, which also bought electricity from the Tsuruga plant, has maintained the same rate calculation framework as before the decommissioning decision. The same with Chugoku Electric and Kyushu Electric, which have decided to decommission the No. 1 reactor at the Shimane plant in Matsue and the No. 1 reactor at the Genkai plant in Saga Prefecture, respectively.

Utilities are not required to immediately reflect savings from reactor decommissioning in their power bills.

The five utilities have not clarified their savings from the decommissioned reactors, but said the surge in thermal power generation costs caused by the March 2011 Fukushima disaster has had a greater financial impact.

Kansai Electric, which raised rates in June, slashed the margin of that hike by ¥9.6 billion per year after taking into account the decommissioning of the No. 1 and No. 2 reactors at Fukui Prefecture's Mihama nuclear plant, and of the Tsuruga reactor.

Kepeco had been paying ¥8.4 billion a year to purchase electricity from the Tsuruga reactor and ¥2.2 billion to finance repair costs for the two Mihama reactors.

Does Govt. want to force evacuees to go back?

June 9, 2015

Plan to end rent subsidies for some Fukushima evacuees under fresh fire

<http://mainichi.jp/english/english/newsselect/news/20150609p2a00m0na006000c.html>

A plan to end rent subsidies for some evacuees from the Fukushima nuclear disaster has come under fresh fire, as it emerged that **those subsidies are costing at most 8.09 billion yen this fiscal year.**

The evacuees under consideration for having their subsidies cut -- at the end of fiscal 2016 -- are voluntary evacuees living in homes other than temporary housing structures built for evacuees. The total Fukushima Prefecture relief budget for disaster evacuees this fiscal year, including non-voluntary evacuees, is over 28.8 billion yen, so the subsidies being considered for being cut account for less than 30 percent of the relief budget.

One expert knowledgeable about evacuees says, "The reason that a plan to end these subsidies has arisen even though the financial burden is not large **may be that government officials want to try and force voluntary evacuees to return to their homes, without respecting evacuees' own judgments on the matter.**" Voluntary evacuees are people who evacuated from areas outside of those where the government ordered evacuations. Until November 2012, Fukushima Prefecture did not allow them to use emergency

temporary housing set up for evacuees in the prefecture, and many voluntary evacuees moved outside of the prefecture.

According to the Fukushima Prefectural Government, for this fiscal year it allocated about 20.73 billion yen for the temporary homes of non-voluntary evacuees within the prefecture, and 8.09 billion yen for those of evacuees outside the prefecture. The evacuees outside the prefecture include non-voluntary evacuees, but the exact numbers are not known. A Fukushima Prefectural Government official says, "Non-voluntary evacuees have been using compensation for their lost real-estate to buy homes, and most of the people getting rent subsidies outside of Fukushima Prefecture are probably voluntary evacuees." Within the prefecture, voluntary evacuees live in around 300 homes, which are not temporary housing structures, but subsidies for their rent are included in the "out-of-prefecture" budget, so the 8.09 billion yen covers all voluntary evacuees from the prefecture.

According to the Cabinet Office, as of April 1 this year, there were evacuees living in 18,742 homes in Fukushima Prefecture other than temporary housing structures, and according to the Fukushima Prefectural Government, evacuees were living in around 10,000 such homes outside of the prefecture. Both numbers include voluntary and non-voluntary evacuees. Neither the Fukushima Prefectural Government nor the central government has yet released exact figures on the number of homes for voluntary evacuees other than temporary housing built after the disaster, nor have they released exact numbers for the total rent paid for them.

Currently, evacuee homes are set to be subsidized until the end of March 2016, with a decision on whether to extend this to be made soon after discussions between the Fukushima Prefectural Government and the Cabinet Office. A plan to end subsidies for voluntary evacuees would extend the deadline for one more year, to the end of March 2017, after which voluntary evacuees would no longer receive them. Although Fukushima Prefecture has money budgeted for subsidizing voluntary evacuees, this money is in effect all paid for by the central government. Tokyo Electric Power Co. has expressed reluctance to pay for voluntary evacuees' rent, and so far the central government has not billed them for such.

Meanwhile, this fiscal year's Fukushima Prefecture budget for radiation decontamination measures is 64.39 billion yen, up 13.35 billion yen from the previous fiscal year. The Ministry of the Environment released an estimate in December 2013 that the total costs for decontamination and mid-term storage for radioactive waste would be 3.6 trillion yen.

June 09, 2015(Mainichi Japan)

Sharing Fukushima lessons with IAEA

June 10, 2015

Japan to share Fukushima experiences with IAEA

<http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html>

Jun. 10, 2015 - Updated 18:16 UTC+2

The Japanese government has expressed readiness to share with members of the world nuclear monitoring agency lessons it learned from the nuclear disaster in Fukushima in 2011.

The board of governors of the International Atomic Energy Agency held a meeting behind closed doors in Vienna on Wednesday to discuss a comprehensive report on the accident at the Fukushima Daiichi nuclear power plant.

The report was co-produced by 180 experts from over 40 countries. It blames Japan's excessively firm belief in the safety of its nuclear power plants for its unpreparedness for the 2011 disaster, which was triggered by a massive earthquake and tsunami.

The ambassador for the Permanent Mission of Japan to the International Organizations in Vienna, Mitsuru Kitano, stressed Japan's responsibility to share experiences and lessons learned from the disaster.

He pledged to ensure the safety of nuclear power.

He also briefed participants on the Japanese government's handling of the disaster. He added that it is most important that **transparency** is secured when sharing the information.

The IAEA plans to draw lessons from the Fukushima disaster to improve the safety of power plants across the globe.

It is to examine opinions of member states in submitting a final report when the agency convenes a general assembly in September.

35 reactors by 2030?

June 11, 2015

Japan needs 35 nuclear reactors operating by 2030, says industry minister

http://ajw.asahi.com/article/behind_news/politics/AJ201506110038

THE ASAHI SHIMBUN

Japan needs about **35 working nuclear reactors by 2030** to achieve the government's long-term energy strategy to return the country's dependence on nuclear energy to slightly under the level it was before the 2011 Fukushima disaster.

That many would be required for nuclear energy to provide between 20 and 22 percent of the country's electricity, said industry minister Yoichi Miyazawa at a Lower House committee session on economy and industry.

Currently, there are 43 nuclear reactors in Japan with three more under construction, but none are actually operating.

After the Fukushima nuclear disaster in March 2011, the government limited the operational life of nuclear power reactors to a maximum of 40 years in principle, with an extension of up to 20 years in exceptional cases.

If the 40-year principle was to be strictly applied to all the existing reactors, there will be only 23 operative reactors in 2030, meaning that 10 or so reactors would have to have their lifespans extended in order to reach the power target.

The three new reactors include those at two new nuclear power plants in Aomori Prefecture, Electric Power Development Co.'s Oma plant and Tokyo Electric Power Co.'s Higashidori plant, while the other is the third reactor at Chugoku Electric Power Co.'s Shimane plant in Shimane Prefecture.

IAEA MEETING

Japan has strengthened safety measures against severe nuclear accidents and limited the operational lifespan of reactors through revisions of the nuclear reactor regulatory law, Ambassador Mitsuru Kitano told an executive meeting of the International Atomic Energy Agency (IAEA) in Vienna on June 10.

It was Japan's responsibility to share the experiences and lessons of the Fukushima disaster with other IAEA member nations, added Kitano, who is ambassador of the Permanent Mission of Japan to the International Organizations in Vienna.

At the meeting, the international nuclear watchdog unveiled **its report on the Fukushima disaster, which will be officially released at its general meeting in September.**

The report pointed out that **blind trust in nuclear safety** has prevented plant operator TEPCO from taking sufficient preparatory measures against tsunami and other natural disasters, while the government and its nuclear watchdog also failed to demand TEPCO take necessary safety steps prior to the accident.

While Kitano declined to comment on the government's opinion on the safety of nuclear power plants at the time the accident took place, he emphasized that Japan created a new nuclear watchdog, the Nuclear Regulation Authority, in 2012 to ensure its independence from the nuclear industry.

Greenpeace on IAEA report

Greenpeace releases confidential IAEA Fukushima-Daiichi accident report

<http://www.greenpeace.org/international/en/news/Blogs/nuclear-reaction/IAEA-Fukushima-Daiichi-accident-report/blog/53055/>

Blogpost by Justin McKeating - 1 June, 2015 at 13:30 10 comments

The International Atomic Energy Agency report fails to accurately reflect the scale and consequences of the Fukushima disaster.

The International Atomic Energy Agency's Board of Governors meets on June the 8th to discuss its confidential Fukushima-Daiichi Accident Summary Report. The report describes itself as 'an assessment of the causes and consequences of the accident at the Fukushima Daiichi nuclear power plant in Japan that began on 11 March 2011.'

Greenpeace has received a copy of the report and we made it public last week. We've also conducted an initial analysis of the report and our findings are not good.

Yukiya Amano, the IAEA Director General says the report is 'an authoritative, factual and balanced assessment, addressing the causes and consequences of the accident, as well as lessons learned.'

Yet our experts find it to be full of inaccuracies, uncertainties, and that it fails to address several highly important issues. We've sent our findings to Mr Amano.

Here are some examples.

- The IAEA admits that radiation monitoring was not working properly in the days immediately after the Fukushima disaster began.
- Despite this uncertainty, the report downplays the health risks to the disaster's many victims.
- This means that the estimates of the levels of radiation the people of Fukushima were exposed to cannot be trusted.
- The IAEA's analysis of the new safety regulations in Japan are superficial at best, and they offer no evidence in the report that the Japanese nuclear industry is operating to the global highest standards of nuclear safety.
- The reality is that there are major flaws in nuclear regulation in Japan with seismic and other threats to nuclear plants safety ignored or underestimated.
- The report dismisses the environmental impact of the disaster on animal life despite scientific investigations finding measurable effects on the region's fauna.
- The report fails to acknowledge the uncertainties that still surround the causes of the disaster. Much of the critical systems inside the reactors that melted down have not yet been inspected.

These are just some of our initial findings. There are more to come.

(You can read our full analysis of the report here. The five part IAEA report is here: part one, part two, part three, part four, part five.)

So we see, as we saw in the aftermath of the Chernobyl nuclear disaster, the IAEA trying to create a narrative that minimizes the health and environmental impacts of Fukushima, while emphasising that lessons are being learned, including in making nuclear safety regulation more effective.

In short, the IAEA is moving to protect the nuclear industry instead of the people whose lives have been destroyed by the Fukushima disaster and those who may be affected by future nuclear accidents.

This is not a surprise, a central role of the IAEA is to promote the global expansion of nuclear power. The fact that all commercial nuclear reactors in Japan – 43 in total – remain shutdown is a direct challenge to the IAEA's mission. That is the context in which the IAEA report must be seen.

After four years, the disaster in Fukushima is still unfolding and will take many decades to address. If the work to clean up the massive damage done is to be carried out effectively and future accidents avoided as much as possible, the IAEA must demonstrate that it can change the way it operates and quickly.

The IAEA at present serves only the interests of the nuclear industry and its drive for profit at the expense of the people who have pay the ultimate price for nuclear power's failures.

Greenpeace is calling on Mr Amano and the IAEA to suspend their consideration of the report's findings. An open and transparent process must be established that considers the views of the people of Japan, as well as independent scientists. We stand ready to meet with representatives of the IAEA to discuss our serious concerns.

Justin McKeating is a nuclear blogger for Greenpeace International, based in the UK.

Decommissioning needs full gov't support

June 15, 2015

Editorial: New technology to help resolve Fukushima nuclear crisis needs gov't backing

<http://mainichi.jp/english/english/perspectives/news/20150615p2a00m0na007000c.html>

The Japanese government has once again revised the work schedule for decommissioning reactors at the triple-meltdown-stricken Fukushima No. 1 nuclear plant. The last major change was in June 2013, and this one pushes back the removal of spent fuel rods from the fuel pools of the No. 1-3 reactors by as much as three years. The delay is due to unexpected difficulties preventing the escape of airborne radioactive contaminants during decontamination and wreckage clearing work.

Decommissioning reactors at the heart of one of the world's worst nuclear disasters is of course bound to be extremely difficult, and this reality is coming into sharp relief.

Progress on dismantling the Fukushima reactors has a direct bearing on both overall regional disaster recovery and when local residents will be able to finally return home. As such, we call on both the government and plant operator Tokyo Electric Power Co. to develop a reactor decommissioning strategy with a solid strategic foundation, and to thoroughly release information on the process.

The latest revisions to the decommissioning work schedule were based on the basic principle of putting the safety of locals and plant workers first. The first version of the work schedule was obsessed with speed. The result was a rash of worker injuries and deaths and other problems that ended up causing progress to be delayed. Rather than making speed top priority, it's more important to carefully and surely reduce the various risks related to the Fukushima plant.

The jobs with the highest priority under the work plan's latest iteration are the recovery of nuclear fuel rods from the fuel pools, and dealing with the vast quantities of radioactively contaminated water produced at the plant. Though these tasks are certainly important, the most difficult hurdle in the decommissioning process will be extracting the melted fuel from inside the stricken reactor vessels. Under the new schedule, this is set to start on just one of the reactors sometime in the year 2021. That's some six years away, but the path from here to there remains foggy at best. First of all, no one knows for sure exactly what state the fuel is in or even where it is in the reactor housings.

The method for getting the fuel out is also up in the air. At first, planners thought it best to fill the reactor vessels with water to suppress the intense radiation when the operation began. This fell by the wayside, however, when it turned out to be difficult to identify damaged spots on the reactor vessels and stop water from escaping. Now, an in-air removal method is being considered, though entirely new equipment will need to be developed to perform the operation in the highly radioactive environment while at the same time preventing contaminants from getting airborne.

There are a number of research institutes and universities across Japan that are receiving government support to invent the technology needed for this reactor decommissioning work. The "control tower" for these efforts is the Nuclear Damage Compensation and Decommissioning Facilitation Corp. (NDF), created by the government in August last year. The corporation is tasked with overseeing each project from basic research through to practical application, and to optimize the development process.

The NDF, however, has just 35 or so technical staff. It's an open question whether the NDF can exercise effective oversight for such a wide program with so few people. The government is trying to enhance the corporation's functions, but there have been no concrete measures forthcoming so far. At this rate, might the 30-40 year target to decommission the Fukushima reactors come under serious pressure?

Prime Minister Shinzo Abe has said more than once that "the national government stands on the front lines" of the efforts to deal with the decommissioning work. Then **more than ever, the government must create a system to provide full and complete support for the technology research and development projects needed to finally bring the nuclear crisis to an end.**

TEPCO aware of large tsunami risk as early as 2008

June 18, 2015

Document shows Tepco was aware of need for tsunami measures in 2008: lawyers

<http://www.japantimes.co.jp/news/2015/06/18/national/crime-legal/document-shows-tepco-aware-need-tsunami-measures-2008-lawyers/#.VYKyUbw mou>

Kyodo

Tokyo Electric Power Co. was aware of the need to take anti-tsunami measures at the Fukushima No. 1 nuclear plant before the 2011 crisis, contrary to its claims regarding such hazards there, lawyers for plaintiffs in a damages suit said Thursday.

Yuichi Kaido, one of the lawyers, told the Tokyo District Court that **an internal Tepco document dated 2008 shows the company “had clearly recognized as of that year that measures against tsunami were inevitable, contradicting the company’s explanations so far.”**

The operator of the radiation-leaking plant crippled by the March 2011 earthquake and tsunami has claimed during the trial and in other venues that it was not able to predict the massive tsunami.

The lawsuit was filed in March 2012 by more than 40 Tepco shareholders seeking to have former and current company directors pay around ¥5.5 trillion in damages to the company for their failure to prevent the crisis.

Tepco has demanded the claim be dismissed.

The internal document, which was compiled for a company meeting held at Fukushima No. 1 in 2008, says **measures against tsunami hazards are “inevitable as we cannot help but expect bigger tsunami than currently projected” given the opinions of academics and the government**, the lawyers said.

According to a report compiled in 2012 by a Diet-appointed panel that investigated the Fukushima nuclear disaster, Tepco projected in June 2008 that after an earthquake the plant could be hit by 15.7-meter waves. The internal document was produced three months after that, but the utility did not take specific measures against tsunami.

The document is another piece of evidence supporting the investigative panel’s report that called the world’s worst nuclear crisis since Chernobyl in 1986 a “clearly man-made disaster” caused by the company.

The lawyers claimed that Tepco apparently tried to avoid spending massive amounts of money on boosting the plant’s preparedness against disasters.

Fukushima No. 1 lost nearly all of its power sources and consequently the ability to cool its reactors after it was hit by the magnitude-9.0 earthquake and huge tsunami on March 11, 2011.

Reactors 1, 2 and 3 suffered core meltdowns while a hydrogen explosion rocked the building housing the No. 4 unit.

TEPCO aware of large tsunami risk as early as 2008 (2)

Document shows TEPCO recognized risk of huge tsunami at Fukushima plant in 2008

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201506180062>

June 18, 2015

By ODAKA CHIBA/ Staff Writer

Tokyo Electric Power Co. in 2008 recognized the “indispensable” need for countermeasures against a towering tsunami at the Fukushima No. 1 nuclear plant, but it ended up doing nothing, an internal document showed.

The document was disclosed on June 18 by TEPCO, operator of the Fukushima plant, at the request of its shareholders who have filed a lawsuit against the utility's executives. The plaintiffs are demanding that company executives be held responsible for the nuclear crisis at the plant that was triggered by the March 2011 Great East Japan Earthquake and tsunami.

"It is indispensable for us to develop measures against a higher tsunami than currently estimated," the document says.

The plaintiffs argue that the document proves that TEPCO executives at the time could foresee the possibility of a huge tsunami striking the nuclear plant. They say the utility in 2008 estimated a 15.7-meter tsunami could hit the plant based on earthquake predictions by a governmental organization. But TEPCO said its 2008 estimate could not be "a factor that inevitably forced them to take concrete countermeasures because there were differences of opinion, even among experts, on how to estimate a quake."

The in-house document was distributed during a TEPCO meeting held on Sept. 10, 2008, to discuss countermeasures at the Fukushima nuclear plant against earthquakes and tsunami.

Akio Komori, a managing executive officer and director of the plant at that time, attended the meeting. The document says it is "difficult to completely deny" the government findings on a possible earthquake and tsunami, and that the company had "no choice but" to raise the maximum height in its estimates for tsunami.

According to the shareholders suing the TEPCO officials, the document includes a sentence that says, "This contains sensitive information and must be returned."

In another document submitted to the Tokyo District Court by TEPCO in the lawsuit, the company says, "The (2008) document just mentioned the possibility of some sort of anti-tsunami measures required in the future and did not point out any specific risk of tsunami."

TEPCO gets more money from banks

June 24, 2015

Struggling TEPCO to gain additional funding from 3 national megabanks

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201506240089>

THE ASAHI SHIMBUN

In a show of confidence, the nation's top three banks and other financial organizations who have been funding embattled Tokyo Electric Power Co. **have agreed to extend 280 billion yen (\$2.26 billion) in loans to the utility for the fiscal year.**

The entities concluded that TEPCO, the operator of the crippled Fukushima No. 1 nuclear power plant, has been successful in cutting costs.

The utility has secured a pretax profit and been in the black for two years in a row, even without the restart of its Kashiwazaki-Kariwa nuclear power plant in Niigata Prefecture.

TEPCO plans on becoming a holding company in the next fiscal year comprised of three subsidiaries that will split its fuel supply and thermal power generation, electric power transmission, and electricity retailing into separate businesses.

Shareholders will vote on the plan at their meeting on June 25.

The banks and other lending institutions have expressed support for the plan, saying they believe the utility's decision to separate its power generation and transmission businesses before its competitors do so will strengthen its ability to compete in the industry after power deregulation is introduced nationwide.

TEPCO had been asking the banks and other financial bodies for funding to help with debenture redemption and capital investments.

For the two years starting this fiscal year, it said it needs a total of 1.3 trillion yen to fund the projects. The company also plans in fiscal 2016 to issue its first debenture since the 2011 Great East Japan Earthquake and tsunami triggered the Fukushima nuclear disaster.

However, TEPCO has been unable to significantly improve its profitability without the restart of the Kashiwazaki-Kariwa nuclear power plant, as its ongoing cost-cutting efforts have limits.

History must be handed down to posterity

June 23, 2015

COMMENTARY: Don't let nuclear disaster be forgotten like great Fukushima monk

<http://ajw.asahi.com/article/views/column/AJ201506230010>

By TOSHIHIDE UEDA/ Senior Staff Writer

YUGAWA, Fukushima Prefecture--A chance to visit a historic Buddhist temple in this northeastern village and learn about a great monk underscored the importance of passing down the history of the Fukushima nuclear disaster correctly to future generations.

My breath was taken away in April by the graceful and well-rounded look of the seated figure of Yakushi Nyorai (Bhaisajyaguru), the principal object of worship at Shoji temple and a national treasure designated by the central government.

Tradition says the statue dates from the first half of the ninth century in the early Heian Period (794-1185).

Yugawa, a farming village in the Aizu Basin, has slightly more than 3,000 residents and is the smallest of all municipalities in Fukushima Prefecture. Shoji temple stands behind a settlement in the village.

Despite the fine weekend weather with cherry petals fluttering in the air, only a handful of visitors could be spotted in the area, which, apparently, couldn't have been more remote from the "garment" of tourism. In 1996, three statues preserved at the temple--the seated Yakushi Nyorai figure and the standing statues of its two attendant bodhisattvas, Nikko Bosatsu (Suryaprabha) and Gakko Bosatsu (Candraprabha)--became the first works of sculpture from the Tohoku region to be designated national treasures.

Nine other Buddhist figures at the temple have been designated “important cultural properties” by the central government.

I wondered how the statues survived more than a millennium in this rural temple.

Shoji officials said the temple was opened by an erudite monk, Tokuitsu by name, in the early Heian Period. Tokuitsu, a monk of the Hosso sect of Buddhism, is honorifically referred to as a “saint” or a “bodhisattva.”

MONK HELPED BUDDHISM FLOURISH

I felt ashamed that I had never known earlier about Tokuitsu. I don’t remember ever having heard the monk’s name mentioned in school classrooms.

The town of Bandai, east of Yugawa, lies at the foot of Mount Bandaisan, the famous volcano. Experts say the town was the locale of a major center of Japan’s Buddhist culture for some time beginning in the early Heian Period.

Tokuitsu led Buddhism to take root in this area. While the years of his birth and death are unknown, tradition says he studied at Nara’s Todaiji temple and elsewhere before he had a temple built at the foot of Mount Bandaisan around 807. The site of remains of Enichiji temple in Bandai, which has been designated a “historic site” by the central government, is where he did so.

The town government of Bandai restored the Kondo (golden hall) and the Chumon (middle gate), structures that formerly stood at Enichiji temple, on the temple remains in 2008 and 2009, respectively. I was told the town government is also weighing follow-up plans, such as making replicas of Buddhist statues lost from the temple, including a figure of Yakushi Nyorai, and designing street architecture along a former approach to the temple.

I visited the town’s Bandaisan Enichiji Shiryokan museum, part of the Enichiji remains complex. Historical documents show that Tokuitsu opened a number of Buddhist temples, most of them in the Aizu district in the west of today’s Fukushima Prefecture. He also opened others in present-day Ibaraki, Tochigi, Gunma and other prefectures. Fifty or more temples are said to have legends associated with Tokuitsu.

Enichiji was at the center of the flourishing Buddhist culture of Aizu, and at one point it purportedly had 300 monks, several thousand armed warrior monks and 3,800 branch temples.

Tokuitsu’s name has survived to this day primarily because he had a major doctrinal argument with Saicho, his contemporary who opened the Tendai sect of Buddhism. The argument purportedly lasted for more than four years. Tokuitsu also criticized the Shingon sect of Buddhism, which Kukai established around the same time.

I was curious to know how a monk of such erudition became more or less forgotten.

One thing that came to mind is that “official history” is written by the central authority.

Emperor Kanmu, who moved Japan’s capital to Kyoto, did not allow Nara’s major temples, which constituted a big political force, to relocate to Kyoto. Instead, he protected new sects of Buddhism initiated by Saicho and Kukai.

Tokuitsu, on the contrary, was a polemic from the Hosso sect of Nara Buddhism. And he was based in Aizu, far removed from the capital.

Another misfortune of siding with the “underdog” befell Enichiji temple in later history.

Historical documents show that the temple sided with the Taira warrior clan when the latter fought the Minamoto warrior clan toward the end of the Heian Period. The chief of Enichiji’s resident monks was killed in a lost battle against Kiso Yoshinaka, a member of the Minamoto clan. When warlord Date Masamune invaded Aizu during the age of warring states in the 16th century, he set fire to the temple, which burned down except for Kondo hall.

Upon the Meiji Restoration of 1868, Japan's new government issued orders to separate Buddhism and Shinto in a drive to end their syncretism, and anti-Buddhist movements rose among the public. Enichiji temple was decommissioned amid that trend in 1869, which put a temporary end to more than a millennium of its history.

HUB OF BUDDHIST CULTURE REVIVED

It was the town's residents who revived Enichiji temple.

"Enichiji was the cradle of Aizu's culture," said Miyuki Suzuki, head of the Enichiji museum. "The local people had a burning desire to bring the temple back to existence."

A movement for rebuilding the establishment culminated in the 1913 revival of a new Enichiji, which stands outside the old Enichiji site to this day.

"It is essential to hand down history in a proper way to posterity," said Bandai Mayor Genichi Igarashi, who has led the restoration efforts at the old Enichiji site.

The consequences of the 2011 disaster at the Fukushima No. 1 nuclear power plant are being written on new pages of history day after day in Fukushima Prefecture. The central government and power utilities, in the meantime, are steadily moving ahead with their plan to restart Japan's nuclear reactors, all of which currently remain idled.

Such a move could box up the history of the nuclear disaster within the bounds of Fukushima Prefecture and send it off to obscurity, just like Tokuitsu's name was left to fade on the terrain of Aizu.

The Fukushima disaster should be part of an "official history" to be shared in a proper way by the entire globe. And it is up to every single one of us to write it.

EDITORIAL: Utilities compromise their futures by rejecting anti-nuclear proposals

<http://ajw.asahi.com/article/views/editorial/AJ201506290030>

During recent general shareholders' meetings, Japan's nine electric utilities with nuclear power plants rejected all proposals by stockholders for a departure from reliance on nuclear energy.

We want to ask their executives, who insist on the need to restart their idled nuclear reactors: "Do you really believe management will be OK that way?"

The power retail market will be liberalized next spring, whereupon each household will be allowed to decide which company they will be purchasing electricity from. **Management policies that have hardly changed from what they were before the Fukushima nuclear disaster of 2011 could face the exacting eyes of consumers when they make their selections.**

The city governments of Osaka and Kyoto, which have major stakes in Kansai Electric Power Co., submitted proposals calling for a phaseout of nuclear power during a shareholders' meeting of the Osaka-based utility, which relied on nuclear energy for 50 percent of its power supply before the Fukushima disaster.

One proposal called for keeping nuclear reactors offline as long as spent nuclear fuel disposal methods remain undecided. Another called for aggressive measures to introduce alternative energy sources that will replace nuclear power.

They were both reasonable proposals made from the standpoint that problems should not be put off and pushed on future generations.

But Kansai Electric's management called for a rejection of the proposals, reiterating that the utility will seek early restarts of its reactors on the basic premise that safety will be ensured. One of its executive vice presidents was bold enough to say that the utility would, in the mid- to long term, have to build new nuclear reactors or replace existing ones.

Things were much the same at other regional utilities.

Chugoku Electric Power Co. reiterated its intention to push its plan to build a nuclear plant in Kaminoseki, Yamaguchi Prefecture. Kyushu Electric Power Co. stressed its determination to seek a prompt restart of its Sendai nuclear plant in Kagoshima Prefecture, whereas Tokyo Electric Power Co., operator of the crippled Fukushima No. 1 nuclear plant, also made clear it wants to continue with its nuclear power operations. It has been only four years since the Fukushima nuclear disaster caused suffering among local residents and induced a collapse of the "safety myth" about nuclear power generation. **We are only left to gape at the brazen way a return to nuclear power is being sought, as if the lessons of the disaster have been forgotten.**

Behind the tough stance of the utilities is the central government, which defined nuclear power as an "important base-load power source" when it endorsed a Basic Energy Plan last year. Earlier this month, Tokyo approved a draft plan to have nuclear energy account for between 20 and 22 percent of Japan's total power supply in fiscal 2030. Achieving that goal would require the operation of existing nuclear reactors beyond the standard service life of 40 years or the building of new reactors.

The use of nuclear energy has been promoted in postwar Japan as a "national policy managed by the private sector." One could say that **the utilities are compromising themselves by believing that they only have to follow the central government, whatever the public may think of them.**

Nuclear power operations are obviously turning into a business segment with uncertain future prospects. Sixteen of Japan's fleet of 43 nuclear reactors have been in service for more than 30 years, which means their operators will soon have to decide whether to keep them alive or decommission them. Extending their service lives is expected to cost the companies hundreds of billions of yen (billions of dollars) because safety regulations were strengthened after the Fukushima nuclear disaster.

We also wonder how exactly the utilities intend to win the understanding of residents and local governments in adjacent areas if they ever plan to build new reactors. We can hardly believe the utilities, which are only looking toward the central government, have the determination or any blueprints to do so. "I can only have the impression that you are going to commit a double suicide with nuclear power," one stockholder said during Kansai Electric's shareholders' meeting.

Members of the utilities' management should rethink the wisdom of continuing with their old ways.

Closed-door sessions have negative effect

July 3, 2015

Experts slam closed-door nuclear briefings

http://www3.nhk.or.jp/nhkworld/english/news/20150703_31.html

Jul. 3, 2015 - Updated 11:11 UTC+2

A panel of experts has criticized Japan's industry ministry for discussing its new policy for disposing of high-level nuclear waste in closed-door sessions.

The ministry-appointed experts said at a meeting on Friday their call for information disclosure on the basic waste disposal policy has fallen on deaf ears.

They also said that holding sessions behind closed doors could have a negative impact on the issue.

The government decided in May to select prospective sites for burying high-level radioactive waste from nuclear power plants and to ask local authorities for their cooperation in building the facilities.

The new policy was implemented following 13 years of failed efforts to solicit candidate sites due to strong safety concerns.

The ministry said it decided to hold closed-door briefings so that local government officials would feel free to speak out.

The ministry had held briefings in 39 prefectures by the end of June. They were attended by nearly 70 percent of local authorities nationwide. But some refused to attend to protest the closed-door policy.

The head of the panel, Hiroya Masuda, said **the ministry must convince local authorities that the briefings don't necessarily indicate candidacy for waste disposal sites.**

Deregulation of power sector

July 5, 2015

Electricity and gas liberalization

<http://www.japantimes.co.jp/opinion/2015/07/05/editorials/electricity-and-gas-liberalization/#.VZlBZkbwmic>

The Diet last month enacted two bills to finalize the liberalization of the electricity and city gas industries. The government should do its utmost to ensure not only fair treatment of all entrants into the markets but also the stable supply of electricity and city gas to consumers.

Under a revision of the Electricity Business Law, the culmination of the liberalization of the power industry will come in April 2020, when power transmission and distribution sections will be separated from the nation's nine major power firms, which now enjoy regional monopolies. An earlier stage of reform started in April when the Organization for Cross-regional Coordination of Transmission Operations was established to facilitate power transmission between western and eastern Japan in case of an emergency. OCCTO's establishment was prompted by the experience of what happened in the wake of the March 2011 crisis at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear power plant. Moving power to disaster-hit eastern Japan was made difficult by the difference in the frequency of electricity between the two regions.

In April 2016, retail sale of electricity to households and other small-lot users will be opened to new entrants. Since the gradual liberalization of electricity sales began in 1995, businesses from various other sectors have been selling electricity to large-scale users such as plant operators and have already taken a market share worth 3 million kilowatts of electricity — equivalent to the output capacity of three nuclear power plants combined.

To help push the liberalization of electricity retail sales for small-lot users, OCCTO will work to increase competition among power suppliers beyond traditionally demarcated service areas. It will also make it easier to transmit electricity generated from renewable energy sources such as wind and solar facilities over long distances, for example between eastern and western Japan.

Currently 1.2 million kW electricity can be transmitted between the country's western and eastern regions. OCCTO plans to eventually increase the capacity to 3 million kW by beefing up frequency conversion facilities. Major power firms have already started a project to raise the capacity to 2.1 million kW by the end of fiscal 2020.

Liberalization of the gas industry will follow deregulation of the power sector. A revision of the Gas Business Law will liberalize the gas retail market in 2017 at the earliest and will spin pipe management divisions off the major city gas firms in Tokyo, Nagoya and Osaka in April 2022 so that new entrants to the business can have better access to gas pipes.

These changes will facilitate not only the entry of new businesses into the electricity and gas markets but also help power and gas companies enter each other's markets. It is hoped that increased competition will result in lower electricity and gas bills for consumers and help initiate new services such as price discounts through the package sale of gas and mobile phone services, and coupon points accumulated through electricity purchases. Some new entities may attract eco-minded consumers by selling power from green sources.

Behind the decision by the Ministry of Economy, Trade and Industry to separate power transmission and distribution sections from the major utility firms is the view that new entrants would face difficulty entering the market unless they can use transmission lines now effectively monopolized by the major firms under more equitable conditions.

Still, doubts remain as to whether the competition between the major firms and new entrants will be fair because the spun-off power transmission and distribution businesses will be under the umbrella of holding companies that also control the power-generating firms that will be spun off the major power

companies. A new committee that will be established to oversee transactions in the power and gas industries must keep a close eye on them and ensure the competition is fair.

The revised Electricity Business Law contains a supplementary provision that says that the power supply and demand situation will be reviewed when the separation of transmission and distribution sections from the major utilities is carried out and “necessary steps” should be taken in view of the situation. This means that depending on the supply and demand situation, the separation may be delayed. For example, major utilities might cite a delay in the restart of nuclear power plants — mostly idled in the wake of the Fukushima disaster — as an excuse to seek a delay of the separation. **The ministry should not allow the firms to link nuclear power generation to the implementation of the deregulation measure.**

The Abe administration, which is pushing for the reactivation of the idled nuclear power plants, plans to have nuclear power account for 20 to 22 percent of Japan’s electricity generation in 2030. But increased competition through deregulation can raise the cost of nuclear power relative to other sources of electricity. **Since liberalization of the power-sector is meant to promote market-based competition under equitable conditions, the government should be aware that any preferential treatment for nuclear power plants to keep them competitive would defeat the purpose of the deregulation measure.**

The government should also keep watch if liberalization of the power market causes any disadvantages to consumers. It needs to eliminate the possibility of major problems, such as power outages that could result from a lack of proper cooperation and coordination among power companies in the liberalized environment. In addition, electricity charges might rise unreasonably in areas where demand for power is low, such as small communities in mountainous areas. The government needs to take adequate steps when necessary to prevent the deregulation from having adverse effects on consumers.

Iran's Nuclear program: What's in it for Japan?

July 6, 2015

Influence of Iran's nuclear program on Japan

http://www3.nhk.or.jp/nhkworld/english/news/20150707_03.html

Jul. 6, 2015 - Updated 23:27 UTC+2

World powers are working on the issue of Iran's nuclear program. Japan has high hopes for a resolution, as **Iran could be a stable source of crude oil and a large potential market for Japanese companies.**

Iran was once one of the main exporters of crude oil to Japan, and has the world's 4th largest reserves.

But European countries and the United States tightened economic sanctions against Iran, prompting Tokyo to withdraw from a project to develop Iran's Azadegan oil field. The field has one of the largest deposits in the Middle East.

Japan has cut crude oil imports from Iran by over half in the past 5 years.

In response to the sanctions, Iran threatened to close the Strait of Hormuz at the mouth of the Persian Gulf, the world's most important route for crude oil shipments.

This prompted crude oil prices to rise and gasoline prices to jump in Japan.

Resolving the nuclear issue may also pave the way for Japanese firms to enter Iran's market, which has 78 million consumers and rich resources.

Ex-members sue JAEA over discrimination

July 5, 2015

4 retirees of gov't-linked nuclear body file damages suit over discrimination

<http://mainichi.jp/english/english/newsselect/news/20150707p2a00m0na015000c.html>

MITO, Ibaraki -- Four retired workers of the Japan Atomic Energy Agency (JAEA) filed a damages suit with the Mito District Court on July 6, demanding the government-affiliated nuclear organization pay a total of about 111 million yen in compensation for its **discriminatory treatment over their wages and job promotions.**

The four plaintiffs argue that they had received discriminatory treatment over their wages and career advancement partly because they pointed out safety problems with nuclear power. They are demanding about 110.8 million yen in damages, including their wage shortfalls as well as compensation for their pain and suffering.

The four retired from JAEA in the spring of this year. Among them is Kenji Komatsuzaki, 60, from Ibaraki Prefecture, who became a full-time, non-regular staff member at the nuclear organization after retirement. According to their complaint and other sources, the four plaintiffs had carried out activities such as distributing leaflets and holding symposiums at a labor union at the JAEA's predecessor Power Reactor and Nuclear Fuel Development Corp. (PNC) because **they were worried about nuclear-related health hazards and safety management systems at nuclear facilities, among other factors.** Responding to their activities, the then PNC labeled the four employees as those who "lack good sense," and gave them discriminatory treatment in wages and over personnel affairs, their complaint says.

According to the plaintiffs, the then PNC checked its staff's thoughts and beliefs over nuclear development and worked out a so-called "**hostility judgment chart**" that divided its staff into four ranks. Between fiscal 1980 and 1982, 32 employees were classified into the "A" rank, which represented employees that criticized the nuclear body most severely. The four plaintiffs were put in the "A" rank.

The plaintiffs emphasized, **"Because nuclear technologies are difficult to come by, there can't be good technological developments unless free speech is guaranteed on the job."**

The JAEA responded, "Because we have not received their complaint as of this moment and we cannot confirm its content, we would like to decline to comment."

Hokuriky Electric doesn't agree with experts' report

July 17, 2015

Hokuriku Electric doubts experts' assessment

http://www3.nhk.or.jp/nhkworld/english/news/20150717_36.html

Jul. 17, 2015 - Updated 13:04 UTC+2

The president of Hokuriku Electric Power Company has expressed doubt about an expert panel's draft report that could lead to decommissioning of one of the firm's nuclear reactors in central Japan.

Yutaka Kanai said on Friday that he believes his company conducted detailed surveys and proved that a fault under the No.1 reactor of the Shika plant is not active.

But he said it's disappointing that experts of the Nuclear Regulation Authority have not agreed.

Kanai said he thinks the experts did not comprehensively consider the firm's survey results, and made their conclusion based on hypothetical calculations and assumptions.

He said his company will consider presenting more data and give a thorough explanation to the NRA.

Executive Vice President Akizumi Nishino said the firm does not agree with the report and is not considering decommissioning the reactor.

The report says there's no clear evidence that the fault is active. But it says strata above its northwestern part may have moved during or after a period between 120,000 and 130,000 years ago.

No legal restrictions to this kind of contract

July 21, 2015

TEPCO gave 50 contracts to company tied to Kariwa mayor

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201507210034

By SATOSHI OTANI/ Staff Writer

KARIWA, Niigata Prefecture--The father of pro-nuclear Kariwa Mayor Hiroo Shinada is a director of a company that received contracts worth millions of yen for work at the Kashiwazaki-Kariwa nuclear plant operated by Tokyo Electric Power Co.

In addition, a gasoline stand run by Shinada's wife is frequented by TEPCO employees as well as workers at nuclear plant-related companies.

Shinada, 58, said there was nothing inappropriate about the business transactions.

"In this community, there is no one who has zero ties to the nuclear plant, but I have always clearly separated family business with my work as mayor," Shinada said. "I never asked the plant to provide work for the companies (with ties to my father and wife)."

Indeed, with a population of about 4,800, Kariwa as a whole depends on the nuclear power plant for much of its economic benefits. And there are no legal restrictions concerning contracts for nuclear plant work given to companies with ties to local mayors.

However, as mayor, Shinada also has the responsibility as representative of the village to make decisions on the safety of the Kashiwazaki-Kariwa power plant.

In the three years since October 2011, after the disaster unfolded at TEPCO's Fukushima No. 1 nuclear power plant, the company where Shinada's 84-year-old father serves as a director received at least 50 contracts worth about 50 million yen (\$402,000) for equipment inspection work at the Kashiwazaki-Kariwa plant, according to documents submitted to the Niigata prefectural government.

The company was a subcontractor for most of those contracts, but it did receive a few direct orders from TEPCO.

Shinada has called for a restart of reactors at the Kashiwazaki-Kariwa plant despite doubts continually raised by Niigata Governor Hirohiko Izumida about whether TEPCO has done everything possible to prevent a recurrence of the Fukushima nuclear accident.

"Having the nuclear plant in operation is the normal situation for this community," Shinada said. "It is the hope of the entire region for an early resumption of operations, and I believe there is a need for nuclear energy in Japan when thinking about the current supply of energy."

The company where his father is a director was established in 1980, soon after construction work began at the Kashiwazaki-Kariwa plant. It initially handled meal catering services within the plant but began work on the plant site in 1989.

Shinada's father said he has served as director since the company was established and also owns company stock.

Kaichi Mitomi, 77, the Niigata prefectural assembly member elected from the district covering Kariwa, has been the company's auditor since the beginning.

"While we would like to refrain from commenting on specific contracts, in general, contracts are based on fair procedures that do not favor any particular company," a TEPCO official said.

The gasoline stand operated by Shinada's wife is located about 2 kilometers from the main gate of the Kashiwazaki-Kariwa plant. Shinada said the stand sells gasoline to those at the plant and fuel oil used for lighting purposes within the TEPCO-operated plant.

Shinada was an executive of the company operating the stand until he became mayor. He has since turned over management to his wife.

Shinada was first elected mayor in December 2000 after serving three terms in the village assembly. He is now in his fourth term as mayor.

There have been other instances in Japan of companies with ties to local mayors winning contracts for construction work at nuclear power plants located within the community. But **there are no legal provisions prohibiting companies with ties to the mayors from winning such orders because those contracts are given by private-sector electric power companies.**

TEPCO's customer info system not ready

July 29, 2015

Delay in TEPCO's development of customer info system could affect electricity deregulation

<http://mainichi.jp/english/english/newsselect/news/20150729p2a00m0na006000c.html>

A delay in the development by Tokyo Electric Power Co. (TEPCO) of a system to provide customer information, which is necessary when customers switch power companies, **could adversely affect the liberalization of retail electric power in April 2016**, it has been learned.

TEPCO Executive Vice President Hiroshi Yamaguchi told the Economy, Trade and Industry Ministry at a July 28 meeting of a panel of experts deliberating challenges to electric power system reform that the company has lagged behind other utilities in the development of such a system.

Yamaguchi attributed the delay to a far larger number of customers in its service area than other power companies, and expressed concern that TEPCO may not be able to provide sufficient functions necessary for liberalization of electricity market by next April.

After the electricity deregulation, consumers can freely choose electric power companies from which they buy electricity.

In cases where customers in TEPCO's service area, including Tokyo, choose to buy power from another utility, TEPCO will be required to provide customer information such as their power equipment and past electricity consumption, to the other firm.

According to Yamaguchi's report to the ministry, TEPCO has 28 million individual and corporate customers in its service area, and assumes that up to 10 million of them will switch to other power suppliers.

TEPCO's development of relevant systems, including one to provide customer information to other utilities, is being delayed due to such a large number of customers and the need to renew in-house software and other systems when the company is to be split into a few entities simultaneously in April, according to Yamaguchi's explanation to the ministry panel.

TEPCO says that it will be able to conclude in late December this year whether the new systems can be put into operation in April 2016 as originally scheduled, while most of the other utilities expect that their new systems will be operational according to schedule.

2 years without any nukes - And now what?

July 30, 2015

EDITORIAL: Reflections on 2 years without nuclear power ahead of planned restarts

<http://ajw.asahi.com/article/views/editorial/AJ201507300035>

Japan has survived without atomic energy for almost two years since all of the country's nuclear power reactors were taken offline in the aftermath of the Fukushima nuclear accident triggered by the March 2011 earthquake and tsunami disaster.

The country rode out summers and winters, despite surges in electricity demand for air-conditioning and heating purposes, with no major blackouts.

The triple meltdown at the Fukushima No. 1 nuclear power plant, which threatened the very survival of the Japanese state, has yet to be brought under control.

Opinion polls show that more than half of the general public is opposed to restarting nuclear reactors. The public's desire to keep the reactors offline, even at the cost of inconvenience, is due to the fact that people have learned how dreadful atomic energy can be.

However, the Abe administration is seeking a return to nuclear power. It is preparing to restart Kyushu Electric Power Co.'s Sendai nuclear power plant in Kagoshima Prefecture in August, and aims eventually to have atomic energy account for 20 percent or more of Japan's electricity mix in the future.

We oppose any return to nuclear power that comes without serious debate. Japan should make utmost efforts to avoid restarts, while at the same time taking care that doing so will not place an onerous burden on people's living standards. Our energy needs should be centered on renewable energy sources rather than nuclear power as the primary source of electricity.

POWER DEMAND ALREADY COVERED

The Asahi Shimbun published a series of editorials in 2011 calling for a society free of nuclear power.

We stated that all of Japan's nuclear reactors should be decommissioned, hopefully in 20 to 30 years, with priority given to aged reactors and high-risk reactors. The reactors to be kept alive should be selected on a "safety first" basis and limited to those necessary from the viewpoint of supply and demand.

We also stated that Japan should do its best to develop and spread the use of renewable energy sources while simultaneously pursuing measures for power saving and energy conservation. Thermal power generation could be strengthened as a stopgap measure, although steps should be sought in the long term so that a departure from nuclear energy does not contribute to global warming.

We also said Japan should push forward with power industry reform to encourage new entrants into the market while moving toward a decentralized energy society where wisdom and consumer choice play a greater role.

Our basic ideas remain the same. But the situation has changed over the last four years.

The most dramatic development is that the amount of electricity generated by nuclear reactors is now zero.

Nuclear reactors were up and running across Japan four years ago. They were subsequently taken offline one after another for regular inspections. Kansai Electric Power Co.'s Oi nuclear power plant in Fukui Prefecture was reactivated temporarily, but no single nuclear reactor has been brought back online since September 2013.

Despite concerns that were raised, no serious power shortages occurred. Emergency power sources were raked up to stave off a crisis on some occasions, but there has always been sufficient supply to cover demand, partly because the practice of saving power has taken root in the public mind, and partly also

because capacities were enhanced at thermal power plants and regional utilities cooperated in supplying power to each other.

But it is too early to say that we have a solid foundation for keeping the number of active nuclear reactors at zero.

The clustered siting of power plants, whereby electricity is sent from large-scale power stations to faraway areas with heavy power consumption areas, has remained unchanged after the nuclear disaster. Systemic vulnerability is still an issue. And there is always the danger of unforeseen circumstances unfolding if a key thermal power plant were to malfunction during peak power demand.

SYSTEMIC VULNERABILITY PERSISTS

The current situation, where thermal power accounts for 90 percent of Japan's electricity, could hardly be called sustainable. As long as Japan relies on imports for its energy sources, the country will remain permanently exposed to the risk of variations in foreign exchange rates and prices.

We are also left to reflect on the extent to which the general public and the Japanese economy could tolerate additional increases in electricity rates. We have to avoid letting rate hikes, without detailed studies, have a serious impact on people's living standards and general economic activity.

The risk of a serious impact on people's lives has yet to be reduced to zero. Given the situation, it is difficult to totally rule out the option of restarting nuclear reactors as a last resort.

However, decisions on restarting individual nuclear reactors must be made with extreme care.

What kind of disadvantage could be averted by activating a particular nuclear reactor? Will a nuclear restart still be necessary after power demand has been covered by a mutual supply of electricity over broad areas? Persuasive explanations should be available from viewpoints such as these.

The nuclear reactor in question must be safe enough from the viewpoint of its geographical location.

Means must also be available to allow residents of adjacent areas to evacuate in an emergency. These are obvious preconditions for a nuclear restart.

The fact that we have got along without nuclear power has correspondingly heightened the hurdles for a restart.

Japan, under these circumstances, must develop renewable energy sources as quickly as possible and pursue a shift to a distributed system of electric power. Indispensable to that end are policy initiatives for guiding a switch to the new direction.

The central government should set a pathway for reform and focus its resources on upgrades on the power grid, disposal of nuclear waste and other efforts. There should also be organizational arrangement for pursuing the decommissioning of nuclear reactors, assistance to local governments that will lose revenue from the nuclear plants they host, and transitional measures for business operators associated with nuclear power generation.

FUKUSHIMA DISASTER THE STARTING POINT

The Abe administration, however, is heading in the opposite direction.

It initially said it would reduce Japan's dependence on nuclear energy as much as possible, but then changed course to maintaining nuclear plants, and left it all up to the Nuclear Regulation Authority to make all decisions on the safety of nuclear reactors ahead of any go-aheads for restarts.

The NRA is tasked only with screening procedures to ensure the safe operation of nuclear power plants. It is not in any way responsible for the entire policy.

The administration told local governments hosting nuclear plants that the central government will be responsible, but what precisely this entails remains to be seen. A mountain of unanswered questions remain about the Sendai nuclear plant, such as measures to ensure the safety of local residents and measures against potential volcanic eruptions.

The Fukushima nuclear disaster should be the starting point for reflecting on the issue of nuclear power generation.

We should think about ways to make the most of the fact that no nuclear reactor is active now.

TEPCO's profits

July 29, 2015

Tepco's quarterly profit triples as fuel prices plunge

<http://www.japantimes.co.jp/news/2015/07/29/business/corporate-business/tepcos-quarterly-profit-triples-as-fuel-prices-plunge/#.VboT2Pnwmos>

Bloomberg

Tokyo Electric Power Co., operator of the wrecked Fukushima No. 1 nuclear plant, said its first-quarter operating profit tripled as a drop in fuel prices helped cut costs.

Tepco, as Japan's biggest utility is known, posted an operating profit of ¥228.3 billion (\$1.85 billion) for the three months ending June 30, compared with ¥70.7 billion a year ago, the company said in a statement Wednesday.

The company benefited from a more than 45 percent plunge in liquefied natural gas prices after crude oil fell to a record low. More than a third of Tepco's power generation capacity comes from LNG, compared with 14 percent from oil and 8 percent from coal.

Factoring in the impact of a weaker yen, the plunge in oil prices alone boosted current profit by ¥276 billion, Tepco said.

"With the drop in the price of crude and a minimization of costs, the operating profit is in the black for the second year in a row," the company said in the statement.

Tepco spent 35 percent less on LNG purchases in the first quarter, while consumption of the fuel fell by 5 percent. The company's spending on crude oil rose by 7.5 percent, while its use was up 25 percent, the company said.

The utility's purchases of coal rose 4.9 percent to 1.75 million metric tons, resulting in a 3.9 percent increase in spending on the fuel.

Indonesia was Tepco's largest crude supplier last year, while Australia was the top coal provider.

Total sales dipped 1.1 percent to ¥1.55 trillion as the company generated 6 percent less capacity in the quarter.

Japan's power consumption dropped 1.8 percent in the quarter from a year earlier, the fifth straight quarterly decline, to 189 terawatt hours, according to industry figures. That's the lowest quarterly use since 2000.

With Tepco struggling to win approval to restart its nuclear reactors, the drop in fuel costs provides relief.

In June, the price of LNG imported into Japan dropped to \$7.60 per million British thermal units, the lowest level in two years. Power utilities with a high ratio of LNG will see an increase in profits, Syusaku Nishikawa, an analyst at Daiwa Securities Co., said by e-mail.

Tepco's first-quarter net income was ¥203.3 billion, compared with a net loss of ¥173 billion a year ago. The company's net income is influenced by costs related to the payout to those affected by the Fukushima nuclear accident more than four years ago.

Govt. agrees increase in compensation

July 29, 2015

Fukushima compensation increased to ¥7 trillion

http://www.japantimes.co.jp/news/2015/07/29/national/fukushima-compensation-increased-%C2%A57-trillion/#.VbiN9_nwmou

Reuters

The government has approved an increase in compensation payments for the Fukushima nuclear crisis to ¥7.07 trillion as tens of thousands of evacuees remain in temporary housing more than four years after the disaster.

Tokyo Electric Power Co. will receive ¥950 billion more in public funds on top of the ¥6.125 trillion agreed earlier, the utility and the government said Tuesday.

The increase, which was agreed following a request by Tepco, adds to the taxpayers' bill for the disaster.

Tepco has faced a stream of legal cases seeking compensation over the triple meltdown at its Fukushima No. 1 nuclear plant.

Electricity bills for households have also risen 25 percent since the catastrophe as the country resorted to importing more fossil fuels with the gradual shutdown of all reactors for safety checks and upgrades.

Prime Minister Shinzo Abe's government and Tepco, which was bailed out by taxpayers in 2012, are undertaking an unprecedented decontamination project to lower radiation levels in towns closest to the plant, although some areas will likely remain off-limits for decades.

Inside the plant, Tepco has struggled to bring the situation under control and it is estimated removing the melted fuel from the wrecked reactors and cleaning up the site will cost trillions of yen and take decades to complete.

The government plans to revoke evacuation orders for most people forced from their homes by the disaster within two years as part of a plan to cap compensation payouts and speed up reconstruction.

TEPCO included in JPX-Nikkei Index 400?

July 31, 2015

Fukushima-tainted Tepco to join JPX-Nikkei Index 400 'shame gauge'

<http://www.japantimes.co.jp/news/2015/07/31/business/financial-markets/fukushima-tainted-tepco-join-jpx-nikkei-index-400-shame-gauge/#.VbsmGfnwmos>

Bloomberg

A stock index showcasing Japan's best companies is about to include one of its most controversial: the utility behind the worst nuclear disaster since Chernobyl.

The JPX-Nikkei Index 400 picks firms with the best operating income, return on equity and market value to shame executives of those it excludes into boosting profit and shareholder returns.

Tokyo Electric Power Co. will be added when the gauge changes its constituents next month, according to Nomura Holdings Inc., Daiwa Securities Group Inc. and Mizuho Financial Group Inc. Surges in earnings and share price sent the operator of the crippled Fukushima No. 1 power plant into contention for a place. Inclusion in the government-inspired shame index means the world's largest pension fund, which is estimated to own more than half the assets tracking the measure, would buy more of a company's shares. Adding Tepco raises questions about the quality of a gauge devised as a badge of honor for the 400 stocks chosen each year.

"There's much debate on whether Tepco is suitable for an index of good companies, but if you abide by the rules, you can't exclude it," said Keiichi Ito, chief quants analyst at SMBC Nikko Securities Inc. in Tokyo.

"Many investors don't own the stock, so the effect on the share price could be big."

JPX-Nikkei 400 constituents are picked based on three-year average return on equity, which measures how efficiently capital is used, and cumulative operating profit, each accounting for 40 percent of the selection criteria. Market value makes up the remaining 20 percent. About 10 firms can also be replaced based on corporate-governance standards, such as providing English-language results and appointing at least two independent outside directors.

Tepco jumped from 973rd last year to 280th under the selection criteria, according to analysis by Mizuho. The utility's market value rose to ¥1.1 trillion (\$8.62 billion) as of the June 30 calculation date, about 60 percent higher than a year before, as shares jumped on optimism Japan will restart its nuclear plants. Three-year average return on equity is about 12 percent, compared with minus 29 percent a year earlier. Cumulative operating income over the three years also turned positive, buoyed by two years of profit. Core meltdowns at three reactors in Tepco's Fukushima No. 1 station in March 2011 forced the evacuation of about 160,000 people and rendered some areas uninhabitable for decades. The company has faced radiation leaks at the Fukushima site, questions over the hiring and treatment of workers there, and has been accused of having a lax safety culture that allowed "man-made" failures to occur before and after the 2011 earthquake and tsunami.

"People wouldn't expect a company like Tepco to be in an index that's supposed to represent dynamic Japan," said Jonathan Allum, a strategist at SMBC Nikko Capital Markets Ltd. in London. "The index isn't quite what it's cracked up to be."

This is the second reassessment of the shame gauge's constituents since the index started last year. In the first, Panasonic Corp. was among 31 companies added, while fellow consumer-electronics manufacturer Sony Corp. was dumped.

This year, Toshiba Corp. may be removed after its \$1.2 billion accounting scandal. The company must correct earnings stretching back six years after an internal probe revealed managers overstated profits under pressure from executives.

"Toshiba's financial data are wrong, so they're not even at the starting line" for selection, Japan Exchange Group Inc. Chief Executive Officer Akira Kiyota told reporters on Tuesday in Tokyo, suggesting the bourse won't be lenient on the 140-year-old manufacturer.

Lixil Group Corp. may meet the same fate, according to Hayato Nagayoshi, chief quantitative analyst at Mizuho Securities Co. The housing-materials maker's position is in doubt after it reported accounting

irregularities at its German unit. McDonald's Holdings Co. (Japan) will probably also be dumped, say brokerages including Bank of America Corp.'s Merrill Lynch unit and Daiwa Securities Group Inc., after food scandals prompted restaurant closures and led to losses.

Toshiba must go, and Tepco shouldn't even be considered given its troubles, according to Ayako Sera, a Tokyo-based strategist at Sumitomo Mitsui Trust Holdings Inc.

“Investors will lose faith in the JPX-Nikkei 400” if Tepco gets in, Sera said. “They need to exercise discretion beyond quantitative criteria if they want to protect the integrity of the index.”

Three ex-TEPCO bosses indicted?

July 31, 2015

Ex-TEPCO execs to face mandatory indictment given panel decision

<http://mainichi.jp/english/english/newsselect/news/20150731p2g00m0dm078000c.html>

TOKYO (Kyodo) -- An independent judicial panel of citizens said Friday it has decided that three former executives of Tokyo Electric Power Co. merit indictment over the 2011 nuclear disaster at the Fukushima Daiichi power plant, setting the stage for them to face mandatory prosecution.

Given the decision by the Committee for the Inquest of Prosecution, the Tokyo District Court will pick lawyers to serve as prosecutors and the three, including Tsunehisa Katsumata, 75, chairman of TEPCO at the time of the disaster, will be indicted on charge of professional negligence resulting in death and injury. The other two are former vice presidents, Sakae Muto, 65, and Ichiro Takekuro, 69.

Kyodo

An independent judicial panel of citizens said Friday it has decided that three former executives of Tokyo Electric Power Co. merit indictment over the 2011 nuclear disaster at the Fukushima Daiichi power plant, setting the stage for them to face mandatory prosecution.[...]

Residents happy with panel's decision

July 31, 2015

Residents hail indictment decision

http://www3.nhk.or.jp/nhkworld/english/news/20150731_80.html

Jul. 31, 2015 - Updated 09:36 UTC+2

The leader of the residents, Ruiko Muto, has praised the panel's decision.

Muto said she believes a court will determine who was responsible for the 2011 Fukushima nuclear disaster and give a fair judgment.

She said that 110,000 people are still unable to return to their homes. She added that **having the former executives face a criminal trial will help prevent a recurrence and create a society in which people can live in peace.**

The residents' lawyer, Hiroyuki Kawai, also said that if the former officials had escaped indictment, the real cause of the accident would have been covered up forever.

He expressed hope that the trial will find out more about what caused the nuclear accident.

TEPCO declined to comment on the decision or the criminal complaint that led to it.

But it said in a statement that it wants to renew its heartfelt apology to the people of Fukushima and many others for causing trouble and concern.

The firm said it will do its utmost for compensation, plant decommissioning and decontamination, based on the principle of seeking reconstruction of Fukushima. It added that it is fully resolved to improving the safety of nuclear power plants.

Three ex-TEPCO bosses indicted

July 31, 2015

3 former TEPCO executives face criminal trial over Fukushima crisis

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201507310053>

THE ASAHI SHIMBUN

Three former executives of Tokyo Electric Power Co. will stand trial over the 2011 Fukushima nuclear disaster after an independent judicial panel of citizens on July 31 again decided that mandatory indictments are warranted.

It will be the first time for TEPCO or government officials to stand formally accused of professional negligence resulting in death and injury in the nuclear crisis that was triggered by the Great East Japan Earthquake and tsunami in March 2011.

The Tokyo No. 5 Committee for the Inquest of Prosecution for the second time rejected prosecutors' decision not to indict the three--former TEPCO Chairman Tsunehisa Katsumata and two former vice presidents, Sakae Muto and Ichiro Takekuro.

Based on the committee's decision, three court-appointed lawyers will indict the three and serve as prosecutors in the trial.

After the crisis unfolded at TEPCO's Fukushima No. 1 nuclear power plant, residents and citizens groups filed criminal complaints with prosecutors against senior TEPCO and government officials.

They argued that the three TEPCO executives failed to fulfill their responsibility to implement necessary safety measures at the plant before the disaster, leading to the deaths of hospital patients during the evacuation and other tragedies.

In September 2013, the Tokyo District Public Prosecutors Office decided not to indict the three former TEPCO executives.

The inquest committee handed down its first decision in July 2014, calling for indictments, but the prosecutors office again said there was not enough evidence to charge the three.

That led to the committee's second examination of the case.

A decision for mandatory indictment requires approval from at least eight members of the 11-member committee.

A chance to "take a fresh look" at 3/11

August 1, 2015

EDITORIAL: Trials of ex-TEPCO bigwigs a chance to take fresh look at disaster

<http://ajw.asahi.com/article/views/editorial/AJ201508010028>

Three former executives of Tokyo Electric Power Co. will stand trial over their criminal responsibility for the 2011 disaster at TEPCO's Fukushima No. 1 nuclear power plant.

For the second time, the Tokyo No. 5 Committee for the Inquest of Prosecution has rejected an earlier decision by prosecutors not to indict the three, setting the stage for the forced prosecution of these three individuals.

They will be accused of professional negligence resulting in the deaths of people who were in hospitals when the disaster happened and other tragedies.

A report issued by the Diet's Fukushima nuclear accident investigation committee states, "It is clear that the accident was a man-made disaster."

But **no government officials or TEPCO employees have been punished, either politically or administratively. In other words, no one has been held accountable for the nation's worst nuclear accident.**

Many Japanese citizens still feel that justice has not been meted out with regard to that harrowing disaster. **Many are also concerned that a similar accident may occur again if nobody is held responsible for what happened in 2011.**

A second decision by the independent judicial panel of citizens to demand the criminal prosecution of the three former TEPCO executives should be viewed as indicative of the disturbing and disquieting feelings among many citizens.

The system of **forced indictment through the judgment of citizens** was introduced in 2009, along with the “saiban-in” citizen judge system. Until that time, public prosecutors monopolized the power to decide whether to indict a suspect. The new system is intended to ensure that public opinion is reflected in the process of criminal prosecution, at least to a certain degree.

In reversing public prosecutors’ decision not to indict the suspects on grounds that there is no compelling case for holding them liable for negligence, the panel of citizens made a grave decision to force trials of the three individuals.

The court should, of course, consider carefully and fairly whether the former TEPCO executives should be held liable for the misfortunes of disaster victims from the viewpoint of evidence submitted.

At the same time, one question that needs to be asked is how TEPCO implemented measures to protect the nuclear plant from a possible tsunami and ensure the plant’s safety.

Collectively, the trials will offer a great opportunity to take a fresh look into the accident from a perspective that is different from those of the investigation committees set up by the government and the Diet.

There have not been many opportunities for people to talk about the disaster in public. But the three former TEPCO executives will probably be given opportunities to speak in the courtroom. The court can also order submission of specific pieces of evidence.

Future public debate on issues concerning nuclear power generation will benefit greatly if the trials uncover unknown facts in the process, such as chronological changes in the utility’s decisions concerning safety measures for its nuclear power plants and the ways the government and other public organizations influenced the company’s policy.

The nation’s judiciary has a long history of handing down rulings related to nuclear power generation. But in most of the past cases concerning the construction and operations of nuclear power plants, the courts ruled against opposing local residents.

The question is whether all these court rulings in favor of nuclear power were influenced in any way by the perception that there is no way to stop the expansion of electricity production with atomic energy based on the government’s energy policy.

The judiciary’s attitude to nuclear power generation has also been called into question by the accident. In considering the criminal liabilities related to the Fukushima nuclear disaster, which has caused an unprecedented scale of damage, are the traditional criteria, like “specific predictability,” sufficiently effective?

The trials should prompt the judicial community to have more in-depth debate on this question.

We strongly hope the trials will be conducted in a way that lives up to people’s confidence in the judicial system.

TEPCOs indictment makes sense for citizens

August 1, 2015

TEPCO execs' mandatory prosecution reflects the sense among regular citizens

<http://mainichi.jp/english/english/perspectives/news/20150801p2a00m0na008000c.html>

A judicial review board's July 31 announcement that three former Tokyo Electric Power Co. (TEPCO) executives should be indicted over the 2011 Fukushima nuclear plant meltdowns reflects existing "sense among ordinary people," and emphasizes the weight of responsibilities that have been placed on the senior officials of the plant operator.

The Tokyo No. 5 Committee for the Inquest of Prosecution dismissed the Tokyo District Public Prosecutors Office's decision to drop cases against TEPCO's former chairman Tsunehisa Katsumata, 75, and two former vice presidents, Ichiro Takekuro, 69, and Sakae Muto, 65 -- claiming that such a decision neglected the significance of the disaster and was based on a false understanding.

Since the committee is made up of 11 citizens, however, its judgment differs from regular prosecution standards. As such, court-appointed attorneys serving as prosecutors are believed to face difficulties in making a good case -- and lengthy trials are expected.

"The committee's report clearly says that the TEPCO executives could have predicted (the disaster)," commented an attorney from a group of lawyers that filed for a review to the committee on behalf of disaster victims. "We have a bright outlook for the trials."

Perhaps the biggest game-changing factor for the public prosecutors' earlier decision not to indict the three former executives was the committee's conclusion that the responsible parties for a nuclear power plant should take into consideration the possibility of a disaster exceeding all expectations, insofar as a nuclear plant accident would result in irreversible effects.

The report emphasized that the TEPCO executives were responsible for preparing for a possible nuclear disaster at the Fukushima plant even though the chance of such an accident was very small -- thereby imposing much greater due diligence on the former utility executives than had the public prosecutors. The fact that the committee referred to a shutdown of the plant to ensure safety was also a notable point. In order to hold someone criminally liable in cases of negligence, prosecutors must prove that the defendant could predict an accident and avoid its consequences. In the TEPCO case, **the utility's 2008 calculation based on projection by a government earthquake research body -- wherein the highest tsunami waves hitting south of the Fukushima plant were estimated to be 15.7 meters -- drew significant attention.** The focal point in the case was whether the utility executives acknowledged this estimate and were able to predict the massive tsunami.

The Tokyo District Public Prosecutors Office had concluded that prior to the disaster, the officials could not have recognized the tsunami risk whereby the plant's main equipment would become submerged in water. The office claimed that the scale of the 2011 earthquake and tsunami had exceeded the projection by the government research body, and that the projection itself had low credibility.

In response to the public prosecutors' argument, the committee cited the 1986 Chernobyl disaster -- pointing out that a nuclear plant accident could discharge a huge amount of radioactive materials that would in turn affect the preservation of humanity. It went on to say **that parties involved in the operation of nuclear power plants "absolutely cannot ignore" estimates for the highest tsunami, and concluded specifically that the three executives could have predicted the disaster.**

Regarding the avoidance of consequences, the committee argued that the executives should have taken every measure possible -- including the suspension of plant operation -- at least during a

period when the utility was working on establishing appropriate tsunami prevention measures. "If the operation had been suspended, the disaster could have been avoided," the report said.

The committee slammed the conclusion wherein the public prosecutors had said that the nuclear accident was unpredictable, and that it could not have been avoided even with waterproof buildings or moving the plant up on higher ground. This was deemed as having "no persuasiveness," and it was concluded that the decision had been "based on a false understanding."

Meanwhile, the executives are facing a class-action suit filed by a group of TEPCO shareholders with the Tokyo District Court, in which the investors are demanding a total of some 5.5 trillion yen from the three, as well as from 24 other former and current TEPCO executives. The 15.7-meter tsunami estimate has also become the point of contention in this lawsuit, with the defendant claiming that the figure was scientifically groundless.

In the criminal trial, which will start as the three executives are facing mandatory prosecution, **the largest points of contention will likely be the scientific credibility of the estimate for tsunami -- as well as how such information was passed to the defendants.** Since court-appointed attorneys serving as prosecutors are allowed to conduct supplementary investigations for mandatory prosecution, they will likely consider interviewing earthquake and tsunami experts, as well as TEPCO employees who were involved in the calculation process.

A number of witnesses are expected to be summoned if the defendants plead not guilty, however, resulting in a prolonged trial.

August 1, 2015

Editorial: Decision to indict ex-TEPCO executives in court over nuclear accident is meaningful

<http://mainichi.jp/english/english/perspectives/news/20150801p2a00m0na009000c.html>

A prosecution inquest panel concluded that the responsibility of former Tokyo Electric Power Co. (TEPCO) executives who failed to take measures to prevent a nuclear accident at its tsunami-hit Fukushima nuclear plant should be clarified through a criminal trial.

The Tokyo No. 5 Committee for the Inquest of Prosecution recommended that former TEPCO Chairman Tsunehisa Katsumata and two former vice presidents, Sakae Muto and Ichiro Takekuro, be prosecuted on charges of professional negligence resulting in death and injury. This was the second recommendation by the prosecution inquest panel, whose eleven members were selected from among members of the general public.

In 2008, three years before the disaster, TEPCO released its estimate that the atomic power plant could be hit by a tsunami up to 15.7 meters in height. The inquest panel determined that the three former executives failed to take necessary measures, and neglected their duty to prevent a serious accident, even though they knew of this possibility.

The panel's decision stated repeatedly that if a nuclear accident were to occur, it could be a serious disaster -- a position that is completely understandable.

The decision says that **in operating nuclear plants, top priority should be placed on safety measures rather than reducing expenses.** Citing nuclear plant accidents overseas, the decision emphasizes that TEPCO should have taken sufficient measures to protect the power station from tsunami, even though such disasters are extremely rare.

Even so, the point of contention in proving that the three committed professional negligence is whether or not they could have predicted and prevented the disaster. The panel's decision takes seriously the responsibility of the three as the top-ranking executives of the utility that operates the Fukushima plant. The decision recognizes that **the executives had been informed regarding the company's forecast that a higher tsunami than previously estimated could possibly hit the power station -- and concludes that they could have implemented countermeasures as a result.**

Prosecutors who had decided not to indict the three had deemed that they could not have specifically predicted the risks of tsunami hitting the plant because of the forecast's lack of reliability. However, the inquest panel dismissed this conclusion as unconvincing.

A court will judge whether the three have criminal responsibility for the nuclear disaster. However, it is of great significance that those representing citizens have concluded twice that the three should be brought to justice.

Several years have passed since the executive and legislative branches' investigative committees on the nuclear crisis were disbanded. Only part of TEPCO insiders' testimonies on the accident has been disclosed.

As such, many people who have been affected by the nuclear crisis are wondering why the accident was not prevented.

Even though the trial of the three former TEPCO executives is not aimed at clarifying the cause of the accident, it is hoped that testimonies provided by the three, as well as from witnesses, will help answer the many questions from disaster victims. During the hearings, moreover, the executives should sincerely describe the roles that they played in managing the utility.

The prosecution inquest panel's decision was in response to a criminal complaint filed by long-term Fukushima evacuees, including one who died during hospitalization. Many victims will pay close attention to the court proceedings, and the responsibility of court-appointed lawyers -- who will act as prosecutors during the trial -- is extremely heavy. Prosecutors should fully cooperate with the lawyers during the trial proceedings.

TEPCO's indictment: A sense of justice

August 1, 2015

Indictment of TEPCO trio encourages Fukushima nuclear accident victims

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201508010032>

THE ASAHI SHIMBUN

Finally, there is a sense of justice in the air over who should take responsibility for the 2011 Fukushima nuclear disaster.

A July 31 decision by a citizens' panel to indict three former executives of plant operator Tokyo Electric Power Co. has given renewed hope to victims that they will get the answers they have been looking for. The decision to indict marked the second time an independent judicial panel of citizens has overturned earlier decisions by prosecutors not to indict.

For the first time, a criminal trial will be held to determine the responsibility of TEPCO executives for the disaster.

Ruiko Muto, 61, who heads a group pursuing the criminal responsibility of TEPCO and government officials, was overcome with emotion when she learned of the decision.

"Even today, 110,000 residents (in Fukushima Prefecture) cannot return to their homes," Muto said.

"Unless the truth is revealed, the victims will not feel rewarded for all the trouble they have been through."

With regard to the three former executives who were indicted, Muto said, "I hope they will reveal the entire truth in the courtroom as to why that accident happened."

Hiroyuki Kawai, who heads the team of lawyers working with Muto's group, said: "If this had ended with a decision not to indict, the real truth about the accident would have been forever buried in darkness. There is a major significance in the decision to indict based on the sense of justice held by ordinary citizens."

In its decision, the citizens' panel noted that in the years before the accident TEPCO's bottom line was worsening.

"There was concern that if measures were taken on work to deal with (a potential) tsunami at the Fukushima No. 1 nuclear plant, the financial situation would be further hurt," the panel said.

Yuichi Kaido, another lawyer, said the latest decision took greater account of TEPCO's financial background.

"The contents were much deeper than the decision made by the first citizens' panel (in July 2014)," he said.

Many of those still trying to cope with the aftermath of the Fukushima accident were unsure whether they would see any immediate improvement in their day-to-day lives.

Reiko Hachisuka, 63, who lives in temporary housing in Aizu-Wakamatsu, Fukushima Prefecture, welcomed the decision to indict. She said many people will never be satisfied until responsibility for the accident is made clear.

An evacuee from Okuma, Hachisuka joined the Diet's Fukushima Nuclear Accident Independent Investigation Commission as a representative of disaster victims.

"Even if a few people are tried in court, that will not lead to an end to our lives as evacuees," she said.

Of the 110,000 Fukushima residents who fled their homes, about 45,000 currently live outside the prefecture.

"I hope everyone realizes there is no direct relationship between the court case and the rebuilding of Fukushima," Hachisuka said. "Nothing will be resolved by making a judgment about someone's responsibility. The problem is much deeper."

Yuichi Manome, 52, an official with the Iwaki city fishing cooperative, said, "Damage continues to be inflicted on Fukushima even today. I hope a clear decision is made in the court."

The Iwaki fishing cooperative resumed the harvesting of sea urchins on July 30 on an experimental basis.

Manome suggested that **the failure to clarify the responsibility of TEPCO executives helped fuel moves to resume operations at other nuclear plants.**

"Despite the magnitude of the accident, no one has been asked to take responsibility," Manome said. "That leads to the thinking that perhaps the accident never happened in the first place."

The Tokyo District Public Prosecutors Office and TEPCO issued statements saying there would be no direct comment on the decision made by the citizens' panel.

The New York Times Gloss on Hiroshima and Nagasaki

Posted: 04 Aug 2015 11:44 PM PDT

Reviewing the review: Nagasaki: Life After Nuclear War, by Susan Southard reviewed by Ian Buruma in The New York Times, **July 28, 2015**

August 6th and 9th, 2015. Seventy years since the atomic bombs were dropped on Japan. The obvious things to say are being said elsewhere, so what follows is an analysis of some American coverage of the dreadful anniversary that has appeared so far.

As this anniversary rolls around each year, the question on everyone's mind, the aging elephant in the room, is whether an American president will ever visit the bombed cities and admit that, yes, maybe, possibly, WWII could have ended sometime around August 1945 without the atom bomb. And maybe the global existential dread of the following years could have been avoided if America hadn't scared Stalin into thinking the USSR was the next target. [1] But we may have to wait a long, long time for any words of contrition to be uttered by an American politician. Some officials may visit and go through the usual contortions to show sympathy and express hope that it may never happen again, but it is still impossible for American leaders to describe it as a war crime, or even as a strategic blunder that wasn't necessary to end the war with Japan. [2][3]

To get an idea of the present limits on American public discourse on this topic, it's interesting to note who gets to write about it in the perpetrator's paper of record, *The New York Times*, one week before the 70th anniversary. The *Times* could have told the story of its own reporter, William L. Laurence, who was on the payroll of both the *Times* and the Manhattan Project in the 1940s. He dutifully reported on all the information he had been privy to as soon as the bombs were dropped, then he passed on to the public the military's lies about the effects of radiation from the bomb blasts in New Mexico, Hiroshima and Nagasaki. Journalists and authors who uncovered this gross breach of journalistic ethics have called for *The New*

York Times to apologize for its role as a state propaganda organ, and for Laurence's Pulitzer Prize to be revoked, but the issue has been studiously ignored by the *Times*. [4]

In the past two weeks leading up to August 6, 2015, the *Times* has run several articles about the 70th anniversary, but they have all been short on historical analysis and long on biographical sketches of survivors or scientists from the Manhattan Project. In the example discussed here, the honor of commemorating the occasion went to Ian Buruma, who in 2010 was ranked by the journal *Foreign Policy* as one of the "top 100 global thinkers." [5] He was described therein as a "classical liberal" in the political and economic sense of the term.

Included on the list were several members of the political and business establishment (Henry Kissinger, Bill Clinton, Madeleine Albright, Robert Gates, David Petraeus, Bill Gates, Sergey Brin, Larry Page, Steve Jobs, Jeff Bezos...) and intellectuals who can be generally described as those who downplay what Western civilization has done to the "developing world" yet hold up Western liberal democracy and economics as the beacon of hope for those who are yet to experience the benefits (Niall Ferguson, Ayaan Hirsi Ali, Steven Pinker, Malcolm Gladwell, Christopher Hitchens, Thomas Friedman, David Cameron...).

Conspicuously absent from the list are famous dissidents such as Noam Chomsky and Ralph Nader, as well as many others who are too far outside ideological boundaries to be included.

In the July 28th edition of *The New York Times*, Ian Buruma addressed the 70th anniversary of the atomic bombs by reviewing the non-fiction book *Nagasaki: Life After Nuclear War*. [6] He paid the obligatory respect to the victims and the peace movement, and he acknowledged the "barbarism" of the atomic bombings and the neglect of the victims during the censorship of the American occupation. The curious omission, however, was the avoidance of the one thing historians have become more certain of over the years: the bombs were not essential for bringing the war to a quick end.

More curious still is the way Buruma accuses the peace movement of being naively manipulated by both rightist and leftist politics. The atom bombs, defeat and the American occupation supplied both left and right in Japan with anti-American grievances, so Buruma asserts, without any explanation, that the peace movement was manipulated by the extreme right, as well as the left.

The problem here is that Buruma confounds two competing views of Japanese history as being one thing called "the peace movement." Most people who follow Japanese society think of the peace movement as leftist, against all forms of militarization, and very prone to denouncing Japan's wartime atrocities. In contrast, the views of conservative political parties and right-wing groups are never associated with anything one would call a peace movement. The real peace movement has in fact fought constant battles to portray Japan's wartime atrocities accurately in textbooks and museum exhibits.

Elsewhere in the review Buruma laments that monuments in Nagasaki Peace Park were donated by the likes of the Soviet Union, Poland, Cuba, the People's Republic of China and East Germany, and then he drops in the completely irrelevant sentence, "Whether the world would have been a safer place on the terms of the Soviet Union and its satellites is less clear." There is something strange about the placement of this statement here, and the implication that is attempted. First, was Nagasaki supposed to humbly accept these expressions of sympathy and shared hopes for a peaceful future, or was the city obliged to denounce the givers as insincere hypocrites? It's not as if the "peace movement" was so politicized that monuments from the USA and other Western countries would have been refused because of their ideology or past deeds. For some strange reason (it's so hard to imagine what it could be), their contributions are absent. Second, there is the inconvenient fact that the Eastern Bloc and China, for all their flaws, never used atom bombs in an act of war. That's just something that the cheerleaders of capitalism and liberal democracies have to live with. Finally, it is ridiculous to imply that the acceptance of a few peace

monuments meant that “the peace movement” was duped into supporting a world order based on “the terms of the Soviet Union.”

In a similar scaremongering slight directed at the peace movement, he added, “preaching world peace and expressing moral condemnation of nuclear bombs as an absolute evil are not a sufficient response to the dangers facing mankind.” He seems to suggest here that the citizens of Hiroshima and Nagasaki have to speak out on every other problem in the world before they should be taken seriously.

The dangers Buruma referred to were actually left unspecified, but it seems the point was made as a deflection to minimize responsibility for Hiroshima and Nagasaki. Supposedly, nuclear abolitionists are deluded if they are not fighting threats that lurk somewhere outside the influence of liberal democracies. One would normally think that the only other threat that comes close to the danger of nuclear war is ecological collapse, which is certain to come if current trends continue. But since this is a problem that has been created by the industrial revolution that rode along with classical liberalism, it goes unmentioned. It’s better to just refer vaguely to “dangers facing mankind.” By implication perhaps we are supposed to understand that this refers to the common euphemisms found in American discourse: “instability in the Middle East” or “saber-rattling” by Russia and China.

Finally, Buruma discusses Japan’s attitude toward its post-war liberal reforms. He refutes Southard’s claim that these were forced on Japan by an occupying nation, but again, the facts get in the way. Japan was an occupied nation and the new constitution was imposed in the absence of democratic representation. Most Japanese people may have liked the reforms, but it is an undeniable fact that they had no choice in the matter. Buruma wrote, “They didn’t have to be forced, for they cooperated quite willingly with the Americans who helped instigate them [the reforms].” But it depends on what you call “willing cooperation.” People tend to willingly cooperate in many circumstances where there are no alternatives. The fact remains that they were denied pride of ownership of these reforms because they had no voice in creating them.

What is more important here is that Buruma neglects the national pathology that arose from this lack of agency. It can’t be remedied as long as Japan remains saddled with its American-supplied constitution, occupied by American military installations and subordinate to American policy. The right feels the nation has been emasculated, and the left suffers from the delusion that Japan has been a pacifist country during an era in which the occupation never really ended. Japan has hosted American military bases, and colluded in, supported and profited from American wars ever since the Korean conflict in the 1950s. The left, and the new generation of protesters decrying the recent re-interpretation of Article 9 (which forgoes the use of force as a way to settle international disputes) is upset that Japan is parting from its post-war tradition of pacifism, but they seem unaware of how complicit Japan has been in American wars. In one sense, it will be a good thing if Japanese soldiers are asked to join the next one. In that case, military cooperation with America might become less popular than it is now, and politicians will finally be held accountable for aiding and abetting American strategic goals.

For someone who is considered a leading intellectual and a Japan specialist, Buruma’s discussion of Japanese history here is surprisingly facile and evasive. On the surface, the review is what passes these days as a compassionate think piece on one of the greatest atrocities of history, but on further reflection, it becomes apparent that the review actually serves up mostly backhanded compliments to the victims and the millions of people who have worked to eliminate nuclear weapons. This wouldn’t be the case if he had not decided to use this opportunity to deflect blame onto his ideological opponents from a bygone era and to chastise the anti-nuclear movement for being “politicized” and naïve about unspecified “dangers facing mankind.”

Notes

[1] Kate Brown, "The Great Soviet and American Plutonium Disasters," interviewed on *TalkingStickTV*, January 18, 2014. https://www.youtube.com/watch?v=O6Ys8ii6r_M As early as September 1945, Soviet spies had found American contingency plans for targeting Soviet cities with atomic bombs, and this shock came on top of the Soviets' bitter feelings of betrayal and abandonment by America, a wartime ally that suddenly seemed to want to take maximum advantage of the USSR's devastation in the post-war era. See also Kate Brown's book *Plutopia: Nuclear Families, Atomic Cities and the Great Soviet and American Plutonium Disasters*, pages 97-98.

[2] Roger Goodman (director), "Hiroshima: Why the Bomb was Dropped," *ABC News*, August 1995. <https://www.youtube.com/watch?v=9-WnLNLe3sk> This documentary is an exceptional case in which a report produced for a mainstream American news channel gave comprehensive coverage of the decision to use the bomb. While leaving the question open for viewers to decide, the evidence presented strongly suggests that American motives were based on objectives beyond the war with Japan, which was sure to end soon thanks to the threat of Soviet involvement.

More

Released on July 15, the World Nuclear Industry Status Report 2015 (*WNISR 2015*) is the latest independent assessment of nuclear energy trends in a series first published in 1992. This year's report comes at a time when most energy and environmental experts shy away from the words "nuclear renaissance" but some view nuclear power as an indispensable substitute for fossil fuels in global efforts to combat climate change. Current trends, however, suggest that a rapid ramp-up of nuclear power is unlikely, and that renewable energy is surging past nuclear power in many countries. Here are a few of the report's key findings:

Nuclear electricity generation. By mid-2015, 30 countries were generating electricity from nuclear power. Nuclear plants generated 2,410 net terawatt-hours of electricity last year, a 2.2 percent increase over the previous year but close to 10 percent below the 2006 historic peak—by comparison, solar power surged by 38 percent and wind by 10 percent. A surprising eight countries (China, Hungary, India, Russia, Slovenia, South Africa, South Korea, and Taiwan) achieved their greatest nuclear production in 2014, but of these countries only China and Russia started up new reactors during the year. The gains in other countries were essentially a result of upgrading or better management at existing power plants.

Although nuclear electricity generation increased last year, nuclear energy's share of global commercial electricity generation has changed little over the past three years. In 2014, nuclear power was 10.8 percent of the global mix. As in previous years, the "big five" countries—the United States, France, Russia, South Korea, and China—generated more than two-thirds of all nuclear electricity in the world. The United States and France accounted for half of all global nuclear production, and France alone generated half of the European Union's nuclear power.

Construction starts and delays. *WNISR 2015* goes further and deeper than previous reports in analyzing the pace of nuclear power plant construction: the length of the process, the reasons for delays, the number of projects that have been cancelled or suspended, and how construction trends vary from country to country. These are limiting factors in any plan for a global scale-up of nuclear power.

The average construction time of the 40 units that started up in nine countries since 2005—all but one (in Argentina) in Asia or Eastern Europe—was 9.4 years, with a large range from 4 to 36 years. Construction starts plunged from 15 in 2010 to three in 2014. There are currently 62 reactors under construction, five fewer than a year ago, and at least three-quarters of these projects are facing delays. In 10 of 14 countries that are building new reactors, *all* projects are delayed, many by years. Five reactors that are "under construction" are projects that began more than 30 years ago.

For the first time, this year's report devotes a full chapter to Generation III+ reactors such as the Westinghouse AP1000, Rosatom AES-2006, and Areva EPR—advanced reactors designed to improve the safety and economics of nuclear power. These reactors are not proving easy to build: By May 2015, 18 next-generation reactors were under construction, but only two projects were still on schedule; the rest were running behind by two to nine years. This includes the AP1000s being built at the Summer and

Vogtle nuclear plants in the United States, which after only two years of construction are late by at least two years.

Generation III+ reactors were originally seen as a transition to even more advanced Generation IV reactors, but if Generation III+ reactors fail, the future for the nuclear industry looks bleak. Small Modular Reactors (SMRs) or radically new reactor designs, known as Generation IV and optimistically touted by some nuclear lobbyists as the key to de-carbonizing the global economy, are still decades away from commercial deployment. Meantime, existing nuclear plants around the world are edging toward retirement, with an average age that has been increasing steadily and now stands at 28.8 years.

Nuclear heavyweights. In both France and Japan, two of the three countries with the largest installed nuclear capacity (the United States is number one), the nuclear industry is in deep trouble. Although Japan still has 40 reactors that are counted as installed capacity, none of them operated in 2014. It was the first time in 50 years that Japan was without nuclear electricity for an entire calendar year. And no lights went out. As of today, it appears likely that two reactors, at most, will restart in Japan this year.

In France, long the world's role model for how to successfully develop nuclear energy, the National Assembly passed an energy bill that defines a target to reduce nuclear's share of the electricity mix from three-quarters to half by 2025. The French state-controlled energy group Areva—the self-proclaimed global leader in nuclear energy—went technically bankrupt after reporting massive losses for four years in a row. Credit-rating agencies have downgraded Areva's long-term debt to "junk," and the company's share price plunged to a record low earlier this month, a level 90 percent below its record high in 2007. Areva is the designated builder for the Hinkley Point C project, which was to be the United Kingdom's first new reactor in decades, and had planned to contribute 10 percent of the investment. That project is now in shambles. In addition to Areva's financial woes, the pressure vessels for the Flamanville (France) and Taishan (China) EPRs—the same European Pressurized Water Reactor design planned for Hinkley Point C—have "very serious" material defects, the French Nuclear Safety Authority told a parliamentary hearing in April 2015.

The rise of renewables. In the United Kingdom, electricity output from renewables (including hydropower) has overtaken the output from nuclear. Meanwhile, China, Germany, Japan, Brazil, India, Mexico, the Netherlands, and Spain generated more power from non-hydro renewables than from nuclear in 2014. Compared with 1997, when the Kyoto Protocol on climate change was signed, in 2014 there was an additional 694 terawatt-hours of wind power and 185 terawatt-hours of solar photovoltaics—each outpacing nuclear's additional 165 terawatt-hours.

What is spectacular is the extent to which the nuclear industry and many decision-makers are appearing to ignore the financial and technical realities of 2015, and the generalized move toward decentralized electricity generation and storage. The industry's track record of delays and cost overruns, coupled with the urgency of replacing fossil fuels with efficiency improvements and low-carbon sources of energy, do not bode well for the long-term future of the industry.

"We are not thinking of transporting nuclear weapons"

August 5, 2015

Japan defense chief says SDF could deal with nukes under security bills

<http://www.japantimes.co.jp/news/2015/08/05/national/politics-diplomacy/japan-defense-chief-says-sdf-deal-nukes-security-bills/#.VcHzgfnwmos>

by Reiji Yoshida

Staff Writer

Under the ruling bloc's security bills, the Self-Defense Forces would theoretically be allowed to transport, repair or store nuclear, chemical and biological weapons for a foreign or multinational force, Defense Minister Gen Nakatani told the Upper House on Wednesday.

But his statement came with an important caveat.

In reality, Nakatani emphasized, Japan would never actually carry out such an operation because the United States, Japan's main military ally, would not ask Tokyo to do so, given the "unique nature" of nuclear weapons and Washington's policy of not forward-deploying nuclear weapons in the Pacific. "It's true (that the bills) do not have any provisions to exclude particular items. However, the SDF would make an independent decision on what it would transport," Nakatani said.

"Japan has maintained the three nonnuclear principles (of not making, possessing or bringing nuclear weapons into the country). We are not thinking about transporting nuclear weapons," he said.

Still, Nakatani's remarks, made in response to a question from an opposition lawmaker, could create a stir and provide ammunition to Diet members who are against the security bills.

It could also further prolong difficult deliberations in the chamber on the legislation.

Kenzo Fujisue of the Democratic Party of Japan, the largest opposition force, noted that the three nonnuclear principles are not enshrined in law, and the security bills themselves do not include any of the assumptions explained by Nakatani during the session.

"There are no legal restrictions. Can we stop a runaway (government)? It should be restricted by law," Fujisue argued in the same Upper House session at the special committee on the security bills.

Under the legislation, the SDF would be allowed to provide logistic support to a foreign or multinational force engaging in a United Nations-authorized military mission, or to the U.S. military in the event that there was a situation that could lead to an armed attack against Japan if it wasn't confronted.

The bills would also allow the SDF to provide "ammunition" to such a foreign or multinational force, but not "weapons."

Japan isn't currently allowed to provide either ammunition or weapons because of war-renouncing Article 9 of the Constitution.

On Tuesday, Nakatani also caused a stir in front of the same committee. According to his definition, missiles are consumable "ammunition" and not "weapons." Thus under the bills, the SDF would theoretically be allowed to provide missiles to a foreign or multinational force.

According to Nakatani, powerful cluster bombs and depleted uranium shells are also "ammunition" because they are "consumable supplies."

During the same session, Prime Minister Shinzo Abe said that cluster bombs and depleted uranium shells are not part of the SDF's weapons cache, thus it would be impossible to provide them to a multinational force.

Opposition lawmakers, however, have criticized the Abe government's apparent ambiguous definition of "ammunition."

The government has insisted the logistic support role is constitutional because it says a conceptual line can be drawn between SDF logistic support and "use of force" by the multinational force in question.

Article 9 of the Constitution stipulates that the Japanese people “forever renounce war as a sovereign right of the nation and the threat or use of force as means of settling international disputes.”

Opposition lawmakers have pointed out that logistics units always play a critical role in military operations and that it is impossible to separate “use of force” from potential logistics support by the SDF.

Security bills technically allow nuclear arms transport: minister

<http://mainichi.jp/english/english/newsselect/news/20150805p2g00m0dm085000c.html>

TOKYO (Kyodo) -- Government-proposed national security legislation would theoretically allow Japan to transport nuclear weapons in logistics support for foreign countries, Defense Minister Gen Nakatani said Wednesday.

During deliberations on the legislation in a House of Councillors panel session, Nakatani, however, immediately ruled out such a possibility citing the country's non-nuclear principles.

Foreign Minister Fumio Kishida also denied the possibility regardless of legal interpretation, telling the same panel, "Given Japan's policy and stance on nuclear weapons, Japanese would never transport nuclear weapons".

The three non-nuclear principles forbid Japan from possessing, manufacturing or allowing nuclear weapons on its territory.

Shinkun Haku, a lawmaker of the biggest opposition Democratic Party of Japan who questioned the ministers during the panel session, said the government should scrap the legislation which would pave the way for the SDF to carry nuclear arms, Haku said.

The security bills are aimed at expanding the role of the SDF abroad and strengthening Japan's security alliance with the United States.

Recent opinion polls indicate a majority of Japanese voters oppose the legislation, which opponents say would make it likelier for Japan to be involved in war.

Nakatani said enhancing the SDF's operations is more important than ever at a time China is stepping up its military assertiveness.

China's expanded maritime activity has become "a security concern for the region including Japan and for the international community," he said.

A-bomb survivors beg Abe to reconsider

Atomic bomb survivors implore Abe to withdraw unpopular security bills

http://ajw.asahi.com/article/behind_news/politics/AJ201508060050

August 06, 2015

By TAKASHI OKUMA/ Staff Writer

HIROSHIMA--Survivors of the atomic bombing here pleaded with Prime Minister Shinzo Abe to drop the new security legislation following a ceremony marking the 70th anniversary of the devastation of the city. "It is a clear violation of the Constitution, and a majority of Japanese either oppose it or hold doubts about it," they told Abe.

Every year, representatives of hibakusha (atomic bomb survivors) meet with the prime minister after his attendance at the memorial ceremony held at Hiroshima Peace Memorial Park.

This year, the representatives of seven hibakusha groups asked Abe to retract the security bills now being deliberated in the Upper House. If the legislation becomes law, it will greatly expand the role of the Self-Defense Forces overseas.

The representatives also handed Abe a document detailing their requests, including the one to retract the bills.

"Some of the measures being pushed by the government go against the wishes of the hibakusha, and we cannot but hold fears and doubts. The best example is the security legislation," the document said.

Abe replied, "(The security legislation) will send the message that the Japan-U.S. security alliance will function in a complete manner, and that will prevent conflicts from occurring."

It was the second straight year that the hibakusha groups have asked the prime minister to rescind a major policy initiative.

Last year, the representatives of the seven groups called on Abe to retract the Cabinet decision made in July 2014 to change the government interpretation of the Constitution and lift the self-imposed ban on the exercise of the right to collective self-defense.

Will Abe's message help reconciliation?

August 7, 2015

EDITORIAL: Abe's war anniversary message should promote reconciliation

<http://ajw.asahi.com/article/views/editorial/AJ201508070021>

A council of experts appointed to advise Prime Minister Shinzo Abe over his planned statement to commemorate the 70th anniversary of the end of World War II submitted its report to him on Aug. 6. Abe will shortly issue his statement after considering the recommendations by the advisory panel. Commenting on the statement issued in 1995 by then Prime Minister Tomiichi Murayama to mark the 50th anniversary of the end of the war, Abe reiterated on Aug. 6 that his message will "carry on the positions (on related issues) of successive Cabinets as a whole." Murayama's statement expressed remorse and apology for Japan's colonial rule and aggression.

Abe's statement will be meaningless if it fails to strike a resonant chord in the people to whom it is addressed. We want him to clearly express his intention to "carry on" the spirit of the Murayama statement with his own words.

“After the Manchurian Incident, Japan expanded its aggression against the continent ... and caused much damage to many countries, mainly in Asia, through a reckless war,” the report states.

It also says, “Going against the dominant trend toward ethnic self-determination, (Japan) implemented colonial rule (over other Asian nations) with great severity, especially after the late 1930s.”

The report is a compilation of the opinions voiced by the experts tasked by Abe to offer advice on the statement he plans to issue.

Although it is not a draft of Abe’s statement, the report’s descriptions about the events leading to the war are largely reasonable.

After recklessly expanding its aggression, Japan surrendered by accepting the Potsdam Declaration.

Then, Japan accepted the rulings handed down by the International Military Tribunal for the Far East, which tried Japan’s wartime leaders, and regained its sovereignty under the San Francisco Peace Treaty, signed in 1951. Since returning to the international community, Japan has been pursuing a pacifist path based on its own soul-searching about the war under the new Constitution.

This is the outline of Japan’s history during and after the war that has become an established view both in and outside Japan, although there may be disagreements over certain details.

But Abe has exhibited a desire to change this widely accepted historical narrative, saying there is no established definition of aggression.

The report by the personal advisers to Abe, however, clearly referred to Japan’s aggression.

Admitting one’s mistake is indispensable if one is to not make the same mistake again.

The Murayama statement, which candidly admitted Japan’s national policy mistake and expressed “deep remorse” and offered a “heartfelt apology,” has been welcomed internationally and served as a foundation for Japanese diplomacy since then.

It is debatable whether Abe needs to issue a new statement in view of the existence of the Murayama document.

As he has decided to go to the trouble of issuing a new message, however, Abe should make sure that it will not cause any new misunderstanding or mistrust between Japan and its neighbors.

As the Japanese leader, Abe has the responsibility to ensure that his statement will offer a view about Japan’s past that transcends his personal feelings, represents the collective sentiment of the Japanese people and wins the support of the international community.

To do so, Abe should focus on the following objectives:

The number of people in Japan and neighboring countries who had firsthand experiences of the ravages of the war is already small and dwindling. Abe’s statement should, first and foremost, resonate with the feelings of these people.

It is also important for Abe to make it clear that his statement is intended as a message for reconciliation to heal Japan’s seriously soured relations with China and South Korea.

The entire world is closely watching Abe’s decision as to what should be the core message of his statement.

--The Asahi Shimbun, Aug. 7

Editorial: Abe should give war anniversary statement aiding reconciliation

<http://mainichi.jp/english/english/perspectives/news/20150807p2a00m0na017000c.html>

A panel of experts discussing the content of a statement that Prime Minister Shinzo Abe will issue on the occasion of the 70th anniversary of the end of World War II has compiled a report on the issue. Based on the report, the prime minister intends to issue a statement on Aug. 14, the day before the anniversary. The report covers four areas -- lessons that should be learned from the experiences of the 20th century, the path Japan has taken in the postwar period, the country's reconciliation with European, North American and Asian countries and a vision for the 21st century.

Of these issues, lessons that should be learned from the experiences of the 20th century are linked directly to the prime minister's historical perceptions, which form the core of his statement. The content of this section can generally be hailed as well-balanced.

The report points out that Western countries, having preceded other countries in technological innovation, went ahead with colonization in the 19th century, but that the brakes were applied on this colonization at the beginning of the 20th century.

The panel's document says that after the Manchurian Incident, Japan "expanded its aggression against the continent" despite the 1922 Nine-Power Treaty and the 1928 General Treaty for Renunciation of War as an Instrument of National Policy. It goes on to say, "Japan lost sight of the global trends, and caused much harm to various countries, largely in Asia, through a reckless war."

The document criticizes Japan's colonial rule, stating, "In the colonies, Japan acted counter to the tide of self-determination. Colonial rule became particularly harsh from the second half of the 1930s on."

As such, the report basically adheres to key words and phrases in a 1995 statement issued by then Prime Minister Tomiichi Murayama on the occasion of the 50th anniversary of the war's end -- "a mistaken national policy," "its colonial rule and aggression," "tremendous damage and suffering" and "deep remorse."

The 16 members of the committee were selected privately by Prime Minister Abe. The panel was not tasked with determining the government's historical perceptions. The report also acknowledges that some members disagreed with the description of Japan's "aggression."

Still, it is of great significance that a panel that the prime minister set up as part of his efforts to draw up his statement put forth historical perceptions that are largely similar to those in the Murayama Statement. If the prime minister were to sidestep the content of the report in his statement, the Japanese public and the international community would find it quite unnatural.

The report contains inappropriate expressions regarding Japan's efforts to reconcile with South Korea. It says that despite Japan's efforts to reconcile with the country, South Korea "moved the goalpost." It is inadvisable for the panel to use such an emotional expression in criticizing South Korea's diplomatic stance.

A bigger issue, however, is the statement Prime Minister Abe will issue based on the report.

Judging from his past words and deeds, there is no reason to doubt Abe is working enthusiastically on the statement out of dissatisfaction with the Murayama Statement. Prime Minister Abe has avoided using the word, "aggression," as the Murayama Statement did, while stating that he basically respects the Murayama Statement.

A statement to commemorate the 70th anniversary is not a setting in which the prime minister should express his personal historical perceptions. It is a statement issued by the person responsible for governing Japan. Abe should recognize this and work out a statement that will contribute to Japan's reconciliation with its neighbors.

What material for Abe's speech?

August 7, 2015 (Mainichi Japan)

Recommendations for Abe war-end statement get mixed reaction in ruling coalition

<http://mainichi.jp/english/english/newsselect/news/20150807p2a00m0na016000c.html>

Senior figures of the ruling Liberal Democratic Party (LDP) hailed an expert committee's recommendations for Prime Minister Shinzo Abe's coming statement for the 70th anniversary of World War II's end as fair and balanced, but the response from some members of the LDP's junior coalition partner Komeito was more muted.

LDP Secretary-General Sadakazu Tanigaki praised the work of the private Advisory Panel on the History of the 20th Century and on Japan's Role and the World Order in the 21st Century, which submitted its recommendations to Abe on Aug. 6.

"It did an excellent job of analyzing where Japan went wrong in terms of the progress and problems in this country and the world in the 20th century," he said. "It's a balanced report."

LDP policy chief Tomomi Inada, meanwhile, stated, "We cannot reflect on what was done wrong if we don't understand what that is. That (the panel) debated the issue so thoroughly and put together this report has tremendous meaning."

One senior Komeito executive also had praise for the recommendations, saying, "It's a bit of a surprise, but they've really put together a decent report." The official added, however, that "the prime minister and our party have different ideas on the matter to start with," suggesting some anxiety about the coming statement among Komeito's ranks.

Komeito places particular importance on continuing the language and tone of the previous two war anniversary statements -- the 1995 Murayama Statement, and the 2005 Koizumi Statement. Party leader Natsuo Yamaguchi told an Aug. 6 news conference in Hiroshima, "(Abe's statement) cannot include major changes in meaning" from the past two. Yamaguchi met with Abe on July 7, and has had several consultations with members of the prime minister's inner circle to demand a reaffirmation of the content of the Murayama and Koizumi statements, as well as a Cabinet decision on the one Abe is to present this month.

Komeito had previously insisted that the statement include explicitly apologetic vocabulary. At his Aug. 6 news conference, however, Yamaguchi revealed that his party hadn't "insisted on the insertion of specific words. I think the prime minister and his associates are carefully considering the wording of the statement such that its meaning does not change" from the past two. At an Aug. 7 meeting of the party's board, Komeito is expected to officially entrust Yamaguchi and other officials with the party's response to Abe's statement.

Opposition party figures, meanwhile, viewed the panel's recommendations for the Abe statement coolly. Democratic Party of Japan (DPJ) Secretary-General Yukio Edano commented, "It looks like a compilation of opinions from many different perspectives," adding, "There have already been two excellent statements, one on the 50th anniversary of the war's end and one on the 60th. I don't really understand the idea behind issuing another one for the 70th anniversary."

Japan Innovation Party (JIP) leader Yoriyoshi Matsuno said of the recommendations, "The phrasing itself will become a diplomatic problem. Why is a statement even being released 70 years after the war?"

Social Democratic Party (SDP) Secretary-General Seiji Mataichi added his voice to the chorus of opposition criticism, stating, "We can't put faith in the report, which is in favor of the administration." On the coming statement, he added, "If it leaves out remorseful and apologetic language, it will likely damage Asian countries' trust in Japan."

August 7, 2015

Advisory report provides mix of material for Abe's war anniversary speech

An advisory panel to Prime Minister Shinzo Abe on Aug. 6 released a report characterizing Japan's military campaign from the 1931 Manchurian Incident in northeastern China through the end of World War II as "aggression," and also referred to Japan's past colonial rule. The report is clearly cognizant of the Aug. 15 statements by then Prime Minister Tomiichi Murayama in 1995 and then Prime Minister Junichiro Koizumi in 2005 on the 50th and 60th anniversaries of the war's end.

The report by the Advisory Panel on the History of the 20th Century and on Japan's Role and the World Order in the 21st Century, also made a positive assessment of postwar Japan in consideration of Prime Minister Shinzo Abe's resolve to issue a future-oriented 70th anniversary statement.

The advisory panel held an inaugural meeting in February in which each of its 16 members stated their own opinions and launched a full-scale debate at the second meeting in March. It focused on the annals of the world and Japan in the 20th century. A majority of the panel members said that Japan's military campaign during the war was aggression and that it is impossible for the panel to deny Japan's invasions. Others expressed dissent. The report notes that the international community has yet to reach a complete consensus on the definition of aggression under international law. In a footnote, the report says there are some objections among panel members against determining Japan's military moves after the Manchurian Incident as aggression.

Two members expressed reluctance to brand Japan's action as aggression. But panel Deputy Chairman Shinichi Kitaoka said at a news conference on Aug. 6 that the panel never thought of changing the text due to dissenting viewpoints. Kitaoka said at a symposium in March that the panel wants Prime Minister Abe to say that Japan invaded foreign territory.

While the Murayama Statement did not make clear the origin of Japan's military action in World War II, the report identified it as the Manchurian Incident because Emperor Akihito, in a New Year's message, declared that it is extremely important for Japan to fully learn the history of the war originating in the Manchurian Incident and think about the future direction of Japan.

The report went beyond the Murayama Statement, elaborating on misguided national policy at a certain period in the past. Takashi Shiraishi, president of the National Graduate Institute for Policy Studies, said at the panel's meeting in May that Japan erred in national policy and that it would be better for Abe to frankly say so.

The report says that the war led to independence of colonized countries, but that it is not accurate to argue that Japan fought for the liberation of Asia, thus rejecting the historical perceptions of some scholars. The report went on to say that Japan made a fatal mistake by simultaneously clashing with nationalism in Asia and taking on major powers such as Britain and the United States, and did harm to the people of Asian countries.

Prime Minister Abe has repeatedly expressed willingness to issue a future-oriented statement, saying there is no need for him to issue an anniversary statement if it means saying the same things as in the Murayama and Koizumi statements. In speeches in Indonesia and the U.S. in April, he expressed "deep

remorse" over the war but made no mention of aggression. Panel Chairman Taizo Nishimuro told Prime Minister Abe in delivering the report on Aug. 6 that the panel expects the premier to accept it as a reference when he issues his 70th anniversary statement.

The report generally recited the past prime ministerial statements on Japan before and during the war but reflected Abe's desire to issue a future-oriented anniversary statement by referring to reconciliation with China and South Korea, proactive contribution to peace and other current challenges. The report mentioned a positive assessment in the international community of Japan's proactive contribution to peace evolving from the early 1990s, its rule of law, liberal democracy and respect for human rights -- phrases and words Abe frequently uses in his remarks.

During the advisory panel's debate, many panel members were critical of the failure of China and South Korea to positively accept Japan's apology in connection with Tokyo's strained relations with Beijing and Seoul, a sour spot in Abe's diplomatic policy. The report, referring to reconciliation with Europe and the U.S., says it is a big prerequisite for the aggressor to atone in a sincere manner, but it is also important for the victim to be tolerant to accept an apology.

On Sino-Japanese relations, the report says the two countries have failed to achieve reconciliation but pointed to past achievements including then Chinese Premier Wen Jiabao's speech in 2007 hailing the Murayama and Koizumi statements as a juncture in Japan-China dialogue. On Japanese-South Korean relations, the report says that it is essential for Japan to approach South Korea with reason and heart to achieve reconciliation but that Seoul has "moved the goalpost" in the history issue in recent years. The report asks the South Korean government to work with Japan to achieve eternal reconciliation.

It is the first time for the Japanese government to set up such an advisory panel on anniversary statements by prime ministers. Abe backed the creation of such a panel to reflect historical perceptions of the public in his upcoming statement as national consensus.

Kitaoka told reporters on Aug. 6 that the report is reference material for Prime Minister Abe as he is prepared to issue a statement on history, postwar Japan and the reconciliation process with Japan's neighbors.

Below are the names and positions of the 16 members of the Advisory Panel on the History of the 20th Century and on Japan's Role and the World Order in the 21st Century:

Keiko Iizuka, head of International News Department at the Yomiuri Shimbun

Yukio Okamoto, president of Okamoto Associates Inc.

Shin Kawashima, professor at the University of Tokyo Graduate School of Arts and Sciences

Shinichi Kitaoka, deputy chairman of the panel and president of the International University of Japan.

Yorihiko Kojima, chairman of Mitsubishi Corp.

Yoshiko Kojo, professor at the University of Tokyo Graduate School of Arts and Sciences

Takashi Shiraishi, president of the National Graduate Institute for Policy Studies

Rumiko Seya, president of Japan Center for Conflict Prevention

Terumasa Nakanishi, professor emeritus at Kyoto University

Masashi Nishihara, president of the Research Institute for Peace and Security

Taizo Nishimuro, panel chairman and president of Japan Post Holdings Co.

Masashi Haneda, professor at the University of Tokyo

Yoshito Hori, president of Globis University

Kunihiko Miyake, visiting professor at Ritsumeikan University

Masayuki Yamauchi, professor emeritus at the University of Tokyo

Takao Yamada, special senior writer at the Mainichi Shimbun

Abe's omissions fuel worry

Anxiety rises over Abe omitting non-nuclear principles from Hiroshima speech

http://ajw.asahi.com/article/behind_news/politics/AJ201508070062

August 07, 2015

THE ASAHI SHIMBUN

Prime Minister Shinzo Abe's omission of the "three non-nuclear principles" during his speech in Hiroshima on Aug. 6 has caused concerns that Japan may be about to ditch a long-held and highly cherished philosophy.

"We will make further efforts toward realization of a world without nuclear weapons," Abe did say in this year's ceremony marking the 70th anniversary of the atomic bombing of the city on Aug. 6, 1945.

But it's what he did not say that is causing anxiety, particularly among atomic bomb survivors. He failed to confirm the nation's three non-nuclear principles: Japan does not possess or produce nuclear weapons and also does not permit other countries to bring those weapons into Japan.

Only after the ceremony, when Abe met with representatives of atomic bomb survivors, did the prime minister say, "I pledge that, by firmly maintaining the three non-nuclear principles, we will continue to lead the efforts toward abolition of nuclear weapons and realization of permanent peace to prevent a recurrence of disasters brought by nuclear weapons."

As criticism spread over his omission at a widely reported ceremony attended by 55,000 people, Abe was forced to respond at a meeting of the Lower House Budget Committee on Aug. 7.

"It is a matter of course that (Japan will maintain) the three non-nuclear principles," he said. "The stance is not changing at all."

Abe also said he would confirm Japan's adherence to the non-nuclear principles in his speech in Nagasaki on Aug. 9.

Since the prime minister's participation became a regular fixture at the Hiroshima ceremony in 1994, it marked the first time that Japan's leader has not mentioned the intrinsic principles.

Abe has taken part in the ceremony three times, including during his first tenure as prime minister from 2006 to 2007. On all three occasions he has mentioned them.

In the evening of Aug. 6, a senior official of the prime minister's office backed Abe.

"We have strongly said our efforts (toward realization of a nuclear-free world) are unchanged," the official said. "It will not make any difference if the prime minister did not mention the principles."

However, the efforts of Abe and his office after the speech to dampen speculation that the three non-nuclear principles might be ushered out have done little to stop a general feeling of unease.

"If the government is thinking that it is not necessary to refer to the three non-nuclear principles on the grounds that it is a matter of course to firmly maintain them, it is the same as the case concerning the security legislation (now being deliberated in the Diet)," said Renho, an acting representative of the largest opposition Democratic Party of Japan, on Aug. 6. "We are anxious that unless there are guarantees to maintain the principles, the government could change them at any time."

Kunihiko Sakuma, 70, director of “Hiroshimaken Genbaku-Higaisha Dantai Kyogikai” (Council of organizations of atomic bomb survivors in Hiroshima Prefecture), was even more angry.

“It is little wonder if it is understood that Japan has abolished the three non-nuclear principles, which is its national credo,” he said.

Toshiyuki Mimaki, 73, a vice director of a different organization, also named, “Hiroshimaken Genbaku-Higaisha Dantai Kyogikai,” said that he was not aware that Abe did not mention the principles in his speech at the ceremony.

“It is frightful that the words went missing from the prime minister’s public speech while we were not paying close attention. The principles may be emasculated in the eras of my children or grandchildren while they are not aware,” he said.

On Aug. 5, Defense Minister Gen Nakatani caused an uproar after he said in the Upper House special committee on the security legislation that the possibility that the Self-Defense Forces will transport nuclear weapons is not ruled out.

“We are concerned because the prime minister did not refer to the principles amid a move to make it possible for Japan to wage a war,” said Hirokami Yamada, 84, head of the secretariat for the Nagasaki Atomic Bomb Survivors Council.

Abe panel report mentions 'aggression,' 'colonial rule,' but mum on need for apology

http://ajw.asahi.com/article/behind_news/politics/AJ201508070067

By TAKASHI FUNAKOSHI/ Staff Writer

An advisory panel to Prime Minister Shinzo Abe submitted a report on Aug. 6 that mentions Japan's aggression before and during World War II, colonial rule and the responsibility of Japan's wartime leaders. However, it does not touch upon the need for an apology to those who suffered during the war because of Japan.

Panel members left it up to Abe to decide if he will include an apology in the statement he will release on Aug. 14 to mark the 70th anniversary of the end of World War II.

It remains to be seen to what extent Abe will incorporate the report's findings in his own 70th anniversary statement.

He has said he would follow "on the whole" the statements released in 1995 and 2005 by predecessors Tomiichi Murayama and Junichiro Koizumi, respectively, when they were prime minister. However, Abe has stopped short of saying he would use the same words from those two statements.

Abe convened the panel to look into historical issues to provide background for his widely anticipated statement. The report, covering developments from before World War II and including the 70 years since the war's end, was submitted to the prime minister by panel chairman Taizo Nishimuro, president of Japan Post Holdings Co., and Shinichi Kitaoka, president of the International University of Japan.

"With this year marking the milestone of 70 years since the war's end, I want to compile a statement to be transmitted to the world that will lay out what we have learned from that war as well as the course that Japan should proceed along in the future," Abe said.

The panel, officially known as the Advisory Panel on the History of the 20th Century and on Japan's Role and World Order in the 21st Century, was formed in late February. Among the 16 members were historians as well as representatives from the business and media sectors. It held seven sessions at which various topics of Japan's past were discussed.

The report said that since the Manchurian Incident in 1931, Japan "expanded its aggression against the continent, ... lost sight of the global trends, and caused much harm to various countries, largely in Asia, through a reckless war."

It added that, "Colonial rule became particularly harsh from the second half of the 1930s."

It also pointed out, "It must be said that the responsibilities of the Japanese government and military leaders ... are very serious."

Reflecting the divisive nature of the topics, the report included a footnote that said, "There were some dissenting views in the panel concerning the use of the word 'aggression.' "

However, at a news conference on Aug. 6, Kitaoka, the deputy chairman of the panel, said about the footnote, "We included the footnote because one member expressed an opposing view which was seconded by another member. We never thought about revising the main part of the report. This is not a case of including both sides of the argument."

Regarding the path Japan took after the war, the report said Japan "is one of the countries that have been faithful" to the new liberal international system based on the premises of peace, rule of law and other principles that was established under the initiative of the United States.

But the panel said Japan still had more to contribute internationally in the security field.

The report also devoted a major part to analyzing the changes in Japan's relationship with various nations since the end of the war.

Regarding the ties with the United States, the report said, "our bilateral relations achieved a rare success in the history of the world."

However, the report could not offer such glowing terms for the relations with China and South Korea.

Regarding the ties with Beijing since the end of World War II, the report said the period represented, "70 years during which ... (Japan's and China's) intentions failed to coincide fully."

The report described a "yet-to-be-achieved reconciliation" in relation to South Korea.

No apology

August 9, 2015

Draft of Abe statement does not include 'apology' for Japan's role in WWII

http://ajw.asahi.com/article/behind_news/politics/AJ201508090024

THE ASAHI SHIMBUN

The draft of Prime Minister Shinzo Abe's statement to mark the 70th anniversary of the end of World War II does not include the word "apology" to Asian countries, which was included in two past landmark statements, according to sources.

Abe showed the draft to executives of the ruling Liberal Democratic Party and junior coalition partner, Komeito, at a meeting on the night of Aug. 7.

According to attendees, Abe reiterated that he will “inherit as a whole” the statements issued by former Prime Ministers Tomiichi Murayama and Junichiro Koizumi to mark the 50th and 60th anniversaries, respectively.

However, the draft of Abe's statement did not include “apology” or similar wording for Japan's role in the war.

Regarding the omission, one Komeito leader told Abe, “You have said that you will follow the past statements. Your statement must convey the feeling of apologies to other countries.”

The draft included the word “remorse” for the war. However, the words “colonial rule and aggression” were not clearly explained to the junior coalition partner's satisfaction.

One Komeito participant asked Abe to put the word “aggression” in a clear context, saying, “Why is Japan showing remorse? Unless you make clear what Japan is showing remorse for, your statement cannot convey (the feeling of remorse).”

The draft also included the strides Japan has made in the postwar era and international contributions the nation should make in the future, the sources said.

In response to the suggestions from Komeito, Abe said, “I have heard (your opinions).”

The focus will now shift to how much of Komeito's input Abe will incorporate into his statement.

“(The meeting held on the night of Aug. 7) is the last one in which we will meet with Komeito representatives to discuss the statement,” an LDP executive said.

However, a Komeito executive said, “We have not yet left (the contents of the statement) entirely up to the prime minister.”

The meeting included Komeito leader Natsuo Yamaguchi and Komeito Secretary-General Yoshihisa Inoue. LDP Secretary-General Sadakazu Tanigaki and Chief Cabinet Secretary Yoshihide Suga also were in attendance.

Abe's Cabinet is scheduled to approve his war anniversary statement on Aug. 14.

Victory for nuclear lobby

August 11, 2015

In major victory for nuclear industry, first reactor goes online under post-Fukushima regime

by Eric Johnston

Staff Writer

SATSUMASENDAI, Kagoshima Pref. – Four years and five months to the day after the crisis began at the Fukushima No. 1 power station, Japan formally returned to nuclear power Tuesday with the restart of Kyushu Electric Power Co.'s Sendai No. 1 reactor in Kagoshima Prefecture.

Despite nationwide public opposition, questions about plant safety, the practicality of disaster response plans and who will be responsible for them, the strongly pro-nuclear Prime Minister Shinzo Abe and the Ministry of Economy, Trade and Industry, as well as the politically powerful utilities, local Liberal Democratic Party politicians, and major corporations involved in the nuclear industry have pushed hard to bring as many reactors back online as possible.

The nuclear lobby strongly argues that atomic power is cheaper than importing oil or coal and will help curb greenhouse gas emissions.

With the restart of the Sendai No. 1 reactor, the first under the new safety inspection regime that went into effect two years ago, attention has now turned to whether there will be a rush to restart other reactors.

In addition to reactor No. 2 at the Sendai plant, which is expected to be brought back online in early or mid-October, another 23 reactors at 14 plants are under consideration to restart.

Three of these, including the No. 3 and No. 4 reactors at Kansai Electric Power Co.'s Takahama facility in Fukui Prefecture and reactor 3 at Chugoku Electric Power Co.'s Ikata plant in Ehime Prefecture, have been given the green light for restart by the Nuclear Regulatory Authority (NRA).

However, the two Takahama reactors have a provisional injunction against their restart slapped on them by the Fukui District Court in April, thereby making their fate uncertain.

On Tuesday morning, workers at the two-reactor Sendai plant in the city of Satsumasendai pulled out the control rods that have been suppressing nuclear fission in reactor 1 for the first time since May 2011, when it was taken offline for mandatory regular checks.

The reactor was expected to reach criticality within half a day, and the utility plans to start generating and delivering electricity in three days.

The reactor will have a test run for about a month, and if no problems are encountered, Kyushu Electric Power will begin selling the nuclear-generated electricity in mid-September.

At about the same time, final preparations will begin for a restart at the plant's No. 2 reactor, which is expected to occur in early or mid-October, with electricity from that reactor being sold by mid-November.

"The Abe administration, under its basic energy plan, has already decided it will activate reactors that have cleared new nuclear safety standards by the NRA, which are the toughest in the world. It's under this policy that the Sendai reactor was restarted," Chief Cabinet Secretary Yoshihide Suga said Tuesday morning.

Local communities like Satsumasendai, and the pro-nuclear local chapters of the Liberal Democratic Party, also rely heavily on central government subsidies and utility donations that come with hosting a plant.

The restart of the Sendai reactor thus marks a major victory for nuclear proponents at not only the national level but in other localities looking to restart another two dozen reactors.

At a news conference in the afternoon, Satsumasendai Mayor Hideo Iwakiri welcomed the restart, saying he believes the plant's reactors are safe and that he hopes they will provide a much-needed financial and economic boost.

"Between 5 and 6 percent of the town budget comes from central government funding for hosting a nuclear power plant or from Kyushu Electric," Iwakiri said.

Tuesday's restart came despite local concerns about what will happen if an accident occurs and, most importantly, who bears responsibility for the orderly and timely evacuation within 30 km of the plant.

"The premise of evacuation plans drawn up by Kagoshima assumes that the main access road in the area will not be damaged and will be available to get people out of the contaminated area before they are exposed to radiation. If that's the case, what happens?" asks Shoji Takagi, a manga artist and anti-nuclear activist.

The question of where final responsibility lies for the overall safety of the plant's operation, including proper safety measures, has emerged as the key issue in the debate over not only Sendai but all possible restarts.

Local officials say they grant permission for restarts based on the "central government's" seal of approval but admit they also need direction from Tokyo to draw up more detailed and effective accident contingency plans.

The NRA, however, says it is only responsible for the technical aspects of the safety of each plant.

Yukio Edano, secretary-general of the Democratic Party of Japan, the nation's largest opposition force, said that while the local governments have been tasked with drawing up and carrying out emergency evacuation programs, the roles of the central government have not been spelled out.

"(The Fukushima crisis) has made it clear that it is impossible for local governments alone to (evacuate residents). The central government should play responsible roles to evacuate them," Edano said.

"But the state is trying to evade that responsibility," he added.

In an attempt to quell lingering concerns, industry minister Yoichi Miyazawa said Tuesday that in the event of an accident, the central government will take the lead in responding to any emergency.

However, with nearly two dozen reactors elsewhere up for restart, both the central government and local authorities who want the money that comes with restarts are likely to find that demands to address these concerns in more detail are not going away.

Kepeco anticipates improved supply

August 11, 2015

Utility says restart will improve supply

http://www3.nhk.or.jp/nhkworld/english/news/20150811_25.html

Aug. 11, 2015 - Updated 07:01 UTC+2

The operator of the Sendai nuclear power plant expects the restart of its reactor to greatly improve energy supply.

Nearly 40 percent of Kyushu Electric Power Company's output came from nuclear power before the 2011 accident in Fukushima. The ratio is higher than those of other utilities.

Company officials say they are meeting this summer's power demand by operating thermal plants at full capacity and procuring power from other firms. But they say the thermal plants are old and often stop running.

The officials say that with the full operation of the Sendai plant's No.1 reactor, the company can secure power reserves of 5 percent or more. The reactor has a generation capacity of 890-thousand kilowatts.

Expensive safety measures

August 12, 2015

Power plant operators to invest ¥3 trillion on safety measures

http://www.japantimes.co.jp/news/2015/08/12/business/power-plant-operators-to-invest-%C2%A53-trillion-on-safety-measures/#.VctRc_nwmos

JJI

Eleven nuclear power plant operators plan to invest a total of ¥3 trillion on a variety of safety measures, informed sources said Tuesday.

The safety measures include installing breakwaters and ensuring emergency power sources are available. In addition, the companies are required to implement anti-terrorism measures by July 2018.

Costs for safety measures are likely to increase further, but such investment will be inevitable for companies eager to win regulatory approval for reactor restarts.

Between them, the 11 companies have applied for regulatory approval for 25 restarts. So far, five of the units have obtained approval, including the No. 1 reactor at Kyushu Electric Power Co.'s Sendai nuclear plant in Kagoshima Prefecture, which went back online on Tuesday.

Tohoku Electric Power Co.'s costs for safety measures will increase to over ¥300 billion from the originally estimated ¥182 billion due to additional construction work, including burying emergency fuel tanks to protect them from high wind.

Kansai Electric Power Co.'s spending will balloon to ¥490 billion from less than ¥300 billion because of anti-terrorism work.

Current plans in place at Chubu Electric Power Co. and Kyushu Electric do not include costs for anti-terrorism work, estimated at some tens of billions of yen.

The companies expect to reduce costs by firing up nuclear reactors as it would reduce the need to buy fuel for thermal power plants.

Kyushu Electric expects a monthly improvement of ¥7.5 billion in its balance sheet per reactor with the restart of the Sendai nuclear plant. The company aims to restart the plant's No. 2 reactor in mid-October.

Tokyo Electric Power Co. projects that the restart of its Kashiwazaki-Kariwa nuclear plant in Niigata Prefecture will improve its balance sheet by over ¥8 billion per month.

If the reactors are not restarted, the companies will be forced to cut costs further.

A long-term suspension of nuclear reactors will force power firms that have never carried out large-scale rate hikes after the March 2011 earthquake and tsunami to consider rate increases, said Yukihiro Takabayashi, managing executive officer of Hokuriku Electric Power Co.

Subsidies for idled plants will be lowered

August 12, 2015

Grants to local bodies hosting idled nuclear reactors to be lowered

<http://mainichi.jp/english/english/newsselect/news/20150811p2a00m0na010000c.html>

The Ministry of Economy, Trade and Industry is set to cut back on subsidies to local governments home to idled nuclear reactors in **an attempt to pressure them into reactivating the reactors**, it has been learned. Starting in fiscal 2016, the ministry will revise grant amounts based on the operational rate of nuclear plants and other factors. Currently, the grants are allocated to local governments hosting nuclear stations that are suspended for safety reasons by deeming their operational rate to be 81 percent across the board. Under the planned new criteria, the deemed operational rate will be set for the respective nuclear plants based on their past performances prior to the meltdowns at the Fukushima No. 1 Nuclear Power Plant -- which stood at an average 70 percent. Because the deemed operational rate is applied to nuclear plants nationwide that have remained offline since the onset of the Fukushima crisis, the government's move may prompt local bodies to call for reactivating reactors in their jurisdictions out of fear for reduced subsidies.

According to the industry ministry, the planned measure is aimed at ensuring fairness among local governments home to nuclear power stations after the Aug. 11 reactivation of Kyushu Electric Power Co.'s Sendai Nuclear Power Plant in Kagoshima Prefecture -- so that the amount of subsidies to local governments with restarted reactors will not be less than those to local bodies with idled reactors. Under the current system, local governments receive grants whose amounts reflect the operational performance of reactors from two fiscal years back -- which will be changed to 1.5 fiscal years back from fiscal 2016. From fiscal 2013 onwards, municipalities have received grants based on the deemed operational rate at 81 percent as many of the reactors they host were suspended for regular inspections by the end of fiscal 2011 in the wake of the Fukushima meltdowns and still remain offline. The uniform 81 percent rate corresponds to the full operational rate except for the regular inspection period once every 13 months.

The ministry started reviewing the grant system after an expert panel to the ministry drew up a report in December last year calling for ensuring fairness among municipalities hosting nuclear plants. The new deemed operational rate will be set at no more than 81 percent and will take into account the operational performance at each nuclear plant prior to the Fukushima meltdowns. Unless reactors are brought back online, grants to each municipality are destined to be cut back.

As many municipalities hosting nuclear stations heavily depend on the grants and other revenues related to nuclear power, they have called on the ministry to maintain the existing deemed operational rate system. The Mihama Municipal Government in Fukui Prefecture -- more than 40 percent of whose revenues in fiscal 2014 were related to nuclear power including the grants for local bodies hosting reactors at 1.49 billion yen -- has already anticipated that the grant amounts will be halved from fiscal 2016 due to the decommissioning of the No. 1 and No. 2 reactors at the Mihama Nuclear Power Plant operated by Kansai Electric Power Co. "If the deemed operational rate is to be brought down on top of this, there will be growing calls for reactivating reactors," said a municipal government official.

Hisao Ito, a special researcher at the Tokyo Jichi Kenkyu Center (Autonomy Tokyo) who is specialized in local government finance, commented, "Under the current scheme where the grant amounts are decided at the discretion of the central government, local governments will not be able to break away from finances dependent on such subsidies. Municipalities should cultivate regional resources other than nuclear power generation, while the central government should support them through impact mitigation measures such as those for former coal mining areas."

Idled reactors expensive

August 17, 2015

Utilities spent ¥1.4 trillion last year to maintain idled reactors

<http://www.japantimes.co.jp/news/2015/08/17/business/corporate-business/utilities-spent-%C2%A51-4-trillion-last-year-maintain-idled-reactors/#.VdHqiJfwmos>

Kyodo

The nation's nine utilities with nuclear power plants had to spend a total of about ¥1.4 trillion last fiscal year to maintain their idled reactors, financial statements showed Monday, revealing part of the reason that electricity rates went up.

Kyushu Electric Power Co. restarted a reactor last week despite strong public opposition, adding to the view the utilities are trying to reactivate their idled plants as soon as possible to help rehabilitate their balance sheets, which are also suffering from rising fuel costs for alternative power generation.

All of the country's commercial reactors remained offline in fiscal 2014, which ended March 31, amid heightened safety concerns following the 2011 crisis at Tokyo Electric Power Co.'s Fukushima No. 1 complex.

Tepco spent the most — ¥548.6 billion — having to maintain the Fukushima No. 2 nuclear complex, which is located about 10 km south of Fukushima No. 1, and the massive Kashiwazaki-Kariwa plant in Niigata Prefecture.

Kansai Electric Power Co., which relied heavily on nuclear power before the Fukushima disaster, spent ¥298.8 billion, while Kyushu Electric spent ¥136.3 billion.

Last week, a reactor owned by Kyushu Electric became the first to come back online under upgraded regulations introduced after the Fukushima meltdowns.

Five of the nine companies — Tohoku Electric Power Co., Tokyo Electric, Chubu Electric Power Co., Hokuriku Electric Power Co. and Kansai Electric — also had to pay some ¥130 billion to Japan Atomic Power Co. to honor their contracts with the entity, even though their reactors were idle.

TEPCO's mounting legal challenges

Fukushima operator's mounting legal woes to fuel nuclear opposition

Source : Reuters

<https://uk.news.yahoo.com/fukushima-operators-mounting-legal-woes-fuel-nuclear-opposition-210834627--finance.html#z4lDBk7>

By Kentaro Hamada, Reuters via Yahoo, August 16, 2015
<http://tinyurl.com/qfqopl8>

IWAKI, Japan (Reuters) - Four and a half years after the Fukushima disaster, and as Japan tentatively restarts nuclear power elsewhere, the legal challenges are mounting for the crippled plant's operator. They include a judge's forced disclosure of a 2008 internal document prepared for managers at Tokyo Electric Power Co warning of a need for precautions against an unprecedented nuclear catastrophe. Also, class actions against Tepco and the government now have more plaintiffs than any previous Japanese contamination suit and, overruling reluctant prosecutors, criminal charges have been levelled against former Tepco executives for failing to take measures to prevent the 2011 meltdowns and explosions.

Radiation from the worst nuclear disaster since Chernobyl in 1986 forced 160,000 people from their homes, many never to return, and destroyed businesses, fisheries and agriculture. The criminal and civil legal cases do not threaten financial ruin for Tepco, which is now backstopped by Japanese taxpayers and faces far bigger costs to decommission the Fukushima plant and clean up the surrounding areas.

Rather, the cases could further increase opposition to nuclear restarts -- which consistently beats support by about two-to-one -- as Prime Minister Shinzo Abe's government pushes to restore nuclear to Japan's energy mix to reduce reliance on imported fossil fuel.

"The nuclear plant disaster has upended our way of life," evacuee and former beekeeper Takahisa Ogawa, 45, testified recently in a court in Iwaki, near the Fukushima power station. "We've lost the support we counted on."

PROVING NEGLIGENCE

Ogawa and other plaintiffs are seeking 20 million yen (£102,192) each in damages from Tepco. More than 10,000 evacuees and nearby residents have brought at least 20 lawsuits against the utility and the

government over the handling of the disaster at the Fukushima Daiichi nuclear plant 220 km (130 miles) north of Tokyo.

The biggest class action, with 4,000 plaintiffs, seeks to dramatically increase Tepco's liability by proving negligence under Japan's civil law, rather than simply proving harm and seeking compensation, said lead attorney Gentaro Managi.

Japan recently approved increasing the amount of compensation payments through a government-run fund to 7 trillion yen (\$56 billion).

Prosecutors twice declined to charge former Tepco bosses over their handling of the disaster, citing a lack of evidence, but a citizens' panel overruled them last month. It's unlikely the three former executives, who will be summoned to give evidence in court, will be convicted as it is hard to prove criminal acts in this type of case, said Nicholes Benes of The Board Director Training Institute of Japan.

The legal actions against Tepco are "serious for the industry" as it seeks to gradually bring some of Japan's 43 idled nuclear reactors back online, said Tom O'Sullivan, an independent energy consultant and former investment banker.

"With potentially up to 25 reactors coming online, board members of other electric power companies must be quite nervous about what could happen if something goes wrong," he said. "Most reactors have been switched off for four years so switching them back on is going to be potentially problematic, not to mention the risk of natural disasters."

"UNAVOIDABLE"

It's unclear what bearing the various lawsuits against Tepco might have on one another, but a common thread is that it should have anticipated the possibility of a devastating quake and tsunami and taken steps to reduce the impact.

The company maintains that the severity of the 9.0 magnitude quake and 13-meter wave could not have been predicted.

But the document introduced as evidence in the shareholders' suit after a judge forced Tepco to produce it, appears to challenge that. The "Tsunami Measures Unavoidable" report, dated September 2008, was filed with the Tokyo District Court in June, but has not been widely reported.

The unnamed authors prepared the report for a meeting attended by the head of the power station and marked the document "to be collected after discussion." It's not clear whether senior executives in Tokyo saw the report at the time.

The report called for Tepco to prepare for a worse tsunami than it previously assumed, based on experts' views.

"Considering that it is difficult to completely reject the opinions given thus far of academic experts on earthquakes and tsunami, as well as the expertise of the [government's] Headquarters for Earthquake Research Promotion, it is unavoidable to have tsunami countermeasures that assume a higher tsunami than at present," says the report.

"This is prime evidence that Tepco recognised the need for tsunami measures," said Hiroyuki Kawai, lead attorney in the shareholders' suit. "This will have an important impact on the lawsuit."

Tepco, in a court filing, counters that the document "does not mean there was a risk that a tsunami would strike and did not assume any specific tsunami countermeasures."

Asked to comment further on the internal report and the range of legal problems facing the company, Tepco spokesman Kohji Sakakibara told Reuters, "We cannot answer these questions because they pertain to lawsuits and because they suppose a hypothetical determination of negligence. However, the company is making appropriate assertions in the lawsuits and expects that in the end the courts will render fair judgements."

The shareholder lawsuit, filed in March 2012, seeks to establish responsibility for the disaster and demands 5.5 trillion yen [\$44 billion] in damages from current and former executives. A verdict is not expected for at least a year.

"This is likely to become a long battle where lawsuits go on for several decades or half a century," said Shunichi Teranishi, a professor emeritus of law at Hitotsubashi University in Tokyo, comparing it to the Minamata mercury poisoning disaster in the 1950s, where lawsuits continue to be filed to this day.

August 17, 2015

Industrial Groups Welcome Japan Reactor Restart

<http://www.nucnet.org/all-the-news/2015/08/17/industrial-groups-welcome-japan-reactor-restart>

Security & Safety

17 Aug (NucNet): The chairmen of three industrial groups in Japan have welcomed the restart of the Sendai-1 nuclear reactor unit, saying it will help the country's economy, the Japan Atomic Industrial Forum (Jaif) said.

Chairman Sadayuki Sakakibara of the Japan Business Federation Keidanren (JBF), Chairman Akio Mimura of the Japan Chamber of Commerce and Industry (JCCI) and Chairman Yoshimitsu Kobayashi of the Japan Association of Corporate Executives (JACE) issued statements after the Sendai-1 nuclear unit restarted on 10 August 2015.

Mr Sakakibara said nuclear power is an important energy source for Japan, "not only from the viewpoints of energy security and economy, but also as a measure to combat global warming".

Mr Mimura said the restart of the reactor will be very helpful to Japan's economy as a whole because rising power costs have become a burden to small- and medium-sized enterprises, as well as to the recovery of local economies. Mr Mimura emphasized that a stable supply of energy at a reasonable price must be realised throughout Japan by all means.

The expertise accumulated during the examination procedures at Sendai-1 should be shared among Japan's power companies and nuclear power station operators in order to speed up the process for restarting other nuclear units, Mr Mimura also said.

Mr Kobayashi said constant efforts have to be made to improve safety at all nuclear power stations, including such systematic aspects as the issuance of highly practical evacuation plans, and the disclosure of accurate information to the public nationwide.

The government should also formulate realistic measures concerning high-level radioactive waste treatment and disposal, as well as the nuclear fuel cycle, so that the country's nuclear power business can be sustainable, Mr Kobayashi also said.

In May 2015, Japan's government said it will "take the initiative" in identifying scientifically suitable or promising candidate sites for a high-level radioactive waste (HLW) repository, moving away from its previous approach of relying on applications from municipalities.

The Japan Times said around 17,000 tonnes of spent fuel from nuclear plants across the country are stored in pools at the plants themselves and in a storage facility at the reprocessing plant in Rokkasho, Aomori prefecture.

In April 2014, Jaif president Takuya Hattori said fossil fuel plants have had to fill the gap left by nuclear energy when the country's nuclear units were shut down after the March 2011 earthquake, tsunami and the Fukushima Daiichi accident. For utilities, this meant having to buy more oil, coal and natural gas adding a cost of about ¥3.7 trillion (about €28.5 billion) for 2014.

Since the shutdown of nuclear reactors in Japan, utilities have increased rates by about 20 percent for household consumers and about 30 percent for industrial consumers, according to Jaif. This has resulted in energy-intensive industries wanting to move out of Japan to countries like South Korea.

On 10 August 2015, Sendai-1 became the first nuclear unit to restart in Japan after all units had been shut down for safety checks and upgrades following the Fukushima-Daiichi accident. The Sendai-1 unit received approval to restart in May 2015, completing the NRA's three-part screening process and new safety requirements introduced for all nuclear plants in June 2013.

Earlier this year Japan's Institute of Energy Economics said 11 nuclear units could be back online by the end of March 2016.

"Truth... the first casualty of war"

August 8, 2015

Truth hurts: censorship in the media

Staff Writer

"Truth, it has been said, is the first casualty of war." — Philip Snowden, July 1916

In September 1945, less than a month after Japan's surrender ending World War II and ushering in the U.S.-led Occupation, Gen. Douglas MacArthur, supreme commander for the Allied powers, began cracking down on alleged Japanese war criminals. Over the next three months, hundreds of politicians, military men, bureaucrats and industrialists would be issued arrest warrants for their role in leading Japan to, and through, the war.

Among those who found themselves under suspicion as Class-A, -B, or -C war criminals were senior members of the press. One of the most notorious was Matsutaro Shoriki, owner of the Yomiuri Shimbun newspaper.

"He was one of the most important journalists who actively propagated the Axis cause before the war and energetically supported it through the war," read a secret report on Shoriki compiled by Occupation officials when he was arrested on Dec. 12., 1945.

"With the large circulation that his newspaper enjoyed, he ought to be regarded as one of the most evil influences in poisoning the public mind."

Shoriki would serve only 21 months in prison before being released, as the Occupation's early zeal for going after the country's conservative and right-wing wartime leaders such as Shoriki gave way to a desire to work with them as a bulwark against the Soviet Union and communism in the new Cold War.

Yet Shoriki was hardly alone. Senior editors and producers working for the country's major print and broadcast media also found themselves arrested or under suspicion in the early months of the Occupation, as the Allies looked to fix blame on the war's most influential propagandists and ensure they would not hinder efforts to rebuild Japan. But the roots of Japan's media problem ran deeper than most in SCAP realized.

Road to censorship

When Japan surrendered, the Asahi, Mainichi and Yomiuri newspapers, along with NHK radio, were the dominant news organizations and had long been subject to censorship. Government control of newspapers dated back to at least 1909, when the Diet passed the Newspaper Law, which restricted freedom of press.

As Gregory Kasza outlines in his 1988 book, "The State and the Mass Media in Japan: 1918-1945," activities banned under the 1909 law included covering closed judicial and legislative meetings, printing the contents of government documents that had not been officially released, insulting the Emperor or agitating for the government to be overthrown. Anything that authorities might define as "subversive" to the public order, or was judged to be a threat to public manners or morals, also ran the risk of being censored.

This law formed the basis of future government efforts that would further restrict press freedom. For example, the 1925 Public Security Preservation Law (also known as the Peace Preservation Law) was aimed at punishing socialist or communist groups, and made it a crime for anyone to form an organization that challenged the national polity or the system of private property.

Following the 1931 Manchurian Incident, which would lead to war with China, the government once again intervened. In March 1933, partially to quell opposition to what the Imperial Japanese Army was doing in Manchuria, the Diet passed a resolution that urged all "radical" ideas to be suppressed.

For NHK, which began radio broadcasts in 1925, a key year was 1934 when the government decided the broadcaster's local stations had too much autonomy. NHK branches at the time sometimes saw news in ways that were too different from the official line heard in Tokyo. Thus, the Communications Ministry forced NHK to centralize its operations in the Tokyo head office, which could now control content for the entire country.

“Programming would not simply flatter popular desires but would promote the ‘Japanese spirit’ and provide leadership,” Kasza writes, paraphrasing the statement of a ministry official.

The Communications Ministry also took charge of the hiring and firing at NHK. Ex-bureaucrats, many of whom often had little or no understanding of radio, were appointed to high-level posts at the broadcaster. This would lead to an inside joke that the ideal NHK executive was a “three *tei* man.” First, he was a graduate of a university such as Tokyo University, a *tei-koku daigaku*, or “Imperial university.” Second, he was somebody who had worked in the Tei-shinsho (Communications Ministry). And, third, he was a *tei-no* — an imbecile.

Japanese media scholars point to a number of laws passed in the late 1930s that removed the final barriers to media censorship — in particular, the 1938 National Mobilization Law, which was drafted in response to the July 1937 Marco Polo Bridge Incident near Beijing, an event that had led to full-scale war between Japan and China.

The law strengthened government control over private organizations, especially the media. Despite protests by some Diet members that it was unconstitutional, the law passed in 1938 under strong pressure from the Cabinet and with concerns, very real at the time, that the military might overthrow the government, as had almost happened during the Feb. 26, 1936, incident in which young military officers tried to stage a coup d’etat.

“The National Mobilization Law was the pivotal moment in the history of the Japanese media,” says Kaori Hayashi, a media scholar at the University of Tokyo’s Graduate School of Interdisciplinary Information Studies. “It became the source of power for all the existing media players, including broadcasting stations, because it excluded new players from the (media) industry, and made the *kisha* (press) club system that exists today legitimate.”

Final consolidation

From the spring of 1938, the move toward more government control of the media accelerated. A few months after the National Mobilization Law, the Home Ministry banned reports that conflicted with the government’s China policy. Furthermore, letters to the editor would be more carefully scrutinized. None that were judged to weaken public resolve would be printed. Nor were newspapers allowed to print letters from soldiers or the families of soldiers in China who faced problems. Building upon the morality clause in the 1909 Newspaper Law, the government also frowned upon articles that introduced “gaudy new fashions” or “frivolous tastes.”

With so many new laws and regulations to possibly run afoul of, and never entirely sure what would pass the censor, major media organs and the government had, by the early 1940s, developed a system of consultation and cooperation. Senior editors would meet with government officials to not only receive legally enforceable directives on what they could and could not print but also “advice” on how to spin the news in a way that would pass the censor and avoid the financial costs — and possible legal action — that would result in newspapers violating government press directives.

By then, there were far fewer voices of dissent in the media to oppose these efforts at control.

“In addition to the state’s legal controls, the continual ‘consultations’ with media people enabled the government to censor material before publication and to blacklist writers,” Kasza said in an e-mail to The Japan Times. “By the late 1930s, many of those banished from the media world had been mainstream rather than radical intellectuals, and this sent a clear message to those who remained active. Media people who wanted to continue resistance were relatively few.”

Over 1940 and 1941, consolidation of the media under government supervision was largely completed. In early 1941, the Cabinet Information Bureau, which would emerge as the most powerful government

authority in terms of media control, issued a directive after consultations with major newspapers such as the Yomiuri, Asahi and Mainichi that banned the publication of state secrets.

Further orders were given to the media to play up government attempts to resolve the war in China (or the “China Incident” as it was referred to). On the home front, reports and editors were forbidden to be overly critical of Diet members. By then, Kasza writes in his book, Cabinet Information Bureau officials were holding constant briefings at the Diet, where bureaucrats would first attend the Diet sessions and then sit in on meetings with editors where they would tell the media what was banned, what they would not like published, and how the papers might spin particular stories to avoid censorship.

The result would be little more than propaganda about war, virtually all of it false. In the months after the December 1941 attack on Pearl Harbor, the media could cheerlead for the navy’s advances in the South Pacific (even as the “China Incident” continued to drag on). However, Japan’s defeat at the Battle of Midway in June 1942 was hushed up, as were subsequent defeats as the tide of war turned.

This was not to say the media themselves were always in the dark about what was really going on, although clandestine efforts to learn the truth were necessary. One the more famous stories of attempts to learn from the outside world the truth of what was happening is that of Mainichi Shimbun’s “Women’s Toilet Press.”

Not long after Pearl Harbor, the women’s toilet in the paper’s headquarters was renovated, which included soundproofing. On the assumption the men in the police and military would not embarrass themselves by searching a woman’s toilet, enterprising journalists hid a shortwave radio there to secretly — and illegally — receive overseas broadcasts.

Over the course of the war, the radio picked up broadcasts from numerous countries, including the United States. It was via this source that Mainichi journalists learned about (but could not report directly on) Japan’s defeats in the Pacific War after 1942, the collapse and surrender of its ally Germany in May 1945 and then, in July 1945, the Potsdam Declaration that called for Japan’s unconditional surrender.

Censorship continues

The end of the war brought with it the American-led Occupation and an often sincere, if sometimes naive, belief on the part of Occupation officials they could fundamentally remake Japan. “Democracy” was the buzzword in the first months after the war. As the Japanese media learned, however, that did not necessarily mean they were free to report on whatever they wished.

In William Coughlin’s definitive 1952 book on Occupation policy toward the media, “Conquered Press: The MacArthur Era in Japanese Journalism,” the author notes that MacArthur had a contentious relationship with the Japanese and foreign media. What could be printed (or broadcast on the radio) under Occupation authority was often decided in an arbitrary manner.

“The application of censorship rules was so confusing and difficult that most large Japanese newspapers set up permanent ‘censorship desks’ at which they posted experts who were expected to keep informed on the latest interpretation of the rules by Supreme Headquarters,” Coughlin writes.

While domestic reports were targeted for censorship, SCAP officials were particularly anxious to keep out foreign media reports that were critical about what was happening in Japan. U.S. Col. Donald Hoover, chief of censorship, said on Nov. 3, 1945 that there were four types of foreign media stories that would not be allowed to be reported in Japan.

These included, Coughlin writes, attempts to build up offenses by American troops into anything resembling a “crime wave,” any attacks in editorials or reports from the U.S. to Japan that might undermine Japanese confidence in the Occupation, blatantly false statements and anything that encouraged militarism.

Censorship would continue throughout the Occupation. By 1948, however, liberal idealists who'd arrived in the autumn of 1945 had all departed, replaced by those concerned with the looming Cold War and keeping militant unions, leftists and socialists out of power — and especially out of the media. Those who had been arrested on suspicion of being war criminals in 1945 were out of jail by 1948 and America's new allies in the struggle against communism.

The change in priorities suited Japanese media owners who were anxious to curb the power of the unions, and they saw the advantages of issuing their own directives in line with SCAP's attitude. On March 16, 1948, the Japan Newspaper Publishers and Editors Association cracked down on printers unions and reporters who reported in a way that "damaged editorial fairness" or didn't follow editorial policy as laid down by management.

"Reporters were virtually deprived of their freedom, and 'neutrality' and 'objectivity' became god-like terms for Japanese reporters," Tokyo University's Hayashi says.

When the Occupation ended in 1951 with the signing of the San Francisco Peace Treaty, Japan's media would consist of all of the prewar daily newspapers as well as NHK and, not long afterward, commercial television stations. With the Americans gone, Japan's media faced fewer legal restraints than at any time since, arguably, the 1909 newspaper law. However, as postwar developments would come to show, the media, like Japan itself, would retain certain prewar habits, customs and political arrangements that, if nothing else, ensured their own survival and prosperity.

Government ban on foreign loanwords forced The Japan Times to change its name in 1943

Strict control of the press during wartime Japan also extended to the realm of English-language newspapers, and particularly to The Japan Times, after its English competitors were incorporated into the paper.

The decision to continue publishing one English-language paper during the war years was made for several reasons. First, it was a source of information for citizens of friendly or neutral countries who remained in Japan during the war years. Second, it was a way for the Japanese government and the Foreign Ministry to speak to the outside world.

"There were liberal circles at both The Japan Times and the Foreign Ministry who wanted to show the world Japan was not being run by a bunch of fanatics," says Peter O'Connor, an expert on the history of English newspapers in Japan and Asia who teaches at Musashino University and Waseda SILS in Tokyo. The paper's exact positions on any given issue weren't always clear, though it did operate under government control. However, it was not restricted: It was sold at venues other than foreign embassies in Tokyo. According to O'Connor, it could also be purchased in kiosks and international hotels by anyone, without having to register with the government or receiving special permission.

This is somewhat ironic given official attempts to ban the public use of English. Mark Irwin, a linguistic scholar at Yamagata University who has written on wartime crackdowns on English, says that between 1940 and 1945, English was declared a *tekiseigo* (combatant language) or a *tekikokugo* (language of an enemy nation).

What this meant in practice was that many English loanwords were replaced with more "Japanese" words. For example, entertainers were no longer allowed to use "bizarre stage names, including those containing English" because they were "fostering the vice of foreigner worship."

English signs at more than 4,000 train stations were removed, sales of records and songs with English titles or lyrics were prohibited, and bars and restaurants in the Ginza were not allowed to have "European-like" names.

Of course, the "Japan" Times became the "Nippon" Times in 1943, because "Japan" was, after all, an English name.

JAEA ignores regulations while NRA turns a blind eye

August 19, 2015

JAEA produced nuclear fuel without permission

<http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html>

Aug. 19, 2015 - Updated 11:03 UTC+2

Japan's nuclear regulators have ordered the Japan Atomic Energy Agency not to produce or test nuclear fuel before clearing screening and inspections.

The agency's facility in Tokai Village, north of Tokyo, has government permission to use nuclear fuel but not to process it, despite having applied to do so in 2004.

On Wednesday, **the agency told the Nuclear Regulation Authority that it test-produced mixed-oxide, or MOX, fuel at the facility last month.** The fuel is a combination of uranium and plutonium reprocessed from spent nuclear fuel.

The agency said it thought that since the production was done experimentally, permission for usage was enough.

Regulators ordered the agency to immediately apply for screening, and said processing permission is needed to produce and test MOX fuel.

The agency said it will respond appropriately to the order.

Meanwhile, **the authority's secretariat has admitted to failing to point out the need for processing permission despite being notified in advance of the agency's test plan.**

End of Kepco's monopoly?

August 23, 2015

Top-heavy, nuke-clinging Kepco faces liberated electricity market

<http://www.japantimes.co.jp/news/2015/08/23/national/top-heavy-nuke-clinging-kepco-faces-liberated-electricity-market/#.VdozDJfwLLP>

by Eric Johnston
Staff Writer

OSAKA – News that 7-Eleven stores in the Kansai region will trade Kansai Electric Power Co.'s electricity in favor of cheaper electricity from Tokyo Electric Power Co. has locals wondering if Kepco's six-decade monopoly over Kansai's electricity supply might be ending.

From October, about 1,000 Seven-Eleven Japan Co. Ltd. stores in three Kansai prefectures will purchase their electricity from Tepco. The move comes just months after Kepco raised rates, and Seven-Eleven Japan, noting Tepco's cheaper fees, made the move to switch utilities.

Stores in Nara, Wakayama and Hyogo prefectures will receive 32,000 kw of Tepco-provided electricity from a self-generator at the utility's Kansai factory. That's enough to power about 10,000 homes. For Seven-Eleven Japan, switching to Tepco means reduced electricity costs amounting to hundreds of millions of yen.

With deregulation in the smaller users electricity market set to begin next April, giving small businesses and residential customers a wider option of providers, Kepco seems particularly ill-placed to take advantage of the new competitive environment.

Prior to 2011, Kepco relied on nuclear power for up to half of its total electricity supply — the highest ratio of any utility in Japan. Because all 11 of its reactors remain idle, though two will be decommissioned, Kepco says it was forced to hike electricity rates in June to make up for lost revenues. But a host of critics, starting with Osaka Mayor Toru Hashimoto, have also noted that Kepco has done little to reduce its top-heavy management structure, especially the number of senior executives, all of whom command huge salaries and bonuses.

Adding to investor concerns is the fact that scare stories about how blackouts will occur without Kepco-provided nuclear power no longer resonate with the public. Thanks to a combination of voluntary reductions in electricity usage and ever more energy efficient technology, Japan as a whole is consuming over 10 percent less electricity now compared to 2010.

Even during the first week of August, when air conditioners were running full blast and temperatures topped 35 degrees, Kepco had plenty of electricity to sell, with demand under 90 percent, and as low as 80 percent, of available supply.

Nowadays, Kepco has changed tactics, and says the only way it can compete against Tepco and new electricity providers is to restart its nuclear plants so it can offer lower prices. But increased competition due to deregulatory measures, the introduction of more energy-efficient technologies like LED lighting, and shifting electricity consumption habits these past four years means Kepco will have to fight a lot harder to keep its old customers — let alone find new ones — in the coming years.

TEPCO blamed (again) for negligence in reporting information

August 25, 2015

Panel blames TEPCO's negligence for delay in information disclosure

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201508250044>

By HIROMI KUMAI/ Staff Writer

An outside panel of experts accused Tokyo Electric Power Co. of **not living up to its responsibility to promptly release all available data on the contaminated water leaks at the Fukushima No. 1 nuclear power plant.**

The third-party panel said that up until February this year, plant operator TEPCO had been negligent in releasing information about radioactive water leaks, although it had data confirming the leaks. Contaminated water had been confirmed leaking into the ocean every time it rained since TEPCO started monitoring the radioactive levels in drainage systems in April 2014. When leaks of contaminated water into the plant's harbor first came into light in summer 2013, the utility pledged to promptly report the radiation levels whenever it obtained monitoring data. But workers at the plant had not been informed of the policy nor were they assigned specific tasks related to the policy. The panel's report concluded that TEPCO showed a tendency to prioritize responding to recurrent troubles at the plant over actually implementing effective countermeasures. "There is an organizational culture at the company for officials to avoid clarifying where responsibility lies and implementing planned countermeasures," the report said. After its shoddy record of reporting information on radiation levels drew fire, TEPCO retraced past data and made it available to the public. It has disclosed all monitoring data on radioactive materials at the plant since Aug. 20.

Typhoon season soon : TEPCO still not fully prepared against radioactive leaks

August 29, 2015

Contaminated rainwater at Fukushima plant repeatedly leaked into sea

<http://mainichi.jp/english/english/newsselect/news/20150829p2a00m0na019000c.html>

FUKUSHIMA -- Rainwater containing radioactive contaminants flowed from a drainage ditch by the reactor buildings at the Fukushima No. 1 Nuclear Power Plant into the sea on five occasions in just over four months, it has been learned.

The ditch is 2 meters deep and 2 meters wide, and stretches for about 800 meters. It was created to ferry rainwater from the plant grounds into the ocean, but in February this year it was learned that highly contaminated rainwater from the top of the No. 2 reactor building had flowed into the ditch and subsequently into the ocean. Tokyo Electric Power Co. (TEPCO), the operator of the plant, set up a 70-centimeter-high dam in the ditch, as well as eight pumps to move water from the ditch to another ditch that runs into a sealed harbor area. The pumps, which together can process rainfall of 14 millimeters per hour, were started on April 17 this year.

On April 21, however, loss of power caused by trouble with power generators resulted in all of the pumps shutting down, and contaminated water leaked into the sea. On July 16, rainfall rose to 21 millimeters per hour at one point. This was more than the pumps could handle, and workers confirmed that water flowed into the ocean. In all, five leaks from the ditch occurred in the period between April 17 and Aug. 27.

The concentrations of radioactive cesium and other radioactive materials in the contaminated rainwater ranged from around 20 to 670 times the safety level set for a "subdrain" plan in which decontaminated groundwater is to be released into the ocean.

The volume of leaked rainwater is unknown, but no changes have been seen in radioactive concentrations in the sea near the plant.

The Fukushima Prefectural Government on Aug. 27 issued a new request to TEPCO to introduce leak prevention measures. The next day, TEPCO raised the ditch dam by 15 centimeters, but Naohiro Masuda, chief decommissioning officer at Fukushima Daiichi Decontamination and Decommissioning Engineering Co., says, "Our main countermeasure will be to **replace the ditch with a new one.**"

This new ditch is designed to carry rainwater into the sealed harbor area. Masuda indicated that until completion of the new ditch -- scheduled within the fiscal year -- additional leaks may be unavoidable. **The plant therefore looks set to enter the typhoon season without full preparations against further leaks.**

In February, after the rainwater leaks were discovered, fishermen protested that TEPCO had not released radiation measurements for the drainage ditch water for around 10 months. Negotiations with fishermen over the subdrain plan were subsequently put on hold. However, the Fukushima Prefectural Federation of Fisheries Co-operative Associations officially agreed to the plan after receiving notification from TEPCO and the national government regarding measures to prevent a recurrence of the leaks.

Regarding the rainwater leaks, federation chairman Tetsu Nozaki commented, "All we can do is to ask TEPCO to improve the situation. The subdrain plan is a separate issue, and there is no change in our acceptance of it."

Final report on Fukushima disaster (2)

Child thyroid cancer unlikely to rise in Fukushima but extent of radiation exposure unclear: IAEA

<http://www.japantimes.co.jp/news/2015/09/01/national/science-health/iaea-fukushima-linked-child-cancers-unlikely-rise-extent-radiation-exposure-unclear/#.VeVMOpfwmic>

Reuters

UNITED NATIONS – An increase in thyroid cancer among children is unlikely after the disaster at the Fukushima No 1 nuclear plant four years ago, but it remains unclear exactly how much radiation children in the vicinity were exposed to, International Atomic Energy Agency said in a new report.

Increased thyroid cancer is generally the leading health concern after exposure to nuclear radiation, but that may not be the case after the three reactor meltdowns at the Tokyo Electric Power Co. plant in March 2011, the Vienna-based watchdog said in the report, which was released Monday.

"Because the reported thyroid doses attributable to the accident were generally low, an increase in childhood thyroid cancer attributable to the accident is unlikely," the report says.

"However, uncertainties remain concerning the thyroid equivalent doses incurred by children immediately after the accident," it adds.

Those uncertainties are largely due to a lack of reliable personal radiation monitoring data immediately after the disaster started, when radioactive iodine and other radioactive materials were spewed into the environment, the report says.

The earthquake and following tsunami made emergency response measures difficult, if not impossible, to implement.

Adding to the uncertainty was the fact that the administration of “stable iodine” to protect children’s thyroid glands was not done uniformly at the time, “primarily due to the lack of detailed arrangements,” the report says.

Detailed screening of children’s thyroid glands is being undertaken now in Japan as part of a survey aimed at the early detection and treatment of diseases.

The report highlights areas where improvements are needed in light of the Fukushima catastrophe. The IAEA said more sustainable solutions are needed for the management of highly radioactive water and radioactive waste being collected at the plant, “including the possible resumption of controlled discharge into the sea.”

The reports adds that countries should prepare detailed scenarios and train workers for coping with worst-case natural disasters, including situations where more than one disaster is combined with a nuclear accident. They should also plan for cleanup operations in the wake of such incidents.

The report calls for strengthened international cooperation in the event of such accidents.

U.N. nuclear watchdog makes comprehensive report on Fukushima accident

<http://mainichi.jp/english/english/newsselect/news/20150901p2g00m0dm048000c.html>

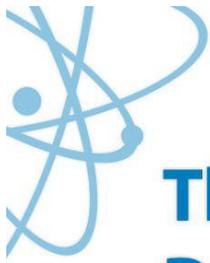

VIENNA (Kyodo) -- The International Atomic Energy Agency on Monday released a comprehensive report on the causes and consequences of the 2011 disaster at the Fukushima Daiichi nuclear power plant, saying that a major factor behind the accident was "the widespread assumption in Japan" that nuclear power plants were safe and an accident of that magnitude unthinkable.

The report, which comes with technical volumes totaling more than 1,000 pages, will be presented to the next annual meeting of the U.N. nuclear watchdog's general conference scheduled to start Sept. 14.

Director General Yukiya Amano said that the safety assumption was accepted by nuclear power plant operators and that regulators and the government did not challenge it. "As a result, Japan was not sufficiently prepared for a severe nuclear accident in March 2011," he said in the report.

The report is a result of a collaboration of some 180 experts from 42 countries. It compiles lessons learned from the accident triggered by a tsunami following a massive earthquake as well as Japan's emergency responses, radiological consequences and post-accident recovery.

IAEA Releases Director General's Report on Fukushima Daiichi Accident

Monday 31 August 2015 14:00 CEST

By Miklos Gaspar, IAEA Office of Public Information and Communication

The IAEA Director General's Report on the Fukushima Accident and the five technical volumes distil and assemble lessons learned from the accident and provide a knowledge base for the future.

The IAEA Director General's Report on the Fukushima Daiichi Accident, along with five technical volumes on this topic by international experts, have just been publicly released. This publication comes ahead of the Agency's General Conference in September.

The report assesses the causes and consequences of the 11 March 2011 accident at the Fukushima Daiichi Nuclear Power Plant in Japan, triggered by a tsunami that followed a massive earthquake. It was the worst emergency at a nuclear power plant since the Chernobyl disaster in 1986.

"The report considers human, organizational and technical factors and aims to provide an understanding of what happened, and why, so that the necessary lessons learned can be acted upon by governments, regulators and nuclear power plant operators throughout the world," IAEA Director General Yukiya Amano said in his Foreword to the Report. "There can be no grounds for complacency about nuclear safety in any country."

The report and the technical volumes distil and assemble lessons learned from the accident and provide a knowledge base for the future. They consider the accident itself, emergency preparedness and response, radiological consequences of the accident, post-accident recovery and the activities of the IAEA since the accident. Measures taken, both in Japan and internationally, are examined. "Although nuclear safety remains the responsibility of each individual country, nuclear accidents can transcend national borders," Mr Amano said in his foreword. "The Fukushima Daiichi accident underlined the vital importance of effective international cooperation. The IAEA is where most of that cooperation takes place. Our Member States adopted the IAEA Action Plan on Nuclear Safety a few months after the accident and have been implementing its far reaching provisions to improve global nuclear safety."

Mr Amano had announced in 2012 that the IAEA would prepare an authoritative, factual and balanced assessment of the accident, addressing both its causes and consequences. The report is the result of an extensive collaboration that involved some 180 experts from 42 IAEA Member States and several international bodies.

The report and the technical volumes are accessible here. A brochure summarizing the main findings is available here.

The Director General's Report in Arabic, French, Russian and Spanish is available here. The Chinese translation will be available later this week. The unofficial Japanese translation of the Foreword and the Executive summary of the Director General's Report are available here. The full translation will be published in September.

Japan Thought Major Nuclear Accident Was 'Simply Unthinkable', Says IAEA Fukushima Report

<http://www.nucnet.org/all-the-news/2015/09/01/japan-thought-major-nuclear-accident-was-simply-unthinkable-says-iaea-fukushima-report>

Unplanned Events & Incidents

1 Sep (NucNet): A major factor that contributed to the March 2011 accident at the Fukushima-Daiichi nuclear station was the widespread assumption in Japan that its nuclear power plants were so safe that an accident of this magnitude was "simply unthinkable", a report by the director-general of the International Atomic Energy Agency says.

The report, which is more than 200 pages long and is published with five technical volumes, says this assumption was accepted by nuclear station operators and not challenged by regulators or by the government. "As a result, Japan was not sufficiently prepared for a severe nuclear accident in March 2011," the report says.

IAEA director-general Yukiya Amano said in his foreword to the report that the accident, the worst emergency at a nuclear power plant since the Chernobyl disaster in 1986, exposed "certain weaknesses" in Japan's regulatory framework. Responsibilities were divided among a number of bodies, and it was not always clear where authority lay.

Mr Amano said there were also certain weaknesses in plant design, in emergency preparedness and response arrangements and in planning for the management of a severe accident.

“There was an assumption that there would never be a loss of all electrical power at a nuclear power plant for more than a short period,” he said. “The possibility of several reactors at the same facility suffering a crisis at the same time was not considered. And insufficient provision was made for the possibility of a nuclear accident occurring at the same time as a major natural disaster.”

Mr Amano said since the accident, Japan has reformed its regulatory system to better meet international standards. It gave regulators clearer responsibilities and greater authority. The new regulatory framework will be reviewed by international experts through an IAEA Integrated Regulatory Review Service mission. Emergency preparedness and response arrangements have also been strengthened.

The IAEA said the report assesses the causes and consequences of the accident, which was triggered by a tsunami that followed a massive earthquake. It considers human, organisational and technical factors and aims to provide an understanding of what happened, and why, so that lessons learned can be acted upon by governments, regulators and nuclear power plant operators.

The report considers the accident itself, emergency preparedness and response, radiological consequences of the accident, post-accident recovery and the activities of the IAEA since the accident. It examines measures taken, both in Japan and internationally.

“Although nuclear safety remains the responsibility of each individual country, nuclear accidents can transcend national borders,” Mr Amano said. **“The Fukushima-Daiichi accident underlined the vital importance of effective international cooperation.”**

Mr Amano had announced in 2012 that the IAEA would prepare an assessment of the accident, addressing both its causes and consequences. The IAEA said the report is the result of an extensive collaboration that involved some 180 experts from 42 IAEA member states and several international bodies.

Delay in decontamination unacceptable

August 31, 2015

Panel: Delay in decontamination work regrettable

http://www3.nhk.or.jp/nhkworld/english/news/20150901_04.html

Aug. 31, 2015 - Updated 22:36 UTC+2

A panel of Japan's Environment Ministry says the government should reflect on the greatly delayed decontamination work in Fukushima Prefecture.

A nuclear accident occurred there in 2011.

The panel of experts released a draft outline at a meeting in Tokyo on Monday. The panel has been looking into the disposal of contaminated waste from the Fukushima Daiichi nuclear disaster.

The draft refers to the government-run decontamination operation in evacuation zones in the prefecture. The projected end of the work was revised to the end of March, 2017 -- about 2 to 3 years later than initially planned.

The panel said the government should reflect on the delay caused by difficulties in securing initial storage sites for contaminated soil and debris.

The draft also refers to the issue of building disposal facilities for radioactive waste. The government plans to set up such facilities in 5 prefectures in eastern and northeastern Japan, but faces local objections.

The panel only said that the government should continue providing explanations to communities.

The draft approves the continuation of the government policy on decontamination and nuclear waste disposal, saying that the basic framework is working effectively.

The panel plans to compile a report at the next meeting.

Assumption of safety behind Fukushima debacle: final IAEA report

<http://www.japantimes.co.jp/news/2015/09/01/national/assumption-safety-behind-fukushima-debacle-final-iaea-report/#.VeaWPJfwmic>

Jiji

BERLIN – The widespread assumption that nuclear plants were safe was behind the March 2011 accident at the Fukushima No. 1 nuclear plant, the International Atomic Energy Agency said in its final report on the crisis.

Before the catastrophe, “there was a basic assumption in Japan that the design of nuclear power plants and the safety measures that had been put in place were sufficiently robust to withstand external events of low probability and high consequences,” the report, released Monday, says.

Because of this assumption, “there was a tendency for organizations and their staff not to challenge the level of safety,” the report says. This “resulted in a situation where safety improvements were not introduced promptly.”

The IAEA report stresses the need to “take an integrated approach that takes account of the complex interactions between people, organizations and technology” in order to better identify plant vulnerabilities to natural disasters and other unexpected events.

The report was compiled by around 180 experts from 42 countries. The plant was damaged in the tsunami caused by the powerful earthquake that hit off the Tohoku coast on March 11, 2011.

Some of the factors that contributed to the accident were “not unique to Japan,” IAEA Director General Yukiya Amano says in the report, adding that “continuous questioning and openness to learning from experience are key to safety culture and are essential for everyone involved in nuclear power.”

The Fukushima No. 1 plant’s vulnerability “to external hazards had not been reassessed in a systematic and comprehensive manner during its lifetime,” the IAEA report says.

“The assessment of natural hazards needs to consider the potential for their occurrence in combination, either simultaneously or sequentially,” it says.

Tokyo Electric Power Co. was “not fully prepared for the multiunit loss of power and the loss of cooling caused by the tsunami.”

“Operators had therefore not received appropriate training and had not taken part in relevant severe accident exercises, and the equipment available to them was not adequate in the degraded plant conditions,” the report says.

Furthermore, the report argues that “it was not fully clear which organizations had the responsibility and authority to issue binding instructions on how to respond to safety issues without delay.”

It points to a lack of “coordinated arrangements for responding to a nuclear emergency and a natural disaster occurring simultaneously.”

On the accident’s effects on human health, the Vienna-based IAEA said that thyroid cancer in children is “the most likely health effect.”

However, it adds that “because the reported thyroid doses attributable to the accident were generally low, an increase in childhood thyroid cancer attributable to the accident is unlikely.”

Still, the report notes that uncertainties remain “concerning the thyroid equivalent doses incurred by children immediately after the accident.”

As for the return home of people who have been evacuated following the accident, the IAEA stressed the need to consider “factors such as the restoration of infrastructure, and the viability and sustainable economic activity of the community.”

The long-term goal of post-accident recovery is to re-establish an acceptable basis for a fully functioning society in areas affected by the nuclear crisis, the report notes.

“Communication with the public on recovery activities is essential to build trust,” it says. For effective communication, “it is necessary for experts to understand the information needs of the affected population and to provide understandable information through relevant means.”

50 years ago TEPCO

50 YEARS AGO

Friday, Sept. 21, 1965 (Supplement published on the occasion of the ninth IAEA Conference, held in Tokyo)

Tepco reveals atomic power generation plans

<http://www.japantimes.co.jp/news/2015/09/05/national/history/accord-reached-french-indo-china-tepco-reveals-atomic-power-generation-plans-tokyo-civil-servants-get-reusable-chopsticks/#.VeyLtZfwmic>

SOON! **THIS SITE WILL BE THE SOURCE OF NUCLEAR POWER!**

Construction of the No. 1 Atomic Reactor (Power Output 350,000 KW) begins this year by the Tokyo Electric Power Company, ends in 1970; No. 2 (output 600,000 KW) begins in 1968; No. 3 (output 600,000 KW) in 1970 and No. 4 (output 600,000 KW) in 1972. The total output will be 2,150,000 KW when the No. 4 Atomic Reactor is completed in 1976. This project will supply limitless electric power energy for the benefit of the public.

 **TOKYO ELECTRIC POWER CO., INC.**
9, 2-chome, Utsunaiwa-cho, Chiyoda-ku, Tokyo, Japan

The sources of energy used for the generation of electric power in Japan have been progressively switched from hydraulic power to coal and then to heavy oil.

The country is now preparing to develop nuclear energy as a new source of energy from the standpoint of economically securing fuel required for steam power generation. The demand made on Tepco is expected to reach 17.89 million kw by 1973.

Tepco's program for nuclear power generation calls for the development of about 2 million kw by 1975. The move is expected to result in the conservation of about 3 million kiloliters of heavy oil, or about one-fifth of the total amount of crude oil needs.

Tepco has constantly kept busy making preparations, doing research and conducting other studies since setting up an atomic energy generation section in 1955.

A land area of about 2 million sq. meters was acquired for this purpose in November of last year along the coast stretching from Okuma-machi to Futaba-machi of Futaba-gun, Fukushima Prefecture.

Plans have been made to install the first and second reactors at this point. The enriched uranium light water model is scheduled to be used as the first reactor.

The Fukushima Research Center was established last December for the purpose of conducting on-the-spot research.

In order to collect enough data needed for ensuring the safety of the atomic power plant and its construction, the center is now busy at work on meteorological observation, geological and oceanographic surveys along with seismographic and subterranean observations — all of which are broad and time-consuming projects.

A study is underway to determine the water pumping formula for the cooling system, but a tentative plan calls for the acquisition of water directly from the sea through the construction of breakwaters.

A new committee, an advisory organ to the president is headed by Naojiro Tanaka, an executive director. It is in charge of drawing up blueprints for the atomic power plants and for making other arrangements necessary for launching the construction.

Another committee was organized this past July, also under the chairmanship of Tanaka, to work on the problem of earthquake-proofing and other technical matters regarding the construction. This committee is made up of academic and engineering experts, both inside and outside the company.

Thus busily engaged, Tepco is moving steadily ahead toward its goal.

Nuclear safety round the world

IAEA chief: Fukushima a lesson for others

<http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html>

Sep. 8, 2015 - Updated 03:52 UTC+2

The head of the International Atomic Energy Agency says he hopes its report on the Fukushima Daiichi accident will provide lessons on improving nuclear safety around the world.

IAEA Director General Yukiya Amano was speaking at a meeting of the board of governors on Monday in Vienna.

Amano cited the agency's final report released on August 31st, which looked into the causes and impact of the accident.

He described the report as a "major undertaking" with contributions from experts from many countries and international organizations. He said it was drawn up to serve as a solid knowledge base for the future.

He later told reporters he hopes that every country will make full use of the report in their efforts to improve nuclear safety.

The report says Japan was not sufficiently prepared for a severe nuclear accident due to an assumption

that nuclear plants were safe.

The ambassador for the Permanent Mission of Japan to the International Organizations in Vienna, Mitsuru Kitano, told the meeting Japan is taking the criticism to heart.

Kitano said that based on lessons from the accident, Japan has introduced various measures and wants to contribute to improving nuclear safety around the world.

Amano Calls For Urgent Action On Protection Of Nuclear Facilities

<http://www.nucnet.org/all-the-news/2015/09/07/amano-calls-for-urgent-action-on-protection-of-nuclear-facilities>

7 Sep (NucNet): Countries must take the threat of nuclear terrorism seriously by ensuring that amendments to the Convention on the Physical Protection of Nuclear Material (CPPNM) that oblige countries to protect nuclear facilities such as nuclear stations enter into force as soon as possible, International Atomic Energy Agency director-general Yukiya Amano has said.

Writing on the Project Syndicate website, Mr Amano said amendments to the 1987 CPPNM that would make it harder for terrorists to obtain nuclear material have yet to enter into force. The resulting vulnerability “needs to be addressed urgently”, he said.

In July 2005, signatories to the CPPNM agreed to amend it to address the risk of terrorism more effectively. The new measures would make it more difficult for terrorists to cause a widespread release of radioactive material by attacking a nuclear power station or detonating a radioactive dispersal device – commonly known as a dirty bomb.

But before the amendment can enter into force, two-thirds of the 152 signatories to the original CPPNM must ratify it. While significant progress has been made – in July, the US, Italy, and Turkey did so – at least 14 more countries are needed.

The original Convention focused only on the international transport of nuclear material, and did not cover the protection of nuclear facilities.

The amendment adopted 10 years ago would oblige countries to protect nuclear facilities and any nuclear material used, stored, or transported domestically. It would expand cooperation on locating and recovering stolen or smuggled nuclear material and coordinate the response to any attack on a nuclear facility. It would also make nuclear trafficking a criminal offence and require signatories to cooperate on improving national systems of physical protection and minimising the consequences of sabotage.

Mr Amano said the fact that there has never been a major terrorist attack involving nuclear or other radioactive material “should not blind us to the severity of the threat”. He said: “There is evidence that terrorist groups have tried to acquire the material needed to construct a crude nuclear explosive device, or a dirty bomb.”

The amount of nuclear material in the world is increasing, he said. Since 1999, the amount of such material being used for peaceful purposes has increased by 70 percent – a trend that will continue as the use of nuclear power grows. “It is essential that effective measures are in place to ensure that these materials are not misused or misplaced, whether accidentally or intentionally.”

Since 1995, the IAEA’s member states have reported nearly 2,800 incidents involving radioactive material escaping regulatory control, Mr Amano said. Although only a handful of these incidents involved material that could be used to make a nuclear explosive device, a relatively small amount of radioactive material could be combined with conventional explosives to create a dirty bomb. Such a weapon could be capable of killing many people, contaminating large urban areas, and sparking mass panic.

Mr Amano said much has been achieved in the secure management of nuclear material since the attacks on the US in September 2001 prompted a renewed focus on the risks of terrorism. Many countries have instituted effective measures to prevent the theft, sabotage, or illegal transfer of nuclear or other radioactive material, and security at many nuclear facilities has been improved. “But much more needs to be done,” he said.

The article is online: <http://bit.ly/1UwwFvV>

Background

The Convention on the Physical Protection of Nuclear Material was signed in Vienna and New York on 3 March 1980 and is the only international legally binding undertaking in the area of physical protection of nuclear material. It establishes measures related to the prevention, detection and punishment of offences relating to nuclear material.

A conference was held in July 2005 to amend the Convention and strengthen its provisions. The amended Convention makes it legally binding for signatories to protect nuclear facilities and material in peaceful domestic use, storage as well as transport. It also provides for expanded cooperation between and among states on measures to locate and recover stolen or smuggled nuclear material, mitigate any radiological consequences of sabotage, and prevent and combat related offences.

Nuclear terrorism a threat without global security co-operation

Source : The Australian

- **Nuclear terrorism is, in the words of US President Barack Obama, “the gravest danger we face”. But while few would dispute this characterisation, the world has unfinished business in minimising the threat. Ten years after world leaders agreed to amend the landmark 1987 Convention on the Physical Protection of Nuclear Material to make it harder for terrorists to obtain nuclear material, the new measures have yet to enter into force. The resulting vulnerability needs to be -addressed urgently.**
- In July 2005, signatories to the CPPNM agreed to amend the convention to address the risk of terrorism more effectively. The new measures that were introduced would make it more difficult for terrorists to cause a widespread release of radioactive material by attacking a nuclear power plant or detonating a radioactive dispersal device — commonly known as a dirty bomb.
- Before the amendment can enter into force, two-thirds of the 152 signatories to the original convention must ratify it. While significant progress has been made — in July, the US, Italy, and Turkey did so — at least 14 more countries are needed.
- The fact that there has never been a major terrorist attack involving nuclear or other radio-active material should not blind us to the severity of the threat. There is evidence that terrorist groups have tried to acquire material to construct a crude nuclear explosive device, or a dirty bomb.
- In 2011, Moldovan police seized highly enriched uranium from smugglers who were trying to sell it. The smugglers, exhibiting a worrying level of technical knowledge, had tried to evade detection by building a shielded container. Thanks to efforts by Moldova, with the assistance of the International Atomic Energy Agency, to boost its nuclear security capabilities, the material was identified and confiscated, and the smugglers were arrested.
- **The amount of nuclear material in the world is increasing. Since 1999, the amount of such material being used for peaceful purposes has risen by 70 per cent — a trend that will continue as the use of nuclear power grows.** It is essential that effective measures are in place to ensure these materials are not misused or misplaced — accidentally or intentionally.
- **Since 1995, the IAEA’s member states have reported nearly 2800 incidents involving radioactive material escaping regulatory control.** Although only a handful of these incidents involved material that could be used to make a nuclear explosive device, a relatively small amount of radioactive material could be combined with conventional explosives to create a dirty bomb. Such a weapon could be capable of killing many people, contaminating large areas, and sparking mass panic.
- The original convention focused only on the international transport of nuclear material, and did not cover the protection of nuclear facilities. The amendment adopted 10 years ago would oblige countries to protect nuclear facilities and any nuclear material used, stored, or transported domestically. It would expand co-operation on locating and recovering stolen or smuggled nuclear material and co-ordinate the response to any attack on a nuclear facility. It would make nuclear trafficking a criminal offence and require signatories to co-operate on national systems of physical protection and minimising the consequences of sabotage.
- Protecting nuclear material is not just an issue for countries that use nuclear power. Terrorists and criminals will try to exploit any vulnerability in the global security system. Any country could find itself used as a transit point — just as any country could become the target of an attack.
- Effective international co-operation is crucial. The consequences of a security failure could be a catastrophe that transcends borders. All countries must take the threat of nuclear terrorism seriously. The most effective way to do so would be to ensure that the amendment to the CPPNM enters into force as soon as possible.
- *Yukiya Amano is director-general of the International Atomic Energy Agency.*

INSIGHT: Failing to see dangers of nuclear power right under one's nose

<http://ajw.asahi.com/article/views/column/AJ201509080001>

By EMIKO INAGAKI/ Senior Staff Writer

Fifty-three months after the fateful nuclear disaster, the Sendai nuclear power plant in Kagoshima Prefecture has become the first in Japan to resume after all were taken offline for safety inspections. But the restart callously disregards the lives of so many people who were uprooted from their irreplaceable ancestral land, jobs, families and friends by the accident at the Fukushima No. 1 nuclear power plant in 2011.

Inspections of nuclear facilities certainly became more stringent after the Fukushima nuclear disaster. But that is no guarantee of their safety. An “unforeseeable” event may occur at any moment, and the cost will be too tragically enormous for anyone to grasp.

Why does the government not want to face up to that fact in earnest? And what about the public, which is allowing the government to move in that direction? While I was furious about these issues, I had the chance to attend a preview of a movie. Seeing it was like getting smacked up the side of the head.

Titled “**Tenku no Hachi**” (**The Big Bee**), the action epic, which features an act of terrorism on a nuclear plant, is based on a work of fiction by Keigo Higashino, a best-selling author.

To my surprise, the work both fully and scrupulously presented all the major problems of nuclear power generation that came under the public spotlight after the Fukushima disaster, such as the vulnerability of spent nuclear fuel storage pools, the fictional nature of the safety myth about nuclear power and the merciless way nuclear plants are being forced on depopulated communities in exchange for subsidies.

The original book was written 20 years ago.

Higashino has commented on the work as follows: After his initial plan for it, he spent five years conducting a lot of research on the issue. He was filled with confidence when he finished writing the novel, but received no reaction at all. He thought that, obviously, his work was being ignored on purpose.

If somebody was purposefully “ignoring” the work, who was it?

I WAS PART OF 'NUCLEAR VILLAGE'

I encountered the issue of nuclear power generation for the first time 27 years ago, when I was a reporter based in The Asahi Shimbun’s Takamatsu bureau in Kagawa Prefecture.

An “output modulation test” was staged at Shikoku Electric Power Co.’s Ikata nuclear power plant in Ehime Prefecture.

A nuclear reactor continues to generate electric power at constant levels day and night, so there is a nighttime surplus of electricity. The test was conducted to raise and lower output levels to enhance efficiency.

Opponents of nuclear power generation reacted angrily to what they argued was a “dangerous” experiment. Thousands of people arrived from all parts of Japan to stage a boisterous protest outside Shikoku Electric’s head office in Takamatsu on the day of the test.

A senior colleague of mine, who had been engaged in a student movement, appeared excited, as he said he was seeing a protest for the first time in a long while. However, local residents gave a chilly reception to the abrupt emergence of the hippie-like band of protesters, which was an uncommon sight.

"What are we supposed to do when all these outsiders suddenly show up and tell us this and that?" went the typical refrain.

I was, frankly, also fed up with the protesters.

The general thinking at the time was: "Japan has great technology. Speaking of possible accidents won't get you anywhere. After all, modern life is impossible without nuclear power."

The anti-nuclear agenda was an unrealistic argument being made by only a few, and was less than catchy as far as news reporting was concerned.

No sooner did I write a halfhearted article about the protest than I returned to covering the police beat--making morning and evening calls to the homes of police detectives in a desperate bid to learn about hidden cases they were pursuing.

That was the way to scoop the competition and enhance my standing at the newspaper. I never attempted, then or afterward, to look into the dilemma of nuclear power generation, although I would have had access to, if only I had sought, a trove of public documents and other materials.

I didn't even know how many nuclear reactors Japan had, and in which parts of the country, when I was confronted by the Fukushima disaster.

If our eyes are clouded and we are only eager to read the situation and act smartly, we don't see anything even if something important is hanging right under our noses or if hints are tossed out in our direction.

We use the phrase "nuclear village" to refer to a community of people who rely on benefits generated by the nuclear power industry, which actually represents a major national project. It is exactly those people that created the safety myth and ended up causing the latest disaster. Higashino may have had the nuclear village in mind as the culprit for ignoring the presence of his book.

After all, I was also possibly a member of the nuclear village. I relied on the safety myth as an excuse for looking away from the sorrow and dilemma of those whom nuclear plants were being forced upon, taking the convenient availability of electric power for granted and continuing to scoff at a deluge of alarms.

I was part of the group of people who ignored Higashino's work, which he had produced with all his might and competence.

LOOKING AT WHAT I SHOULD LOOK AT

One phrase has long stuck in my mind.

I visited a community last year that lies about a 10-kilometer radius from the disaster site. Its deserted landscapes that were frozen in time and were silently tumbling away appeared so eerie that a lump formed in my throat as I realized the exorbitant price of an affluent life.

I blurted out to a local resident who was guiding me around, "Can you forgive Japan for moving to restart its nuclear reactors, oblivious of a disaster of this magnitude?"

The resident remained silent for a while and then muttered, "If nobody changes, nothing will probably ever change."

Will I be able to change? Will I be able to keep myself separate from the popular sentiment of the time, refuse to conform to the general trend, look at what I should look at and say what I should say?

TEPCO a good investment?

September 9, 2015

Tepco's index-topping gains fueled by electricity shake-up

<http://www.japantimes.co.jp/news/2015/09/09/business/corporate-business/tepcos-index-topping-gains-fueled-electricity-shake/#.VfAQT5fwmic>

Bloomberg

Japan's reform of its energy market is proving a boon to investors in the company at the center of the Fukushima No. 1 nuclear plant disaster.

Tokyo Electric Power Co's shares have surged 59 percent in the six months through Tuesday's close, making it the best performer on the Nikkei 225 Stock Average and the 174-member Bloomberg World Utilities Index.

Tepco, owner of the wrecked plant, is seen as an early beneficiary of government-backed power reform. By April, residential power customers will be able to choose their provider for the first time. And by 2020, utilities will be required to separate their transmission, distribution and retail businesses.

"Looking towards the electricity market reform to be completed by 2020, a company the size of Tepco is an attractive investment," Mana Nakazora, an analyst at BNP Paribas Securities (Japan) Ltd., said by email. While the company's stock price has surged this year, it is still less than half of where it was before the Fukushima disaster. The shares fell 3.1 percent to ¥751 at the close of Tokyo trading on Tuesday. They closed at ¥2,153 the day before Fukushima, but have increased 55 percent since Tepco announced on May 1 that it will transition to a holding company beginning in April.

Tepco was rated new overweight on Tuesday with a target price of ¥1,000 a share by Yuji Nishiyama, an analyst at JPMorgan Securities Japan Co.

Spokesman Tatsuhiro Yamagishi declined to comment on the performance of the company's stock.

For Tepco, a more open energy market in Japan offers the opportunity for growth at a company whose survival was in question just a few years ago. The Fukushima disaster put it on the verge of default, with the head of Japan's biggest stock market telling the company to file for bankruptcy protection. Tepco was saved by a ¥1 trillion infusion from the government in 2012, the nation's largest bailout since the 1990s. The power company received ¥5.61 trillion from the state-backed Nuclear Damage Compensation and Decommissioning Facilitation Corp. to deal with payouts to victims of the Fukushima meltdown, Tepco reported last month.

Under the April reorganization, Tepco's nuclear operations will be placed into a holding company, while debt investors will be repaid from the funds of a spun-off power grid company.

Tepco's probability of debt nonpayment has dropped to 0.309 percent from about 1.121 percent on Oct. 16, according to the Bloomberg default-risk model, which considers factors such as share prices and debt. The probability of debt nonpayment was as high as 6.156 percent in 2012.

"The company's default risk has disappeared," said BNP Paribas's Nakazora.

The government's power reform began this year with the creation of an organization to manage the nation's supply and demand balance. Next year's full retail liberalization, the second stage of the reform, will allow utilities to more freely expand outside their traditional regions. The government aims to remove rate regulations by 2020.

A drop in fuel costs saw Tepco increase operating profit threefold in the quarter ended June 30. The price of liquefied natural gas imported into Japan fell to a six-year low in June, while crude oil prices are near a record low.

"Investors expected first-quarter profits to have a big increase due to the drop in oil then liquefied natural gas," Syusaku Nishikawa, a Tokyo-based analyst at Daiwa Securities Co., said by email.

Yet challenges remain. Liabilities related to the Fukushima disaster and Tepco's responsibilities will continue to pressure the company's credit quality in the long term, according to Mariko Semetko, a vice president at Moody's Japan K.K., which rates the company's outlook as negative.

Tepco, which operates the world's biggest nuclear plant by capacity at its Kashiwazaki-Kariwa facility in Niigata Prefecture, has yet to restart any of its nuclear reactors. Resuming operations at the facility would boost profit by as much as ¥32 billion a month, the company has said.

"The recent improvements in profitability are definitely a plus," Semetko said by phone. "But the company hasn't yet started its Kashiwazaki-Kariwa plant and there are a lot of uncertainties around costs related to Fukushima. With all of that in mind, we haven't been able to stabilize the outlook yet."

Naoto Kan: Nuclear uneconomical

September 16, 2015

Former PM Naoto Kan says nuclear power makes little economic sense, must end

<http://www.japantimes.co.jp/news/2015/09/16/national/former-pm-naoto-kan-says-nuclear-power-makes-little-economic-sense-must-end/#.VfmQX5fwlLN>

by Kazuaki Nagata
Staff Writer

Although the first reactor in Japan to be fired up in two years went online last month, former Prime Minister Naoto Kan said Wednesday that Japan needs to seek a nuclear-free path.

This is a lesson the country has learned from the Fukushima nuclear disaster, said Kan, who was prime minister when the Fukushima No. 1 plant was hit by a huge quake and tsunami on March 11, 2011.

"I'm absolutely sure that there will no longer be nuclear power by the end of this century. This is because it doesn't make sense economically, and enough energy can be provided without it," Kan said in a lecture to foreign residents in Tokyo.

While reactor 1 at the Sendai plant in Kagoshima Prefecture was restarted in August, Japan has survived the past few summers without nuclear power, Kan said.

He added that although the current government is still promoting nuclear power, Japan has seen an increase of renewable energy since the Fukushima accident, especially from solar panels.

He said nuclear power was believed to be a cheap source of energy, but it is actually expensive, considering the cost of decommissioning and managing nuclear waste.

Kan also shared his experience of visiting Olkiluoto Nuclear Power Plant in Finland, where a final nuclear waste repository is being constructed. There, he was told it would take 100,000 years for the radiation of nuclear waste to descend to the same level of the uranium that exists in the natural environment.

Using nuclear power, Kan said, means increasing the amount of dangerous waste that will trouble future generations, adding that this is why other former prime ministers such as Junichiro Koizumi and Morihiro Hosokawa are also voicing their wish to end Japan's dependence on it.

IAEA briefing on Fukushima disaster

September 18, 2015

IAEA holds briefing on Fukushima accident report

<http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html>

Sep. 18, 2015 - Updated 07:07 UTC+2

The International Atomic Energy Agency has briefed its members on its report on the Fukushima Daiichi nuclear power plant accident in 2011. It says an assumption that nuclear power plants are safe meant Japan was unprepared for a severe accident.

The IAEA held the briefing at its headquarters in Vienna, Austria, on Thursday. The 1,200-page-plus report was put together by about 180 experts from more than 40 member countries.

IAEA Director General Yukiya Amano said the report will be useful for all countries that either have, or are planning to build, nuclear power plants.

Experts pointed out in the report that Japan was not sufficiently prepared for a severe nuclear accident due to the assumption that nuclear plants were safe.

Participants exchanged views on the report at the end of the briefing. A Japanese representative expressed determination to pass on the experiences and lessons learned from the disaster to the international community.

Delegates from other countries spoke on the importance of sharing information to improve the safety of nuclear energy.

Just "hoping for inspired improvisation"

September 19, 2015

Rearranging the deck chairs on the nuclear Titanic

<http://www.japantimes.co.jp/opinion/2015/09/19/commentary/rearranging-deck-chairs-nuclear-titanic/#.Vf6xP5fwmic>

by Jeff Kingston

The International Atomic Energy Agency's recently released postmortem on the Fukushima nuclear accident of 2011 makes for grim reading and serves as a timely reminder of why the restart of the Sendai nuclear plant in Kyushu is a bad idea.

When an atomic energy advocacy organization delivers multiple harsh assessments of Japan's woeful nuclear safety culture and inadequate emergency countermeasures and disaster management protocols, it's time to wonder how much has really changed in the past five years — and whether restarting any of the nation's nuclear reactors is a good idea.

In 2012, the government established a new nuclear safety watchdog agency called the Nuclear Regulation Authority (NRA) and it now contends that Japan has the strictest nuclear safety regulations in the world. But is that true? And does it matter?

David Lochbaum, co-author of last year's "Fukushima: The Story of a Nuclear Disaster," the best book on the meltdowns that I've read, likens recent reforms to "rearranging the deck chairs on the nuclear Titanic." He's not buying Japan's claim of having the world's strictest guidelines.

"I'd sooner buy the Brooklyn Bridge," Lochbaum says. "What would Japan have said about its safety guidelines on March 10, 2011? Would they have conceded that their safety guidelines ranked 23rd worldwide, but that level of protection was good enough for the people of Japan?"

"It's all valueless posturing. No regulator in any country would publicly confess to anything less than the best on the planet."

Had the NRA existed pre-Fukushima, Lochbaum thinks the disaster would have shown that structure to be inadequate.

"The NRA would have been splintered and its roles relegated to various governmental agencies," he says.

At the time, however, responsibility and authority for nuclear safety was divided among various agencies, so the government moved to concentrate such powers under the NRA and calls that a solution.

"Disasters are bad and require changes," Lochbaum says. "That the changes fail to address the underlying problems gets lost."

However, Japan is not the only nation "rearranging the nuclear deck chairs" to conjure a simulacrum of enhanced safety, and Lochbaum points to an incident in 2008 in Pennsylvania as an example.

"When contract security officers were discovered sleeping on the job at the Peach Bottom nuclear plant,

its owner fired the contractor and brought the security officers in-house,” he says. “It was essentially the same group of individuals wearing different emblems on their uniforms. But somehow the different emblems ‘fixed’ the problem and all was well with the world.”

A relevant story since **most of the NRA’s employees used to work at the discredited Nuclear and Industrial Safety Agency, which was blamed for poor oversight and safety lapses due to regulatory capture and servile deference to the utilities.**

“It’s more convenient than truthful to blame Fukushima on regulatory capture,” Lochbaum says. “I am unaware of any reactor type operated by any company in any nation that would have survived the one-two punch that the earthquake and tsunami dealt that plant.” Yet, it is disconcerting to know that according to Lochbaum, “Fukushima’s design and operating procedures were not radically different than those deployed worldwide.”

Both the IAEA report and Lochbaum emphasize the need for defense in depth, meaning multiple levels of safety infrastructure, equipment and redundancy to reduce the possibility of a nuclear accident.

Defense in depth depends on manifold barriers that lessen risk, but Lochbaum points out all the barriers that failed at Fukushima: off-site power was lost, on-site power was lost, backup on-site power could not be deployed in time, the protective sea wall was insufficient, and more.

“Had just one of these barriers worked, Fukushima would not have happened,” Lochbaum says. “There was simply not enough what-iffing going on” — what the IAEA describes as a “failure to challenge existing safety systems.”

By not preparing for the worst and relying on probabilistic scenarios based on overly optimistic assumptions, the IAEA implies that Japan’s nuclear regulators and plant operators were derelict in their duties. There is a danger that the NRA, in touting its new safety regime, is yet again nurturing a myth of safety.

“When our guesses are good, the ‘strictest regulations’ look real good,” Lochbaum says. “When our guesses are bad, it must be regulatory capture or centralized governance, or de-centralized governance, or whatever lame excuse wanders by.”

The NRA will still rely extensively on plant operators reporting and self-inspections to ensure compliance with regulations. Given that all the utilities operating reactors admitted they faked their repair and maintenance data, why trust them now?

Lochbaum also notes the huge discrepancies between safety assessments by the U.S. Nuclear Regulatory Commission and plant operators. He likens safety goals to nuclear speed limits, but these are meaningless since the government’s radar gun and the utilities’ speedometers are way out of line. The closest match has a radar reading of a utility doing 110 miles per hour when it claimed it was following the 55 mile-per-hour speed limit. But at another nuclear plant at Watts Bar in Tennessee, when the “atomic speedometer showed 55 miles per hour, the NRC’s radar gun indicated a smokin’ fast 42,853 miles per hour!”

He concludes that existing risk-assessment models “cannot be used for anything other than amusing storytelling and nonproductive time-wasting until their results have closer agreement. **Differing by factors of 2 to 800 about risks doesn't allow risk-informed decision-making.** It supports risk-deformed decision-making.”

And don't bank on Japan's reactor stress tests or other new measures such as taller sea walls, longer-duration batteries and other incremental upgrades.

“Individually and collectively, (those things) hedge our guesses and make it less likely that a bad guess will trigger another nuclear disaster,” Lochbaum says. However, “As long as **protective barriers are determined by guesswork without the 'what if' backups,** nuclear disasters will continue to happen.”

The IAEA says there is no room for complacency about nuclear safety, but **it fails to call Japan out for a major flaw in its disaster emergency preparedness.** It details the need for a proper emergency evacuation organization, training and drills, but under current rules this is the responsibility of local hosting towns, one that exceeds their limited capacity — especially now that the evacuation zones around nuclear plants have been expanded to 30 km. Simulations of evacuations under optimistic assumptions underscore that people living inside the evacuation zone will be exposed to significant radiation because transport networks will be jammed. And if we factor in a volcanic eruption depositing a thick layer of ash and a simultaneous tsunami wiping out coastal roads, the evacuation would be disastrous.

The Titanic was also ill-prepared to evacuate its passengers because it failed to consider the unimaginable and thus mismanaged the risk. It seems the lessons of Fukushima are also being ignored in favor of wishing away risk, and **hoping for inspired improvisation.** There is thus good reason why citizens across Japan are filing lawsuits to block reactor restarts and some gutsy judges are resisting pressure from the nuclear village and siding with common sense.

TEPCO had been warned

September 25, 2015

TEPCO was advised on tsunami risk before quake

<http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html>

Sep. 25, 2015 - Updated 01:48 UTC+2

The Japanese government has revealed that an official had advised Tokyo Electric Power Company to implement better tsunami measures 2 years before the 2011 Fukushima Daiichi nuclear accident.

Authorities on Thursday released depositions by 5 people who testified before a government

investigative panel on the nuclear crisis. They include a former inspector of the now-defunct Nuclear and Industrial Safety Agency.

Initially, in September 2009, the utility told the agency official a tsunami from a possible earthquake could reach as high as 8 meters.

An expert from TEPCO used a massive quake from the 9th century as the basis for the estimate.

The agency official then suggested TEPCO to take concrete measures to prepare for a tsunami as he knew the pumps to cool the reactors would be submerged under those circumstances.

The inspector reportedly advised the utility to move the equipment inside buildings, like the Fukushima Daini plant, TEPCO's other nuclear power station in Fukushima Prefecture.

The documentation says a TEPCO official responded the utility could not decide by itself and needed to consult the Japan Society of Civil Engineers.

Another TEPCO official cast doubt on the plan by wondering if it's really possible to halt the reactors for that purpose.

The inspector further testified he didn't push the plan to the point of earmarking a budget for it.

After reviewing the statements, the government panel decided the agency did not urge TEPCO to take concrete action. It concluded the utility believed the government agency approved of its decision to wait until experts provided advice.

Japan Crushes Resistance to Restart

As the Japanese authorities restarted a nuclear reactor in Sendai, please find hereafter a link to a contribution to:

The Asia-Pacific Journal, Vol. 13, Issue. 38, No. 1, September 21, 2015:

Japan Crushes Resistance to Restart Nuclear Power Plants

This paper delivers an analysis of the rationale behind the arguments (including economic arguments) mobilized by the Japanese authorities to legitimize their decision to restart the n°1 reactor in Sendai, under the sign of blackmail.

<http://www.japanfocus.org/-Thierry-Ribault/4374/article.html>

Japan Crushes Resistance to Restart Nuclear Power Plants

The Asia-Pacific Journal, Vol. 13, Issue. 38, No. 1, September 21, 2015

Thierry Ribault

Summary: This article reviews the Abe administration's moves to crush opposition to nuclear power and restart the first nuclear reactors since the closure of all 54 nuclear power plants following the triple meltdown of March 11, 2011. The author punctures official claims of an economic crisis resulting from post-3.11 import of fossil fuels, the basis for the Abe restart program. Likewise, claims that preserving a share of the energy mix to nuclear power is essential and inescapable in order to avert or alleviate climate crisis. Finally, the author considers the implications of government policies for the possible creation of a Japanese nuclear weapons arsenal.

On August 11, 2015, the n°1 reactor at Sendai nuclear power plant, located in Kagoshima Prefecture in south-west Japan, was reactivated, and one month later Kyushu Electric Power inserted 157 fuel rod assemblies into the n°2 reactor planned to restart in mid-October¹. The Abe administration seeks to make this moment decisive in its energy strategy, insisting that nuclear power is “vital” for the future of the nation, in ways that recall statements between 1931 and 1945 that the invasion of Manchuria was also “vital” for the Empire. The pragmatic criticism levelled against such an approach with regard to the future of Japanese energy by the former Prime Minister Koizumi Junichiro, who pointed out that Japan had managed to rebuild itself after the Second World War *without* Manchuria, had no impact. Koizumi has become one of the leading actors of the pro-renewable energy elite, which includes the pro-solar billionaire Son Masayoshi, CEO of Softbank. Adamant about its national-nuclearism, the Abe administration seems to adopt the rule that whatever is furthest from the truth is also what is most communicable. Such has been the case with the raising of the thresholds of unacceptability with regard to the radioactive contamination of both the population and nuclear workers. The administration has also denied the health effects associated with the Fukushima Daiichi nuclear disaster, despite the evidence of an epidemic of thyroid cancer. Moreover, evacuated people are being sent back into contaminated zones, a decision accompanied by a “risk communication” policy relayed and supported internationally by handpicked UN experts².

Naturally, there has been tension, including within the government itself, and notably from political and industrial groups that favour promotion of renewable energy, mainly biomass and hydroelectric power. Even some of the most ardent defenders of nuclear power within parliament or government have changed their views to favour renewable energy. It is a (discreet) war of succession in terms of economic interests whose long-term outcomes are unforeseeable. It is certain, however, that with the reactivation of Sendai's n°1 reactor, Abe and his collaborators have won a battle in the *clique struggle*. They have achieved this largely thanks to a tool classically used in politics: blackmail. In this case, this blackmail has several facets: first, blackmail about the threat of trade deficit; second, about the threat of climate change; third, about the exploding costs of non-nuclear electricity and the threat of decreasing income for the giant power companies from nuclear power, and, finally, about the threat of an atomic bomb.

All the ingredients of the Abe administration's approach to the power plants were actually fully elaborated in the following passage extracted from the Prime Minister's response at the plenary session of the House of Councilors in January 31, 2013: «The Policy established by the former administration to halt the operation of all nuclear power plants by the 2030's lacks a concrete basis and has engendered anxiety and distrust among the municipalities that have accepted nuclear facilities and cooperated with the national government's energy policies, the international community, industry, and the remainder of the Japanese people. Therefore we will carry out a zero-based review of their strategy for energy and the environment and will establish a responsible energy policy which also ensures a stable supply of energy and reduces energy costs.»³

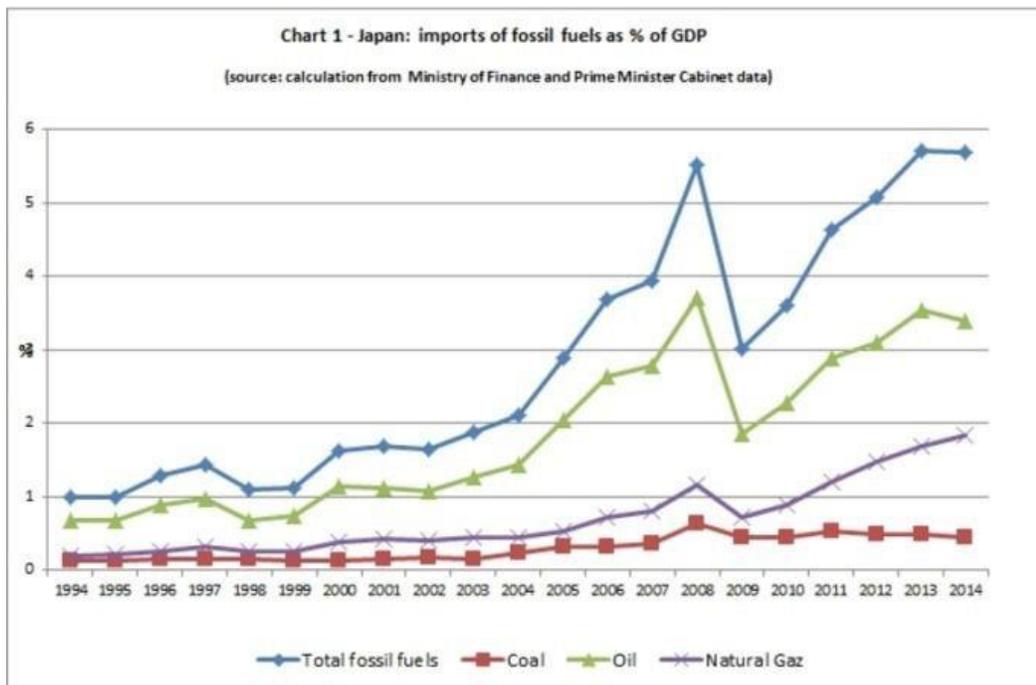

Thus, from the “zero-based review”, to the energy cost reduction guarantee, the security connoted “stable supply”, and the demagogic and manipulative argument according to which the Japanese people lost confidence and became anxious *because* “the policy established by the former administration to halt the operation of all nuclear power plants by the 2030’s” lacked a “concrete basis”, and not simply because of the explosion and the meltdown of three nuclear reactors that were supposed to be eternally safe, every single argument of the Abe administration is an inversion of the actual truth.

Let us examine in detail the content of each of these facets of the blackmail before drawing conclusions on the nature of the authoritarianism of the Abe administration on one hand, and the effectiveness of individual and collective action to fight this administration on the other.

1. The threat of trade deficit

In 2013, for the first time in three decades, the Japanese balance of trade was in deficit by a total of 11.5 billion yen. 7 billion of this was attributed to the relocation of Japanese industries to other parts of Asia – not connected with the Fukushima disaster – and 4 billion to the additional cost of petrol and gas to produce energy no longer supplied by nuclear power plants. However, from April 2015, the balance of trade was once again in surplus, with petrol purchases dropping by 51%, petroleum products by 38%, and liquefied natural gas by 12%.⁴ The following months were slightly negative, but the weaker yen policy of the Abe Administration (since December 2012) helped reassert the value of exports which substantially increased: in July 2015, the percent change from the same term in the preceding year was 7.6% for exports (of which machinery was 8%, electrical machinery 10.5%, transport equipment 10.4%), imports were -3.2% (of which -29% for mineral fuels), and the trade balance was -72.2%.⁵

Actually the growing share of imports of fossil fuels in the Japanese GDP is not new; indeed, it has been steady since the 1990s (Chart 1). The trend was halted in 2009, to restart in 2010, with a new peak in 2013 at a comparable level with that reached in 2008 (5.5%), but still lower than the levels reached during the oil shock of 1980 (6.6%). For petrol and coal, 2014 shows a reverse trend toward low levels, and even though we don’t know what the future will be, according to METI, prices of liquefied natural gas could be halved between 2014 and 2015. The data made public for the first half of 2015 suggest an extension of the fall in fossil fuel imports against GDP to 3.9% (against 5.7% in 2014). Considering the trade balance in the first semester of the year, the 2015 trade deficit could be four times lower than that of 2014.

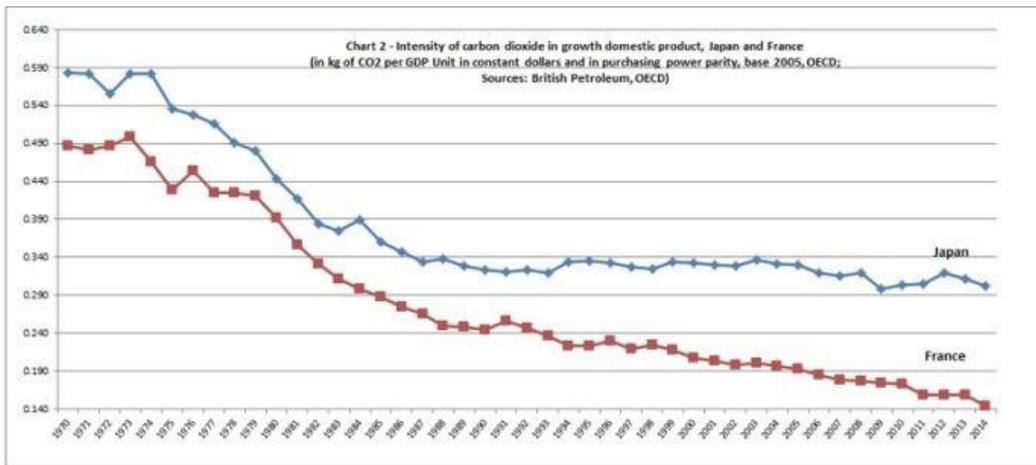

The results of a study by the energy economist Bernard Laponche in 2014⁶ confirm that the claim of a relationship between the termination of nuclear power and expansion of the Japanese trade deficit is groundless. According to Laponche, if “the energy bill (net import of fossil fuels) truly increased 46% between 2010 and 2013, 6% of this hike is due to changes in the energy system, namely the fall of nuclear electricity production, while 40% is due to the rise in imported fuels, particularly petrol, whose rising international price was unrelated to the fall in nuclear power production in Japan” (p.61).

Our first conclusion then is the following: Stopping the use of nuclear power in the wake of the Fukushima disaster did not have the expected disastrous impact on the Japanese balance of trade, and the loudly proclaimed “wealth drain” did not occur.

2.The threat of climate change

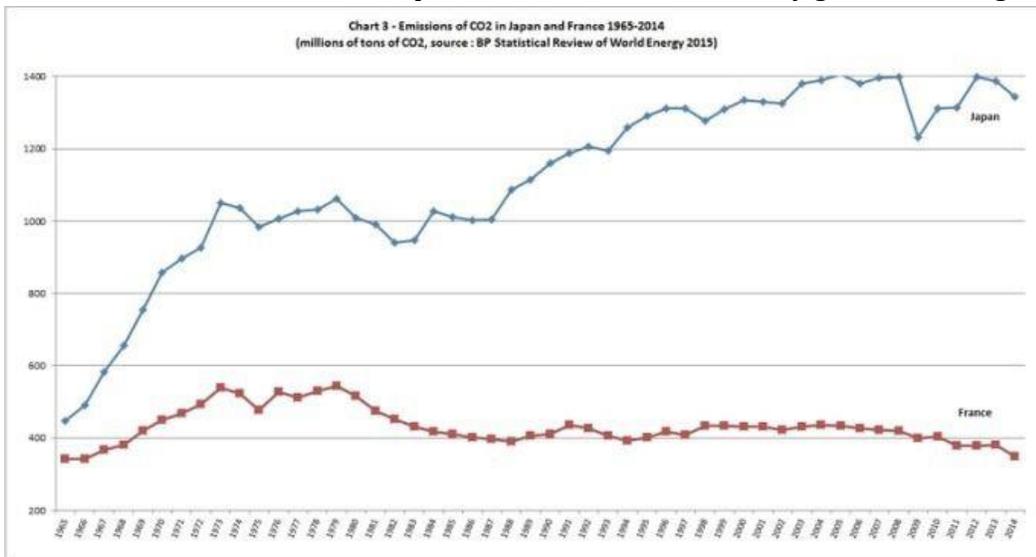

Since 2007-08, the intensity of Japanese GDP in carbon dioxide has been 1.8 to 2 times higher than in France, compared with 1.2 times during the 1970’s (Chart. 2). In the long run, this intensity has been falling in both countries, with some temporary reverses. This was the case in 1973, 1984, 1994, 1998, 2003, 2008, 2010, 2011 and 2012 in Japan, and in 1973, 1976, 1991, 1996, 1998 and 2003 in France. In Japan, CO2 intensity resumed its long-term fall in 2013 and 2014. Thus, this was not Japan’s first re-intensification in carbon dioxide emissions, and the shut down of nuclear power was just one element affecting a long term trajectory of declining CO2 intensity.

On the other hand, with few brief exceptions, the absolute value of CO2 emissions has not stopped increasing in Japan since the 1950s (Chart 3). Not until 2009, right after the 2008 “Lehman shock,” did a significant decrease occur, before recovering to cruising speed in 2010. A new peak was reached in 2012, before the fall in 2013 and 2014.

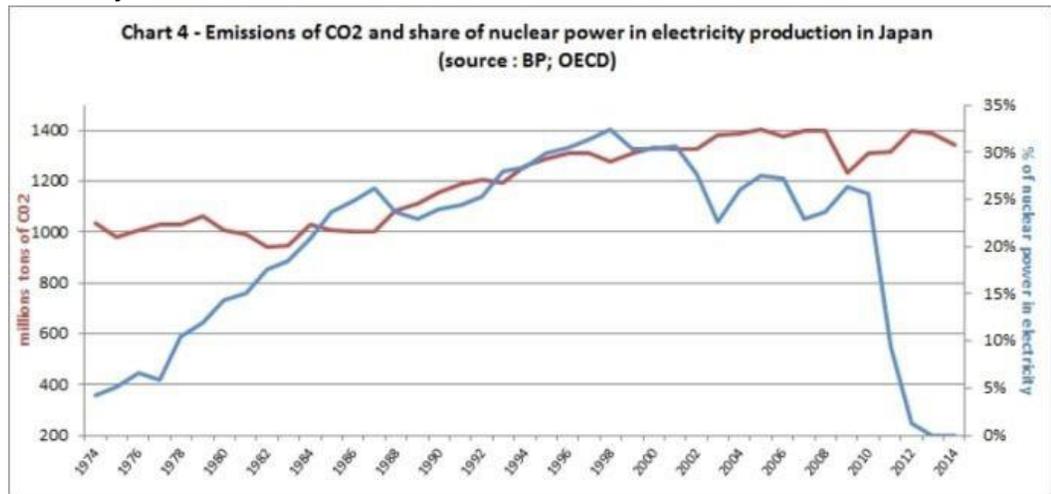

In France, for more than the last three decades, the absolute level of carbon dioxide emissions remained roughly constant, even higher than the level reached at the end of the 1950s, while the intensity of carbon in GDP fell steadily from 1974.

Thus, if the oil shocks did tend to slow down CO2 emissions in the short run, in countries like Japan and France where production is highly energy intensive, the nuclear shock did keep total emissions, in absolute value, on a quasi-continuous ascending curve, despite promises to reduce emissions in both countries on the basis of nuclear power in a world threatened by global warming.

Despite a significant increase in the use of fossil fuels, the total amount of CO2 emissions in Japan did not increase after the Fukushima disaster at the speed estimated by experts and by ardent nuclear defenders: energy savings kicking in, compensating for 28% of the nuclear electricity fall between 2011 and 2014, and the increased use of renewable energy are the two main factors behind this development. Thus, although coal and oil consumption rose after 2010, they did not reach pre-2008 crisis levels. CO2 emissions in Japan, of which 40% are related to the production of electricity, maintained an identical trajectory before and after the Fukushima disaster. And, from 2012, they returned to their 2002–2008 level, that is about 1.4 billion tonnes of CO2.

The disaster did not therefore precipitate Japan into a sudden and unstoppable increase in carbon dioxide emissions; rather it reinforced the upward trend experienced prior to the disaster, from the period of “recovery” that followed the 2008 crisis.

To sum up, the fall in the share of nuclear power in total electricity production in Japan in 2011 (12%) and 2012 (1%), did not lead to a proportional rise in carbon dioxide emissions (Chart 4). On the contrary, during the recent period, a drop in CO2 emissions has been observed: 0.9% in 2013, 3.1% in 2014. Finally, it can be noted that the increase in Japanese nuclear power plants between the 1960s and the 1970s coincided with one of the largest increases in CO2 emissions in the country – the volume increasing by 2.4 times between 1965 and 1973 against 1.3 times between 1973 and 2014. Several periods will follow where the growth of the nuclear power share into electricity production will go with the growth of CO2 emissions, particularly 1974-1978, 1982-1984, 1990-1997, 1999-2001, 2003-2006 and 2007-2008.

Therefore, our second conclusion is that, in the long term, the development of nuclear power never halted the almost uninterrupted increase in Japanese carbon emissions. In an economic system founded on a double energy dependency, the growth in both nuclear power’s share of electricity production and CO2 emissions may run in parallel and articulate with each other rather than the opposite, contrary to what one might anticipate.

3. The threat of exploding prices and costs of non-nuclear electricity

Between 2009 and 2014, electricity prices for Japanese households and small and medium size enterprises, and for big companies rose respectively by 24.4% and 35.6% (table 1). This increase has been presented by the government as a second disaster following the triple earthquake, tsunami and nuclear meltdown of March 2011. However, once again, to impute such price increases to the nuclear power stoppage is to forget the past, since the price levels reached in the early 1990’s were equivalent to current levels which are being touted as a “record”. It also involves correlating in an unsound way the rise in electricity prices and the nuclear power stoppage while, when viewed in comparison with France, where the share of nuclear power in electricity production is between 75% and 77%, a country giving priority to nuclear power is also put at risk of high electricity price hikes: between 2009 and 2014 electricity prices in France grew respectively 44.6% for households and small and medium size enterprises, and 40% for big companies, that is, a greater increase than in Japan.

Table 1 – Comparative prices of electricity in current €/kWh including VAT

(sources: METI, Eurostat (1) et (2))

<image: http://img.over-blog-kiwi.com/1/22/53/68/20150927/ob_5d562e_tableau.jpg>

According to the projection released by Japan's Ministry of Industry in April 2015, nuclear power will be produced at a cost of 10.1 yen per kilowatt-hour in 2030 against 8.9 yen in 2011. This will make nuclear energy the least expensive source of energy compared to coal (12.2 yen), gas (13.4 yen) and renewable energy (solar: between 12.7 and 15.5 yen; wind: between 13.9 and 21.9 yen).⁷ The estimate of the cost of nuclear energy takes into account compensation for accidents, aid to local governments and costs related to the security of nuclear plants. The costs incurred by a nuclear accident have been greatly reduced by government experts to take into account the introduction of security standards that are much stricter and more reliable than those in place before the Fukushima disaster. According to their calculations, the authorities have thus halved the likelihood of a major accident.

Moreover, the estimated cost of the nuclear kilowatt-hour is based on the statements of investors in security made by electricity companies. However, shortly after publication of the figures, these companies revealed that their actual expenses would be two and a half times higher than those declared 30 months earlier and would reach at least 2.4 trillion yen.⁸

Yet it is on the basis of these cost estimates that the Japanese "energy mix" for electricity production by 2030 was defined in April: 20% to 22% for nuclear power – which implies either overturning the existing rule on shutting down reactors after 40 years of use or the building of new reactors – and 22% to 24% for renewable energy.⁹

As we will see below, by making the energy issue a *security* issue, the government legitimizes the preservation of a large share of nuclear power in Japan's energy mix. Particularly it allows justification of an arbitrary increase in the energy self-sufficiency rate from 6% now to 24% in fiscal 2030. Since this energy self-sufficiency rate is structurally defined as the share of renewables *and* of nuclear energies in the total primary energy supply, reaching the 24% target means, *mechanically*, to increase the share of nuclear power to 11% of total primary energy supply, with the balance (13%) coming from renewables largely insufficient to compensate by themselves for the decrease of fossil fuels. In other words, the self-sufficiency rate target is nothing but a tailored-made guarantee that nuclear power will be assured a substantial share in the Japanese energy mix for the coming decades. Abe's renewable energies policy appears to be simply a back up to legitimize this necessity under the cover of «clean» energy to save the climate, and «independant» energy to save the nation's sovereignty from foreign fossil fuels providers. According to a study by the Mitsubishi Research Institute conducted in December 2014 for the Ministry of Environment, by 2030, approximately 31% of Japan's electricity production could be generated in the form of renewable energy, including solar, wind, geothermal and hydroelectric power, as opposed to approximately 2% in 2013 (excluding large hydro)¹⁰. The Ministry considers that the guaranteed feed-in tariffs of renewable energy could drop sharply and be maintained, even with a significant production of renewable energy, to a level below that estimated by METI. Moreover, the substitution of renewable energy for fossil fuels could save between 11 and 25 trillion yen by 2030. However, during the development of its energy plan, METI neither took these figures nor studies into account; their findings have also gone unheeded.¹¹

Thus, our third conclusion: first, there is no correlation between the rise in electricity prices and the nuclear power stoppage; second, the cost estimates of the different energy sources made by the Japanese government have been arbitrarily distorted to make a false case for the economics of nuclear power.

4. The threat of decreased income from nuclear power

In addition to its unconditional support for the reactivation of nuclear power plants, the Ministry of Economy, Trade and Industry (METI) is moving to cut back on subsidies to local governments with idle nuclear plants.

Under the current system, local governments receive grants whose amounts depend on the operational performance of their reactors during the two preceding fiscal years. From 2013, municipalities have received grants based on an across the board deemed operational rate of 81% while all reactors were suspended for safety inspections in the wake of the 2011 disaster. This rate corresponds to the full operational rate except for the regular inspection period once every 13 months. Starting in 2016, the reference period will be reduced to one and a half years. Unless the reactors concerned are reactivated, the operational rate will be reduced to the rate before the March 11, 2011 disaster; that is, 70% on average. According to METI, this adjustment whose goal is clearly to press for reactivation, is “aimed at ensuring fairness” with regard to municipalities which have already reactivated their nuclear reactors. *Consequently, in municipalities such as Mihama in Fukui prefecture – at the heart of what is referred to as the “Nuclear Ginza” – where 40% of tax revenues are attributable to nuclear power and where subsidies will be halved owing to the dismantling of several reactors -- politicians are under pressure to support the reactivation of reactors in their territory.*

5. The (real) threat of atomic bombs

Owing to the fact that its nuclear fuel recycling programme has shut down and its plutonium stockpile accumulation continues to cause international concern, Japan has been under “pressure” – to the extent possible – to use its fuel reserves in its reactors. Thus, US Under Secretary of State for Arms Control and International Security, Rose Gottemoeller, recently told journalists that Japan should complete its pending fuel recycling programme and burn plutonium as a fuel called MOX in its reactors: “If there is going to be a plutonium reprocessing program, the flip side of it is that there has to be a very vigorous MOX program and that the MOX actually has to be burned in power plants.”¹²

The question remains, however, whether Japan can restart the 18 reactors needed to burn the plutonium it holds, and specifically whether the Rokkasho reprocessing plant can actually start up.

The desire to guarantee legitimacy to the existence of a centre for storage, plutonium extraction and reprocessing and MOX production at Rokkasho, located in northern Japan, is not new. Indeed, this reprocessing chain, built in partnership with AREVA from 1993, has never become operational and its fuel storage capacity will soon be saturated: 2834 tonnes of fuel are now in the factory’s pools, 90% of the available capacity on the site. Using Rokkasho’s infrastructure is the sole action that could guarantee the sustainability of this 20 billion euro gem whose dismantling costs are estimated at an additional 80 billion euros. This is taking place within a context in which there is a sharp decline in Japanese demand for plutonium used in breeder reactors (the Monju reactor has experienced a series of accidents and has produced electricity for only one hour over the last 20 years) and for MOX in conventional reactors. Japan currently holds 157 tonnes of plutonium, of which 100 tonnes are located in nuclear power plants. The remaining 57 tonnes have been shipped to reprocessing plants and 45 tonnes have been separated (35 tonnes are stored in France and the UK). These can make 5000 nuclear bombs. Rokkasho’s reprocessing capacity could enable the annual production of eight tons of separated plutonium, sufficient to make 1000 atomic bombs.

The question that nobody asks, but that we believe requires attention is thus: beyond its civilian use, does Japan intend to make a non-civilian use of its plutonium reprocessing and production plant?

The amendment to the “Atomic Energy Basic Law” that was quietly passed on June 20 2012 stated that, henceforth, “*the nuclear energy policy of Japan has to contribute to national security*”, sheds light on this issue. Further light is shed by the more recent vote on security laws, extending the possibility for intervention of self-defense forces in conflicts abroad in the name of strengthening the Japan-US alliance in matters of security. Defense minister Gen Nakatani thus recently acknowledged that these laws paved the way for a “theoretical possibility” for Japan to transport nuclear weapons during logistical operations.

However, he reiterated that the country would not engage in this type of intervention given the “non-nuclear principles” to which Japan has been committed.¹³

We noted, in a paper written in October 2012, that: *“this new context is not characterized by Japan’s technological capacity to build a nuclear weapon within a limited period, but rather by the fact that, drawing on the opportunity for the reform of its Nuclear Regulation Authority in the wake of the Fukushima disaster, Japan is establishing a legal framework adequate for the recognition and activation of such capacity. The next step could be a reform of Article 9 of the constitution, consistent with the bigger political role that the United States intends to see Japan play in Asia, notably with regard to China. Although the development of Japanese military nuclear reactors is only a mere potentiality, it provides a strong argument to its neighbors who also aspire to “nuclear sovereignty”, resulting in the escalated accumulation of nuclear weapons.”* ¹⁴

Three years later, it is no longer necessary to evoke the likely scenario. Indeed, the Japanese constitution has been revised by Abe administration fiat challenging the pacifist stance on which Article 9 was premised. The considerable resistance to this revision has had little impact on the political regime that some do not hesitate to describe as a “dictatorship”.

According to Hasebe Yasuo of Waseda University, one of the three constitutional experts invited in June by the Japanese parliament to speak on the constitutionality of security laws, the latter “undermine legal stability”. Hasebe also pointed out that, “There is this enormous distance that is hardly understandable from a commonsense point of view between the words and terms in the security bills that are seemingly limiting the conditions for use of force.”

He also questioned the remarks made by the Vice President of the Liberal Democratic Party, Masahiro Komura that “constitutional scholars never fail to stick to the words in Article 9 of the Constitution”. “Does this mean”, asked Hasebe, “that Mr. Komura is going to say that he wants to wield political power without sticking to the Constitution? That is fairly scary.” ¹⁵

Reacting to a formulation in the safety laws which states that “the intentions, capability and scale of the aggressor will be taken into comprehensive consideration before a decision is made over whether to allow for use of force” Kobayashi Setsu of Keio University, another constitutional expert, noted that “essentially, the statement is urging the public to give carte blanche to the government over the operation of the military by leaving everything to chance. It is the idea of a dictatorship.”

This seems to have been unwittingly confirmed by Nishi Osamu, an expert from Komazawa University and member of the group of private advisers to the Prime Minister who contributed to the formulation of the security laws. Nishi argued that “there is no small number of people who deem the bills to be constitutional”, adding that “Constitutional debate is not about deciding something by majority vote.”

A group of Japanese parliamentarians recently revealed that even before debate on the details of the security bills inside the ruling coalition took place, meetings were held in December 2014 in the United States between Japanese representatives and US military forces in which Kawano Katsutoshi, chief of staff of the Self-Defense Forces Joint Staff, stated that “the new security legislation would be ready by the summer of 2015” and that the construction of a new military base to replace U.S Marine Corps Air Station Futenma in Okinawa Prefecture was considered under “a positive view.” ¹⁶

Thus, our fifth conclusion is that the articulation between civil nuclear power and military nuclear power sheds some light on why, with 53% of Japanese opposing the security laws,¹⁷ these laws were nonetheless passed into law, and why, with 57% against reactivation of the Sendai nuclear plant,¹⁸ reactor n°1 has nonetheless been reactivated.

Conclusion

It is therefore under the banner of blackmail that the Abe administration has reactivated the n°1 reactor at Sendai nuclear power plant. In Japan as elsewhere, by trying so much to present nuclear power as the

Swiss army knife of all good public energy policy – anti-CO2 emissions and anti-global warming, anti-increases in electricity prices and costs hikes, anti-trade balance disequilibrium and anti-energy dependency – planners refuse to adapt reality to the truth, willfully choosing to shape the latter on the image of the former, constantly presented as immutable in order to ensure full exercise of authority. In so doing, they submit everyone to the tyranny of threats.

“We need the security bills to avert war”,¹⁹ Abe declared in front of the *hibakusha* – the victims of Hiroshima and Nagasaki in August. This is just one additional element in the *national operation to secure* – through fraudulent means as well as by threatening violence – and with the consent of victims, renunciation of all forms of personal or collective action that could thwart the state’s authoritarianism. In his speech on August 6 on the occasion of the ceremony commemorating the 70th anniversary of the Hiroshima atomic bombing –for the first time since his ascension to power – Prime Minister Abe made no mention of the “three non-nuclear principles” that ban the production, possession and import of nuclear weapons into Japanese territory.

While representatives of citizens’ associations and bomb victims have expressed their “hope that this year will not become a turning point towards war”, others have not failed to draw attention to their “hope for the realisation of a world free of nuclear weapons.”²⁰

It is questionable, however, whether such “hopes”, like those of the 160 Satsumasendai demonstrators who opposed the reactivation of reactor n°1 – supported on the occasion by former Prime Minister Kan Naoto, a convert to anti-nuclearism since 2011 – and those of the valiant owners of the five cars which momentarily blocked the entrance to the power plant, have the ability to significantly alter the political orientations we have outlined above.

In an interview on “the state of urgency and legitimate defence” that took place a year after the Chernobyl disaster, Günther Anders raised an interesting question: “what lies at the core of hope? Is it the belief that things will get better?” His response is as true today as it was then: “we must not raise hope, we must prevent it. For no one acts through hope. All those who hope abandon improvement to another entity.”²¹ The time has come to speak of reprehensible actions in the nuclear field, and having hope will no longer be an alibi. In the atomic age, hope ceased to be virtuous. If to struggle is to have eyes open, it is not hope which can sustain the ability to resist in a padlocked situation, but the right to exercise legitimate self-defense against nuclear violence.

Hope tends to be “synonymous with cowardice” and it is from their intimate knowledge of this identity that nuclear blackmailers derive their force. For as long as their opponents remain hopeful, they will remain frighteningly harmless.

Notes

1 Mainichi, September 11 2015.

2 While, unofficially, the radiation exposure limit has been raised for the population, contaminated zones under 20 mSv a year having been progressively reopened to the public since April 2011, the last being the town of Nahara in Fukushima Prefecture where 7,400 residents have been “allowed” to return home permanently in early August (Asahi, June 17 2015), Japanese nuclear plant workers will officially also “be allowed to be exposed” to more than twice the current level of radiation in emergency situations, according to the Nuclear Regulation Authority’s Radiation Council. The radiation council announced in a report released July 30, that their radiation exposure limit will be raised from the current 100 mSv to 250 mSv in emergencies (Mainichi, June 17 2015).

As for risk communication, it is defined by UNSCEAR experts as the «interactive exchange of information and opinions concerning risks» (p.15). More precisely: “Risk communication is a key component of the risk analysis process, and is linked closely to risk assessment and risk management. Proactive risk communication, coupled with public involvement in the remedial process, is critical to the success of any remedial activity. Addressing public health concerns is a major communication challenge. The building blocks of an effective risk communication strategy are trust, transparency, ethics, technical accuracy, values, credibility and expression of caring. Different types of messages may be more – or less – suitable for different audiences (e.g. the general public, policy-makers, decision-makers, the mass media). Fears and perceptions need to be addressed – even if they are not commensurate with the actual risks. It is of utmost importance to prevent reactions that themselves carry risk (such as self-administration of potassium iodide), to allay unnecessary fears (such as avoidance of breastfeeding because of health fears), and to promote healthy coping mechanisms (such as social solidarity)” (*Health risk assessment from the nuclear accident after the 2011 Great East Japan Earthquake and Tsunami based on a preliminary dose estimation*, World Health Organization 2013, p.87.) In practical terms, risk communication policy in the Fukushima context consists in educating people to the nuclear culture and to encourage everyone to get used to a contaminated environment through educational workshops on radioactivity and cancer at schools, the dissemination of handbooks teaching how to manage life in a contaminated environment, and TV commercial campaigns on the virtues of fresh products from the contaminated areas.

As for the health effects of the Fukushima disaster, while experts from the UN Scientific Committee on the Effects of Atomic Radiation (UNSCEAR) have been emphasizing since March 2011 that in Fukushima as in Chernobyl, the social and psychological impacts on health would be greater than the direct effects of radiation, they have also been asserting that “Radiation exposure following the nuclear accident at Fukushima-Daiichi did not cause any immediate health effects” and that “It is unlikely to be able to attribute any health effects in the future among the general public and the vast majority of workers” as was concluded during the 60th session of the Vienna-based UNSCEAR, on May 2013. A more recent report from IAEA reaffirmed the same stance, asserting that, “Because the reported thyroid doses attributable to the accident were generally low, an increase in childhood thyroid cancer attributable to the accident is unlikely” (...) “However, uncertainties remain concerning the thyroid equivalent doses incurred by children immediately after the accident”. According to the report, those uncertainties are largely due to a lack of reliable personal radiation monitoring data immediately after the disaster started, when radioactive iodine and other radioactive materials were spewed into the environment (Japan Times September 1st 2015).

Echoing such prophecy and uncertainty based science, the Fukushima Medical University Health Survey identified 98 residents 18 years old and younger diagnosed with thyroid cancer and 14 others diagnosed with possible thyroid cancer, but asserts that no causality relation with the Fukushima accident can be established (Mainichi, September 1st 2015). A child in Fukushima Prefecture has been diagnosed with

thyroid cancer in the latest health survey, which began in April 2014, and seven others are also suspected of having thyroid cancer but have not received a definitive diagnosis. They all tested negative in the first survey. "Despite the new results, I don't think we need to change our previous view" that they were not affected by radiation, said Hokuto Hoshi, who heads the panel (Japan Times, February 13 2015).

TEPCO had been warned (2)

September 26, 2015

Tepco rejected requests for anti-tsunami steps before 2011 nuclear crisis

<http://www.japantimes.co.jp/news/2015/09/26/national/tepco-rejected-requests-antitsunami-steps-2011-nuclear-crisis/#.VgY-rpfwmid>

Kyodo

Tokyo Electric Power Co. turned down requests in 2009 by the nuclear safety agency to consider concrete steps against tsunami waves at the Fukushima No. 1 nuclear power plant, which suffered a tsunami-triggered disaster two years later, government documents showed Friday.

“Do you think you can stop the reactors?” a Tepco official was quoted as telling Shigeki Nagura of the now-defunct Nuclear and Industrial Safety Agency, who was then assigned to review the plant’s safety, in response to one of his requests.

The detailed exchanges between the plant operator and the regulator came to light through the latest disclosure of government records on its investigation into the nuclear crisis, adding to evidence that Tepco failed to take proper safety steps ahead of the world’s worst nuclear accident since the 1986 Chernobyl disaster.

According to records of Nagura’s accounts, Nagura heard Tepco’s explanations of its tsunami estimates at the agency’s office in Tokyo in August and September 2009 as it was becoming clear that coastal areas of Fukushima and Miyagi prefectures were hit by massive tsunami following an earthquake in 869.

Tepco said the height of waves was estimated to be around 8 meters above sea level and will not reach the plant site, which was located at a height of 10 meters, they show.

But Nagura said he remembered thinking pumps with key cooling functions, which were located on the ground at a height of 4 meters, “will not make it” and told Tepco, “If this is the outcome, you better consider concrete responses.”

In refusing to immediately act, Tepco said it would wait for related studies to be carried out by the academic society of civil engineers, which it had requested to be done by March 2012.

Nagura also proposed placing the pumps inside buildings to protect them from being exposed to water, but a Tepco official told him, “Our company cannot make a decision without seeing the results of the (studies by the) society of civil engineers.”

Then another Tepco official told Nagura, “Do you think you can stop the reactors?” according to the government documents.

Nagura recalled in the documents, “I wondered why I had to be told such a thing.” But he also admitted that, after all, he only encouraged Tepco to “consider” tsunami countermeasures and did not request that it “take” specific measures.

The Fukushima crisis has revealed how Japan, which had boasted of possessing the world’s safest nuclear power plants, was ill-prepared against a severe nuclear accident.

Three reactors suffered core meltdowns after they lost their key cooling functions amid a loss of all electrical power following a huge earthquake and tsunami on March 11, 2011.

The government-appointed nuclear accident investigation panel has already issued a final report, and the government is now gradually disclosing the records of hearings conducted to people involved.

Namie residents sue TEPCO

September 30, 2015

117 Fukushima town residents sue TEPCO, gov't over nuclear disaster

<http://mainichi.jp/english/english/newsselect/news/20150930p2a00m0na015000c.html>

KORIYAMA, Fukushima -- Over 100 residents of Namie, Fukushima Prefecture, affected by the Fukushima nuclear crisis, have jointly sued Tokyo Electric Power Co. (TEPCO), the operator of the crippled nuclear plant, and the central government.

The 117 individuals from 32 households in the Tsushima district of the town, designated by the government as **a zone where residents will likely be unable to return in the foreseeable future**, filed their suit with the Koriyama branch of the Fukushima District Court on Sept. 29. **They are demanding that their hometown be restored to its original state through decontamination work and that the defendants pay them a total of some 6.5 billion yen in damages.**

This is the first class action by residents of an area designated a "difficult-to-return zone" because of the nuclear disaster, according to the attorneys for the plaintiffs.

In their suit, the plaintiffs are demanding that the whole Tsushima district be decontaminated to **reduce radiation levels to 1 millisievert per year -- internationally regarded as the upper limit on exposure to radiation, excluding that which exists in nature and the amount that people are exposed to in medical treatments and checkups -- by March 2020.** The residents are also demanding 30 million yen each in compensation if the defendants fail to meet the deadline for decontamination, citing the difficulty of rebuilding the community if the time limit is not met.

They are also **asking that the compensation they are receiving for mental anguish be increased** from the current 100,000 yen each a month to 350,000 yen. Moreover, they are calling for an additional 3 million yen each in damages for what they say was unnecessary exposure to radiation due to the defendants' failure to release their predictions on the spread of radioactive substances shortly after the onset of the nuclear crisis.

About an additional 480 residents from some 170 households in the district are expected to join the 117 plaintiffs in the lawsuit.

TEPCO officials referred to prosecutors over water pollution

October 2, 2015

TEPCO execs sent to prosecutors over contamination

<http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html>

Oct. 2, 2015 - Updated 12:26 UTC+2

Fukushima police have referred former and current officials of Tokyo Electric Power Company to prosecutors over the pollution caused by the 2011 nuclear accident at Fukushima Daiichi nuclear power

plant.

A group of residents filed a criminal complaint 2 years ago against the utility and 32 top officials over the leaks of highly radioactive wastewater from the nuclear plant into the sea.

The group says the company and the executives failed to properly manage storage tanks of contaminated water or build underground walls to block the flow.

Investigators say they have conducted interviews with TEPCO officials and analyzed various materials.

The Fukushima District Prosecutors' Office will determine whether it will lay criminal charges against the company and its officials.

Tokyo Electric Power Company officials declined to make specific comments, but said that they responded to the investigation in an honest manner.

Fukushima police to send toxic water case against TEPCO, execs to prosecutors

<http://mainichi.jp/english/english/newsselect/news/20151002p2a00m0na016000c.html>

FUKUSHIMA -- Police here will refer Tokyo Electric Power Co. (TEPCO) and 32 current and former TEPCO executives to prosecutors **in connection with leaks of toxic water into the Pacific** in the aftermath of the 2011 Fukushima nuclear disaster, investigative sources say.

The police will send papers on the case to the Fukushima District Public Prosecutors' Office **on suspicion TEPCO and the executives violated the environmental pollution offense law.**

Among the 32 individuals are TEPCO President Naomi Hirose, former Chairman Tsunehisa Katsumata and former President Masataka Shimizu. They are suspected of being negligent in their duties and releasing radioactively contaminated water into the ocean from the crippled Fukushima No. 1 Nuclear Power Plant. An initial criminal complaint accusing TEPCO executives of professional negligence resulting in injury or death was filed jointly by individuals and representatives of a citizens' group. In September 2013, the same complainants filed with the Fukushima police against the TEPCO executives on suspicion of violating the environmental pollution offense law.

The complaint says the central government ordered TEPCO to build underground walls to prevent leaks of contaminated groundwater, but that TEPCO postponed taking the measure, citing costs and other reasons. Furthermore, the complaint accuses TEPCO of using weak water storage tanks resulting in the leak of some 300 metric tons of contaminated water, and of insufficient monitoring measures that led to the delayed discovery of the leak and increasing the volume of water that escaped.

JFBA calls for more gov't support for People affected by 3/11

October 2, 2015

Lawyers' group calls for more government support for those affected by Fukushima radiation

http://www.japantimes.co.jp/news/2015/10/02/national/lawyers-group-calls-for-more-government-support-for-those-affected-by-fukushima-radiation/#.Vg_H4Zfwmic

Kyodo

CHIBA – Japanese lawyers urged the government Friday to enhance health support for people affected by the 2011 Fukushima nuclear disaster, at a time when around 110,000 people are living away from their homes with the prospect of returning still uncertain.

“The state should provide periodical and continual medical checkups for free to those who lived or live in radiation-hit areas,” the Japan Federation of Bar Associations said in a resolution adopted during its annual human rights conference at the Makuhari Messe convention center near Tokyo.

“The results of the checkups should be widely shared, with consideration given to privacy, so experts can examine them to study the effects of low-dose exposure and map out countermeasures,” the JFBA noted.

Among the 110,000 evacuees, around 45,000 are living outside Fukushima Prefecture, home to the disaster-hit Fukushima No. 1 nuclear complex, and have to decide whether to return home.

“The evacuees may face difficulties even if they return home, as many communities have been disbanded during the four-and-a-half years since the earthquake, tsunami and nuclear disasters, while medical and administrative services will not be sufficiently provided there,” the federation said.

“On the other hand, some of those who decide to stay where they are now will carry double debt loads for their old and present homes,” it said.

Given the situation, **the JFBA also pressed the government to expand support for housing and psychological counseling so evacuees can reconstruct their lives.**

The adoption of the resolution followed a symposium the previous day, at which lawyers, medical experts and municipal leaders discussed how to address nuclear-related issues generated by the triple meltdowns at the Fukushima plant.

Among the panelists was Masaharu Tsubokura, a physician involved in medical practices in areas neighboring the crippled plant.

“The health problems the evacuees face have been caused not only by radiation exposure but also the changes to their living conditions as a result of evacuation,” he said. “Amid social isolation, those suffering strokes and developing diabetes are growing.”

The resolution also touched on the issue of where to ultimately dispose of radiation-tainted waste from the Fukushima disaster, with the mayors of the two towns the central government has selected as candidate sites appearing at the symposium.

Shioya Mayor Kazuhisa Mikata and Kami Mayor Hirobumi Inomata said they opposed the government plan, as the chosen sites are vulnerable to natural hazards and the facilities, if constructed, would damage their municipalities' water resources.

Opposition to the sites has grown partly because the government failed to include local residents in the decision-making process and did not provide a clear explanation, the federation said.

Based on the view that the nuclear disaster violated people's fundamental human rights, including the right to healthy living, the JFBA urged the government during a previous human rights meeting to review its pro-nuclear energy policy and eliminate nuclear power generation.

Will TEPCO's executives be indicted?

October 3, 2015

Police push for charges against TEPCO, execs over pollution problems after nuclear disaster

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201510030052>

THE ASAHI SHIMBUN

FUKUSHIMA--Police are pushing for criminal charges to be filed against Tokyo Electric Power Co. and 32 of its current and former executives over leakages of contaminated water from the Fukushima No. 1 nuclear power plant.

Prefectural police officials here announced Oct. 2 that they had referred the case to prosecutors, but at the same time did not disclose if they had asked prosecutors to indict those named in the documents.

The TEPCO executives, as well as the utility itself, were listed as suspected violators of the pollution law for failing to prevent the leakage of highly radioactive water into the Pacific Ocean.

The Fukushima prefectural police sent papers to the Fukushima District Public Prosecutors Office in response to criminal complaints submitted against TEPCO and its executives since October 2013 by Fukushima residents who were affected by the 2011 triple meltdown at the Fukushima plant.

Among those named in the papers are TEPCO President Naomi Hirose and Tsunehisa Katsumata, a former chairman.

TEPCO executives were negligent in converting the temporary tanks holding contaminated water on the Fukushima No. 1 plant site to safer ones, according to the police. That failure led to the leakage of about 300 tons of contaminated water from the temporary tanks up until July 2013.

The executives were also blamed for delaying the installation of walls to prevent groundwater from flowing into the reactor buildings. This alleged failure meant that between 300 and 400 tons of contaminated water leaked from the reactor buildings on a daily basis from June 2011 to September 2013. After Fukushima residents filed the criminal complaint, prefectural police interviewed all current and former TEPCO executives named in the document.

An official with TEPCO refrained from commenting on the decision to refer the case to prosecutors.

Nuclear plant operators should be held liable for negligence

October 3, 2015

Who's responsible for the Fukushima disaster?

http://www.japantimes.co.jp/news/2015/10/03/national/media-national/whos-responsible-fukushima-disaster/#.Vg_HrZfwmic

by Jake Adelstein

Special To The Japan Times

The International Atomic Energy Agency released its comprehensive — but mostly ignored — final report on Fukushima on Aug. 30.

It blamed the March 2011 triple meltdowns at Tokyo Electric Power Co.'s Fukushima No. 1 power plant on a blind belief in “the nuclear safety myth.” In other words, the myth that Japan's “nuclear power plants were so safe that an accident of this magnitude was simply unthinkable.”

“The regulation of nuclear safety in Japan at the time of the accident was performed by a number of organizations with different roles and responsibilities and complex interrelationships,” the report said. “It was not fully clear which organizations had the responsibility and authority to issue binding instructions on how to respond to safety issues without delay. The regulations, guidelines and procedures in place at the time of the accident were not fully in line with international practice in some key areas, most notably in relation to periodic safety reviews, re-evaluation of hazards, severe accident management and safety culture.”

I'm sure we all remember the “unforeseeable” accident that happened in Fukushima in March 2011, an accident that will take an estimated 40 years and billions of dollars to clean up, some of it already subsidized with taxpayer money and higher electric bills.

Having restarted a reactor at the Sendai nuclear power plant in Kagoshima in August, one might suspect that the administration of Prime Minister Shinzo Abe and Kyushu Electric Power Co. don't appear to remember this accident very well.

For a start, putting the reactor in Kagoshima back online didn't exactly go according to plan. Despite months of inspection, seawater was detected in the reactor's cooling system in late August. Alarm bells sounded.

In spite of all the checks and balances that were introduced in the wake of the Fukushima disaster, power utilities are continuing to drop the ball as far as their reactors are concerned. How can we ensure such oversight is avoided?

Katsunoba Onda, author of “Tepco: The Darkness of the Empire,” which predicted in 2007 the nuclear accident at Fukushima, and lawyer Hiroyuki Kawai, who established the National Network of Counsels in Cases against Nuclear Power Plants, have proposed a very simple way of ensuring this happens: **hold nuclear plant operators criminally liable for negligence. The threat of incarceration might help them take their work more seriously and less likely to cut corners.**

The Prosecutorial Review Board appears to back such a proposal, approving the first criminal prosecutions of three former Tepco executives last July. The board consists of a panel of 11 private citizens, who operate under a rarely used set-up in the Japanese legal system that allows outsiders to review prosecutors' decisions.

The panel ordered that Tsunehisa Katsumata, chairman of Tepco at the time of the accident, and two former heads of the utility's nuclear division, be charged with professional negligence resulting in death and injury.

Prosecutors, however, have to date been slow to pursue criminal liability in the case. They did accept submissions from the public but then leaked their decision not to prosecute just as Japan won the right to host the 2020 Olympic Games. The story, however, doesn't end there.

This decision was again sent to the Prosecutorial Review Board, which again recommended that a criminal case be filed. For the second year in succession, the Prosecutorial Review Board overruled the prosecutors.

Prosecutors have reportedly continued to reject the case because "it is not possible to prove negligence." The IAEA report is expected to be submitted as evidence showing the exact opposite.

"When you have a disaster of this scale, isn't it crazy not to pursue responsibility?" Kawai, who led the citizen's group that filed charges with the prosecutors, told Nikkan Gendai. "The common sense of the people overturned the judgment of prosecutors, prosecutors who favor large companies and the powerful. Tepco knew about the possibility of a large-scale tsunami and did nothing about it. The idea that if it's not easily foreseeable, no one is responsible is mistaken. Abe says 'Japan has the safest nuclear standards in the world.' He's the only one saying it. It's not true. The Abe administration's push for war and for nuclear energy are very dangerous — one mistake and this country will be destroyed."

If the Tepco executives are tried in court and found guilty, it wouldn't be the first time nuclear power operators were convicted of criminal negligence resulting in death. In 1999, two employees died in an accident at the Tokaimura power plant run by JCO, a nuclear fuel cycle company. Six of the company's executives were later charged and pleaded guilty to criminal charges of negligence resulting in the deaths. They were all given suspended sentences.

Dark Side of the Rising Sun is a monthly column that takes a behind-the-scenes look at news in Japan.

How did NRA nuclear files find their way online?

October 3, 2015

<http://mainichi.jp/english/english/newsselect/news/20151003p2a00m0na008000c.html>

The Nuclear Regulation Authority (NRA) secretariat says it does not know how leaked nuclear-related files used in one of its training sessions got out.

The Mainichi Shimbun has confirmed that the files included instructional materials and training session footage. New employees underwent training from April to May last year. Fifty-eight books -- totaling about 3,800 pages -- including the training text, and about 60 hours out of a total of about 74 hours of training footage appear to have been leaked. The NRA secretariat has confirmed that the files are genuine.

Within the text are 80 pages describing the equipment of a boiling water reactor. In addition to diagrams of the reactor and the pumps and turbines within, the pages includes the steps between activating a reactor and getting it up to the status of normal operation, as well as water temperature and pressure data related to starting one of these reactors.

Most of the leaked data was classified at the **second-to-lowest level of a four-level scale of confidentiality, which "does not include classified information but could obstruct business operations."**

In recorded video of the training showing a debate about where the blame for the nuclear disaster lay, new employees said, "Looking at the Fukushima (No. 1 Nuclear Power Plant) accident, my personal opinion is that you can't say that Tokyo Electric Power Co. was entirely at fault," and, "It is not the fault of just one group, but the fault of both (power producers and regulators.)"

Training session files were found to have leaked in March this year, and 50 pages relating to the nuclear waste reprocessing facility in Rokkasho, Aomori Prefecture, found their way online. That leak apparently occurred when a company hired by the NRA secretariat in October last year to translate the documents into English outsourced the work to a third party.

The latest leak was also of documents assigned for translation to this company, but the company claims it only outsourced a part of the work and denies involvement in the latest case. The source of the latest leak has yet to be determined.

The International Atomic Energy Agency asks all nations to carefully manage information on nuclear power facilities to prevent nuclear terrorism. In January this year, the NRA presented security guidelines for its employees regarding the handling of nuclear information. A representative from the NRA secretariat admits that the leaks have been a "problem."

More about NRA leaks

October 7, 2015

NRA secretariat says all nuclear files for training session possibly leaked

<http://mainichi.jp/english/english/newsselect/news/20151007p2a00m0na001000c.html>

A senior official of the Nuclear Regulation Authority (NRA) secretariat said on Oct. 6 that it was highly likely that all of the internal documents used in one of its training sessions for its new employees had been leaked.

"We have judged that there is a high possibility that all of the materials have been released," Katsumi Matsuura, director of the general affairs division at the NRA secretariat, said at a regular news conference on Oct. 6.

The NRA secretariat has been looking into the incident, including the possibility of the internal files leaking from inside in addition to the possibility of a leakage from a translation company the secretariat commissioned to translate the documents. But Matsuura said how the documents had actually been leaked has yet to be identified.

The internal documents in question are textbooks totaling 3,800 pages used in a training session held between April and May 2014 for the secretariat's new employees as well as a total of 74 hours of training footage.

The Mainichi Shimbun had earlier confirmed that all of the textbooks and about 60 minutes of training footage had been leaked, The revelations raised questions about the way the organization handling nuclear information manages sensitive data.

The leaked documents include data on procedures to operate nuclear reactors as well as data showing water temperatures and pressure levels in reactors.

The NRA secretariat set up an in-house investigation team last month.

Matsuura said at the news conference, "We will continue to look into the matter and consider preventive measures."

TEPCO faces multiple official compensation claims

October 12, 2015

TEPCO facing compensation demands from dozens of local gov'ts over nuclear disaster

<http://mainichi.jp/english/english/newsselect/news/20151012p2a00m0na006000c.html>

Seventeen prefectures including Fukushima Prefecture and seven major cities have filed compensation claims totaling 56.36 billion yen against Tokyo Electric Power Co. (TEPCO), citing damage caused by the meltdowns at the Fukushima No. 1 Nuclear Power Plant in 2011, the Mainichi Shimbun has learned. TEPCO has refused to pay over 20 billion yen of the claimed amount, and six prefectures and one ordinance-designated city either plan or already have filed for nuclear damage compensation under the **alternative dispute resolution (ADR) system**.

Development of a compensation system for such entities has been slow compared with individual residents or companies. An official from one of the municipalities says the national government needs to get involved with concrete measures.

The Mainichi Shimbun surveyed all 47 prefectures, including Tokyo, as well as the nation's ordinance-designated cities, over the amount and details of compensation they were demanding from TEPCO as of the end of August this year. All prefectures and ordinance-designated cities in the Kanto and Tohoku regions have filed for damages. Mie and Shimane prefectures in the west of Honshu Island have also asked the utility to pay for dosimeters and other devices that the prefectural governments purchased in the wake of the nuclear disaster.

According to sources related to prefectural and municipal governments, TEPCO has agreed to pay a total of 36.29 billion yen in compensation for the drop in revenues of public businesses such as those managing water and sewage systems, the cost of radiation tests on school meals and agricultural and livestock products, and the cost of processing and storing waste contaminated with radioactive substances, among other damage.

In some cases, however, TEPCO fixed the period for damage caused by the nuclear disaster. In addition, the utility has not agreed to cover the drop in residence tax and other tax revenues in Fukushima Prefecture, caused by many moving out the prefecture due to the disaster, or the cost of measures to curb harmful rumors regarding radioactive contamination in Akita Prefecture and the cost of extending assistance to nuclear disaster victims in Gunma Prefecture.

Dissatisfied with TEPCO's handling of the situation, the Aomori, Akita, Yamagata, Miyagi and Chiba prefectural governments have filed claims for damage via the ADR system. Gunma Prefecture and the city of Sendai are set to follow suit. The Iwate Prefectural Government has already reached a 250 million yen settlement with TEPCO.

According to Iwate, Miyagi and Fukushima prefectures -- the three areas hit hardest by the 2011 triple disaster -- most municipalities have filed for compensation from TEPCO, with the total amount claimed reaching 62.88 billion yen. Of that, the utility has agreed to pay only 8.65 billion yen. In addition, some municipalities in other prefectures have also demanded that TEPCO pay compensation for damages. In total, prefectural and municipal governments across the country are reportedly seeking over 120 billion yen in damages from the utility.

A TEPCO official told the Mainichi Shimbun, "We are paying local governments compensation in amounts that fall within a necessary and logical range based on interim guidelines set by the Dispute Reconciliation Committee for Nuclear Damage Compensation."

Japan pledges to help Iran on nuclear matters

October 13, 2015

Japan to provide expertise on nuclear energy to Iran

http://ajw.asahi.com/article/asia/around_asia/AJ201510130043

By DAISUKE KANDA/ Correspondent

TEHRAN--Japan pledged Oct. 12 to provide personnel and expertise to Tehran to help it develop nuclear energy for peaceful purposes.

Agreement was reached here during talks between Foreign Minister Fumio Kishida and his Iranian counterpart Mohammad Javad Zarif.

Kishida and Zarif agreed that Japan will provide its know-how on earthquake-preparedness at nuclear facilities based on its experience of the Fukushima nuclear disaster in 2011.

Tokyo will also share its experience of emergency measures it took after the triple meltdown at the Fukushima No. 1 nuclear power plant and other steps to improve safety at nuclear facilities.

"Japan will continue efforts to foster cooperation between the two countries by providing its expertise to Iran in fields with which it has advanced know-how," Kishida said during a news conference.

The two ministers also signed a bilateral investment pact to entice Japanese companies to make inroads into the Iranian market.

Under a historic accord Iran signed with a group of six nations led by the United States, Tehran can continue nuclear development to supply energy and for medical purposes. The United States had imposed sanctions against Iran over its uranium enrichment program.

In exchange, the pact requires Tehran to establish a "nuclear safety center" to obtain technological expertise on nuclear energy with support from the six nations and other countries.

According to a joint statement released after the ministerial meeting, Japan will dispatch nuclear experts to the center to help it map out strategies to cope with a nuclear accident.

Japanese experts will also provide training to their Iranian counterparts to explain the importance of building nuclear facilities capable of withstanding earthquakes and provide know-how on calculating and managing nuclear materials.

The experts are likely to arrive at the center next year or later when Iran is ready to implement the accord with the six countries.

The investment pact, which aims to assist Japanese firms as they tap into the Iranian market, was signed after only one month of negotiation. Teheran has signed similar investment accords with 52 countries, including Germany, France, China and South Korea.

Kishida also agreed to set up a Japan-Iran cooperation council to promote bilateral cooperation in economic, environmental and other fields.

During the news conference, Zarif expressed confidence in expanding bilateral cooperation, saying a very bright future lies ahead for the two countries' diplomatic relations.

US & the two Koreas

October 17, 2015

US ready to talk with North Korea 'if it is serious about denuclearization'

<http://www.japantimes.co.jp/news/2015/10/17/asia-pacific/politics-diplomacy-asia-pacific/u-s-ready-talk-north-korea-serious-denuclearization/#.VileXivwmos>

by Matthew Pennington

AP

WASHINGTON – The U.S. is ready to negotiate with longtime adversary North Korea as it has with Iran, but Pyongyang has to be serious about abandoning nuclear weapons, President Barack Obama said Friday. Obama was speaking after meeting with South Korean President Park Geun-hye, a close ally, who echoed the U.S. leader's view.

The North has conducted three nuclear tests since 2006 and is developing a mobile ballistic missile that could potentially hit the U.S.

Obama said Iran was prepared to have a "serious conversation" about the possibility of giving up the pursuit of nuclear weapons. He said there is no indication of that in North Korea's case.

International aid-for-disarmament talks with the North stalled seven years ago.

"At the point where Pyongyang says, 'We're interested in seeing relief from sanctions and improved relations, and we are prepared to have a serious conversation about denuclearization,' it's fair to say we'll be right there at the table," Obama told a joint news conference.

However, he added that North Korea's violations of past agreements calls into question its willingness to allow the kind of "rigorous" verification regimes put in place with Iran.

Park's visit follows heightened tensions this summer at the heavily militarized border between the two Koreas, and speculation that North Korea could be planning another nuclear test explosion or a rocket launch into space using ballistic missile technology.

In a joint statement issued after Friday's meeting, the U.S. and South Korea said that if North Korea takes such a step, "it will face consequences, including seeking further significant measures by the U.N. Security Council." The statement also said they will never accept North Korea as a nuclear weapons state.

Park has cultivated closer relations with China as she looks to coax Beijing away from its traditional embrace of Pyongyang.

Last month, she prompted hand-wringing in Washington when she attended a Chinese military parade marking the end of World War II that was snubbed by the leaders of most major democracies.

But Obama said he had no problem with Park meeting Chinese President Xi Jinping, and joked that Xi “was in this room, eating my food,” during a state visit to the U.S. last month.

“We want South Korea to have a strong relationship with China, just as we want to have a strong relationship with China. We want to see China’s peaceful rise. We want them to be cooperating with us in putting pressure on the DPRK,” Obama said, referring to the North’s official title, the Democratic People’s Republic of Korea.

But he added that the U.S. expects South Korea to speak out if China fails to abide by international norms and rules.

The U.S. has voiced mounting concerns to Beijing over cybertheft and China’s massive island-building in areas of the disputed South China Sea.

Obama and Park discussed the often-touchy relations among China, Japan and South Korea, whose leaders are to hold a long-awaited summit in Seoul in early November. Park said that the summit will be an opportunity to improve South Korea’s relations with another key U.S. ally, Japan, which will be welcomed by Washington.

The U.S. retains 28,500 troops in South Korea, a legacy of the 1950-53 Korean War. Obama called the U.S.-South Korean alliance “unbreakable.” Park called it “the lynch pin of peace and stability in the Asia-Pacific.” Her language may rankle a little with Japan, which is also a critical U.S. ally in the region, hosting nearly 50,000 American troops.

Obama commended Park’s handling of an August standoff between the two Koreas, when they threatened each other with war after two South Korean soldiers were wounded by land mines Seoul says were planted by the North. The tensions have since eased, and the two sides have agreed to resume reunions of Korean families divided by the Korean War next week.

The Obama administration has faced criticism from hawks and doves alike for a lack of high-level attention on North Korea, which estimated to have enough fissile material for between 10 and 16 nuclear weapons.

Shikoku Electric satisfied

October 26, 2015

Shikoku Electric welcomes governor's consent

http://www3.nhk.or.jp/nhkworld/english/news/20151026_24.html

Oct. 26, 2015 - Updated 05:15 UTC+1

The president of Shikoku Electric Power Company has told reporters that the governor's agreement to the restart of the No. 3 reactor at the Ikata nuclear power plant was a big step forward.

Hayato Saeki said he will continue to make efforts to further improve the safety and reliability of the plant.

He said he will seek the restart of the reactor as early as possible.

But he refrained from commenting on the specific timing of the restart, saying that screening is still underway.

Feed-in tariffs review: Public consensus essential

October 31, 2015

Review of feed-in tariff system

<http://www.japantimes.co.jp/opinion/2015/10/31/editorials/review-feed-tariff-system/#.VjTi0yt1BLN>

A review of the feed-in tariff system, introduced in 2012 to promote introduction of renewable energy following the shutdown of nuclear reactors in the wake of the 2011 disaster at Tokyo Electric Power Co.'s Fukushima No. 1 power plant, is underway by a panel of experts at the Ministry of Economy, Trade and Industry.

Planned amendments to the system, aimed at addressing several problems that came to light in its first three years, should be implemented in ways that contribute to boosting the scant share of renewable sources in the nation's electricity supply. The reform should also be accompanied by **greater efforts to build a public consensus on what cost the nation is ready to shoulder to establish a sustainable energy supply.**

Currently, electricity generated by renewable sources accounts for only 12.2 percent of the nation's total. The share of sources such as solar and wind but not including hydro stands at a mere 3.2 percent. To achieve the government's goal of boosting the renewable share to 22 to 24 percent in 2030 — and hopefully beyond — the system to expand renewable energy supply needs to be based on a long-term vision.

The feed-in-tariff system, which began in July 2012, makes it mandatory for power companies to buy electricity generated by renewable sources at fixed prices set by the government, so that the prospect of stable revenue will facilitate investment in renewable power generation. The system has indeed sharply boosted the introduction of solar power, whose facilities can be built relatively easily and quickly. **Solar power output during the peak-demand period in summer 2014 reached 6.33 million kilowatts — the equivalent of six nuclear reactors.**

However, much of the increase in renewable energy output capacity under the system — more than 90 percent of the total — has been concentrated in solar. This sharp increase in output led several major

power companies to suspend purchases of electricity from solar power operators, on the grounds that their power supply system could be disrupted.

It has also been pointed out that **many operators of solar power businesses that have obtained a government permit to sell the electricity at a high fixed price have not started producing power because they're waiting for the cost of solar panels and other items to decrease.**

The system should be corrected to prevent distortions in the way renewable energy develops. And yet it appears indisputable that the system is contributing to expansion of the use of renewable energy in this country. In the ongoing review, **the government should not lose track of the system's basic purpose — to reduce the risks for businesses that are serious about developing renewable energy, and to get all of society to share the cost of expanding the use of renewable energy.**

The fixed prices for purchase of electricity from renewable sources are set high to ensure a profit margin for the producers. The power companies' cost of buying such electricity is passed on to households and businesses.

During the current fiscal year, the total cost of purchasing renewable energy is projected to reach ¥1.8 trillion. The cost is expected to rise to as high as ¥4 trillion in 2030 if the renewable supply is doubled from the current level in line with government targets.

Reportedly under consideration in the ministry's review of the system is a mechanism to introduce an auction for energy operators if the output of solar power reaches a certain level, so that the purchase of power from more efficient operators would be prioritized and trim the overall cost.

Also called for in the review is a more balanced promotion of various renewable sources whose output is less affected by weather conditions than solar. **The ministry is believed to be weighing whether to fix purchase prices for wind, hydro, geothermal and biomass for several years ahead — instead of revising them annually — to promote investments in energy facilities that require a long period to be completed.**

This could reduce the risk of price fluctuations for prospective operators and encourage them to cut costs. Under the feed-in-tariff system, the additional charges that consumers pay for electricity will increase as the power supply from renewable sources rises. While the government and power producers should make sustained efforts to win the understanding and support of consumers, the latter will also need to think about the benefits and problems of the system as they weigh the impact on their pocketbooks.

To help build a popular consensus on the issue, discussions of the feed-in tariff system and other measures to promote introduction of renewable energy should be made transparent, rather than being monopolized by the bureaucracy and business interests.

Cancers after 3/11: But who to trust?

October 31, 2015

Cancer and Fukushima: Who to trust?

<http://www.japantimes.co.jp/news/2015/10/31/national/media-national/cancer-fukushima-trust/#.VjTiCit1BLN>

by Philip Brasor

Special To The Japan Times

South Korean director Kim Ki-duk is a noted provocateur. His latest movie, "Stop," is about a Japanese couple who were living near the Fukushima No. 1 nuclear power plant when it suffered a meltdown in March 2011.

They evacuate to Tokyo, where the wife is pestered by an underground cult that insists she abort her presumably irradiated fetus, and she becomes convinced she should. Her husband is equally convinced there is nothing wrong with the baby and ties his wife up to prevent her from doing anything. Kim's point seems to be that whichever position you take on the nuclear accident, it will invariably drive you insane. But these positions do divide families. In an interview that appeared Oct. 20 on Norikoe Net TV, writer Minori Kitahara remarks to filmmaker Hitomi Kamanaka that there are no men in her latest documentary, "Little Voices from Fukushima," which centers on a group of mothers trying to gain more information about the effects of radiation on their children's health, because the authorities give them none. Kamanaka says these women's husbands refused to appear on camera "even though they support what their wives are doing."

There are even more mothers involved in the movement whose spouses forbade them to participate in the filming. Because of their jobs, these men gravitate toward the establishment stance, which in this case holds that there is no solid evidence showing that the radioactivity released by the Fukushima accident has had a harmful effect on area residents, including children. **Public health in Fukushima is, according to Kamanaka, a gender-identified issue. "The nuclear industry is very much a man's world,"** she says.

The male-dominated media augments the confusion by throwing out stories related to radiation in Fukushima filled with unexplained statistics: three Fukushima hospitals ran tests on 2,700 children and discovered no radioactive cesium in their bodies; the International Atomic Energy Agency says an increase in the incidence of thyroid cancer in Fukushima is "unlikely." Then Toshihide Tsuda, a professor at Okayama University, contradicts the purport of these stories by publishing a study in the journal of the International Society of Environmental Epidemiology that found thyroid cancer incidence rates of Fukushima residents "under the age of 19" was 20 to 50 times the national level. News items that mention the study also point out that Tsuda's conclusions are questioned by experts who call them "premature" or indicative of a "screening surge," meaning that since so many people were tested more cancers than normal were bound to be found and these cancers may not have been caused by radiation.

Tsuda addressed these doubts last month during a press conference at the Foreign Correspondents' Club of Japan, explaining that even if a screening surge is factored in, the incidence rate for thyroid cancer is well above the norm. Moreover, the rate of cancer incidence four years after the accident is comparable to the rate of thyroid cancer incidence in Belarus four years after the Chernobyl nuclear disaster, and that led to 6,000 children undergoing surgery. He called on the authorities to undertake "better and broader" screenings and implement measures to address this probable increase in cancer cases.

The operative word here is "cancer," which dominates the conversation because of its terrifying overtones. However, it is treated by both sides as a quantitative matter: How many children will get cancer and how much of it was caused by radioactivity?

What's missing is the qualitative dimension. Katsuya Kodama, a medical researcher whose specialty is the effects of radiation on cells, pointed out during a recent discussion on the Internet news channel DemocraTV that DNA strands are always being damaged and repair themselves as a matter of course. Radiation above a certain level, however, can cause more permanent damage, which may lead to cancerous cell growth.

But all cancers aren't the same, and according to his research, the type of cell mutations found in the children in Fukushima don't usually lead to "shortened life spans." The small nodules found on the subjects' thyroid glands are cancerous but that doesn't mean they're fatal. Thyroid cancer develops very slowly, but once a parent hears from a doctor that his or her child "has cancer," the reaction is to have it removed immediately, even though it may not be necessary. Fifteen Chernobyl children diagnosed with thyroid cancer eventually died, but Kodama believes death was due to the effects of surgery and not the cancer itself. Though the number of thyroid cancer diagnoses has risen in the United States in recent decades, the number of annual deaths from the disease has remained unchanged. In Kodama's view, the argument has less to do with the effects of radiation than with how the medical community addresses cancer.

He isn't saying that radioactivity isn't dangerous or that people living in the area shouldn't be screened; he's saying the matter should be explained medically and not just statistically. Strangely enough, his research, like Tsuda's, has been rejected by the establishment. When he presented his findings to the Nuclear Regulation Authority, they told him they were afraid people would "misunderstand." **In accordance with the official line regarding the possible health crisis in Fukushima, it's better not to talk about it at all.**

This attitude only exacerbates the situation. Two years ago the government set up an advisory system for the regions affected by the nuclear accident. Residents could talk to experts about safety and relief measures. Last week, Tokyo Shimbun reported that the program has been a bust, since **residents don't trust anyone representing the authorities to give them straight answers.** As one person involved in the program told the paper, "Everyone has different opinions about the effects of radiation, and it always leads to conflicts."

Fukushima at Pugwash Conference

November 04, 2015

Fukushima in focus at Pugwash Conferences nuclear power debate

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201511040048

THE ASAHI SHIMBUN

NAGASAKI--Lessons learned from the Fukushima disaster led a discussion on the risks of nuclear power generation at the Pugwash Conferences on Science and World Affairs here on Nov. 3.

Some experts called for a cautious approach in response to the 2011 meltdowns at the Fukushima No. 1 nuclear power plant caused by the Great East Japan Earthquake and tsunami.

Others presented the case for continued use of atomic energy.

Kiyoshi Kurokawa, professor emeritus at the University of Tokyo, who served as chairman of the Parliamentary Investigation Commission on the Fukushima Nuclear Accident, was a panelist at the plenary session titled "The Risk of Civil Use of Nuclear Energy."

"Awareness of safety was lacking (in Japan about nuclear power plants)," he said, referring to the Fukushima plant.

He suggested that measures to deal with nuclear accidents be formulated in an open forum with international experts contributing.

Sharon Squassoni, a researcher for the U.S. think tank Center for Strategic and International Studies, also took a cautious stance.

She said that cheaper methods to obtain energy are available, and that the Fukushima disaster clearly showed a gap between expectations of nuclear power generation and its reality.

Squassoni also spoke of the need to consider the scope of the safety that must be guaranteed.

But Ramamurti Rajaraman, an Indian physicist, argued for the promotion of nuclear energy. He said that its risks have to be compared with those of not possessing electricity.

An audience member also said that the energy source is necessary.

“Atomic energy is helpful for (economic) growth of developing countries. Although there were accidents in Chernobyl, Three Mile (Island) and Fukushima, we must not get emotional,” the individual said.

The Pugwash Conferences were started by scientists in Canada in 1957 to discuss ways to abolish nuclear weapons. Since the 2011 Fukushima accident, participants in the international event have also discussed the dangers of the nonmilitary use of nuclear energy.

The current event, the 61st in the series, runs until Nov. 5.

MHI buys stake in Areva

Mitsubishi Heavy to buy stake in French nuclear giant's reactor subsidiary

<http://ajw.asahi.com/article/business/AJ201510310044>

October 31, 2015

THE ASAHI SHIMBUN

Mitsubishi Heavy Industries Ltd. (MHI) will take an equity stake in Areva NP, the reactor manufacturing subsidiary of struggling French nuclear giant Areva, the Japanese company said Oct. 30.

MHI also said it is discussing a deal to take a stake in the parent company of the state-owned group of nuclear power businesses.

“The capital investment will be highly recoverable from the initial investment,” Mitsubishi Heavy President Shunichi Miyanaga said at a news conference in Tokyo to announce the company’s financial statements. “We believe there is no potential risk in the deal.”

Miyanaga also said MHI is “productively considering” a proposal to invest in the parent company, which specializes in fuel-related businesses.

The leading Japanese heavy machinery manufacturer and Areva, which is trying to rejuvenate its business, have joined forces to develop an advanced medium-size nuclear reactor called Atmea 1. It will be delivered to a Turkish nuclear power plant currently under construction.

MHI decided to inject capital into Areva NP because the reactor maker’s advanced technology is essential in developing Atmea 1 and the nuclear venture in Turkey is projected to generate long-term profits.

Areva and the state-owned power utility Electricite de France SA (EDF), which plans to hold an equity stake in Areva NP, are willing to sell maximum 34 percent stakes in Areva NP.

MHI and the two French entities will negotiate the scale of the investment before signing a basic agreement in January or February next year.

A-bomb survivors demand extension of black rain area

November 5, 2015

Hiroshima A-bomb survivors demand recognition as 'black rain' victims

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201511050052

By GEN OKAMOTO/ Staff Writer

HIROSHIMA--A group of atomic bomb survivors here has filed a lawsuit against local governments demanding recognition as victims of radioactive "black rain" and access to free medical checkups. In the suit filed at the Hiroshima District Court on Nov. 4, the 64 plaintiffs said the Hiroshima prefectural and municipal governments should retract their earlier rejections and certify the victims as hibakusha atomic bomb survivors.

The plaintiffs argue it is unacceptable that they have not received the hibakusha certificates despite their exposure to black rain.

The plaintiffs said they believe this is the first group lawsuit demanding recognition as victims of the radioactive black rain that fell shortly after the atomic bombing of the city on Aug. 6, 1945.

The central government in 1976 officially recognized atomic bomb survivors who were exposed to black rain in an area near ground zero. The decision was based on 1953 findings by the Hiroshima local observatory, which concluded that there was "heavy" precipitation of radioactive black rain in that area. Survivors in this area have been given free health checkups. If they develop cancer or cirrhosis, they can receive financial assistance for treatment as certified hibakusha.

But those exposed to black rain in other areas are not eligible for the relief measures. The Hiroshima prefectural and municipal governments have not issued certificates to these people in line with the central government's designation.

The plaintiffs said the central government's judgment was "extremely unfair."

"Some of us have suffered cancer and other illnesses and have been worried about our health over the years due to our exposure to black rain," one of the plaintiffs said.

After the suit was filed, Hiroshima Mayor Kazumi Matsui and Hiroshima Governor Hidehiko Yuzaki released statements that said they were taking seriously the fact that victims have resorted to legal action to seek relief measures.

The municipal and prefectural governments, they said, had no choice but to reject the plaintiffs' requests because the central government has not expanded the recognized area of heavy black rain.

The local governments have asked the central government to widen the recognized area for relief sixfold based on their study conducted in fiscal 2008.

But the central government declined that request in 2012, citing a health ministry panel report that concluded the proposed expansion lacked scientific grounds.

A-bomb survivors file suit demanding 'black rain' area be expanded

<http://mainichi.jp/english/english/newsselect/news/20151104p2a00m0na020000c.html>

HIROSHIMA -- A group of 64 Hiroshima atomic bombing survivors have filed a suit demanding local governments expand areas covered by free checkups for people exposed to radioactive "black rain" after the bombing.

The plaintiffs -- all residents of Hiroshima Prefecture -- are currently not receiving assistance under the Atomic Bomb Survivors' Assistance Law as they were outside the black rain area recognized by the government. They had earlier applied to the Hiroshima prefectural and municipal governments for A-bomb survivors' certificates, but their requests were rejected.

The group filed the suit with the Hiroshima District Court on Nov. 4, demanding the Hiroshima prefectural and municipal governments issue A-bomb survivors' certificates to them. While the Hiroshima Municipal Government is demanding the black rain area recognized under the assistance law be expanded, the national government has been lukewarm to the idea. Through the lawsuit, the plaintiffs are seeking to have the government review the system for recognizing A-bomb survivors and expand the designated black rain area.

According to the complaint, the plaintiffs -- who were 5 months to 20 years old at the time of the Aug. 6, 1945 atomic bombing of Hiroshima by U.S. forces -- currently suffer from cancer, anemia, hypothyroidism and other symptoms due to their exposure to the radioactive black rain, which hit the city shortly after the bombing.

In March this year, the plaintiffs started applying for A-bomb survivors' certificates and another type of certificate that could be converted into the first type once they develop certain diseases with the Hiroshima prefectural and municipal governments, claiming that they were "under circumstances susceptible to radiation from the atomic bombing" and were therefore eligible for the certificates. Their requests, however, were turned down.

In the suit filed with the Hiroshima District Court, the plaintiffs are demanding the Hiroshima prefectural and municipal governments nullify their decisions to turn down their applications for those certificates. However, because the local governments' decisions were based on current laws and ordinances, the plaintiffs are also contesting the relevance of the national government's relief measures for A-bomb survivors.

In 2010, the Hiroshima prefectural and municipal governments asked the national government to expand the recognized black rain area by six times the current size after conducting an independent survey on A-bomb survivors. However, the national government concluded in 2012 that it would not expand the recognized area on the grounds that an expert panel to the Ministry of Health, Labor and Welfare decided that there were "no scientific grounds" in the survey results.

Masaaki Takano, 77, head of the plaintiffs' group and chairman of an association of Hiroshima Prefecture black rain victims' groups, said, "The national government failed to recognize our longtime pleas and the prefectural and municipal governments' requests to expand the recognized area. We have no choice but to bring the case to court."

In comments released after the filing of the suit, Hiroshima Mayor Kazumi Matsui and Hiroshima Gov. Hidehiko Yuzaki said they understood that people who were not recognized by the law as A-bomb survivors felt compelled to opt for seeking legal judgment. In the meantime, they also said that they had no choice but to reject survivors' applications based on the current laws and government decrees, adding that they would respond to the matter properly after consulting with the national government.

Fukushima at Pugwash Conference (2)

November 4, 2015

Pugwash Conference discusses risk of peaceful use of nuclear energy

<http://mainichi.jp/english/english/newsselect/news/20151104p2a00m0na010000c.html>

NAGASAKI -- A special session focusing on the risk of peaceful use of atomic energy was held here as part of the 61st Pugwash Conference on Science and World Affairs on Nov. 3, where participants discussed the Fukushima nuclear disaster and the role of scientists.

Kiyoshi Kurokawa, former chairman of the National Diet of Japan Fukushima Nuclear Accident Independent Investigation Commission, said about the disaster at the Fukushima No. 1 nuclear plant operated by Tokyo Electric Power Co., "The accident occurred against the backdrop of closed and non-transparent bureaucratic and corporate culture, among other factors."

In order to prevent a recurrence of such a disaster, "**We must think about nuclear energy as responsible citizens, not as individuals belonging to organizations**," he said.

In a lecture delivered during the conference, Osamu Shimomura, a 2008 Nobel Prize in Chemistry laureate, recounted his experience of the Aug. 9, 1945 atomic bombing of Nagasaki and said, "Everything derives from wars. I hope that we can live in a world without wars or nuclear weapons."

Time for "honorable retreat" from Tokyo Olympics

November 4, 2015

Let's call the whole thing off: The former Japanese ambassador to Switzerland, Mitsuhei Murata, recently suggested that Japan should stage an 'honorable retreat' from hosting the 2020 Olympics due to the unpredictable situation at the crippled Fukushima No. 1 nuclear power plant. | KYODO

Voices | HOTLINE TO NAGATACHO

Time has come for an 'honorable retreat' from Tokyo 2020 over Fukushima

<http://www.japantimes.co.jp/community/2015/11/04/voices/time-come-honorable-retreat-tokyo-2020-fukushima/>

Dear Olympics minister Toshiaki Endo,

Let me begin this message by offering you my sincerest condolences. Condolences for what? For the death of the belief that a trouble-free 2020 Tokyo Olympics would serve to showcase Japan's economic revival.

Up to this point, the exact opposite has been the case, due to the scrapping of plans for a very expensive new National Stadium, the scuttling of the Olympic logo amid charges of plagiarism and newspaper headlines alleging, for example, that "Japan's Olympics fiascoes point to outmoded, opaque decision-

making.” Even more recently, Japan sports minister Hakubun Shimomura offered to resign over the Olympic stadium row.

Among these developments, the charge alleging “outmoded, opaque decision-making” is perhaps the most troubling of all, because it suggests that both of the major setbacks the 2020 Olympics has encountered are systemic in nature, not merely one-off phenomena. If correct, this indicates that similar setbacks are likely to occur in the future. But how many setbacks can the 2020 Olympics endure?

At this point it may be apt to recall the warning of 13th-century Zen master Dogen: “If there is the slightest difference in the beginning, the result will be a distance greater than heaven is from Earth.”

One lesson to be learned from Dogen’s words is that in order to understand the mess you are in now, you should reflect on how you got into it in the first place. When this is done, the “beginning” becomes clear, i.e., Prime Minister Shinzo Abe’s 2013 statement to the International Olympic Committee that the situation at the crippled Fukushima No. 1 nuclear plant was “under control.” The prime minister went on to tell the Diet, “The effect of radioactive substances in the nearby waters is blocked within 0.3 sq. km of the plant’s harbor.”

One needs only to look at recent stories describing the torrential downpours in the Fukushima area to know that this claim, if it were ever true, is clearly no longer valid. Even Tepco stated: “On Sept. 9 and 11, due to typhoon No. 18 (Etau), heavy rain caused Fukushima No. 1 drainage rainwater to overflow to the sea.” This is not to mention the high probability that relatively decontaminated areas have been contaminated once again by the heavy rains carrying radioactive particles lodged in the nearby mountains down onto the plains. Nor does it take into account that no one knows the location or condition of the melted fuel in reactors 1, 2 and 3.

Unfortunately, Zen master Dogen didn’t explain what to do when you find yourself in a spot where heaven is already far removed from Earth — or the truth, in this instance. Fortunately, the former Japanese ambassador to Switzerland, Mitsuhei Murata, recently proposed an eminently reasonable solution. It is time, he says, for Japan to stage an “honorable retreat” from hosting the 2020 Olympics while there is still time to select and prepare an alternative site.

In an article in the September issue of *Gekkan Nippon*, Murata buttressed his proposal by pointing out another misstatement in Abe’s IOC testimony, namely, “(Fukushima) has never done and will never do any damage to Tokyo.” In response, Murata pointed to a number of incidents showing that Tokyo was affected by Fukushima radioactive fallout, including the discovery on March 23, 2011, that water from the purification plant in the Kanemachi district of Tokyo contained more than 200 becquerels per liter of radioactive iodine, double the recommended limit for young infants stipulated in the Food Sanitation Act. Murata’s major concern, however, was not about the past but the present and future. He noted the danger still posed by large numbers of spent fuel rods suspended in spent fuel pools in reactors 1, 2 and 3. Unlike the spent fuel rods in reactor building 4 successfully removed by the end of 2014, the remaining rods can’t be removed from the damaged reactor buildings due to the high levels of radioactivity surrounding these reactors, all three of which suffered meltdowns.

Murata’s gravest concern is a number of troubling indications of recurring criticality in one or more of the reactors at Fukushima No. 1. For example, he notes that in December 2014, both radioactive iodine-131 and tellurium-132 were reported as having been detected in Takasaki city, Gunma Prefecture. Given the short half-lives of these radioactive particles, their presence could not be the result of the original meltdowns at Fukushima.

Murata is not opposed to the Tokyo Olympic Games per se, but finds them a major distraction to what needs to be done immediately — namely, gathering the best minds and expertise from around the world and, with the full support of the Japanese government, doing everything humanly possible to bring

Fukushima No. 1 truly “under control.” This will help to ensure the Pacific Ocean is no longer used as an open sewer for Fukushima-produced radiation, and also address the ongoing pain and distress of the residents of Fukushima Prefecture and beyond.

As Murata noted in the conclusion of his article, “Heaven and Earth will not long countenance immoral conduct.” Recognizing this, Minister Endo, will you join the call for an “honorable retreat”?

Kyoto

MHS closer to investing in Areva

November 6, 2015

Source : Bloomberg

<http://www.bloomberg.com/news/articles/2015-11-06/mitsubishi-heavy-steps-closer-to-investment-in-france-s-areva>

Mitsubishi Heavy Steps Closer to Investment in France's Areva

Masumi Suga

November 6, 2015 — 10:21 AM CET

- Couches proposal in terms of wider Franco-Japan collaboration
- Two nuclear companies have relationship going back to 2006

Mitsubishi Heavy Industries Ltd. moved closer to investing in Areva SA's reactor unit after it said it has begun examining a “concrete proposal” to take a minority stake, a step that would deepen ties between Japan and France in the generation of nuclear energy.

Japan's sole producer of pressurized water reactors said Friday that in coming weeks it will consider the conditions for making an offer for Areva NP, including “ownership ratios,” and will also “work up a proposal of Japan-France collaborative measures” around the safety and reliability of nuclear power plants.

The Tokyo-based company's statement comes a month after French Prime Minister Manuel Valls sought Japanese investment in the Areva unit as part of wider collaboration between the two governments over nuclear energy. Any deal would help state-owned Areva shore up its finances after losses caused in part by the retreat from atomic energy in countries including Japan and Germany.

Mitsubishi's investment would deepen a partnership with Areva that began in 2006. The two companies signed a \$22 billion agreement in May 2013 to build a nuclear power plant in Turkey, the first major order for a Japanese firm since Fukushima. It would also signal the importance to Mitsubishi of seeking overseas contracts to replace domestic sales lost by the shuttering of Japan's atomic reactors in the wake of the 2011 disaster.

Nuclear Cooperation

Mitsubishi would join Electricite de France SA in owning Areva NP. EDF, the world's biggest operator of nuclear plants, said in July it plans to take a majority stake in the reactor unit as part of a rescue plan for

the unprofitable Areva. The two state-controlled companies also agreed to set up a venture to manage new projects, including exports, that would be led by EDF.

Mitsubishi first said it was interested in investing in Areva NP June. This week, Areva SA said China National Nuclear Corp. may buy a minority stake in the parent company as part of wider ranging nuclear cooperation.

Mitsubishi is a maker of ships, planes and rockets. Its recent success has been in power systems that now account for 40 percent of revenues. Its thermal business is conducted in partnership with another Japanese conglomerate, Hitachi Ltd.

Japan restarted the first of its 43 operable atomic reactors in August despite public opposition. The government anticipates that nuclear will account for as much as 22 percent of electricity generation by 2030.

Mitsubishi built about half of the nuclear reactors in Japan. For its project, the Turkish government chose a 1,100-megawatt unit, called Atmea, which was jointly designed by Mitsubishi and Areva.

Keeping Monju is like flogging a dead horse

November 5, 2015

NRA's 'new management' call for Monju reactor proves divisive

<http://www.japantimes.co.jp/news/2015/11/05/national/nras-new-management-call-monju-reactor-proves-divisive/#.Vjsv3St1BLM>

by Eric Johnston

Staff Writer

OSAKA – Two decades after a sodium leak and fire shut it down and nearly six decades after it was first conceived, the Monju prototype fast-breeder reactor in Tsuruga, Fukui Prefecture, suffered another blow Wednesday when the Nuclear Regulation Authority called for it to be turned over to another operator.

To date, over ¥1 trillion has been poured into Monju — a plant that has never produced commercial electricity. **Despite remaining inactive, safety measures alone cost ¥50 million a day.**

Anti-nuclear activists have hailed the NRA's unusually critical language as an important step toward scrapping the reactor, which was supposed to burn plutonium mixed with uranium.

Fukui politicians who heavily support Monju, including the prefecture's governor and the mayor of Tsuruga, doubt that another operator can be found. They also worry that scrapping it would create local concerns as well as safety issues.

"What does it mean when the NRA says that it can't leave Monju's operations to the (government-backed) Japan Atomic Energy Agency? There aren't any other organizations it can be left to," Tsuruga Mayor Takanobu Fuchikami told reporters after the decision.

Fukui Gov. Issei Nishikawa also criticized the decision, saying such advice was "lacking in kindness."

"Monju's system should be rebuilt as a research facility, as part of Japan's national strategy," Nishikawa said.

Monju, conceived in the 1950s, has faced nothing but technical trouble, domestic and international controversies, and scandals.

Originally slated to go live in 1970, Monju did not reach criticality until 1994. It was shut down following a December 1995 leak and fire involving liquid sodium. The incident was at that time Japan's worst nuclear-related accident.

Further delays and scandals meant that by 2005, when Monju was taken over by JAEA after its predecessor organization was disbanded, officials hoped it would be commercially viable by around 2050. But after it was revealed in 2012 that JAEA had failed to inspect nearly 10,000 reactor components in and after 2010, the NRA ordered Monju not to engage in preparatory work until it was satisfied safety had been improved.

Despite the technical difficulties and official denials, **fears Japan might somehow use Monju to produce nuclear weapons were also heightened after statements from senior Japanese officials, including Prime Minister Shinzo Abe.**

In 2002, Abe, while serving as deputy chief Cabinet secretary, said Japan could legally possess nuclear weapons so long as they were small and strategic. That same year, Ichiro Ozawa, then the leader of the Democratic Party of Japan, suggested plutonium at Japanese nuclear power plants made it possible for Japan to produce 3,000 to 4,000 warheads.

Activists are urging the government to give up on the project.

"Monju should be permanently shut down. **If the Japanese government is capable of immediately and permanently scrapping Monju, we can gain some trust that it intends to have a logical, functional basic energy policy,**" said Aileen Mioko Smith, executive director of Kyoto-based anti-nuclear group Green Action. "If it continues the status quo by flogging a horse that has been dead for 20 years, it bodes badly for Japan's energy future."

The Tokyo Olympics "belittle the Fukushima crisis"

Tokyo, 10 October, 2015

The Tokyo Olympic Games and the Fukushima Crisis

Mitsuhei Murata

Executive Director, Japan Society for Global System and Ethics

Former Japanese Ambassador to Switzerland

Preface

The lack of the sense of crisis over Fukushima is in stark contrast to the gravity of the crisis. Fukushima is now undeniably a global security issue. The unstoppable contamination of the Pacific Ocean and the atmosphere is seriously menacing the West Coast of the United States. Japan should make utmost efforts to cope with the Fukushima crisis by retreating from the Tokyo Olympic Games that disseminate the false impression that Fukushima is under control.

Deteriorating situation in Fukushima

Japan is laboring under the consequences of the Accident never before experienced by humanity. Four and half years after the 3.11 disaster, it has been shown that a severe nuclear accident cannot be brought under control by a single state. The Japanese government is bent on restarting nuclear reactors and exporting nuclear technology without clarifying the causes of the accident. The majority of the Japanese severely criticize this move as immoral and irresponsible. It is questioned if Japan is in possession of the governability and the capacity needed to cope with the impending crisis.

Units 1, 2 and 3 remain inaccessible because of lethal levels of radiation surrounding the buildings. Their containment vessels need a constant flow of nitrogen to maintain low levels of oxygen in order to prevent hydrogen explosions.

If the molten nuclear fuel rods are exposed through cracks to the atmosphere due to a mega earthquake or the liquidization of the site that causes the collapse or the inclination of a nuclear reactor, Japan's landmass would become uninhabitable to a large extent. The problem of workers on the site is very serious. The average number of daily workers is now more than 7.000. This requires numerically more than 2.5 million workers a year. Decommissioning of the reactors on the site will take decades. It makes one shudder.

The restart has taken place without clarifying where the responsibility lies for another accident and without establishing truly reliable systems for evacuating residents.

The whole of Japan is threatened by the worsening situation emanating from the molten fuel rods, suspected to be widely disseminating neutron and tritium radiation. Limitless steam observed at the site evokes the possibility of re-criticality at the site. The undeniable necessity for international verification of the suspected re-criticality at the site should bring about the indispensable international cooperation to cope effectively with the Accident.

The ongoing radioactive contamination of the sea with no prospect for a solution is dishonoring Japan, being criticized as harming the global environment. In spite of all this, attempts are shamefully being made to hide Fukushima. The Tokyo Olympic Games 2020 was decided with the false assurance that Fukushima had been brought under control.

The United States is menaced by the spreading contamination

Recently, a serious typhoon hit eastern Japan creating flooding that has not occurred for at least 50 years. You can imagine the extraordinary amount of radioactive cesium, strontium, and other isotopes spread hundreds of miles from the nuclear catastrophe site yet to be cleaned up and now displaced by the flood into newly contaminated villages.

The consequences of the radioactive contamination of the Pacific Ocean from Japan to the West Coast of the United States are drawing increased attention. Some experts now estimate that the wave of radiation from Fukushima will be 10-times bigger than all of the radiation from the entire world's nuclear tests throughout history combined. There are reports stating that dangerous radiation levels have been detected in snows found in Texas, Colorado and Missouri, warning that the US, indeed, is going to face the severest consequences of the ongoing historic, and seemingly unstoppable, nuclear disaster.

The daily increasing contaminated water has been put in nearly 1000 hastily fabricated and often leaking storage tanks. Its total volume surpasses more than 600,000 tons and approaches the limitations possibly to end by being totally released into the sea.

The protection of the health of the residents of the US West Coast will soon become a central political issue for the Obama Administration. It cannot but awaken the whole world to the uncontrollable and spreading consequences of the Fukushima Accident.

The Tokyo Olympic Games belittle the Fukushima crisis

It is undeniable that the Tokyo Olympic Games constitute serious impediments for coping with the consequences of the March 11 Disaster by raising the prices of construction materials and aggravating the serious labor shortage in the region.

My interview article was published in the magazine "Monthly Japan" (September). It is entitled "An honorable retreat from the Tokyo Olympic Games" and is given a central place. Reactions are noteworthy and expanding.

In my recent message addressed to Prime Minister Shinzo Abe, I suggested to him to cancel the Tokyo Olympic Games, announcing at the same time the candidature for 2028 or 2032 games.

The estimation of the total cost, 2 trillion yen according to the Organizing Committee, has shocked the public. More than 50 times less funding (34.5 billion yen) has been spent for coping with the contaminated water problem at Fukushima Daiichi!

The Tokyo Olympic Games seems to be being utilized to divert attention from Fukushima and to give the impression to the world that Fukushima no longer poses a threat. Shrewd observers point out that there is 'the front and the back' relationship between the Tokyo Olympic Games and nuclear reactors. The two are interrelated. The setback of the one will mean that of the other.

The initial commitments of the Tokyo Olympic Games have now been all broken. The original plan of the National Stadium has been cancelled. The emblem of the Tokyo Olympic Games, suspected of plagiarism, has been abandoned. The editorial of the Asahi News Paper dated 25 September 2015 expresses its amazement at the irresponsibility and the carelessness of the Organizing Committee. The IOC could disqualify Tokyo. Japan is now obliged to choose between an honorable retreat and a shameful disqualification. The future of the Olympic Games is at stake. It is as a believer in the

spirit of the Olympic Games and the Olympic Movement that I am pleading for an honorable retreat, and this, in order for Japan to consecrate maximum efforts to control the Fukushima crisis.

EDITORIAL: 2020 Tokyo Olympic organizing committee needs major reorganization

<http://ajw.asahi.com/article/views/editorial/AJ201510050019>

October 05, 2015

Following a fresh start to design the new National Stadium, the effort to develop a new logo for the 2020 Tokyo Olympics and Paralympics has also been launched.

As a new team to carry out the mission, the Tokyo Games organizing committee has set up the Tokyo 2020 Emblems Selection Committee comprising figures in the sports and academic communities as well as art experts.

With an eye to announcing the official Olympic logo next spring, the new panel will decide by mid-October the requirements for accepting applications such as ages and qualifications along with the screening method.

As it established the emblem selection panel, the Tokyo Organizing Committee of the Olympic and Paralympic Games published the results of its postmortem on the logo debacle. At the request of designer Kenjiro Sano, the organizing committee decided on Sept. 1 against using his emblem design amid accusations of plagiarism.

Toshiro Muto, director general and chief executive officer of the organizing committee, and his two deputies have decided to voluntarily return part of their pay to take responsibility for flawed operations and supervision.

This is a review of the logo selection process made internally, not by independent outsiders. The findings of the inquiry nevertheless highlight the organizing committee's outrageous sloppiness and irresponsibility.

Unless the committee, which clearly lacks transparency, is transformed into a much improved organization, there remain concerns that similar problems will turn up again.

The report on the investigation fully acknowledges that the selection process was seriously flawed in all aspects, including the requirements for applications for the emblem competition, the selection of the members of the screening panel, the screening method and adjustments made to the original design.

At the beginning, the report argues that basic concepts for the emblem, such as its principal message, were not worked out sufficiently, with no clear idea given about what kind of emblem was suitable for the 2020 event.

Since the most basic ideas about the logo design were not thought out well, it was probably inevitable that the emblem thus selected would have to be scrapped.

This report on the internal probe into the selection process, however, is far from satisfactory.

The original emblem design was modified twice in response to requests by some senior officials of the organizing committee. But the report offers no detailed explanation about how that occurred.

It has yet to be made clear what kind of closed-door discussions were behind the modifications to the design, which had been picked through a public selection process based on an international competition. At a meeting of the organizing committee's councilors where the results of the review were reported, there were no references to the responsibility of Yoshiro Mori, the president, and other top committee officers for the emblem fiasco.

The fact that the committee is eschewing the crucial debate over who should be held accountable for the logo debacle--and the stadium snafu for that matter--raises serious doubts about whether it is a healthy organization.

The newly created emblem committee stresses its intention to ensure that the selection will be made through an open process.

"We will try to figure out an approach that gets many people involved in both the application and selection phases," said Ryohei Miyata, president of the Tokyo University of the Arts, who serves as chairman of the panel.

No matter how the selection committee is revamped, however, it is impossible to win public support for the selection process without a fundamental reform of the organizing committee itself, which supervises the project.

There is still a clear need for an exhaustive third-party investigation into what occurred. The committee should first make clear who are responsible for the blunder and then consider seriously its own reorganization to avoid making the same mistake.

Sports minister, blamed for Olympic debacle, to remain in Cabinet until reshuffle

http://ajw.asahi.com/article/behind_news/politics/AJ201509250081

September 25, 2015

THE ASAHI SHIMBUN

Sports minister Hakubun Shimomura took a pay cut for the fiasco over the new National Stadium for the 2020 Tokyo Olympics and will be replaced when Prime Minister Shinzo Abe reshuffles the Cabinet.

Shimomura said at a news conference on Sept. 25 that he called Abe the previous evening to express his intention to step down.

However, Abe, an ideological soul mate of the conservative politician, asked Shimomura to remain at the post until the Cabinet reshuffle expected in early October. Shimomura said he agreed to that proposal.

Shimomura said he decided to resign hours after a third-party committee released a report on Sept. 24 about the confusion over the construction of the new National Stadium, the main venue of the 2020 Summer Games in Tokyo. The initial design was scrapped amid public outrage after the expected construction costs ballooned to more than 250 billion yen (\$2.1 billion) from an initially envisaged 130 billion yen.

The report named Shimomura as one of those most responsible for the failed plan, saying he "could not create an appropriate organizational structure" to oversee the planning and construction of the stadium. Shimomura said he will return about 900,000 yen to central government coffers, a figure including six months' salary as minister of education, culture, sports, science and technology.

"Although there was no illegal act on my part, I felt I bore political responsibility for not being able to stand in the forefront of a national movement to build up momentum (for the Olympics)," Shimomura said at the Sept. 25 news conference. "I made the decision with the release of the report."

Other top officials will also return part of their pay.

Shinichi Yamanaka, who stepped down on Aug. 4 as vice education minister, will return 10 percent of two months' salary, while the same will be done by Ichiro Kono, the president of the Japan Sport Council, which is in charge of the project to build the stadium.

Kono will resign as president on Sept. 30 and be replaced by Kazumi Ohigashi, a former J.League chairman.

Kono was also singled out by the sports ministry's third-party committee for failing to fulfill his responsibility of overseeing such a difficult and complicated project as building a new National Stadium. The report also criticized what it called a "top-heavy" decision-making process symbolized by an advisory panel to Kono that consisted of such individuals as former Prime Minister Yoshiro Mori, representatives of various sports organizations and heavyweights in the cultural sector.

The report said the panel transformed from a simple advisory panel to effectively the ultimate decision-making organ in the process behind the construction of the stadium.

Nuclear nations cling to their A-bombs

November 6, 2015

Editorial: Nuclear powers cling to their A-bombs, letting disarmament efforts wilt

[O <http://mainichi.jp/english/english/perspectives/news/20151106p2a00m0na007000c.html>](http://mainichi.jp/english/english/perspectives/news/20151106p2a00m0na007000c.html)

On Nov. 2, the First Committee of the United Nations General Assembly, dedicated to disarmament issues, voted on a Japan-backed draft resolution on "united action with renewed determination towards the total elimination of nuclear weapons." Especially for the only nation ever to be attacked with nuclear arms, the result was not a truly happy one.

The vote was 156 nations in favor, making 2015 the 22nd year in a row the resolution has been adopted -- a welcome development to be sure. This year, however, the United States, Britain and France -- which had all backed the draft last year -- abstained. Meanwhile, two countries that had abstained last year -- China and Russia -- voted against the resolution this year.

Until 2015, the United States had voted in favor of the resolution every year since Barack Obama took over as president in 2009. This year's version, however, contains some new wording, such as expressing "deep concern at the catastrophic humanitarian consequences of any use of nuclear weapons," and encouraging "every effort to raise awareness of the humanitarian impact of the use of nuclear weapons, including through, among others, visits by leaders, youth and others, to the cities devastated by the use of nuclear weapons." The draft also contained the term "hibakusha" (atomic bombing survivors) in the Latin alphabet.

The phrase "humanitarian consequences" appears to have sparked the greatest alarm among all the new additions. The U.S., Britain, France, China and Russia are all permitted to possess nuclear arms under the Treaty on the Non-Proliferation of Nuclear Weapons (NPT), which calls on all of them to make sincere efforts at disarmament. In recent years, however, they have been going in the opposite direction, expanding and modernizing their atomic arsenals.

That being the case, this document decrying the inhumanity of nuclear arms, and the strengthening movement for a new international legal framework including a treaty to supersede the NPT, has the U.S. and Britain on guard. Meanwhile, though Japan is calling for nuclear arms reductions under the NPT framework, does it in fact favor a new treaty banning the weapons outright? The U.S., Britain and other atomic powers have likely developed concern about that possibility as well.

The average age of the atomic bombing survivors is now over 80, and it has been 70 years since the bombs were dropped on Nagasaki and Hiroshima. The Japanese government submits the nuclear weapons abolition resolution every year, and it's no surprise that Japan included a few new phrases in the 2015 resolution. **The problem is really the obstinacy of the nuclear powers, those countries clinging to their A-bombs as they make what look like half-hearted efforts at fulfilling their nuclear disarmament duties.**

It is also inappropriate to dredge up historical issues in this discussion. In opposing the resolution, China referenced Japan's wartime aggression, and said that Japan was attempting to use the resolution provision on visiting Hiroshima and Nagasaki as a tool to twist history. At the NPT conference in April and May this year, too, China made similar claims against Japan. But then nuclear disarmament is an issue concerning the entire world, and the future of humanity itself. In this context, using Japan's past misdeeds as ammunition against it in the present is simply meaningless.

Now that the resolution has been approved by the First Committee, it will go to a General Assembly vote in December. No country is likely to change their vote in the meantime, but **we would very much like to see the ostensibly anti-nuclear Obama administration take a proactive stance on the resolution and support it.** The U.S. must be aware of the slow hollowing out of the NPT. If things keep progressing as they are, North Korea will become a nuclear power and the entire anti-proliferation effort will be set adrift. The U.S. should have a greater sense of urgency on this problem.

Meanwhile, even as Japan has sponsored the nuclear abolition resolution, it has taken a far more cautious attitude to a related proposal on a nuclear abolition treaty, maintaining its status as a bridge between the nuclear and non-nuclear powers. As the gap in opinion on either side of that bridge begins to widen, however, Japan will eventually be forced to change its approach. **First of all, it must re-evaluate its own position as mediator, and then be a truly proactive intermediary in the pursuit of nuclear disarmament.**

The Fukushima crisis even "destroyed" elections

November 10, 2015

Namie mayoral candidate seeks votes of Fukushima evacuees in Tokyo's Shibuya

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201511100060>

By CHIKAKO KAWAHARA/ Staff Writer

In front of bustling Shibuya Station in Tokyo, passers-by paid little attention to a candidate stating his campaign platform.

It's likely that most wouldn't have been interested anyway in the issues in the mayoral election in far-off Namie, Fukushima Prefecture.

But due to the nuclear accident following the Great East Japan Earthquake and tsunami in March 2011, Namie residents have evacuated far and wide.

"The accident even destroyed the election, which forms the basis of democracy," the candidate said on Nov. 9 in his stump speech in the nation's capital.

After the nuclear disaster at the Fukushima No. 1 power plant, **Namie, located north of the crippled plant, was entirely evacuated with residents spreading out across Japan. About 30 percent of them moved to 45 prefectures outside Fukushima Prefecture.**

The candidate left Nihonmatsu, Fukushima Prefecture, where he evacuated to, early in the morning on Nov. 9 and drove to Tokyo in his election campaign car. About 20 Namie residents gathered near the station to listen to his campaign message and get an update on the current situation in their hometown. A 49-year-old female part-time worker who evacuated to Saitama from Namie was among his sparse audience.

"I am sad that no one stops to hear his speech," she said, adding that she came here instead of her parents, who are in their 80s.

The candidates for the Namie mayoral election were announced on Nov. 5. The three candidates who are running in the poll, which will be held Nov. 15, are Keizo Oguro, the 59-year-old former chairman of the Namie town assembly; Bunsei Watanabe, the 65-year-old former vice mayor of Namie; and Tamotsu Baba, the 66-year-old incumbent Namie mayor.

Oguro and Watanabe are running for mayor for the first time while Baba is seeking a third term. None of the candidates are affiliated with any party. The election results will be announced on the same day.

Registered voters living outside Fukushima Prefecture can obtain a ballot through the mail and cast their vote at the election commission offices in the municipalities where they evacuated to.

M. Nasu: "...democracy and peace are like air"

November 11, 2015

Hibakusha: Author ends 'hilarious trio' series due to increasingly oppressive political climate

<http://mainichi.jp/english/english/features/news/20151111p2a00m0na024000c.html>

The no-war policy that has long supported post-World War II Japan is being undermined by newly railroaded security legislation that would allow the overseas dispatch of Japan Self-Defense Forces. Additionally, Japan abstained from a Nov. 5 United Nations General Assembly First Committee vote on a draft resolution that would establish a working group to consider a worldwide nuclear weapons ban treaty.

Amid such circumstances, the 2015 autumn series of "Hibakusha" will kick off with a children's book author who is ending his long-running series, "Zukkoke sannin gumi" (Go, Hilarious Trio!) in response to the recent political and social climate.

Since the first installment of "Go, Hilarious Trio!" featuring 6th-grade boys was published in 1978, the series has sold over 25 million copies, and is the longest-selling children's literature series in the country. The installment set to come out in December, however, will be its last.

At his home in the Yamaguchi Prefecture city of Hofu in late October, author Masamoto Nasu raised his voice. "The security-related legislation is unconstitutional, and must be repealed."

Having experienced the atomic bombing of Hiroshima 3 kilometers away from ground zero as a 3-year-old, and having grown up on democracy-oriented education adopted after the war, Nasu had been vocal about his opposition to the government-backed security legislation, characterizing it as "evil laws that signal a massive shift in our 70-year, post-war history."

Since 2005, the series has featured the three boys as middle-aged men taking on real-life problems that forty-somethings commonly face, such as child rearing and care for aging parents. Their close friendship has remained unchanged over the years, and helps them overcome obstacles.

Children's book author Masamoto Nasu holds up a sample cover of his final installment of the "Go, Hilarious Trio!" series at his home in Hofu, Yamaguchi Prefecture, on Oct. 27, 2015. Nasu is also an anti-nuclear power activist, and has written stories about the Battle of Okinawa and "Manmo-Kaitaku-Seishonen-Giyugun" (Emigration of Youth Troops to Manchuria-Mongolia Areas). (Mainichi)

Children's book author Masamoto Nasu holds up a sample cover of his final installment of the "Go, Hilarious Trio!" series at his home in Hofu, Yamaguchi Prefecture, on Oct. 27, 2015. (Mainichi)

Click to enlarge

<http://mainichi.jp/english/english/features/news/20151111p2a00m0na024000c.html>

While Nasu was working on the latest installment, however, the security legislation was passed in the Diet. As a witness to a changing Japan, Nasu wrote the following afterword:

"The trio was a product of peace and democracy. The reason they go around freely having so much fun was because they lived in a peaceful and democratic Japan. It looks like times are going to change for the worse now. I don't want to portray the trio living in a world like that."

When he was a child, Nasu learned about the Constitution from his father, Shigeyoshi, who passed away in 1978 at the age of 79. Upon Japan's surrender in 1945, Shigeyoshi had quit his job as a teacher and began working for a company. One day, a typically patriarchal Shigeyoshi held a family meeting and declared, "We're entering an age of 'democracy.' If you have anything to say to me, you say it."

In elementary school, all decisions were made through classroom discussions. Nasu recalls that upon hearing that Japan was never going to war again, he thought, "Japan's going to become a great country."

"When I was going through my father's things (after he passed away), I discovered a copy of the Constitution that was falling apart. My father had underlined a lot of passages in red."

Nasu says he wanted to write stories in which children themselves figure out how to solve their problems. The lives led by the trio in his series were based on his own. "We lived through the best era of democracy," Nasu says. The three boys-turned-men were a physical manifestation of that.

However, what he believed long ago would "become a great country" is now turning into a very oppressive country for Nasu. While there was strong public opposition to the security legislation that was passed, public opinion polls show that around one-third of the Japanese public remain uninterested. That scares Nasu. "For many who grew up in the post-war era, democracy and peace are like air."

This is precisely why Nasu is determined to take the next step. The "Go, Hilarious Trio!" series may end, but Nasu has no intention of putting down his pen. He wants younger generations to think about war and peace as their own problems through the war that he will portray in his new stories. That, he believes, is his responsibility as a generation that has declared it would never go to war again.

Hibakusha: Continuing calls for abolition of Japan's new security laws

<http://mainichi.jp/english/english/features/news/20151112p2a00m0na014000c.html>

NAGASAKI -- On the late autumn day of Nov. 9, residents gathered in front of the Peace Statue at Nagasaki Peace Park. The residents stage sit-ins on the ninth of every month in memory of the devastating atomic bombing of Nagasaki on Aug. 9, 1945. Within the ring of residents sat 75-year-old Koichi Kawano, chairman of the Japan Congress against A- and H-Bombs.

With a stern expression, Kawano spoke out against security-related legislation that was recently railroaded into law.

"Let's continue our opposition," Kawano said, clutching a microphone. "We have to raise our voices more." Less than two months after the legislation was passed, topics of conversation and interest in society are turning toward economic policies and other issues. Kawano seemed almost desperate.

Kawano was hit by the atomic bombing of Nagasaki when he was 5 years old. At the time he was on a street near his home 3.1 kilometers from the hypocenter. He spotted a U.S. B-29 bomber flying overhead and right afterwards, when the blast of the bomb hit, it hurled him 10 meters.

Fortunately he was not injured, and the other members of his family were safe. In the bomb shelter, Kawano's grandparents forbade the children from going outside, telling them that there were many people burned so badly one couldn't tell if they were men or women. On a mountainside that evening, as the family headed to a bigger bomb shelter, Kawano saw the city burning red.

Later, when Kawano was in his second year of elementary school, his teacher entered the classroom one day with a happy expression on her face.

"Listen, everybody, Japan has become a country that doesn't wage war," she said. The teacher earnestly taught the students the significance of Japan's new Constitution, which came into effect in May 1947. She focused especially on war-renouncing Article 9.

At the time there wasn't enough food, and there were many war orphans. But when he thought, "So we're going to have peace from now on," Kawano was filled with hope. This marked his encounter with Japan's pacifist Constitution.

After graduating from high school, Kawano began working for the Nagasaki Prefectural Government, and devoted himself to labor union activities. Both as an atomic bomb survivor, or hibakusha, and as chairman of the Japan Congress against A- and H-Bombs, Kawano spoke out against war and nuclear weapons. The day after Japan's security-related legislation was rammed through a special committee of the House of Councillors on Sept. 17, Kawano held a news conference in Nagasaki.

"Do politicians know just how many people suffered in the atomic bombings? This is the worst stain in the history of Constitutional politics," he said.

Being one of the younger hibakusha, Kawano plans to take part in demonstrations and gatherings to call for abolishment of the security legislation. In Nagasaki, young people launched a group opposing the security legislation, and they continue to hold regular demonstrations.

Seeing demonstrators calling out "No more Hiroshimas, no more Nakasakis," Kawano feels he can depend on them.

"Fortunately, the Constitution has not been changed. We must not give up," he said. He repeated his words a second time, and then a third, as if he were speaking to himself. (By Asuka Ohira, Nagasaki Bureau; photo by Toyokazu Tsumura)

(This is the second part of a six-part series.)

Expensive, underused nuclear fuel carrier

November 12, 2015

Nuclear fuel carrier criticized at review session for wasteful gov't projects

<http://mainichi.jp/english/english/newsselect/news/20151112p2a00m0na008000c.html>

The government's Headquarters for the Promotion of Administrative Reform held an open review session on Nov. 11 to check whether there is any wasteful spending in government-sponsored projects.

As for projects related to the Japan Atomic Energy Agency (JAEA), which operates the trouble-plagued Monju prototype fast-breeder reactor, many participants in the review session criticized the fact that **1.2 billion yen has been spent each year mainly to maintain a nuclear fuel carrier which has rarely been used.** Some of the participants urged the government to present "options that include termination or review (of the project) in the future."

In connection with the open verification session on budgets related to the nuclear fuel cycle project, large parts of the JAEA's materials on bids and contracts are undisclosed. Taro Kono, state minister in charge of administrative reform, lashed out at the situation, saying, "We cannot spend money on things we cannot explain to the public."

The "Kaiei Maru" spent nuclear fuel carrier was built in fiscal 2006 to transport nuclear material such as spent fuel generated at the "Fugen" prototype nuclear test reactor in Fukui Prefecture, which is being dismantled after its shutdown in 2003. A cumulative total of 10 billion yen has been spent to develop and maintain the ship, but the vessel has been used to transport nuclear fuel only four times in the past. The ship has not been used at all since November 2009. Many experts participating in the review session said something like "We don't understand why they need it."

A project related to the Oma Nuclear Power Plant in the Aomori Prefecture town of Oma also came under fire. The Electric Power Development Co., commonly known as J-Power, has applied for funds for the project that is supposed to be subsidized by the Ministry of Economy, Trade and Industry. The reactor at the power station would be the world's first full-MOX commercial reactor using uranium-plutonium mixed oxide fuel in the reactor cores. The industry ministry has granted a total of 29 billion yen in subsidies to J-Power for technological development since fiscal 1996. But the budget execution rate has been 0 to 4 percent in the last three fiscal years. An expert urged the government to have J-Power take funds equivalent to the amount of the subsidies from its profits and return them to government coffers, saying, "It should be thoroughly reviewed."

Nonetheless, open verification sessions are not aimed at questioning the pros and cons of national policies. Discussion on whether there is the need for the nuclear fuel cycle project the government has been pursuing under the Basic Energy Plan is not subject to the review session. Therefore, whether the Monju reactor should be kept alive or dismantled was not discussed.

Among other issues discussed at the open verification session was the outlay (5 billion yen) for conducting a "national survey on academic ability and learning" under the jurisdiction of the Ministry of Education, Culture, Sports, Science and Technology. Currently, all sixth-grade students at elementary schools and third-grade students at junior high schools are subject to the survey, but some participants said: "Sample surveys should be considered," and "Results of the survey should be released proactively." The administrative project review is different from the budget screening designed to determine whether each project should be scrapped or kept alive. It is a system in which each government ministry or agency checks whether there is any wasteful project on its own and releases the results of its review. **The total of 55 projects reviewed in the latest session included 19 nuclear-related projects that were selected to be subject to the open verification session in line with Kono's intention. But the review results are not binding.** Kono has expressed his intention to negotiate with each Cabinet minister ahead of the compilation of the state budget for fiscal 2016.

Time to scrap Monju's "financial folly"

November 13, 2015

EDITORIAL: Scrap Monju reactor project and use money to develop renewable energies

<http://ajw.asahi.com/article/views/editorial/AJ201511130034>

The annual public review of policy programs by the government to identify wasteful spending ends on Nov. 13. For three days, the government's administrative reform promotion council has been scouring the budgets of ministries and agencies for savings.

The focus of the budget review this year is the Monju prototype fast-breeder reactor.

The Nuclear Regulation Authority recently recommended that the operator of the troubled-plagued experimental reactor, the government-affiliated Japan Atomic Energy Agency, should be replaced.

Certain expenditures related to the Monju project, mainly state subsidies, were examined in the public review. But the council should take this opportunity to scrutinize all aspects of the controversial project instead of evaluating only the subsidies. We are keen to see the panel demonstrate that continuing the project doesn't make sense and the reactor should be decommissioned from the viewpoint of administrative reforms.

It is already clear that the Monju project is a financial folly.

The construction cost, which was originally estimated at 35 billion yen (\$285 million) when the project was in an early planning stage in the 1970s, has ballooned to 1 trillion yen. Although the reactor has been offline for more than 20 years due to a series of accidents and scandals, 20 billion yen is still spent annually, or 50 million yen a day, for maintenance.

The maintenance costs of the reactor under the initial budget for the current fiscal year are almost equivalent to the amount (23.8 billion yen) being shelled out to promote renewable energy projects for local power production and consumption.

The outlays for the Monju project are far larger than the spending on a demonstration project to build a transmission network for wind power generation (10.5 billion yen) or the appropriation to support research for the development of geothermal power sources (8 billion yen).

Following the 2011 Fukushima nuclear disaster, Japan widened the scope of its energy policy to make greater efforts to develop and promote alternative power sources, including renewable energy.

Instead of spending a huge amount of taxpayer money to keep Monju alive, the government should use the cash to build a new, cleaner energy future for this nation.

Japan is facing a serious fiscal crunch. The government is drowning in a sea of debt as its welfare spending is surging amid the rapid aging of the nation's population.

The government has no choice but to raise taxes while cutting its expenditures on social security, education and other programs. It cannot afford the luxury of pouring a hefty sum of money into a questionable nuclear reactor with no prospects for practical operation.

The Monju project has survived for so long despite its troubled history because nobody loses money when the reactor is out of operation.

When a reactor operated by an electric utility is shut down because of an accident or a scandal, the company will immediately face a rise in costs that hurts its financial standing.

In contrast, Monju is treated as a research reactor, and the national program gets funded almost automatically.

Both the industry ministry and the science and technology ministry, which are in charge of the nuclear power policy, have a clear interest in supporting the continuation of the Monju project.

If this project is terminated, these ministries will be forced to make a sweeping review of the entire nuclear fuel recycling program and tackle the formidable challenge of disposing of plutonium extracted from spent nuclear fuel.

This year's public budget review is led by Taro Kono, the newly appointed minister in charge of administrative reform who has been a champion of the cause.

We urge Kono to make the decision to scrap the Monju project as a step to press ahead with meaningful administrative reforms.

There is definitely no reason for approving annual spending of 20 billion yen as the cost of postponing this decision.

--The Asahi Shimbun, Nov. 10

Toshiba didn't report massive losses in its nuke business

November 13, 2015

Toshiba's American nuclear unit reports 1.3 billion dollar loss

<http://mainichi.jp/english/english/newsselect/news/20151113p2a00m0na004000c.html>

Nuclear power giant Westinghouse Electric Co., an American subsidiary of electronics manufacturer Toshiba Corp., booked a combined impairment loss of 1.3 billion U.S. dollars (about 160 billion yen) in fiscal 2012 and 2013, it's been learned.

The weak performance in the company's nuclear plant construction projects caused Westinghouse to revalue its assets, heightening the uncertainty of the core business of Toshiba following a massive accounting scandal that has hurt the Japanese electronics giant.

In the meantime, Toshiba has not reflected the losses in its consolidated financial reports, which is likely to spark criticism from the market.

When a company's earnings slump in certain business units, it can report the losses by stating the value of its assets in relation to the poorly performing units.

Since the meltdowns at the Fukushima No. 1 Nuclear Power Plant in March 2011, electric power companies and other businesses have held back on building new nuclear stations. Under such circumstances, Westinghouse was unable to receive orders for nuclear plant construction and has come under pressure to re-evaluate its future earnings. The company reported 900 million U.S. dollars (approximately 110 billion yen) in impairment losses in fiscal 2012 and marked an additional loss of 400 million dollars (about 50 billion yen) the following year.

In both business years, Westinghouse's businesses ended in the red, but **Toshiba did not disclose details of its nuclear unit's financial reports.**

Since Westinghouse is an unlisted company, the fact that Toshiba did not reveal its business reports is legal under the Financial Instruments and Exchange Act. Toshiba has repeatedly stressed that there is no need to make a downward revision in its Westinghouse-related assets in its consolidated financial reports, saying that its businesses related to maintenance and inspection of existing nuclear stations and nuclear fuel projects are doing well. **Toshiba, however, has failed to sufficiently explain why it, as a parent company, has not made downward revisions in its consolidated reports when one of its subsidiaries has reported losses of the equivalent of 160 billion yen.**

As there is no prospect of Toshiba's business expansion in new nuclear plant projects, speculation could arise over the company's need to report massive losses in its nuclear power business.

Restricting citizen's activities in public halls?

November 24, 2015

Editorial: Free exchange of opinions should be guaranteed at public facilities

<http://mainichi.jp/english/english/perspectives/news/20151124p2a00m0na020000c.html>

There are moves to limit the use of municipal and other public halls for citizens' activities in relation to the Constitution and nuclear power among other key issues, giving the public an oppressive feeling. Freedom to use such facilities should be guaranteed as much as possible.

The Saitama Municipal Assembly revised an ordinance on the management of a city-owned facility for citizens groups this past October. Following such revisions, the municipal government will terminate its contract with a nonprofit organization (NPO) to manage the conference hall and place the facility under the direct control of the city in spring next year.

The change was sparked by calls by a Liberal Democratic Party (LDP) member of the city assembly. "There are some citizens' organizations that are engaged in political activities. These organizations are given priority in using the hall, raising questions about fairness. The hall should be placed under the city's direct control and standards for managing the facility should be reviewed," the assembly member said.

Specifically, questions were raised over the use of the city-run facility by 14 citizens' organizations that are involved in such activities as those on war-renouncing Article 9 of the Constitution, atomic power policy and the abduction of Japanese nationals by North Korea.

The NPO -- the Saitama NPO Center -- has demanded that the revisions to the ordinance be retracted on the grounds that it would restrict freedom of citizens' activities and that no particular organization has been given priority in using the facility.

The Saitama NPO Center has been commissioned by the municipal government to manage the facility since 2007. Approximately 1,700 registered organizations use the hall for meetings and other purposes. Under the Act on Promotion of Specified Non-profit Activities, political issues are recognized as part of NPOs' activities. The Saitama Municipal Government's ordinance on NPOs has been enforced pursuant to the law. There is no ground for determining that NPOs' activities regarding Article 9 of the Constitution and nuclear power run counter to the ordinance.

Courts have handed down numerous rulings that respect freedom of expression and freedom of assembly, which are guaranteed by the Constitution, to the maximum extent. The Supreme Court has ruled that the managers of halls and other public facilities can refuse to lend such facilities for meetings and other events only in cases where it is clearly predicted that the gatherings would cause danger.

However, apart from the Saitama Municipal Government, **some universities and other institutions are also trying to distance themselves from citizens' activities regarding politics.** Rikkyo University refused to lend a hall in October for a symposium organized by the Association of Scholars Opposed to the Security-related Laws.

The university explained that the symposium is not purely an academic gathering as the reason for its decision. However, some members of Rikkyo University's teaching staff who negotiated with the university said they had been told that "the symposium could have political implications."

According to citizens' organizations across the country, there have been cases in recent years in which the managers of public conference halls expressed a reluctance to lend rooms for rallies on Article 9 of the Constitution and security-related legislation. **If an atmosphere is to be prevalent in which political activities are rejected or unwelcomed, it could restrict citizens' activities.**

It is important to guarantee sites for free debate particularly on themes over which public opinion is split. If the public were to be deprived of such sites, it would obstruct the development of a wholesome civil society.

December 2, 2015

Business lobby chief: Fukushima nuclear accident an 'extremely localized event'

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201512020049

By GO KOBAYASHI/ Staff Writer

The crisis at the Fukushima No. 1 nuclear power plant is a “localized event,” according to the chairman of Keizai Doyukai (Japan Association of Corporate Executives), one of the nation’s top business organizations.

Chairman Yoshimitsu Kobayashi made the remarks at a regular news conference in Tokyo on Dec. 1 when he was punctuating the dangers of global warming.

“The nuclear plant (accident) was an extremely localized event if seen on a terrestrial globe,” said Kobayashi, who is also chairman of Mitsubishi Chemical Holdings Corp. “While the accident is as

regrettable as anything, it is like fulminant hepatitis in a sense that only a localized area is affected instantaneously.”

Kobayashi also likened carbon dioxide, which is considered the primary greenhouse gas causing global warming, to “chronic diabetes.”

“If the global temperature rises by 5 degree by 2100, the sea level will rise by 80 centimeters or so, and island countries in the southern oceans will not survive as nations,” he said. “CO2 is that dangerous disease.”

Workers are still battling to keep the situation under control at the Fukushima No. 1 nuclear plant, which suffered a triple meltdown after it was hit by the Great East Japan Earthquake and tsunami in March 2011. About 100,000 Fukushima residents are still living as evacuees.

After the news conference, Kobayashi defended his remarks, saying he meant to send a warning that “global warming could pose dangers as serious as the nuclear accident.”

Keizai Doyukai earlier this year urged the central government to maintain at least a 20-percent dependence on nuclear energy in 2030.

Ratio of energy sources won't have to be revealed

December 4, 2015

Utilities not required to reveal electricity sources under new ministry rules

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201512040071

By SHINYA TAKAGI/ Staff Writer

Power companies will not be required to disclose the ratio of their electricity sources when the liberalization of power sales begins in April, The Asahi Shimbun has learned.

The Ministry of Economy, Trade and Industry will not impose the requirement as utilities are cautious about the disclosure.

Consequently, consumers will not know the ratio of electricity sources when they are deciding which company to buy power from.

The ministry plans to solicit feedback on the policy from a panel of experts and the public by year-end before finalizing the guidelines, which are based on the Electric Utility Industry Law.

Under the new guidelines, which take effect early next year, when utilities begin sales promotions ahead of the deregulation, they will not be obligated to provide a ratio of their electricity sources, which include nuclear power and renewable energies.

The guidelines will encourage utilities to voluntarily disclose their ratio of electricity sources, although they will not be required to do so. The guidelines describe this admission and the voluntary disclosure of carbon dioxide emissions as “desirable acts.”

The guidelines do not mention disclosure of the amount of radioactive waste generated.

Power companies that volunteer the information will be required to provide the planned ratio and the actual ratio because electricity generation often cannot be implemented as planned.

Renewable energies that use the feed-in-tariff (FIT) system will be described as, for example, “FIT electricity (solar).”

In European countries such as Britain, Germany and France, where liberalized electricity retailing has already been established, power companies are required to provide the ratio of their electricity sources for the previous year.

In Japan, consumers' groups and other organizations have been demanding that the ministry require utilities to disclose the ratio.

However, electric power companies are wary, arguing that **disclosure would increase costs. It is also believed they fear that consumers will shun utilities that generate electricity through nuclear power or coal-fired thermal power.**

Has survey on evacuees' wishes been used against them?

December 5, 2015

Nuclear evacuees surveyed about living in public housing later became non-eligible

<http://mainichi.jp/english/english/newsselect/news/20151205p2a00m0na013000c.html>

Fukushima Prefecture included more people in surveys for 2013 estimates on demand for new public housing after the Fukushima No. 1 nuclear plant meltdowns than it ended up allowing into the housing, and the estimates based on those surveys were never publically released, it has been learned.

The estimates were reported in a document obtained by the Mainichi Shimbun. **This document was created in May 2013 by a Tokyo consulting company paid around 30 million yen by the Fukushima Prefectural Government for the work.** The estimates were based on fiscal 2012 surveys by the Reconstruction Agency and the Fukushima Prefectural Government of evacuees from 11 municipalities near the crippled plant.

The estimates were made based on three types of evacuees seeking a place in the housing: people wanting to live there until evacuation orders for their home municipalities were lifted; people wanting to live there after evacuation orders for their home municipalities were lifted but until a livable environment had been established; and people wanting to live in the housing permanently.

The estimated numbers of residences required for the three types of evacuees were between 3,136 and 5,663 for the first group; between 2,743 and 4,172 for the second group; and between 3,366 and 4,837 for the third group. Only the first category, however, matches up with the standards for "**long-term evacuees**" -- the only type of evacuee allowed to apply for the residences. Additionally, two of the 11 municipalities covered by the estimates, the city of Tamura and the town of Naraha, had their evacuation orders lifted in April 2014 and September 2015, respectively, making their residents ineligible for the housing.

The units were first proposed during the Democratic Party of Japan administration, and in September 2012 the Fukushima Prefectural Government announced preparations to build the first 500 residences. At this point, the project was being funded from reconstruction funds, and which evacuees would be eligible for a place had not yet been decided. At the end of that year, however, the Liberal Democratic Party and Komeito took over the government, and at a January 2013 meeting on disaster recovery, Prime Minister Shinzo Abe ordered the creation of a plan to allow evacuees to return home quickly, and to secure homes

for long-term evacuees. **The Act on Special Measures for the Reconstruction and Revitalization of Fukushima was revised in April 2013 to allow special government funding for the new housing, and to restrict eligibility to long-term evacuees.**

The unreleased documents obtained by the Mainichi state explicitly that "under the current system to restrict entry into publically-managed housing to long-term evacuees," others hoping to keep living in the units after their evacuation orders have been lifted "may not be included."

A representative for the Fukushima Prefectural Government said, "It's not good to say that the national government 'toyed with us' by its policy shift, but the survey on evacuees' wishes and the establishment of the new fund (with its eligibility restrictions) happened in parallel." The official added that prefectural staff had to start applying the restrictions "in a hurry" to keep in line with national government policy.

The Fukushima Prefectural Government has announced 4,890 planned public housing units for nuclear disaster evacuees, but even when combined with around 2,800 such residences for tsunami survivors, the number of residences covers only 17 percent of the around 43,700 Fukushima households that remained without a permanent home as of the end of last year.

States secrets law seriously flawed

December 7, 2015

State secrets law still deeply flawed

<http://www.japantimes.co.jp/opinion/2015/12/07/editorials/state-secrets-law-still-deeply-flawed/#.VmVvt78R-ov>

Nearly a year after it entered into force on Dec. 10, 2014, the problems of the state secrets law remain unaddressed, including the opaque aspects of its implementation. The law's biggest flaw is that its definition of information that can be designated as state secrets is so vague and wide-ranging that it could be abused by officials who handle the information. In theory, some types of information can remain classified indefinitely if the government wishes so. The government and the Diet should at the very least make the oversight mechanism effective so that arbitrary classification of state secrets will not take place. They also should discuss creating a system under which citizens and journalists can request that designated secrets be declassified.

As part of the oversight mechanism to prevent misuse of the law, the government has set up a supervisory committee within the Cabinet secretariat, made up of vice minister-level bureaucrats from each ministry and headed by the chief Cabinet secretary. It has also created a position within the Cabinet Office, filled by a senior bureaucrat, to check whether designation of state secrets and their management are properly done. A 20-member section to assist the official has been established.

Although the supervisory committee and the officer are empowered to call on government organizations handling state secrets to submit relevant materials and take corrective steps if necessary, the fact remains that designation of state secrets by government officials is monitored only by fellow bureaucrats. Under government guidelines, 19 ministries and agencies, including the Defense Ministry, the Foreign Ministry, the Cabinet secretariat, the National Security Council, the National Police Agency and the Nuclear

Regulation Authority, may classify information in 55 categories in the areas of defense, diplomacy, counter-intelligence and counterterrorism.

Given the nature of those oversight bodies, it is legitimate to ask whether they can be effective in preventing improper classification and management of secrets. So far, the supervisory committee held meetings only twice, in January and April. Although the supervisory officer is obliged to submit a report to the prime minister once a year, currently there is no prospect that such a report will be delivered anytime soon. It also must be pointed out that the oversight bodies are not empowered to enforce the declassification of secrets even if they determine that they were unjustifiably designated as such.

The protection of officials who report wrongful designations of secrets is also insufficient. Although hotlines have been established under the law for whistleblowers to raise alerts, they are allowed only to summarize the information they think has been inappropriately classified. If their summaries are judged to include crucial or a major part of the classified information, they could be charged with leaking the secrets. Such a system would only discourage officials from revealing wrongful acts.

Each chamber of the Diet has a board of oversight and review of state secrets. As of the end of June, the Defense Ministry and nine other organizations had designated 417 pieces of information as state secrets. The government submitted a report on its designation of state secrets up to the end of 2014 to the Diet panels in June for their reviews, but the boards' power is weak. They can ask the government to present state secrets if necessary, but the government can turn down the request if it determines that doing so would be detrimental to national security. Although the Diet bodies can call for improvements in the operation of the law, such requests have no binding power.

In addition to the flaws of the oversight system, there are other problems that must be addressed.

Although the law requires the government to pay due consideration to the people's right to know and freedom of the press, there remains the possibility that depending on the situation, members of the press or civic groups seeking disclosure of government information could be charged with and punished for "instigating" leaks of state secrets by bureaucrats. People judged to have obtained state secrets through illicit means could face an imprisonment for as long as 10 years. As such, the law clearly has an intimidating effects on journalists and citizens.

Under the law, the government can keep designated state secrets classified for up to 30 years. But that period can be extended to a maximum of 60 years if the Cabinet sees it as necessary from a national security standpoint. Certain types of secrets in seven categories, including information on ordnance and intelligence gathering capabilities, can remain classified even longer.

The United States has a system that enable citizens to request that state secrets be declassified on the strength of the Freedom of Information Act or executive orders of 1995 and 2009. The Interagency Security Classification Appeals Panel, consisting of senior level representatives appointed by six government bodies including the Departments of State, Defense and Justice and the National Archives rules on appeals by citizens whose requests for declassification under the executive orders have been rejected at the agency level. According to the Information Security Oversight Office's report for 2013, the ISCAP acted on a total of 1,509 documents since its inception in 1996 and declassified 409 of them in their entirety and 640 others in part and accepted the declassification decisions of agencies in 460 others. In Japan, the state secret law does not accord to citizens the right to seek the declassification of state secrets. A Freedom of Information Law exists, but it is difficult for citizens to utilize it because a meaningful summary list of information designated as state secrets is not publicly available. If citizens make a disclosure request under the law, the probability is high that the government will reject it on the grounds that the disclosure would damage the nation's security or diplomatic interests. If citizens turn to

the courts to seek the disclosure of information, it would be extremely difficult for them to win because the law does not give courts the authority to review classified documents.

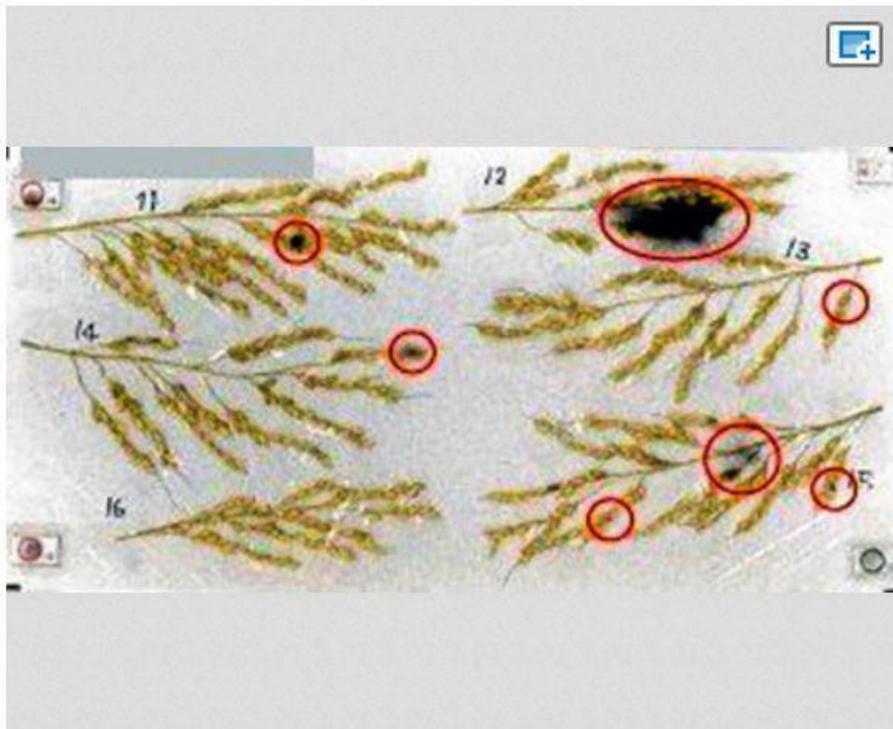

The Diet should either drastically revise the state secrets law to fix these serious flaws, including creating a system allowing citizens to seek the disclosure of classified documents, or abolish the law and begin discussions from scratch on checks and balances concerning the handling of state secrets.

Radioactive rice : Cover-up suspicions?

December 9, 2015

City to investigate NRA's conclusion that radioactive rice unrelated to Fukushima plant work

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201512090084>

The black marks on rice stalks harvested in Minami-Soma show radioactive substances. (Provided by the Ministry of Agriculture, Forestry and Fisheries)

By MASAKAZU HONDA/ Staff Writer

MINAMI-SOMA, Fukushima Prefecture--Addressing **cover-up suspicions**, the city assembly here will investigate **how the Nuclear Regulation Authority concluded that work at the crippled Fukushima nuclear plant was not the cause of radioactive contamination of rice paddies.**

The assembly unanimously decided to investigate during a regular session that started on Dec. 2 in response to a petition submitted by a citizens group called “Genpatsu-jiko no Kanzen-baisho o Saseru Minami-Soma no Kai” (Minami-Soma’s group that requires complete compensation for the nuclear accident).

The group doubts the NRA’s assertion that the contamination of rice harvested in the city in 2013 was not related to debris-removal work at the Fukushima No. 1 nuclear plant. It has also expressed **outrage that the government has stopped trying to confirm the cause.**

“The government should continue a scientific investigation so that farmers can be engaged in rice farming without anxieties, and accurate information can be conveyed to citizens in evacuation,” the petition said. “Suspicious remain that the NRA concealed facts with the intention of reaching that conclusion.”

The agriculture ministry had raised the possibility that work to remove debris at the Fukushima plant in 2013 scattered radioactive substances that contaminated rice paddies in Minami-Soma more than 20 kilometers away.

However, **the NRA reached a different conclusion, saying that while radioactive substances were stirred up by the work, they remained within the nuclear plant compound,** south of Minami-Soma.

The NRA did not specify the likely source of the contamination, and the government discontinued the investigation.

The citizens group’s petition, submitted to a regular assembly session in September, asked the city to scrutinize the process in which the NRA reached its conclusion and to gather views from several scholars. The NRA’s public relations office declined to comment on the issue on Dec. 8.

“As the documents of the petition were not issued to the NRA, we cannot make a comment,” the office told The Asahi Shimbun.

As for the issue of determining the cause of the contamination, NRA Chairman Shunichi Tanaka has said that it is a job for the agriculture ministry.

“I absolutely cannot accept (Tanaka’s remark),” Minami-Soma Mayor Katsunobu Sakurai said.

December 9, 2015

City to investigate NRA's conclusion that radioactive rice unrelated to Fukushima plant work

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201512090084>

Nuclear pact with India

December 11, 2015

Abe off to India for talks with Modi on nuclear technology pact

<http://www.japantimes.co.jp/news/2015/12/11/national/abe-off-india-talks-modi-nuclear-technology-pact/#.VmrpTr8R-os>

Jiji, Reuters

Prime Minister Shinzo Abe left Friday for a three-day visit to India, where he will meet with his Indian counterpart, Narendra Modi, to discuss a proposed bilateral nuclear cooperation treaty.

Speaking to reporters at his office before departure from Tokyo International Airport at Haneda, Abe expressed his intention to make efforts to reach an agreement on measures to prevent Japanese nuclear technologies sold to India from being diverted to military use.

“Japan is the only country in the world that has ever suffered an atomic bombing,” Abe said. “We’re holding negotiations based on this fact.”

India is not a signatory to the Nuclear Nonproliferation Treaty. The nuclear cooperation agreement with India would be Japan’s first with a country outside the NPT regime.

Japan and India started negotiations on a bilateral nuclear cooperation treaty in 2010. They are in the final stages of discussions on whether to stipulate in the treaty that bilateral nuclear cooperation would be suspended if India conducts a nuclear test again. India has not carried out a nuclear test since 1998.

At their meeting slated for Saturday in New Delhi, Abe and Modi are also expected to reaffirm that their countries will strengthen cooperation with the United States at a time when China is accelerating its maritime expansion.

“I’m aiming for results (from the meeting) that will add strong momentum to the further development of the relationship between Japan and India,” Abe said.

The two leaders are also seen agreeing on the use of Japan’s shinkansen system for a planned high-speed railway between Mumbai and Ahmedabad in western India. Japan is planning to support the project with a large amount of low-interest yen loans.

On Thursday, an Indian government minister and official said India’s Cabinet has cleared a \$14.7 billion Japanese proposal to build its first bullet train line, one of India’s biggest foreign investments in its infrastructure sector.

The decision ahead of Abe’s visit gives Japan an early lead over China, which is also bidding to build high-speed rail lines across large parts of India’s congested and largely British-era system.

Japan had offered to finance 80 percent of the cost of the train, which would link the financial capital Mumbai with Ahmedabad, the commercial center of Indian Prime Minister Narendra Modi’s home state of Gujarat, at an interest rate of less than 1 percent.

“It’s been done,” said a government minister who attended the Cabinet meeting headed by Modi late on Wednesday.

An official in Modi’s office confirmed the decision, saying there were some issues relating to the bullet train that had since been sorted out in time for Abe’s visit.

“We expect to make an announcement during the visit,” the official said. Both the minister and the official declined to be identified.

Broad agreements are also likely to be reached on two bilateral treaties that would enhance defense cooperation between Japan and India.

One is designed to prevent the transfer of defense technologies to a third country, while the other will specify rules for information protection.

This is Abe’s third trip to India, including during his first tenure between 2006 and 2007. It will be the fifth time for him to have bilateral talks with Modi.

Abe and Modi will together visit the sacred Hindu city of Varanasi on Saturday in a gesture to further deepen their personal relationship of trust.

State secrets law: "Chilling effect" on media independence

December 11, 2015

Secrets law, one year later

<http://www.japantimes.co.jp/opinion/2015/12/11/commentary/japan-commentary/secrets-law-one-year-later/#.Vmrqc78R-ov>

by Mina Pollmann

On Dec. 10, 2013, a new state secrets law was passed by the Diet, even as thousands turned out to protest. The new law was criticized for its vagueness, severity and lack of independent oversight. One year later, on Dec. 10, 2014, the controversial legislation went into effect and a large portion of the public continued to oppose it. Another year later — and no one is talking about it.

Perhaps that is a good thing. After all, it would mean that there have been no overt instances of the law being applied to the detriment of press freedom — or at least no instances that we know of. But complicit silence is harder to quantify, and as Sarah Repucci, director of Freedom House's Freedom in the World project, points out, "Sometimes you don't ever need to implement a law, if by its existence you are able to encourage self-censorship."

The main impetus for the passage of the new law was a desire to share more information with the United States as the security situation facing Japan becomes more concerning. Japan has historically been known as a "spy heaven," and the need to change this stigma is what is driving recent developments.

Richard Samuels, director of the Center for International Studies at MIT, observes: "Because Washington's experience with intelligence-sharing with the Japanese government had been unsatisfactory due to leaks, it was widely rumored that the U.S. urged Japan to create a formal classification regime. The Abe administration cited the desire to enhance alliance confidence and intelligence-sharing by the U.S. as a central reason for the introduction of the legislation. But this also should be seen as a next step in the evolution of Japan's own intelligence community." How much the law was inspired by internal developments within Japan versus external developments in the relationship with the U.S. is a question worth untangling.

The U.S. has been long involved in Japan's state secrets protection regime. Shortly after Japan's defeat, the Supreme Commander Allied Powers abolished the existing system associated with the ultra-secretive wartime government. But, after that about-face, when the U.S. realized that Japan would be a key battlefield in the Cold War, they resurrected protection for state secrets by revising the National Public Service Act in 1948 and passing the Self-Defense Forces Law in 1954. Bilaterally, Japan and the U.S. signed the 1952 Special Criminal Act, which protects secrets held by U.S. forces stationed in Japan, and in addition, the 1954 United States Mutual Security Act Secrets Protection Law, which protects secrets related to U.S. military equipment supplied to Japan.

The ruling Liberal Democratic Party had been trying to revise the lax state secrecy protection regime since as early as 1957. In 1985, Yasuhiro Nakasone made a push to pass a new state secrets law, but the domestic opposition was too great and the issue was shelved for almost two decades.

The "war on terror," regional challenges such as China and North Korea, and the rising dominance of the conservative LDP brought the issue back to the forefront. In addition to these important factors, as Brad Williams writes in *Pacific Affairs*, "one cannot overlook the important role of the U.S., whose pressure, both subtle and overt, has not only encouraged Japan to assume greater military roles and missions but has also forced the Japanese to rethink the efficacy of existing secrecy provisions."

A series of leaks since the early 2000s had shaken U.S. confidence in Japan as a security partner. In September 2000, a Maritime Self-Defense Force officer was arrested for selling military secrets to a Russian defense attache. This led to a tightening of the law in 2001. In May 2005, classified intelligence about a possible accident on a Chinese submarine made it to the front page of the *Yomiuri Shimbun*, which

led to the investigation of an Air Self-Defense Force officer. In January 2007, it was found that an MSDF officer had unauthorized possession of sensitive data on the Aegis combat system. The investigation that followed revealed that the information was given to 38 people, and was also being used in a MSDF technical training program. To regain U.S. trust, in August 2007 Japan signed a General Security of Military Information Agreement with the U.S., though Tokyo had been hesitant to do so. It is this dynamic interplay between leaks in Japan and subsequent U.S. pressure that has driven developments in Japan's state secrets protection regime.

The state secrets law is not just an issue for the Japanese right, as is often portrayed. The imperative is to establish a stronger state secrets protection regime in order to maintain the health of the U.S. alliance is recognized across the political spectrum. Discussions to tighten punishments had already begun in late 2011, in response to leaked footage of the 2010 collision between a Japanese patrol boat and Chinese trawler, under the Democratic Party of Japan government. Due to domestic opposition, the DPJ chose not to submit the bill during the 2012 Diet session. That brings us to where we are today, with the law in its present form passed under the Abe government two years ago.

As noted above, under the previous law the length of imprisonment for most Japanese who leaked state secrets was limited to one year, though defense officials could be imprisoned for five to 10 years. Now, government officials and defense industry employees who leak state secrets face up to 10 years in prison and a fine of ¥10 million. Even journalists and activists who unwittingly solicit information deemed to be state secrets can be prosecuted under this new law, as those who conspire to leak state secrets face up to five years in prison and those who acquire state secrets through illicit means face 10 years.

Even more worryingly, the process of defining state secrets is entirely in the government's hands. A supervisory committee and panel have been set up to oversee the classification process, yet their independence is questionable as both bodies are composed of government officials. There is no third-party involvement to determine whether the classification is appropriate. Furthermore, there is no protection for whistle-blowers and no mechanism to punish officials who classify information as a "state secret" for frivolous or self-serving reasons. Plus, the designation for certain types of secrets can be extended from 30 to 60 years or even indefinitely based on an internal government decision.

As mentioned at the outset, there have been no known cases of the new state secrets law being applied to prosecute journalists or whistle-blowers. As of last January, the government had designated 382 cases as subject to the new law. Most are related to defense and international diplomacy. No doubt, most of these state secrets ought to be given the highest protection possible. However, there is lingering concern the law could be misapplied in the future. As The Japan Times reports, there's also the possibility of the law hampering state account audits.

Jeffrey Kingston, a professor at Temple University, is troubled by the lack of transparency this law will condone. **"There is no independent oversight body, meaning that officials have a carte blanche to cover their tracks,"** he comments. The bureaucrats "will designate too much information as 'special secrets' so that their decisions won't be scrutinized or second-guessed until they are dead. What we know from various scandals is that bureaucrats have often decided against the public interest and now have a way to hide their misdeeds."

Balancing the protection of information that ought to be kept secret for the public's sake with the protection of press freedom to report on information that ought to be publicized is always tricky. Toshi Minohara, a professor at Kobe University, feels that the law is important as secrets of a certain nature need to stay secret — but it should be tweaked somewhat. Proper measures need to be put in place for relevant government officials to be held accountable for their actions, so there has to be more stringent

regulations regarding the preservation and maintenance of classified records, along with a clear process by which this information can become available at a later date, he argues. Furthermore, legal protection for whistle-blowers is necessary, as, he concludes, “for the government, this can become a convenient tool to cover up what is inconvenient. And looking back on history, when there is any room for abuse (of power), there will be just that — abuses.”

In Japan, there is a tendency for the government to destroy evidence, or even more egregiously, not produce any evidence. There is no law in place to force institutions or officials to keep a record or require disclosure after a certain amount of time has lapsed. The most recent example of this would be the lack of records keeping by the Cabinet Legislation Bureau as they reinterpreted the Constitution to allow for the exercise of collective self-defense. Perhaps the single most consequential change in Japan’s postwar history — and not a word has been written about what the decision-makers were saying as they made that change!

Even aside from this particular law, Japan is often criticized for the quality and independence of its media. Benjamin Ismail, head of the Asia-Pacific desk at Reporters Without Borders, describes how Japanese respondents to their anonymous surveys report unusually severe self-censorship, corporate and peer pressure (to cover or not cover certain kinds of stories), and restricted access to information. They also reported incidents of being expelled from press conferences for asking tough questions, and only being able to publish controversial stories in tabloids instead of mainstream media outlets. Ismail describes the reporting following the Fukushima incident as a “catalyst” that has finally brought to light the many problems in Japanese media.

As Kingston puts it, “The (state secrets) law doesn’t have to be acted on to have a chilling effect on investigative journalism in a nation not known for much investigative zeal.”

“The law exists in an environment of, at best, repeated disregard for the type of press freedom expected in advanced democracies — and at worst, willful infringement,” Repucci says. She cites the recent delay of a visit to Japan by David Kaye, U.N. special rapporteur on the promotion and protection of the right to freedom of opinion and expression, as a “perfect example”:

Nothing overt was said and postponing the visit is not any form of violation in and of itself, but the fact that the government declined to provide a convincing explanation and appears to have indirectly requested that the visit take place nearly a year from now is behavior consistent with that of a government that wants to be free to control the media as it sees fit, without oversight. The government may never see a need to implement the state secrets law against the media, but it would not have passed such a law if it did not want to have the option of using it. And yet one year after the law was enacted, no one is talking about this law anymore.

From the government’s perspective, “Out of sight, out of mind,” is their best strategy to coopt the public. But it is precisely because of this complacency, which will allow such a law to become entrenched over the years, that it is important to continuously reinvigorate the debate over the appropriate balance between protecting state secrets and protecting the right to know in Japan.

India not a signatory of NPT

Activists of the Communist Party of India (CPI) and All India Students' Association (AISA) hold banners during a sit-in protest against the nuclear power talks between Indian Prime Minister Narendra Modi and his Japanese counterpart, Shinzo Abe, in New Delhi, India, on Dec. 12. (AP Photo)

December 13, 2015

Japan's nuclear power deal in principle with India a first with an NPT non-signer

http://ajw.asahi.com/article/behind_news/politics/AJ201512130019

THE ASAHI SHIMBUN

Prime Minister Shinzo Abe's agreement in principle to supply nuclear power technology to India may run counter to Japan's stated commitment against the proliferation of nuclear weapons.

The deal was reached on Dec. 12 during a meeting between Abe, who is visiting New Delhi, and his Indian counterpart, Narendra Modi.

If an actual nuclear power agreement is signed, it would mark the first for Japan with a nation that has not signed the Nuclear Nonproliferation Treaty.

The latest move by Japan was met swiftly with criticism in Hiroshima and Nagasaki.

Hiroshima Mayor Kazumi Matsui issued a statement on Dec. 12 asking that no nuclear power agreement with India be signed until it joined the NPT. The agreement reached between Abe and Modi "cannot be said to be in line with the position of maintaining the NPT structure by preventing its hollowing out," Matsui said.

Japan and India began negotiating a nuclear power agreement in 2010 when the Democratic Party of Japan was still in power. Japan had wanted a provision in any such deal that would allow it to immediately stop any nuclear power cooperation should India resume testing of nuclear weapons, which has been on hold since 1998.

Japan insisted on that position because of its goal of abolishing nuclear weapons, being the only nation in the world to have been subjected to the destructive power of such devices.

Although a joint declaration and a memorandum regarding a nuclear power agreement were released on Dec. 12, no provisions were included regarding a suspension of cooperation should India resume nuclear testing.

In the joint declaration, the two leaders confirmed that a nuclear power agreement would be signed after completion of the technological details through further negotiations between the two nations.

According to Japanese officials who briefed reporters, in his meeting with Modi, Abe said Japan would suspend cooperation if India resumed nuclear testing. Those officials said that reference would serve as a brake against India if it considered resumption of nuclear testing.

The move toward providing nuclear power technology with a nation that has not signed the NPT would be a major shift for Japan, which had emphasized nuclear nonproliferation until now.

At the same time, the Abe administration has placed the export of major infrastructure projects as a key pillar of its economic growth strategy, so it is eager to export nuclear power plant technology.

Before Abe's meeting with Modi, a high-ranking Foreign Ministry official said, "With the experiences of Hiroshima and Nagasaki, Japan is the only nation that has been hit by nuclear bombs and that is why Japan has pushed a nuclear nonproliferation diplomacy. We will not enter into an agreement that is not in line with that stance."

India has long insisted that it has the right to develop nuclear weapons. While it has announced a moratorium on nuclear testing, it apparently did not want to commit in writing any suspension of nuclear power cooperation should it ever resume nuclear testing.

This would not be the first time India has pushed for an agreement on nuclear power technology cooperation that did not contain a provision against nuclear testing.

India reached a similar deal with the United States in 2008. The United States has a domestic law that includes a provision that allows for suspension of nuclear power cooperation should nuclear testing be conducted.

The news of the latest agreement on Dec. 12 was criticized by Miyako Jodai, 76, who survived the atomic bombing of Nagasaki on Aug. 9, 1945. She linked the latest agreement with the 2011 accident at the Fukushima No. 1 nuclear power plant.

"The people of Fukushima are still suffering and spent nuclear fuel cannot be disposed of properly," Jodai said. **"It is wrong to sell nuclear plant technology overseas by emphasizing only its safety and convenience."**

State secrets laws : Potential for govt. cover-ups

December 12, 2015

EDITORIAL: Anxiety still lingers over 1-year-old secrecy law

<http://ajw.asahi.com/article/views/editorial/AJ201512120025>

A full year has passed since the state secrets protection law came into force.

"I believe the citizens are aware that nothing of the kind that they initially feared has taken place during this time," Chief Cabinet Secretary Yoshihide Suga said.

We, however, disagree.

That is because, by the very nature of the secrecy law that took effect on Dec. 10, 2014, it remains impossible to find out from the outside if any information that is inconvenient for the government has not been withheld or if the law has not been applied in an arbitrary manner.

"I think I should have taken more time to provide more detailed explanations," Prime Minister Shinzo Abe said at a news conference two years ago when he had the state secrets protection law enacted. "From now on, I will explain carefully to erase people's concerns."

It remains to be seen if careful explanations have actually been provided or if people's concerns have really been erased.

It has been disclosed recently that in 2013, prior to the Cabinet approval of the state secrets protection bill, the Board of Audit of Japan pointed out to the Cabinet Secretariat that government ministries and agencies could refuse to submit documents that contain designated state secrets, a situation that was "constitutionally problematic."

In response, the Cabinet Secretariat said it would issue a notice to instruct government ministries and agencies to comply with auditing as before, but it has yet to make good on that word. Board of Audit officials said no ministry or agency has so far cited the secrecy law to withhold documents, but said the notice should be issued at any rate, because there is the undeniable possibility that auditing could be obstructed in the future.

Article 90 of the Constitution says that "final accounts of the expenditures and revenues of the state shall be audited annually by a board of audit."

That provision was included to reflect that, under the prewar Constitution of the Empire of Japan, the government's secret funds and military expenses were excluded from auditing, which resulted in a lack of auditing control over the ballooning expenses related to the armed forces.

The Cabinet Secretariat may be taking that historical context and the weight of the Constitution too lightly. It should promptly issue the notice as it said it would.

It has also been learned that a survey trip to Japan by a U.N. special rapporteur on freedom of expression, which had initially been scheduled for early December, was delayed at the last minute at the request of the Japanese government, which asked the rapporteur to postpone his visit to autumn 2016 at the earliest. The rapporteur had planned to gather information on the state secrets protection law and other matters. A Foreign Ministry official said the delay was not requested because Tokyo found anything inconvenient in the issues to be surveyed, but simply because it was difficult to schedule the availability of officials in charge of the matter. But suspicion against administrative organs will linger as long as the essential nature of the state secrets protection law, which allows them to conceal whatever they wish, remains the same. Now is the time for Abe to "explain carefully to erase people's concerns." Doing so amounts to a minimal duty for the person responsible for brushing aside deep-rooted criticism and concerns to have the secrecy law enacted.

--The Asahi Shimbun, Dec. 12

Secrecy legislation carries potential for serious government cover-ups

<http://mainichi.jp/english/articles/20151208/p2a/00m/0na/023000c>

Under the Constitution of the Empire of Japan, which remained in force from 1890 until 1947, the Board of Audit of Japan faced limitations on checking military-related budgets. Since secret funds of the government and military were exempt from auditing in those days, the bulk of military-related budgets remained in a "black box."

The book "Kaikai Kenshin Hyakunenshi" (100-year history of the Board of Audit), published in 1980 by the Board of Audit of Japan, states that there were considerable constraints on auditing under the Military Secrets Protection Law (revised in 1937). The law was designed to punish those who leaked military secrets.

Based on lessons learned from this past, Article 90 of the current Constitution stipulates that "Final accounts of the expenditures and revenues of the State shall be audited annually by a Board of Audit ..." This means that the Board of Audit is independent of the Cabinet. There have been no provisions so far even in the Self-Defense Forces Act that limit the provision of defense secrets to the Board of Audit. Specially designated state secrets include documents on budgetary measures for defense and foreign policies.

Regarding Section 1 of Article 10 of the Act on Protection of Specially Designated Secrets, Hiroshi Arikawa, former commissioner of the Board of Audit and professor of public policy at Nihon University, said, "If those who are subject to auditing can select which documents to submit, I would have to say it infringes on Article 90 of the Constitution."

The special secrets act, which imposes heavy penalties on those who leak important state secrets and those who obtain such information through unauthorized means, carries the potential for serious cover-ups of information. The government should make efforts to allay such doubts.

"A slap in the face of NPT"

December 14, 2015

EDITORIAL: Japan-India nuclear cooperation a slap in the face of NPT

<http://ajw.asahi.com/article/views/editorial/AJ201512140016>

The framework for preventing the spread of technology and materials for building nuclear weapons is becoming increasingly compromised.

Even Japan, which has suffered atomic bombings, has joined the ranks of the world's nations that are eager to pitch nuclear technology even to a country with nuclear weapons for the sake of commercial interests.

During a visit to India on Dec. 12, Prime Minister Shinzo Abe agreed with his Indian counterpart, Narendra Modi, that the two countries will sign a deal on civil nuclear cooperation. The agreement would bolster the export of nuclear technology by Japanese enterprises.

India became in possession of nuclear weapons without joining the Nuclear Nonproliferation Treaty (NPT). Its relations with neighboring Pakistan, which also refused to join the NPT and armed itself with nuclear weapons, remain strained.

Providing nuclear technology to such a nation should be called an act of folly that makes light of the longstanding and persevering nuclear nonproliferation efforts of the global community and would further emasculate the nonproliferation regime.

Rising calls for the abolition of nuclear weapons in the years following World War II, when the world came under a threat of the potential use of nuclear weapons, were the driving force behind the NPT, which entered into force in 1970.

Nations of the world, including Japan, joined the treaty under its guiding principle, which obligates the United States, Britain, France, China and Russia to commit to nuclear disarmament in exchange for granting them the status of nuclear-weapon states. The NPT also allows the other countries to use nuclear power only for peaceful purposes.

Supplier nations made it a rule not to trade in nuclear technology with countries outside that framework. But the United States took the initiative in granting an exception to India in 2008. Since then, the United States, France, Russia, South Korea and other nations have all signed nuclear agreements with India.

Those countries are looking at India as a promising market for pitching nuclear power plant technology. That is because India already hosts about 20 nuclear reactors and plans to build 40 more at a time when it is becoming increasingly difficult to build reactors in advanced nations.

The United States and other countries should realize that compromising the nuclear nonproliferation principles for the benefit of business opportunities would engender serious problems for the future. Japan, among others, is a nation that should be taking the lead in creating a nuclear-free world. It not only knows about the tragic consequences of the use of nuclear weapons but also has experienced one of the world's largest nuclear plant disasters and continues to be plagued by the resulting radioactive contamination.

Japan is the country that should be applying the brakes on any moves toward nuclear proliferation. The previous administration led by the Democratic Party of Japan, however, opened negotiations on the nuclear deal with India five years ago. Both the DPJ government and Abe's current administration cannot escape the charge of having forgotten the duty and responsibility of a nation that has suffered atomic bombings.

Abe told a news conference Dec. 12 that he would go along with India in pursuing a world free of nuclear weapons. But he has yet to provide a specific action to achieve that goal.

We are only left to wonder how we could explain to North Korea and Iran, which are insisting on their own nuclear development programs, why we are dealing differently with India. We could lose our convincing power for dissuading other nations from following in their footsteps.

The threat of nuclear arms will only increase as long as Japan, the United States and other countries, which should be guardians of the nonproliferation regime, are using their own hands to undermine its foundation.

--The Asahi Shimbun, Dec. 13

Murphy's Law lives in Fukushima

December 14, 2015

Fukushima Amplifies Murphy's Law

<http://www.counterpunch.org/2015/12/14/fukushima-amplifies-murphys-law/>

by Robert Hunziker

Murphy's Law has found a permanent home in Fukushima: "Anything that can go wrong will go wrong."

For instance, only recently, radioactive cesium in tunnels at Fukushima suddenly spiked by more than 4,000 times similar measurements from one year ago. This spooky/huge spike in radiation levels hit 482,000 Becquerels per liter. TEPCO intends to investigate the reason behind the enormous anomalous increase, *Radiation Spikes in Fukushima Underground Ducts*, NHK World, Dec. 9, 2015. Over the course of a year, 4,000 times anything probably is not good.

Not only that but the barrier constructed at the Fukushima nuclear power plant to hopefully prevent contaminated water from leaking into the ocean is tilting and has developed a crack about 0.3 miles in length along its base. The wall is 0.5 miles long and 98 feet below ground.

An ocean barrier, indeed: "Higher levels of radiation from Japan's 2011 Fukushima nuclear accident are showing up in the ocean off the west coast of North America, scientists from the Woods Hole Oceanographic Institution reported," *Higher Levels of Fukushima Radiation Detected Off West Coast*, Statesman Journal, Dec. 3, 2015. Fortunately, so far, the detected levels still remain below U.S. government-established safety limits.

In the meantime, TEPCO battles one of the most perplexing disasters of all-time with an average number of daily workers more than 7,000. The difficulty of procuring workers at the site is beyond imagination. Homeless people are hired off the streets to do the dangerous decontamination work.

The Tokyo 2020 Olympics

The situation better get better really soon because the Olympics are scheduled for 2020, which brings to mind perilous lost corium, the sizzling hot melted core in Plant #2, that hopefully, keeping one's fingers crossed, has not burrowed into the ground, spreading deadly isotopes erratically, ubiquitously throughout. Still, nobody knows where this Missing Corium-Waldo of the Nuclear World is located. Meanwhile, Greenpeace/Japan accuses the International Atomic Energy Agency (IAEA) of downplaying the health risks of the 2011 Fukushima disaster and accuses the agency of acting in concert with Japanese Prime Minister Shinzo Abe's attempts to "normalize" the disaster, *Greenpeace Japan: IAEA Downplays Dangers of Fukushima Disaster*, Sputnik News, Feb. 9, 2015. Hurry, hurry, the Olympics is coming! One clever approach to the problem of too much radiation is to increase the "allowable limits": "The permissible annual level of radiation exposure has been dangerously heightened in Japan after the March 11th accident. One (1) millisievert (mSv) has been elevated to 20 mSv for residents in affected areas. The government increased the annual limit for nuclear workers' radiation exposure from 100 mSv to 250 mSv in 'emergency situations,'" Mitsuhei Murata (Executive Director of Japan Society for Global System and Ethics and former Japanese ambassador to Switzerland) *Nuclear Disaster and Global Ethics*, UN World Conference on Disaster Risk Reduction, March 16, 2015.

When the "permissible level" of radiation was initially moved higher, the Japan Medical Association stated: "The scientific basis for choosing the maximum amount of 20 mSv in the band of 1 to 20 mSv is not clear." Furthermore, according to Physicians for Social Responsibility, there is no safe level of radiation. Apropos the Fukushima situation: "It is unconscionable to increase the allowable dose for children to 20 millisieverts (mSv). Twenty mSv exposes an adult to a 1 in 500 risk of getting cancer; this dose for children exposes them to a 1 in 200 risk of getting cancer. And if they are exposed to this dose for two years, the risk is 1 in 100. There is no way that this level of exposure can be considered 'safe' for children." Recent studies confirm "exposure to low levels of radiation can cause cancer," specifically, "No matter whether people are exposed to protracted low doses or to high and acute doses, the observed association between dose and solid cancer risk is similar per unit of radiation dose," (Source: British Medical Journal,

Press Release, *Low Doses of Ionizing Radiation Increase Risk of Death from Solid Cancers*, International Agency for Research on Cancer, WHO, Oct. 21, 2015).

In sharp contrast to Japan's position, Chernobyl's officialdom has a different take on "permissible annual radiation exposure," specifically: "The radiation limit that excluded people from living in the 30km zone around the Chernobyl nuclear plant exclusion zone was set at 5mSV/year, five years after the nuclear accident. Over 100,000 people were evacuated from within the zone and will never return," (Greenpeace Japan). Never ever return!

Nuclear disasters don't go away easily. For example, Chernobyl is already facing a brand new crisis. The durability of the original decaying blighted sarcophagus expires within the next 12 months. However, the new replacement sarcophagus, the world's biggest-ever metallic dome, will not be accomplished in time as they are short of funds (615million EUR).

In addition to Ukraine's internal strife with pro-Russian citizens, the country has serious financial difficulties. All of this amounts to one more "spoke in the wheel" against nuclear reactor proliferation (Incidentally, China has 400 reactors on the drawing board). Who knows if and when a crippled reactor ends up in the hands of a financially strapped country? Then what?

Already, Ukraine has 15 nuclear reactors standing tall, so far, amongst whizzing bullets and powerful rockets. Dismally, Ukraine has conceivably become a nuclear holocaust tinderbox in the midst of cannon fire, rumbling tanks, and surface-to-air missiles, for example, Malaysia Airlines Flight 17 was shot down by a missile, supposedly by accident, on July 17, 2014, all 298 on board died.

Meanwhile, back in Japan, raising the level of permissible annual radiation exposure does not escape international notice. According to Dr. Ian Fairlie, former head of the Secretariat of the UK Government's CERRIE Committee on Internal Radiation Risks: "The Japanese government goes so far as to increase the public limit for radiation in Japan from 1 mSv to 20 mSv per year, while its scientists are making efforts to convince the International Commission on Radiological Protection (ICRP) to accept this enormous increase."

But, wait a moment; the Olympic Committee has already designated Tokyo 2020. Is it possible the IOC has the cart ahead of the horse, maybe way ahead?

As for the newly established higher acceptable Japanese limit for radiation: "This is not only unscientific, it is also unconscionable," Dr. Fairlie, *Unspoken Death Toll of Fukushima: Nuclear Disaster Killing Japanese Slowly*, Sputnik International, Aug. 8, 2015. After all, on a factual basis, "unscientific and unconscionable" are strong indictments.

Yet, the Olympic committee has already approved Tokyo 2020, and people from around the world will be making plans to attend. Withal, if the Olympic Committee is okay with Japan's capricious radiation conditions, then shouldn't everybody else be okay with it too? Well....

All of which brings to mind: If Fukushima's a canary in the mineshaft that exposes nuclear power's hidden dirty underbelly, meaning, once things go wrong they really go wrong, adhering to Murphy's Law, then what of the potential consequences of big ole nuke plants in war zones? How would Murphy's Law apply in a war zone? The most comfortable answer is: Don't even think about it.

Still, the world's 430 nuclear reactors are "big fat sitting ducks." According to former ambassador Murata, nuclear reactors are "the world's most serious security problem."

Thus, Fukushima may be more than the poster child of nuclear power's fragility vis a vis extreme forces of nature; it's also a surrogate poster child for lurking dangers behind and within terrorism and within war zones when "anything that can go wrong will go wrong," for example, a downed airliner over Ukraine.

Nuclear Reactors are as Dangerous as Nuclear Weapons (Murata)

Rockets have been fired at nuclear facilities in Israel. " Hamas claimed responsibility for the rockets, stating that it had been attempting to hit the nuclear reactor. Militants from Hamas's Qassam Brigades said they had launched long-range M-75 rockets towards Dimona" (The Jerusalem Post, July 9, 2014). As mentioned earlier, Ukraine is home to 15 nuclear reactors in the midst of a war zone. What if a missile accidentally, or purposefully, hits a nuclear reactor? Does Fukushima provide any clues as to the consequences of such a disaster?

Assuming Fukushima is truly a harbinger of how remarkably well nuclear disasters harmonize with, in fact, cohere to Murphy's Law, it probably implies that "all bets are off."

Postscript: "The future of the Olympic Games is at stake. It is as a believer in the spirit of the Olympic Games and the Olympic Movement that I am pleading for an honorable retreat, and this, in order for Japan to devote maximum efforts to controlling the Fukushima crisis," Mitsuhei Murata, Former Japanese Ambassador to Switzerland and Executive Director, Japan Society for Global System and Ethics, Tokyo, October 28, 2015.

Japan-India pact a risky deal

December 16, 2015

The risky nuclear deal with India

<http://www.japantimes.co.jp/opinion/2015/12/16/editorials/risky-nuclear-deal-india/#.VnKFPL8R-id>

During his visit to New Delhi last week, Prime Minister Shinzo Abe and his Indian counterpart Narendra Modi agreed in principle on a civil nuclear cooperation pact that would pave the way for export of Japan's nuclear power plant technology to India. It will be Japan's first such deal with a country that has not signed the Nuclear Nonproliferation Treaty. In working out its further details, the government needs to ensure a clear mechanism to prevent India from using the technology provided by Japan to enhance its nuclear weapons capabilities. This is Japan's duty as the only country in history to suffer nuclear attacks.

Japan has so far refrained from signing a civil nuclear cooperation pact with countries that are outside the NPT regime. Such an agreement with India, a de facto nuclear weapons power, is tantamount to Tokyo accepting possession of nuclear weapons by a country that is not a party to the NPT, representing a major shift in Japan's nuclear policy. It may compromise Japan's position of calling on North Korea, which has withdrawn from the NPT regime, to end its nuclear weapons program. The pact would have the effect of further reduce India's incentive to join the NPT regime. One wonders whether the Abe administration has seriously considered these effects.

The root of Japan's talks with India for a civil nuclear pact goes back to a proposal made in the late 2000s by U.S. President George W. Bush to change the rules of the Nuclear Suppliers Group (NSG), a multinational body designed to control the export of nuclear apparatuses and technology to ensure nuclear nonproliferation. Behind the proposal was the Bush administration's desire to strengthen the United States' strategic ties with India. Although the NSG, whose members include the U.S., Russia, Germany, France, Britain, Canada and Japan, had prohibited civil nuclear cooperation with India because

of its nuclear explosion test in 1974, the group in 2008 granted a waiver to India from its rules. Japan was initially cautious about the change but eventually succumbed to pressure from the U.S.

The change prompted the U.S., France, Russia, South Korea and others to sign agreements with India on nuclear cooperation. Abe's move represents the desire of Japan's nuclear power industry, whose prospect in the domestic market is uncertain following the 2011 Fukushima crisis, to enter the growing market of nuclear power in India. Currently, 21 nuclear power plants are in operation in the country, and there are plans to build over 30 more to meet the demand of its expanding population.

Abe says his agreement with Modi ensures that Japan's nuclear technology provided to India would be used solely for peaceful purposes. A government official said Japan would halt the implementation of the pact if India tests a nuclear weapon, which it has not done since 1998. That would be a logical course of action for Japan.

A major problem with the planned pact is that Japan would allow India to reprocess nuclear fuel burned in a plant built with Japanese components and materials. Plutonium extracted through reprocessing of spent fuel can be converted into nuclear weapons. To prevent that, the pact needs to have a mechanism to verify the volume of such plutonium and its whereabouts. Still, **the more plutonium India can secure for commercial purposes, the more it can possibly concentrate on using uranium produced in the country for military purposes.** India and Pakistan, which also possesses nuclear weapons, are in confrontation for many years. **Utmost efforts must be made to stop India from reinforcing its nuclear arsenal by taking advantage of this pact.**

During the talks with Abe, Modi also agreed to introduce Japan's shinkansen technology to build a high-speed railway linking Mumbai and Ahmedabad in western India. India hopes the project worth ¥1.8 trillion — for which Tokyo has agreed to extend ¥1.46 trillion in loans — will begin in 2017 and be put to service in 2023. Although Japan succeeded in exporting its bullet-train technology to Taiwan in the late 1990s, it lost out to China in October in the competition to sell the technology to Indonesia. India appears to have put priority on the safety and technological advantage of the shinkansen system. Japan should support India in the training of personnel, including operation controllers, drivers and maintenance workers, in addition to the export of hardware.

Abe's latest visit to and deals with India are **part of his administration's efforts to check the rising influence of China by deepening Tokyo's ties with New Delhi.** The two leaders agreed that the Maritime Self-Defense Force will become a permanent participant in India and the U.S.' annual joint naval drill known as Exercise Malabar, which is carried out with China's rise as a regional maritime power in mind. Japan and India also signed deals paving the way for transfer of Japanese defense equipment and technology and exchanges of defense-related information.

While Japan and India are both wary of China's growing maritime presence in the region, New Delhi is more flexible in its approach toward Beijing. For example, India is a founding member of the China-led Asian Infrastructure Investment Bank, from which Japan, along with the U.S., has opted out. **Abe should realize that building friendly ties with both China and India in a balanced manner will contribute to enhancing Japan's interests.**

Decontamination budget hits record

December 17, 2015

Japan's radiation decontamination budget to hit record ¥522.3 billion

<http://www.japantimes.co.jp/news/2015/12/17/national/japans-radiation-decontamination-budget-to-hit-record-%C2%A5522-3-billion/#.VnKD9r8R-ic>

JJI

The Environment Ministry has sought a **record ¥522.3 billion in its budget proposal for fiscal 2016**, with most of the spend related to decontamination work in areas affected by the March 2011 nuclear disaster.

The proposed figure for the year from April, presented at a meeting led by the ruling Liberal Democratic Party's environment policy division on Wednesday, was up from some ¥450 billion in this summer's budget request.

The increase reflected higher-than-expected costs for decontamination work shouldered by the Fukushima Prefecture government, which hosts Tokyo Electric Power Co.'s Fukushima No. 1 power plant, the site of the nuclear accident.

Decontamination work is conducted by municipalities, backed by financial support from the central government.

The government also plans to book some ¥78.3 billion for decontamination costs in a fiscal 2015 supplementary budget proposal.

With municipalities aiming to finish decontamination work by the end of fiscal 2016, the central government will look to help accelerate the efforts by boosting the budget.

In the fiscal 2016 budget proposal, the ministry also included some ¥134.6 billion mainly for maintenance costs for interim facilities where contaminated soil is temporarily kept.

A further ¥214 billion is for costs related to the disposal of radioactive substances and other designated waste produced by the nuclear accident.

Japan-India pact: "A disaster in the making"?

The prospect of a nuclear deal with Japan is worrying because it ignores voices on the ground and takes India a step closer to the construction of untested and expensive reactors

During Japanese Prime Minister Shinzô Abe's visit to India last week, Japan and India reportedly made progress on a nuclear deal that they have been discussing for more than seven years. The governments did not actually conclude the deal: the Joint Statement released by the Prime Ministers only includes a droll phrase welcoming the "agreement reached... on the Agreement... for Cooperation in the Peaceful Uses of Nuclear Energy" and expresses the hope that "this Agreement will be signed after the technical details are finalised".

These "details" include deep concerns about India's growing weapons arsenal within Japan's polity that even Mr. Abe's militaristic government has found difficult to ignore. Nevertheless, even the prospect of an India-Japan nuclear deal is worrying because it takes the country a step closer to the construction of untested and expensive reactors. Moreover, despite the Narendra Modi government's "Make in India" rhetoric, the agreement will primarily benefit multinational corporations based in Japan.

A silent nuclear player

Although the debate on reactor imports in the past few years has largely focussed on France, Russia and the United States, Japan is an important background player in this market. Except for the Russian VVER reactors at Kudankulam, in Tamil Nadu [which is the Vodo-Vodyanoi Energetichesky Reaktor or Water-Water Power Reactor and a pressurised water reactor], Japanese corporations have a key role in the three other reactor designs that the government is planning to import: the Westinghouse AP1000 reactors for Mithi Viridi (Gujarat), the General Electric (GE) Economic Simplified Boiling Water Reactors (ESBWR) for Kovvada (Andhra Pradesh), and Areva's European Pressurised Reactors (EPRs) for Jaitapur (Maharashtra). The Japanese company, Toshiba, holds a controlling stake in Westinghouse. The ESBWR was developed by GE in collaboration with Japan's Hitachi. Finally, the EPR is so large that Japan Steel Works is one of the few companies in the world that can forge some of its critical components. The India-Japan nuclear deal is meant to clear the way for these Japanese corporations to sell their wares in India. Nuclear suppliers have a clear interest in this deal. A global downturn in the nuclear industry after the Fukushima disaster in 2011 has left them with serious commercial difficulties. GE, which built the Fukushima reactors, was considered a "laggard" in the industry even before its reputation was damaged by the accident. It has since struggled to find buyers for its ESBWR design, which was certified by the U.S. Nuclear Regulatory Commission only last year. Last month, Toshiba announced that from the time it acquired the company in 2006, Westinghouse had accumulated a net operating loss of \$290 million. Areva is now virtually bankrupt — its rating downgraded to "junk" by Standard & Poor's — after billions of euros in recent losses. Its reactor division may be taken over by the French state-run Électricité de France, and possibly Mitsubishi.

Need for new markets

Nor is there any scope for reactor sales within Japan. The Fukushima disaster, which has not been contained even after four years, continues to remind many Japanese of the dangers of nuclear power. A commission established by the Japanese Parliament emphasised the role of poor safety practices in the Japanese nuclear industry and went so far as to state that "this was a disaster 'Made in Japan'". Despite a strong push by the Abe government, nuclear power finds little support in the country. A poll conducted by

a Japanese national newspaper *Asahi Shimbun* in 2014 found that 77 per cent of respondents supported a phase-out of nuclear power.

It is not surprising, therefore, that Japanese nuclear corporations have turned to India as a market for their technology. But there are good reasons for India to resist this sales pitch. Even with domestic Indian reactors, nuclear power has been an expensive source of electricity, but with imported reactors the costs become prohibitive. This is, in large part, due to the astronomical capital costs of reactors. Since none of the reactor designs being considered — the AP1000, the ESBWR, and the EPR — are operational anywhere in the world, cost figures must rely on projections, and these have been rising with each passing year. For example, just this month, it was reported that the total costs of the two AP1000s being built in the U.S. state of Georgia might rise to \$21 billion, significantly more than the initial projection of \$14 billion. Likewise, the latest estimate, from September 2015, of the cost of the EPR being built at Flamanville (France) is €10.5 billion (\$11.6 billion), up from €3.2 billion.

Costly proposition

It is straightforward to translate this into a final tariff, using techniques that we described in a paper for the *Economic and Political Weekly* in 2013. Even accounting for a reduction in construction costs in India, a reactor that costs \$11.6 billion in Europe is likely to lead to a first-year tariff of about Rs.19 per unit of electricity. For perspective, recent winning bids at auctions from coal and solar power have been in the range of Rs.4.50 to Rs.5.50 per unit of electricity.

The Indian government claims that it would reduce costs by manufacturing reactor components in India, and concomitantly promote India's domestic manufacturing industry. However, the deal with Japan shows that this is mostly empty rhetoric. In a press briefing last year, the Joint Secretary (East Asia) explained that India's motivation in pursuing a nuclear agreement with Japan had to do with its belief that "in the area of nuclear technology there are certain advantages which rest with Japanese industry, in large-scale forgings for example". Of course, if key reactor components are forged in Japan, they cannot simultaneously be "made in India".

Disaster in the making?

Another problem with the proposed reactors has to do with safety. The reactors under consideration are untested, and provide no empirical track record of safe operation. Although the industry produces some calculations, using a technique called probabilistic risk assessment to claim that these reactors are safe, these techniques are unreliable both on theoretical and empirical grounds. Indeed, given the complexity of the new designs, it is only natural to expect construction difficulties that will also impact safety. Just a few months ago, Areva announced that it had found serious flaws in the fabrication of the pressure vessel of the EPR under construction in Flamanville. The industry is itself well aware of the possibility of a devastating accident, as is clear from its constant efforts to alter India's liability law and pre-emptively insulate itself from the consequences of a disaster.

GE's CEO, Jeffrey Immelt, explicitly stated earlier this year that he would not invest in India without legal indemnity: "I am not going to put my company at risk... there is no project that is worth it." One lesson that India should definitely learn from Japan has to do with the danger of giving in to such threats. More than 50 years ago, Japan succumbed to pressure from nuclear suppliers and instituted a law to indemnify them. Consequently, when the GE reactors at Fukushima suffered an accident, in part due to a design defect that had been pointed out decades earlier, GE was protected from any claims by victims. The cost of the clean-up, estimated at about \$200 billion, has been borne almost entirely by Japanese taxpayers. Of course,

multinational suppliers would like to institute the same outrageous arrangement in India, but there is no reason that the government should oblige them.

Citizens in both India and Japan have expressed their serious concerns about this deal and India's nuclear imports. Recently, 13 villages near Jaitapur passed a joint resolution against that nuclear plant. Large protests have also taken place at Kovvada and Mithi Virdi. Before Mr. Abe's visit, the mayors of Hiroshima and Nagasaki took the unusual step of jointly writing to their Prime Minister asking him to reconsider the deal with India. It is revealing that the leaders of "Asia's largest democracies" have entirely ignored these voices on the ground, and instead moved to bail out the multinational nuclear industry.

On 3/11 emergency declaration reached only 16% of Fukushima residents

December 19, 2015

Only 16% of Fukushima residents knew of emergency declaration

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201512190021>

THE ASAHI SHIMBUN

The government's declaration of a nuclear emergency on March 11, 2011, reached only 16.5 percent of residents in Fukushima Prefecture by the following day, according to a Cabinet Office survey.

A key reason for this seems to have been that the communication structure in coastal areas was wiped out by the towering tsunami generated by the magnitude-9.0 Great East Japan Earthquake that led to the disaster at the Fukushima No. 1 nuclear power plant.

The government directive was issued about four hours after the earthquake struck.

The survey findings on 19,535 evacuees from 22 municipalities in Fukushima Prefecture underscore the difficulties in promptly notifying residents in such an emergency situation, which is essential for ensuring that all residents are evacuated smoothly.

The survey, the largest government-sponsored study on people evacuated in the aftermath of the Fukushima disaster, was undertaken between February and May 2014.

The Cabinet Office said it was done in line with a law to use such data for mapping out extensive evacuation plans for nuclear accidents. It sent questionnaires to 59,378 people, and 19,535, or 32.9 percent of them, responded.

The central government issued the emergency declaration in Tokyo at 7:03 p.m. on March 11, 2011, approximately four hours after the earthquake hit. Only 16.5 percent of the respondents said they were informed of the declaration by the following day.

At 9:23 p.m. on March 11, the government also instructed all residents living within a 3-kilometer radius of the crippled plant to be evacuated and those living within 10 km of the facility to remain indoors.

But only 15.6 percent and 18.8 percent of the respondents, respectively, said they knew of the instructions by March 12.

Among residents of the town of Namie, located within a 10-km radius of the plant, only 9.7 percent were informed of the emergency declaration by March 12.

The communication infrastructure in the coastal town was knocked out by the earthquake and tsunami, which also caused power blackouts in the area.

The government sequentially extended evacuation areas, and residents in a 20- to 30-km radius of the plant were instructed to remain sheltered indoors on March 15.

In another startling finding, only 63.2 percent of the respondents said they were informed of the March 15 instruction by the end of April--a full six weeks later--and 59.9 percent said they complied with the guidance.

The triple meltdown at the Fukushima plant led to the release of vast amounts of radioactive materials into the environment. After the disaster, local governments in areas surrounding nuclear plants around the country mapped out evacuation plans that call for residents living within a 30-km radius of a plant to remain sheltered until radiation readings reach a certain level.

The survey results show that local governments need to devise better systems to ensure that residents are promptly informed in times of emergency.

Tepco will post profit even if reactors do not restart

December 18, 2015

Tepco expects 2016 profit even if reactors are not restarted, plans to issue bonds

<http://www.japantimes.co.jp/news/2015/12/18/business/corporate-business/tepco-expects-2016-profit-even-reactors-not-restarted-plans-issue-bonds/#.VnUY6r8R-id>

Kyodo

Tokyo Electric Power Co., operator of the disaster-struck Fukushima No. 1 nuclear power plant, expects to post a profit next year even if unable to restart any reactors, according to a plan given to its creditor banks.

Tepco will likely turn a profit for the fourth straight year due to cost-cutting efforts and reduced fuel costs, the result of plummeting crude oil prices, the plan shows. Tepco expects to post an unconsolidated pretax profit of ¥314 billion (\$2.56 billion) for the current business year to March 31.

The plan also stipulates that Tepco plans to issue ¥330 billion in corporate bonds in fiscal 2016, the first bonds the utility will have issued in six years.

Next year, Tepco's pretax profit is projected at ¥156.9 billion if nuclear reactors at its Kashiwazaki-Kariwa plant in Niigata Prefecture are reactivated next October, and ¥114 billion if restarted in January 2017, according to the plan.

The plan did not include a profit figure if the plant remains offline the entire year, saying only that it would still turn a profit.

The Nuclear Regulation Authority has indicated readiness to examine whether reactors. 6 and 7 units at the Kashiwazaki-Kariwa plant meet new safety regulations adopted in the wake of the 2011 nuclear disaster at Fukushima No. 1.

But it is unclear whether Tepco could obtain local consent to reactivate them as Niigata Gov. Hirohiko Izumida maintains a cautious stance.

Takahama restart ignores safety concerns

December 25, 2015

EDITORIAL: Fukui court ignores all safety lessons from Fukushima disaster

<http://ajw.asahi.com/article/views/editorial/AJ201512250028>

A local court has handed down a ruling on a plan to restart offline nuclear reactors that harks back to the era before the Fukushima nuclear disaster in 2011.

The Fukui District Court on Dec. 24 nullified an injunction against restarting the No. 3 and No. 4 reactors at Kansai Electric Power Co.'s Takahama nuclear plant in Fukui Prefecture. The injunction was issued by the same court in April.

In its April decision, the district court said the new safety standards of the Nuclear Regulation Authority (NRA) were "far too lenient, and meeting them does not guarantee the safety of nuclear power plants." This time around, however, the court said, "The framework of the new safety standards for safety examinations by the NRA, which has high levels of expertise and independence, is reasonable."

The court also endorsed the NRA's assessment that the two reactors had cleared the safety standards, saying there are no "unreasonable elements in the judgment."

The court also turned down local residents' request for an injunction against the restarts of the No. 3 and No. 4 reactors at Kansai Electric's Oi plant, also in Fukui Prefecture, saying, "It cannot be said that the restarts are imminent."

In April, the court pointed out that as many as five earthquakes exceeding the design basis earthquake ground motion (DBEGM) levels had occurred at four nuclear plants since 2005. The DBEGM serves as a benchmark for quake-resistant design of a nuclear plant. It also referred to the fact that spent nuclear fuel stored in pools at the Takahama plant were not placed in sufficiently sturdy facilities.

The latest court decision dismissed all these safety concerns, saying, "The danger is controlled to an extent where it can be ignored in light of socially accepted standards."

In 1992, the Supreme Court handed down a ruling that set a precedent for cases involving technical issues related to nuclear power generation. In ruling over a lawsuit concerning Shikoku Electric Power Co.'s Ikata nuclear power plant, the top court said the judiciary should respect opinions of nuclear experts and refrain from making judgments about highly technical issues that require expert knowledge unless there are clearly errors in safety checks that are too serious to be overlooked.

The Dec. 24 court decision is in line with the Supreme Court ruling.

But the meltdowns at the Fukushima plant took place while the judiciary continued making decisions on related issues under this framework.

A severe accident at a nuclear power plant could cause immeasurable damage in wide areas for a very long time.

The latest court decision, which seems to leave the judgment to experts and be based on the assumption that serious accidents seldom occur, blatantly disregards the fact that unexpected accidents could happen.

This has been an important viewpoint in debate on the future of nuclear power generation in this nation since the March 11 disaster.

Kansai Electric Power has argued that **each day of delay in the restarts of the two reactors at its Takahama plant costs the company about 400 million yen (\$3.27 million) in losses.**

With the removal of the judicial block to the resumption of the two reactors, the process of bringing them back online will accelerate.

But the utility should not forget that many Japanese people cast critical eyes on nuclear power generation. **When electric utilities plan to restart idled reactors, they seek consent only from the prefecture and the municipalities that host their plants.**

But parts of Kyoto and Shiga prefectures are also located within 30 kilometers from the Takahama nuclear plant. Utilities should widen the scope of local communities from which they seek consent to restart reactors.

There has also been **insufficient debate on the risk posed by a concentration of nuclear power plants in Fukui Prefecture.**

Neither the government nor electric utilities must be allowed to forge ahead with any plan to restart reactors without addressing all these safety concerns.

TEPCO refuses to pay for decontamination as agreed

December 28, 2015

TEPCO refusing to pay for decontamination work planned since end of FY '13

<http://mainichi.jp/english/articles/20151228/p2a/00m/0na/010000c>

Tokyo Electric Power Co. (TEPCO), the operator of the tsunami-ravaged Fukushima nuclear plant, has refused to foot the costs of decontamination work that has been planned and conducted after a December 2013 Cabinet decision, it has been learned.

The Environment Ministry is poised to demand money it is expected to spend on decontamination of areas with high radiation levels -- where the government has deemed that it is difficult for residents to return in the foreseeable future -- from TEPCO. The ministry began this year to decontaminate such an area in the Fukushima Prefecture town of Okuma, but there is no prospect that TEPCO will foot some 20 billion yen in the costs of the work that the ministry will temporarily shoulder.

As the Environment Ministry is in conflict with the Economy, Trade and Industry Ministry that supports TEPCO's position, a massive amount of taxpayers' money is being invested in such work without clarifying who should bear the expenses.

The Act on Special Measures concerning the Handling of Environment Pollution by Radioactive Materials, which was enacted in the wake of the March 2011 nuclear crisis, requires TEPCO to "try to swiftly pay for decontamination when and if demanded."

Moreover, the guidelines for Fukushima recovery, approved at a Cabinet meeting on Dec. 20, 2013, state that the government should demand that TEPCO foot the expenses of decontamination and the construction of temporary storage facilities for radioactively contaminated waste that were implemented or being planned. However, the guidelines do not mention whether TEPCO should be required to pay the costs of decontamination and relevant projects that were not being planned when the guidelines were approved.

According to the Environment Ministry, TEPCO has agreed to foot the costs of decontamination in "difficult-to-return" zones, which was performed on a trial basis before the Cabinet approved the guidelines. However, TEPCO has refused to pay for decontamination of main roads in such zones on the grounds that the utility is not obligated to pay for these projects, which were conducted after the Cabinet decision.

Hiroshi Ono, head of the Environment Ministry's decontamination and temporary storage planning coordination team, has raised questions about the utility's response.

"It's unreasonable to decide whether to pay for the costs depending on whether decontamination was planned before or after the Cabinet decision, although decontamination is based on the same special measures law," Ono said. "We understand that we can demand payments for decontamination of the difficult-to-return areas."

However, the economy ministry's Agency for Natural Resources and Energy takes a different position. "The Cabinet decision doesn't state that the government can demand the costs for decontamination that was not part of the original plan. We've instructed TEPCO to follow the Cabinet decision," said an agency official.

An official of TEPCO's public relations division said, "We'll respond to the matter in accordance with the special measures act, the nuclear power accident compensation system and the 2013 Cabinet decision, while listening to explanations from concerned ministries and agencies and consulting with them."

Since the government has decided that TEPCO must foot the costs of decontamination, the 32 trillion yen which will be set aside for disaster recovery projects over a 10-year period does not include decontamination costs. Therefore, if TEPCO refuses to pay for decontamination costs, the government will be forced to secure additional resources.

"The Environment Ministry and the Agency for Natural Resources and Energy should hold negotiations to draw a conclusion on the matter," said a senior Finance Ministry official.

The Environment Ministry has demanded TEPCO foot a total of 381 billion yen in decontamination costs on 12 occasions, and the power company has basically complied with the demands, paying 350.5 billion yen of the amount so far.

The decontamination work in Okuma is the first in the difficult-to-return zones. The work began in summer this year and is scheduled to be completed at the end of this fiscal year. The cost of decontaminating 95 hectares in the town is estimated at over 20 billion yen.

The town of Okuma is asking for decontamination of the remaining 305-hectare area while the towns of Futaba, Namie and Tomioka as well as other local bodies in the prefecture are requesting full-scale decontamination.

How much "aid" all in all for TEPCO?

December 28, 2015

Vague language left gov't on hook for nuke disaster cleanup costs, but for how much?

<http://mainichi.jp/english/articles/20151228/p2a/00m/0na/011000c>

The total cost of dealing with the Fukushima nuclear crisis, including compensation payouts and building mid-term waste storage facilities, is set to clock in at a staggering **11 trillion yen**. How much of that will end up being paid by the Japanese government? How much "aid" is TEPCO going to get, all told? Different government ministries and agencies have different ideas about where to draw that line, as do various figures in the ruling parties, so **the upper limit remains fuzzy**. And this lack of certitude has produced its own, new problems.

In November 2013, the ruling parties put together recommendations for how much of the nuclear disaster cleanup bill should be left to TEPCO. There were some in the parties who called for a new special measures law to be passed that would provide state funds for decontamination and other work. With public opposition brewing, however, in the end the parties said only that "the handling of operations after the present decontamination plans have been implemented will be considered from a public works perspective."

More than two years later, however, we still do not know if that "handling of operations" means decontamination work itself, or some other variety of environmental improvement. In fact, interpretations differ even among the lawmakers who thought up the 2013 recommendations, with some saying that "decontamination should be a public works project," and others declaring that "cleanup work should, as a basic principle, be TEPCO's responsibility."

The government appeared to accept the recommendations, and incorporated them -- and the uncertain statement about who was going to pay for unplanned cleanup work -- into Fukushima Prefecture recovery guidelines passed by Cabinet decision in December 2013.

The core of the matter is the growing desire to clean up the towns of Okuma and Futaba, hosts to the stricken Fukushima No. 1 nuclear plant and whose central parts have been designated as "hard to return" zones. According to one senior government official involved, **"There was no debate about how to view decontaminating the difficult to return zones, and so the question of who would bear the cost was just left up in the air."** The 2013 Cabinet decision furthermore does not specify what counts as "planned decontamination work."

So, if the government isn't going to bill TEPCO for "unplanned" decontamination work, where is the money going to come from? The government bears a heavy responsibility for pushing debate on this question down the road.

Takahama restart based on "unmet conditions, weak promises"

December 28, 2015

EDITORIAL: Approval to restart Takahama reactors based on unmet conditions, weak promises

<http://ajw.asahi.com/article/views/editorial/AJ201512280015>

The Fukui District Court recently nullified its earlier injunction against reactivating the No. 3 and No. 4 reactors of the Takahama nuclear power plant in Fukui Prefecture.

Kansai Electric Power Co., operator of the nuclear plant in the town of Takahama, is expected to restart one of the two reactors as early as late January.

But the procedure for obtaining the approval of the hosting government of Fukui Prefecture, which was completed immediately before the court decision, was laden with problems. We oppose moves to press ahead with the planned restarts under the current circumstances.

Fifteen nuclear reactors are concentrated in Fukui Prefecture, including some for which decisions have been made for decommissioning.

Fukui Governor Issei Nishikawa set five conditions for his approval, calling on the central government and Kansai Electric to clearly pinpoint their responsibilities.

Public opinion has consistently been cautious about restarting nuclear reactors following the 2011 disaster at the Fukushima No. 1 nuclear plant. Nishikawa called strongly on the central government to “promote public understanding,” and he obtained Prime Minister Shinzo Abe’s assurances that he will ensure that meetings with residents will be held across Japan for that purpose.

The governor called on Kansai Electric to precisely explain when it plans to build an interim storage facility outside Fukui Prefecture for spent nuclear fuel. The utility said in November that it will locate the site for the facility around 2020 and have it operational around 2030.

Nishikawa said he believes that all his conditions have been met. But the substantiality of those commitments remains questionable.

Kansai Electric has said it hopes to install an interim storage facility somewhere in the Kansai region, and it has long been canvassing local governments for their understanding. But resistance to hosting such a facility remains strong, and the building site is not likely to be selected any time soon. There is no denying suspicions that the plan could end up as an empty promise.

Questions also remain on the extent to which Nishikawa has fulfilled his own responsibilities.

He has never had the prefectural government organize meetings with local residents, saying it is up to the central government and the plant operators to explain the safety and necessity of nuclear plants.

An emergency evacuation plan for areas within a 30-kilometer radius of the Takahama nuclear plant was only worked out earlier this month. That zone contains parts of Kyoto and Shiga prefectures and has a total population of about 180,000.

But Nishikawa approved the planned restarts without waiting for a drill held across prefectural borders, arguing that working out an emergency evacuation plan is not a legal requisite for restarting a nuclear reactor.

Obtaining the host communities’ approval for a reactor restart should primarily be a process to enhance the safety and peace of mind of local residents.

It is all too regretful that another undesirable example has been set, following the earlier approvals to restart the Sendai nuclear power plant in Kagoshima Prefecture and the Ikata nuclear power plant in Ehime Prefecture.

The central government was also quite candid in postulating that restarting nuclear reactors is a foregone conclusion. Industry minister Motoo Hayashi visited Fukui, the capital of Fukui Prefecture, four days before the court decision to ask Nishikawa for his approval.

The local governments and residents of communities adjacent to nuclear plants are strongly dissatisfied that they have no say in decisions on reactor restarts. Kansai Electric has rejected the demands of the Kyoto and Shiga prefectural governments for inclusion on the list of “hosting communities,” whose approvals are required for restarting reactors of the Takahama nuclear plant. The central government has only been looking on, arguing that approvals of the hosting communities are not a legal requirement.

Abe has said he will provide explanations to gain the public’s understanding of the importance of nuclear power generation. That leads us to believe that he should also be presenting guidelines on the extent and coverage of the “hosting communities,” whose approvals are necessary for nuclear restarts.

This article dates a bit (last July) but things haven't changed that much since at Fukushima.

View from Inside Fukushima Prefecture: Vastly Different from Govt. Pronouncements

<http://fukushimaupdate.com/view-from-inside-fukushima-prefecture-vastly-different-from-govt-pronouncements/>

July 9, 2015

translation services

by Robert Hunziker / ukprogressive.co.uk / July 8, 2015 /

Because of Japan’s unconscionable open-ended new secrecy law, it is very likely journalism in the nation has turned tail, scared of its own shadow. Nevertheless, glimmers of what has happened, of what is happening, do surface when brave people come forward.

On May 22nd 2015 Hiromichi Ugaya, a photojournalist who is well-informed, insightful, and engaging, was interviewed about what he witnessed in the aftermath of one of the world’s most horrendous disasters. Hiromichi Ugaya was born in Kyoto City, Japan in 1963. He is an accomplished photojournalist with experience in both Japan and the United States, receiving his bachelor’s degree at Kyoto National University and his master’s degree at Columbia University.

Naïveté of Public

Hiromichi first visited Fukushima within two weeks of the disaster, and he has returned nearly 50 times to photograph scenes. His is a personal mission because the tragedy does not receive adequate media coverage. According to him, very few journalists cover the aftermath; television in Japan has lost interest; the public is blasé and dangerously naïve; Japanese publishers do not entertain stories about Fukushima, and the mainstream media in Japan ignores the impact of the aftermath.

Curiously, it’s as if a news blackout has been covertly instituted, and maybe it has. What people do not see, do not hear becomes invisible, out of sight out of mind, similar to the after-effects of radiation exposure, which are not felt, not smelled, not tasted, not physically recognized by people, until it’s too late, until it’s too late, until it’s too late.

Then again, maybe The Act on the Protection of Specially Designated Secrets, Act No. 108 promulgated on December 13, 2013 is quelling public opinion?

According to a leading Japanese newspaper, the law “almost limitlessly widens the range of what can be considered confidential,” and the new secrecy law allows bureaucrats and politicians to “designate state secrets to their liking,” Nobuyuki Sugiura, Managing Editor, Tokyo Head Office, *Asahi Shimbun will continue to respond to the public's right to know*, The Asahi Shimbun, December 7, 2013.

Those who leak state secrets face up to 10 years in prison.

And, repeating that standardized rule: Bureaucrats and politicians can “designate state secrets to their liking.” Is this a world's first? Does this mean that bureaucrats and politicians can determine the fate of anybody and/or everything?

In the face of cowardly authoritarianism, history teaches lessons of harsh reality, for example, Chernobyl is an example of the long-term tragedy associated with nuclear accidents, thirty years later, nearly one million dead (source: Alexey V. Yablokov, Center for Russian Environmental Policy, Moscow, *Chernobyl: Consequences of the Catastrophe for People and the Environment*, The New York Academy of Sciences, Vol. 1181, December 2009).

Chronicling the first four years of Fukushima, Hiromichi Ugaya composed a photo book about the tragedy as a personal countermeasure to widespread public apathy: *Portrait of Fukushima: 2011-2015: Life After Meltdown*, which is a treasure trove of over 200 unpublished photos, telling the story from the beginning to the present.

Regions of Fukushima persist ghostlike: “America Tonight journeyed to the affected areas, which are separated into zones of higher and lower radiation risk. In the hardest-hit area, known as the “exclusion zone,” the streets remain virtually empty, eerily silent and frozen in time at the moment residents fled the quaking earth and incoming sea. The garbage and debris that litter the area defy the kempt and pristine neighborhoods for which Japan is famous,” Michael Okwu, *Inside Fukushima's Ghost Towns*, Aljazeera America, Jan.6, 2014.

An Insider's Story- the interview

The government's initial reaction to the disaster is scandalous. According to Hiromichi, the authorities should have been “more open to the public.” Because of failure to communicate the danger, unnecessary radiation exposure was widespread. Minimal information was provided and evacuations were delayed much too long.

In essence, he believes the authorities were probably concerned about public panic. Regrettably, that concern may serve to haunt and endanger lives for many years. For example: “The most serious leakage of radiation took place March 15th, which was day-five of the nuclear accident, but still, within the radius of 10-20 kilometers, many citizens were still there... They were exposed to the radiation. The number of the people who got exposed to the radiation comes up to like 230,000, which is ten times bigger than Three Mile Island of 1979. So, it's huge and all the population on Fukushima, two million, have to go for medical checks every year.”

Hiromichi suspects an outbreak of thyroid cancer over the next few years. Already, according to local reports, 107 cases of thyroid cancer have been confirmed. Yet, the gestation period for radiation's effect is 5-40 years. And, this is only the fourth year.

He believes the Japanese people are not well informed. They only see the limited thyroid cancer cases so far even though those are merely an early harbinger, only foreshadowing the beginning of a long process of widespread complications for years to come. As well, it is doubtful people want to face the brutal truth; avoidance is an easy way out when fear reigns supreme.

Additionally, it is likely that widespread health problems will occur well beyond the limits of Fukushima Prefecture. The radioactive plume traveled notably beyond the immediate area. In March, in the immediate aftermath of the explosions, the plume traveled to Tokyo. "The area between Fukushima and Tokyo has some huge hotspots. In the northern Tokyo metropolitan area, also huge hotspots. Over the eastern region of Japan, the radioactive plume spread across a huge area."

Hiromichi met with families of Fukushima Prefecture. The accident triggered bizarre behavior amongst families and within communities. The first reaction of family members was to evacuate their children to the next prefectures. But, complications arose, for example, "The problem happened because... first fathers tried to evacuate with their families... in those places where the evacuees reached, the fathers could not find a job. So, the fathers went back to their hometowns to their former jobs although the hometown was contaminated."

The families of Fukushima squabbled and divided over issues of whether to leave their homes, sometimes leaving behind stubborn family members who refused to leave their lifetime residence. As well, entire communities divided into camps of pro-evacuation versus anti-evacuation, leading to conflict, arguments with old friends labeled as traitors.

Along the way, people experience horrible depression, drinking problems, headaches, vomiting, and loss of appetite, symptoms which are outside of physical normality.

Hiromichi's story leaves one dangling, wondering what's to become of the tens of thousands who are homeless to this day, what happens to those who live in fear, to the depressed who now view life as meaningless. And, to those who have already returned to fringe areas.

His is the inside story, the bitter truth behind the recklessness inherent within the complexity of nuclear power generation, toying with enormous untamed power, like wild horses on the plains, originated from $E=mc^2$.

Still, to this day, purportedly, "More people have died from stress-related causes than from the initial disasters in Fukushima," Alexis Dudden, professor of history, University of Connecticut, *The Fourth Winter of Fukushima*, Truthout, Jan. 4, 2015.

Beyond that, as time marches on, it is almost certain to bring on a perniciousness of cancer-related complications of unconscionable consequence, look at Chernobyl (1986) where to this day, in the still-contaminated villages and towns of Ukraine and Belarus children are horribly deformed without torsos and babies genetically mutated born without thighs or without fingers and where the "Chernobyl necklace" or thyroid cancer is universally widespread (Source: John Vidal, *Nuclear's Green Cheerleaders Forget Chernobyl at Our Peril*, The Guardian, April 1, 2011). It's 30 years later, and it continues!

The Health Impact

Green Cross International, which is committed to phasing out nuclear energy worldwide, issued a report d/d March 9, 2015: *Fukushima Daiichi Power Plant Disaster: How many people were affected? 2015 Report*. According to Adam Koniuszewski, Chief Operating Office of Green Cross International: "Our local presence and ongoing activities to help the communities... gives us a first-hand experience of the human and environmental consequences of nuclear disasters."

Mikhail Gorbachev, former Communist Party General Secretary, formed Green Cross International in 1993. According to the former Soviet Union President and Nobel Peace Prize laureate: "We are facing a global environmental crisis, a conflict between man and nature," Alexei Yablokov, *Heroes of the Environment*, Time Magazine, October 17, 2007. Chernobyl happened on his watch.

Estimates of radiation fallout, as obtained by Green Cross Int'l, show that 80% of the released radiation was deposited in the ocean and the other 20% dispersed within a 50 km radius. Over time, the overall risk of cancer will increase, especially for children at risk for entire lifetimes.

“Approximately 32 million people in Japan are affected by the radioactive fallout from the nuclear disaster in Fukushima.”

“The number of deaths from the nuclear disaster attributed to stress, fatigue and hardship of living as evacuees is estimated to be around 1,700 so far.”

So it goes, the long reach of radiation exposure is only starting as the gestation period runs 5-to-40 years. Not only that but the Fukushima Power Plant is still white hot, very hot. Despairingly, the melted core is somewhere inside of or outside of the nuclear containment vessels, nobody knows where, an enormous problem riddled with unforeseen danger for the environment, for humanity, maybe forever.

Why is Japan brazenly restarting nuclear power plants in the face of Fukushima’s continuing calamity, a tragedy that has only just started?

Underage workers to clean Fukushima?

January 5, 2015

Labor shortage sucks underage workers into Fukushima nuclear cleanup

<http://mainichi.jp/english/articles/20160105/p2a/00m/0na/016000c>

It was the spring of 2015, and a 37-year-old construction company owner in Fukushima Prefecture got a call on his phone from an unknown number.

"Can you use me again?" the person on the other end said, the voice tugging at the man's memory. Ah, that's right. It was a young man who'd worked for him about two years before, doing decontamination work near the Fukushima No. 1 nuclear plant. The problem was, the worker had only been 17 at the time. It was July 2013 when the man was arrested on suspicion of violating the Labor Standards Act, which states that it is illegal to assign dangerous work to anyone under the age of 18. Cleaning up a nuclear

disaster zone certainly qualified. The then 17-year-old was one of four underage workers -- all aged 16 or 17 -- in the man's cleanup team, eventually bringing the police to his door.

At the time, the man was working for a construction firm owned by his foster father, leading decontamination teams in the field. He looked at his roster of workers, but saw no problems with the ages that went along with the names. The birthdays listed put all the workers safely above 18; they'd been falsified on the orders of the man's foster father. The man himself did not know this, and so was not indicted. His foster father, however, was arrested and found guilty of labor standards violations.

The formerly under-age worker on the phone, now 20, showed no signs he was upset over the events of 2013. The man told the youth that, if he was willing to work hard, he'd give him a shot at the man's firm, founded after the arrests about two years before.

The cleanup effort began in earnest in summer 2012, a little more than a year after the March 2011 triple-meltdown at the nuclear plant. Virtually the entire construction sector in Fukushima Prefecture became involved in the work, starting with major construction firms who actually took the work orders and then fed them into a vast trickle-down pyramid of subcontractors. The man's foster father's firm was one such subcontractor, taking work that had already been subcontracted three or four times already -- a practice that does not officially exist. With these hand-me-down contracts in hand, the foster father's firm recruited workers.

The 37-year-old man planned out the jobs and also spent a lot of time on-site, even in high radiation areas. His dosimeter beeped so relentlessly that it became just another background noise, and he began to ignore it. He regularly took his mask off outside to drink, and walked into the vehicle serving as a break room -- an area that is supposed to be hermetically sealed from the outside air -- without changing out of his protective suit.

The man thought that some members of his team -- the four boys under 18 -- looked a little too young, and though he had doubts about the birthdays listed on the worker roster, he didn't investigate further. If the firm was found employing under-age workers, it would have to report the violation to the contractor above it, which could impact future orders. The man kept his suspicions to himself.

His July 2013 arrest apparently came after one of the boys submitted a complaint to authorities. At the time, the national government was offering regular nuclear cleanup workers per diem wages of between 21,700 yen and 25,000 yen. Once a work order had trickled down from the primary contractor through the layers of subcontractors, however, the workers actually on the ground never saw the full amount. The men in the 37-year-old's cleanup team were being paid less than a third the official wage. It seems the boy who reported the man had grown frustrated with his paycheck.

All the men on the team applied freely for the job. From his detention center cell, the man's foster father wrote him a letter saying, "We have to be very thorough when it comes to (worker) ages. I've learned a lot from this." The man also came to the realization that, as adults, they had to act responsibly.

Across Fukushima Prefecture, some 30,000 people go to work at decontamination sites every day. The companies, always short of workers, as well as the workers themselves have for the most part become numb to the dangers of radiation. Most of the underage workers at the man's foster father's firm said they wanted to stay on even after their employer's arrest. The Japanese Constitution urges caution on youth labor, but the reality on the ground is a far cry from the constitutional ideal.

Child and youth labor has a storied history in Japan. In the Meiji period, groups of child laborers in match and textile factories included kids under the age of 10. From 1911 on, the law was slowly updated to ban employment of children under 12, though loopholes for apprentice nursemaids and other jobs remained. The student mobilization of World War II saw children return to factories in large numbers, churning out weapons and ammunition for the war effort.

All this led to a ban on child exploitation being included in the postwar Constitution, while the minimum employment age was raised to 15 in the 1947 labor standards law, which also forbade dangerous work for anyone under 18.

The 37-year-old man himself joined the workforce as a teenager. His mother died when he was in the first grade, and he never knew his father. After his mother's death, his grandmother took him in and raised him, but she, too, passed away when he was 16. He dropped out of high school after just two months and became a construction worker. Looking around at other people his age spending their time enjoying themselves, he decided that the only way to win in life was with money and qualifications, and he threw himself into work.

In April last year, the man started his own company with seven employees. Among them was the young man who had called him. The 20-year-old, saying he wanted a high salary, went to work in the still evacuated town of Namie. The man told him the radiation was high in Namie, but his young employee said he didn't care. If the youngster was so keen, the man thought, he'd give him the work he wanted, as well as a monthly salary topping 300,000 yen. It was the most he could pay for a young worker.

The man's 17-year-old son quit a vocational school and also went into construction, working at a different firm than his father's. The boy isn't involved in the decontamination, but his company has been subcontracted to do many nuclear cleanup jobs, which worries his father. In the dying days of 2015, the man called up his son and told him he should become a painter. It didn't cost much to get into and he could start his own business relatively quickly. His son said he'd think about it.

Rokkasho: 2.94 trillion yen

January 5, 2015

Japan's ¥2.9 trillion nuclear recycling quest coming up on three decades

<http://www.japantimes.co.jp/news/2016/01/05/national/science-health/japans-%C2%A52-9-trillion-nuclear-recycling-quest-coming-three-decades/#.Vou8V1IR-ov>

by Emi Urabe and Stephen Stapczynski
Bloomberg

It's designed to recycle spent uranium from Japan's nuclear power plants, consists of more than three dozen buildings spread over 740 hectares, costs almost ¥3 trillion and has been under construction for nearly three decades. The amount of fuel successfully reprocessed for commercial use: zero.

Under construction since the late 1980s, the complex is designed to turn nuclear waste into fuel by separating out plutonium and usable uranium. The start date of the project has now been pushed back for the 23rd time, with operations set to commence in 2018.

The money continuing to pour into the Rokkasho reprocessing complex in Aomori Prefecture is raising speculation that attention is being diverted from more-promising avenues of energy development, including renewables.

“Reprocessing is an idea that seemed good to many in the nuclear industry when it was first proposed, but with time and experience has proven to be uneconomical,” M. V. Ramana, a professor at Princeton University’s Nuclear Futures Laboratory, said by email. “There is a lot of sense in the idea that Japan should just cut its losses and stop trying to get this plant to operate.”

The idea for Rokkasho can be traced to the 1960s when the government decided to pursue a “closed nuclear fuel cycle” — a system which would allow resource-poor Japan to recycle old fuel in order to reduce import dependence and insulate itself from fluctuating prices.

The insistence on developing a closed fuel cycle has diverted funds, as well as generations of scientists and engineers, from renewables and other alternatives, according to Ramana.

“From the point of view of a nation with few natural resources, completion and stable operation of the nuclear fuel cycle is extremely important,” said Makoto Yagi, chairman of Japan Nuclear Fuel Ltd., which operates the facility.

Construction of the Rokkasho facility, the heart of the endeavor, was supposed to be completed by 1997. Delays due to technical and safety issues have kept it from operating commercially while costs ballooned to an estimated ¥2.94 trillion, according to Japan Nuclear Fuel.

The government and the country’s power industry view fuel reprocessing generally, and the project in Rokkasho specifically, as one of the only ways to lower import dependence and find a home for thousands of tons of highly radioactive spent fuel.

The facility was originally intended to separate plutonium from spent fuel for use in so-called fast-breeder reactors — plants that produce more fuel than they consume.

While Monju, the nation’s first prototype fast-breeder reactor, has remained closed due to its own technical issues, Rokkasho expanded construction to include a facility that processes plutonium-uranium mixed-oxide fuel, known as MOX, that can be used in some of Japan’s existing reactors.

In its most-recent delay, Japan Nuclear Fuel announced in November that commercial startup of its plutonium reprocessing facility would be delayed to 2018 due to post-Fukushima safety requirements.

Start of the MOX facility was delayed to 2019.

Even when reprocessing begins, the recycled fuel won’t be any cheaper than uranium, which has slumped about 49 percent on the spot market since the March 2011 Fukushima crisis.

“In the short term, recycling is not economically advantageous,” Dale Klein, former chief of the U.S. Nuclear Regulatory Commission, said in an interview in Tokyo. “But it does things like reduce your volume” of spent fuel.

Restrictions on Fukushima food imports to EU to be eased

January 7, 2015

EU to ease rules on Japanese food imports

<http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html>

Jan. 7, 2016 - Updated 10:23 UTC+1

The European Union this week will ease restrictions on food imports from Japan that were introduced in the aftermath of the Fukushima Daiichi nuclear accident in 2011.

The restrictions require Japan to conduct radiation checks on food products from Fukushima Prefecture and neighboring areas before they can be shipped to EU countries.

The European Commission decided on Wednesday to lift those measures for certain products, if their radiation levels have stayed below safety limits long enough. The changes will take effect on Saturday.

Almost all of the agricultural goods from Fukushima will be exempted, such as vegetables, buckwheat, tea, beef and other meat products, and fruits other than persimmon.

In addition, all food products from Aomori and Saitama, as well as rice and soybeans from 6 other prefectures in northeastern Japan will be exempted.

Japanese government officials say they will work to have the remaining restrictions lifted as soon as possible.

Nuke taxes

January 7, 2015

Genkai mayor asks Kyushu Electric to pay tax on spent nuclear fuel

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201601070028>

THE ASAHI SHIMBUN

GENKAI, Saga Prefecture--Kyushu Electric Power Co. indicated it was willing to pay a new tax on spent nuclear fuel stored at its Genkai nuclear plant to help the town recover lost revenue from reactor shutdowns.

Genkai Mayor Hideo Kishimoto on Jan. 6 asked Kyushu Electric Power President Michiaki Uriu to accept the tax plan, which would provide Genkai with about 300 million yen (\$2.5 million) in new tax revenue annually.

Kyushu Electric Power is seeking to resume operations of the No. 3 and No. 4 reactors at the Genkai plant, but it has also decommissioned the No. 1 reactor. Having that reactor offline has hurt Genkai's municipal treasury.

After the meeting at the town government hall, the mayor told reporters that Uriu appeared prepared for the new tax because a similar levy has been imposed by Satsuma-Sendai city in Kagoshima Prefecture.

Kyushu Electric Power operates the Sendai nuclear power plant there.

Kishimoto said he holds two views on when the new tax would be imposed: as soon as possible or after the Genkai reactors are restarted.

“Although Kyushu Electric Power has moved into the black with the Sendai plant back in operation, it is only a small amount,” Kishimoto said. “They are saying their profit margin will not recover unless the Genkai plant also resumes operations, so they may not have the leeway right now.”

For his part, Uriu told reporters: “While I understand the need from the standpoint of the fiscal condition of the town government, I also asked for the town government’s understanding about the extremely difficult nature of our own fiscal condition. We want to work out the details, including the actual tax rate.”

When the four reactors at the Genkai plant were running, the town government’s fiscal condition was so robust that from fiscal 1995, it did not need any handouts from the central government in the form of ordinary tax subsidies.

At that time, a major portion of the town’s revenues came in the form of taxes paid by Kyushu Electric Power for both operating the nuclear reactors and for property taxes on the land where the plant is located.

Some of those revenues are based on the amount of electricity generated, so the town’s tax revenues plunged after the Genkai reactors were taken offline for safety reasons following the 2011 accident at the Fukushima No. 1 nuclear power plant.

The tax that Kyushu Electric Power pays Satsuma-Sendai city for spent nuclear fuel works out to about 390 million yen a year, based on a tax rate of 250,000 yen for each fuel assembly.

Reprocessing: "There is no option to call it off"

January 7, 2016

Nuclear Watch: 'Nursing care plan' for nuclear plants (Pt. 60)

<http://mainichi.jp/english/articles/20160107/p2a/00m/0na/005000c>

The Akatsuki Maru vessel that transported 1 metric ton of plutonium from France to Japan is pictured in this photo taken at a port in Tokai, Ibaraki Prefecture, on Jan. 5, 1993. (Mainichi)

Many of those involved in nuclear power say the electric power industry appears to have no intention to "die with the nuclear fuel cycle project."

The Nuclear Regulation Authority (NRA) recommended on Nov. 13, 2015, that the Japan Atomic Energy Agency (JAEA) be replaced by another entity as the operator of the trouble-plagued prototype fast-breeder reactor Monju.

Three days later, Japan Nuclear Fuel Ltd. (JNFL), which was founded on the initiative of the electric power industry, announced that the completion of its nuclear fuel reprocessing facility under construction in Rokkasho, Aomori Prefecture, will be delayed by about two years to the first half of 2018.

These two core facilities in the nuclear fuel cycle project, in which nuclear fuel spent at atomic power stations is reprocessed and reused in nuclear reactors, are in difficult situations.

In spring this year, electric power retail will be fully liberalized. Since consumers will be allowed to freely select electric power suppliers, competition between utilities is expected to intensify, which could cause the profits of electric power companies to decline. As such, the nuclear fuel cycle project is becoming increasingly burdensome for power companies as there are no prospects that the project will be put into practical use in the foreseeable future.

Nevertheless, Toichi Sakata, former vice minister at the Education, Culture, Sports, Science and Technology Ministry, has ruled out the possibility that the government will abandon the project.

"There is no option to call it off," says Sakata, 67, who was involved in the operation of the Akatsuki Maru vessel that transported plutonium from France to Japan.

This is not only because over 2 trillion yen has been spent on the project but also because the Aomori Prefectural Government would certainly demand that some 3,000 metric tons of spent nuclear fuel stored at the reprocessing facility be removed from the prefecture if the project were to be discontinued.

About 70 percent of pools for spent fuel at nuclear plants across the countries are filled, and they do not have enough capacity to store spent nuclear fuel if returned. The abandonment of the nuclear fuel cycle project could force electric power companies to suspend their nuclear power generation, which is a highly profitable business, causing great confusion.

The Economy, Trade and Industry Ministry took action in response to the situation. **At a meeting of experts on Nov. 30, the ministry decided to set up an entity to supervise JNFL. By establishing a system to force electric power companies to engage in processing spent nuclear fuel, the national government showed its determination to continue the nuclear fuel cycle project. This may be a sign that Japan's atomic energy policy, in which private companies operate nuclear plants under national policy, will shift into one in which the government supervises atomic power business based on its own policy.**

"It's so-to-speak a plan on 'nursing care' for atomic power stations," says Hitoshi Yoshioka, professor at Kyushu University.

Yoshioka points to the possibility that the accounting system and the system of paying compensation in case of a nuclear accident will be reformed and that a system similar to one under which utilities must buy electric power generated with renewable energy at fixed prices will apply to nuclear power.

The Economy, Trade and Industry Ministry has urged power companies to build more facilities to store spent nuclear fuel. In response, electric power companies announced on Nov. 20 last year that they will build such facilities with a total capacity of 6,000 tons, a 30 percent increase from the current capacity, by sometime around 2030. (By Haruyuki Aikawa, Senior Writer)

TEPCO makes plans to retain customers

January 7, 2015

Tepco unveils loyalty tie-ups in bid to retain household customers

<http://www.japantimes.co.jp/news/2016/01/07/business/corporate-business/tepcu-unveils-loyalty-tie-ups-bid-retain-household-customers/#.Vo-POVIR-ot>

by Kazuaki Nagata

Staff Writer

With the retail electricity market set to be deregulated in April, Tokyo Electric Power Co. on Thursday unveiled a range of new price plans that offer discounts to customers who sign up with specific partners. The revamp, which involves third-party suppliers from the gas, communication and entertainment sectors, is an attempt to retain customers. Tepco has tens of millions of them, but from April many may desert it for cheaper competitors.

Tepco's new offers are designed to appeal to a wide range of users. **Signing a package plan with both Tepco and Nippon Gas Co., a provider of household gas, will yield an annual discount of about ¥6,000. And SoftBank Corp. plans to grant discounts to its mobile phone subscribers if they choose Tepco for their power,** although details have yet to be announced.

Other partners include Internet access provider So-net Corp., cable music distributor Usen Corp. and consumer electronics retailer Bic Camera.

The utility said it will launch a **loyalty incentives program** under which users receive five points per ¥1,000 of utility charges. One point is worth ¥1.

The points can be moved to two other loyalty programs, T-point, operated by Culture Convenience Club Co., and Loyalty Marketing Inc.'s Ponta.

Tepco said users will be able to pay electricity bills with points from the spring of 2017.

Tepco said it will provide four basic plans, naming them standard, premium, smart life, and night.

It said the standard plan is similar to existing rates, but that users can benefit from the use of points.

The premium plan, which the firm recommends for people who use a lot of power, has a fixed monthly fee of ¥9,700, and if users exceed consumption of 400 kWh per month, an additional ¥29.04 per 1 kWh is charged.

Until now, Tepco has had a stranglehold on power supply in the Kanto area because Japan assigned specific regions to monopolies, citing the need to ensure a stable supply.

Competition from April is already apparent. Last month, new entrant Tokyo Gas announced the prices it will charge for households that switch over. It will be the company's first foray into household power supply.

Moreover, regional utilities will be able to sell electricity outside their traditional areas of operation.

Tepco plans to enter Kansai.

TEPCO's luring tactics

January 8, 2016

TEPCO to drop electricity rates to lure customers after deregulation

<http://mainichi.jp/english/articles/20160108/p2g/00m/0bu/009000c>

TOKYO (Kyodo) -- Tokyo Electric Power Co. said Thursday that it will lower electricity rates by up to about 6 percent in April in a bid to attract customers as the deregulation of the retail electricity market in Japan is set to spark fierce price competition.

The power company will cut the monthly house-use electricity rate for a four-person household to 19,100 yen (\$162), for example, if a customer signs up for a two-year power service contract by the end of March. The new price will be lower than the current 20,300 yen and also 3 to 5 percent cheaper than rates offered by Chubu Electric Power Co. and Kansai Electric Power Co. TEPCO plans to sell electricity in central and western Japan -- the markets currently monopolized by the two rivals.

At present, Japan's regional power firms can sell electricity to retail customers only in their respectively designated areas.

But the market barriers will be lifted when the liberalization of the retail market starts in April, opening up opportunity to firms not traditionally in the power business.

The deregulation will spur tough price competition and put a major power firm like TEPCO at risk of losing customers to new rivals.

Fukushima foods: EU eases restrictions

January 9, 2016

EU due to start easing restrictions on food imports from Fukushima

<http://www.japantimes.co.jp/news/2016/01/09/national/eu-due-start-easing-restrictions-food-imports-fukushima/#.VpDoHFIR-ot>

Kyodo

The European Union will start easing restrictions Saturday imposed on Japanese food imports over the Fukushima nuclear disaster, including vegetables and beef produced in the prefecture, the farm ministry said.

Tsuyoshi Takagi, Cabinet minister in charge of rebuilding from the March 2011 quake, tsunami and nuclear crisis, on Friday welcomed the bloc's decision. At present, all food items from Fukushima except alcoholic beverages must be shipped with radiation inspection certificates.

That requirement will be removed for vegetables, fruit excluding persimmons, livestock products, tea and soba, because the radiation levels of these items never exceeded permissible levels in 2013 and 2014, according to the farm ministry.

Other food from the prefecture such as rice, mushrooms, soybeans and some fishery products — excluding scallops, seaweed and live fish — will remain subject to the requirement.

The allowable limits are set at 100 becquerels per kilogram for vegetables and fruit, 50 Bq/kg for milk beverages and infant food, and 10 Bq/kg for drinking water, in accordance to Japanese standards.

The EU move follows the Agriculture, Forestry and Fisheries Ministry's announcement in November that the bloc would ease the restrictions after gaining approval from the European Commission.

The decision also comes as the European Union and Japan are in the midst of negotiations for a free trade agreement. In the talks, Tokyo is seeking the elimination of duties on Japanese vehicles, while Brussels is looking to expand exports through the reduction of tariffs on pork, cheese, wine and other agricultural products.

"We will make persistent efforts so (restrictions) on all items (from Fukushima) will be eliminated," Takagi said at a press conference Friday.

The minister added that he will continue to work with other countries to lift similar restrictions imposed after the triple meltdown at the Fukushima No. 1 nuclear power plant raised concerns over the safety of food produced in Japan.

The European Union will also remove restrictions on all food imports from Aomori and Saitama prefectures.

Aside from Fukushima, restrictions will remain in place for some items produced in 12 prefectures in northeastern, eastern and central Japan.

At least 14 countries, including Australia and Thailand, have abolished restrictions on Japanese food imports, while dozens of countries like South Korea maintain special rules.

12-day IAEA mission to assess NRA

January 11, 2015

IAEA starts review of Japan's nuclear regulator

<http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html>

Jan. 11, 2016 - Updated 04:59 UTC+1

Experts from the International Atomic Energy Agency have begun their first review of Japan's nuclear regulator since it was set up after the Fukushima nuclear disaster in 2011.

Team leader Philippe Jamet told officials with the Nuclear Regulation Authority on Monday that **they will evaluate how Japan has improved its nuclear regulatory framework since the accident.** He said team members will offer frank opinions so further improvements can be made.

During the 12-day mission, **the experts will interview NRA officials and visit nuclear power plants, including Fukushima Daiichi.**

The IAEA sends teams of experts to countries at their request to assess their regulators and nuclear

inspections.

In 2007, a team reviewed NRA's predecessor and recommended that its independence from government offices that promote the industry be legally clarified. It also called for reviews of nuclear inspections.

Fukushima governor to attend Davos Forum

January 12, 2016

Fukushima governor to attend Davos forum

<http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html>

10:01 UTC+1

Fukushima's governor will attend this year's World Economic Forum to discuss recovery efforts in the prefecture after the 2011 earthquake, tsunami and nuclear disaster.

Masao Uchibori told reporters on Tuesday he was invited by organizers to join the annual global gathering of financial and political leaders in Davos, Switzerland. The event will take place from January 20th to 23rd.

Uchibori will attend a session on the 22nd themed on Fukushima's recovery and lessons to the world.

He plans to talk about the earthquake and tsunami, lessons from the nuclear accident at the Fukushima Daiichi plant, and the current status of recovery in the prefecture.

The governor is also expected to offer sake from local breweries at a Davos event.

Uchibori said he wants to express his gratitude to global leaders for their support, explain the status of reconstruction, and **promote Fukushima's food and tourist resources.**

Fukushima officials say it is rare for a prefectural governor to attend the Davos forum.

Former Tokyo governor Shintaro Ishihara and his deputy have attended the meeting before.

Japan's top government spokesman announced earlier that Prime Minister Shinzo Abe will not attend the gathering, as he is placing priority on enacting a supplementary budget for the current fiscal year.

Fukushima governor to attend Davos forum next week

<http://www.japantimes.co.jp/news/2016/01/12/national/fukushima-governor-to-attend-davos-forum-next-week/#.VpSv-FIR-ot>

Kyodo

FUKUSHIMA – Fukushima Gov. Masao Uchibori said Tuesday he will attend this year’s World Economic Forum meeting to talk about recovery efforts in the prefecture.

The annual gathering of financiers and government officials will take place in Switzerland starting Jan. 20. Uchibori is scheduled to attend a meeting about the revitalization of Fukushima and explain what is going on. It is rare for a governor to attend the global gathering.

“It is a precious opportunity to be able to communicate directly with people from all over the world,” Uchibori told a news conference. “I want to report (on) the steady progress that is being made toward rebuilding Fukushima.”

It is expected that sake brewed in Fukushima will be served at an event during the gathering.

Uchibori was invited to the Davos forum after attending an event related to the World Economic Forum in Tokyo last June.

Govt to lift evacuation orders for 9 municipalities

January 12, 2016

Govt. to help Fukushima evacuees return home

<http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html>

Jan. 11, 2016 - Updated 23:31 UTC+1

The Japanese government says it will **step up efforts to help evacuees return to communities** affected by the 2011 nuclear accident in Fukushima Prefecture.

The government plans to lift all evacuation orders for 9 municipalities near the damaged nuclear plant by the end of March next year.

The plan excludes some areas that have the highest levels of radioactive fallout from the nuclear disaster.

Of the 9 municipalities where evacuation orders are still in place, evacuees from the city of Minami-Soma, the town of Kawamata and the villages of Katsurao and Kawauchi are allowed to stay at their homes overnight as they prepare to return if the orders are lifted.

But there are persistent concerns among evacuees about radiation and the living environment if they return.

The government plans to speed up measures to help rebuild commercial areas, medical institutions and welfare facilities in those communities.

The government also plans to help businesses construct factories, stores and restaurants with subsidies earmarked in the draft budget for fiscal 2016 that starts in April.

Five years on: Time to reflect on recovery?

January 11, 2016

Editorial: 5th anniversary of 3.11 disasters moment to reflect on recovery, Japan's future

<http://mainichi.jp/english/articles/20160111/p2a/00m/0na/006000c>

One of the lesser known casualties of the destruction wrought by the Great East Japan Earthquake, tsunami and nuclear meltdowns could be linguistic. Dialects unique to some areas hit by the triple disaster are thought to be in danger of dying out, as the communities that speak them have collapsed.

Tohoku University professor Takashi Kobayashi and other researchers conducted a survey on dialects in the disaster areas. In his related book, Kobayashi points out that restoration of regional communities cannot be achieved without restoration of local culture. "This is because the people lived immersed in regional culture," he wrote.

March 2016 will mark the fifth anniversary of the Great East Japan Earthquake. However, work to restore disaster-hit areas has not progressed smoothly. In many cases, regional communities partly defined by their local dialects have disintegrated, their residents losing the local web of mutual emotional support after being forced to evacuate to other areas. Currently, over 180,000 survivors are living away from their hometowns, about 100,000 of them from parts of Fukushima Prefecture affected by the nuclear crisis. Many have no prospect of returning home in the foreseeable future.

In a meeting of the government's Reconstruction Promotion Council in October, Prime Minister Shinzo Abe said, "The government is determined to achieve psychological recovery from the disasters by supporting efforts to form regional communities and taking other measures," in addition to reconstruction of homes destroyed by the disasters. But what does "psychological recovery" mean?

In June 2011, the Reconstruction Design Council in Response to the Great East Japan Earthquake compiled a report calling for "creative" reconstruction of disaster-hit areas, and submitted it to then Prime Minister Naoto Kan. The recommendation was based on the idea that **people can endure hardships better if they have hope for the future.**

The report called for regional community-oriented reconstruction and stated that the national government should work out a basic reconstruction policy and specific systems to support such reconstruction work. Whether politicians can light the flame of hope in disaster areas is being tested. Looking at the reality, however, politicians have failed to achieve this. Reconstruction of disaster-hit areas is now closely linked to the Abe administration's key local economic revitalization policy. This is because the triple disasters sped up the local aging of society and depopulation in disaster-hit areas.

The government is designating a five-year period from spring 2016 for the reconstruction and vitalization of local economies. In other words, the government is looking to turn reconstruction of areas devastated by the disasters into a model of this policy. The government has worked out specific measures to put the brakes on the declining population as part of efforts to boost local economies, but has also failed to show a clear vision for residents' future livelihoods.

Areas of central Niigata Prefecture hit by the Chuetsu Earthquake in 2004 have given a clue to how to revitalize local economies. Most areas hit by the quake are in mountainous areas where the population is aging and decreasing. Based on a spirit of mutual help within their communities, these regions set goals of restoring sustainable livelihoods for mountain residents and trying to bring about a future suited to regional resources and characteristics. They also interacted with many supporters outside their regions and made the best of cooperative reconstruction efforts.

It is true that the Great East Japan Earthquake contributed to depopulation, but there are positive aspects of disaster areas.

A panel of experts to evaluate reconstruction following the Chuetsu quake pointed out in a report released in March last year that residents of affected areas were living positively. "We visited areas hit by the disaster on the occasion of the 10th anniversary. We have the impression that people are lively and active in their neighborhoods, interacting with each other and enjoying the richness of their lives in mountainous areas, instead of feeling that their communities are slumping because of depopulation," the report said.

The scale of the Chuetsu disaster and the environment of the affected areas are different from those of the Great East Japan Earthquake. Still, it is a common goal for all areas across the country to find ways to maintain and make effective use of mountain areas' abundance and unique characteristics despite depopulation.

Some regions devastated by the Great East Japan Earthquake are taking advantage of their characteristics to steadily recover from the disaster.

The Tokyo Olympics and Paralympics will be held in 2020, when the period for reconstruction and vitalization of local economies nears an end, and human capital and funds will further concentrate in the capital. This tendency could widen a perception gap between Tokyo residents, who are excited at the Games, and those in other regions that have barely benefited from the event.

If this perception gap widens, it would damage national unity. Therefore, it is important to keep in mind the Reconstruction Design Council's recommendation that "all people should take on the massive disasters as their own problem, strengthen their solidarity and share the burden with each other in promoting reconstruction."

On March 11, 2016, the anniversary of the triple disasters, it is necessary to evaluate the reconstruction efforts that have been made so far. It is the role of not only politicians but also all members of the public to consider how to design the future of Japan, including disaster areas. We must together light a flame of hope in all regions of Japan, based on reflection on the past five years.

Japan needs to hold in-depth debate on nukes

January 12, 2016

Nuclear Watch: When will Japan awake from the 'dream' of nuclear energy? (Pt. 63)

<http://mainichi.jp/english/articles/20160112/p2a/00m/0na/005000c>

People form human letters saying the equivalent of, "Congratulations, initial firing ceremony," on the premises of JRR-1, Japan's first nuclear reactor, on Sept. 18, 1957. (Mainichi)

"Japan still has a dream that the country had when it started using atomic energy," said Nobuyasu Abe, a member of the Japan Atomic Energy Commission (AEC), when he talked in a recent interview about challenges that Japan's nuclear energy policy faces.

Abe, 70, has raised questions about Japan sticking to all nuclear-related projects, including fast-breeder reactors and nuclear fuel reprocessing facilities, based on the idea in the 1950s that uranium is an important resource and must be effectively utilized. **Abe calls it "a law of inertia," and dismisses it as Japan's bad habit. He points to the need to hold in-depth debate on the issue depending on changes of the times.**

Japan has repeated that it will never have surplus plutonium. Still, Japan has found no way to spend 47.8 tons of plutonium that the country has accumulated. With revisions to the Japan-U.S. nuclear energy agreement coming in three years, bilateral negotiations on the matter will face rough going unless Tokyo paves the way for solving this problem.

"Holding Japan-U.S. talks (on the issue) is equal to considering the future direction of Japan's atomic energy," says Toichi Sakata, 67, former vice minister of education, culture, sports, science and technology, who was involved in bilateral talks in the 1980s.

Sakata suggests that **unless all those involved in the use of nuclear energy begin discussions to work out long-term policy measures, Japan's utilization of atomic energy will come to a deadlock.**

There is a reference case in Britain, which has accumulated 114 tons of plutonium for civilian use, more than twice the amount Japan possesses. Britain held discussions for nearly two years from 2010 on whether plutonium is a resource or waste because the country needed to spend 2 billion pounds a year, or some 240 billion yen at the exchange rate at the time, on storing plutonium and had difficulties managing it. People from various circles participated in the discussions. The process of the discussions was fully

released to the public for national debate. They concluded that plutonium should be used to make mixed-oxide fuel and plutonium that could not be processed to produce such fuel should be dumped. Tatsujiro Suzuki, 64, professor at Nagasaki University who had served as acting chairman of the AEC, points out that Britain has expressed its readiness to take over plutonium Japan has accumulated if Tokyo pays a certain amount of money. Suzuki says this is an option. One cannot help but wonder when Japan will awake from its "dream." **Japan should hold in-depth debate from a long-term perspective instead of adopting an all-or-nothing approach of simply debating whether to promote or discontinue the use of atomic energy.** (By Haruyuki Aikawa, Senior Writer)

Fukushima Pref to seek compensation through mediator

The amount of compensation claimed (and paid) differs according to the article

January 14, 2016

Fukushima Pref. to seek nuclear accident compensation via alternative dispute resolution

<http://mainichi.jp/english/articles/20160114/p2a/00m/0na/020000c>

FUKUSHIMA -- The prefectural government here is planning for the first time to **seek compensation through the system of alternative dispute resolution (ADR)** for a portion of damages resulting from the nuclear disaster at the Tokyo Electric Power Co. (TEPCO)'s Fukushima No. 1 Nuclear Power Plant. The Fukushima Prefectural Government's claim is scheduled to be filed as early as April with a center for resolving disputes regarding nuclear damage compensation after gaining approval from the prefectural assembly.

The claim seeks about **1 billion yen in compensation for costs associated with the nuclear crisis that include the salaries of employees for a radiation contamination department that was newly created following the disaster, as well as expenditures associated with combatting harmful rumors.**

Compensation through the ADR system has already been sought by a total of seven prefectures in addition to Fukushima: five additional prefectures in the Tohoku region, along with Gunma and Chiba prefectures.

An ADR-related settlement has been reached by Iwate Prefecture.

Fukushima Prefecture has already sought a total of around 30.4 billion yen in damages from TEPCO, which provided compensation totaling some 14.1 billion yen for costs including treatment and management of waste products containing radioactive materials, as well as examinations for radioactive contamination of agricultural and livestock products.

The Fukushima Prefectural Government plans to initially seek a total of around 1 billion yen via ADR, and to subsequently decide based upon the response whether to ask for the rest of the funds.

A representative of TEPCO's Fukushima press bureau said in an interview, "We would like to respond in a sincere manner."

Fukushima to turn to third-party mediator to resolve claims dispute with TEPCO

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201601140031>

By NOBORU OKADA/ Staff Writer

FUKUSHIMA--The Fukushima prefectural government, exasperated by Tokyo Electric Power Co.'s foot-dragging, plans to turn to a third-party organ for the first time to resolve a dispute over damages arising from the 2011 nuclear disaster.

Prefectural authorities will be seeking an estimated 1 billion yen (\$9 million) in compensation for expenses resulting from the triple meltdown at the Fukushima No. 1 nuclear power plant.

As the two sides remain far apart on key issues, prefectural officials decided to ask the central government's nuclear damage claim dispute resolution center to serve as mediator.

The prefectural government is hoping that this strategy will convince TEPCO to cover budgetary outlays for personnel expenses for the new departments and sections that had to be established to deal with the nuclear accident.

The submittal of the mediation request could be made in April once the Fukushima prefectural assembly gives its approval.

Compensation is also being sought for a public relations campaign that was implemented to lure tourists who stayed away from the prefecture in the aftermath of the nuclear accident.

Discussions with TEPCO on such expenditures proved fruitless.

"We would like to obtain the judgment of a third party for those parts that we are not convinced about," a prefectural official said.

Fukushima authorities will propose that the mediator be used in the prefectural assembly session to be convened in February.

Since July 2012, the Fukushima prefectural government has submitted three separate compensation requests to TEPCO totaling 11.01 billion yen. TEPCO has so far paid about 3.92 billion yen for projects to assist small businesses to resume operations as well as to relocate prefectural senior high schools.

Referring to the proposed mediation, a TEPCO official said, "We will respond in a sincere manner based on the established procedures."

Toshiba, nukes and fiscal woes

January 16, 2016

The elephant in the room for Toshiba is nuclear

<http://www.japantimes.co.jp/news/2016/01/16/national/media-national/elephant-room-toshiba-nuclear/#.VpqhjVKDmov>

by Philip Brasor

Special To The Japan Times

Japanese press outlets often cover scoops from competing outlets, but it's rare to build on a competitor's story with original reporting, especially when the scoop is a few years old. In December, the weekly magazine Aera, which is affiliated with the Asahi Shimbun, ran an article about a secret meeting that took place between representatives of Japan, Mongolia and the United States almost five years ago. This meeting was first reported by Haruyuki Aikawa in the May 9, 2011, issue of the Mainichi Shimbun. What interested Aera reporter Atsushi Yamada about the article was Aikawa's assertion that Toshiba Corp. was on hand for the negotiations. In 2006, Toshiba had bought a majority share in the American company Westinghouse, a manufacturer, like Toshiba, that started out in the home electronics field and eventually expanded into nuclear power plant construction. Japan said it would buy uranium mined in the central Asian country and in return Mongolia would tap Japan's nuclear energy expertise in building power plants and, more significantly, nuclear fuel reprocessing facilities that would incorporate the acceptance of high-level nuclear waste from Japan and other countries.

Though the Mainichi story received little attention in Japan or the U.S., it was translated and disseminated in Mongolia, thus leading, only three months after the 2011 nuclear meltdown in Fukushima, to citizen protests against the deal, which opponents said would turn their country into a "toilet" for the world's nuclear waste. Later, the Mongolian government said it might be difficult for it to accept this waste. Yamada read subsequent emails between Toshiba's president at the time, Norio Sasaki, and an official of the U.S. Dept. of Energy, which said that negotiations with Mongolia should continue and that any further arrangements be made in a confidential manner. Toshiba's public relations department confirmed the existence of the emails to Yamada but denied that Toshiba had asked the Mongolian government to receive outside nuclear waste. The negotiations, it said, had more to do with "building on the system of nuclear nonproliferation."

Aikawa told Yamada that while ostensibly the negotiations were between the three governments, the plans for the deal were drawn up by the U.S. and Toshiba with the aim of selling nuclear power plants to emerging economies under a scheme called Comprehensive Fuel Service. According to this scheme, vendors assure potential customers that they will handle any future nuclear waste produced by power plants the customers buy, which is why Mongolia's acceptance of such waste is so important. Due to local resistance, neither the U.S. nor Japan has anywhere to dump spent fuel, even their own.

The reason Yamada became so interested in this topic years after the fact is that in the meantime, Toshiba has been caught up in financial scandals that have brought the company to its knees, and he wanted to **explore the connection between Toshiba's nuclear energy business and its fiscal woes.**

The connection itself is not a secret. **Toshiba spent almost ¥600 billion to buy its share of Westinghouse, which at the time of the purchase was only worth about ¥250 billion.** The extra "goodwill" money (*norendai*) was in anticipation of future revenues that would accrue as Toshiba expanded its nuclear energy business both in Japan and throughout the world with Westinghouse as its "trump card." But then Fukushima happened, putting a serious damper on demand for plant construction.

The revenues Toshiba envisioned didn't materialize, and the norendai became a huge liability it tried to hide through bookkeeping. Sasaki, his predecessor and his successor are all now being sued by Toshiba's management for ordering improper accounting practices after Nikkei Business reported that Toshiba was violating Tokyo Stock Exchange regulations regarding the disclosure of a subsidiary's losses.

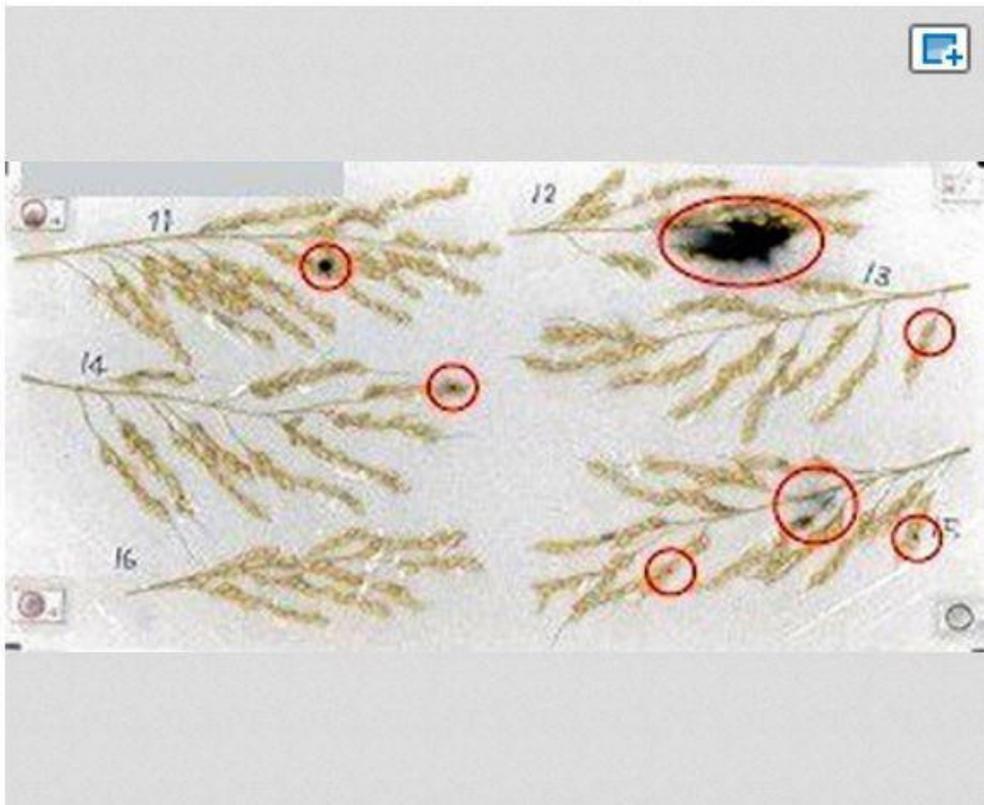

However, at the end of December, the Financial Services Agency, in its investigation of the accounting scandal, did not find Toshiba to be at fault, but rather punished the auditing firm of Ernst & Young ShinNihon for "failure to detect" Toshiba's improper accounting practices. In a follow-up article in the Jan. 11 issue of Aera, the reporter wondered if this arrangement didn't smack of "conspiracy," and an FSA representative told the magazine that the agency "suspected" as much but "could not find any evidence." For the next three months, ShinNihon is suspended from signing any new business contracts and must pay a "surcharge" of ¥2.1 billion. Though that may sound severe, industry people told Aera that usually in such cases penalized companies are suspended from conducting business altogether.

So why didn't the FSA accuse Toshiba of accounting fraud, especially given that it's not uncommon for auditors to revise their findings so as not to inconvenience powerful clients? As Yamada points out, the agency didn't even mention Westinghouse in its findings.

Perhaps the government still needs Toshiba, since Prime Minister Shinzo Abe has pegged Japanese growth at least partly to the export of nuclear technology. In November, the Asahi Shimbun interviewed the CEO of Westinghouse, who said his company had plans to build dozens of new reactors all over the world, "including Japan." Abe is selling nuclear technology to Vietnam, Turkey and other countries, and in October he finalized a trade deal with Mongolia.

Ryoko Imaoka, an associate professor at Osaka University and longtime expert on Mongolia, has explained that **the U.S., desperate to find a friendly country to accept nuclear waste, was pushing Japan to make a deal with Mongolia. Japan publicly downplays the nuclear part of the trade agreement** and Japanese media have obliged, though Mitsubishi Corp. is already developing three new mines there. She says the country's currently dormant uranium pits remain extremely radioactive and it's not clear where any nuclear waste would be buried, but in any event there are Mongolians who are ready to sue to shut the whole thing down.

Rice contamination: Fukushima No.1 was the culprit

The black spots show radioactive particles found on the ears of rice harvested in autumn 2013 in Minami-Soma, Fukushima Prefecture. (Provided by Ministry of Agriculture and Fisheries)

January 18, 2016

Researchers: No doubt cleanup at Fukushima nuclear plant contaminated rice crops in 2013

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201601180052>

THE ASAHI SHIMBUN

MINAMI-SOMA, Fukushima Prefecture--Radioactive substances that contaminated rice paddies here in 2013 came from the crippled Fukushima No. 1 nuclear plant, an **international group of researchers** said, rejecting a denial issued by Japan's nuclear safety authority.

The researchers, led by Akio Koizumi, a professor at Kyoto University's Graduate School of Medicine, reached the conclusion after analyzing radioactive substances and taking spot readings of radioactivity levels around Minami-Soma.

Koizumi presented the final report of the group, consisting of 11 researchers from Japan, Europe and the United States, to local farmers and other parties at a community center in Minami-Soma on Jan. 17.

"The cause of further contamination was the radioactive particles dispersed from contaminated rubble during the cleanup effort at the Fukushima No. 1 nuclear plant," Koizumi concluded in the report.

Earlier, the agriculture ministry and the Nuclear Regulatory Authority (NRA) gave different views on the source of the contaminated rice.

In 2013, rice crops from areas of Minami-Soma were found with unexpectedly high radioactivity levels more than two years after the triple meltdown at the nuclear plant located 20 kilometers south of the city. One theory was that highly radioactive substances were dispersed when workers were lifting and removing contaminated rubble at the Fukushima plant on Aug. 19 that year. Two workers at the plant were exposed to high doses of radiation during the cleanup process.

The Ministry of Agriculture, Forestry and Fisheries said the cause of the contaminated rice was “unknown” although it acknowledged “the possibility of the dispersal of contaminated dust.” The farm ministry discontinued its investigation without specifying the source of the contamination.

The NRA, however, said the contaminated rice was not related to the cleanup work at the nuclear plant. The Minami-Soma city assembly expressed outrage over the NRA’s stance. Some in the city suspected the NRA of a cover-up.

Koizumi and the other researchers digitally recreated an accidental dispersal of contaminated dust from the plant in August 2013.

They used a new analysis system to estimate the amount of radioactive cesium that spread toward Minami-Soma based on radioactivity readings around the city and other factors.

The group’s cesium estimate was more than 3.6 times the amount initially estimated by the NRA.

The research group in September 2014 also collected soil samples from 10 locations around the contaminated rice paddies to determine the amount of strontium 90 in the area.

They confirmed that the ratio of strontium 90 to radioactive cesium in the soil samples was similar to the ratio that would be found near the Fukushima nuclear plant.

Beta-ray emitting strontium 90 is less airborne and tends to remain within close proximity of nuclear weapon testing sites or nuclear accidents. Radioactive cesium is more volatile and can easily adhere to fine dust spread by the wind.

In general, the amount of strontium 90 decreases the farther it gets from a nuclear plant, compared with radioactive cesium. In fact, hardly any strontium 90 has been detected far away from the Fukushima plant. Based on the amounts of radioactive particles recorded around Minami-Soma, the researchers concluded that a highly irregular plume of radioactive cesium reached Minami-Soma on the third week of August 2013.

“Every single piece of data in the paper supports the fact that contamination by radioactive dust came from the debris at the nuclear plant,” Koizumi said.

Asked about the NRA’s conclusion, Koizumi said: “It seems they were blinded by their estimated amount of dispersed particles, and their choice for the analysis system was misguided. This kind of attitude would only increase the anxiety of residents in the affected areas.”

The group’s findings were published in the international academic journal [Environmental Science & Technology](#) last month after a peer review.

(This article was written by Masakazu Honda and Miki Aoki.)

An old story with updates

What has happened to Japan's radioactive cars?

When the nuclear reactors in Fukushima exploded in 2011, approximately 8,000 square kilometers were heavily contaminated with fallout and residents were forced to evacuate, probably for the rest of their lives. This news has been widely reported, but another aspect of the contamination received almost no coverage. It took a while for authorities to lock down the evacuation zones, and in those first few weeks there appeared to be no awareness of the need to control the movement of contaminated property out of the zone. People's clothes and belongings, even their cash, were likely covered in radioactive dust, but the objects of most obvious concern should have been vehicles.

Because the government failed to quickly control the movement of vehicles and guarantee fair compensation to owners, people stuck with a "hot car" had to choose between taking a total loss on an expensive and essential personal asset, or selling it as soon as possible before the market woke up to the risk and valued these cars at zero. Within a few months there were reports of radioactive cars showing up in used car lots far from Fukushima. It seems to have not occurred to any journalists writing about this problem that TEPCO and the Japanese government had a moral obligation to compensate car owners whose vehicles were ruined by radiation. People wring their hands about what can be done to stop these sales, but they fail to see that the only question is whether the guilty parties, and/or insurance companies, are going to offer the fair value that these vehicles had on March 10, 2011.

Dealers recognized that there was going to be a lot of trouble from shifting radioactive cars around domestically, so they also turned to the export market. There were reports of hundreds of Japanese used cars being turned away at ports in Russia and Australia. Then the Japanese government cracked down, as much as they could (always reactive rather than proactive – a day late and a dollar short), so more radioactive cars started showing up at domestic dealers. But dealers and consumers got wise and bought dosimeters to make sure that they didn't get stuck with a worthless car. Still, unscrupulous exporters had enough control over some ports to get some cars out, and they turned to countries that were least likely to be checking. In the fall of 2012 reports came out of African nations telling of radioactive Japanese imports showing up there. Apparently, they are not all as easy to fool as the Japanese exporters believed. Some countries, lacking the instruments to check every used car imported from Japan, have entirely banned them. African policy specialist and journalist, Chika Ezeanya, reported from Nigeria:

“Cars having up to twenty times the permissible level of radiation have found their way to African countries where several governments are clueless or unconcerned about such health risks. Governments of Kenya and Tanzania however, are among the few African countries, who, unable to afford the high cost of testing all incoming vehicles, have expressly banned the importation of cars from Japan into their markets. The Kenyan government went as far as destroying some cars after it hired independent firms to test for radiation levels.”

Sadly, this is just one more example of how Japan deliberately and/or neglectfully blunders through international soft diplomacy and tarnishes its own image. It is incredible that Toyota, Nissan, Mazda, Honda and Suzuki don't care more about what radioactive car exports could do to their brands. If they cared, they would pressure the government to assert control over used car exports. Whether it's a First World, valuable market or a Third World nation that buys mostly used cars, these struggling Japanese brands cannot afford to be complacent.

[...]

Updates:

July 2014:

Jay Ramey. "Radioactive cars from Japan keep turning up in Central Asia." *Autoweek*. July 11, 2014.

This report states that persistent exporters are finding ways to get through strict controls at major ports. Radioactive used cars are now coming to market in Central Asia through minor road border crossings. A director of the Disease Prevention Department in Bishkek, Kyrgyzstan said the cars can't be sent back, so they might turn them into scrap. I'm not sure how they think that is a solution because scrapping means recycling the material into other consumer goods.

If the Japanese car industry were being managed intelligently, the major manufacturers would have long ago set up a buy-back program for radioactive cars, just as they can afford to do with recalls on other defective products. It would save their brand reputation overseas. It's shameful that they so badly disregarded the safety of consumers in the the developing world and underestimated their ability to detect radioactive cars.

Radioactive cars from Japan keep turning up in Central Asia
July 10, 2014

<http://autoweek.com/article/car-news/radioactive-cars-japan-keep-turning-central-asia>

A total of 70 used cars imported from Japan and found to have increased levels of radiation are being stored in Bishkek, Kyrgyzstan, and cannot be sent back, according to Silk Road Reporters citing local news outlets. Car retailers in Kyrgyzstan, who have been importing significant numbers of used cars from Japan for resale in the country, have been finding cars that exhibit levels of radiation above normal. Several batches of cars have been seized by the government during the last three years and have at times been sent back to Japan through an agreement with the Japanese government. However, irradiated cars keep turning up in Bishkek, the capital, and not all of them are being detected in a timely manner.

"These cars cannot be dispatched back. Neither China nor Japan will accept them. For this reason, we have to keep them here and deal with their further disposal," Tolo Isakov, director of the Disease Prevention Department in Bishkek, told the AKIpress news outlet, according to Silk Road Reporters.

Isakov told AKIpress and Novosti.kg, another Bishkek-based news outlet, that currently a decision is being made whether to scrap the cars. The cars have been quarantined in an impound lot, but the local authorities do not know what to do with them. The batch of (so far) 70 cars has been building up in the impound lot over time, with cars having come through several other countries. Isakov did not mention the levels of radioactivity that have been detected in these cars, though it is expected to vary from car to car. The import of used Japanese cars is big business in Central Asia, especially in Mongolia and the Russian far-east regions that are the largest consumers of used Japanese cars in the area. In cities like Vladivostok, Russia, RHD Japanese cars make up roughly 50 percent of all registered passenger cars.

A shipment of 132 irradiated cars was recently detected coming into the port of Vladivostok in January 2014, with the cars having been barred from entry in port, according to the Australian website CarsGuide. Russia has been more successful at detecting irradiated cars coming in from Japan due to stringent checks in the ports of Vladivostok and Khabarovsk. However, that is mainly due to the direct route that cargo ships with used cars normally take, in addition to systematic screenings by customs officials. The routes

that used Japanese cars usually take to small Central Asian countries like Kyrgyzstan are more circuitous, and cars with radiation levels above normal frequently escape detection as they are driven across the border on license plates from neighboring countries.

AIEA on NRA: Improved on transparency but can do better on screening and expertise

January 22, 2016

IAEA: Japan nuclear regulation should improve skills, law

<http://mainichi.jp/english/articles/20160122/p2g/00m/0dm/062000c>

TOKYO (AP) -- A team of experts from the International Atomic Energy Agency says Japan's nuclear safety regulation has improved since the 2011 Fukushima disaster, but it still needs to strengthen inspections and staff competency.

It's the first IAEA review for the authority since it was established in 2012. Japan adopted stricter safety requirement for plant operators, but the law stipulating on-site inspections has remained unchanged. The 17-member team, which concluded a 12-day inspection that included the wrecked Fukushima plant, said Friday that Japan's regulatory body demonstrated independence and transparency -- crucial elements lacking before the disaster, when a separate agency was in charge.

The team urged the Nuclear Regulation Authority to enhance inspection competence and Japan's government to amend its nuclear safety law to make on-site safety checks more effective and flexible.

IAEA assesses Japan's nuclear regulator

<http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html>

Jan. 22, 2016 - Updated 08:22 UTC+1

The International Atomic Energy Agency says Japan's nuclear regulator has been independent and transparent since its launch, but needs better screening and expertise.

The IAEA held hearings on Japan's Nuclear Regulation Authority since January 11th for its first assessment of the regulator.

The authority was established one year after the 2011 nuclear accident at the Fukushima Daiichi plant. The UN watchdog conducts such assessments of regulatory frameworks for nuclear and radiation safety at the request of member countries.

The agency provided an outline of its assessment on Friday, the last day of the procedure.

It said the authority is transparent and independent of nuclear plant promoters, and has tightened its safety measures. But it called on the regulator to **work to attract competent and experienced staff and enhance its skills regarding nuclear and radiation safety.**

The agency also advised that the regulator's inspection procedures be made more flexible to allow for focusing inspections on key facilities.

Assessment team leader Philippe Jamet said his team recommended that Japan adopt more top experts, as many of the country's nuclear power stations are to resume operation. Jamet is the commissioner of the French Nuclear Safety Authority.

The team plans to compile an official report in April.

Faulty control at the Nuclear Material Control Center

January 22, 2016

Data leaked from Japan nuclear inspection body via Chinese software

<http://mainichi.jp/english/articles/20160122/p2a/00m/0na/023000c>

Unspecified data leaked from the nonprofit Nuclear Material Control Center in Tokyo last year **after an employee installed Chinese-made file sharing software without permission**, inviting unauthorized access from a Chinese server, according to people close to the case.

Although the chances of classified information having been leaked are low, the center's lax information control is likely to come under scrutiny.

Under the center's in-house regulations, it was obliged to report the case to the secretariat of the Nuclear Regulation Authority (NRA), but failed to do so, judging the leak did not constitute a threat to nuclear security. The NRA, which oversees the center, is questioning the public interest incorporated foundation about the episode.

According to the NRA secretariat and other sources, the employee belongs to the inspection section of the center's Rokkasho Safeguards Center in Aomori Prefecture. The regional center oversees Japan Nuclear Fuel Ltd.'s spent fuel reprocessing and uranium enrichment plants, Tohoku Electric Power Co.'s Higashidori Nuclear Power Station, and other facilities in Aomori Prefecture. **Staffers at the Rokkasho center are in charge of maintaining and managing surveillance cameras and measurement equipment necessary for inspections.**

The Rokkasho center's internal documents say the employee in question installed the Chinese-made file sharing software called Xunlei. The Chinese software is used to view video content but presents a high risk of information leaks.

In-house rules ban the use of file sharing software, but the employee installed the Chinese program along with other free software in April last year.

The Nuclear Material Control Center logged 12 cases of unauthorized access alone last September, and found records of data transmissions to a Chinese server. The center has been unable to find out what kind of data was leaked, but suggests that the employee's PC did not contain classified information such as on nuclear materials.

The center has worked with a private company since late August last year to keep constant tabs on communications with the outside as part of measures to fight data leaks. This outsourcing company found out about the unauthorized access, and **it is possible the illicit access had been going on since before the beefed-up security policy.**

The NRA secretariat employee in charge of safeguards says that the center's failure to notify the agency of the security breach is considered inappropriate, and that the agency plans to have the center tighten information controls. **Kenji Murakami, president of the Nuclear Material Control Center, declined to be interviewed, saying he had no time.**

Suspected data leak at nuclear inspection body

<http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html>

Jan. 22, 2016 - Updated 12:31 UTC+1

A Japanese agency in charge of inspecting, analyzing, and processing information about nuclear material management says data may have leaked from one of its computers through file-sharing software.

The Tokyo-based Nuclear Material Control Center said on Friday that the suspected leak of data on inspection equipment occurred last September at **Rokkasho Safeguards Center**, in Aomori Prefecture, northern Japan.

Officials of the center said **a monitoring system detected that unspecified data was being sent to outside computers.**

They said an employee at Rokkasho apparently installed the software without knowing it. File-sharing software is prohibited by in-house rules.

The center did not report the case to the government's Nuclear Regulation Authority.

The center is commissioned by the authority to check whether nuclear facilities handle radioactive material properly.

Another computer at Rokkasho Safeguards Center contains important data about where plutonium is stored and when the material has been transported.

The officials said an investigation will look into whether the file-sharing software in question has been installed on other computers, and whether critical data has leaked.

IAEA mission makes recommendations

<https://www.iaea.org/newscenter/pressreleases/iaea-mission-says-japan%E2%80%99s-regulatory-body-made-fast-progress-sees-challenges-ahead>

January 22, 2016

IAEA Mission Says Japan's Regulatory Body Made Fast Progress, Sees Challenges Ahead

Tokyo, Japan

2016/3

An International Atomic Energy Agency (IAEA) team of experts said Japan's regulatory body for nuclear and radiation safety has demonstrated independence and transparency since it was set up in 2012. The team also noted that it needs to further strengthen its technical competence in light of upcoming restarts of nuclear facilities.

The Integrated Regulatory Review Service (IRRS) team today concluded a 12-day mission to assess the regulatory framework for nuclear and radiation safety in Japan which was modified following the accident at the Fukushima Daiichi Nuclear Power Station. The modification included the establishment of the Nuclear Regulation Authority (NRA) in September 2012.

"In the few years since its establishment, the NRA has demonstrated its independence and transparency. It has established new regulatory requirements for nuclear installations and reviewed the first restart applications by utilities," said team leader Philippe Jamet, Commissioner of the French Nuclear Safety Authority. "This intensive and impressive work must continue with equal commitment, as there are still significant challenges in the years to come."

IRRS missions are designed to strengthen the effectiveness of the national nuclear regulatory infrastructure, while recognizing the responsibility of each State to ensure nuclear safety.

Before being halted following the Fukushima Daiichi accident, Japan's nuclear power reactors produced about 30 per cent of the country's electricity generation. Two reactors were restarted in 2015 with NRA authorization, and the regulatory body is reviewing other restart applications using the new

requirements. The country also has fuel cycle facilities, research reactors and widely uses nuclear applications in other fields.

The team of experts made recommendations and suggestions to the NRA and the Government to help them enhance the implementation of Japan's regulatory framework to strengthen nuclear and radiation safety.

They reviewed the responsibilities and functions of the Government and the regulatory body for safety, the authorization of nuclear and radiation facilities and activities, safety assessments, inspections of nuclear facilities, emergency preparedness and response, and several other areas in the field of nuclear and radiation safety.

The experts met with staff of the NRA, observed regulatory activities including inspections, and visited nuclear-related sites. They also met with other Japanese officials.

The IRRS team comprised 19 experts from 17 countries - Argentina, Australia, Brazil, Canada, the Czech Republic, Finland, France, Ireland, the Republic of Korea, the Russian Federation, Slovenia, South Africa, Spain, Sweden, Switzerland, the United Kingdom and the United States of America - and five IAEA staff.

"The IRRS team members made great efforts to thoroughly review the activities of the NRA," said NRA Chairman Shunichi Tanaka. "NRA will seriously consider the findings in striving to further enhance nuclear safety and security in Japan."

"Japan has reformed its regulatory system with impressive speed and effectiveness following the Fukushima Daiichi accident. Today, the system provides for clearer responsibilities and greater authority to the regulatory body," said Juan Carlos Lentijo, IAEA Deputy Director General and Head of the Department for Safety and Security. "The NRA is on a good path to continue this crucial progress in the future. Its work must continue to ensure that the new regulatory system is applied fully to all facilities and activities."

The IRRS team identified good practices:

- The swift establishment of a legal and governmental framework that supports a new independent and transparent regulatory body with increased powers.
- NRA's prompt and effective incorporation of lessons learnt from the Fukushima Daiichi accident in the areas of natural hazards, severe accident management, emergency preparedness and safety upgrades of existing facilities, into Japan's new regulatory framework.

The mission provided recommendations and suggestions for improvements in most of the areas covered by the review. Examples include:

- **The NRA should work to attract competent and experienced staff, and enhance staff skills relevant to nuclear and radiation safety through education, training, research and enhanced international cooperation.**
- **Japanese authorities should amend relevant legislation to allow NRA to perform more effective inspections of nuclear and radiation facilities.**
- **The NRA and all entities it regulates should continue to strengthen the promotion of safety culture, including by fostering a questioning attitude.**

The final mission report will be provided to the Japanese Government in about three months. The Japanese Government has announced that it plans to make the report public.

Compensation after nuclear accidents: Where should the limit be?

January 24, 2016

Panel begins debate on limit of compensation in event of nuclear accident

<http://www.japantimes.co.jp/news/2016/01/24/national/panel-begins-debate-limit-compensation-event-nuclear-accident/>

JJI

The Japan Atomic Energy Commission has started full discussions by experts on whether to limit the power plant operator's liability to pay damage compensation in the event of a nuclear accident. Currently, nuclear plant operators in Japan bear unlimited liability for compensation, but some experts demand that a ceiling be set for their responsibility.

The discussions are expected to be difficult, as limiting the liability would raise the problem of how to compensate affected people and businesses for the damage in excess of the limit.

For the March 2011 triple meltdown accident at Tokyo Electric Power Co.'s disaster-stricken Fukushima No. 1 plant, Tepco shoulders full liability for compensation under the nuclear compensation law.

But as Tepco alone cannot finance all the costs for compensation payments and decontamination work, the government set aside ¥9 trillion in assistance, which has been provided to the company through Nuclear Damage Compensation and Decommissioning Facilitation Corp., a public-private organization. Tepco repays the aid little by little.

Electric power industry people have been pushing for a cap on nuclear plant operators' liability for compensation. "If the sky's the limit for compensation, we cannot project an outlook for our nuclear energy business," a senior official of a major power utility said.

In line with the government's policy of continuing to use nuclear energy, an expert panel of the Japan Atomic Energy Commission started debate last year on any problems with the current compensation regime.

Some panel members argued for a limited liability system. "Shouldering risks that go beyond the limit of the private sector will impede fund procurement by electric power companies," one member said.

On the other hand, a separate member said, "Limited liability is not an option, considering the current situation of Fukushima."

There are also concerns that a narrower scope of responsibility for power companies could be detrimental to their commitment to safety.

With the panel divided sharply, a government official said no conclusion is expected at an early date.

The expert panel plans to produce a report on their discussions next year, and the government will subsequently start working on any necessary amendments to the nuclear compensation law.

Even if the nuclear compensation system is revised, past nuclear accidents will not be covered by a limited liability system.

Among countries that impose limits on an electric power company's liability of compensation for a nuclear accident, the United States sets the maximum liability at \$12.6 billion and Britain has a ceiling of £140 million (\$199.7 million), according to the Japan Atomic Energy Commission. Under the U.S. system, if the scale of nuclear damage exceeds the limit, the president proposes a supplementary compensation program to the Congress.

Has Kyushu Electric been cheating?

January 24, 2016

Kyushu Electric accused of 'cheap trick' in forgoing quake-proof center at Sendai plant

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201601240026

THE ASAHI SHIMBUN

Kyushu Electric Power Co. is being lambasted by the public and scholars after backtracking on plans for a quake-proof building at its Sendai nuclear plant after two reactors were restarted.

The utility will forgo the project since an alternative building at the plant in Kagoshima Prefecture has passed inspection by the Nuclear Regulation Authority.

The decision was made after two reactors at the Sendai plant resumed operations last year.

Kyushu Electric's change of heart has infuriated citizens' groups opposed to nuclear energy, with some calling it a "cheap trick."

Tadahiro Katsuta, associate professor of nuclear energy policy at Meiji University, who was involved in drawing up new safety standards that called for facilities from where nuclear reactors could be safely operated even in emergencies, criticized the utility.

"It seems that Kyushu Electric, which had been concerned about the NRA response, has gone on the counter-offensive now that the safety screening results are in," Katsuta said. "Unless this trend is stopped, it could continue on to affect other issues beyond the quake-proof building and return to the days before the Fukushima nuclear disaster when regulatory agencies were not in an advantageous position (vis-a-vis the utilities)."

Before the Sendai reactors resumed operations in August and October 2015, Kyushu Electric had announced plans to build the quake-proof building by the end of fiscal 2015. However, in December 2015, the utility turned around and said it would cancel the building plan and use a much smaller building to handle major emergencies at the Sendai plant.

Even Shunichi Tanaka, NRA chairman, appeared taken aback by the shift in position by Kyushu Electric.

"The company obtained approval with the quake-proof building as a precondition so it should fundamentally abide by that stance," Tanaka said. "While we would welcome any change that moves in a safer direction, if it is only being done to save money then we will have to significantly intensify the screening process."

The NRA is expected to hear an explanation from Kyushu Electric on Jan. 26.

The need for quake-proof buildings arose from the lessons learned after the Kashiwazaki-Kariwa nuclear power plant in Niigata Prefecture, operated by Tokyo Electric Power Co., was damaged in the 2007 Niigata Chuetsu-oki Earthquake.

Such buildings played an important role in bringing the nuclear accident at the Fukushima No. 1 nuclear power plant under control after the 2011 Great East Japan Earthquake and tsunami.

Kyushu Electric applied for a safety screening with the NRA in July 2013 after it said it would construct a three-story quake-proof building and include in it an emergency response center with a planned floor space of about 620 square meters.

Such centers have become mandatory under new safety standards for nuclear plants. While those rooms have to be able to function even after being hit by earthquakes and other natural disasters, the structure does not have to be quake-proof.

Because Kyushu Electric was hurrying to restart the Sendai reactors, it completed an alternative emergency response center in September 2013 that has about 170 square meters of floor space. The one-story structure is quake-resistant, but not quake-proof.

Kyushu Electric said that center would only be used until the quake-proof building was completed.

That alternative center allowed Kyushu Electric to become the first utility to pass the NRA safety screening under the stricter safety standards.

Kyushu Electric also said it was upgrading the alternative center into its permanent emergency response center because it had been found acceptable and there was no longer a need to build the quake-proof structure.

In addition, Kyushu Electric will construct a quake-resistant two-story building with two basement floors next to the emergency response center that will have lodging space for workers who will be on call to provide support in an emergency.

16 billion yen of taxpayer money to promote MOX projects

January 24, 2016

Japan doles out over ¥16 billion in subsidies for slow-moving MOX projects

<http://www.japantimes.co.jp/news/2016/01/24/national/science-health/japan-doles-%C2%A516-billion-subsidies-slow-moving-mox-projects/#.VqUByFKDmov>

JJI

The government has used taxpayer money to provide over ¥16.2 billion in subsidies to local governments for promoting so-called pluthermal power generation using mixed oxide fuel (MOX), a survey has shown. The subsidies, financed with revenue from a tax for power-resources development imposed on electricity users, have been distributed to local governments that accepted pluthermal power generation at facilities in their regions.

The Jiji Press survey released Saturday illustrates that a large amount of taxpayers' money has been spent on the pluthermal project in order to win support from local governments.

The project, a key part of the country's nuclear fuel cycle policy, uses MOX fuel, a mixture of uranium and plutonium extracted from spent nuclear fuel.

So far, just four reactors in Japan have used MOX fuel, including reactor 2 at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear power plant. The reactor, set to be decommissioned, experienced a core meltdown after the March 2011 earthquake and tsunami.

The Federation of Electric Power Companies of Japan hopes to eventually raise the nation's total number of reactors carrying out pluthermal generation to somewhere between 16 and 18.

However, pluthermal projects have failed to progress as expected, prompting critics to urge the central government to conduct an immediate review of its policy.

The other three reactors that have run on MOX fuel are the No. 3 reactor at Kyushu Electric Power Co.'s Genkai plant in Saga Prefecture, the No. 3 reactor at Shikoku Electric Power Co.'s Ikata plant in Ehime Prefecture and the No. 3 reactor at Kansai Electric Power Co.'s Takahama plant in Fukui Prefecture. The Takahama plant reactor is set to be rebooted later this month using MOX fuel.

The survey found that seven of the nine prefectural governments and all of the 10 other municipalities entitled to the subsidies — one to promote the fuel-cycle policy and the other to support host municipalities — have actually received the payments.

The exceptions, Hokkaido and Shizuoka prefecture, have refrained from applying for the subsidies. While the Fukushima disaster has spurred safety concerns among citizens, a series of scandals — including attempts to influence public opinion — in favor of pluthermal projects — have eroded trust in the plan, sources said.

In Hokkaido, the No. 3 reactor at Hokkaido Electric Co.'s Tomari plant has been designated for pluthermal power generation. In Shizuoka Prefecture, the No. 4 reactor at Chubu Electric Power Co.'s Hamaoka plant has also been tapped for the pluthermal project.

Of the four prefectures where pluthermal generation has been carried out, Saga received ¥6.097 billion in state subsidies and Ehime was given a total of ¥6.059 billion by the end of fiscal 2014.

Fukui, meanwhile, has received ¥2.486 billion as of the end of 2013 and is expected to get more subsidies through fiscal 2015.

Group forms to keep an eye on TEPCO's criminal trial

January 27, 2016

Group to monitor trial of former TEPCO executives to clarify truth about Fukushima disaster

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201601270055>

By MASAKAZU HONDA/ Staff Writer

Lawyers, journalists and scientists will form a group to help expose the truth and spread details about the Fukushima nuclear disaster during the criminal trial of three former executives of Tokyo Electric Power Co.

“We will encourage the court to hold a fair trial while transmitting information regarding the trial across the nation,” said an official of the planned organization, whose name is translated as “support group for the criminal procedure on the Fukushima No. 1 nuclear power plant.”

Tsunehisa Katsumata, former chairman of TEPCO, the operator of the crippled plant, and two former vice presidents, Sakae Muto and Ichiro Takekuro, face mandatory charges of professional negligence resulting in death and injury.

Although the trial is still months away, 33 people are now setting up the group, including **Ruiko Muto**, who heads an organization pursuing the criminal responsibility of TEPCO and government officials for the Fukushima nuclear disaster.

Tetsuji Imanaka, an assistant professor of nuclear engineering at the Kyoto University Research Reactor Institute, and Norma Field, a professor emeritus of East Asian Studies at the University of Chicago, have also joined.

Three reactors melted down at the Fukushima No. 1 nuclear plant after the Great East Japan Earthquake and tsunami struck on March 11, 2011. A number of hospital patients died in the chaotic evacuation. About 14,000 residents of Fukushima Prefecture filed a criminal complaint against TEPCO executives, government officials and scientists in 2012, saying they were aware of the dangers to the Fukushima nuclear plant from a tsunami, but they failed in their responsibility to take proper countermeasures. Tokyo prosecutors twice decided not to indict the three former TEPCO executives. However, the Tokyo No. 5 Committee for the Inquest of Prosecution, a panel of citizens, decided to forcibly indict the three in July last year.

“It has been almost five years since the disaster, but many details, including their foreseeability of the tsunami, remain unclear,” said science writer **Takashi Soeda**, one of the group’s co-founders. “As TEPCO has not unveiled a sufficient amount of information even in inquiries conducted by the Diet and the government or in civil lawsuits, the truth must be uncovered through the legal force of a criminal trial.” Five lawyers appointed by the Tokyo District Court will act as prosecutors in the trial.

Legal experts expect the lawyers will indict the former TEPCO executives and release a statement naming the victims around March 11, the fifth anniversary of the triple disaster that still haunts the Tohoku region.

Grant of over 13 billion yen given to TEPCO

Press Releases 2016

http://www.tepco.co.jp/en/press/corp-com/release/2016/1266357_7763.html

Press Release (Jan 22, 2016) Financial Assistance from the Nuclear Damage Compensation and Decommissioning Facilitation Corporation

On January 22, we received a funding grant of 13.4 billion yen from the Nuclear Damage Compensation and Decommissioning Facilitation Corporation (hereinafter referred to as NDF) based on the revision of the Special Business Plan which was approved on July 28, 2015.

This financial assistance was given in response to the 48th request we made in order to cover the compensation payouts due by the end of February 2016. **The amount of the payouts to be paid by that time had been estimated to exceed the sum of the compensation we had received in accordance with the "Act on Contract for Indemnification of Nuclear Damage Compensation" (188.9 billion yen) and the financial assistance that the NDF has provided (5.7475 trillion yen).**

With financial assistance from the NDF, we are determined **to continue to pay the compensation with courtesy and compassion** to all of those who have been afflicted by the nuclear damage.

Sendai emergency building: Safety claim groundless, says NRA

January 26, 2016

Regulator rejects plant's emergency office plan

http://www3.nhk.or.jp/nhkworld/english/news/20160126_35.html

Jan. 26, 2016 - Updated 12:16 UTC+1

Japan's nuclear regulator has rejected an application by the operator of the Sendai plant to continue using an existing building as an emergency office.

It says **the operator's revised plan to keep using the building as an emergency office will not ensure improved safety.**

The No.1 and No.2 reactors at the Sendai plant in southwestern Japan were put back online last year.

During the reactors' screening process, Kyushu Electric Power Company submitted a plan to build a structure with the latest quake-absorbing technology, including the emergency office, by the end of March this year.

The utility cleared the screening by constructing a temporary building for use until the quake-absorbing one is completed.

But last month, the utility submitted a revised plan to the Nuclear Regulation Authority, saying the existing building is fully capable of serving as an emergency office.

Under the revised plan, the utility will not construct a quake-absorbent structure and will only build a quake-resistant support facility with break rooms and a doctor's office.

Utility officials explained at Tuesday's meeting of the regulator that the quake-resistant technology has already passed the screening process, and so the new building **could be opened earlier.** They say this would ensure greater safety at the plant.

Authority member Toyoshi Fuketa said the application does not explain when the facility could be put into service, and so **the claim of improved safety is groundless.** He asked Kyushu Electric Power to submit a new application.

The utility says it will consider what to do, with an eye to reapplication.

The issue of the emergency office does not affect the regular operations of the plant.

Needed: Faster communication for nuclear accidents

January 26, 2016

Faster communication sought for nuclear accidents

http://www3.nhk.or.jp/nhkworld/english/news/20160127_05.html

Jan. 26, 2016 - Updated 23:32 UTC+1

The Japanese government is to consider introducing a dedicated communication system between central and local officials to ensure they can share crucial information in the event of a nuclear accident.

Officials at the Cabinet Office and the Nuclear Regulation Authority will study connecting local governments to the computer system from fiscal 2017.

The officials say this system displays the development of an accident and the responses to it in chronological order and stores evacuation instructions and other documents.

They say the system is used for communications between a government task force and the offsite emergency response center of a nuclear power plant.

Such information is mainly sent to local governments by fax.

Central and local officials who took part in a disaster drill at the Ikata plant in Ehime Prefecture last November complained that faxing was too slow and they could not be sure if the other party had received the information.

Immediately after the 2011 Fukushima accident, some of the evacuation information sent from the central government did not reach local authorities.

A fax about iodine tablets was not noticed for some time at the offsite center of the Fukushima Daiichi plant.

The Cabinet Office says it wants to connect local authorities to the system to secure multiple communication routes and to make sure that information will be delivered quickly and accurately.

Takahama restart ignores safety concerns

January 28, 2016

EDITORIAL: Takahama reactor restart raises fresh nuclear safety concerns

<http://ajw.asahi.com/article/views/editorial/AJ201601280025>

The No. 3 reactor at Kansai Electric Power Co.'s Takahama nuclear power plant in Takahama, Fukui Prefecture, is set to restart on Jan. 29.

It will be the third nuclear reactor to be brought back online under stricter safety regulations drawn up by the Nuclear Regulation Authority after the Fukushima nuclear disaster in 2011.

The No. 1 and No. 2 reactors of Kyushu Electric Power Co.'s Sendai nuclear plant in Kagoshima Prefecture were brought back online in August and October, respectively.

This March will mark the fifth anniversary of the catastrophic accident at the Fukushima No. 1 nuclear power plant.

Electric utilities have formally requested that the NRA inspect 25 of the 43 reactors across the nation, plus one under construction, to determine whether they meet the new safety standards.

The No. 3 unit at Shikoku Electric Power Co.'s Ikata nuclear power plant in Ehime Prefecture is expected to be the next reactor to go online following the ones at the Sendai and Takahama plants.

We are deeply concerned about offline reactors starting up again one after another, especially as there are troubling signs that the bitter lessons from Fukushima are being lost.

Once again we express our opposition to the plan to restart the Takahama plant reactor.

SAFETY CONCERNS BEING IGNORED

In a July 2011 editorial, we called for a major shift in the government's energy policy to build a society without nuclear power generation.

Before the 2011 calamity, nuclear energy accounted for nearly 30 percent of power supply in Japan.

There was concern that terminating nuclear power generation immediately would trigger a massive power crunch and soaring electricity bills, seriously impacting people's livelihoods.

We argued that Japan should sharply reduce its dependence on atomic power and strive to build a society powered mainly by renewable energy sources.

We also maintained that offline nuclear reactors should be allowed to resume operations only after their safety has been ascertained and they were clearly necessary for meeting demand for electricity.

The first thing to point out about the plan to bring the reactor at the Takahama plant back on stream is that the "safety first" principle has been ignored.

The grim lesson we learned from Fukushima is that nuclear accidents far above anyone's expectations can actually happen.

Fifteen nuclear reactors are located around Wakasa Bay in Fukui Prefecture, including some that are being decommissioned. This area has one of the highest concentrations of nuclear power facilities in the world. What would happen if a natural disaster, for instance, triggers severe accidents at more than one nuclear power plant in a particular area?

No clear answer has been given to this question, which was raised by the Fukushima triple meltdown.

The NRA paid scant attention to this risk in its safety inspection of the reactor at the Takahama plant.

Last year, Kansai Electric Power decided to scrap two small and aged reactors in Fukui Prefecture, where it has 11 reactors in total. But the utility also decided to continue operating three reactors beyond their 40th year of service.

There is no denying that efforts to minimize the safety risks involved in the reactors in the prefecture have been grossly insufficient.

The No. 3 unit at the Takahama plant is a so-called plutonium-thermal reactor which burns mixed oxide (MOX) fuel consisting of plutonium blended with uranium. It should not be forgotten that this fact further increases safety concerns among local residents.

POOR SAFETY PROTECTION FOR RESIDENTS

The emergency evacuation plan, which should serve as the last protective shield for local residents during nuclear emergencies, is far from reliable.

Local governments of areas within 30 kilometers of a nuclear power plant are required to develop plans for emergency evacuations of local residents.

A total of 12 municipalities in the three prefectures of Fukui, Kyoto and Shiga are located within that distance of the Takahama plant. They have a combined population of 179,000.

Late last year, the government's Nuclear Emergency Preparedness Commission approved the wide-area evacuation plans that have been worked out by the three prefectures.

In the worst case scenario, local residents living within a 30-km radius would be evacuated to 56 cities and towns in the four prefectures of Fukui, Hyogo, Kyoto and Tokushima, according to these plans.

But only seven cities of the 56 municipalities have devised plans to accept evacuees in such a situation, according to a survey by The Asahi Shimbun.

Most of the municipal governments surveyed said they had concerns about factors such as their ability to secure necessary facilities, manpower and materials to accept evacuees and the possibility of vehicles contaminated with radiation entering their areas.

Their anxiety is by no means surprising given that before the Fukushima accident it was not assumed that residents living outside a 10-km radius of a nuclear power plant might have to be evacuated in a nuclear emergency.

Ensuring the effectiveness of evacuation plans requires repeated drills and reviews to evaluate the blueprints.

But no evacuation drill has been conducted under an evacuation plan for an area around the Takahama plant. It is deeply worrisome to see the reactor being restarted without confirmation of the feasibility and effectiveness of the evacuation plans.

In response to anxiety among local residents, many of the local governments of areas within 30 km of the plant asked Kansai Electric Power to give them the right to consent to a plan to restart a reactor.

But the utility rejected their requests, while the central government has stuck to the position that all that is required for a reactor restart is consent from the local governments of the area where it is located.

Restarting a reactor without solving these safety issues can only be described as a premature move.

ROAD MAP NEEDED FOR NUCLEAR-FREE FUTURE

Electric power companies have stressed concerns about stable power supply and rises in electricity charges due to increasing fuel costs as main reasons for their efforts to resume operations of idle reactors. But the situations related to these problems have been clearly changing prior to the fifth anniversary of the Fukushima disaster.

All nuclear reactors remained out of operation for nearly two years until last summer. But no serious power shortage occurred during the period.

In addition to various maneuverings by utilities to meet demand, such as delaying regular safety checks of their thermal power plants, spreading power-saving efforts among the public also contributed significantly to preventing a power crunch.

Kansai Electric Power's sales of electricity, for instance, have fallen by about 10 percent from before the Fukushima accident.

Deregulation of the power retail market will allow households to choose their suppliers, starting in April. This will make consumers even more conscious of the efficiency of their use of electricity.

After growing for a while because of factors blamed on the economic effects of shutting down reactors, Japan's trade deficit has started shrinking thanks to falls in fuel costs due to lower crude prices.

Kansai Electric Power says it can lower its electricity charges if the reactor at the Takahama plant starts running again. But amid serious safety concerns, this offers no convincing rationale for restarting the reactor.

Another big question related to reactor restarts is how to find a location for interim storage of spent nuclear fuel that is piling up in pools within nuclear power complexes.

The dispute over the plan to restart the reactor in Fukui Prefecture has underscored differences in the stance of the local communities calling for the implementation of the plan, and that of the Kansai region, which has generally been cautious about supporting the plan despite the fact that it consumes the electricity generated at the nuclear plant.

There can be no realistic vision for a future without nuclear power generation without support from the local communities that have been hosting nuclear plants for many years.

All the parties involved, including not only the central government but also areas that consume electricity generated at nuclear power plants, should work together to lay out such a future vision.

--The Asahi Shimbun, Jan. 28

Nuke restart strengthens utility's profits

January 30, 2016

Kyushu Electric expects financial windfall thanks to nuclear reactor restarts

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201601300040

THE ASAHI SHIMBUN

FUKUOKA--Kyushu Electric Power Co. is expecting a **65 billion yen (\$536.8 million) net profit in fiscal 2015, in part due to the restart of two reactors** at its nuclear power plant in Kagoshima Prefecture.

This will be the first time the regional utility has posted a net profit in five years. The company reported a 114.6 billion yen net loss in fiscal 2014.

Its president, Michiaki Uriu, said the utility will now push for the early restarts of two reactors at its Genkai nuclear plant in Saga Prefecture.

"We have made all-out effort as a company to avoid losses for this fiscal year, and such efforts have borne fruit so far," Uriu said at the news conference announcing the profit forecast at the company's headquarters in Fukuoka on Jan. 29.

The utility said the resumption of the operation of the reactors at the Sendai nuclear power plant in Satsuma-Sendai had **reduced the company's fuel costs**.

Kyushu Electric also announced its forecast of posting 1.845 trillion yen in sales for fiscal 2015, which ends in March. This is down 1.5 percent from the previous year. It will also post 80 billion yen in ordinary profit, compared with a 73.6 billion yen loss in fiscal 2014.

The utility said the resumption of the No. 1 reactor at the Sendai plant in August 2015 and the No. 2 reactor in October helped the company reduce its reliance on thermal power plants, for which fuel is more expensive.

The company estimates that the reactor restarts would push up the company's total earnings by 78 billion yen for fiscal 2015.

The decline in oil prices has also helped the company to reduce fuel costs for thermal plants, which helped push up the company's net profit by about 30 billion yen.

Uriu said **the company will push for the early restart of No. 3 and No. 4 reactors at the Genkai plant to strengthen the utility's financial standing.**

"The impact of reactor restarts at the Sendai plant has been certainly large, but we are making profits thanks to such fluctuating factors as the declining fuel price," Uriu said. "We believe that we have not achieved a positive turnaround for our earnings structure yet."

The two reactors at the Sendai plant that were brought back online last year will be shut down for two to three months for a periodical inspection after fall 2016.

The company also hopes to improve its earnings structure to counter the liberalization of retail electricity sales starting April.

What nuclear "renaissance"?

Nuclear renaissance? Failing industry is running flat out to stand still

http://www.theecologist.org/News/news_analysis/2987010/nuclear_renaissance_failing_industry_is_running_flat_out_to_stand_still.html

Dr Jim Green

30th January 2016

Despite the endless rhetoric about a 'nuclear renaissance', there are fewer power reactors today than there were a decade ago, writes Jim Green. The one country with a really big nuclear build program is China, but no one expects it to meet its targets. And with over 200 reactor shut-downs due by 2040, the industry will have to run very hard indeed just to stay put.

Over the next 10-20 years, global nuclear capacity may increase marginally, with strong growth in China more than masking patterns of stagnation and decline elsewhere. Beyond that, the aging of the global fleet of power reactors will be sharply felt.

Ten new power reactors began supplying electricity last year (eight of them in China), and eight reactors were permanently shut down.

Nuclear power's 20-year pattern of stagnation continues. In 1995 there were 434 'operable' reactors - operating plus temporarily shut down reactors. In 2005 there were 441, and now there are 439.

Thus there are fewer reactors today than there were a decade ago. Moreover the 439 figure includes 41 reactors in Japan that have been shut down for several years, and not all of them will be restarted.

The nuclear power industry's malaise was all too evident at the COP21 UN climate change conference in Paris in December. Former World Nuclear Association executive Steve Kidd noted:

"It was entirely predictable that the nuclear industry achieved precisely nothing at the recent Paris COP21 talks and in the subsequent international agreement. ...

"Analysis of the submissions of the 196 governments that signed up to the Paris agreement, demonstrating their own individual schemes on how to reduce national carbon emissions, show that nearly all of them exclude nuclear power.

"The future is likely to repeat the experience of 2015 when 10 new reactors came into operation worldwide but 8 shut down. So as things stand, the industry is essentially running to stand still."

According to the International Atomic Energy Agency, only seven out of 196 countries mentioned nuclear power in their climate change mitigation plans prepared for the COP21 conference: China, India, Japan, Argentina, Turkey, Jordan and Niger.

Now it's getting nasty

A striking feature of the debates around the COP21 conference was the vitriol directed at the anti-nuclear and environmental movements. Tim Judson from the Nuclear Information and Resource Service noted:

"The industry's rhetoric is getting increasingly desperate and personal. The industry rolled out a new front group called 'Nuclear for Climate', which handed out thousands of copies of a book attacking anti-nuclear activists and blaming us for the climate crisis.

"Needless to say, their efforts to intimidate activists are backfiring. In fact, they have given us a clear sign of how close we are to winning.

"Greenpeace International's Kumi Naidoo reminded activists in a speech in December - in which he broadened the call for divestment to include nuclear, as well as fossil fuels - of the famous adage attributed to Gandhi about the path to victory: 'First they ignore you. Then they laugh at you. Then they fight you. And then you win.'"

Perhaps the five stages of grief are relevant as nuclear lobbyists confront the reality that the nuclear renaissance didn't eventuate and isn't likely to. Denial and anger are very much in evidence, along with some bargaining ('we need all low carbon power sources'), depression and, in time, acceptance.

China's great leap forward

With 30 operable reactors, 24 under construction, and many more in the pipeline, China remains the only country with significant nuclear expansion plans. China is unlikely to meet any of its targets - 58 GW by 2020, 110 GW by 2030 and up to 250 GW by 2050 - but growth will be significant nonetheless.

Growth could however be derailed by a serious accident, which is all the more likely because of China's inadequate nuclear safety standards, inadequate regulation, lack of transparency, repression of whistleblowers, world's worst insurance and liability arrangements, security risks, and widespread corruption.

There are fears, for example, that China may press ahead with its twin-EPR project at Taishan despite fears over the metallurgy of its reactor vessels and heads. Similar components supplied to the EPR at Flamanville in France have been found to have areas of excessive carbon leading to brittleness and possible failure in use. The French project is now on hold and may never be completed.

Over the next 10-20 years, global nuclear capacity may increase marginally, with strong growth in China more than masking patterns of stagnation and decline elsewhere. Beyond that, the aging of the global fleet of power reactors will be sharply felt: the International Energy Agency anticipates almost 200 permanent shut-downs by 2040.

Steve Kidd notes that the industry is running to stand still, and it will have to run faster to stand still as the annual number of shut-downs increases.

Growth elsewhere?

India is the only other country where there is a possibility of significant nuclear growth in the nearish-future. But nuclear growth in India has been modest - six reactor start-ups over the past decade - and may remain so.

In early 2015, India claimed to have resolved one of the major obstacles to foreign investment by announcing measures to circumvent a liability law which does not completely absolve suppliers of responsibility for accidents.

But those claims were met with scepticism and a capital strike by most foreign suppliers is still in effect. Strong public opposition - and the Indian state's brutal response to that opposition - will also continue to slow nuclear expansion.

India has just signed an 'preliminary agreement' with EDF to build a massive six-reactor EPR project at Jaitapur, 360km south of Mumbai. But given the still-unresolved liability issues and the EPR's disastrous construction record to date, it's hard imagine any but the most cautious of progress taking place.

Meanwhile renewables are surging ahead. One part of the Jaitapur deal that is likely to move ahead fast is 142MW of wind power in Gujarat that EDF is to develop with its Indian partner, SITAC.

And in mid-January 2016, the latest auction of solar energy capacity in India achieved a new record low price of 4.34 rupees / kWh (US\$0.064; €0.059). Energy minister Piyush Goyal said: *"Through transparent auctions with a ready provision of land, transmission and the like, solar tariffs have come down below thermal power cost."*

Russia has 35 operating reactors and eight under construction (including two very low power floating reactors). Only six reactors have started up over the past 20 years, and only four over the past decade. The pattern of slow growth will continue.

As for Russia's ambitious nuclear export program, Steve Kidd noted in October 2014 that it *"is reasonable to suggest that it is highly unlikely that Russia will succeed in carrying out even half of the projects in which it claims to be closely involved"*.

South Korea has 25 operable reactors and three under construction. Six reactors have started up over the past decade. Along with China, India and Russia, South Korea is supposedly one of the four countries driving the 'nuclear renaissance'. But the best the industry can hope for in South Korea is slow growth.

South Africa plans 9.6 GW of new nuclear capacity to add to the two Koeberg reactors. But the nuclear program is more theatre than reality. Pro-nuclear commentator Dan Yurman states:

"South Africa's plans to build 9.6 GW of nuclear power will continue to be embroiled in political controversy and be hobbled by a lack of realistic financial plans to pay for the reactors."

"Claims by both Rosatom and Chinese state nuclear firms that they have won the business are not credible. Even if written down on paper, these claims of contracts cannot be guaranteed in the long term due to the political twists and turns by South African President Jacob Zuma."

"Most recently, he burned through three finance ministers over differences about whether the country could afford the cost of the reactors said to be at as much as US\$100 billion including upgrades to the electrical grid. Additionally, Zuma is distracted by political and personal scandals."

Brazil's nuclear industry provided some theatre in 2015 with the arrest of Othon Luiz Pinheiro da Silva, the former CEO of Brazil's nuclear power utility Eletronuclear, for allegedly accepting bribes to fix the bidding process for the Angra 3 reactor under construction 100 km from Rio de Janeiro. Fourteen other people were also charged as a result of the federal police's 'Operation Radioactivity'.

"The arrest is a tragedy for the industry," said former Eletrobras' chief executive Luiz Pinguelli Rosa. *"The industry was already in crisis, but now the corruption concerns are bound to delay Angra 3 further and cause costs to rise even more."*

Newcomer countries: The World Nuclear Association claims that *"over 45 countries are actively considering embarking upon nuclear power programmes."* Balderdash. Only two 'newcomer' countries are actually building reactors - Belarus and the United Arab Emirates. Other countries might join the nuclear club but newcomers will be few and far between.

Moreover, some countries are phasing out nuclear power. Countries with nuclear phase-out policies include Germany, Belgium, Taiwan, and Switzerland. Other countries - e.g. Sweden - may phase out nuclear power partly as a result of deliberate government policy and partly because of natural attrition: aging reactors are being shut down without replacement.

Stagnation and decline

Patterns of stagnation or slow decline in North America and western Europe can safely be predicted. In 2014, the European Commission forecast that EU nuclear generating capacity of 131 GW in 2010 will decline to 97 GW in 2025.

The European Commission forecasts that nuclear's share of EU electricity generation will decline from 27% in 2010 to 21% in 2050, while the share from renewables will increase from 21% to 51.6%, and fossil fuels' share will decline from 52% to 27%.

The most important nuclear power story of 2015 was legislation enacted in the French Parliament in July that will reduce nuclear's share of electricity generation from 75% to 50% by 'around' 2025, and caps nuclear capacity at the current level of 63.2 GW.

The legislation also establishes a target of 32% of electricity generation from renewables by 2030, a 40% reduction in greenhouse gas emissions and a 20% reduction in overall energy consumption by 2030.

In April 2015, a report by ADEME, a French government agency under the Ministries of Ecology and Research, shows that 100% renewable electricity supply by 2050 in France is feasible and affordable. French EPR reactor projects in **France and Finland** are three times over budget and many years behind schedule. As already noted, in April 2015 it was revealed that EDF's Flamanville EPR under construction in France has a weak pressure vessel and head, and that the same problem may afflict China's twin-EPR project with EDF at Taishan.

A January 2016 update to the World Nuclear Industry Status Report discusses the miserable state of the French nuclear industry:

"The French state-controlled AREVA, having announced an outlook of a further 'heavy loss' in 2015, was downgraded by credit-rating agency Standard & Poor's to B+ ("highly speculative"). On 29 December 2015, the company plunged to a new historic low on the stock market (€5.30 compared to €72.50 eight years ago). "On 7 December 2015, Euronext ejected the French heavy weight Électricité de France (EDF), largest nuclear utility in the world and "pillar of the Paris Stock Exchange", from France's key stock market index, known as CAC40. One day later, EDF shares lost another four percent of their value, which led to a new low, a drop of over 85 percent from its 2007 level. ...

"The French nuclear industry's international competitors are not doing much better. AREVA's Russian counterpart Atomenergoprom as well as the Japanese controlled Toshiba-Westinghouse were both downgraded to 'junk' ('speculative') by credit-rating agencies during the year."

Next door in **Belgium**, ageing reactors at Doel and Tihange - shut down a year ago because of serious safety concerns over numerous leaks and, at Tihange, 16,000 reactor vessel cracks - are scheduled to start up shortly, triggering serious concern across Europe. An Avaaz petition to be delivered to Belgium by German Environment Minister Barbara Hendricks on Monday has already attracted almost 500,000 signatures.

In the **United States**, utilities announced two more reactor shut-downs in 2015: the FitzPatrick reactor in New York will be shut down in 2016, and the Pilgrim reactor in Massachusetts will be closed between 2017 and 2019.

Five reactors are under construction but a greater number have been shut down recently or will be shut down in the next few years. The last reactor start-up was in 1996. In August 2015 the Environmental Protection Agency released its final Clean Power Plan, which failed to give the nuclear industry the subsidies and handouts it was seeking.

A decade ago, the US Nuclear Regulatory Commission was flooded with applications for US\$127 billion (€117b) worth of reactor projects. Now, obituaries for the US nuclear power renaissance are increasingly common.

The situation is broadly similar in the **United Kingdom** - the nuclear power industry there is scrambling just to stand still. It should be clear by the end of this year whether the extraordinarily expensive Hinkley C EPR project will go ahead. But the signs are not good for the project's backers: EDF was due to make its 'final investment decision' this week, but flunked out owing to its inability to raise the necessary £18 billion.

According to the World Nuclear Association, most of the UK's reactors are to be retired by 2023. If other projects prove to be as expensive and difficult as Hinkley C, it's unlikely that new nuclear capacity will match retirements.

In **Japan**, only two of the country's 43 operable reactors are actually operating. Perhaps half to two-thirds of the reactors will eventually restart. Five reactors were permanently shut down in 2015, and the six reactors at Fukushima Daiichi have been written off.

Before the Fukushima disaster, Tokyo planned to add another 15-20 reactors to the fleet of 55, giving a total of 70-75 reactors. Thus, Japan's nuclear power industry will be at most half the size it might have been if not for the Fukushima disaster.

Generation IV reactors to the rescue?

Rhetoric about 'super safe', 'best thing since sliced bread' Generation IV reactors will likely continue unabated. That said, critical reports released by the US and French governments last year may signal a slow shift away from Generation IV reactor rhetoric.

The report by the French Institute for Radiological Protection and Nuclear Safety (IRSN) - a government authority under the Ministries of Defense, the Environment, Industry, Research, and Health - states:

"There is still much R&D to be done to develop the Generation IV nuclear reactors, as well as for the fuel cycle and the associated waste management which depends on the system chosen."

IRSN is also sceptical about safety claims: *"At the present stage of development, IRSN does not notice evidence that leads to conclude that the systems under review are likely to offer a significantly improved level of safety compared with Generation III reactors ... "*

The US Government Accountability Office released a report in July 2015 on the status of small modular reactors (SMRs) and other 'advanced' reactor concepts in the US. The report concluded:

"While light water SMRs and advanced reactors may provide some benefits, their development and deployment face a number of challenges ... Depending on how they are resolved, these technical challenges may result in higher-cost reactors than anticipated, making them less competitive with large LWRs [light water reactors] or power plants using other fuels ..."

"Both light water SMRs and advanced reactors face additional challenges related to the time, cost, and uncertainty associated with developing, certifying or licensing, and deploying new reactor technology, with advanced reactor designs generally facing greater challenges than light water SMR designs."

"It is a multi-decade process, with costs up to \$1 billion to \$2 billion, to design and certify or license the reactor design, and there is an additional construction cost of several billion dollars more per power plant." Even SMR boosters are struggling to put a positive spin on the situation. Launching a Nuclear Energy Insider report on SMRs, lead author Kerr Jefferies said: *"From the outside it will seem that SMR development has hit a brick wall, but to lump the sector's difficulties together with the death of the so-called nuclear renaissance would be missing the point."*

According to a US think tank, 48 companies in north America, backed by more than US\$1.6 billion (€1.5b) in private capital, are developing plans for advanced nuclear reactors. But even if all that capital was invested in a single R&D project, it would not suffice to commercialise a new reactor type.

The UK government also sees a big future for SMRs and has even promised to spend £250 million on *"nuclear innovation and Small Modular Reactors"*. But it will face two big problems. First, the money won't go far. And second, nuclear power is already being outcompeted by wind and solar, which are getting cheaper all the time.

Dan Yurman notes in his review of nuclear developments in 2015: *"Efforts by start-up type firms to build advanced reactors will continue to generate a lot of media hype, but questions are abundant as to whether this activity will result in prototypes."*

"For venture capital firms that have invested in advanced designs, cashing out may mean licensing a design to an established reactor vendor rather than building a first-of-a-kind unit."

Dr Jim Green is the national nuclear campaigner with Friends of the Earth Australia and editor of the Nuclear Monitor newsletter, where this article was originally published. Nuclear Monitor is published 20 times a year. It has been publishing deeply researched, often strongly critical articles on all aspects of the nuclear cycle since 1978. A must-read for all those who work on this issue!

Kansai business leaders happy with restarts (and TPP)

February 4, 2016

Kansai business leaders hail nuclear power plant restarts, urge TPP ratification

<http://www.japantimes.co.jp/news/2016/02/04/business/kansai-business-leaders-hail-nuclear-power-plant-restarts-urge-tpp-ratification/#.VrOEe1KDmos>

by Eric Johnston

Staff Writer

KYOTO – The annual meeting of Kansai area corporate leaders opened Thursday in Kyoto with declarations of support for a recently restarted nuclear power plant and calls for the swift ratification of the Trans-Pacific Partnership.

The two-day Kansai Economic Seminar brought together over 500 participants including heads of companies. Tabled for discussion were local and national economic, social, and political issues ranging

from developing a more diverse and skilled young workforce in the face of a rapidly aging society to tourism promotion.

Kansai Economic Federation chairman Shosuke Mori, who also serves as chairman and director of Kansai Electric Power Co., opened the meeting by touching on local and national energy issues. He said Japan's energy policy has taken a new turn with the restart of Kepco's Takahama No. 3 reactor last week and the restart of two reactors at Kyushu Electric's Sendai plant last August.

"The restart of these reactors means the situation since September 2013, where Japan had no nuclear plants operating, has been eliminated," Mori said. "This is a very significant development. Kepco will also restart the Takahama No. 4 reactor in about a month, and we're talking about reducing electricity rates after April 1."

Mori did not address the deregulation of the electricity market in April to allow for competition in the household market and how it might impact the Kansai economy.

This move opens up Kepco to a range of competitors, many of which hope to sell electricity derived from renewable energy or natural gas. As Japan's regional utilities have a monopoly and control access to their transmission lines, it remains unclear what the impact on Kepco will be.

The seminar took place on the day that 12 nations, including Japan, signed the TPP agreement in New Zealand. Mori said the TPP nations account for nearly 40 percent of the world's GDP and called for early ratification of the treaty by members' legislatures.

However, some participants noted factors which could delay implementation of the TPP, including the facts that leading figures in the U.S. race oppose the deal and U.S. Congress remains skeptical. Another factor, they said, is the resignation last week of economy minister Akira Amari, who negotiated the TPP for Japan.

KEPCO's change of plans: Sacrificing to costs

February 5, 2016

Editorial: KEPCO's altered stance on nuclear plant emergency building breaches trust

<http://mainichi.jp/english/articles/20160205/p2a/00m/0na/019000c>

Is Kyushu Electric Power Co. (KEPCO) really taking nuclear safety seriously? Such misgivings arise when we consider the utility's decision to scrap plans to build a seismically isolated facility at its Sendai Nuclear Power Plant in Kagoshima Prefecture.

When it applied for safety screening for the No. 1 and No. 2 reactors at the plant, KEPCO promised to build a seismically isolated emergency response center that was to serve as a frontline base in the event of a nuclear accident. Later, however, the company decided it would make do with an existing quake-resistant facility, and it applied to the Nuclear Regulation Authority (NRA) at the end of last year to alter its plans. KEPCO has no experience obtaining government permission and building a seismically isolated nuclear power facility, and told the NRA that if it were to instead use a quake-resistant facility with which it has

plenty of experience, it would be possible to begin operations at an early date, thereby enhancing safety. Yet it has not actually stated when it would be able to begin operating the quake-resistant facility.

The NRA views the power company's turnabout negatively, and has asked KEPCO to resubmit its application, on the basis that it lacks grounds for its claim.

In August last year, the No. 1 reactor at the Sendai Nuclear Power plant was reactivated, becoming the first to be restarted after passing new safety standards implemented in the wake of the Fukushima Nuclear Disaster. The plant's No. 2 reactor was similarly reactivated in October. When KEPCO applied to the NRA for safety screening, the utility had promised that it would build an important base-isolated structure, aiming to complete it sometime around this fiscal year. Inside the structure, it was to establish an emergency response center with a floor space of about 620 square meters. It said it would temporarily use a substitute quake-resistant facility with a floor space of about 170 square meters while the base-isolated structure was being built.

Quake-resistant structures are built to withstand the shaking of temblors. Seismically isolated buildings, on the other hand, use buffers to absorb the shaking. This system makes it harder for equipment inside to be damaged and has the advantage of allowing workers to move smoothly even if aftershocks occur. When the Fukushima nuclear disaster occurred, a seismically isolated structure became a base for handling the disaster at the Fukushima No. 1 Nuclear Power Plant, and its importance became widely recognized.

Under KEPCO's new plan, the substitute response center would be upgraded to a regular response center, and a quake-resistant facility that could provide support with a rest facility and medical office would be set up alongside it.

KEPCO stresses that it would be able to secure a level of safety at least on par with a seismically isolated building. But **changing its plans after restarting the reactors represents a breach of faith toward the NRA.** It's like putting one's hand out in a game of rock, paper, scissors after the other player has already revealed their move. KEPCO has similarly declared that it will take its plan to build a seismically isolated structure at its Genkai Nuclear Power Plant back to the drawing board, sparking a backlash from a local municipality.

Under new standards, there is admittedly no regulation requiring emergency response centers to be seismically isolated -- as long as the functions of a quake-resistant structure can be maintained in an earthquake.

However, **utilities have a responsibility to constantly work at improving safety -- not being satisfied with merely passing the standard.** Saying, "We have no experience so we can't do it" is no excuse.

It would appear in this case, that safety is taking a back seat to costs and ease of construction.

KEPCO needs to carefully respond to these kinds of misgivings and state in concrete terms why safety would improve under the changed plans. If it can't do that, then it should give up on changing the original plans.

TEPCO: "We must expand the overseas business"

February 8, 2016

Tepco looks overseas as shake-up, competition loom at home

<http://www.japantimes.co.jp/news/2016/02/08/business/corporate-business/tepco-looks-overseas-as-shake-up-competition-loom-at-home/#.VrhqtlKDmos>

Bloomberg

Tokyo Electric Power Co. is seeking to expand operations abroad to diversify amid a power market shake-up at home.

Japan's biggest utility faces a fully liberalized power market from April and the prospect of new entrants encroaching on its base of about 29 million customers. Tepco expects to make up for lost customers by expanding into Japan's other regions and considering opportunities abroad, according to President Naomi Hirose.

"We have 100 percent of the market share in our area, so when it liberalizes, we can't go to 101 percent," Hirose said at a press briefing in Tokyo on Friday. "We must expand the overseas business."

Tepco has another reason for looking overseas. Japan's electricity use is falling as the population declines and customers cut usage. The nation consumed about 806 terawatt-hours of electricity from its 10 regional power utilities in 2015, the lowest since 1998, according to data from the Federation of Electricity Power Companies of Japan.

Tepco's sales will probably fall 18 percent between the fiscal years ending March 31, 2015, and 2017, according to the average estimate of five analysts compiled by Bloomberg. The company also hopes to boost revenue by entering the gas-retail market when it liberalizes in April, 2017.

Tepco has investments in power projects in countries including Taiwan, Thailand and Indonesia. Revenue from Tepco's overseas power-producing business increased to about ¥100 billion in the last fiscal year ended March 31, a threefold expansion from a decade earlier, according to a company presentation dated April 28.

The company also consults on overseas projects, ranging from technical support to assisting with electricity savings, according to its website. Revenue from its overseas consulting services was ¥1.11 billion last fiscal year.

Minister apologises but what did she really say?

February 10, 2016

Environment minister apologizes for comments on Fukushima radiation limits

Japanese version

<http://mainichi.jp/english/articles/20160210/p2a/00m/0na/013000c>

Environment Minister Tamayo Marukawa apologized during a post-Cabinet meeting press conference on Feb. 9 over a report in the Shinano Mainichi Shimbun that quoted her criticism of the former government of the Democratic Party of Japan (DPJ)'s policy to lower the annual additional radiation exposure dose to 1 millisievert after the accident at the Fukushima No. 1 Nuclear Power Plant.

According to the newspaper report, Marukawa had criticized Goshi Hosono, former environment minister and chair of the now opposition DPJ's Policy Research Committee, when she spoke during a meeting of the

House of Councillors members of the ruling Liberal Democratic Party (LDP) in the city of Matsumoto, Nagano Prefecture, on Feb. 7.

"It might sound strange to talk about an 'anti-radiation faction,' but there are some people who will say they are worried no matter how far you lower (the radiation level)," Marukawa was quoted as saying.

"The former environment minister made the decision (to lower the radiation level) amidst the hype from these kinds of people, without any sort of scientific basis whatsoever."

Marukawa offered an apology for the remarks during the Feb. 9 press conference, saying, "I do not recall using such wording. The general meaning of what I had been trying to say was not properly conveyed, and I am extremely sorry for the lack of clarity in my words."

"Our long-term (radiation level) objective will continue to be 1 millisievert," Marukawa added.

The DPJ, which was in power at the time of the nuclear disaster, had set the level of long-term radiation exposure (excluding natural radiation) for members of the general public at 1 millisievert, in accordance with recommendations issued by the International Commission on Radiological Protection.

Some governmental and ruling party figures see that this 1 millisievert level has become regarded as a "safety standard" and the figure is serving to prevent residents from being able to return home.

Marukawa was also quoted as saying during the Feb. 7 meeting, "There are people who remain unable to return home when they should be able to do so (because decontamination has not brought the radiation levels down to the specified level)."

Takahama: A "problematic" restart

February 10, 2016

Takahama's problematic restart

<http://www.japantimes.co.jp/opinion/2016/02/10/editorials/takahamas-problematic-restart/#.VrtmGKdMot>

The No. 3 reactor of Kansai Electric Power Co.'s Takahama nuclear power plant in Fukui Prefecture, which was restarted in late January, is expected to start commercial operations in late February. Its No. 4 reactor is also set to be restarted around the same time. Although the Takahama Municipal Government and Fukui Prefecture gave their consent to the restart, there are serious concerns, including those expressed by nearby municipalities and their residents.

Following the restart of the No. 1 and No. 2 reactors at Kyushu Electric Power Co.'s Sendai nuclear power plant in Kagoshima Prefecture, Takahama unit 3 is the third reactor to come back online under the safety regulations introduced by the Nuclear Regulation Authority following the shutdown of the nation's nuclear plants in the wake of the March 2011 disaster at Tokyo Electric Power Co.'s Fukushima No. 1 plant. But it is the first to run on mixed oxide (MOX) fuel, which contains not only uranium but also plutonium extracted from spent nuclear fuel. The No. 4 reactor at Takahama will also use MOX fuel. Japan has accumulated 48 tons of plutonium — enough to make an estimated 6,000 nuclear bombs — as a result of the government's nuclear fuel cycle policy, which aims to reprocess spent fuel to extract uranium and plutonium to be used again as fuel. The Takahama restart may help the government show its resolve

to cut its plutonium stockpile to address U.S. concerns over nuclear proliferation. But the restart will pose a problem in the not-too-distant future. The spent fuel storage facilities for reactors 3 and 4 are expected to become filled in seven or eight years after they are reactivated. Spent uranium fuel from nuclear power plants is to be sent to a fuel reprocessing facility in Rokkasho, Aomori Prefecture, still on a trial run, but the plant cannot reprocess used MOX fuel — meaning that there will be no place to store overflowing spent fuel from the Takahama reactors. Although Kansai Electric aims to choose a site for a medium-term storage facility outside Fukui by around 2020, no prefectures seem willing to host it.

In the wake of the 2011 Fukushima disaster, local governments within 30 km of a nuclear power plant are now required to devise plans to evacuate their residents in the event of a major accident. In the case of Takahama, nearly 180,000 residents in 12 municipalities in Fukui, Kyoto and Shiga prefectures live in the 30-km zone. Part of the city of Maizuru, Kyoto Prefecture, is within 5 km of the Takahama plant. Despite this, Kansai Electric stuck to the position that to restart the reactors it only needs consent from the host town of Takahama and Fukui Prefecture, and it ignored calls from Kyoto and Shiga prefectures and many other municipalities within the 30-km zone that it should also gain their consent. The same situation happened when Kyushu Electric Power Co. pushed to restart the Sendai reactors. The power companies should address the concerns harbored by municipalities and residents that do not host plants but lie close enough to be affected by a nuclear disaster.

Despite the requirement for compiling evacuation plans, no evacuation drills with local residents have been carried out in the municipalities around Takahama and many residents have received no instructions on where they should evacuate to in the event of a severe accident. Maizuru, for example, won't release a new evacuation plan for its residents until March. While there are plans to evacuate some Fukui residents to Hyogo, Kyoto and Tokushima prefectures, many municipalities are not ready to receive them. In addition, evacuations may not proceed as planned in extreme weather conditions such as heavy snow or when roads are congested. The Fukushima disaster also exposed the evacuation difficulties faced by inpatients at hospitals and elderly people in nursing care facilities. And as there are few access roads to the Takahama facility, the evacuation of plant workers and dispatch of emergency teams may be hindered. The Takahama facility is among 14 nuclear power plants concentrated by Wakasa Bay in Fukui Prefecture. If a major disaster hits the plants simultaneously, the area will be highly vulnerable.

In December, the Fukui District Court quashed an injunction issued by the same court in April against restarting the Takahama reactors, paving the way for Kansai Electric to put them back online. Although the ruling upheld the NRA's new safety standards for restarting reactors as rational and endorsed the authority's decision that the Takahama reactors met the standards, both Kansai Electric and the NRA should not forget that the ruling also stated that the NRA's decision does not rule out the possibility of a severe accident and that high-level efforts for safety must be constantly maintained because there is no such thing as absolute safety. Since it is believed that controlling a reactor that burns MOX fuel is more difficult than one that uses uranium, Kansai Electric cannot be too cautious in operating the Takahama plant.

Environment minister finally does about-face

February 13, 2016

Environment minister retracts radiation remarks, refuses to resign

<http://mainichi.jp/english/articles/20160213/p2a/00m/0na/008000c>

Environment Minister Tamayo Marukawa has retracted her controversial remarks that denied the scientific grounds for the radiation criteria set after the Fukushima No. 1 nuclear plant disaster, while ruling out the possibility of stepping down.

At a press conference on Feb. 12, Marukawa announced the withdrawal of her earlier comments in which she said "there is no scientific evidence" for the government's long-term goal of lowering the annual additional radiation exposure dose to 1 millisievert or less through decontamination and other efforts. Her retraction, which came five days after she made the remarks during a speech in Matsumoto, Nagano Prefecture, marks **a major about-face** as she had earlier practically denied making such comments, on the grounds that she had no recollection of them.

"I would like to extend my sincere apologies once again to disaster victims, including those in Fukushima," Marukawa said on Feb. 12. However, she stopped short of offering her resignation as a Cabinet minister. "I've concluded that I should retract my remarks in order to maintain my relationship of trust with people in Fukushima. It is my responsibility to work to live up to the wishes of Fukushima," the environment minister said.

Marukawa apparently surmised any further denial of her own remarks would aggravate her relations with the Fukushima Prefectural Government and other disaster-hit local governments, while opposition parties were eager to grill her further in the Diet. By retracting her statements the minister aimed to defuse the situation.

According to reports by the Shinano Mainichi Shimbun, Marukawa made the remarks during a meeting of House of Councillors members of the ruling Liberal Democratic Party on Feb. 7, where she said the government's long-term radiation goal was "decided by the then environment minister without any scientific grounds" -- accusing then Environment Minister Goshi Hosono of the Democratic Party of Japan (DPJ). In response, the DPJ demanded Marukawa step down from her post.

Later at a Diet session and on other occasions, Marukawa effectively denied making such remarks, saying, "I don't remember using such phrases. I'm sorry my point didn't get across due to insufficient explanation."

On Feb. 12, however, Marukawa said she came to believe she made those remarks after examining a note recording her remarks and a testimony by an attendee of the Feb. 7 meeting. She then telephoned Fukushima Gov. Masao Uchibori to offer an apology.

The long-term radiation goal, which was introduced during the reign of the DPJ government, provides that decontamination work and other efforts should be carried out to lower the annual radiation exposure dose for the general public at normal times to 1 millisievert or less after deducting exposure to natural radiation.

Marukawa said on Feb. 12, "The government will work together to achieve that goal," emphasizing that the current administration will uphold the long-range goal.

Environment minister withdraws radiation remark, apologizes to Fukushima residents

http://ajw.asahi.com/article/behind_news/politics/AJ201602130023

By YU KOTSUBO/ Staff Writer

Environment Minister Tamayo Marukawa retracted her remark about the government having “no scientific grounds” for its radiation decontamination target in the Fukushima nuclear disaster, saying she wanted to rebuild trust with local residents.

As the minister in charge of overseeing the decontamination efforts in Fukushima Prefecture, Marukawa, 45, said Feb. 12 she wants to “sincerely apologize to residents in Fukushima.”

During a speech in Matsumoto, Nagano Prefecture, on Feb. 7, she labeled the government’s long-term goal of reducing radiation levels near the crippled Fukushima No. 1 nuclear plant to an annual dose of 1 millisievert or less as having “absolutely no scientific grounds.”

A local newspaper, The Shinano Mainichi Shimbun, picked up the story and reported her comments on Feb. 8, which she promptly denied having made.

At Diet sessions on Feb. 9 and 10, Marukawa stated that she had “no recollection of using such wording” in the speech.

Nevertheless, she told the news conference on the evening of Feb. 12 that she had decided of her own volition to “retract the remark in order to maintain a relationship of trust with residents in Fukushima.”

Marukawa went on to say that the government's decontamination target is “indeed scientific in the sense that it was set as a result of thorough discussions by scientists.”

Her acknowledgment of making the faux pas will likely prompt the opposition camp to go on the offensive during Diet sessions in the coming week. For the time being, at least, Marukawa is standing firm. She said she has no intention of stepping down and wants to continue fulfilling her duties.

The decontamination goal was set by the Democratic Party of Japan-led government of the time on the basis of recommendations by the International Commission on Radiological Protection in the aftermath of the triple meltdown at the Fukushima plant triggered by the 2011 earthquake and tsunami disaster.

After the newspaper covered her remarks, Marukawa told reporters on Feb. 8 that she did not remember using such wording as “scientifically ungrounded.” She repeated the plea at Lower House Budget Committee sessions on Feb. 9 and 10.

During a regular news conference after the Feb. 12 morning Cabinet meeting, the minister finally acknowledged the possibility of making the remark.

She eventually retracted the comment later the day after obtaining a memorandum of her speech and confirming the content with attendants.

February 12, 2016

Environment minister withdraws radiation remarks

<http://www.japantimes.co.jp/news/2016/02/12/national/japans-environment-minister-withdraws-radiation-remarks/#.Vr7vG-aDmos>

JJI

Environment Minister Tamayo Marukawa on Friday withdrew remarks she reportedly made about the government’s radiation decontamination target following the March 2011 Fukushima nuclear disaster.

Speaking at a news conference, Marukawa said she apologizes from the bottom of her heart to those suffering from the nuclear accident, including people in Fukushima Prefecture.

She denied that she might step down over the remarks, saying she will continue to fulfill her duties.

Marukawa has been under fire since a newspaper reported remarks she made in a speech in the city of Matsumoto in Nagano Prefecture on Sunday.

She was quoted as saying the government's long-term goal of reducing radiation levels near Tokyo Electric Power Co.'s crippled Fukushima No. 1 nuclear plant to an annual dose of 1 millisievert or less has no scientific grounds.

The goal was set by the government led by the now-opposition Democratic Party of Japan, based on recommendations from the International Commission on Radiation Protection and requests from the Fukushima Prefectural Government.

At Friday's news conference, Marukawa said that the central government will not drop the decontamination goal.

February 12, 2016

Environment minister apologizes to Fukushima governor over radiation comments

<http://mainichi.jp/english/articles/20160212/p2a/00m/0na/014000c>

Environment Minister Tamayo Marukawa said on Feb. 12 that she telephoned Fukushima Gov. Masao Uchibori to apologize over a report on her remarks allegedly denying scientific evidence for the government's long-term goal of lowering the annual additional radiation exposure dose to 1 millisievert after the 2011 meltdowns at the Fukushima No. 1 Nuclear Power Plant.

She also said at a post-Cabinet meeting news conference that she offered a similar apology to a local government leader in Fukushima Prefecture, saying she did not explain herself fully during a Feb. 7 meeting of House of Councillors members from the ruling Liberal Democratic Party in Nagano Prefecture. Marukawa emphasized, though, that she has no plan to retract her comment, saying there was no record of her remarks and she cannot independently confirm them. She added that the current government will continue to maintain its long-term radiation level objective, work hard to achieve this goal, and also restore the areas hard hit by the Great East Japan Earthquake, tsunami and Fukushima nuclear disaster.

2.6 billion dollars to decommission Monju

February 16, 2016

Scrapping prototype reactor could cost \$2.6 bil.

<http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html>

Feb. 16, 2016 - Updated 11:50 UTC+1

Japan's science ministry has revealed that it could cost an estimated 2.6 billion dollars to decommission the troubled Monju fast-breeder nuclear reactor.

The Japan Atomic Energy Agency made the estimates for the prototype reactor in 2012, one year after the Fukushima nuclear accident. The reactor is located at a plant in Fukui Prefecture, central Japan.

This is the first time the decommissioning costs have emerged.

Dismantling the reactor was estimated to take about 1.1 billion dollars. That's double to triple the cost of dismantling a regular reactor.

Maintenance and management was set at 1.3 billion dollars, while removing spent nuclear fuel was projected to cost about 200 million dollars.

The estimates did not include costs of transporting nuclear fuel and removing sodium used to cool the reactor.

The agency officials say they made the estimates due to debate at the time on whether to continue Monju's development. They say **Monju is larger than conventional reactors, so the decommissioning cost is greater.**

A panel of Japan's science ministry is in discussions to find a new operator for Monju after a series of safety problems were found at the plant.

Decommissioning of troubled fast-breeder reactor Monju would cost 300 billion yen

<http://mainichi.jp/english/articles/20160216/p2a/00m/0na/005000c>

The operator of Monju, a trouble-prone prototype fast-breeder nuclear reactor in Tsuruga, Fukui Prefecture, estimates that it would take at least 300 billion yen to decommission the reactor, the Mainichi Shimbun learned Feb. 15.

This is the first time that Monju's decommissioning cost -- which is several times the cost of decommissioning regular nuclear reactors -- has come to light.

The Nuclear Regulation Authority (NRA) has sought replacement of the reactor's operating body, the Japan Atomic Energy Agency (JAEA).

Over 1 trillion yen has been pumped into the Monju reactor thus far, and even if it were reactivated, repairs and other maintenance costs would surpass another 100 billion yen. As such, massive costs would be required to either decommission or reactivate the reactor.

The estimate was made in 2012. If decommissioning of Monju were to undergo the same procedures as the prototype nuclear test reactor Fugen, also in Tsuruga, it would take approximately 30 years and cost some 130 billion yen to dismantle the facility. It would cost an additional 20 billion yen to remove spent nuclear fuel, and some 150 billion yen for maintenance and management costs, such as electricity and labor. **Estimated costs for the removal of spent nuclear fuel include temporary storage, but because no storage site has been decided, the cost of transporting spent fuel to such a site has not been included.**

In the case of ordinary nuclear reactors, such as the No. 1 and No. 2 reactors at Chubu Electric Power Co.'s Hamaoka nuclear plant in Shizuoka Prefecture, the cost of decommissioning both is expected to cost around 84 billion yen, while decommissioning both the No. 1 and No. 2 reactors at Kansai Electric Power Co.'s Mihama nuclear plant in Fukui Prefecture is estimated to cost around 68 billion yen.

Because Monju is sodium-cooled, decommissioning costs are relatively higher than regular, water-cooled nuclear reactors. Furthermore, because the decommissioning technology for sodium-cooled reactors has yet to be established, funds for further research and development will also be needed. In response to numerous maintenance errors pointed out with the Monju reactor, the NRA advised the Ministry of Education, Culture, Sports, Science and Technology last November to propose an alternative operator to the JAEA. The NRA also demanded that if the ministry is unable to do so by around this coming summer, a fundamental review of Monju be conducted. The ministry set up a panel of experts late last year to consider a new operator for the troubled reactor.

TEPCO ordered to compensate voluntary evacuees

February 19, 2016

TEPCO ordered to pay damages for voluntary evacuation from Fukushima

<http://mainichi.jp/english/articles/20160219/p2g/00m/0dm/021000c>

KYOTO (Kyodo) -- A Japanese court on Thursday ruled that the operator of the disaster-struck Fukushima Daiichi nuclear complex is liable for damages stemming from voluntary evacuation by residents in Fukushima Prefecture, believed to be the first ruling of its kind.

The Kyoto District Court ordered Tokyo Electric Power Co. to pay about 30 million yen (\$264,000) in damages to a couple in which the husband lost his job and developed mental illness after the family

voluntarily fled in the wake of nuclear disaster triggered by a huge earthquake and tsunami in March 2011.

The sum the court awarded to the couple in their 40s is also much bigger than the 11 million yen proposed by a government-established center to mediate out-of-court settlements for nuclear accident compensation.

The plaintiffs said the ruling "set an example that there is no need to give up when evacuees do not feel satisfied with the sum" presented by the dispute resolution center. The couple, who have evacuated to the city of Kyoto, sought about 180 million yen from TEPCO in the lawsuit filed in 2013.

According to the ruling, the husband was managing a company before he and his family fled Fukushima in the wake of the nuclear disaster. The husband then developed sleeping problems and suffered from depression before becoming unable to work around May 2011.

Presiding Judge Masayuki Miki determined that the nuclear accident "was one of the main reasons" that the husband suffered mental and other problems. He also found that the financial loss the couple faced was the consequence of the accident.

Of the amount TEPCO was ordered to pay, about 21 million yen in damages is associated with lost employment income and expenses due to evacuation, the ruling said.

Another 1.7 million yen is compensation for being "forced to move to a land with no ties with Fukushima Prefecture which they were familiar with," the court said, adding that they "lost a stable life."

During the triple reactor core meltdown disaster, residents living within 20 kilometers of the TEPCO nuclear plant and some areas beyond were ordered to evacuate. Many others also fled from their homes at their own discretion.

February 18, 2016

Court orders TEPCO to compensate evacuees

<http://www3.nhk.or.jp/nhkworld/english/news/nuclear.html>

Feb. 18, 2016 - Updated 12:30 UTC+1

A court has ordered Tokyo Electric Power Company to compensate 5 people who evacuated after the accident at the Fukushima Daiichi nuclear plant.

The Kyoto District Court issued the ruling on Thursday and told the utility to pay about 30 million yen, or over 260 thousand dollars.

The plaintiffs evacuated from Fukushima to Kyoto Prefecture and elsewhere on a voluntary basis.

They're seeking compensation of nearly 1.6 million dollars. They say they could not work since the accident due to insomnia, depression and other stress-related health problems.

The court said it's reasonable that the plaintiffs voluntarily evacuated, as information on the danger of the unprecedented disaster had not been revealed.

The court also said the plaintiffs had to evacuate from familiar surroundings and that this caused considerable stress and illnesses.

The firm says it will study the ruling in detail and deal with it sincerely.

In a first Tepco told to compensate couple for damage stemming from voluntary Fukushima evacuation

<http://www.japantimes.co.jp/news/2016/02/18/national/crime-legal/first-tepco-told-compensate-couple-damage-stemming-voluntary-fukushima-evacuation/#.VsX2bOaDmot>

Kyodo

The Kyoto District Court has ordered the operator of the crippled Fukushima No. 1 nuclear power plant to pay about ¥30 million to a couple for economic and health damage caused by the family's decision to voluntarily flee the radiation in Fukushima Prefecture.

The husband lost his job and developed a mental illness during the ordeal.

This is believed to be the first time that a court has found Tokyo Electric Power Co. liable for damages stemming from a voluntary evacuation after the plant's triple core meltdown, which was triggered by the Great East Japan Earthquake in March 2011.

The sum awarded is also far more than the ¥11 million proposed by a government-established center that mediates out-of-court settlements for nuclear accident compensation cases.

A lawyer for the plaintiffs, who are in their 40s, said the ruling "set an example that there is no need to give up when evacuees do not feel satisfied with the sum" presented by the dispute resolution center.

The couple — who had moved twice before settling down in the city of Kyoto in May 2011 — had sought ¥180 million in damages.

According to the written complaint, the husband became unable to work because he developed pleurisy (a respiratory disease) and depression after the evacuation. Their children also experienced emotional distress from being harshly treated by classmates because they came from Fukushima Prefecture.

After three reactors experienced meltdowns during the disaster, residents within 20 km of the nuclear plant and some areas beyond were ordered to evacuate. Many others also fled at their own discretion and remain in temporary housing.

Taking individual circumstances of voluntary evacuees into account

February 19, 2016

Lawyer urges Fukushima evacuees to individually file suits against TEPCO

<http://mainichi.jp/english/articles/20160219/p2a/00m/0na/012000c>

A Kyoto District Court ruling on Feb. 18 that ordered Tokyo Electric Power Co. (TEPCO) to pay a man in his 40s and his family redress for damages due to voluntary evacuation has drawn mixed reactions from voluntary evacuees and other parties. The ruling marked the first time that TEPCO, the operator of the disaster-stricken Fukushima No. 1 Nuclear Power Plant, was deemed responsible for damages stemming from voluntary evacuation by local residents.

The court ordered the utility to pay about 30 million yen in damages to the family from Koriyama, Fukushima Prefecture, because the man -- the owner of multiple restaurants -- lost his job and developed mental illness after voluntarily evacuating to Kyoto with his family in the wake of the nuclear disaster triggered by the Great East Japan Earthquake and tsunami in March 2011. The compensation is much higher than about 11 million yen proposed by the government-backed alternative dispute resolution (ADR) procedures.

"We are relieved as (the compensation) will allow us to make a living for the time being, but with only such a limited amount we can't forecast our future prospects because my husband can't work (because of mental illness)," lawyer Kenichi Ido quoted the man's wife as commenting at a news conference after the ruling.

Ido is a former judge who, as the then presiding judge at the Kanazawa District Court, ordered a halt to the operation of the No. 2 reactor of the Shika Nuclear Power Plant in Ishikawa Prefecture in 2006. Ido said at his news conference, "It's a commendable ruling in that it accepted our key arguments. There are many voluntary evacuees who have been compelled to settle for small amounts of compensation by TEPCO. They should file suit individually."

According to people with knowledge of ADR-brokered compromise settlements involving voluntary evacuees, compensation standards set by TEPCO and the governmental Dispute Reconciliation Committee for Nuclear Damage Compensation have been very strict, limiting redress to only 80,000 yen per adult and a labor incapacity period to six months. The Kyoto District Court's ruling raised redress to the man to 1 million yen.

Lawyer Naoto Akiyama, a member of the Daini Tokyo Bar Association who handles many ADR cases, praised the decision as "a ruling which offers hope to evacuees who moved voluntarily, reflecting individual circumstances without being bound to the standards." Masafumi Yokemoto, a professor of environmental policy at Osaka City University's Graduate School of Business who is familiar with the ADR issue, says, "It's unlikely for the central government and TEPCO to change the standards, but an accumulation of judgments in individual suits will be the key to substantially change the standards."

Evacuees from the Fukushima nuclear disaster have filed class action lawsuits across the country. Akiko Morimatsu, 42, co-leader of a national coalition of groups of plaintiffs in Fukushima nuclear disaster lawsuits, fled from Koriyama to Osaka with her two children. She says, "**The ruling is epoch-making for ordering a far bigger amount of compensation than the ADR norms by taking individual circumstances of voluntary evacuees into consideration. If many people raise their voices in the future, the reality of damages will come to light more clearly.**"

But she expressed her displeasure with the ruling in that it limited the reasonable period of voluntary evacuation to the end of August in 2012, saying, "**It's wrong because it's based on government propaganda.**" The ruling reflects a decision by the governmental Dispute Reconciliation Committee for Nuclear Damage Compensation to set the deadline for local residents to continuously evacuate rationally, arguing there was not enough information about dangers from the nuclear disaster up until that deadline.

Official: Nukes stored on Okinawa during Cold War

In a first US admits nuclear weapons were stored in Okinawa during Cold War

<http://www.japantimes.co.jp/news/2016/02/20/national/history/first-u-s-admits-nuclear-weapons-stored-okinawa-cold-war/#.VsgrAuaDmot>

by Jesse Johnson
Staff Writer

Long an open secret, the U.S. government has for the first time officially acknowledged that nuclear weapons were stored on Okinawa during the Cold War.

In a statement on the Department of Defense's Open Government website, the Pentagon revealed Friday "that U.S. nuclear weapons were deployed on Okinawa prior to Okinawa's reversion to Japan on May 15, 1972."

The Defense Department statement also acknowledged "that the U.S. government conducted internal discussion and discussions with Japanese government officials regarding the possible re-introduction of nuclear weapons onto Okinawa in the event of an emergency or crisis situation."

Although widely known — various accounts and documents of a secret deal had previously shed light on the storage of atomic weapons on the islands both before and after Okinawa's reversion — the issue had been controversial because **Japanese leaders and U.S. officials had consistently denied the presence of such weapons within Japanese territory.**

In a 1967 address to the Diet, Prime Minister Eisuke Sato introduced the nation's **Three Non-Nuclear Principles**, which, reflecting public sentiment, have guided the country's nuclear policy since.

The three principles, which helped Sato win the Nobel Peace Prize in 1974, stated that Japan shall neither possess nor manufacture nuclear weapons, nor shall it permit their introduction into Japanese territory.

The National Security Archive at George Washington University said in a posting Friday that "however welcome the release may be, its significance is somewhat tempered by the astonishing fact that U.S. Air Force photographs of nuclear weapons on the island have been publicly available for over 25 years."

The nongovernmental group posted several photos, which were originally released in 1990 from U.S. Air Force collections at the National Archives and Records Administration. The photos had apparently gone unnoticed until now.

Okinawa remains home to a large number of U.S. military bases, and has been the site of recent protests over the transfer of U.S. Marine Corps Air Station Futenma, which has dominated headlines over the past year.

Japan is the only nation to have been attacked with nuclear weapons. The atomic bombs dropped on Hiroshima and Nagasaki in 1945 killed an estimated 200,000 people and, ultimately, led to the Japan's surrender in World War II.

Wasteful reconstruction schemes

February 22, 2016

<http://www.japantimes.co.jp/opinion/2016/02/22/commentary/japan-commentary/wasteful-spending-tohoku/#.VssbluaDmot>

Wasteful spending in Tohoku

Along the beaches of Kesenuma, Miyagi Prefecture, which used to boast popular resorts, a colossal seawall is nearing completion, measuring 14.7 meters high, 9 meters thick at the base and 5 km long. This is but one of many wasteful construction projects being carried out under the pretext of rebuilding the areas in northern Japan devastated by the March 2011 earthquake and tsunami.

Almost five years after the disasters, there are many projects under way that waste huge sums of taxpayer money and benefit only a handful of construction firms and individuals who have sold their land to make way for such ventures. As if by coincidence, law enforcement authorities have taken action over bid rigging among paving companies involved in expressway construction.

Why is such a huge seawall being built in an area of Kesenuma that is mostly rice paddies? A local source confides it is because municipal assembly members, local powerful figures and those close to them sold the land to the central government at a high price. An estimated ¥2.5 billion is said to have been paid by the government to the property owners for the otherwise worthless land on which the seawall is being built.

The total cost for building the 5-km seawall was initially set at ¥23 billion but has now ballooned to ¥36 billion. This is but a small portion of an overall coastal seawall construction project stretching over 400 km in Iwate, Miyagi and Fukushima prefectures, the total cost of which is budgeted at ¥1 trillion.

As of last fall, only 17 percent of the project had been completed. Even though more than 80 percent of it can still be canceled, neither the central government nor the prefectural and municipal governments have any intention of suspending the project.

Another wasteful reconstruction scheme relates to relocating tsunami victims to higher ground. One such project being pushed by the city of Higashi-Matsushima, Miyagi Prefecture, envisages developing a hillside area to accommodate 450 houses. But the cost for the land redevelopment alone is ¥40 billion, or some ¥100 million per house — a figure that befits only the most luxurious residential area.

Even if this project is completed, there are many people who initially welcomed the plan but have found it impossible to build their own house in the area. This is because, according to a member of an association of tsunami victims, the cost to build a house has gone up 50 percent from the initial estimate of ¥15 million.

The Miyagi Prefectural Government, meanwhile, is building 15,000 houses under a seven-year, ¥180 billion plan. As of the end of last year, about half had been completed. But 16 of the 21 municipalities where those houses were built are plagued with vacancies since many of the more than 20,000 quake victims currently living in rent-free temporary housing facilities are refusing to move into these permanent houses. As construction work continues on the remaining 7,000-plus houses, the vacancy rate is bound to increase, rendering it foolish to put any more money into the project.

A total of ¥3.5 trillion in public money is to be poured into areas devastated by the quake and tsunami to build housing facilities or to move people to higher ground. But the results of this spending spree are characterized by huge seawalls resembling prison walls, redeveloped highland areas where only a small number of houses have been built and housing with high vacancy rates.

Another sector in which public money is being wasted is road construction. Many plans for new roads, which had been submitted before the 2011 disasters, are now resurfacing as if to ride on the coattails of the massive reconstruction projects.

One example is a 100-km road to connect the inland city of Morioka and the coastal city of Miyako, both in Iwate Prefecture. Local residents had clamored in vain for the new road for more than two decades. After the disasters, however, money was suddenly allocated for the road, ostensibly for the purpose of securing emergency transport.

Similarly, the Ministry of Land, Infrastructure, Transport and Tourism is pushing a new coastal “reconstruction highway” linking Miyagi and Aomori prefectures.

Such reconstruction projects have brought big benefits to many players in the construction industry — and not just major general contractors but also smaller regional firms. Hashimototen Co., for one, has grown rapidly in the post-earthquake years to become the second-largest contractor in Miyagi Prefecture in terms of completed construction projects, thanks to its close connection with a powerful Liberal Democratic Party Lower House member — Akihiro Nishumura, a former vice minister of reconstruction — and other LDP lawmakers.

A suspicion has reportedly arisen that Hashimototen conspired with third-ranking Maruhon Gumi Corp. to split a pair of tunnel contracts so that each could build one for about ¥1 billion.

Major general contractors are also suspected of collusion. In the immediate aftermath of the earthquake, Hazama Corp. and Maeda Corp., both of which have footholds in the Tohoku region, won many contracts for debris removal. According to a local construction industry insider, this prompted leading general contractors to ask LDP lawmakers to coordinate construction orders for reconstruction projects.

As if to prove that notion, contracts for huge reconstruction projects have all been won by majors like Kajima Corp., Shimizu Corp. and Taisei Corp. Local firms that have been chosen as subcontractors by the majors have prospered so much that their executives are buying expensive cars like Mercedes to reduce their tax payments, says an insider close to a major general contractor.

The very root of this and other unethical conduct in the tsunami-hit areas appears to lie in the staggering ¥26 trillion to be spent by the central government in the first five years following the disasters. If the local

governments are not required to bear any cost, it is logical that they won't worry if the money is going to waste.

Last year, the Reconstruction Agency sought to oblige the prefectures and municipalities to bear part of the cost but faced bitter opposition and was criticized for “bullying the disaster victims.” In the end, it was decided that they will shoulder no more than 3 percent of the total spending. For example, the construction cost of the Sanriku Expressway linking Sendai with Miyako will be wholly shouldered by the central government. A member of the Miyagi Prefectural Assembly, speaking on condition of anonymity, said that the ¥26 trillion has “spoiled” the three prefectures hit hardest by the disasters — Fukushima, Miyagi and Iwate.

The situation in Fukushima Prefecture is complicated by the nuclear crisis, which forced residents near the affected power plant to flee. Even though the evacuation order was lifted last September for the town of Naraha, more than 2,000 former residents had not returned as of Jan. 14, choosing instead to remain in the city of Iwaki.

Currently they are receiving monthly compensation of ¥100,000. A local newspaper reporter said that many of those continuing to remain in temporary housing units are likely to become public welfare recipients after they have used up the compensation money.

It is true that there are local residents who are still suffering from the effects of the March 2011 disasters. But now that five years will soon have passed, attention should not be turned away from the reality of the devastated areas. Continuing to lavish funds on the victimized areas will only result in money collected from taxpayers from all over the country disappearing into the dark — a world that has nothing to do with reconstruction in the true sense of the word.

This is an abridged translation of an article from the February issue of Sentaku, a monthly magazine covering political, social and economic scenes.

News from the nuclear village

‘Nuclear for Climate’ Wins 2016 Pime Award For Communication Excellence

<http://www.nucnet.org/all-the-news/2016/02/23/nuclear-for-climate-wins-2016-pime-award-for-communication-excellence>

23 Feb (NucNet): The European Nuclear Society's (ENS) Pime 2016 award for communication excellence in the nuclear sector was won by the 'Nuclear For Climate' campaign, an initiative created jointly by the French Nuclear Energy Society (SFEN), the American Nuclear Society (ANS) and ENS, and supported by more than 140 members. The campaign aimed to promote the role nuclear power plays in the fight against climate change. The award was announced on 16 February, the final day of the Pime (Public Materials Information Exchange) conference in the Romanian capital Bucharest. The conference included plenary sessions and workshops on social media, lobbying, communications strategies, and engaging with stakeholders and environmentalists. **In a keynote speech, ENS secretary-general Jean-Pol Poncelet told the conference that “anti-nuclear challenges” during the forthcoming Chernobyl and Fukushima anniversaries must be tackled by communicators “transparently and with full honesty”.** The next Pime conference will take place on 20-22 March 2017 in the Netherlands, hosted by the Dutch Central Organisation for Radioactive Waste (Covra).

PIME Award for Communications Excellence
Winner of the Pime 2016 Award:
Initiative Nuclear for Climate

PIME 2016
<http://www.euronuclear.org/events/pime/pime2016/award.htm>

14 - 17 February 2016 in Bucharest, Romania

Initiated by the French Nuclear Energy Society (SFEN) Nuclear for Climate (N4C) is a global grassroots initiative involving nuclear associations, scientific societies and industry forums, nearly 150 organizations worldwide gathering more than 100 000 scientists, technicians, engineers, professional of nuclear energy. In the perspective of the Paris climate summit in December 2015, the COP21, the initiative has helped to coordinate national and international actions of the various associations. The initiative ederated around a common message:

"Nuclear energy is part of the solution for fighting climate change".

Nuclear for Climate's partners

Through its members, Nuclear for Climate stands as spokesperson of the scientists and employees of the nuclear sector. Thanks to scientific associations, N4C brings a credible contribution to the climate change fight. With, in particular its young professionals, the nuclear sector has a human face, friendly, future-oriented, which contrasts with the traditional image of "nuclear lobby".

The initiative was officially launched September 16, 2014 on the sidelines of the IAEA General Conference in Vienna (Austria), with 12 partners: SFEN (France), FORATOM & ENS, Belgian Nuclear Forum (Belgium), WNA, NEI & ANS (US), JAIF (Japan), KNS (Korea), AERB (Brazil), CNS (China), NIA (UK), CNA (Canada) and IYNC, the global network of young generations of nuclear power, with more than 40 local networks. Today Nuclear for Climate brings together 147 organizations from 57 countries, including 9 international associations (ENS, FORATOM, LAS-ANS (Latin America), WiN Europe, WFEO, WNA, INSC, IYNC, WiN Global).

Presentations from the short-listed candidates for the 2016 PIME Award for Communications Excellence:

Series of gaffes raises doubts about Cabinet's qualifications and convictions

February 16, 2016

EDITORIAL: Marukawa's gaffe about Fukushima heightens doubts about Cabinet's aptitude

<http://ajw.asahi.com/article/views/editorial/AJ201602160048>

Environment Minister Tamayo Marukawa caused a stir by claiming the government had no scientific grounds for its radiation decontamination target around the crippled Fukushima nuclear plant. Her comment came in a Feb. 7 speech on the government's long-term goal of reducing radiation levels near the Fukushima No. 1 nuclear plant to an annual dose of 1 millisievert or less.

"There are people who worry about radiation no matter how much the levels have been lowered, people who might well be described, appropriately or not, as an 'anti-radiation camp,'" Marukawa said. "While such people were making noise, the environment minister at that time decided (on the target) without any scientific grounds."

Her remarks were reported the following day by The Shinano Mainichi Shimbun, a local newspaper. Decontaminating areas polluted with radioactive materials and curbing additional exposure to radiation is one of the top policy priorities for Prime Minister Shinzo Abe's Cabinet.

Nearly five years since the nuclear disaster unfolded, decontamination efforts alone appear unlikely to achieve the long-term target in some areas. Residents from these areas have no hope of returning to home soon.

The Democratic Party of Japan-led government set the long-term decontamination goal based on recommendations of the International Commission on Radiological Protection. The panel recommended annual doses in the range of “1 to 20 millisievert” as a yardstick for recovery from the accident.

The government’s decision to adopt the stricter end of the recommended range for the decontamination target reflected strong demand for absolute safety and security among communities in the affected areas. Responding to residents’ desire to return home as soon as possible while pursuing the tough long-term goal has proved a formidable challenge.

The goal, determined after considering a complicated mix of factors, has forced the government to continue making strenuous efforts while learning from mistakes.

If Marukawa didn’t know this background, she should be accused of failing to do her homework. Or **did she know all these facts and was simply trying to demean the previous DPJ-led government?**

Even more troubling is how she flip-flopped in replying to questions about her remark.

The environment minister initially responded to questions posed at the Diet and from reporters by repeatedly saying she had “no recollection of using such wording” in the speech.

On the morning of Feb. 12, however, she changed her account and admitted having made the comments. She retracted the remarks in the evening that day.

Did she really forget making the remarks? Or did she bet that people would eventually forget the matter if she kept saying she had no memory of saying such things?

In any case, Marukawa’s remarks raise serious questions about her aptitude for her job.

However, Marukawa is not the only Cabinet member who has made a verbal blunder indicating a disturbing carelessness in speech.

In a Feb. 9 news conference, Aiko Shimajiri, the state minister for Okinawa and Northern Territories affairs, could not read the kanji characters for the Habomai group of islets, and asked her secretary how the characters should be read. The Habomai islets are part of the Northern Territories, a chain of islands claimed by Japan but occupied by Russia.

Abe himself recently made an embarrassing verbal error.

In an Internet program of his Liberal Democratic Party, Abe misnamed the 2014 Stockholm agreement in which North Korea promised a fresh investigation into the fates of Japanese citizens it had abducted decades earlier. Abe mistakenly called it the Oslo Agreement, a 1993 peace accord between Israel and the Palestine Liberation Organization.

Nobody is free from slips of the tongue or misunderstandings.

But the above-mentioned errors are serious because dealing with the nuclear disaster, tackling the territorial dispute with Russia and resolving the North Korea abduction issue are important challenges placed high on the Abe Cabinet’s policy agenda.

These gaffes could call into question not only the ministers’ qualifications for their jobs but also the Cabinet’s stances toward the issues.

TEPCO admits failing to used guidelines on meltdowns

February 24, 2016

TEPCO admits initial assessments of Fukushima meltdowns were wrong

<http://www.japantimes.co.jp/news/2016/02/24/national/tepcos-admits-initial-assessments-fukushima-meltdowns-wrong/#.Vs1dpuaDmot>

Staff Report

Tokyo Electric Power Co. admitted Wednesday its staff at the Fukushima No. 1 nuclear plant had guidelines on how to determine that a nuclear reactor is melting down, but that operators failed to use them as the disaster unfolded in March 2011.

The implication is that if operators knew this checklist existed they could have triggered a response more appropriate to what turned out to be one of the world's worst disasters in the history of nuclear power. The company's admission is an acknowledgment that its initial assessments at the site were wrong. The disaster began on March 11, 2011, but continues today in the shape of vast quantities of radioactive water building up at the site. Moreover, three reactor cores are filled with hot, melted fuel and may be untouchable for years.

TEPCO's refused to admit "meltdown" for 2 months

February 24, 2016

Tepco admits it should have declared meltdowns at Fukushima plant much earlier

<http://www.japantimes.co.jp/news/2016/02/24/national/tepcos-admits-initial-assessments-fukushima-meltdowns-wrong/#.Vs26LuaDmot>

by Reiji Yoshida

Staff Writer

Nearly five years after the nation's worst nuclear accident, Tokyo Electric Power Co. has admitted that its staff failed to follow damage assessment guidelines, according to which they should have reported the meltdowns almost immediately.

A Tepco spokesman on Wednesday said the company's Disaster Management Manual requires a reactor to be declared "in meltdown" if 5 percent or more of its fuel rods are determined to be "damaged."

Tepco knew the extent of the damage early on. As of March 14, 2011, it estimated that 55 percent of the fuel rod assemblies of the reactor No. 1 and 25 percent of those at reactor No. 3 were "damaged," based on the levels of radiation detected, Tepco spokesperson Yukako Handa told The Japan Times by phone.

Yet, despite widespread public skepticism at that time, the company refused to use the word "meltdown" for a period of about two months.

This led to widespread public speculation about a cover-up and failure to admit the extent of the damage. The sudden removal of a nuclear regulator spokesman fueled this.

Handa said a meltdown would have been declared if the guidelines had been followed correctly. But she said Tepco reported its estimates of damage to the government immediately — as required by law — and its failure to describe the situation as one of meltdown did not break regulations.

“Executives in charge of public relations at the time of the accident were not aware of the assessment criteria written in the Disaster Management Manual,” Handa said.

“They believed there was no clear definition of a ‘meltdown,’ so they didn’t make any clear remarks about one,” she said.

Handa said Tepco will investigate why it failed to follow the assessment manual.

Wednesday’s announcement by Tepco was the first confirmation that such a manual even exists. NHK broke the news earlier in the day.

Whether to admit a “meltdown” was taking place at the plant was a sensitive topic for both the central government and Tepco from the start.

On March 12, one day after the tsunami knocked out power and cooling facilities, Koichiro Nakamura, a senior official at the now-defunct Nuclear and Industry Safety Agency, told a news conference that a “meltdown of a reactor’s core” may be taking place at the Fukushima plant, given the radiation levels detected.

Nakamura was promptly removed from a PR position at the agency, sparking speculation of a government cover-up of something critical underway at the site.

TEPCO did not follow own manual

February 24, 2016

TEPCO failed to follow manual on meltdown

http://www3.nhk.or.jp/nhkworld/en/news/20160224_33/

A new finding on the 2011 Fukushima Daiichi nuclear accident has raised questions about the way the plant’s operator initially explained the catastrophe taking place in the reactors.

Nuclear fuel in 3 of the plant's reactors melted down following the earthquake and tsunami on March 11th of that year.

Tokyo Electric Power Company did not admit there had been meltdowns for 2 more months.

The utility previously said it could find no grounds to conclude the reactors had melted down.

But it has been revealed that the firm's in-house manual noted that damage of more than 5 percent to a reactor core should be called a meltdown. A core houses nuclear fuel.

TEPCO found the description in the manual in a probe following a request from an investigative panel of the Niigata prefectural government.

If the utility had followed the manual, it should have assessed the damage was a meltdown 3 days after the accident, when the reactors' sensors were restored.

Engineers learned at that time that fuel in the No.1 reactor was 55 percent damaged, and 30 percent in the No.3 reactor. Both clearly meet the criteria of a meltdown.

TEPCO revised its manual after the accident. It now says it will assess and disclose when a meltdown has occurred before nuclear fuel is damaged 5 percent.

TEPCO's understanding of 'meltdown' questioned

http://www3.nhk.or.jp/nhkworld/en/news/20160224_27/

A new finding is raising questions about the explanation first offered for what was happening inside damaged reactors at the Fukushima Daiichi nuclear plant in 2011.

Nuclear fuel in 3 reactor cores melted following the earthquake and tsunami that March.

But Tokyo Electric Power Company officials failed to describe these as meltdowns.

They said there were no grounds for reaching that conclusion.

But 2 months later the utility formally admitted all 3 had melted down.

NHK has learned that the firm's own manual says a meltdown has occurred if at least 5 percent of a core has melted. Nuclear fuel is housed in the core.

The operator told NHK it discovered this definition in the course of responding to a request from a Niigata Prefectural Government panel investigating the accident.

An NHK reporter says this would suggest TEPCO did not understand the precise definition of a meltdown until nearly 5 years after the accident.

The utility says it will continue to investigate why it didn't use the word meltdown soon after the crisis began.

Tepco Admits Fukushima Operators Did Not Check Guidelines

<http://www.nucnet.org/all-the-news/2016/02/24/tepcos-admits-fukushima-operators-did-not-check-guidelines>

Unplanned Events & Incidents

24 Feb (NucNet): Tokyo Electric Power Company (Tepco) said today its staff at the Fukushima-Daiichi nuclear station had guidelines on how to determine that a nuclear reactor is melting down, but that operators failed to use them properly as the accident unfolded in March 2011. Tepco said in a statement in Japanese on its website that operators did not thoroughly check the guidelines and failed to determine that core melt was a possibility. Tepco said laws, regulations and internal rules have been amended and retraining has been carried out, but admitted it needs to further improve its efforts to disseminate information about failures at the time of the accident.

Only took TEPCO five years

February 25, 2016

TEPCO discovers after 5 years that it could have quickly declared Fukushima plant meltdown

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201602250043>

By JIN NISHIKAWA/ Staff Writer

Nearly five years later, Tokyo Electric Power Co. said Feb. 24 that it has discovered a guideline in its operational manual that would have allowed it to announce meltdowns in the nuclear disaster in only days instead of the two months it actually took.

TEPCO apologized for failing to be aware for such a long time of the guideline on how to declare meltdowns at its Fukushima No. 1 nuclear power plant, triggered by the Great East Japan Earthquake and tsunami on March 11, 2011.

While the utility announced that reactor cores had been damaged at the No. 1 and No. 3 reactors by March 14 and at the No. 2 reactor by March 15, it did not admit that meltdowns had occurred in the three reactors until May 2011.

Based on its "nuclear disaster countermeasures manual," which was revised 11 months before the disaster, the utility could have instead declared meltdowns at the three reactors by those dates, it said.

"We sincerely apologize for failing to confirm the presence of the guideline in the manual for five years," a TEPCO spokesperson said Feb. 24.

The company will conduct an internal investigation to determine why it failed to promptly determine and announce meltdowns based on the manual.

In the few days after the Fukushima crisis unfurled, core meltdowns at the No. 1 to No. 3 reactors dispersed a large amount of radioactive materials into the environment.

Video footage of TEPCO's in-house teleconferences around the time show that company executives recognized the possibility of meltdowns at the reactors from the early stages of the crisis.

But the company maintained that the reactors suffered "core damage," a condition in which nuclear fuel inside a reactor core is damaged, rather than a "meltdown" at news conferences and in its announcements. In May it officially acknowledged that meltdowns had occurred.

The utility has explained that the delay was caused by the lack of a basis to assess meltdowns in the wake of an accident.

Early on May 14, 2011, TEPCO confirmed that the No. 3 unit had suffered damage to 30 percent of its reactor core and 55 percent of the No. 1 reactor's core was damaged, based on rising radiation levels inside reactor containment vessels. It also determined that 35 percent of the No. 2 reactor's core was damaged on the evening of May 15.

The newly discovered guideline in the disaster countermeasures manual, which was revised in April 2010, stipulates that the company should declare a meltdown when damage to a reactor core exceeds 5 percent, TEPCO officials said.

Company officials failed to announce the meltdowns because they were unaware of the guideline in the manual, according to TEPCO.

The existence of such a standard was confirmed earlier this month during an in-house investigation into how the utility responded to the Fukushima nuclear crisis.

The investigation is being conducted at the request of Niigata Prefecture where TEPCO's Kashiwazaki-Kariwa nuclear power plant, which the company aims to restart, is located.

In a statement on Feb. 24, Niigata Governor Hirohiko Izumida called on TEPCO to conduct a thorough internal investigation to uncover the "truth behind its concealment of meltdowns," including determining who gave instructions.

Greenpeace: 5 years and far from over

Source : Greenpeace

<http://www.greenpeace.org/international/en/news/Blogs/nuclear-reaction/fukushima-nuclear-crisis-japan-radiation-research/blog/55623/>

Five years on and the Fukushima crisis is far from over

Blogpost by **Shaun Burnie** - 24 February, 2016 at 20:00 1 comment

Five years ago the Rainbow Warrior sailed along the Fukushima coast conducting radiation sampling. Now it's back, and has Japan's ex-Prime Minister on board.

Scotland is over 9,000 km from Japan, but there's something the two countries have in common. Along the Scottish coastline, buried in riverbeds, and mixed into the Irish Sea, you can find significant radioactive contamination coming from the other side of the world. Yes, radioactive contamination. All the way from Japan.

Since the 1970s, Sellafield, a nuclear-reprocessing plant in northwest England has been contracted to process high level nuclear waste spent fuel from Japanese reactors. More than 4000 tonnes of spent nuclear fuel was shipped from Japan to Sellafield, including waste from Tokyo Electric Power Company (TEPCO), the owner of the Fukushima Daiichi nuclear plant. As result of reprocessing at Sellafield, more than 8 million litres of low level nuclear waste is discharged into the ocean every day. It's been labelled the "most hazardous place in Europe" - with levels of contamination in the fields, soils and estuaries at a

level that can only be described as a nuclear disaster zone. In fact, the Irish Sea is arguably the most radioactively contaminated sea in the world

We're about to approach the five-year anniversary of the Fukushima Daiichi nuclear disaster, and this is a stark reminder that no matter where you are or how far away, nuclear power has a local and global impact.

I remember waking up to the news on March 11, 2011. Though I was at home in Scotland, I've never felt so connected to the people of Japan. Having spent decades with Greenpeace actively campaigning against nuclear power in Japan, I knew deep down that a catastrophic accident was only a matter of time. With media requests coming in thick and fast, I recall appearing on BBC World News live. In mid-interview, as I was talking about the specific threat at Fukushima, I was interrupted as the news crossed to Japan where Reactor 3 exploded.

Greenpeace Japan sent a team to the Fukushima evacuation zone to conduct independent radiation testing; and researchers on the Rainbow Warrior, kitted up in full body chemical suits, pulled floating seaweed from the surrounding area to use as samples. Our results were unfortunately as you would expect – high levels of contamination. Subsequently, we've also found radiation is still so widespread that it's unsafe for people to return across large parts of Fukushima.

Nearly five years later and I'm in Japan on-board the Rainbow Warrior - this time with the famously anti-nuclear former Prime Minister of Japan, Mr. Naoto Kan. It's truly an honour and privilege to hear him describe the first hours and days of the accident in March 2011, as well as show him the research that we are carrying out. As we sailed within 2km of the nuclear plant the feelings are both profound and surreal. From the deck we've seen steel tanks holding hundreds of thousands of tons of contaminated water; the four reactors now shielded behind temporary structures in an effort to contain some of the radioactive material from being released into the atmosphere; and inside the reactors themselves lie hundreds of tons of molten reactor fuel for which there are no credible plans to deal with.

But there's another reason the Rainbow Warrior is here. A Greenpeace Japan research vessel is conducting underwater marine radiation surveys within a 20km radius of the Fukushima Daiichi plant, with the Rainbow Warrior acting as campaign ship. As with the radioactive contamination near my home in Scotland, Greenpeace is aiming to further the understanding of the impacts and future threats from nuclear power and in particular the Fukushima Daiichi nuclear accident.

For Mr Naoto Kan, who was Japan's leader when the disaster hit, this voyage is as much personal as it is political. In the years since 2011 he has spoken out publicly against the nuclear industry, standing alongside millions of Japanese people opposed to nuclear power – a far cry from the current “tone-deaf” Abe administration, which is desperately trying to save a nuclear industry in crisis. Opposed by the majority of citizens, and beset by enormous technical, financial and legal obstacles, it's an effort that I believe is doomed to failure.

But there's hope.

Like the many communities across the country that are switching to innovative renewable power projects, Mr Kan knows that nuclear should be buried in the past. Renewables in Japan are rising. In the 2015 fiscal year, solar power capable of generating an estimated 13 TWh was newly installed - more than the two Sendai reactors in southern Japan that were restarted that year can produce.

For Japan to go 100% renewable it must urgently formulate more ambitious targets; stop all planned investments in new coal power plants and finally abandon plans to restart its ageing reactors and remove the institutional and financial obstacles to renewable energy growth.

A nuclear free future is not only possible it is essential. Renewable energy is the only safe and secure energy for the people of Japan and the world. .

Shaun Burnie is a senior nuclear specialist with Greenpeace Germany.

Takahama's extension a way of bypassing 40-year rule?

February 25, 2016

Extension of nuclear reactor operations could water down 40-year rule

<http://mainichi.jp/english/articles/20160225/p2a/00m/0na/017000c>

The Nuclear Regulation Authority (NRA) gave de-facto safety clearance to the No. 1 and No. 2 reactors at the Takahama Nuclear Power Station in Fukui Prefecture on Feb. 24, effectively marking the first time for reactors aged over 40 years to pass new safety regulations introduced in the wake of the Fukushima No. 1 Nuclear Power Plant disaster.

While a rule limiting the operational period of reactors to 40 years has been passed in the Diet based on bitter lessons from the Fukushima No. 1 Nuclear Power Plant disaster, the NRA's move shows the country has moved a step forward toward prolonging the service life of aging reactors ahead of the fifth anniversary of the onset of the nuclear catastrophe.

As the government is also setting goals for a future energy mix on the premise of extending reactor operations, the 40-year rule appears destined to be watered down.

"We can overcome technical issues (with aging reactors) if we spend money on them," NRA Chairman Shunichi Tanaka told a press conference on Feb. 24, suggesting that reactors that have been running for over 40 years can be operated for longer if large amounts of money are spent on their refurbishment. When the NRA was launched in 2012, Tanaka had stated, "My understanding is that reactors reach a turning point after about 40 years," and "It would be quite a challenge to extend the service life (of aging reactors) by 20 years." Tanaka's latest remarks represent a major turnaround in his stance on the matter.

The 40-year rule is based on precedents in the United States, and was included in the revised Act on the Regulation of Nuclear Source Material, Nuclear Fuel Material and Reactors, which came into force in 2013. The then administration led by the Democratic Party of Japan (DPJ) explained in the Diet that the 40-year rule was based on the timing of pressure vessel deterioration resulting from exposure to neutrons. The DPJ government also ruled out the possibility of ordinarily extending the service life of aged reactors by up to 20 years, calling this an "exception."

The Federation of Electric Power Companies of Japan, however, opposed the introduction of the 40-year rule, saying that the rule would undermine technical achievements and spark confusion. The 40-year rule has also been "treated like a nuisance" within the Liberal Democratic Party (LDP), according to a senior LDP official, with legislators elected in prefectures hosting nuclear plants drawing up a statement calling for a review of the rule.

Amid such circumstances, Kansai Electric Power Co., which operates the Takahama nuclear plant, spent some 380 billion yen on the renovation of the plant's four reactors before obtaining de-facto safety clearance from the NRA.

In general, old, flammable cables are used at dated reactors. If nuclear plants are to extend their operations, utilities must implement large-scale fire-prevention measures. **Kansai Electric Power Co.**

replaced 60 percent of old cables -- stretching a total of 1,300 kilometers -- with flame-resistant ones at the No. 1 and 2 reactors at the Takahama plant, and also took measures to prevent fire from spreading by wrapping the remaining cables in fireproof sheets. These efforts won the NRA's de-facto stamp of approval. **If such a method is adopted at the seven other nuclear plants in Japan that use similar cables, it could create a loophole in the 40-year rule.**

The NRA, meanwhile, is under pressure to accelerate its safety screenings on the two reactors at the Takahama plant. For reactors over 40 years in service to be reactivated, they must not only pass safety screenings but also have their construction plans and the extension of operations approved before the legal deadline. The NRA is now set to conduct full-scale inspections on the pressure vessels and other apparatus at the plant to check the rate of their deterioration. The legal deadline for putting the No. 1 and 2 reactors back into operation is looming on July 7 -- the three-year mark since the new safety regulations came into force -- and the reactors must clear the relevant conditions before that deadline, or else they must be decommissioned.

Since last autumn, the NRA has had workers focus on screening the No. 1 and 2 reactors, effectively giving priority to the Takahama plant over the other plants awaiting screenings. The Feb. 24 issuance of de-facto approval for the two reactors' operation came only 11 months after Kansai Electric Power Co. filed an application for the safety review in March last year.

Swift measures were taken because the NRA may face litigation if a delay in screening results in reactor decommissioning.

There remain many hurdles ahead, however, before the two reactors can be reactivated. The NRA shelved work to examine the quake resistance of equipment inside the reactors until after the safety clearance. Even if the reactors manage to pass the quake resistance evaluations and gain final approval by July, the utility must also build domes shielding against radiation on top of the reactor buildings, among other construction work, in order to have their service life extended. Therefore, the resumption of operations of the two reactors is expected to come **sometime after October 2019**, even if all conditions are met.

"If the Takahama plant manages to have the extension of the reactors' service life approved, it will serve as a model for other plants in terms of expenses and the response to regulations," said a senior official with a major power company.

February 24, 2016

Analysis: Nuclear watchdog's green light for Takahama reactors a threat to '40-year rule'

<http://mainichi.jp/english/articles/20160224/p2a/00m/0na/017000c>

In putting together what is essentially a passing grade for the No. 1 and No. 2 reactors at the Takahama Nuclear Power Plant in Fukui Prefecture -- which have been in operation for over 40 years -- to further extend their operation, the Nuclear Regulation Authority (NRA) could be signaling a trend of brushing aside what is supposed to be a general rule of decommissioning reactors after 40 years of service. Applications to have the NRA screen the two reactors for extensions were made in March last year. They were among the later applications on the list, numbering 22nd and 23rd. But the NRA has held evaluations

on the two reactors nearly every week since last fall, and they have become the sixth and seventh to have rough drafts of their evaluations approved.

This preferential treatment is irregular when considering that other nuclear reactors have been waiting over 2 1/2 years for their evaluation results.

Speeding up evaluations of the Takahama plant reactors paved the way for the NRA to beat a legal time limit that would require the reactors to be shut down if they weren't approved for extension by July this year.

Should the NRA's evaluation have dragged on past this time limit, it might have been sued by the reactors' owner, Kansai Electric Power Co.

The government wants to avoid older reactors being shut down so it can keep to its policy of having nuclear power account for 20 to 22 percent of Japan's power supply in fiscal 2030. However, an extension of reactor operations by up to 20 years beyond their designated operational life of 40 years is supposed to be limited to "exceptions."

At a press conference in 2012 right after the NRA's establishment, NRA Chairman Shunichi Tanaka commented, "It would be quite hard to get a 20-year extension." But after only 11 months of evaluation, the possibility of such an extension has come forward for the Takahama reactors. The Takahama case could serve as a springboard for more reactors to bypass the "40-year rule" on decommissioning.

The 40-year-rule was put together in the Diet to reduce the nation's dependence on nuclear power in the wake of the lessons learned from the Fukushima No. 1 Nuclear Power Plant disaster. It may be time for the NRA to return to the spirit of that original initiative.

Is the 40-year limit becoming meaningless?

February 25, 2016

EDITORIAL: Extending life of nuclear reactors should not be left solely up to utilities

<http://ajw.asahi.com/article/views/editorial/AJ201602250031>

Japan's nuclear regulator has endorsed the safety of two reactors that have been in service for more than four decades.

The Nuclear Regulation Authority (NRA) announced on Feb. 24 that the No. 1 and No. 2 reactors of Kansai Electric Power Co.'s Takahama nuclear power plant in Fukui Prefecture meet the new safety standards introduced after the 2011 Fukushima nuclear disaster.

The NRA's verdict has opened the door to an extension of the operating lives of the aging reactors to up to 60 years, one of Kansai Electric's key goals for its nuclear power generation.

A revision to a law following the catastrophic accident at the Fukushima No. 1 nuclear power plant has set the legal life of nuclear reactors at 40 years. But one extension by up to 20 years is allowed with NRA approval.

To extend the operational lives of the two reactors, the operator must receive several approvals from the NRA. If the NRA decides that the reactors have fulfilled all the related criteria, this will become the first case of an extension of the legal life of reactors under the new system.

The 40-year limit was introduced by the government led by the Democratic Party of Japan, which was in power when the nuclear disaster occurred, to demonstrate its commitment to weaning Japan from its dependence on atomic energy. It was aimed at ensuring a steady phasing out of nuclear power generation through the decommissioning of aging reactors.

The provision for an extension of the life span was added in response to concerns about possible power shortages due to insufficient capacity.

But **no specific rules have been set with regard to what kind of circumstances should justify permitting extended operations.**

What is vital for electric utilities is the economic viability of their nuclear power plants. Five small reactors that are not sufficiently cost-effective under the 40-year limit on operations have been set for retirement. Of the remaining 43 reactors, 18 units have been in service for more than 30 years. **Utilities will apply for permission to run aging reactors beyond the 40-year legal life span if it makes economic sense.** Some applications for a longer license have already been filed with the NRA.

If an extension of the legal life of reactors is approved one after another, the 40-year limit could become meaningless.

With such decisions, we are concerned that the government's nuclear energy policy and the energy future of this nation are being defined under the initiative of electric utilities focused on generating profits.

Where is the political will that transcends the profit equations of power suppliers?

If aging reactors are allowed to exceed the 40-year life span in rapid succession, the disturbing safety risk posed by a thick cluster of reactors in Fukui Prefecture will not be reduced.

Prime Minister Shinzo Abe has repeatedly pledged to reduce Japan's dependence on nuclear energy as much as possible. **The government should make it clear that an extension can be made as an exception.**

Before the harrowing nuclear accident, there was no legal life for nuclear reactors. Initially, electric power companies said the operational life of their reactors was around 30 to 40 years.

Later, the former nuclear regulator, which has been replaced by the NRA, introduced a system that allowed utilities to operate reactors for up to 60 years if they submit maintenance plans every 10 years after the 30th year of service. The regulator cited progress in analysis technology as the reason for extending operational licenses for reactors.

The previous government's decision to replace this system with the new 40-year rule reflected its will to phase out nuclear power generation in this nation.

Immediately after assuming the post, NRA Chairman Shunichi Tanaka was skeptical about extending the life of reactors, saying it was "considerably difficult."

In assessing the safety measures Kansai Electric has taken for the reactors at the Takahama plant, however, the NRA has given the green light to the utility's plan to cover electric cables with a fire-resistant sheet where it is difficult to replace them with flame-retardant cables.

The NRA's move has greatly encouraged utilities seeking to gain permission to run reactors past the 40-year limit because this has been a major technical obstacle to meeting the safety standards.

In his policy speech at the beginning of the current Diet session in January, Abe made no reference to nuclear power generation. Does this indicate that the government will not do anything to stop the growing trend toward longer-term reactor operations?

If so, the government will act against both the past words of the prime minister concerning the issue and the wishes of many Japanese to see their nation free from nuclear energy.

--The Asahi Shimbun, Feb. 25

Indictment nears

February 26, 2016

Charges near for former TEPCO executives over Fukushima nuclear disaster

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201602260087>

THE ASAHI SHIMBUN

Lawyers on Feb. 29 are expected to indict three former executives of Tokyo Electric Power Co. on charges of professional negligence resulting in death and injury in connection with the 2011 Fukushima nuclear disaster.

The indictment mandated by a citizens panel will be filed at the Tokyo District Court by lawyers serving as prosecutors.

Tsunehisa Katsumata, a 75-year-old former TEPCO chairman, and two former vice presidents, Sakae Muto, 65, and Ichiro Takekuro, 69, led the utility when the Great East Japan Earthquake and tsunami on March 11, 2011, triggered the meltdowns at the Fukushima No. 1 nuclear power plant.

The indictment will say the three former executives were aware that such a large tsunami could strike the coast of the Tohoku region, but they did not take measures to protect the nuclear plant.

The indictment will also argue that their failure to carry out their professional duties led to the deaths of patients at hospitals in mandatory evacuation zones as well as injuries to other residents during the evacuation.

A **criminal complaint** was filed against the three former executives by residents and citizens groups. The Tokyo District Public Prosecutors Office in September 2013 decided not to indict the former executives, saying it was difficult for TEPCO to forecast such a large-scale natural disaster hitting the nuclear plant.

However, the Tokyo No. 5 Committee for the Inquest of Prosecution in July 2014 overrode the prosecutors' decision, and sent the case back to them for a further look.

But the prosecutors again decided not to indict the three.

The citizens panel in July 2015 again overrode the decision, saying the three former executives should face mandatory indictment and be tried in court.

Court-appointed lawyers will serve as the prosecutors in the trial.

Ex-TEPCO executives face trial over disaster

February 26, 2016

3 ex-TEPCO execs to be indicted Mon. over Fukushima nuclear disaster

<http://mainichi.jp/english/articles/20160226/p2a/00m/0na/005000c>

TOKYO (Kyodo) -- Three former executives of Tokyo Electric Power Co. will be indicted Monday for allegedly failing to take measures to prevent the tsunami-triggered crisis at the Fukushima Daiichi nuclear complex, a lawyer in charge of the case said Friday.

- **【Related】** TEPCO could have known Fukushima meltdown days after disaster
- **【Related】** Upcoming Tokyo photo exhibition to convey scars of 2011 quake disaster

The three, who will face charges of professional negligence resulting in death and injury, are Tsunehisa Katsumata, 75, chairman of TEPCO at the time, and two former vice presidents -- Sakae Muto, 65, and Ichiro Takekuro, 69.

Prosecutors decided not to indict the three in September 2013, but the decision was overturned in July 2015 by an independent committee of citizens that mandated the three be charged on the grounds they were able to foresee the risks of a major tsunami prior to the disaster.

Source close to the matter said the three will be indicted without being taken into custody.

But the trial to look into the criminal responsibility of the then key TEPCO figures is unlikely to start by the end of the year, as preparations to sort out evidence and points of issues apparently require a considerable amount of time, they said.

At the six-reactor plant located on the Pacific coast, tsunamis triggered by the massive earthquake on March 11, 2011, flooded power supply facilities and crippled reactor cooling systems. The Nos. 1 to 3 reactors suffered fuel meltdowns, while hydrogen explosions damaged the buildings housing the No. 1, 3 and 4 units.

The Committee for the Inquest of Prosecution has said the former executives received a report by June 2009 that the plant could be hit by tsunami as high as 15.7 meters and that they "failed to take pre-emptive measures knowing the risk of a major tsunami."

It also blamed the three for the injuries of 13 people, including Self-Defense Forces members, when hydrogen explosions occurred at the plant and the death of 44 hospital patients who evacuated amid harsh conditions.

A group of Fukushima citizens and other people filed a criminal complaint in 2012 against dozens of government and TEPCO officials over their responsibility in connection with what became one of the world's worst nuclear crises.

But as prosecutors decided not to file charges on them, including then Prime Minister Naoto Kan, the group narrowed down its target and asked the committee to examine whether the prosecutors' decision was appropriate.

Ex-TEPCO executives face trial over Fukushima

http://www3.nhk.or.jp/nhkworld/en/news/20160226_23/

Three former executives of the Tokyo Electric Power Company are set to face a court trial for the March 2011 nuclear accident at the Fukushima Daiichi plant.

NHK has learned that court-appointed lawyers have decided to indict former TEPCO chairman Tsunehisa Katsumata and former vice-presidents Sakae Muto and Ichiro Takekuro.

The 3 ex-executives are to be charged with professional negligence resulting in deaths and injuries. The lawyers were named by the court to act as prosecutors.

In 2013, public prosecutors decided not to press charges, but a prosecution inquest panel of citizens voted last July to indict them. This paved the way for the mandatory indictment by court-appointed lawyers.

Sources say the lawyers consider the three failed to implement necessary measures, despite being told a tsunami could cause flooding at the Fukushima plant.

The lawyers reportedly say the nuclear accident led to the deaths of patients after they were evacuated from Futaba hospital.

The 3 would-be defendants are expected to enter a plea of not guilty, saying they could not have predicted a massive tsunami.

Nobody has yet been held criminally responsible for Japan's worst nuclear accident.

And don't do it again!

February 25, 2016

Suga: Govt. to tell TEPCO to prevent recurrence

http://www3.nhk.or.jp/nhkworld/en/news/20160225_26/

Japan's government says it will instruct the operator of the damaged Fukushima nuclear plant to take steps to prevent a recurrence of its failure to swiftly determine that a meltdown occurred.

Chief Cabinet Secretary Yoshihide Suga on Thursday expressed regret over the delay by Tokyo Electric Power Company, or TEPCO, in determining meltdowns had taken place at the Fukushima Daiichi plant in March 2011.

The utility on Wednesday said it could have judged the incidents at 3 reactors to have been meltdowns 3 days after the accident if it had followed an in-house manual. The firm did not determine there had been meltdowns until 2 months later.

Suga said it was extremely regrettable that TEPCO failed to properly check the manual at that time and gave wrong explanations about the meltdowns.

Niigata Prefecture, which hosts a nuclear power plant, has been asking TEPCO to clarify its grounds for determining meltdowns. The utility previously said no such grounds were determined, even though definitions of a meltdown were included in the manual.

Suga said TEPCO officials should be aware that nuclear power generation is not possible without a relationship of trust with host communities. He said the utility must provide detailed explanations to the prefecture.

He also said the industry ministry will strictly instruct the firm to look into what happened at the time and to take proper steps to prevent a recurrence.

Pr. Hirose: TEPCO's "big error"

Expert criticizes TEPCO's failure to follow manual

http://www3.nhk.or.jp/nhkworld/en/news/20160225_10/

A Japanese expert has criticized the operator of the damaged Fukushima Daiichi nuclear power plant for its failure to follow a manual on judging when a meltdown occurs.

Professor Emeritus Hirotada Hirose of Tokyo Woman's Christian University called the failure "a big error".

Nuclear fuel in 3 of the plant's reactors melted down following the earthquake and tsunami on March 11th, 2011.

Tokyo Electric Power Company, or TEPCO, did not admit there had been meltdowns until 2 months after the accident.

The utility previously said it could find no grounds to conclude the reactors had melted down.

But it admitted on Wednesday that the utility's in-house manual noted that damage of more than 5 percent to a reactor core should be called a meltdown.

If the utility had followed the manual, it should have assessed the damage was a meltdown 3 days after the accident.

Hirose said it was a big mistake that TEPCO officials did not follow the manual's guidelines.

He says the delay in announcing the meltdown made people think that the situation at the plant wasn't as serious as it was.

Hirose said TEPCO has repeated accidents and falsified data, and that nobody will be able to trust the firm unless it changes such practices. He said TEPCO should proactively provide information on its errors.

TEPCO not very convincing

February 26, 2016

EDITORIAL: TEPCO gives unconvincing excuse for delay in meltdown declaration

<http://ajw.asahi.com/article/views/editorial/AJ201602260057>

Tokyo Electric Power Co., the operator of the stricken Fukushima No. 1 nuclear power plant, said Feb. 24 that it could have declared the reactor meltdowns at the plant much earlier than it did.

The utility said it discovered a guideline in its operational manual that would have allowed it to announce core meltdowns only three days after the plant was struck by the tsunami in 2011 instead of the two months it actually took.

In a Feb. 24 news conference, a TEPCO official said the manual had been discovered for the first time earlier in February.

But the company's explanations about the delay in announcing the meltdowns, triggered by the Great East Japan Earthquake and tsunami on March 11, 2011, and the recent "discovery" of the document are by no means convincing.

TEPCO initially maintained that the reactors suffered "core damage," a condition in which nuclear fuel inside a reactor core is damaged, rather than a "meltdown." It did not admit that meltdowns had occurred in the three reactors until late May 2011, more than two months later.

The utility claimed it had taken so long to acknowledge the meltdowns because there was "no basis" for making the judgment.

But this claim has proved false. At that time, TEPCO was suspected of concealing facts to make the accident look less serious than it actually was. The latest revelations revive such suspicions.

In a statement on Feb. 24, Niigata Governor Hirohiko Izumida called on TEPCO to conduct a thorough internal investigation to uncover the “truth behind its concealment of meltdowns,” including determining who gave the instructions.

Niigata Prefecture is home to TEPCO’s Kashiwazaki-Kariwa nuclear power plant, which the company aims to restart. Izumida has every right to make the demand.

Even more baffling is the “discovery” of the manual nearly five years after the nuclear crisis broke out. Back then, core meltdowns were clearly defined as nuclear emergencies under the nuclear disaster special measures law. Given that TEPCO has been very sensitive to the question of whether trouble at a nuclear power plant, no matter how minor, should be reported to the government, it is hard to believe that the company failed to remember the standard concerning meltdowns.

It is clearly impossible to directly confirm whether a core meltdown is taking place during a severe nuclear accident.

That’s apparently the reason why TEPCO established a clear criterion for a nuclear meltdown that required the company to declare a meltdown when damage to a reactor core exceeds 5 percent.

When a nuclear accident occurs, only the operator of the nuclear plant has access to detailed data about what is happening. Both the government and news media depend on information provided by the plant operator for related policy decisions and news coverage.

A utility’s failure to swiftly offer accurate information about the situation could cause the government to make misguided policy decisions and the media to distribute incorrect reports about the accident.

TEPCO’s report on its investigation into the nuclear disaster, released in 2012, defended the company’s use of the term “core damage.” The report argued that the company had tried to provide accurate information about the conditions of the reactors based on available data by avoiding the term “core meltdown” because there was no clear and widely shared definition of the term.

It cannot be said that TEPCO provided the entire picture of what happened based on exhaustive and effective efforts to identify all the factors involved.

The company’s guideline concerning core meltdowns was “discovered” during an in-house investigation into how the utility responded to the Fukushima nuclear crisis. That investigation was conducted at the request of a technical committee of the Niigata prefectural government.

The prefecture called for a fresh inquiry in connection with TEPCO’s plan to restart the Kashiwazaki-Kariwa nuclear power plant.

TEPCO has said it will look into how it failed to notice the existence of the guideline through a probe involving outsiders.

The utility should determine who should be held accountable for that failure.

The company also needs to offer convincing answers to such questions as how it will prevent a recurrence and whether problems with its corporate culture played a role. Otherwise, its efforts to regain public trust are destined to fail.

--The Asahi Shimbun, Feb. 26

(Still) depending on TEPCO: Fukushima' dilemma

February 26, 2016

Fukushima towns grudgingly realize survival again depends on TEPCO

<http://ajw.asahi.com/article/0311disaster/recovery/AJ201602260069>

THE ASAHI SHIMBUN

Futaba Mayor Shiro Izawa was taken aback when the president of Tokyo Electric Power Co. paid a visit in early January.

Izawa has been working out of a temporary government office in the town of Iwaki, Fukushima Prefecture, since the disaster at TEPCO's Fukushima No. 1 nuclear plant forced all residents to evacuate Futaba in 2011.

"Have you perhaps forgotten that TEPCO is the perpetrator that has driven Futaba into the situation it finds itself?" Izawa grumbled at TEPCO President Naomi Hirose. "I am beyond furious."

But within minutes, Izawa was peppering Hirose with requests to rebuild life in his community.

Residents and government leaders around the still stricken nuclear plant continue to vilify the plant's operator, but they are increasingly aware that economic survival depends largely on the very entity that turned their communities upside down.

Before the 2011 Great East Japan Earthquake and tsunami caused the meltdowns at the Fukushima No. 1 nuclear plant, the host and surrounding communities depended largely on nuclear power plants for government subsidies and employment.

They are resigned to having again depend on TEPCO for the billions of yen that will be sunk into the prefecture for work to decommission the reactors at the utility's No. 1 plant as well as its No. 2 plant in Fukushima Prefecture.

Every day, about 7,000 workers pass through the gates of the Fukushima No. 1 plant for the decommissioning process that is expected to take decades to complete.

Some say the nuclear plant has been a source of income than crosses generations.

A 61-year-old man who was part of the team that constructed the No. 6 reactor at the plant now dismantles tanks that once contained radiation-contaminated water there.

"The nuclear plant remains unchanged as a stable workplace from before the accident," he said.

His father was also involved in construction of the nuclear plant, which started operating in 1971.

After the 2011 disaster, relatives beseeched the man to cut all ties with the plant. But he has no intention of ending his work there.

The effects of the accident indeed sparked anger and distrust of TEPCO and nuclear power in general.

The Fukushima prefectural government decided to end its dependence on nuclear plants and supply all electricity through renewable energy sources. It has asked for the decommissioning of all reactors in the prefecture.

However, the prefectural government faces the difficult task of revitalizing the local economy because about 70,000 residents remain in evacuation close to five years after the accident.

Decommissioning work is now one of the only realistic large-scale options to support the local economy.

The central and prefectural governments are placing high hopes on research and development related to decommissioning the reactors.

In September 2015, after the evacuation order was lifted for the town of Naraha, the Japan Atomic Energy Agency built a facility in the municipality to conduct experiments on remote-control use of robots in the decommissioning work.

An international joint research center is planned for Tomioka, which lies immediately north of Naraha.

"Community development will not proceed unless there is a core structure," a government source said. "It would be perfectly all right if money was injected through the decommissioning business."

TEPCO has been constructing bases for decommissioning work in municipalities where evacuation orders are still in place.

In Okuma, a community that co-hosts the Fukushima No. 1 nuclear plant, TEPCO has built a facility to prepare 2,000 meals a day for workers at the plant. There are also plans to construct dormitories that can house 750 employees.

By the end of March, TEPCO's Fukushima Revitalization Headquarters, now based at the J-Village training center about 20 kilometers from the Fukushima No. 1 plant, will move to Tomioka.

"It is the responsibility of the central and other governments as well as TEPCO to create a situation where those who want to return can do so," said Yoshiyuki Ishizaki, chief of the headquarters.

Kazuyuki Shima, 37, who has lived in temporary housing in Iwaki since evacuating from Okuma, believes that creating jobs will lead to a revitalized local community.

He now works at the TEPCO facility that prepares meals for workers.

"If people gather for decommissioning, the restart of supermarkets and hospitals will also be accelerated," Shima said. "That will make it easier for local residents to return. If that happens, I believe this community will not be forgotten."

At the same time, the decommissioning plans have led to unusual demographics.

Often, the number of workers involved in decommissioning exceeds the number of residents who have returned to their homes.

That is the case in Hirono, a town within a 30-kilometer radius of the Fukushima No. 1 plant. The town also has nearly twice as many men as women.

To prevent housing facilities from sprouting up all over the town, the local government plans to adopt an ordinance requiring prior notification of construction plans of such buildings.

About 1,300 workers involved in decommissioning and decontamination work around the plant now reside in Naraha, about triple the number of residents who have returned home.

The Naraha town government is encouraging the construction of housing for the workers at a golf course away from the residential area.

"Residents might be concerned about the large number of strangers in their community and will be hesitant about returning home," a high-ranking town official said.

In Mayor Izawa's deserted town of Futaba, there are no signs of when residents can return home.

After lambasting the TEPCO president, Izawa asked for help in persuading companies involved in decommissioning R&D to build offices in Futaba.

"I do feel the contradiction, and I am in quite a dilemma," Izawa said. "But without that, can a local government that never had any other major industry ever think of surviving?"

False compensation claims with insider's help?

February 27, 2016

TEPCO insider helped cook up false nuke crisis compensation claims: ex-NPO exec

<http://mainichi.jp/english/articles/20160227/p2a/00m/0na/006000c>

An ex-NPO executive accused of making false claims for nuclear crisis compensation has testified in his trial that someone inside Tokyo Electric Power Co. (TEPCO) provided instructions on how to make the claims, it has been learned.

Kazuaki Shindo, a 44-year-old former senior executive at Nakano Ward, Tokyo-based NPO "Higashinihon Daishinsai Genshiryoku Saigaito Hisaisha Shien Kyokai" (support association for victims of the Great East Japan Earthquake and nuclear disaster), made the statement at the Tokyo District Court on Jan. 25. Shindo is on trial for allegedly conspiring with an event management company in Fukushima Prefecture around April 2012 to extract about 12 million yen in compensation from TEPCO through a false claim for sales lost due to the nuclear disaster.

The NPO is accused of acting as a compensation claim agent for companies posing as victims of the nuclear disaster. Hiroshi Murata, 57, another former senior official of the NPO who was arrested and indicted with Shindo, was given a nine-year prison sentence on Feb. 15.

Shindo testified he was told by Murata, "If (the TEPCO employee) checks your documents and you then submit a perfect application, your claim will go smoothly."

According to Shindo's testimony, the TEPCO employee was a friend of Murata's, and he taught Shindo how to fill in the compensation claim forms. Shindo said that when a false claim was paid out, the NPO would give the insider a cut.

Shindo provided specific examples of the advice given to him by the employee, such as, "Subcontractor companies should apply for compensation individually." He also said there was at least one case where the NPO paid the insider a 5 percent cut of the compensation money. When a prosecutor asked, "What was the payment for?" Shindo said, "I think it was for the information provided and the quality of the instructions."

At the trial, the TEPCO employee was referred to only by the pseudonym "Yamazaki." Shindo said he had not met Yamazaki in person, and that he was told by Murata that Yamazaki joined the scam because, due to personal matters, his salary alone was insufficient. He also said that he gave Yamazaki's mobile phone number to investigators.

Shindo's lawyer told the Mainichi Shimbun, "The insider must have existed. The claims actually went through, and unless (the insider) was someone of significant standing, they could not have pulled this off." A representative for TEPCO's public relations office said, "We reserve comment on individual testimony, but we will cooperate earnestly with the authorities."

TEPCO's executives indicted

February 29, 2016

Three ex-TEPCO executives indicted over Fukushima nuclear disaster

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201602290064>

THE ASAHI SHIMBUN

Three former executives of Tokyo Electric Power Co. will finally have to explain in court their actions--or inaction--in relation to the disaster at the Fukushima No. 1 nuclear plant five years ago.

Court-appointed lawyers serving as prosecutors filed indictments at the Tokyo District Court on Feb. 29 against the three former executives on charges of professional negligence resulting in death and injury.

Former TEPCO Chairman Tsunehisa Katsumata, 75, and two former vice presidents, Sakae Muto, 65, and Ichiro Takekuro, 69, are accused of failing to implement safety measures despite being aware of the possibility that such an accident could unfold at the utility's Fukushima No. 1 nuclear plant.

The indictment says the three knew beforehand that a tsunami exceeding 10 meters could hit the plant, flood a reactor building, cause a loss of electric power, and lead to an explosion. But they still did not take adequate measures to safeguard the plant.

The Fukushima No. 1 plant is located 10 meters above sea level.

A tsunami greater than 10 meters did hit the plant site following the Great East Japan Earthquake on March 11, 2011. The waves flooded reactor buildings, knocked out power and caused hydrogen gas explosions.

A number of patients at hospitals in the vicinity of the stricken nuclear plant died or were injured in the subsequent evacuation. The indictment said the three former executives should be held criminally responsible for these deaths and injuries.

The three former executives are expected to plead innocent at their trial.

However, the trial is expected to bring into the open internal TEPCO documents that have not been released until now.

After a criminal complaint was submitted by residents and citizens groups, the Tokyo District Public Prosecutors Office decided in September 2013 not to indict the former executives, citing the difficulty in predicting such an accident.

However, in July 2014, the Tokyo No. 5 Committee for the Inquest of Prosecution overrode the prosecutors' decision and sent the case back to them for a further look.

But the prosecutors again decided not to indict the three.

In July 2015, the inquest committee handed down a second decision stating the three former executives should be indicted because "they bore the obligation to hold a high level of attention in order to prepare against the remote chance of an accident."

Before they submitted the indictment to the court, the five court-appointed lawyers serving as prosecutors read over the former executives' responses to questioning by prosecutors.

TEPCO issued a statement on Feb. 29 saying it would refrain from commenting on a legal case.

Ex-TEPCO officials indicted over Fukushima

http://www3.nhk.or.jp/nhkworld/en/news/20160229_23/

Three former executives of the Tokyo Electric Power Company have been indicted over the March 2011 nuclear accident at the Fukushima Daiichi plant.

Court-appointed lawyers indicted on Monday former TEPCO chairman Tsunehisa Katsumata and 2 former vice presidents, Ichiro Takekuro and Sakae Muto.

The 3 former executives have been charged with professional negligence resulting in death or injury.

The lawyers were named as prosecutors by the court.

In 2013, public prosecutors decided not to press charges against the 3. But a prosecution inquest panel of randomly selected citizens voted last year to indict them.

The indictment says the former executives could have predicted that the nuclear power plant would be inundated by tsunami waves, but they failed to take appropriate safety measures. It says this led to hydrogen explosions at several reactor buildings and resulted in the injury of 13 people.

The indictment also says the former executives forced patients and others to evacuate a hospital in Okuma Town. It says that as a result, the conditions of 44 people worsened and they died.

While addressing a Diet committee, Katsumata said he did not receive a briefing on the possibility of tsunami-triggered flooding, because the report stopped at the division in charge of nuclear power and plant operation.

Takekuro told the committee they did not take substantial measures because the possibility of a serious accident was calculated based on an assumption.

Muto said they believed standards discussed by experts were enough to ensure safety.

Former Tepco execs indicted for failing to anticipate, prevent meltdowns

Kyodo

<http://www.japantimes.co.jp/news/2016/02/29/national/crime-legal/tepco-trio-face-charges-failing-act-prevent-11-meltdown-debacle/#.VtRZ-OaDmot>

Three former executives of Tokyo Electric Power Co. were indicted Monday for allegedly failing to take measures to prevent the tsunami-triggered crisis at the Fukushima No. 1 nuclear plant in March 2011. The indictment, mandated by an independent panel of citizens after prosecutors decided against bringing charges, seeks to answer in court the question of whether the key Tepco figures should be held criminally responsible for the disaster.

The three executives facing charges of professional negligence resulting in death and injury are Tsunehisa Katsumata, 75, chairman of Tepco at the time, and two former vice presidents, Sakae Muto, 65, and Ichiro Takekuro, 69.

The indictment blames them for injuries to 13 people, including Self-Defense Forces personnel, from hydrogen explosions at the plant, as well as the deaths of 44 patients forced to evacuate from a nearby hospital.

In a statement Monday, Tepco's public relations office offered a renewed apology over the accident but declined to comment on the indictment because it concerns a criminal case.

The three executives were not taken into custody. They are likely to plead not guilty.

The crisis at the six-reactor plant on the Pacific coast started when tsunami triggered by the massive earthquake of March 11, 2011, flooded power supply facilities and crippled reactor cooling systems. Reactors 1, 2 and 3 suffered fuel meltdowns, while hydrogen explosions damaged the buildings housing reactors 1, 3 and 4.

The trial is expected to be long and is unlikely to start before the end of the year, as preparations to compile evidence and points of issue will require a considerable amount of time, sources familiar with the case said.

After prosecutors dropped their charges, the Committee for the Inquest of Prosecution, an independent committee of citizens, overturned the decision in July 2015, saying the three were responsible because they should have foreseen the risks of major tsunami prior to the disaster.

The prosecutors had determined it was hard for them to predict major tsunami.

The inquest committee has said the former executives received a report by June 2009 that the plant could be hit by tsunami as high as 15.7 meters and that they “failed to take pre-emptive measures knowing the risk of a major tsunami.”

A group of Fukushima residents and other people filed a criminal complaint in 2012 against dozens of government and Tepco officials over their responsibility in connection with the nuclear crisis.

But when the prosecutors decided not to file charges, including against then-Prime Minister Naoto Kan, the group narrowed its list of targets and asked the committee to examine whether the prosecutors’ decision was appropriate.

Criminal action against 3 former TEPCO bosses

February 29, 2016

Former Tepco bosses charged over Fukushima meltdown

<http://www.theguardian.com/environment/2016/feb/29/former-tepco-bosses-charged-fukushima>

First criminal action to be taken after 2011 disaster, in which three nuclear reactors went into meltdown after earthquake

Justin McCurry in Tokyo

Three former executives from Tokyo Electric Power (Tepco) have been charged with contributing to deaths and injuries stemming from the triple meltdown in 2011 at the Fukushima Daiichi nuclear power plant.

Their indictment on Monday marks the start of the first criminal action to be taken in connection with the disaster, which forced the evacuation of 160,000 residents, many of whom are still unable to return to their homes.

Tsunehisa Katsumata, who was Tepco’s chairman at the time, has been charged with professional negligence resulting in death, along with two former vice-presidents, Sakae Muto and Ichiro Takekuro. The men, who have not been taken into custody, allegedly failed to take measures to defend Fukushima Daiichi, despite being aware of the risk from a tsunami.

Three of the plant's six reactors went into meltdown after a magnitude-9 earthquake triggered a tsunami along the north-east coast of Japan on 11 March 2011. The waves flooded the facility's back-up power supply and crippled the reactors' cooling systems, causing massive radiation leaks.

Experts say prosecutors could struggle to prove criminal responsibility for failing to prevent the meltdown. The trial, which is not expected to begin until next year, could reveal information about the disaster that Tepco has yet to make public.

Japan's public broadcaster, NHK, said the three former executives would plead not guilty to the charges and argue that it was impossible to predict the size of the tsunami.

An independent judicial panel of citizens ruled last July that the men should go on trial, after public prosecutors had twice decided not to pursue the case.

The 11-member panel, which has the power to compel prosecutors to act, said Katsumata, 75, Muto, 65, and Takekuro, 69, should be held criminally responsible for the deaths of 44 elderly hospital patients during and soon after the evacuation, and injuries to Tepco staff and members of the self-defence forces. Campaigners called the indictments "a major step", and called on Japan to abandon nuclear power.

Advertisement

"The people of Fukushima and Japan deserve justice," said Hisayo Takada of Greenpeace Japan. "The court proceedings that will now follow should reveal the true extent of Tepco's and the Japanese regulatory system's enormous failure to protect the people of Japan.

"Tepco and the Japanese regulator continue to ignore demands to disclose key details of what they know about the causes of the accident. The 100,000 people who still can't return home deserve to have all the facts."

Of the country's 43 working reactors, four have been restarted since last year, while the remainder are undergoing repairs and checks under stricter post-Fukushima safety regulations.

Reports by the government and MPs have been strongly critical of the safety culture at Tepco, and of lax oversight by the government and regulators.

Last year, the International Atomic Energy Agency pointed to a misguided faith in the safety of nuclear power as a key factor in the Fukushima accident. A 2012 parliamentary report said Fukushima was a "manmade disaster" caused by poor regulation and collusion between the government, Tepco and the industry's watchdog.

Tepco has insisted it was impossible to anticipate a tsunami of the size that struck the plant almost five years ago. The judicial panel said, however, that the executives ignored a 2008 internal report predicting that the plant could be struck by tsunami as high as 15.7 metres, adding that they had "failed to take pre-emptive measures, knowing the risk of a major tsunami".

Only last week, the utility admitted it had failed to announce that meltdowns had occurred in three Fukushima Daiichi reactors until two months after the accident.

Advertisement

Tepco said it had been unaware of a company emergency manual that defined a meltdown as damage to more than 5% of the fuel inside a reactor. For weeks, the firm said the reactors had sustained less serious "core damage".

The nuclear and industrial safety agency, the industry watchdog at the time, also refused to describe the accident as a meltdown.

Tepco only started using the word meltdown May 2011, after a computer simulation showed fuel in one reactor had almost entirely melted and fallen to the bottom of the primary containment chamber, and that two other reactor cores had melted significantly.

The firm conceded its initial wording had been misleading, but insisted it had responded appropriately.

“Core damage or meltdown, it didn’t make any difference in how we responded to the emergency, which was to cool the cores no matter what,” said Tepco spokesman Shinichi Nakakuki.

Could the tsunami have been predicted?

February 29, 2016

Tsunami predictions focal point at court

http://www3.nhk.or.jp/nhkworld/en/news/20160229_35/

The outcome of the trial will be determined by whether the 3 defendants could have predicted a major tsunami such as the one that triggered the nuclear accident at Fukushima Daiichi.

Tokyo Electric Power Company was found to have predicted in 2008 that there was a risk that a tsunami of up to 15.7 meters could hit the plant.

It made the estimate based on an assessment by a Japanese government task force for the promotion of earthquake research.

But the utility failed to take specific measures on the grounds that a tsunami of that scale was unlikely.

In 2012, former TEPCO chairman Tsunehisa Katsumata told the Diet that he did not receive the report of his company’s prediction.

The 2 former vice presidents said they were aware of the report, but they maintained that the figure lacked sufficient basis.

The defendants will not be found accountable unless they are found to have neglected their professional duty.

The issue of whether the nuclear accident could have been avoided altogether will also be taken up at the trial.

Both the Diet panel and the government’s team of investigators have yet to unveil the contents of the hearings conducted with the 3 officials.

Third-party panel to be set up

February 29, 2016

Panel to probe why Fukushima meltdown criteria manual wasn't found for almost 5 years

<http://mainichi.jp/english/articles/20160229/p2a/00m/0na/015000c>

A third-party investigative panel to be set up by Tokyo Electric Power Co. (TEPCO) will focus on why the company failed to find its own manual containing criteria for judging nuclear reactor core meltdowns until nearly five years after the onset of the Fukushima nuclear disaster, and whether the document was covered up.

The discovery of the manual, which came earlier this month, highlights the lack of a crisis mentality among TEPCO employees, as well as the utility's fear of a negative reaction from the government, which was excessively nervous about the phrase, "reactor core meltdowns."

Akio Takahashi, president of the Japan Atomic Industrial Forum, Inc. (JAIF), who was in charge of responding to the March 2011 Fukushima No. 1 Nuclear Power Plant accident as a then TEPCO fellow, declined to mention the manual issue.

"I don't know whether there was a judgment that meltdowns had occurred," he told a JAIF regular news conference on Feb. 25. This is despite the fact that there are records that TEPCO employees held teleconference discussions on the company's response to the accident on the assumption that meltdowns had occurred.

The manual on countermeasures against nuclear disasters, which was compiled in 2003, defines a meltdown as a situation in which over 5 percent of the core of a reactor has been damaged. Based on the manual, TEPCO could have determined three days after the onset of the disaster triggered by the March 11, 2011 quake and tsunami that meltdowns had indeed occurred at the Fukushima No. 1 complex. Yet it was more than two months after the disaster broke out that the company acknowledged the meltdowns. Questions remain as to whether the existence of the manual had been covered up. Tsuneo Futami, a specially appointed professor at the Tokyo Institute of Technology who served as head of the Fukushima No. 1 plant from 1997 to 2000, said, "I guess employees failed to share the manual because they were under the impression that meltdowns would never take place, and forgot its existence."

Some employees, however, should have been involved in compiling the manual.

One of the possible reasons the manual's existence was not disclosed is that TEPCO was wary of how the government would react.

At a news conference on March 12, 2011, following a hydrogen explosion at the power station's No. 1 reactor building, a then deputy director-general at the Nuclear and Industrial Safety Agency (NISA), who was serving as a spokesman for the now-defunct agency, clearly stated that a meltdown had occurred at the plant.

Fearing that the word, "meltdown," could give the public the impression that the nuclear plant had been disastrously damaged, however, the prime minister's office admonished NISA and its spokesman was

replaced. From then on, TEPCO avoided using the term "meltdown," and instead used softer words, such as "damage."

The possibility cannot be ruled out that TEPCO failed to check the plant's status against the manual, worrying about how the prime minister's office would react.

TEPCO's report on its investigation into the disaster, released in 2012, makes no mention of the manual, suggesting that its in-house probe was shoddy. If the third-party panel to be set up shortly is to end up releasing a report that is favorable to TEPCO, the utility would come under fire from the public. The emergence of the manual's existence has put TEPCO in a corner as it aims to restart its idled Kashiwazaki-Kariwa Nuclear Power Plant in Niigata Prefecture.

TEPCO's delay led to govt's delay

March 2, 2016

FIVE YEARS AFTER: TEPCO admits to delay in reporting onset of Fukushima nuclear accident

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201603020041>

THE ASAHI SHIMBUN

Tokyo Electric Power Co. delayed reporting the emergency at the Fukushima No. 1 nuclear power plant to the central government for about an hour after it started, according to an in-house investigation.

TEPCO's investigation provided details of the crisis that unfurled after the Great East Japan Earthquake and tsunami struck on March 11, 2011, and confirmed the delay, the utility said March 1.

The lag led to a delay in the government's declaration of an emergency situation.

"In the chaos immediately after the outbreak of the emergency situation, staff members may have failed to make the report," a TEPCO official said. "We want to look in detail into whether they have appropriately dealt with the situation."

Electric power companies are required by law to report emergency situations at nuclear power plants to the government immediately after they occur.

It is a two-stage process involving a preliminary Article 10 report, which is followed with an Article 15 report. An Article 15 report leads directly to the government's declaration of an emergency situation.

The Great East Japan Earthquake struck at 2:46 p.m. At around 3:35 p.m., waters from the ensuing tsunami began to inundate the compound of the Fukushima plant. From 3:37 p.m. to 3:41 p.m., all electricity sources for alternating current were lost in order for the No. 1, No. 3 and No. 2 reactors. At 3:42 p.m., TEPCO judged that all electricity sources for alternating current at the three reactors were lost, including all the electric generators for emergency situations, and informed the government through an Article 10 report.

Around the same time, batteries became submerged at the No. 1 and the No. 2 reactors. Because of that, electrical sources for direct current were also lost. Those electricity sources were "lifelines" to monitor water levels in the nuclear reactors and manage cooling systems.

When all of those electricity sources were lost, the utility was required to immediately file an Article 15 report.

However, TEPCO made the Article 15 report at 4:45 p.m., about one hour later, on grounds that it was not able to monitor water levels at the No. 1 and No. 2 reactors.

The fax the utility sent to the government read, "As a precautionary measure, we made a judgment that the current situation corresponds to that described in the Article 15."

After the in-house investigation TEPCO admitted the possibility that it could have made the Article 15 report immediately after the tsunami struck the nuclear plant instead of delaying it for an hour.

The investigation results were further evidence that TEPCO failed to appropriately deal with the nuclear accident immediately after it unfolded.

Last month, it became known that the utility was unaware for five years of the existence of internal guidelines to assess whether meltdowns have occurred at nuclear reactors.

TEPCO's corporate culture hasn't changed, says NRA

March 3, 2016

Nuclear watchdog slams TEPCO over long overdue 'discovery' of meltdown manual

<http://mainichi.jp/english/articles/20160303/p2a/00m/0na/008000c>

The head of Japan's nuclear watchdog has slammed Tokyo Electric Power Co. (TEPCO) over its recent announcement that it found an in-house manual containing criteria for judging nuclear reactor core meltdowns almost five years after the Fukushima No. 1 Nuclear Power Plant accident.

Shunichi Tanaka, chairman of the Nuclear Regulation Authority (NRA), told a regular press conference on March 2, "It represents the corporate culture of TEPCO that has remained unchanged since before the nuclear accident. I want the company to seriously reflect upon its actions.

"While the company had properly prepared a manual, it insists that it failed to notice the existence of the manual up until recently. I wonder what the utility created the manual for?" Tanaka continued, raising questions about TEPCO's assertion that the manual only turned up in February this year.

With regard to the recent automatic shutdown of the No. 4 reactor at Kansai Electric Power Co.'s Takahama Nuclear Power Plant in Fukui Prefecture, which took place only three days after the reactor was reactivated on Feb. 26, Tanaka said, "I had told the utility that being free from any trouble would lead to regaining public confidence. The accident has betrayed such expectations, and it is utterly regrettable."

Will TEPCO's trial fill the (information) gaps?

March 1, 2016

EDITORIAL: Fukushima disaster trial offers chance to reveal TEPCO's organizational woes

<http://ajw.asahi.com/article/views/editorial/AJ201603010033>

A case concerning responsibility for the disaster at the Fukushima No. 1 nuclear power plant will be brought to court.

Three former executives of Tokyo Electric Power Co., operator of the plant, face a trial over the nuclear crisis triggered by the Great East Japan Earthquake and tsunami in 2011.

Court-appointed lawyers serving as prosecutors filed indictments with the Tokyo District Court on Feb. 29 against the three former executives on charges of professional negligence resulting in death and injury. Former TEPCO Chairman Tsunehisa Katsumata, 75, and two former vice presidents are accused of failing to implement sufficient safety measures against tsunami. A number of patients at hospitals in the vicinity of the plant died in the subsequent evacuation and workers were injured at the plant.

The mandatory indictments reflect public criticisms and suspicions concerning the nuclear accident.

Many citizens have taken a dim view of the fact that nobody has been held accountable for the nuclear accident, which the company claims was “beyond expectation.” TEPCO’s profit-oriented policy is also believed to be behind the failure to take sufficient safety measures at the plant.

Such huge accidents are caused by a complicated confluence of factors. There is inevitably a limit to what the trial of the former TEPCO executives can do in terms of clarifying the whole picture of the disaster. The trial will be focused on the three individuals’ criminal liability for negligence from the viewpoint of the law and evidence.

Still, the trial can reveal important facts about the information the former executives had before the accident and the decisions they made in responding to the information.

We also hope the trial will shed light on problems with the organization and corporate culture of a large utility operating many nuclear reactors so that important lessons can be gleaned.

After residents and citizens groups filed a criminal complaint, the Tokyo District Public Prosecutors Office decided not to indict the former executives, citing the difficulty in predicting such an accident.

But a committee for the inquest of prosecution comprising 11 citizens has twice decided that the former TEPCO executives should be prosecuted, triggering the process for forced indictment.

A report on the accident published by TEPCO in 2012 did not make clear who should be held responsible and what kind of lessons should be learned. The document’s descriptions were vague about many key subjects, especially issues regarding TEPCO’s entire organization, such as the company’s advance assumptions about possible tsunami, steps it had taken against the risk, and how the company handled related information during the crisis.

The Diet-appointed commission tasked with investigating the nuclear accident said the root cause dated back before the disaster.

But many questions remain unanswered about how the utility dealt with the risks before the accident. Why didn’t TEPCO take stronger measures against the risk of tsunami even though it had estimated a tsunami of up to 15.7 meters could hit the plant? What was the thinking behind this failure to take such measures?

The government’s investigative committee has interviewed around 770 people and disclosed the testimonies of about 200, who have given their consent. But only about 20 of them are former TEPCO executives and other people linked to the utility.

We do hope the trial will fill in as many information gaps as possible.

The trial should also provide an opportunity to take a closer look at the roles played by the investigative panels.

All panels established to look into the accident finished their work in about one year, leaving many stones unturned.

These panels should scrutinize all relevant factors, including flaws with related organizations, to prevent a recurrence of the disaster. The systems and functions of investigations into nuclear accidents should be expanded and enhanced.

The damaged nuclear reactors that have spewed large amounts of radioactive materials into the environment must be continuously cooled with water. Water contaminated with radioactive substances keeps accumulating at the plant.

Around 100,000 people are still living away from their homes as evacuees. The nuclear accident has still not been brought under control.

Obviously, more efforts are needed to draw crucial lessons to ensure nightmarish nuclear accidents will never happen again.

5 years later and still often looking away from safety issues

5 Years Later Fukushima Still Spilling Toxic Nuclear Waste Into Sea, Top Execs Face Criminal Charges

Lorraine Chow | March 1, 2016 8:42 am

Five years after the worst nuclear disaster since Chernobyl, three former executives of Tokyo Electric Power Co. (Telco) were indicted Monday for allegedly failing to prevent the tsunami-sparked crisis at the Fukushima Daiichi nuclear plant.

Former Tepco chairman Tsunehisa Katsumata and former vice presidents Ichiro Takekuro and Sakae Muto were charged with contributing to deaths and injuries stemming from the nuclear meltdown triggered by the March 11, 2011 earthquake and tsunami.

Their indictment is Japan's first criminal action taken in connection with the nuclear crisis. If convicted, the three men could face up to five years in prison or a penalty up to 1 million yen.

According to The Japan Times, the trio have been blamed for injuries to 13 people, including Self-Defense Forces personnel, hydrogen explosions at the plant and the deaths of 44 patients who were forced to evacuate from a nearby hospital. The indictment seeks to answer in court the question of whether the three bosses should be held criminally responsible for the disaster, the publication stated.

Tepco had been warned years earlier about the dangers of an earthquake and a tsunami hitting the plant. According to The Japan Times, the inquest committee said the former executives received a report by June 2009 that the plant could be hit by a tsunami as high as 15.7 meters and that they "failed to take pre-emptive measures knowing the risk of a major tsunami."

The three executives were not taken into custody and are likely to plead not guilty to the charges arguing that it was impossible to predict the size of the tsunami, according to Abc.net.au. The trial is not expected to begin until next year.

Still, many have been encouraged by the indictment.

“I’m full of emotion,” Ruiko Muto, head of a campaign group pushing for a trial, told a Tokyo press briefing. “This will be a great encouragement for hundreds of thousands of nuclear accident victims who are still suffering and facing hardship.”

Environmental group Greenpeace also called the charges against the Tepco executives a step forward for Fukushima victims.

“The court proceedings that will now follow should reveal the true extent of **Tepco’s and the Japanese regulatory system’s enormous failure to protect the people of Japan**,” Hisayo Takada, deputy program director at Greenpeace’s Japan office, said in a statement. “Tepco and the Japanese regulator continue to ignore demands to disclose key details of what they know about the causes of the accident. The hundred thousand people who still can’t return home deserve to have all the facts.”

In response to the indictment, a Tepco spokesman said, “We will continue to do our utmost to sincerely address the issue of compensation, decontamination and decommissioning of the plant, and at the same time we express our unflinching resolve to ensure strengthening the safety measures at our nuclear power plant.”

The nuclear meltdown forced the evacuation of 160,000 locals who lived around the power plant with many who will never return. The devastating fallout continues to this day, as Scientific American wrote in their upcoming issue:

The plant has yet to stop producing dangerous nuclear waste: its operator, the Tokyo Electric Power Company (Tepco), currently circulates water through the three melted units to keep them cool—generating a relentless supply of radioactive water. To make matters worse, groundwater flowing from a hill behind the crippled plant now mingles with radioactive materials before heading into the sea. Tepco collects the contaminated water and stores it all in massive tanks at the rate of up to 400 metric tons a day. Lately the water has been processed to reduce the concentration of radionuclides, but it still retains high concentrations of tritium, a radioactive isotope of hydrogen. Disputes over its final resting place remain unresolved. The same goes for the millions of bags of contaminated topsoil and other solid waste from the disaster, as well as the uranium fuel itself. Health reports, too, are worrisome. Scientists have seen an increase in thyroid cancers among the children who had lived in Fukushima at the time, although it is too early to tell if those cases can be attributed to the accident.

Indeed, as Beyond Nuclear reported in October, a study examining children who were 18 years and younger at the onset of the Fukushima nuclear meltdown found an increase in thyroid cancers, as predicted by World Health Organization initial dose assessments.

Despite the environmental and human health catastrophe—as well as widespread public opposition—Japan restarted its first nuclear reactor **in August**.

“Five years since the Fukushima accident began, Japan’s nuclear regulator is repeating the same kind of mistakes that led to the Fukushima nuclear disaster. Last week, the plutonium-fueled Takahama 4 reactor was restarted, just days after a radioactive leak in the primary coolant system,” Kendra Ulrich, senior global energy campaigner at Greenpeace Japan, said in a statement Monday.

“Japan’s nuclear regulator continues to look the other way on major safety issues. The government continues to press ahead with nuclear restarts despite unresolved safety problems that put the public at risk. It’s time to break free from nuclear and embrace the only safe and clean technology that can meet Japan’s needs—renewable energy.”

Last week, Greenpeace’s Rainbow Warrior vessel surveyed waters near the Fukushima plant to take samples from the seabed to be analyzed in independent laboratories in Japan and France.

"It's very important (to see) where is more contaminated and where is less or even almost not contaminated," Greenpeace's Jan Vande Putte told AFP, stressing the importance of such findings for the fishing industry.

Utilities only interested in overturning safety assessment

March 4, 2016

Utilities aim to overturn NRA expert panel's fault assessment

<http://mainichi.jp/english/articles/20160304/p2a/00m/0na/012000c>

With the latest draft report from an expert panel at the Nuclear Regulation Authority (NRA), which pointed out the possibility of an active fault running beneath the Shika Nuclear Power Plant in Ishikawa Prefecture, fault assessments for all nuclear plants that face questions about their geological safety have been reported. The operators of these nuclear stations are now looking to overturn the panel's judgment in the NRA's safety screening process.

- **【Related】** Fault under Shika nuclear reactor likely to be active: NRA expert panel

Of 10 nuclear reactors at six nuclear power plants, three stations, including the Shika plant operated by Hokuriku Electric Power Co., have been judged to be likely situated above active faults. As the nuclear plant operators have raised objections to the panel's assessment results, the focal point of future safety screenings is whether they will be able to prove the panel's conclusion wrong.

The NRA had established an on-site field survey team with experts and carried out investigations of the six nuclear plants, over which the organization's predecessor the Nuclear and Industrial Safety Agency claimed that additional screening was necessary.

In addition to the No. 1 and No. 2 reactors at the Shika nuclear plant, the expert team recognized the possibility of active faults under the No. 2 reactor at Japan Atomic Power Co.'s Tsuruga nuclear station in Fukui Prefecture and the No. 1 reactor at Tohoku Electric Power Co.'s Higashidori nuclear power plant in Aomori Prefecture.

The new regulatory standards for the operation of nuclear power plants adopted in the wake of the 2011 Fukushima nuclear disaster forbid construction of key facilities such as a nuclear reactor right above an active fault. Since the No. 1 reactor at the Shika plant and the No. 2 reactor at the Tsuruga plant have been judged to be possibly located directly above active faults, they face higher chances of being decommissioned.

As for the No. 2 reactor at the Shika plant and the No. 1 reactor at the Higashidori plant, they are located near active faults, meaning that drastic anti-seismic reinforcement measures or relocation of facilities is necessary. This will likely push back the timing of the restart for these nuclear reactors.

Hokuriku Electric applied to the NRA for safety screening for the No. 2 reactor at the Shika nuclear plant in August 2014, and the nuclear watchdog will debate on the existence of an active fault at the safety inspection.

Meanwhile, the utility released a comment following the March 3 draft report on the Shika nuclear plant, saying, "The draft report is far from acceptable. We will submit new geological data to back our

argument." The company also plans to apply for a safety inspection of the No. 1 reactor at the Shika plant, which was pointed out to be located directly above an active fault.

March 4, 2016

Active fault likely runs under Shika nuke plant

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201603040047

THE ASAHI SHIMBUN

A Nuclear Regulation Authority panel has concluded that an active fault line likely runs under a reactor at the idled Shika nuclear power plant, which could threaten the reactor with decommissioning if the findings are confirmed.

The NRA panel of experts compiled its conclusions on March 3 regarding a study into the Shika plant in Ishikawa Prefecture.

"It is rational to interpret the fault (under the No. 1 reactor) as active," the panel said.

The panel is comprised of four outside specialists on geological faults and Akira Ishiwatari, an NRA commissioner.

Hokuriku Electric Power Co., the operator of the plant, intends to contest the panel's findings. The utility faces the possibility of having to mothball the No. 1 reactor if an active fault is confirmed to run under an important facility of the plant.

New safety standards for nuclear plants, which were put into effect after the March 2011 Fukushima nuclear disaster, prohibit major facilities in locations that lie above an active fault.

The panel plans to submit a report of its findings to the NRA in the near future. The NRA is expected to handle the report as "significant findings."

A final determination on whether active faults lie under the Shika plant will be made during safety screenings that will be conducted under the new standards.

The focus of the study was on three faults that run under the plant.

In the summer of 2015, the expert panel compiled a draft report that said, "The possibility of an active fault cannot be denied."

An additional expert asked to evaluate that draft concurred with the findings.

At the March 3 meeting, the panel examined the S-1 fault that runs beneath the No. 1 reactor building. The panel looked over detailed sketches of the geographical formation made when the nuclear plant was being constructed.

That led to the wording, "It is rational to interpret the fault (under the No. 1 reactor) as active," supporting past findings about the fault.

The panel indicated that its assessment was made based on a limited number of documents and called on Hokuriku Electric Power to provide additional data.

The panel also looked at the S-2 and S-6 faults, both of which run under important facilities of the No. 1 and No. 2 reactors. The panel concluded there was the possibility that those two faults were also active. Such findings would mean that the No. 2 reactor could also not meet the new safety standards unless major anti-quake measures were implemented.

On March 3, Akizumi Nishino, an executive vice president with Hokuriku Electric Power, insisted that none of the faults were active and indicated that the utility would challenge the findings during safety screenings for the No. 2 reactor. He also said the company will seek to have a safety screening for the No. 1 reactor as well.

A major question will be whether Hokuriku Electric Power can submit additional geological data that can overturn the findings of the expert panel.

(This article was written by Masanobu Higashiyama and Koji Kitabayashi.)

Impact of radiation should not be played down

March 4, 2016

Mutations, DNA damage seen in Fukushima forests, says Greenpeace

<http://www.japantimes.co.jp/news/2016/03/04/national/science-health/mutations-dna-damage-seen-fukushima-forests-greenpeace/#.VtnNuaDmot>

AFP-JIJI

Conservation group Greenpeace warned on Friday that **the environmental impact of the Fukushima nuclear crisis five years ago on nearby forests is just beginning to be seen and will remain a source of contamination for years to come.**

The March 11, 2011 magnitude-9.0 undersea earthquake off the nation's northeastern coast sparked a massive tsunami that swamped cooling systems and triggered reactor meltdowns at the Fukushima No. 1 nuclear plant.

Radiation spread over a wide area and forced tens of thousands of people from their homes — many of whom will likely never return — in the worst nuclear accident since Chernobyl in 1986.

As the fifth anniversary of the disaster approaches, Greenpeace said **signs of mutations in trees and DNA-damaged worms were beginning to appear, while “vast stocks of radiation” mean that forests cannot be decontaminated.**

In a report, Greenpeace cited “apparent increases in growth mutations of fir trees, ... heritable mutations in pale blue grass butterfly populations” as well as “DNA-damaged worms in highly contaminated areas.”

The report came as the government intends to lift many evacuation orders in villages around the Fukushima plant by March 2017, if its massive decontamination effort progresses as it hopes.

For now, only residential areas are being cleaned in the short-term, and the worst-hit parts of the countryside are being omitted, a recommendation made by the International Atomic Energy Agency.

But **such selective efforts will confine returnees to a relatively small area of their old hometowns, while the strategy could lead to re-contamination as woodlands will act as a radiation reservoir, with pollutants washed out by rains,** Greenpeace warned.

The conservation group said its report relies largely on research published in peer-reviewed international journals.

But “most of the findings in it have never been covered outside of the close circles of academia”, report author Kendra Ulrich said.

The government's push to resettle contaminated areas and also restart nuclear reactors elsewhere around the country that were shut down in the aftermath of the crisis are a cause for concern, Ulrich said, stressing **it and the IAEA are using the opportunity of the anniversary to play down the impact of the radiation.**

"In the interest of human rights — especially for victims of the disaster — it is ever more urgent to ensure accurate and complete information is publicly available and the misleading rhetoric of these entities challenged," she said.

Scientists, including a researcher who found mutations of Fukushima butterflies, have warned, however, that **more data are needed to determine the ultimate impact of the Fukushima accident on animals in general.**

Researchers and medical doctors have so far denied that the accident at Fukushima would cause an elevated incidence of cancer or leukemia, diseases that are often associated with radiation exposure. But they also noted that long-term medical examination is needed, especially due to concerns over thyroid cancer among young people — a particular problem for people following the Chernobyl catastrophe.

LDP arguments often "incoherent"

March 6, 2016

INSIGHT: LDP warns of crises, but not the one at home

<http://ajw.asahi.com/article/views/column/AJ201603060012>

By HIROHITO OHNO/ Director of The Asahi Shimbun Editorial Board

The ruling Liberal Democratic Party argues the Constitution of Japan should be amended to include provisions on emergency situations. But the party's argument, once again, is incoherent.

According to the LDP's commentary in Q&A format on its draft of an amended Constitution: "The provisions would allow, among other things, an emergency situation to be declared and the prime minister or other officials to be temporarily empowered to deal with the emergency situation in case a military contingency, a large-scale disaster or other circumstances has taken place."

"Has taken place" sounds odd. Japan has always been in the midst of an emergency situation since that fateful day five years ago. It's not that the Fukushima No. 1 nuclear power plant disaster "has taken place." It "is taking place."

The government's "declaration of a nuclear emergency situation," issued immediately after the disaster started, has never been lifted.

The generation of huge amounts of highly radioactive water at the nuclear plant has not been brought under control. And what has become of the melted nuclear fuel is anybody's guess.

Plans to send in robots to determine the location and situation of the melted fuel have not progressed as desired. As many as 7,000 workers are doing their best every day to bring the situation under control, but the end is nowhere in sight.

Still, the administration of Prime Minister Shinzo Abe is rushing to restart nuclear reactors, although emergency evacuation routes have yet to be finalized and evacuation drills have been insufficient.

It is quite difficult to find any consistency between the reactor restart decision of the administration and the headlong way it is seeking to establish the emergency situation provisions.

I met Ulrich Beck (1944-2015), an erudite sociologist known for his theory of “risk society,” in Munich two months after the Great East Japan Earthquake and tsunami triggered the Fukushima nuclear disaster on March 11, 2011.

The argument that the catastrophe was caused by a natural disaster “is ... categorically a mistake,” I remember him saying at the time. “**The decision to build an atomic industry in the area of an earthquake is a political decision; it’s not done by nature.**”

He argued that **a natural phenomenon turned into a disaster precisely because humans had brought risk to that area.**

AIR OF VAGUE ANXIETY

The current administration says it wants to be prepared for risks, but it does not appear to be looking squarely at the true situation.

This is not the first time the Abe administration has appeared incoherent. It was just as incoherent when it railroaded the security legislation bills through the Diet last year.

The Abe administration has repeated the slogan “proactive pacifism” and emphasized unrealistic scenarios, such as a blockade of the Strait of Hormuz in the Middle East and a Japanese mother and her children forced to flee from a military encounter.

That said, the administration has shown little interest in the huge numbers of refugees fleeing conflict in the Middle East, even though their mass exodus not only represents a humanitarian issue but also constitutes a crisis that is shaking global stability.

Real emergency situations are posing serious challenges to political leaders although solutions are not readily available. By contrast, the administration’s imaginary emergency situations are nowhere to be found.

When the national security bills were before the Diet, conservative politicians and commentators reiterated, “Abide by the Constitution, and the nation will be lost.”

They also churned out an air of vague anxiety to win public support, a favorite trick used in all ages and countries by those in power.

VACUUM OF LAWMAKERS

The LDP also argues that a military contingency or a disaster that obstructs voting in a Lower House election could lead to a Lower House devoid of all members. The party says emergency provisions should be in place to prevent such a situation from occurring.

But if the party is so concerned about a vacuum of lawmakers in case of an emergency, then why are party members calling for a snap Lower House election to be held on the same day as the Upper House election this summer?

If simultaneous elections are held for both chambers of the Diet, all Lower House members and half of the Upper House lawmakers, up for election, would be outside of parliament engaging in election campaigns. That would create a greater vacuum of lawmakers than if only one election is held.

This is probably more proof that LDP officials’ talk of “emergency situations” refers to imaginary scenarios that they are not concerned about after all.

If they were really worried, they wouldn’t dare hold a double election.

They argue that a potential vacuum in the legislature poses a major risk, but they are quite nonchalant about a greater vacuum that would result from a double election.

Those pushing for constitutional amendment in this manner are hardly deserving of the description of “having a strong sense of responsibility,” a phrase that Abe has used to describe them.

Fukushima: What lessons for Japan?

March 7, 2016

Editorial: What has Japan learned from the nuclear crisis?

<http://mainichi.jp/english/articles/20160307/p2a/00m/0na/013000c>

One cannot help but wonder what Japan has learned from the crisis at the Fukushima No. 1 Nuclear Power Plant triggered by the March 2011 Great East Japan Earthquake and tsunami, and how the country should build a new society.

Many members of the public apparently feel frustrated when they look back on the past five years. A nuclear accident can happen even if preventive measures are taken. Japan has higher risks of nuclear disasters than other countries as it is prone to earthquakes and has numerous active volcanoes. Following meltdowns at the power station, many people decided that Japan should create a society that does not rely on nuclear power even if it is difficult to achieve.

Five years have passed since the outbreak of the nuclear disaster. Nevertheless, some 100,000 residents of the affected areas are unable to go back to their hometowns, and are still taking refuge elsewhere in Fukushima and outside the prefecture. Radioactive substances that leaked from the crippled plant contaminated soil in wide areas, dealt a fatal blow to local industries and caused splits in families and local communities.

While witnessing such extensive damage, the government has adopted a policy of retaining nuclear power and electric power companies restarted four nuclear reactors over the past year. Those who are in favor of maintaining nuclear power even say, "An accident like one in Fukushima will never occur again." Japan should squarely face this serious nuclear crisis and consider whether the country should revive its reliance on atomic power.

Shortly after the outbreak of the disaster, the then administration of the Democratic Party of Japan (DPJ) reversed Japan's energy policy and set a goal of eliminating atomic power stations by the 2030s. However, the Liberal Democratic Party (LDP)-led government that was launched in late 2012 retracted the previous administration's strategy, and adopted a policy of maintaining nuclear power while aiming to decrease Japan's reliance on atomic energy for power generation.

In deciding on a power supply configuration for 2030, the LDP-led administration placed priority on reducing near-term costs. **The government's policy-making process returned to the pre-disaster system without trying to reflect public opinion.**

The Mainichi Shimbun has been of the view that restarting atomic power stations is inevitable under certain conditions if Japan is to pursue a society without nuclear power and pay close attention to economic and social risks involving the use of such energy. However, it must be premised on broad consensus among the public. Ensuring the safety of residents in areas around nuclear plants is a prerequisite for restarting nuclear power plants.

True, regulations on safety measures have been revised. The Nuclear Regulation Authority (NRA) independent of the executive branch of the government has been established and regulatory standards

have been stiffened. Safety measures have also been beefed up to include responses to serious nuclear accidents.

However, Japan has only improved its defective safety measures to meet global standards. Measures to protect residents from radiation are still not subject to regulatory standards and the NRA is not responsible for checking regional disaster prevention plans and resident evacuation plans. Japan should review these matters since such safety measures are subject to regulatory standards in the United States. Lessons from problems involving the chain of command in response to the nuclear disaster and confusion over disclosure of information to the public have not been put to good use. Furthermore, it recently came to light that Tokyo Electric Power Co. (TEPCO), the operator of the crippled Fukushima plant, found an in-house manual containing criteria for judging nuclear reactor core meltdowns nearly five years after the accident, showing that the utility could have declared much earlier that meltdowns occurred at the power station. **This reflects the failure to re-examine the way relevant information is disclosed.**

Kyushu Electric Power Co. has stated recently that it will not construct a seismic isolated building, which will serve as a key building for responses to an accident, on the premises of nuclear plants it intends to reactivate.

These attitudes of power companies have raised serious questions about their awareness of the need to enhance safety measures at nuclear plants. If power companies believe that it is all right if they only meet regulatory standards, it could lead to the revival of the myth of the infallible safety of nuclear plants. Both the NRA and operators of atomic power stations should continue to warn that serious accidents could occur at such plants and regularly review how to respond to accidents.

At the end of last month, three former executives of TEPCO were indicted over the nuclear disaster after a prosecution inquest panel concluded for the second time that the three deserve prosecution. The move is in line with public sentiment as there are apparently numerous members of the public who are dissatisfied with the fact that nobody has been held criminally responsible for the disaster. **A system that fails to clarify responsibility for serious accidents has remained unchanged since the Fukushima accident. It is necessary to make it clear specifically who should take responsibility for a serious nuclear accident and how.**

It is also a serious problem that the government has been unable to drastically change its policy of promoting the nuclear fuel cycle project -- in which fuel spent at nuclear plants is reprocessed and reused at power stations -- even though the project has been deadlocked. If the government is to continue the project as it is, Japan would have to operate nuclear reactors to consume plutonium generated through the reprocessing of spent nuclear fuel, running counter to phasing out of nuclear power. The government is trying to continue reprocessing spent nuclear fuel, but it rather should consider burying such waste deep underground.

Even if Japan were to completely eliminate nuclear power, the country would not be able to avoid the final disposal of highly radioactive nuclear waste. Following the outbreak of the Fukushima nuclear crisis, the government has changed the way to select candidate sites for final disposal facilities, and is set to announce a "hopeful" candidate site from a scientific viewpoint by the end of this year. However, questions remain over how to form consensus among members of the public over the matter. The government does not appear truly enthusiastic about settling the issue. If the government is to go ahead with reactivation of idled nuclear reactors without addressing the issue, it would represent a return to the pre-disaster atomic energy policy.

Judging from these circumstances, critics might lament that Japan failed to learn anything essential from the nuclear disaster. However, it is important to solve all these problems one by one without giving up hope. **Public awareness of the need to save electric power has not been completely lost, even if it may have**

diminished. Last summer, there was enough electric power despite the scorching heat, largely because of efforts to cut back on electric power consumption.

Another way to prevent moves to revive Japan's reliance on atomic power may be to reform the electric power supply system by eliminating power companies' regional monopolies. While promoting transparent competition, power suppliers should be encouraged to introduce renewable energy and the public should be urged to reduce power consumption, both to the maximum extent. Japan still has these options. The country should take the opportunity of the fifth anniversary of the outbreak of the nuclear disaster to pursue a society that does not depend on nuclear power.

Questioning Gov't compensation conditions

March 8, 2016

5 years on: Fukushima residents raise questions about gov't compensation scheme

<http://mainichi.jp/english/articles/20160308/p2a/00m/0na/013000c>

In June 2015, the central government decided to retain evacuation orders up until March 2017 and set the target deadline for paying compensation to Fukushima residents affected by the 2011 nuclear disaster at March 2018 regardless of the timing of lifting evacuation orders.

Before the government made that decision, the period for paying compensation to residents of zones under the evacuation order had been set "until one year after the lifting of the evacuation order" under the then compensation standards set by the government in connection with the crisis at the Fukushima No. 1 Nuclear Power Plant.

Under the previous scheme, the later the evacuation order was to be lifted, the longer the government was to continue to pay compensation. The scheme, therefore, prompted some people within the central government and local bodies to argue that reparations were preventing affected residents from returning to their original hometowns or preventing them from becoming independent. However, the government's move to set the uniform deadline for compensation has raised questions that the scheme does not take into account the conditions of each individual region.

In the winter of 2014 -- nearly three years after the outbreak of the Fukushima nuclear crisis -- Tadamori Oshima, then chairman of the ruling Liberal Democratic Party (LDP) Headquarters for Accelerating Reconstruction after the Great East Japan Earthquake, and Naraha Mayor Yukiei Matsumoto were seen at a small restaurant in the Fukushima Prefecture city of Iwaki. While the snow was falling silently outside, the two men were sipping sake. It was a get-together meeting aimed at discussing how to lift the evacuation order for Naraha, which could be the first among municipalities whose entire areas were under evacuation orders to do so.

In May 2014, about several months later, Naraha Mayor Matsumoto said at a news conference that Naraha residents would return to the town "after the spring of 2015." The LDP's Oshima, who had known what

Matsumoto would say in advance, called for early lifting of the evacuation order by urging the mayor to drop the word "after." But Matsumoto adamantly refused to do so.

Behind the clash between Oshima and Matsumoto over the issue was the compensation period set until "one year after the lifting of the evacuation order." During the 13 rounds of town hall meetings held between April and May 2014, Matsumoto was told by local residents that "it will take several years from the lifting of the evacuation order before we settle down to a good life. We should also have the government continue to pay compensation." Therefore, Matsumoto called on the central government to keep paying compensation to the local residents, saying, "They need compensation money for a while even after the evacuation order is lifted." Unless his demand was accepted, it would be difficult for him to agree to lift the evacuation order.

"We needed a political decision that would change the rules over the lifting of the evacuation order for Naraha. Even for other municipalities, setting a deadline rather than idly postponing lifting of evacuation orders will lead to their independence," said LDP lower house legislator Masayoshi Yoshino from Fukushima Prefecture, a senior official of the LDP Headquarters for Accelerating Reconstruction after the Great East Japan Earthquake.

Under the ruling party proposal worked out by Oshima and others in May 2015 and presented to the central government, the evacuation orders for residence restriction zones and zones preparing for the lifting of the evacuation orders would be lifted by March 2017 at the latest. The proposal set the period for compensation for psychological difficulties up until March 2018 regardless of the timing of the lifting of evacuation orders. In June 2015, the government made a decision at a Cabinet meeting in line with the proposal.

For the central government, the lifting of the evacuation order for Naraha was more significant as compared with the Miyakoji district of Tamura city and the eastern part of Kawauchi village for which evacuation orders had already been lifted because it had a larger population. If the compensation period were to be set for March 2018 regardless of the timing of the lifting of the evacuation orders, there would be no point in delaying the return of local residents to their original hometowns. Using Naraha as a model, the central government would be able to push other municipalities to return to where they used to be and demonstrate its efforts to rebuild the disaster-stricken region.

The central government set the target period for lifting evacuation orders as March 2017 partly in order to bring it in line with the definition of difficult-to-return zones. That's because they were defined from the beginning as zones whose annual radiation dose would not likely drop below 20 millisieverts -- a minimum reference dose that would allow residents to return home -- even six years after the outbreak in March 2011 of the nuclear disaster.

Mayor Matsumoto subsequently accepted the central government's plan to lift the evacuation order for Naraha in September 2015. He welcomed the central government's Cabinet decision to extend the compensation period by about 18 months from the period until "one year after the lifting of the evacuation order," saying that his demands were "granted in full."

Matsumoto said, "When I said I want them (local residents) to become independent at a recent town hall meeting, most of them understood what I said."

The government's move to set the uniform deadlines for lifting evacuation orders and for the compensation period has sparked a backlash from some people and municipalities. That's because it is difficult for many of the municipalities where decontamination has been moving more slowly than in Naraha to predict how many of their residents will return home even if decontamination is completed and the evacuation orders are lifted as planned. If no one lives there, there will be no commercial activities there, either.

In the Fukushima Prefecture town of Namie, 44 percent of decontamination work on residences carried out by the Environment Ministry was completed as of Feb. 15, 2016.

According to a survey conducted in 2015 by the Reconstruction Agency, 48 percent of Namie residents decided not to return to the town, while only 17.8 percent of residents were willing to do so. "The central government is telling us to become independent, but even if I reopen my business, if no one returns, it will hardly pay its way," said Fumitaka Kanazawa, a 59-year-old man who used to run a funeral business with 20 employees in Namie. His five-member family lives mostly on compensation money for psychological damage -- 100,000 yen each a month. But if the evacuation order is to be lifted by March 2017 in accordance with the government plan, there will be no compensation payments one year later. Moreover, compensation for damages to business operations will stop after February 2017.

Vigilance must be redoubled to ensure safety

March 8, 2016

Japan's nuclear watchdog chief urges safety vigilance by government, utilities

<http://www.japantimes.co.jp/news/2016/03/08/national/japans-nuclear-watchdog-chief-urges-safety-vigilance-government-utilities/#.Vt6im-aDmot>

Kyodo

The head of the Nuclear Regulation Authority is urging the government and utilities to redouble their vigilance to ensure reactor safety, warning them not to drop their guard simply because units have cleared the NRA's tough safety screening.

NRA Chairman Shunichi Tanaka, chairman of the Nuclear Regulation Authority, said passing the screening is "not enough" during an interview Monday ahead of Friday's fifth anniversary of the Fukushima No. 1 disaster.

The government calls the new regulations the best in the world and has promoted the restart of reactors that were taken offline in the wake of the Fukushima crisis.

Tanaka said the strict regulations should not promote any new "safety myth," referring to the pre-Fukushima situation in which nuclear plants in Japan were assumed to be accident-free.

"If they are to establish a new safety myth, it would be better to cancel nuclear power," he said.

Tanaka stressed that it is not just Tokyo Electric Power Co. but the entire nuclear industry that should bear responsibility for Fukushima, and that no reactor should be allowed to resume operations unless it is approved under the new regulations.

The NRA chairman said the situation at Fukushima No. 1 is calm, with cleanup work making steady progress.

But he expressed doubts about the efficacy of an underground ice wall that Tepco has built around reactor buildings to prevent groundwater from flowing into their basements.

The wall "will not essentially help reduce the risk" of an increase in toxic water, he said.

Decontamination work, on the other hand, is effective and should help more people return to their homes in the evacuation zones, as radiation levels in many such areas have fallen to acceptable levels, he said.

Akio Matsumura: Our lessons from Fukushima

Our Lessons from Fukushima: New Concerns for the Future

March 6, 2016 Environment, Japan, Nuclear

français

Akio Matsumura

This week people across the world are commemorating the fifth anniversary of the worst nuclear power accident in history, which occurred at the Fukushima Daiichi Power Plant in Japan on March 11, 2011.

A woman is seen at a temporary housing complex covered in snow that accommodates nuclear evacuees from Okuma, a town inside the exclusion zone next to Tokyo Electric Power Co's (TEPCO) tsunami-crippled Fukushima Daiichi nuclear power plant, in Aizuwakamatsu, Fukushima prefecture, February 17, 2015. REUTERS/Toru Hanai

Many aspects of the crisis continue to affect human and environmental safety. There are still 178,000 evacuees in total (99,750 at Fukushima) who do not know when they can return home. 400 tons of contaminated water run into the sea every day. Frequent torrential rains wash away radioactive materials remaining at the site into the sea. 814,782 tons of contaminated water are stored at about 1,000 tanks, with more tanks built every month. The 7,000 workers at the site undertake dangerous tasks every day. The dedicated workers have solved many problems so far, but many continue to perplex managers and cleanup crews. No one approaches reactors 1, 2, and 3 due to strong radiation, and no scientific solution is expected for at least forty years. Unfortunately, future disruption cannot be discounted – the possibility of another strong earthquake in forty years is non-zero.

Since the Fukushima accident, we were fortunate to quickly receive opinions and recommendations across many fields. Nuclear scientists, medical doctors, military personnel, seismologists, biologists, oceanographers, volcanologists, journalists, spiritual leaders, parliamentarians, students and grass-root organizations, and public opinion leaders all weighed in. The horizontal perspective that emerged offered

a different view than was possible from any single discipline, no matter how expert the practitioner. The Japanese benefited from these messages that cut through the confusion that pervaded the media at the time.

On the occasion of the 5th anniversary of the Fukushima nuclear accident, I would like to recall the early stages of the event, and share my own appraisal and recommendations from the lessons I have learned from this painful event.

In the first two weeks, experts and the public alike sought technical solutions. Panic grew when few were available. Did the cores meltdown? What was the appropriate distance to evacuate? How could we maintain the cooling systems for the reactors through multiple system failures? Are the ventilation systems working? Was this worse than Chernobyl? Can Self-Defense Force helicopters drop water on the spent-fuel pools of units 3 and 4?

It might be impossible to accurately describe the panic shooting through Japan's leaders and the public at the time. Government agencies and the utility in charge, the Tokyo Electric Power Company, were unprepared for the catastrophic nuclear disaster. The public blamed both parties, and they blamed each other, for poor communication and delays.

The confusion and panic were not limited to Japan, but extended to the US government as well. There was a huge gap between the two governments' assessments of the damages of the six reactors, in particular of the fourth reactor, which because of coincidental maintenance was in a unique position. Mixed messages on safety and damage caused more panic: Japan's government decided 12.5 miles (20 km) was an appropriate evacuation zone while the US government settled on 50 miles (80km) for its citizens. The United Kingdom, France, Germany, and other countries told their citizens to consider leaving Tokyo, 125 miles away (200 km).

From the start, a few experts knew the crisis went beyond current technical solutions, but that any step forward would require more information. Early in the confusion, my good friend, the late Dr. Hans-Peter Durr, former Director of Astrophysics at the Max Planck Institute in Germany, called me to suggest I inform the Prime Minister of Japan that the Fukushima accident was much worse than Japan's government had let on. Although Japan had not admitted the core meltdown then, Hans-Peter knew that Fukushima had brought us to the edge of our scientific knowledge. He recommended Japan invite an independent assessment team of top nuclear scientists and structural engineers to develop a solution. I passed his urgent message on to the Prime Minister office and party leaders.

What was the scope of the problem? A year after the crisis and we still had little quantitative sense. One way to begin to get a sense was to know the number of spent fuel assemblies on site. TEPCO did not share this information, so I asked Ambassador Mitsuhei Murata to check discretely with inside sources. He informed us that the total number of spent fuel assemblies at the Fukushima Daiichi site, excluding the assemblies in the pressure vessels, was 11,421. Then I asked Robert Alvarez, former Senior Policy Adviser to the Secretary and Deputy Assistant Secretary for National Security and the Environment at the U.S. Department of Energy, an explanation of the potential impact of the 11,421 assemblies.

On April 3, 2012, Bob interpreted this number for us. The results were astounding. The Cesium-137 at the site was 85 times greater than at the Chernobyl accident.

While it would not necessarily go "boom" like a nuclear bomb, this amount of radiation had enormous destructive potential. People were shocked to find this out. The article quickly gained over one million readers and was shared virally through the Internet. There is no doubt that without the warnings by international scientists about the potential global catastrophe of the fourth reactor, Japan's government would not have made it a priority to remove the 1,535 fuel assemblies, which contained 14,000 times the radiation of the Hiroshima bomb.

Without experts from multiple fields, important information would have been remained with the government and nuclear utility, rather than with the public.

But even with this information, large aspects of the crisis and its cause are hidden if the focus remains technical. Mr. Kiyoshi Kurokawa, chairman of the National Diet of Japan Fukushima Accident Independent Investigation Commission, has a different, but definitive, perspective.

The earthquake and tsunami of March 11, 2011 were natural disasters of a magnitude that shocked the entire world. Although triggered by these cataclysmic events, the subsequent accident at the Fukushima Daiichi Nuclear Power Plant cannot be regarded as a natural disaster. It was a profoundly manmade disaster – that could and should have been foreseen and prevented. And its effects could have been mitigated by a more effective human response.

How could such an accident occur in Japan, a nation that takes such great pride in its global reputation for excellence in engineering and technology? This Commission believes the Japanese people – and the global community – deserve a full, honest and transparent answer to this question. What must be admitted – very painfully – is that this was a disaster “Made in Japan.”

Its fundamental causes are to be found in the ingrained conventions of Japanese culture: our reflexive obedience; our reluctance to question authority; our devotion to ‘sticking with the program’; our groupism; and our insularity.

For me, Fukushima taught that we live with new threats, and have been living with them for decades. I learned that a nuclear power plant accident can have an unimaginable impact over human life for centuries. The accident has caused untold harm to those whose lives were disrupted by the plant. If things had gone worse, what about the effect of 24,000 years of environmental harm on future generations?

It is one thing if the public had been aware of and accepted these risks when the plant was constructed. Unfortunately, this was not the case in Japan. Those in charge did not even accept these risks, not at the time of construction, nor at the time of the accident. Not even now.

TEPCO has admitted only last month, five years later, that it delayed two months in using the term “meltdown” at the site. Arnie Gundersen of Fairewinds and Mycle Schneider, author of the World Nuclear Industry Status Report, have indicated that it was obvious from the moment there were massive releases of fission gases that a meltdown was underway. But TEPCO’s denial had an impact on how they handled the panic. As Dr. Helen Caldicott suggested, it was obvious that Japan’s government should have evacuated women and children sooner and much farther away. Helen wrote for our blog: *The Nuclear Sacrifice of Our Children : 14 recommendations to help radiation contaminated Japan.* TEPCO and government authorities refused to hear the wake-up call, brushing off the warnings of many experts.

After five years of reflection, Fukushima has pointed me to new concerns with nuclear power plants. It is my important discovery from the Fukushima nuclear power accident that we failed to understand the radiation from the nuclear bombs and the radiation from the nuclear accident are little different in terms of the risk for human life. We have long accepted the dangers of attacks by state actors with nuclear weapons, and now we understand the threat of human error and natural disasters like earthquakes, tsunamis, and volcanoes, on nuclear power plants. What about attacks on nuclear power plants? Above all, I am concerned with terrorist attacks on nuclear power plants in volatile countries, especially Pakistan.

Prime Minister Nawaz Sharif and President Xi Jinping shake hands as China agrees to build more nuclear power plants in Pakistan.

The odds are high and increasing that a terrorist group will target one or more of the many nuclear power plants around the world. These as well as many other such plants remain insecure from various threats – and intelligence of some threats remains hard to share between governments. The United States could not warn Japan, a close ally, of some specific threats if they wanted to! Other nuclear threats, like a small suitcase-sized nuclear device exploding in Times Square, continue to give experts and presidents nightmares. Given the probability of these risks in the year ahead, regardless of whether we live in a democratic or authoritarian society it is surprising that the public has no information on the matter. As we saw in Fukushima, so much pain is caused by the sudden realization that we have been asked to live with risks that were hidden from us until it was too late.

Experts will and should do much of the work in defining, examining, and making recommendations for solutions on these risks. This responsibility increases as more nuclear power plants are built and planned – especially in China, India, the United Arab Emirates, Vietnam, and Indonesia. But an open conversation with the public brings many benefits for preventing attacks and accidents and reacting appropriately once they have occurred. Social media presents itself as a potential bridge between society and experts from many fields when a nuclear accident or attack occurs. Indeed, this could be a powerful tool to complement efforts of other organizations working hard to prevent nuclear disasters. Loss of control of information is difficult for any authority, but Fukushima and other scenarios like Ebola have shown the limits of top-down communication channels.

Politicians face many competing challenges and interests in their jobs as they lead society forward. Nuclear energy looks like a good fit for the challenges of climate change, for example. But no assessment can be considered correct or honest if the risks of any solution are not presented openly to all interested parties, including the public. Fukushima has offered us an opportunity to have a wide-ranging debate on the challenges we face at the intersection of many human needs – carbon-free energy, safety, environmental health, human security, and preservation for future generations. These are issues that will define our human society for centuries to come – we should not miss the chance to discuss them with all the facts on the table.

A parting note: Sir Brian Flowers, a prominent British nuclear physicist, pointed out that if nuclear power plants had been built and deployed in Europe before WWII, then large parts of Europe would be

uninhabitable today because of conventional warfare and conventional sabotage directed against those nuclear plants.

Reactions to court order

March 9, 2016

Fukui, Shiga gov. react to court order

http://www3.nhk.or.jp/nhkworld/en/news/20160309_36/

Fukui Governor Issei Nishikawa says it is extremely regrettable that inconsistent court decisions have been making those in areas hosting nuclear power plants worry about nuclear power.

He made the remarks after a Japanese court on Wednesday issued an injunction suspending 2 reactors' operations at a Takahama plant.

Nishikawa says the issue of nuclear power should be dealt with by the government, including judiciary authorities and nuclear regulators as a whole, to deepen people's understanding about the issue.

He says the government, including the Nuclear Regulation Authority, need to squarely face up to the issue.

Shiga Governor Taizo Mikazuki said in a statement he sees the injunction as a decision by the court, which placed emphasis on the safety of the nuclear plant.

He says the government and operators of nuclear plants need to take seriously the continuing public skepticism about nuclear power and take every safety measure available.

Mikazuki will also continue asking the government and the industry to respond sincerely and responsibly to lingering concerns among the people in areas with nuclear plants.

Kansai Electric: Injunction is unacceptable

http://www3.nhk.or.jp/nhkworld/en/news/20160309_28/

Kansai Electric Power Company issued a statement saying it is regrettable that the court failed to understand its claim, and that the injunction is totally unacceptable.

The utility said it will halt the No.3 reactor as ordered. But it says it will quickly take steps to lodge an objection and prove the reactors' safety to have the injunction canceled as soon as possible.

Surprise court order: Reactions

What is the priority?

Editorial: Give priority to putting disaster victims' lives back in order

March 9, 2016 (Mainichi Japan)

<http://mainichi.jp/english/articles/20160309/p2a/00m/0na/012000c>

Efforts to restore regions hit by the Great East Japan Earthquake, tsunami and ensuing nuclear crisis and the livelihoods of residents in affected areas have come to the crossroads as March 11 marks the fifth anniversary of the triple disasters. The government is ending its intensive reconstruction period and is poised to implement a new policy to support disaster-ravaged areas.

About 30 percent of communities ravaged by tsunami have completed their relocation to higher ground, but there are many areas that face harsh realities, such as depopulation and the aging of society. It is necessary to consider what is needed to support the livelihoods of disaster victims.

Newly built houses are lined in a residential area developed on a hilly area in the Koizumi district of southern Kesennuma, Miyagi Prefecture, which faces the Pacific coast.

Residents of the Koizumi district, hit hard by the tsunami, began consultations on relocation of their entire neighborhood to higher ground shortly after the disasters. The construction of the new residential area based on advice from scholars is viewed as a model of local resident-led regional development.

However, some unexpected problems have surfaced over the past five years. Some people unable to wait for the development of the new residential area acquired land lots in other areas while others left their hometown. Koizumi residents had initially planned to develop 90 land lots but actually created 65. Some 17 of them remain unsold.

The biggest problem for residents of the area is that little progress has been made on efforts to attract shops to their neighborhood, forcing residents to go far away for shopping. Many households in reconstruction housing units in the same district comprise of elderly people. Shigeaki Oikawa, who served as a coordinator in the relocation of the neighborhood, says, "Government organizations should pay closer attention to securing means of transportation for us."

Over the five-year intensive reconstruction period, the national government set aside 26 trillion yen for disaster recovery efforts. In particular, the central government has characterized relocation of neighborhoods devastated by tsunami to inland areas or higher ground and land elevation and readjustment projects as the core of what it calls "creative reconstruction." Projects to relocate tsunami-hit neighborhoods to higher ground materialized in many areas because the central government agreed to fully foot the cost of such relocations.

In some regions, such relocation projects were carried out smoothly thanks to in-depth discussions among local residents, like one in Iwanuma, Miyagi Prefecture. Projects to relocate whole neighborhoods hit by tsunami to higher ground have played a certain role in maintaining these communities.

In many other areas, however, such relocation projects were not carried out as planned. Many residents were forced to abandon moving to new neighborhoods as time went by. As a result, the number of households covered by these projects in all the disaster-ravaged areas decreased by some 8,000 from approximately 28,000 as initially planned.

Many coastal areas in the Tohoku region have been suffering from depopulation and the aging of their populations for many years. The Great East Japan Earthquake, tsunami and the nuclear crisis have further contributed to the outflow of younger people. According to the latest census, all municipalities in coastal areas of Iwate Prefecture saw their populations shrink from pre-disaster periods. In Miyagi Prefecture, the populations in Onagawa and Minamisanriku among other municipalities decreased sharply.

Some neighborhoods that relocated to higher ground or inland areas are just like marginal villages because there are few young residents. Serious questions remain as to whether these neighborhoods will be able to maintain their communities in the long run.

It is expected to take a considerable amount of time to complete large-scale projects to elevate land in the Iwate Prefecture city of Rikuzentakata and other areas. One cannot help but wonder whether it is appropriate to force residents of these areas to live in temporary housing for more than five years while waiting until the elevation work is completed. The national government should scrutinize whether it could have shown residents sufficient options regarding reconstruction methods that suit the situation of each area.

The government should be aware that many residents face difficulties in putting their livelihoods back in order because the reconstruction of their housing has been delayed. Officials regard the next five years as a period when the government will aim to complete its disaster recovery efforts. However, much of the 6.5 trillion yen that will be set aside for recovery efforts over that period will be used for building infrastructure, such as storm surge barriers and roads.

The central government should shift its disaster recovery efforts from public works projects to livelihood assistance and the creation of new industries. Projects for building large-scale storm surge barriers with the aim of blocking tsunami, which stirred controversy over landscape conservation, are being delayed because of a shortage of construction materials and soaring personnel costs. The necessary height of such levees should be flexibly reviewed.

Priority should be placed on efforts to create new jobs and maintain regional communities. Even if communities in disaster areas are urged to be independent and self-reliant, this would not sufficiently tap the latent strength of regional communities. Private-sector ideas are becoming more important under such efforts rather than assistance that the central and local governments extend to disaster-ravaged areas.

There are good examples of efforts to revitalize the economies in disaster areas. In Ishinomaki, Miyagi Prefecture, "Ishinomaki 2.0," an organization made up of local residents and those from other prefectures, is promoting the revitalization of the local economy. The organization is aiming to build better neighborhoods than the pre-disaster period under the slogan, "We never think of restoring our town to the pre-3.11 (March 11) situation."

Specifically, the group is carrying out projects to support young people's efforts to start businesses in the city after they visited the area to participate in volunteer activities and promoting exchanges between these young people. Architect Tsukasa Nishida, 40, a resident of Yokohama who is involved in the group's activities, says, "Participation of young people living outside is necessary for disaster recovery."

Young people who have moved to the Karakuwa Peninsula in Kesenuma, Miyagi Prefecture, from various other areas have launched a project to revitalize the local economy. Close attention should be paid to these activities even though they are still small-scale.

Use of vacant lots and vacant rooms in newly developed residential areas on higher ground and reconstruction housing will likely pose a challenge. It is necessary to consider allowing young people, who are interested in the reconstruction of disaster-ravaged areas, to move into these vacant lots and rooms. Such efforts will help maintain communities in these areas.

The situation of disaster-hit regions that suffer from depopulation and the aging of their populations reflect Japan's future. The government as well as the general public should take the reconstruction of disaster-ravaged areas as a task for the entire nation and support such efforts from a long-term perspective.

Edano blasts Govt. for pushing nukes

March 9, 2016

Face of government in Fukushima aftermath blasts Abe push for nuclear power

<http://www.japantimes.co.jp/news/2016/03/09/national/face-of-government-in-fukushima-aftermath-blasts-abe-push-for-nuclear-power/#.VuEhMOaDmot>

by Andy Sharp and Maiko Takahashi

Bloomberg

In his trademark blue jumpsuit, the bleary-eyed Chief Cabinet Secretary Yukio Edano became the government's face of the Fukushima nuclear crisis as he faced the press every few hours. Five years later, he has **stern words for Japan's atomic watchdog, the plant's operator and Prime Minister Shinzo Abe's nuclear restart policy.**

Edano, secretary-general of the now-opposition Democratic Party of Japan, refutes claims by the current administration that the Nuclear Regulation Authority is imposing the world's most stringent safety standards in the earthquake-prone nation.

"The government's explanation is mistaken," the 51-year-old said in an interview last week at his Tokyo office. "The regulations have not won international recognition as the world's toughest."

The NRA was set up in 2012 by Edano's party to replace a predecessor criticized for ignoring warnings before the Fukushima disaster and having cozy ties with operators. The NRA judges whether facilities meet safety guidelines for restart, and is viewed by the International Atomic Energy Agency as demonstrating independence and transparency.

The regulatory body regards its regulation as "one of the most stringent standards in the world," and from time to time, has been inaccurately quoted and criticized as if we were saying it was "the most," NRA spokesman Go Kobayashi said in an email.

Edano's comments come just weeks after three former executives of plant operator Tokyo Electric Power Co. were indicted for professional negligence over the disaster, which prosecutors say led to the death of more than 40 people during the evacuation. The indictments are the first time a court will examine whether the failure to prevent the worst nuclear disaster since Chernobyl constituted a crime.

Last month, Tepco said that it knew of meltdowns at the Fukushima reactors in the days after the March 11, 2011 disaster — something it refused to acknowledge for about two months after the accident, triggering speculation about a cover-up.

Edano said that on March 14 — three days later — he thought the possibility of a meltdown was very high. "While we amateurs took action based on that hypothesis, Tepco — who are supposed to be the professionals — kept on saying 'things are not yet clear,'" he said. "It was we amateurs who were right." Regarding Tepco's announcement that it was aware of the meltdown, Edano said it was better to be late than "continuing to hide" this information. "It's a problem if Tepco doesn't take responsibility like it should."

Tepco spokesman Yukako Handa said by email that the company will investigate the sequence of events and causes of why it couldn't declare the nuclear core meltdown.

Edano was born in Tochigi Prefecture, which borders Fukushima; his alma mater is the University of Tohoku in Sendai, a coastal city devastated by the tsunami. His role during the crisis was a combination of deputy prime minister and chief of staff, holding an average of five televised briefings a day in the weeks after the magnitude-9.0 earthquake and enormous tsunami hit northeastern Japan.

Getting about two hours sleep a night, he patiently provided details on radiation levels, evacuation orders, power rationing and recovery efforts. He was praised on social media for his work ethic, with some pleading with him to get more sleep.

The Abe administration goal is to have nuclear power make up as much as 22 percent of the nation's energy needs by 2030. A total of about 30 to 33 reactors of Japan's operable 43 reactors will have to be restarted to meet the target, according to Syusaku Nishikawa, a Tokyo-based analyst at Daiwa Securities Co.

Edano said he had deep reservations about the government's restart plan.

"As things stand I strongly question whether evacuation plans can be said to be sufficient," he said. "The government isn't getting involved, the government isn't taking responsibility."

Chief Cabinet Secretary Yoshihide Suga told reporters in Tokyo on Tuesday that Edano's criticism of the plan was "way off the mark." He said that safety was the top priority and there were no problems whatsoever with the evacuation plan.

A Kyodo News survey over the weekend showed that about two-thirds of local government leaders across Japan wanted the government to reduce its reliance on nuclear power, or scrap it completely.

Still, Edano said he felt it was his duty to serve the public in a time of crisis, giving news conferences even when he had no new information to provide. He continues to feel that burden.

"Even though five years have passed, people are still living in temporary housing, and many are living a long way from the hometowns they want to return to," he said. "Even though we are now in opposition, I always feel a heavy responsibility as part of the administration at the time."

Asked whether he had kept any of the jumpsuits, Edano said: "They are government property. I can't even take one as souvenir."

March 9, 2016

Mr. Suga not happy about court decision

March 10, 2015

Suga: Govt. won't review nuclear regulations

http://www3.nhk.or.jp/nhkworld/en/news/20160310_26/

Japan's Chief Cabinet Secretary says the government will continue to promote the restart of nuclear reactors, despite an injunction ordering 2 reactors at the Takahama plant to be taken offline.

Yoshihide Suga said on Thursday the reactors were judged by the Nuclear Regulation Authority to have met new regulations said to be the world's toughest.

He said the government honors that judgment, and added it has no plans to review those regulations.

Court injunction a major blow to Kepco's business

March 10, 2016

Takahama reactor injunction torpedoed Kansai Electric's business strategy

<http://mainichi.jp/english/articles/20160310/p2a/00m/0na/007000c>

The court-ordered suspension of the No. 3 and 4 reactors at the Takahama Nuclear Power Plant is a major blow to operator Kansai Electric Power Co.'s business, sending the utility's strategy for the April liberalization of Japan's retail electricity market back to square one.

- **【Related】** Utility begins work to halt Takahama reactor following court order
- **【Related】** Japan court rules against operating restarted Takahama reactors
- **【Related】** Shiga Pref., Takahama nuclear plant operator sign safety accord
- **【Related】** Mayor OKs reactor restarts at Takahama nuke plant; questions remain on evacuation plan

Bringing the generating capacity of the Takahama reactors back online was directly connected to Kansai Electric's plans to lower power prices to boost the company's competitiveness in a wide-open retail electricity market. The March 9 injunction issued by the Otsu District Court, however, has torpedoed that scenario.

Kansai Electric's plan appeared to be progressing smoothly. The Takahama reactors in Takahama, Fukui Prefecture, passed the Nuclear Regulation Authority (NRA)'s strict new safety inspections, and the No. 3 reactor resumed operations in January. Some technical trouble would delay the restart of the No. 4 reactor "for about a month," according to one Kansai Electric executive, but the firm could look forward to the plant once again generating income. As such, the utility was ready to launch a retail power marketing strategy in May that would play up its business stability and reduced household electricity prices. Now, after the injunction, Kansai Electric will be getting zero power out of the Takahama reactors. At a March 9 news conference at the company's headquarters in Osaka's Kita Ward, atomic fuel cycle section chief Kazuo Kijima told reporters, "We believe this will have an extremely severe impact" on the utility. Before the Fukushima nuclear crisis, Kansai Electric had been Japan's most atomic power-reliant utility, and thus has been the hardest hit by the eventual shutdown of all the country's reactors in the wake of the March 2011 disaster. Fuel costs for thermal power generation sank Kansai Electric into the red for four straight fiscal years, up to March 2015.

Household electricity rate hikes in 2013 and 2015, plus plunging crude oil prices, will finally get the firm back in the black for the year ending in March 2016, with an expected profit of 150 billion yen. Kansai Electric estimates, however, that the Takahama reactors will cost the company some 300 million yen for every day they remain idle. The expenses won't affect fiscal 2015 results, but "there could be some impact" on profitability for the fiscal year ending March 2017, according to Kansai Electric business planning head Takeshi Tanihara.

The company may lose customers when the retail electricity market opens to competition in April. According to the Organization for Cross-regional Coordination of Transmission Operators, some 73,400 applications to alternate household electricity suppliers had been submitted in Kansai Electric's service area as of Feb. 26.

"There are probably a lot of households that were putting off a decision on switching suppliers until they could get a definite idea of how much Kansai Electric would reduce its prices," an executive at one company set to join the retail electricity market told the Mainichi Shimbun. "If Kansai Electric can't cut rates now, it's certainly possible its customer base will become extremely fluid."

NRA should help relieve residents' worries

March 11, 2016

NRA chairman urges caution in plant decommissioning amid residents' radiation fears

<http://www.japantimes.co.jp/news/2016/03/11/national/nra-chief-urges-careful-decommissioning-plant-ease-minds-nearby-residents/#.VuK9euaDmot>

by Kazuaki Nagata

Staff Writer

As five years have now passed since the Fukushima No. 1 nuclear power plant meltdowns began, the chairman of the Nuclear Regulation Authority on Friday stressed that regulators must firmly monitor the decommissioning of the crippled plant to ease concerns of residents affected by the event.

Addressing hundreds of fellow regulators, NRA Chairman Shunichi Tanaka said towns near the Fukushima plant are still struggling to revive their communities and **former residents are constantly worried about radiation levels.**

"There are many things that we can do to help them," Tanaka said.

"First, we need to direct our utmost efforts to the decommissioning of the Fukushima No. 1 plant, so that it won't be a cause of concern" for Fukushima residents, he said.

The NRA has been tasked with overseeing the decommissioning of the plant, which is being carried out by operator Tokyo Electric Power Co.

Tanaka also said **regulators can help by providing more efficient decontamination plans and maps to show radiation levels near the plant.**

While evacuation orders have been lifted for some areas close to the plant, **nearly 100,000 people are living in limbo after being evacuated.**

The NRA chairman mentioned that some evacuees from the town of Tomioka plan to return home to see the cherry blossoms this year.

However, they will only be able to see the sakura blossoms and get glimpses of their hometown from the inside of a bus because they are worried about radiation exposure.

"I think we share the feeling that we want them to be able to see the cherry blossoms, but not from inside a bus," he said. "What can we do to realize that? What can we do to prevent more people from seeing such

a sad scene? I want you to think about it again by taking this opportunity on March 11," said Tanaka, who has headed the NRA since its inception in 2012.

The NRA was born of lessons learned from the Fukushima meltdowns — the world's worst nuclear disaster since Chernobyl, Ukraine, in 1986.

Before the disaster, the regulatory body was under the wings of the Ministry of Economy, Trade and Industry, which actually promotes the use of nuclear energy, which is why it was strongly criticized, because its regulators lacked the necessary teeth to strictly regulate plant operators.

Now, the agency has been separated from the nuclear promotional body and boasts a considerable degree of independence from politicians.

And counting

March 10, 2016

Tepco's nuclear crisis has cost Japanese people ¥3.46 trillion

<http://www.japantimes.co.jp/news/2016/03/10/national/tepcos-nuclear-crisis-cost-japanese-people-%C2%A53-46-trillion/>

Jiji

Japanese people have paid more than ¥3.46 trillion over the past five years in costs associated with the triple meltdown at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear power plant, Jiji Press learned.

The per capita cost of damages, decontamination work, measures against tainted water and other relevant work needed to deal with the crippled plant, which was heavily damaged in the March 2011 earthquake and tsunami, came to ¥27,000.

The disaster-response costs are the aggregate of the government's direct fiscal spending, expenses from the proceeds of the sale of government-held Tepco shares and from the government's energy-related special account, and additional charges that Tepco and six other power firms received through rate increases to cover damages.

Following the Fukushima accident, the seven power firms have raised rates to cover damages by at least a total ¥327 billion through fiscal 2015, which ends this month.

In its rate increases, Tepco included over ¥219.3 billion of costs for maintaining equipment that treats tainted water, and operating call centers that handle inquiries about damages.

The additional charges are paid to the government, which is paying damages temporarily on behalf of Tepco, through the Nuclear Damage Compensation and Decommissioning Facilitation Corp. after operational fees for the institution are deducted. The institution's operational expenses through fiscal 2014 came to ¥11.7 billion.

The proceeds from the Tepco share sale and disbursements from the energy-related special account are used to fund decontamination work, disposal of radioactive waste and interim storage facilities for tainted soil. Such costs totaled ¥1.69 trillion through fiscal 2014, and the government has temporarily paid that amount on behalf of Tepco.

Loans extended by banks to fund the institution's purchases of Tepco shares are guaranteed by the government. If the loans turn sour, taxpayer money will be used to cover the losses.

The institution expects some ¥2.5 trillion in capital gains through selling of the Tepco shares if the share price goes up sharply, which it says will be enough to cover costs related to the decontamination work. From the energy-related special account, which includes revenues from the tax designed to encourage the development of electric power sources, some ¥1.1 trillion is used to build interim storages. In the government's direct spending through fiscal 2014, a total of ¥1.21 trillion was spent on decommissioning work, radiation checkups and the maintenance of research and development. **Including costs for decontamination work and other direct spending by the government in fiscal 2015 that have yet to be confirmed, the public burden is estimated to grow further.**

Court injunction: The shock

March 10, 2016

Takahama injunction delivers body blow to Japan's nuclear power industry

<http://www.japantimes.co.jp/news/2016/03/10/national/takahama-injunction-delivers-body-blow-to-japans-nuclear-power-industry/#.VuK8zuaDmot>

by Eric Johnston

Staff Writer

OSAKA – Wednesday's decision by an Otsu District Court judge to slap a provisional injunction on the restart of the No. 3 and 4 reactors at Kansai Electric Power Co.'s Takahama nuclear plant has sent a shock through the nuclear power industry.

Moreover, pro-nuclear politicians fear that the nation's push to restart as many reactors as possible as quickly as possible has come to a halt.

On the eve of the fifth anniversary of the 2011 disaster, which included the meltdown of three reactors at the Fukushima No. 1 plant and led to the nation suspending its use of nuclear power for an extended period, only two reactors, Kyushu Electric Power Co.'s Sendai No. 1 and 2 reactors, were generating electricity.

The Takahama No. 3 reactor was restarted in January. Kepco officials said it would be shut down in accordance with the court order by Thursday evening.

The No. 4 reactor was already idle after a malfunction forced Kepco to abandon its restart last month.

The Otsu court said the shutdowns were ordered partially because Kepco failed to submit documentation backing up its claims that the reactors meet new safety standards.

One of the most significant aspects of Wednesday's ruling was that the judge sided with the plaintiffs over whether or not Kepco's earthquake prediction methods were valid.

The court found Kepco's standards and conclusions for what is the most "probable" and the "average" quake to not be backed up by sufficient documentation.

“This is a central point in other lawsuits elsewhere in Japan that are trying to halt restarts. The fact that the Otsu judge sided with the plaintiffs on this point will have an effect nationwide,” said Hiroyuki Kawai and Yuichi Kaido, who head a group of nationwide lawyers fighting for Japan to pull the plug on nuclear power.

What happens next? Kepeco can file an objection to the ruling with the Otsu court, which would decide to either uphold or dismiss it. If the injunction is dismissed, the reactors can be restarted.

But upholding the ruling likely means Kepeco would appeal to the Osaka High Court for a review of the lower court ruling. Regardless, the entire legal process would take many months, and possibly years, with no clear path to restarts.

That possibility is distressing local leaders in Fukui, who approved the restarts in the expectation that central government financial assistance would begin to flow again.

It is the second time a provisional injunction has been placed on the Takahama reactors. Last year, one was issued and then withdrawn by a separate court.

On Wednesday, Fukui Gov. Issei Nishikawa criticized the injunction.

“We at the local level take the problems of nuclear power seriously,” he said. “The repetition of the courts shutting them down and then overturning the decision and then shutting them down again is cause for concern about a loss of trust and create unease among residents.”

The Otsu ruling also calls on the national government to take the lead in formulating evacuation plans for residents within 30 km of a nuclear plant, and not just leave such planning to local governments.

That raises the possibility of further lawsuits seeking injunctions against other reactors on the grounds that the central government has not taken the lead in formulating evacuation plans. Nationwide, there are 135 cities, towns, and villages in 21 prefectures within 30 km of nuclear power plants.

"It's unclear who is responsible for whatever is done"

March 11, 2016

Editorial: Face the reality of Fukushima to move forward together

<http://mainichi.jp/english/articles/20160311/p2a/00m/0na/020000c>

Five years have passed since the Great East Japan Earthquake and tsunami horrified the whole nation. The disasters left more than 18,000 people dead or unaccounted for. Approximately 174,000 people are still taking shelter. Efforts to restore disaster-hit areas are only half way through. The entire country must continue to support the recovery of disaster areas.

In particular, the situation of Fukushima Prefecture affected by the crisis at the Fukushima No. 1 Nuclear Power Plant remains severe. There are no prospects that the prefecture will completely recover from the nuclear disaster in the foreseeable future, and those who were forced to leave their hometowns affected by the crisis have been scattered around the country. Over 2,000 Fukushima residents have died as a

result of factors related to the disasters, far more than other disaster-hit prefectures. The disasters are continuing to place a heavy psychological and physical burden on Fukushima Prefecture residents. Large black bags stuffed with waste generated by decontamination work are being piled up like a mountain in many places in disaster-hit areas of Fukushima Prefecture. How much land has been contaminated with radioactive substances? How can damage from the nuclear disaster be repaired? Can those who have evacuated from their hometowns go home in the future?

To answer these questions, it is necessary to grasp the real state of radioactive contamination and the amount of damage that is still continuing now.

What is needed now is to seriously face the situation of Fukushima and move forward with residents of the prefecture toward recovery.

The investigative committees set up by the executive and legislative branches of the government as well as private panels have examined the process of the nuclear accident and compiled reports. Still, the government has not sufficiently conducted a comprehensive investigation or evaluation focusing on specific damage caused by the nuclear disaster. A certain amount of relevant data has been accumulated, but no records have been put together in a systematic way.

Fukushima University professor Ryota Koyama says, "A lack of a government report on the nuclear disaster means that the government has failed to fully examine and evaluate the accident."

Specifically, Koyama underscores the need for the government to grasp the situation concerning the evacuation of residents and the state of contamination of soil with radioactive substances, conduct a survey on residents' health conditions, analyze the results of an examination of locally made agricultural products, carry out radiation countermeasures and assess such efforts.

In particular, it is essential to conduct a detailed survey on the livelihoods of some 100,000 residents who are taking shelter in and outside the prefecture. A growing number of these people have made up their mind to settle down in areas other than their hometowns, but many people cannot have clear prospects for their future.

The government can offer options that suit the livelihood of each evacuee only by understanding the difficulties they face, including those who have voluntarily fled their affected hometowns.

Ukraine, where the Chernobyl nuclear disaster occurred in 1986, and its neighbor Belarus release detailed reports on the accident every five years since the crisis broke out.

Ukraine's reports list the situation of radioactive contamination and residents' health conditions, as well as the accident's economic impact among other items. The attitudes of the governments of these countries to compile reports on the disaster to fulfill their responsibility should be appreciated.

A road map toward disaster recovery can be drawn and the scope of damage that needs to be recovered can be specified only after the state of damage becomes clear. Currently, the government is implementing recovery policy measures without clarifying the specific damage.

The safety of Fukushima rice, which had enjoyed a reputation for its quality, is guaranteed through inspections on all rice. Nevertheless, Fukushima rice still cannot regain its pre-disaster reputation.

Groundless rumors have damaged the brand image of Fukushima rice, and the prices of the products are being reduced in the process of marketing. However, such a structural problem is not taken into account in calculating the amounts of compensation. Nor has the problem led to the government's review of its agricultural policy.

The fact that numerous disputes over compensation for residents have been entangled is also rooted in the same problem. More than 12,000 people have launched class action lawsuits over compensation for damage from the nuclear disaster with district courts across the country. This is apparently because the

government's compensation policy and its framework are far from the state of damage felt by residents affected by the nuclear disaster.

Kiyoshi Kurokawa, a visiting professor at the National Graduate Institute for Policy Studies, who served as chairman of the Diet's investigative panel on the nuclear crisis, pointed to the lack of clarity in who is responsible for disaster recovery work.

"It's unclear who's responsible for whatever is done. The irresponsibility of leaders, which is a reality of Japanese society, has led to opportunistic and deceptive responses, damaging the international community's confidence in the country," he told a recent news conference at the Japan National Press Club in Tokyo.

What he pointed out is closely related to the basis of the country. Japan must not adopt its past stance in implementing disaster recovery measures over the next five years. The government should implement realistic policy measures. The time is ripe for the country to begin drawing up an annual "Fukushima white paper" that squarely faces damage from the atomic power disaster to provide a basis for such realistic disaster recovery measures.

It is the role of politics to take responsibility for the compilation of such an annual report.

The government should consider having the legislative branch play a leading role in working out such a report, as done in a report by the Diet's investigative panel on the nuclear disaster, in order not to be bound by the vertically divided administrative structure.

Signs of recovery are beginning to show in disaster-hit areas in Fukushima Prefecture.

The central government suggested that it will lift the evacuation order for the Odaka district of the prefectural city of Minamisoma in April. Residents of the district are divided over whether they should be fully allowed to return because infrastructure remains inadequate. Still, the number of residents temporarily visiting their homes is growing, and they say lights can be seen in their hometown, although the residential area had previously been pitch-black at night.

It is a long way to go for evacuees to fully restore their hometowns, but it is essential to steadily rebuild affected areas to ensure all residents can go home. Support from the public will be a driving force behind such efforts.

TEPCO promises compensation and complete clean-up

March 11, 2016

TEPCO president vows to fulfill responsibility

http://www3.nhk.or.jp/nhkworld/en/news/20160311_35/

The president of Tokyo Electric Power Company has pledged that the utility will fulfill its responsibility for dealing with the aftermath of the accident at the Fukushima nuclear power plant.

Naomi Hirose observed a minute of silence at 2:46 PM at the Fukushima Daiichi plant on Friday. It was the exact time the massive earthquake occurred on March 11th in 2011. He was joined by about 80 staff members, who are taking charge of decommissioning the plant.

Hirose told them that the tsunami shattered the plant operator's overconfidence and conceit.

He said many tasks remain to be done, such as retrieving nuclear fuel and paying damages to affected people. He called for unity in carrying out the tasks.

Hirose later told reporters that the accident has forced residents near the plant to evacuate and suffer hardships, and many of the affected people have died. He said he is very sorry for them.

The TEPCO president also said people may be reluctant to return to the area when evacuation orders for their communities are lifted.

He promised that **his company will complete its tasks that include scrapping the plant, compensation, and removing radioactive fallout from the environment.**

TOKYO — Of the thousands of workers who have answered the help-wanted ads at Fukushima Daiichi, the ruined and radioactive nuclear power plant in northeastern Japan, the part-time lettuce farmer and occasional comic-book artist Kazuto Tatsuta must be among the least likely.

“I needed a job,” Mr. Tatsuta, 51, recalled of his decision in 2012 to accept work at the site of one of the world’s worst nuclear accidents.

His duties included welding broken water pipes and inspecting remote-controlled robots that survey radioactive hot spots. And his comic strips, once populated with baseball players and gangsters, now tell stories of middle-aged, blue-collar men like himself who do the grunt work at Fukushima, some of whom find a sense of purpose and belonging they lacked in the outside world.

At Fukushima, Five Years Later

The head of Tokyo Electric Power Company, Tepco, decommissioning and Prime Minister Shinzo Abe of Japan spoke about the task of radioactive containment at Fukushima Daiichi nuclear power plant.

By REUTERS on Publish Date March 10, 2016. Photo by Kazuhiro Nogi/Agence France-Presse — Getty Images. Watch in Times Video »

“It’s secure. You’re not going to get laid off there,” Mr. Tatsuta said. “But you’re also working for a goal.”

Five years after a powerful earthquake and tsunami struck, causing three reactors at Fukushima to melt down, that goal is the focus of a colossal effort at once precarious and routine. A veneer of stability at the plant masks a grueling, day-to-day battle to contain hazardous radiation, which involves a small army of workers, complex technical challenges and vexing safety trade-offs.

Fukushima has become a place where employees arrive on company shuttle buses and shop at their own on-site convenience store, but where they struggle to control radiation-contaminated water and must release it into the sea. Many of the most difficult and dangerous cleanup tasks still lie ahead, and crucial decisions remain unsettled.

“There’s no precedent or manual,” said Prof. Tatsujiro Suzuki, a former vice chairman of the Japanese Atomic Energy Commission who is now at Nagasaki University.

A smooth cleanup is a top priority for Prime Minister Shinzo Abe, who wants to rebuild Japan’s tattered nuclear power industry. He has had little success so far. This week, a court ordered one of only two atomic power stations operating in the country to shut down, saying new safety measures it put in place after the Fukushima disaster were inadequate. More than 40 reactors are sitting idle.

The effort at Fukushima has reached a few milestones. About 1,500 spent fuel rods were successfully removed from a damaged storage tank in late 2014, a delicate and risky operation. Much of the contaminated rubble left by the tsunami and hydrogen explosions has been cleared, and overall radiation levels are down. Workers will soon be able to enter some areas of the plant without full-body protective gear.

Fukushima Five Years After Nuclear Disaster

Five years after an earthquake and tsunami devastated the northeast Japanese coast, Japan has not fully recovered.

But a full cleanup of the site — including the extraction of melted uranium fuel from the damaged reactor cores — is expected to take at least 40 years according to the government’s timetable and a century by other estimates. In the meantime, officials acknowledge, Fukushima remains vulnerable.

“The question is, Is there a Plan B to deal with another big quake or tsunami?” Professor Suzuki said.

The duration of the cleanup also creates the risk of labor shortages, he said, especially in jobs requiring special skills. Japan’s population is shrinking and, with the future of nuclear power uncertain, many young people are unwilling to stake careers on the industry.

By the Numbers

- Fukushima residents displaced by radiation as of January 2016: 99,750
- Total people displaced by the tsunami and radiation: 174,000 as of February 2016
- Still living in temporary government housing: 60,784 people as of January 2016
- Nuclear reactors back online: One as of March 2016

By Makiko Inoue. Sources: Fukushima Prefecture & Reconstruction Agency

For now, Fukushima is bustling with about 7,000 workers, much more than before the disaster and twice as many as two years ago. The town of Iwaki to the south has become a kind of workers' village. At dawn, vans and buses line up to ferry workers to the plant via staging areas where they don protective white Tyvek suits, radiation monitors and gas masks.

"You think of it as totally normal work," said Mr. Tatsuta, who asked to be identified only by his pen name to avoid being blacklisted by the plant's owner, Tokyo Electric Power Company.

Water is perhaps the biggest challenge at Fukushima. Engineers must keep it flowing through the damaged reactor cores to prevent the melted fuel from overheating, and then through miles of plastic pipes to recycle it inside the plant. But because the buildings are damaged, radioactive water leaks out and builds up in the basements. When it rains, more water seeps in.

To prevent it from spreading, Tokyo Electric pumps out about 720 tons of water from the basements every day, storing it in huge tanks that workers are building. About 1,000 of the tanks have already been filled. But because there are not enough tanks, the plant also releases 2,000 tons of the water into the ocean every week after a process that removes most, but not all, of the radioactive particles.

Tokyo Electric says the water poses no danger to people or marine life because radiation levels are low and further diluted in the ocean. But environmentalists are worried, nearby fishing grounds remain closed and it is a public-relations nightmare for the government.

Other workers are building a mile-long "ice wall" around part of the plant to prevent rain and groundwater from seeping into the basements. The plan is to pump chemicals into the soil to freeze it, but the technique has never been used on such a large scale before.

The company says it may not be able to solve the water problem until 2020. Other goals, including the removal of spent fuel rods stored inside the reactors, are still further off.

And then there is the problem of the melted nuclear fuel itself. Tokyo Electric has ruled out burying the buildings in thick layers of concrete as the Soviets did at Chernobyl, because so much radioactive material remains that it could explode during the burial process or burn through the concrete or into the ground.

Robots have recently begun mapping out areas around the cores, which are still too dangerous for workers to approach. Engineers are trying to determine if cracks in the containment vessels can be repaired, which would allow them to fill the cores with water to ensure the fuel remains submerged as it is extracted, minimizing the risk of releasing radiation. The process is expected to take decades and cost billions.

For workers at the site, radiation is a constant enemy — though many see it more as a threat to their livelihoods than their lives. Government regulations forbid cleanup workers to be exposed to too much radiation, and when they hit the limits, they risk being laid off or reassigned to lower-paying jobs.

"If you go over the radiation limits, you can't work," Mr. Tatsuta said. "You're always calculating how to keep the dose low."

The temptation to cheat can be strong, for both workers and their managers. A government examination of Tokyo Electric's safety practices in 2013 found that it had underreported the radiation exposure of a third of the workers whose records were reviewed. The company says it has since tightened reporting procedures.

Minoru Ikeda, 63, a retired postal worker, said he had joined the cleanup in 2013, over his wife's objections, because of a sense of social obligation and curiosity. "Fukushima felt so close and so far away at the same time," he said. "I wanted to see for myself."

He started out cutting contaminated weeds in a town deserted since the accident and stuffing them into plastic bags. Mountains of collected soil and leaves have piled up across the region, as politicians debate how to dispose of it.

Eventually, Mr. Ikeda got work in the plant itself, picking up papers and broken glass in the administrative offices. "There was still sand on the floor from the tsunami," he recalled, "and newspapers dated March 11," the day of the disaster.

He later wrote a memoir describing the rhythm of life in the cleanup zone, where almost the entire work force is male and many have little history of stable employment.

Because it took so long to change in and out of protective gear and pass through radiation checks, he usually worked only two to three hours a day, he said. In off hours, he and his colleagues slept, drank or played pachinko, a Japanese gambling game that resembles pinball.

Mr. Ikeda still carries a small "radiation book," similar to a bank passbook. Over 15 months, it shows, he was exposed to 7.25 millisieverts, well below the regulatory limit but still high enough that, should he contract cancer during his lifetime, he would be eligible for workers' compensation.

Mr. Ikeda's last job at Fukushima involved the destruction of used protective coveralls. Tens of thousands had been compacted into cubes for incineration, but they were too big for the incinerator. Mr. Ikeda and his team broke the cubes apart and repacked the coveralls in smaller bundles.

"The work's not hard," he said, "if you don't think about radiation."

Not worth it...

March 14, 2016

Fukushima evacuations were not worth the money, study says

<http://www.japantimes.co.jp/news/2016/03/14/national/fukushima-evacuations-were-not-worth-the-money-study-says/#.VuL4-aDmot>

by William Hollingworth

Kyodo

LONDON – The costs of evacuating residents from near the Fukushima No. 1 plant and the dislocation the people experienced were greater than their expected gain in longevity, a British study has found.

The researchers found that at best evacuees could expect to live eight months longer, but that some might gain only one extra day of life. They said this does not warrant ripping people from their homes and communities.

The team of experts from four British universities developed a series of tests to examine the relocations after the Fukushima crisis and earlier Chernobyl disaster in 1986.

After a three-year study, the academics have concluded that Japan “overreacted” by relocating 160,000 residents of Fukushima Prefecture, even though radioactive material fell on more than 30,000 sq. km of territory.

“We judged that no one should have been relocated in Fukushima, and it could be argued this was a knee-jerk reaction,” said Philip Thomas, a professor of risk management at Bristol University. “It did more harm than good. An awful lot of disruption has been caused. However, this is with hindsight and we are not blaming the authorities.”

The team used a wide range of economic and actuarial data, as well as information from the United Nations and the Japanese government.

In one test, an assessment of judgment value, the researchers calculated how many days of life expectancy were saved by relocating residents away from areas affected by radiation.

They compared this with the cost of relocation and how much this expenditure would impact the quality of people’s lives in the future.

From this information, they were able to work out the optimal or rational level of spending and make a judgment on the best measures to mitigate the effects of a nuclear accident.

Depending on how close people were to the radiation, the team calculated that the relocations added a period of between one day to 21 days to the evacuees’ lives.

But when this was compared with the vast amounts of money spent, the academics came to the conclusion that it was unjustified in all cases.

In some areas, they calculated that 150 times more money was being spent than was judged rational.

Thomas adds, the tests do not take into account the physical and psychological effects of relocating, which have been shown to have led to more than 1,000 deaths among elderly evacuees.

Other studies have also found that once people have lived away for a certain period of time it can become increasingly difficult to persuade them to return.

After Chernobyl, the world’s worst nuclear disaster, around 116,000 people were initially relocated away from the disaster zone.

Looking back on the incident, the team judged it was only worthwhile to relocate 31,000 people because they would have lost in excess of 8.7 months in life expectancy had they remained.

However, for the rest of the 116,000 people, it would have been a more rational decision to keep them where they were, given that their average loss of life was put at three months.

Four years later, a further 220,000 people were relocated from areas close to Chernobyl. Researchers found this unjustified.

Thomas says the loss in life expectancy following a nuclear accident has to be put into context alongside other threats all people face.

For example, it has been claimed that the average Londoner will lose about 4½ months in life expectancy due to high pollution levels.

Thomas concludes governments should carry out a more careful assessment before mounting a relocation operation of at least a year. A temporary evacuation could be a good idea while authorities work out the risk from radiation, he said.

In the future, Thomas would like to see more real-time information made available to the public on radiation levels in order to avoid hysteria and bad planning.

On a plus note, the team found that other remedial measures — decontaminating homes, deep ploughing of soil and bans on the sales of certain food products — were far more effective.

Thomas has already discussed his findings with colleagues at the University of Tokyo and he is keen that his findings can help better quantify the risks from radioactive leaks.

The project was sponsored by the Engineering and Physical Sciences Research Council, Britain's main agency for funding research in engineering and the physical sciences. **It was intended to give advice for nuclear planners both in Britain and India.**

The research team comprised specialists from City University in London, Manchester University, the Open University and Warwick University.

Fukushima Report: 10,000 Excess Cancers Expected in Japan as a Result of 2011 Reactor Meltdowns, Ongoing Radiation Exposure

Report Gauges Cancer Prospects for Children, Rescue/Recovery Worker, and General Population; Japanese Government Criticized for "Disturbing" Failure to Examine Wider Radiation-Related Diseases

March 9, 2016

WASHINGTON, D.C. & BERLIN – March 9, 2016 – Residents of the Fukushima area and the rest of Japan will experience more than 10,000 excess cancers as a result of radiation exposure from the triple-reactor meltdown that took place on March 11, 2011, according to a new report from Physicians for Social Responsibility (PSR) and International Physicians for the Prevention of Nuclear War (IPPNW).

Titled "*5 Years Living With Fukushima*" and available online at www.psr.org/FukushimaReport2016, the PSR/IPPNW report laments that the full impact of Fukushima may never be known, due to Japan's failure to immediately and fully track radiation exposures, as well as a "disturbing" lack of testing of the general population for radiation-related diseases and other impacts (miscarriages, fetal malformations, leukemia, lymphomas, solid tumors or non-cancerous diseases). The massive initial radioactive emissions were not recorded at the time of the triple-reactor meltdown and some radioactive isotopes (including strontium-90) have not been measured at all.

The PSR/IPPNW report uses the best available science and data to gauge the excess cancer rates among children, rescue and clean-up workers, and the general population of Japan. In addition to the 200,000 Fukushima residents relocated nearby into makeshift camps, the exposed include millions of others in Japan as a result of fallout-contaminated food, soil and water. Fukushima is often incorrectly seen as a "past" event; the reality is that radioactive emissions from the wrecked reactors continue to this day both into the atmosphere and in the form of 300 tons of leakage each day into the Pacific Ocean.

Key findings of the PSR/IPPNW report include the following:

- **Children.** "116 children in Fukushima Prefecture have already been diagnosed with aggressive and fast-growing, or already metastasizing, thyroid cancer – in a population this size about one to five cases per year would normally be expected. For 16 of these children a screening effect can be excluded as their cancers developed within the last two years."
- **Workers.** "More than 25,000 cleanup and rescue workers received the highest radiation dose and risked their health, while preventing a deterioration of the situation at the power plant site. If data supplied by the operator TEPCO is to be believed, around 100 workers are expected to contract cancer due to excess radiation, and 50 percent of these will be fatal. The real dose levels, however, are most likely several times higher, as the operator has had no qualms in manipulating

the data to avoid claims for damages – from hiring unregistered temporary employees to tampering with radiation dosimeters and even crude forgery."

- ***The rest of Japan.*** "The population in the rest of Japan is exposed to increased radiation doses from minor amounts of radioactive fallout, as well as contaminated food and water. Calculations of increased cancer cases overall in Japan range from 9,600 to 66,000 depending on the dose estimates."

Catherine Thomasson, MD, report co-editor, and executive director, Physicians for Social Responsibility, said: **"The health legacy of Fukushima will haunt Japan for years to come and it cannot be wished out of existence by cheerleaders for nuclear power. Unfortunately, the pro-nuclear Japanese government and the country's influential nuclear lobby are doing everything in their power to play down and conceal the effects of the disaster. The high numbers of thyroid cancers already verified with 50 additional waiting for surgery in the children of Fukushima prefecture is astounding. The aim seems to be to ensure the Fukushima file is closed as soon as possible and the Japanese public returns to a positive view of nuclear power. This rush to re-embrace nuclear power is dangerous to the extent that it sweeps major and very real medical concerns under the rug."**

Dr. Alex Rosen, pediatrician and vice-chair, International Physicians for Prevention of Nuclear War, said: **"One is of course reminded of the tobacco lobby disputing the notion that the horrific effects of its products have no adverse health impacts. This self-serving falsehood echoed for decades was made possible simply because the long-term health effects of smoking were not immediately observable. The 10,000 to 66,000 people who will develop cancer solely as a result of the "manmade disaster" are neither 'negligible' nor 'insufficient,' as Japanese authorities, the nation's nuclear lobby, and various industry-dominated international bodies, would have you believe."**

Tim Mousseau, PhD, professor of Biological Sciences, University of South Carolina, said: **"It is unfortunate that, in some regards, we have better and more complete data about the impacts of Fukushima radiation on trees, plants and animals than we do on humans. We are seeing higher mortality rates, reduction in successful reproduction and significant deformities. A great deal of this research has been done to date and it has troubling implications. The research findings should be heeded to direct human studies, particularly regarding the question of genetic and transgenerational effects of radiation."**

Robert Alvarez, senior scholar specializing in nuclear disarmament, environmental, and energy policies, Institute for Public Studies, and former senior policy advisor, US Department of Energy, said: **"Radioactive fallout from the reactors has created de facto 'sacrifice zones' where human habitation will no longer be possible well into the future. In November 2011, the Japanese Science Ministry reported that long-lived radioactive cesium had contaminated 11,580 square miles (30,000 sq km) of the land surface of Japan. Some 4,500 square miles – an area almost the size of Connecticut – was found to have radiation levels that exceeded Japan's allowable exposure rate of 1 mSV (millisievert) per year. Fourteen of the nation's 54 reactors are permanently shut down as they are on fault lines and only four have been restarted."**

The PSR/IPPNW report also cautions that Fukushima was far from a one-time radiation incident: "The wrecked reactors have been leaking radioactive discharge since March 2011, de-spite assurances by the nuclear industry and institutions of the nuclear lobby such as the International Atomic Energy Organization that a singular incident occurred in spring 2011, which is now under control. This statement ignores the continuous emission of long-lived radionuclides such as cesium-137 or strontium-90 into the atmosphere, the groundwater and the ocean. It also ignores frequent recontamination of affected areas due to storms, flooding, forest fires, pollination, precipitation and even clean-up

operations, which cause radioactive isotopes to be whirled into the air and spread by the wind. Thus, several incidents of new contamination with cesium-137 and strontium-90 have been discovered during the past years, even at considerable distance beyond the evacuation zone."

The report also notes: "Finally, there are frequent leaks at the power plant itself – particularly from the cracked underground vaults of the reactor buildings and from containers holding radioactive contaminated water, which were hastily welded together and already exhibit numerous defects.

According to TEPCO, 300 tons of radioactive wastewater still flow unchecked into the ocean every day – more than 500,000 tons since the beginning of the nuclear disaster. The amount and composition of radioactive isotopes fluctuate widely so that it is not possible to ascertain the actual effect this radioactive discharge will have on marine life. What is clear, however, is that increasing amounts of strontium-90 are being flushed into the sea. Strontium-90 is a radioactive isotope that is incorporated into living organisms in a similar way to calcium - in bones and teeth. As it travels up the marine food chain, it undergoes significant bioaccumulation and, because of its long biological and physical half-lives, will continue to contaminate the environment for the next hundreds of years."

ABOUT THE GROUPS

Physicians for Social Responsibility has been working for more than 50 years to create a healthy, just and peaceful world for both the present and future generations. PSR advocates on key issues of concern by addressing the dangers that threaten communities. www.psr.org.

International Physicians for the Prevention of Nuclear War is a non-partisan federation of national medical groups in 64 countries, representing tens of thousands of doctors, medical students, other health workers, and concerned citizens who share the common goal of creating a more peaceful and secure world freed from the threat of nuclear annihilation. www.ippnw.org

Judging on site

March 18, 2016

Judges inspect evacuated areas in Fukushima for on-site evidence

<http://ajw.asahi.com/article/0311disaster/recovery/AJ201603180055>

By MANA NAGANO/ Staff Writer

FUKUSHIMA--Fukushima District Court judges inspected the houses of three evacuated plaintiffs on March 17 in connection with a lawsuit filed against the government and Tokyo Electric Power Co. over the nuclear disaster.

It marked the first visit by judges to evacuation zones regarding litigation concerning the accident at the Fukushima No. 1 nuclear power plant, which was caused by the Great East Japan Earthquake and tsunami in March 2011.

Called "Nariwai Soshō" (livelihood suit), the lawsuit has about 4,000 plaintiffs seeking consolation money and the restoration of their former lives that were lost because of the nuclear accident.

What was gleaned from the on-site inspections will be used as evidence in the trial.

The plaintiffs had called for the judges to visit the affected sites and hear their explanations to assess the scope of damage of the nuclear disaster.

The inspections involving about 50 people, which were closed to the media, started at 10:45 a.m. and ended around 4:30 p.m.

Three judges, including Presiding Judge Hideki Kanazawa, first visited the home of Sadatoshi Sato, a 68-year-old who raised livestock before the disaster, in Namie.

Other plaintiffs, government officials and TEPCO representatives accompanied the judges. All participants wore white protective suits and masks.

At Sato's home, the judges viewed empty cattle sheds. Sato had been raising about 150 cattle when the nuclear accident unfolded, but most of them starved to death while he was evacuating. Sato also took the judges to the site where the dead cattle were buried.

"I want the judges to give a thoughtful ruling so that the dead cattle would rest in peace," Sato told reporters after the inspection.

The judges also visited the homes of 67-year-old Yuji Fukuda in Futaba and a woman in Tomioka who had been operating a piano school out of her house before the nuclear accident.

Fukuda's house is in a difficult-to-return zone about 4 kilometers from the Fukushima No. 1 nuclear plant. He showed the judges his once-thriving garden. He also told them about a local store that is now desolate.

"I told the judges from the bottom of my heart that I am not the only one who has suffered," Fukuda said.

"I had wanted the judges to come sooner. But my hope has finally come true."

Fukushima: What lessons for EU energy future?

Lessons from Fukushima for EU energy policy

<https://euobserver.com/opinion/132640>

By Ian Hudgton

BRUSSELS, 11. Mar, 08:44

On 11 March 2011, one of the biggest earthquakes in history shook Japan's northeast. The Tohoku earthquake triggered a 10-metre (33ft) tsunami, which smashed into the power plant on the Fukushima coastline precipitating three nuclear meltdowns and forcing nearby towns to evacuate.

The disaster killed over 19,000 people across Japan and caused an estimated 16.9 trillion yen (€136 billion) in damages.

Five years on from the Fukushima Daiichi nuclear power plant disaster - which remains the world's second worst disaster after Chernobyl in 1986 - some 10,000 children whose families fled Fukushima Prefecture have yet to return.

Despite Tokyo's pledge of 26.3 trillion yen (€211 billion) over five years and a further 6 trillion between now and 2020 to rebuild the disaster area, the Japanese population are reported to be picking up the bill. The Financial Times recently found that the nuclear disaster has cost Japanese taxpayers almost €90.8 billion, as the underlying cost of the disaster is mainly "being pay by the public, either through electricity bills or as tax", according to Ritsumeikan University professor Kenichi Oshima.

The wider consequences stemming from the Fukushima disaster are far-ranging. Radioactivity from the nuclear disaster can still be found in some freshwater fish and ocean bottom dwellers near Fukushima have a higher risk of contamination with the radioactive chemical cesium.

Public awareness

In a recent investigation, Greenpeace found that over 9 million cubic metres of nuclear waste are scattered over at least 113,000 locations across Fukushima prefecture.

The NGO's underwater investigation is set to release findings on the extent to which the Pacific Ocean and local rivers have been contaminated by radioactive material later this month.

Therefore, it comes as no surprise that a cautious, sceptical attitude over Japan's nuclear future is prevailing. The disaster changed the national debate over energy policy overnight. As some analysts suggest, the crisis "dramatically raised public awareness about energy use and sparked strong anti-nuclear sentiment".

But the New York Times recently commented despite the legacy of Hiroshima and Nagasaki, and the accidents at the Three Mile Island and Chernobyl nuclear plants, Japan never faced the levels of popular opposition to nuclear power seen in the US and Europe, before the disaster at Fukushima.

I welcome the measures taken by Japan to address the disaster - including the recent indictment of three former Tokyo Electric Power (TEPCO) executives on charges of criminal negligence - but there remains a lot to be done.

Following the Fukushima disaster, one by one the country's nuclear plants were shut-down for maintenance checks and prevented from restarting as a result of widespread public concern.

Anti-nuclear sentiment

Earlier this week, the Otsu District Court ordered Kansai Electric Power to shut down two of its nuclear reactors in Takahama, western Japan following complaints by local residents over the safety of the plant. It seems that even despite the Nuclear Regulation Authority being established in 2012, the Japanese population are wary of any nuclear plant restarting. Yet so far four out of the 43 operable reactors in Japan have restarted under the new, post-Fukushima safety rules.

Japan still relies heavily on nuclear power for domestic energy purposes, which constituted almost 30 percent of Japan's energy mix prior to 2011.

The country's industry ministry is aiming to make nuclear energy account for 20-22 percent of the country's electricity mix by 2030 with renewable energy sources to make up for 22-24 percent, liquefied natural gas set at 27 percent and coal at 26 percent of electricity generation between now and 2030.

Earlier this week Japan's former prime minister, Naoto Kan, who held office at the time of March 2011 stated that over the past five years, Japan spent two years without a single nuclear plant on line.

He said that "we can secure enough power without nuclear plants and I believe we should stay away from the large risk posed by nuclear plants and focus instead on renewable energy by changing our sources of power".

Opinion polls across Japan reveal a growing anti-nuclear sentiment. In a nationwide survey sent to all of Japan's local authorities - of which 99.6 percent responded - 44.6 percent sought cuts in Japan's dependence on nuclear power and 21 percent requested the eventual abolishment of nuclear power generation.

Renewable energy

Given the public mood, I am hopeful that Japan continues to diversify its energy mix, and decrease its over-reliance on nuclear energy altogether.

For a country such as the UK, who is undoubtedly able to rely on a diverse range of energy options, the nuclear way is quite clearly not the way forward.

As I said back in 2011, Fukushima offers us a clear-cut example of why we must retain our opposition to the development of nuclear power stations in Scotland and across the UK. The construction of the two nuclear reactors at Hinkley Point in Somerset, England is therefore an unwelcomed, costly and high-risk expense for the taxpayer.

The Guardian reports that the UK government agreed to pay £92.50 (€119.40) for each unit of electricity: more than double the market price now.

With an abundance of natural resources and opportunities for renewable energy sources, not at least offshore wind and tidal power along with wave energy, there is simply no justification for the UK Government to opt out of a cleaner, safer, more cost effective solution to the UK's energy needs.

Five years on from the Fukushima disaster, I hope that Japan finds alternative, renewable efficient and most importantly safe means to provide energy and that the UK, along with other EU states, commemorate the victims of Fukushima with the view to opt for renewable sources of energy over a high-risk and unnecessarily expensive nuclear energy future.

Ian Hudghton is the president of the Scottish National Party and a member of the European Parliament's delegation to Japan

Deregulation: What's in it for people?

March 22, 2016

What benefits, options will liberalization of electricity industry bring to consumers?

<http://mainichi.jp/english/articles/20160322/p2a/00m/0na/015000c>

The country's retail electricity market will be fully liberalized in April, allowing consumers to freely choose and decide which companies they want to buy electricity from.

Ten major regional power companies such as Tokyo Electric Power Co. (TEPCO) have so far been monopolizing the retail electricity market for regular households, but a number of business operators have decided to make new entrants into the market, competing to acquire customers through cheaper rate plans and other means. What changes will the power deregulation bring to people's livelihoods? The following are some key points for choosing power suppliers and related issues.

There were 253 new entrants or new electricity companies registered with the Ministry of Economy, Trade and Industry as of March 18, and nearly a half of them are planning to sell electricity to households. There are a variety of new entrants: major oil wholesalers that have their own thermal power plants; major telecom carriers that are set to sell electricity purchased from other suppliers as packages with their own services; start-up companies that are set to sell mainly renewable energy such as solar generated electricity; and other firms. They have actively been engaged in publicity campaigns to attract customers, presenting rates that are up to 10 percent cheaper than those from major power companies. JX Nippon Oil & Energy Corp., Japan's largest oil wholesaler, emphasized its experience in selling electricity for more than a decade, with a campaign slogan saying, "We are an experienced power

distributer." The company entered the electricity market for businesses in 2003. It has a production capacity of 1.63 million kilowatts of electricity that exceeds the capacity of a single nuclear power plant, using oil leftover from refining petroleum, among other means. Tokyo Gas Co., too, has been generating electricity by using liquefied natural gas it procures on its own as raw material and selling the electricity to businesses through its affiliated companies. Gas and oil companies are challenging major power companies by taking advantage of their accumulated expertise to sell electricity at low prices. KDDI Corp., a major telecom carrier, is to enter the retail electricity market under the banner of its "au denki" brand. It will not have its own power plants, but rather receive power supplies from Kansai Electric Power Co. and other utilities. KDDI is to attract its users by returning up to 5 percent of their electricity bills to its mobile phone service contractors in the form of electric money. Jupiter Telecommunications Co., Japan's top cable television operator, is to procure electricity from a trading company that also is an investor of the telecom firm and offer discounts on electricity bills for its customers who have signed up for packages of electricity and cable television services.

In addition to rate plans for electricity supplied by TEPCO, mobile company SoftBank Corp. has set up a plan with renewable energy sources such as solar power making up 57 percent of the total supply. There have been movements aimed at securing "local production and local consumption" by utilizing renewable energy generated in each region. One of the examples is Miyama Smart Energy Co. launched by the Miyama Municipal Government in Fukuoka Prefecture.

Major power companies have prepared to compete with new electricity providers, with TEPCO, for example, offering rate plans designed to give discounts of up to 5 percent. However, Kansai Electric has abandoned its plan to start offering discounts on power bills from May after the Otsu District Court issued a provisional injunction ordering the company to suspend operations of the No. 3 and 4 reactors at its Takahama Nuclear Power Plant in Fukui Prefecture. The utilities could face an uphill battle if their nuclear reactors that are capable of generating power at low costs remain idled.

Meanwhile, new electricity providers are entering the retail electricity market mainly in densely-populated Tokyo, Osaka and other major cities. According to the Japan Organization for Cross-regional Coordination of Transmission Operators, which promotes consumers to switch power providers, there were 274,000 applications filed for new rate plans as of Feb. 26. But more than 90 percent of them were concentrated in the service areas of TEPCO and Kansai Electric. Therefore, there are still insufficient options for households in regions where the number of new entrants is small.

March 12, 2016

Knowledge is power: Navigating the household electricity market after deregulation

<http://www.japantimes.co.jp/news/2016/03/12/business/tech/knowledge-power-navigating-household-electricity-market-deregulation/#.VuVEG-aDmot>

by Eric Johnston
Staff Writer

The country's household and small business electricity market will be deregulated from April 1, allowing individuals to choose their electricity provider. Optimists, especially renewable energy advocates and small entrepreneurs, hope the development will break the stranglehold that the country's 10 regional utilities have on a market worth an estimated ¥8 trillion.

However, while around 200 firms are currently prepared to sell electricity generated by a wide range of sources under a broad range of plans, **utilities still control the distribution grid**. That, combined with intense price competition and restrictions on how sellers advertise, means consumers hoping to reduce their dependency on, or break free entirely of, nuclear and fossil-fueled electricity after April 1 are going to have to research different firms, costs and plans very carefully before signing a contract.

At the end of February, Kansai Electric Power Co. was feeling upbeat about the future of nuclear power. Five years after the March 11, 2011, earthquake, tsunami and meltdowns at the Fukushima No. 1 nuclear power plant, it had restarted its Takahama No. 3 reactor and was preparing to extend operations of its Takahama No. 1 and 2 reactors, now more than 40 years old, for another two decades.

With a Nuclear Regulation Authority widely seen as favorable toward restarts, a fundamentally pro-nuclear Fukui prefectural governor and local town councils hosting its nuclear plants desperate for the money that comes with restarts, Kepco was confident that nuclear power was finally back.

It helped that Takahama's No. 4 reactor was also scheduled to restart at the end of February. To the shock of Kepco officials, however, television cameras invited to broadcast live the flick of a switch to restart the reactor instead recorded loud alarms and scenes of worried staff running around, realizing there was a problem and that the reactor could not be restarted, at least on that day.

Then, in a move that shocked the utility, the Otsu District Court in Shiga Prefecture issued a provisional injunction last week that forced the Takahama No. 3 reactor to shut down a little over 40 days after it had restarted. The injunction also applied to the idled No. 4 reactor.

Why the rush to restart? Without as many of its reactors as possible back online as quickly as possible, Kepco says it will be unable to reduce electricity rates. That means the utility, which relied on nuclear power for nearly half of its electricity prior to March 11, 2011, and has enjoyed a virtual monopoly in Kansai for decades, could lose out once the country's household electricity market is deregulated on April 1 and it faces new competition.

To date, nearly 200 enterprises — ranging from the 10 regional utilities to SoftBank, Lawson's convenience stores and new firms emphasizing gas or renewable-generated electricity — are officially authorized to sell electricity to consumers. **A price war has broken out, with some newcomers promising rates that are often lower than the utilities.**

Yet the deregulation, as noted previously, is only partial. The major utilities will still be in control of the electricity grids. For the first time, however, individual consumers will be able to pick and choose who sells them the electricity off the grid.

The opening of the household and small business sector to retail competition has created a lot of interest among firms seeking to enter the market, but it has also created a number of concerns about supply and service, even as consumers express show a keen interest in switching.

A survey of 1,000 people last November by the Agency for Natural Resources and Energy on how they felt about the deregulation showed that if their electricity bills were to come down by at least 10 percent, 62 percent would consider changing suppliers. Just 8 percent said they would not switch companies, no matter how much lower the competition might be.

In an attempt to allay such fears, the government has said that switching providers will not mean a decrease in the quality of electricity and that in the event of problems at one of the newer firms with

distribution, the major utilities would back them up by sending power down the line, thus preventing blackouts.

From the end of January, a number of companies began offering electricity plans on various websites. Consumers looking for the best deals can begin by going online to those websites that compare the different firms, their provider contracts and prices. Three popular sites (available only in Japanese) can be found at Kakaku.com, Enechange.jp and Enepi.jp.

Each site will request basic information, such as where you live, how many people live with you, and what kind of building (house or apartment) you live in.

You may then be asked who your current electricity supplier is, how much electricity you are contracted for and how much you actually use. The latter information is available on the meter card of your current provider.

Depending on the site, you might also be asked the amount of your most recent electricity bill, or other information about your electricity use and preferences.

Once the pertinent data has been entered, you'll be taken to a simulation site that offers a list of firms each with different prices, plans and conditions. And it's here where the buyer needs to beware. **There are any number of plans from any number of firms. Some lock you into a two-year contract and place financial penalties if you cancel before that (very important to know if you're planning to move within one or two years). Some plans may have strict conditions on the price offered, depending on how much electricity you buy and the time of day you want to use it.**

After doing a simulation that compares prices and services from different plans, you can make your choice and sign a contract.

Roughly three weeks later, on average, the firm will send someone to your home to install a smart meter. In principle, you won't be charged for the cost of replacing your old meter with a new one, unless there are special construction needs.

Once the new meter has been installed, you're on the new plan and you can cancel your contract with whoever was providing you electricity before.

Kikuko Tatsumi, a member of the Nippon Association of Consumer Specialists' environment committee, notes that many of the plans currently on offer are package deals that include services other than electricity, and that people need to consider the sorts of add-ons that might be included in a plan and consider their needs carefully.

"Don't forget that what you're buying is electricity," she says.

In addition, Tatsumi cautions, be prepared for **aggressive sales tactics** from those representing, or claiming to represent, an electricity supplier.

"I've heard stories of people getting phone calls from those claiming to represent a group like the 'security association,' who inquire about a person's electricity bill and say they want to visit to discuss it," Tatsumi says. "There are a lot of complaints about flyers being stuffed in mailboxes or salespeople telephoning, trying to sell electricity plans."

Price, of course, will be the final determining factor for many consumers. This may well mean going with firms that get their electricity mostly from fossil fuel sources (and possibly nuclear power) if they want the cheapest plan.

For environmentally concerned households that dislike nuclear power, don't mind paying a bit extra if necessary, and demand to know what energy source the electricity from the firm they are purchasing comes from in order to select a supplier that minimizes, or even excludes entirely, coal, oil or nuclear-generated electricity, there is good news and bad news.

The good news is that **firms are being encouraged to offer customers a breakdown of the different sources of electricity they're selling, and over what period they plan to use that energy mix.** For example, sellers are allowed to let households know that, over a certain length of time, they'll be sending them electricity, of which, for example, 50 percent is generated from coal or oil, 10 percent is from liquefied natural gas, 30 percent is from nuclear and 10 percent is from renewables.

The bad news is that providing as much detailed information as possible on energy sources is not a legal requirement for the firms, merely something that is "desired."

In fact, very few of those registered to sell electricity so far appear to be that specific. A survey of 20 firms in the March 1 edition of the Japanese magazine *Economist* showed less than half were offering detailed information on their sites about the energy mix they were using.

Furthermore, in the case of renewable-generated energy covered by the country's feed-in tariff, firms are being discouraged from using phrases such as "we sell green power" or "we sell clean power."

In one sense this is good — it will make it tougher for unscrupulous firms to misrepresent themselves by using such language if the majority of power they're selling comes from energies that are anything but clean.

However, it also forces consumers searching for firms and plans that offer the greenest possible supply source at the most affordable price to make some tough choices if the company offering a deal within their budget won't say where the electricity comes from.

For those want to go as green as possible, one option is to visit the Power Shift website. Run by Friends of the Earth Japan, here you will find a dozen firms (as of early March) that offer customers their energy mix and environmental impact; concentrate on purchasing renewable energy under the feed-in tariff program; agree to not use nuclear or fossil fuel-generated electricity, except as backup sources; emphasize local usage of renewable energy; and are not funded by the big utilities. Of the dozen firms currently listed, eight are in the Tokyo region, two are in Kyushu and there is one each in the Osaka and Nagoya regions. "We interview firms that want to prioritize renewable energy and have plans for doing so," says Akiko Yoshida of Power Shift. "Many are small — and the amount of renewable energy in Japan is still limited — so it's really difficult for the firms we list to sell only renewable-generated electricity. It doesn't mean companies focused on selling renewable-energy generated electricity are expensive, but they can't offer supercheap prices, either."

As the major utilities control the grids and because they remain wary of renewable energy, the extent to which the sector will expand from April is as yet unclear, even if some firms offer plans that are very competitive with fossil fuel electricity. **By 2020, however, grid transmission of electricity will be deregulated, theoretically allowing for competition and easier access to renewable energy sources.**

Of course, the utilities know this, which is why **firms such as Kepco are in a race against time.** Even as the Takahama reactors sit idle under the injunction, the utility wants to restart them and run them for another two decades.

Not only to revive nuclear power, which Kepco claims will allow it to lower its own prices, but also to ensure that, as Japanese bureaucrats once did when they picked and chose which industries to support, that deregulation does not lead to "excessive competition" that would threaten to impede their old ways of doing business, or cause too much "confusion in the marketplace" of the kind that is not good for the politically connected utilities.

Dissecting consumer energy choices online

For more information on finding and selecting a new electricity supplier after April 1, check the following websites:

The Electricity Market Surveillance Commission: The commission is the government body that monitors firms selling to the home electricity market. It can provide information on which ones are officially registered, and offer consultations if you run into trouble with the firm you're buying from. www.emsc.meti.go.jp

The National Consumer Affairs Center: The center offers basic advice along the lines of "let the buyer beware," with suggestions on the kinds of questions to ask anyone who shows up at your door on a Sunday morning, or calls during dinner and tries to sell you a new electricity plan. www.kokusen.go.jp

Electricity Plan Comparison Sites: At Kakaku.com (kakaku.com/energy), Enechange.jp (enechange.jp) or Enepi.jp (enepi.jp), consumers can log on, provide basic details about themselves, their energy lifestyles and the amount they are currently paying, and receive a list of different plans from different firms that might suit their needs.

Power Shift: This is the site for consumers who want to be clean, green and nuclear-free to the greatest extent possible using government-approved, local sellers, and don't mind paying extra. power-shift.org/choice

Kankeiren's utter contempt for people and judiciary

March 19, 2016

VOX POPULI: On a precarious slide to utter disrespect of all Japan stands for

<http://ajw.asahi.com/article/views/vox/AJ201603190019>

Vox Populi, Vox Dei is a daily column that runs on Page 1 of The Asahi Shimbun.

At a news conference on March 17, top officials of Kankeiren (Kansai Economic Federation) pulled no punches in criticizing the Otsu District Court's March 9 injunction ordering the shutdown of the No. 3 and No. 4 nuclear reactors at the Takahama power station operated by Kansai Electric Power Co.

As a group that represents the interests of the regional business community, Kankeiren obviously has its own case to make. However, I was quite taken aback by some of the remarks officials made to reporters. The vice chairman, Kazuo Sumi, said at the outset that he was angered by the court's decision, and then thundered, "How is it possible for a judge of a mere district court to throw a monkey wrench into our nation's energy policy?"

Sumi went on to call for "speedy legal revision to ensure that something like this will never happen again."

No court decision can be expected to satisfy all of the people all of the time. But even so, I must say that Sumi's remarks amounted to utter contempt of one of the three branches of government. Essentially, what he said was this: "If the judiciary doesn't do what the administration says, the legislature must take care of that."

If this sort of reasoning came from his lack of understanding of what the separation of powers is all about, that is a truly sorry state of affairs.

A reporter at the news conference tried to nail down Sumi's intent by pointing out that his remarks were "rather extreme." But Sumi apparently meant exactly what he said, as he stuck to his guns.

Still, he would not have said "a mere district court" with contempt, had he ever thought about Article 76 of the Constitution that provides: "**All judges shall be independent in the exercise of their conscience and shall be bound only by this Constitution and the laws.**"

But where **contempt of the Constitution** is concerned, the current coalition government has an even worse track record. The manner in which the Abe administration enacted the highly questionable national security legislation is only one example.

And let's not forget how the administration ignored demands by the opposition parties last autumn for the convocation of an extraordinary session of the Diet under Article 53.

The snub was all the more outrageous because the ruling Liberal Democratic Party's draft of a revised Constitution spelled out that the Cabinet is required to call an extraordinary Diet session within 20 days of the demand.

Not only the judiciary, but the legislature--the supreme organ of government--was also treated with contempt.

This is what Japan has become under the Abe administration, and this just cannot be right.

--The Asahi Shimbun, March 19

Power industry, Govt. and NRA should heed the Court

March 19, 2016

A caution on nuclear restarts

<http://www.japantimes.co.jp/opinion/2016/03/19/editorials/caution-nuclear-restarts/#.Vu1-C-aDmot>
The Otsu District Court's provisional injunction earlier this month ordering Kansai Electric Power Co. to shut down reactors 3 and 4 at its Takahama nuclear power plant in Fukui Prefecture — against which the utility filed a complaint last week— carries a significance that other power companies, the government and the nation's nuclear regulators must not ignore.

The court charged that Kepco's explanations as to why the reactors' safety in the event of severe accidents is secure are inadequate, called on the national government to develop standards for evacuation plans for residents in the event of a nuclear accident, and expressed concerns about the Nuclear Regulation Authority's basic approach toward nuclear safety following the 2011 disaster at the Fukushima No. 1 nuclear power plant.

The power industry and the government should take the decision as a warning that they should not push for the restart of idled plants unless they can fully ensure the plants' safety and are prepared to adequately protect residents in the event of a major accident.

The NRA also needs to carefully weigh the decision and should not hesitate to update its post-Fukushima plant safety standards if necessary.

The injunction was issued in response to a lawsuit filed by residents of Shiga Prefecture — which is not the host of the Takahama plant. **Power companies should take the court order as a rejection of their**

position that merely getting the consent of host prefectures and municipalities is sufficient to put nuclear power plants back online.

After the meltdowns at Tokyo Electric Power Co.'s Fukushima plant in 2011 caused an extensive radiation fallout, local governments within 30 km of a nuclear power plant were required to devise evacuation plans for residents in the event of a major nuclear accident. But Kepco obtained approval from only the host prefecture and host municipality to restart the Takahama reactors.

The court decision makes it clear that people living outside the host prefecture and host municipality have a right to take legal action against the operation of a nuclear power plant. **The decision may lead to similar lawsuits against other nuclear plants.**

The court decision is significant in that it refers to **the most important lesson of the Fukushima disaster — that the supposed cost advantages of nuclear power cannot justify the devastating effect of a major accident and subsequent environmental destruction**, which, as the court pointed out, can cross national borders.

Although it appears that this lesson may have been forgotten by the power industry and government officials who are pushing for restart of idled nuclear reactors, it represents the doubts about nuclear power that are held by a majority of people in this country five years after the Fukushima catastrophe. The court also made a point about the investigation into the cause of the Fukushima nuclear debacle, saying that it is only halfway through and that **it remains unclear whether it is correct to identify the massive tsunami caused by the magnitude 9 earthquake as the primary cause of the meltdowns**. It expressed a “strong concern” over the attitude of the NRA, which compiled the new safety standards despite the absence of a thorough probe and analysis of the causes of the Fukushima calamity. The Abe administration has touted the standards as being the most stringent in the world — but has not given concrete evidence, such as comparison with standards adopted in other countries, to prove why the standards can be characterized as such.

In addition, the court said that nuclear plant safety standards should be created on the principle that even if a severe accident happens due to the failure to incorporate necessary safety steps, it must be prevented from developing into a calamitous situation.

Since the current standards written in 2013 will continue to be used in screening nuclear power plants to determine if they should be restarted, **the NRA should heed the court, study what is insufficient in the standards and take corrective measures where necessary.**

Evacuation plans continue to be a major issue for residents living near nuclear power plants. In its ruling the Otsu court stated that in the wake of the Fukushima catastrophe the national government has the duty to draw up standards for evacuation in the event of a nuclear accident.

Given that **the NRA standards do not cover evacuation plans and because evacuation plans devised by local governments around nuclear power plants have many questionable points**, the court's position should be taken seriously by the Abe government as it continues to push for the restart of idled nuclear power plants.

Sounds like intimidation

March 23, 2016

Kansai Electric chief lambasted over 'threats' against plaintiffs

http://ajw.asahi.com/article/behind_news/social_affairs/AJ201603230074

THE ASAHI SHIMBUN

Lawyers protested what they described as “threats” from the chief of Kansai Electric Power Co., who suggested that **the company may seek damages from plaintiffs if successful in overturning an injunction to shut down its nuclear reactors.**

Two groups of lawyers sent a letter of protest to Makoto Yagi, Kansai Electric’s president, on March 22, saying his remark is tantamount to “threats” against plaintiffs and “absolutely unacceptable.”

At a news conference on March 18, Yagi said, “If a higher court overturns the injunction, seeking damages (from the plaintiffs) could be a possible option.”

Yagi, who was speaking as chairman of the Federation of Electric Power Companies of Japan, said that the losses caused by the suspension of reactor operations is estimated to be 10 billion yen (\$89.06 million) a month.

He noted that lodging a claim for damages “could possibly be considered in general terms, but we have not made any decision at the moment.”

The remark was referring to the Otsu District Court’s injunction on March 9 against the operations of the No. 3 and No. 4 reactors at Kansai Electric’s Takahama nuclear power plant in Fukui Prefecture.

The case involved 29 plaintiffs from Shiga Prefecture living in areas 30 to 70 kilometers from the plant. Otsu is the prefectural capital.

The protest letter was sent jointly by the attorneys representing the plaintiffs behind the injunction and another group of lawyers called Datsugenpatsu Bengodan Zenkoku Renrakukai (Nationwide liaison group of lawyers seeking a break from nuclear power).

It urged Yagi to retract his remark, saying that it **“can only be understood to have an intention to put a brake on people planning new requests for court injunctions against nuclear reactors across Japan.”**

Yuichi Kaido, a co-leader of the liaison group, said Yagi's remark is totally inappropriate.

“On all accounts, it is a threat to people who requested the court injunction in line with judicial proceedings in hopes that another nuclear accident should not be allowed to occur.”

In response to the letter, Kansai Electric’s public relations office issued a statement.

“The remark explained that in general terms, lodging a claim for damages could be an option only after a lower court ruling is overturned. At present, nothing has been decided about seeking damages,” the statement said. “The remark was not made to intimidate the complainants (behind the injunction) nor to rein in (future legal actions).”

Moral responsibility of nuclear burden

March 14, 2016

Japan Political Pulse: What will become of the nuclear burden?

<http://mainichi.jp/english/articles/20160314/p2a/00m/0na/023000c>

Japan's only option is to get away from nuclear power. The spent nuclear fuel that comes from nuclear plants is nothing but a burden, and the same is true of the plutonium at research facilities. This burden grows and grows, and so not even a final place to store high-level radioactive waste can be decided upon. I would like those pretending that such a place is going to be decided on soon to end such thinking, and those talking as if the nuclear fuel cycle will be completely established soon to stop their lies.

On March 9, the Otsu District Court issued a provisional injunction to halt the Kansai Electric Power Co.'s Takahama Nuclear Power Plant in Takahama, Fukui Prefecture. As always, the various newspapers were divided in their take on this. Even if in the end it is simply considered to be a difference of opinions, I cannot ignore the arguments of the pro-nuclear energy group -- that the injunction is "an outrageous demand for a no-risk solution," or that it is "out of step with the precedent set by the Supreme Court" -- and I wish to respond.

When a severe nuclear disaster happens even once, an area some dozens to hundreds of kilometers from the plant becomes contaminated with radiation. More than 100,000 people have their livelihoods destroyed -- many more if the disaster affects an urban area -- and lose the land that is their home. Because of the effects of radiation on genes, future generations are threatened as well. **In terms of both its scale and nature, it is a whole different level of disaster compared to others. To even be discussing it in the same terms as something like an airplane crash is a mistake.**

Even if the likelihood of such a disaster is said to be "once in a million years per reactor," that doesn't mean we can accept that and agree to reactivate them.

One other thing I wish to say -- to those who criticize the district court's injunction as out of line with the Supreme Court ruling -- is that we must ask, what is wrong with being out of step? The only Supreme Court ruling in a case on nuclear power was in 1992, well before the Fukushima nuclear disaster, for a case involving the Ikata Nuclear Power Plant. The essence of that ruling was that "Whether or not a nuclear plant is safe will be left to the decision of the prime minister after hearing the opinions of experts." There is no reason that we must humbly abide by that ruling, made based on a policy of green-lighting administrative actions after the fact, a policy that formed out of Japan's economic growth years. There have been court rulings allowing for the reactivation of nuclear plants, so it may be too early to say that the tide has turned in the court battles over plant reactivation, but the judges are also citizens of this country, and **it is the original, proper function of the judiciary to hold basic doubts, to think freely and unfettered and speak out against the administration.**

There is also another burden, in the form of **excess plutonium**. According to a special report on March 5, coming out of Washington D.C. through Kyodo News, in the middle of this month a British-registered nuclear fuel transport ship will load up 331 kilograms of research-use plutonium at Tokai, Ibaraki Prefecture, and head to the U.S.

Japan holds 37 metric tons of plutonium in Great Britain and France, where it was sent for reprocessing, and 10.8 metric tons within its own borders. This is by far the greatest amount for a country not armed with nuclear weapons. The plutonium used at research facilities is of high purity and easily converted to military use, and this is why the United States, the standard bearer for the reduction of nuclear material, moved to retrieve it under a publically-released agreement between Japan and the United States.

However, China, seeing no progress on this front, had its ambassador to the United Nations level criticism last fall that Japan had enough plutonium to load in 1,350 nuclear warheads.

While China -- lacking results of its own in reducing its nuclear arsenal -- is not in a position to criticize Japan, Japan and the U.S. are moving forward with the transport of the plutonium so that they will be

backed by their actions when they speak at the Nuclear Security Summit in Washington D.C. at the end of this month, which Prime Minister Shinzo Abe will attend.

Even if Japan sets out now on a path away from nuclear energy, it will have to move forward while shouldering the burden of a massive amount of nuclear waste. We have a moral responsibility to not create any more nuclear pollution than we have already, and to not place additional burdens on our future generations. (By Takao Yamada, Special Senior Writer)

Fraudulent claims for compensation

March 24, 2016

TEPCO employee faces prosecution over alleged nuke accident compensation fraud

<http://mainichi.jp/english/articles/20160324/p2a/00m/0na/011000c>

Police sent papers on a Tokyo Electric Power Co. (TEPCO) employee to the Tokyo District Public Prosecutors Office on March 23 for alleged fraud after advising members of a nonprofit organization in a fake compensation scheme after the Fukushima No. 1 Nuclear Power Plant disaster, it has been learned.

- **【Related】** TEPCO insider helped cook up false nuke crisis compensation claims: ex-NPO exec

The employee, a man in his 40s, was referred to prosecutors by the third division of the National Police Agency organized crime policy unit for his connection to the fraud. According to individuals connected with the investigation, his role involved instructing two former senior executives of the NPO in how to submit false compensation claims to TEPCO on the basis of revenue being lost due to the nuclear accident. According to the allegations, the TEPCO employee worked together with the two employees of the Nakano, Tokyo-based NPO -- the "Higashinihon Daishinsai Genshiryoku Saigaito Hisaisha Shien Kyokai" (support association for victims of the Great East Japan Earthquake and nuclear disaster) -- between December 2011 and January 2012 to submit the fraudulent claims on behalf of a civil engineering and construction firm in Fukushima Prefecture, for which the NPO was acting as an agent.

A total of between 10 and 20 million yen in compensation fees was consequently received from TEPCO, among which the employee pocketed more than 4 million yen.

When questioned by the police agency's organized crime unit officials regarding the case, the suspect admitted that he had received the funds from the NPO officials. He said, however, "I did not believe that I was involved in making fraudulent claims."

Meanwhile, an official with the TEPCO public relations department said, "We understand that prosecutors are continuing to investigate (this case), and we are declining to comment upon it -- including with respect to whether or not the company is aware of the individual in question."

The two NPO affiliates were arrested by the police unit in August 2014 for their alleged role in the scheme. Kazuaki Shindo, 44, is presently undergoing court proceedings for fraud in conjunction with the case, while Hiroshi Murata, 57, received a nine-year prison sentence for the same crime, which he is presently appealing.

During a court hearing conducted at the Tokyo District Court in January last year, Shindo testified that 5 percent of the fraudulently-received compensation funds had been paid to the TEPCO employee "for the information provided and the quality of the instructions."

According to TEPCO, companies seeking compensation must prove that their revenue fluctuated before and after the nuclear disaster by submitting tax returns -- or financial statements showing account settlements of income and expenditures -- in addition to other documents specified by TEPCO. Either original or copied versions of the documents are accepted.

With respect to the incident in question, the materials submitted by the NPO included copies of tax returns that had been falsified in order to inflate pre-disaster profits. TEPCO, not realizing the fraudulent nature of the materials, approved the compensation requests.

An official connected to the investigation commented, **"Copies of documents are easier to falsify than originals, which is one explanation for the submission of the bogus claims."**

Police officials in both Osaka and Fukushima prefectures have detected additional fraudulent claims following the nuclear disaster.

"Such incidents are likely being enabled by an insufficient system for screening (such claims)," commented one investigator. "TEPCO bears a portion of the responsibility."

Why has slogan signboard been removed?

March 27, 2016

Fukushima town remains empty, but nuclear slogan disappears

<http://mainichi.jp/english/articles/20160327/p2g/00m/0dm/034000c>

March 27, 2016 (Mainichi Japan)

FUTABA, Fukushima (Kyodo) -- The clock at a train station here still points to 2:46 p.m., the time when the massive earthquake occurred on March 11, 2011, triggering devastating tsunami.

The town, which is home to part of Tokyo Electric Power Co.'s radiation-leaking Fukushima Daiichi nuclear power plant, remains empty as all residents had to evacuate due to high levels of radiation following the nuclear accident triggered by the natural disaster five years ago.

At a gymnasium in Futaba, fallen ceiling panels were left without being cleared. Everything is covered with dust.

Just outside the gymnasium, there used to be a slogan which appeared frequently in media reports in the past five years. The signboard reading "Nuclear power: the energy for a bright future," has turned into an ironic reminder of how Japan had blindly worshipped nuclear energy's safety.

In December last year, the slogan was removed from the signboard by town authorities. The town explained that the signs had become "decrepit" and they could fall, according to Yuji Onuma, a Futaba resident who has evacuated to Ibaraki Prefecture near Tokyo.

Onuma, 40, is the one who created the slogan in 1988 when he was in the sixth grade. Back then, he was commended by the town mayor and felt "proud." Onuma recalls that he used to pass under the signboard every day on his commute to work.

But since the disaster and ensuing nuclear crisis, he started to feel "ashamed." Every time TV footage showed the slogan and the abandoned town as its background, Onuma says the conflicted feelings got worse.

Onuma then thought that he had to "deal with it once and for all." He asked the town to keep the signboard as it is to remember the nuclear accident, even though the request could see him face ridicule in the community.

On March 17 last year, however, the town assembly decided to remove it. Earlier in the month, Prime Minister Shinzo Abe visited Futaba. Town officials trimmed grown tree branches to welcome the premier, which made the sign even more visible.

Onuma opposed the removal, collecting some 7,000 signatures for his cause. In June, Mayor Shiro Izawa decided to keep the removed signboard at the town hall, but Onuma's request that it remain in its original position was denied. The signboard itself was taken away on March 4 this year.

Continuing to show the slogan "may have been inconvenient for (the government's plan to) resume idle nuclear reactors," said Onuma.

"The town put priority on the elimination of the slogan rather than cleanup of the debris" that still remains on the streets in Futaba, he added.

The town's no-go zone is eerily silent. The only things that hint of the life that was once there are blinking traffic lights.

At an elementary school's gymnasium, red-and-white curtains hang on the walls, probably for a graduation ceremony that had been planned in March five years ago.

A radiation detection device placed next to a thermometer in the school yard showed radiation levels of 2.141 microsieverts per hour -- some 10-times the level the government expects in decontaminated areas. Construction works to boost the quake-resistance of the school building had been finished the year before the earthquake and tsunami occurred. "The building survived the quake, but the works were in vain because of the nuclear accident," said Onuma.

Can utilities sue for lost revenue?

March 27, 2016

Ikata restart ruling prompts Kepco to raise threat of countersuits

<http://www.japantimes.co.jp/news/2016/03/27/national/ikata-restart-ruling-prompts-kepco-raise-threat-countersuits/#.VvfKHHpdeot>

by Eric Johnston

Staff Writer

OSAKA – Kansai Electric Power Co., angered by the decision earlier this month by the Otsu District Court in Shiga Prefecture to slap a provisional injunction on restarting two reactors at the Takahama nuclear power plant on safety grounds, is lashing out at its critics and threatening to sue them for lost revenue.

“As a general rule, seeking damages against such people is a possible target for discussion, although we’ve not decided anything,” Kepco President Makoto Yagi said at a new conference on March 18.

Kepco said it was desperate to have Takahama reactors 3 and 4, which are in neighboring Fukui Prefecture, back online before April 1 so it can offer more competitive rates when full deregulation of the electricity market takes place. The utility loses about ¥10 billion a month when the reactors are offline. The plaintiffs in the Shiga case, however, fired back at Yagi last week.

“Such comments are a threat to others who don’t want to see another nuclear accident and want to go to court to seek provisional injunctions against other possible restarts throughout Japan,” two groups involved in the Shiga case said in a formal letter of protest to Kepco.

With anti-nuclear citizens and their lawyers energized by the court ruling, Kepco and other nuclear advocates in Japan fear a flood of new lawsuits will emerge from residents near any reactor that gets the green light to restart.

Just a couple of days after the Otsu ruling, 67 plaintiffs including atomic bomb survivors from Hiroshima and Nagasaki announced they had filed a lawsuit at the Hiroshima District Court to prevent the restart of three reactors at Shikoku Electric Co.’s Ikata nuclear power plant in Ehime Prefecture.

Some of them also filed a separate suit seeking a provisional injunction to effectively block Shikoku Electric from restarting the Ikata plant’s reactor 3, which has already cleared new safety inspections and received local political approval, paving the way for its restart as early as this summer.

Is an apology good enough?

March 23, 2016

TEPCO apologizes for meltdown announcement delay

http://www3.nhk.or.jp/nhkworld/en/news/20160323_30/

Tokyo Electric Power Company has apologized to a Niigata Prefectural Government panel for not realizing sooner that 3 reactors at its Fukushima Daiichi plant had melted down in March 2011.

The panel is studying the safety of the Kashiwazaki-Kariwa nuclear plant in the prefecture. Niigata has made verification of the details of the Fukushima accident a prerequisite for the plant's restart.

TEPCO waited 2 months after the Fukushima accident to announce the meltdowns. The panel had questioned the delay. But TEPCO insisted it had no basis for making the determination.

Last month, nearly 5 years after the disaster, the utility revealed it could have declared the reactors had melted down 3 days after the accident if it had adhered to an in-house manual.

On Wednesday, Managing Executive Officer Takafumi Anegawa apologized to the panel. He said the utility should have realized and reported the existence of the manual sooner.

Panel members asked the utility why the manual went unnoticed for 5 years. They said the utility's longstanding and false claim that it had no standards for determining a meltdown makes it an untrustworthy nuclear plant operator.

The prefectural panel says it will resume discussions after a panel of outside experts set up by TEPCO submits a report on the cause of the delay.

Forget profitability when it comes to decommissioning

March 26, 2016

Editorial: 40-year reactor life rule must prevail over profitability

<http://mainichi.jp/english/articles/20160326/p2a/00m/0na/014000c>

Shikoku Electric Power Co. has decided to decommission the No. 1 reactor at the Ikata nuclear power complex in Ehime Prefecture, as the reactor will have been in operation 40 years come September next year.

In the wake of the Fukushima No. 1 nuclear plant disaster, the government has set a new rule limiting the operational life of reactors to 40 years, in principle. An extension of up to 20 years can be granted by the Nuclear Regulation Authority (NRA). Ikata nuclear plant operator Shikoku Electric Power Co. had sought to have the No. 1 reactor's lifespan extended, but abandoned the idea after finding the enormous safety improvement costs would make it unprofitable to keep the reactor running.

Reactor pressure vessels are said to deteriorate in 40 years due to being bombarded by neutrons. From the viewpoint of ensuring nuclear plant safety, reactors over 40 years of age need to be decommissioned, regardless of their profitability. It is hoped that Shikoku Electric's decision will set a precedent for other power companies.

Five other reactors around the 40-year limit are already set to be decommissioned, including the No. 1 and 2 reactors at Kansai Electric Power Co.'s Mihama nuclear plant in Fukui Prefecture, and the No. 1 reactor at Kyushu Electric Power Co.'s Genkai nuclear station in Saga Prefecture -- decisions made in March last year. With the decommissioning of the Ikata plant's No. 1 reactor, the number of reactors in Japan will be reduced to 42.

The six reactors facing decommissioning are relatively small, with output in the 300,000 to 500,000 kilowatt range. More recent reactors can generate 1 million kilowatts each.

The decision over whether to decommission reactors is left up to each utility, and behind Kansai Electric and Kyushu Electric's decisions to decommission the aforementioned reactors also lay the issue of profitability. The smaller the output of a reactor is, the less profitable it is considering the massive cost of safety measures.

Meanwhile, Kansai Electric has applied to the NRA to extend the service life of the No. 1 and 2 reactors at the Takahama nuclear plant, and the No. 3 reactor at the Mihama plant, both in Fukui Prefecture. The utility decided that those reactors -- which can each generate about 800,000 kilowatts -- will be profitable enough even with the immense safety costs.

However, aging reactors are fraught with more problems than deteriorating pressure vessels. The longer it has been since a reactor entered operation, the fewer engineers there are who can pass down legacy technologies. Some experts point out that there is a limit to how much the safety of elderly reactors can be

improved because their design concept itself is outdated. The question of decommissioning a reactor and its output and economic efficiency should be considered separately.

Furthermore, utilities face a host of other challenges to moving ahead with steady decommissioning. **First and foremost, the final disposal site for the colossal amount of radioactive waste that will be generated by dismantling reactors has yet to be decided. There are not even regulatory standards for disposing of the severely contaminated inner components of reactors.**

It is also imperative to **secure storage locations for spent nuclear fuel generated by nuclear plants.** Under the government's nuclear fuel cycle policy, spent fuel had been destined for the reprocessing plant in Rokkasho, Aomori Prefecture. However, the plant is under safety review by the NRA, and there is no prospect of it becoming operational anytime soon.

Power companies and the government need to overcome these challenges. Reactor decommissioning seriously affects regional economies and the finances of local governments dependent on nuclear plant hosting subsidies. The central government's support is indispensable in associating the decommissioning business with regional revitalization, among other measures.

Just another form of blackmail

March 28, 2016

EDITORIAL: Nuclear power proponents still scoffing at public safety concerns

<http://ajw.asahi.com/article/views/editorial/AJ201603280014>

An Otsu District Court injunction has suspended operations of two reactors at Kansai Electric Power Co.'s Takahama nuclear power plant in Fukui Prefecture, one of which was online.

Again, the significance of that development should be taken to heart. Proponents of nuclear power, in particular, should squarely face up to the public anxiety that lies in the backdrop of the court decision. But instead they are boiling with disgruntlement.

"Why is a single district court judge allowed to trip up the government's energy policy?" Kazuo Sumi, a vice chairman of the Kansai Economic Federation, said resentfully.

"We could demand damages (from the residents who requested the injunction) if we were to win the case at a higher court," Kansai Electric President Makoto Yagi said, although he prefaced his remark with a proviso that he is arguing only in general terms.

The government is maintaining a wait-and-see attitude.

The decision called into question the appropriateness of the Nuclear Regulation Authority's new regulation standards and government-approved plans for evacuations in case of an emergency.

But NRA Chairman Shunichi Tanaka argued, "Our standards are nearing the world's top level."

And the government has no plans to review its emergency evacuation plans. It has only reiterated that it will "proceed with restarts of nuclear reactors in paying respect to NRA decisions."

The Otsu decision is the third court order issued against the operation of nuclear reactors since the meltdowns five years ago at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear power plant.

There has, in fact, been no fixed trend in court decisions. Another court rejected residents' request last year for an injunction against reactor restarts at Kyushu Electric Power Co.'s Sendai nuclear plant in Kagoshima Prefecture.

But courts appear to be playing a more active role now than before the Fukushima disaster.

The nuclear proponents' reactions reveal an underlying thinking: "The use of nuclear power is indispensable for Japan, which does not abound in energy resources. The government set up the NRA following the Fukushima disaster to increase expert control. Regional utilities have also taken safety enhancement measures. Courts are therefore asked not to meddle."

But they should have a deeper understanding that this argument is no longer convincing to the public and court judges.

Some critics say the latest decision deviated from the 1992 Supreme Court ruling saying that decisions on the safety of nuclear plants should be made by administrative organs on the basis of expert opinions. But that argument is also off the mark.

The ruling, given in a case over Shikoku Electric Power Co.'s Ikata nuclear plant, certainly presented that point of view. But it also stated that the objective of safety regulations based on the Law on the Regulation of Nuclear Source Material, Nuclear Fuel Material and Reactors is to "make sure that no serious disaster will happen by any chance."

A safety net, left in the hands of experts, collapsed all too easily during the Fukushima disaster, turning the phrase "by any chance" into reality.

Courts, which are the guardians of law, should rather be commended for trying to find out independently, to the extent that they can, if there is enough preparedness when a nuclear reactor will be restarted.

The latest alarm bell sounded by the judiciary sector provides an opportunity to ask once again why all the safety measures taken after the Fukushima nuclear disaster are still struggling to win the trust of the public.

The Fukushima disaster changed the awareness of the public. The judiciary sector was also affected.

It is high time for a change among nuclear proponents.

Ikata restart ruling prompts Kepco to raise threat of countersuits

<http://www.japantimes.co.jp/news/2016/03/27/national/ikata-restart-ruling-prompts-kepco-raise-threat-countersuits/#.VvfKHHpdeot>

Staff Writer

OSAKA – Kansai Electric Power Co., angered by the decision earlier this month by the Otsu District Court in Shiga Prefecture to slap a provisional injunction on restarting two reactors at the Takahama nuclear power plant on safety grounds, is lashing out at its critics and threatening to sue them for lost revenue.

“As a general rule, seeking damages against such people is a possible target for discussion, although we’ve not decided anything,” Kepco President Makoto Yagi said at a new conference on March 18.

Kepco said it was desperate to have Takahama reactors 3 and 4, which are in neighboring Fukui Prefecture, back online before April 1 so it can offer more competitive rates when full deregulation of the electricity market takes place. The utility loses about ¥10 billion a month when the reactors are offline. The plaintiffs in the Shiga case, however, fired back at Yagi last week.

“Such comments are a threat to others who don’t want to see another nuclear accident and want to go to court to seek provisional injunctions against other possible restarts throughout Japan,” two groups involved in the Shiga case said in a formal letter of protest to Kepco.

With anti-nuclear citizens and their lawyers energized by the court ruling, Kepco and other nuclear advocates in Japan fear a flood of new lawsuits will emerge from residents near any reactor that gets the green light to restart.

Just a couple of days after the Otsu ruling, 67 plaintiffs including atomic bomb survivors from Hiroshima and Nagasaki announced they had filed a lawsuit at the Hiroshima District Court to prevent the restart of three reactors at Shikoku Electric Co.’s Ikata nuclear power plant in Ehime Prefecture.

Some of them also filed a separate suit seeking a provisional injunction to effectively block Shikoku Electric from restarting the Ikata plant’s reactor 3, which has already cleared new safety inspections and received local political approval, paving the way for its restart as early as this summer.

TEPCO's executives won't be prosecuted

March 30, 2016

Prosecutors drop TEPCO case over radioactive water leakage

<http://ajw.asahi.com/article/0311disaster/fukushima/AJ201603300068>

THE ASAHI SHIMBUN

FUKUSHIMA--The Fukushima District Public Prosecutor’s Office announced on March 29 that it will not prosecute Tokyo Electric Power Co. or its executives for violating an environmental pollution law.

The decision came two and a half years after a group of plaintiffs, including residents of Fukushima Prefecture, filed a criminal complaint against TEPCO, operator of the crippled Fukushima No. 1 nuclear power plant, and its 32 current and former executives.

The group sought to bring charges against the utility and its executives for allowing radioactive contaminated water to be discharged into the sea.

In its decision, the prosecutors said there was “insufficient” evidence to press charges against TEPCO and some of its executives, including Naomi Hirose, company president. The remaining executives, the prosecutors said, “had no authority or responsibility to set measures to avoid the leakage in the first place,” therefore, the accusation has “no grounds.”

“The Fukushima police investigated the case for almost two years. It is extremely disappointing,” said Ruiko Muto, 62, the head of the plaintiff’s group, at a news conference in Tokyo on March 29. “We wanted them to look into the case further. We can’t accept this decision.”

The group is planning to appeal to the Committee for the Inquest of Prosecution. The group will meet with its lawyers on March 30 and decide on whether it will pursue further action.

Charges ruled out for Tepco figures over Fukushima No. 1 radioactive water spillage into sea

<http://www.japantimes.co.jp/news/2016/03/30/national/crime-legal/charges-ruled-tepco-figures-fukushima-no-1-radioactive-water-spillage-sea/#.VvurrHpdeot>

JJI

FUKUSHIMA – Public prosecutors decided on Tuesday not to indict Tokyo Electric Power Co. President Naomi Hirose and other current and former executives of the utility over radioactive water leaks from the crippled Fukushima No. 1 nuclear power plant into the ocean.

Sufficient evidence was not found, the Fukushima District Public Prosecutor’s Office said.

In September 2013, a civic group filed a criminal complaint against 32 current and former Tepco executives, including Hirose and Tsunehisa Katsumata, former chairman of the operator of the northeastern nuclear power plant, saying tainted water leaked from storage tanks into the ocean due to their failure to take preventive measures.

Through its investigation, the Fukushima Prefectural Police concluded that some 300 tons of stored radioactive water had flowed into the sea as of July 2013 because Tepco executives neglected to monitor the tanks or take leak-prevention measures, and sent the case to the prosecutors last October.

The prosecutors said there was no evidence supporting the allegation that the leaked tainted water was carried into the sea by groundwater at the plant, which suffered meltdowns following the massive earthquake and tsunami in March 2011.

The group said it will ask for a prosecution inquest panel’s investigation.

Power to the people?

March 31, 2016

Electricity shake-up gives power to the people

<http://www.japantimes.co.jp/news/2016/03/31/reference/japans-electricity-shake-gives-power-people/#.Vv0jjnpdeot>

by Kazuaki Nagata

Staff Writer

Japan’s electricity market receives a fundamental shake-up on Friday, with the introduction of greater competition for households and small businesses. Until now, regional utilities have monopolized supply. There will be some unfamiliar names among the new entrants, bringing with them a wide range of choices and benefits.

Following are questions and answers about deregulation in the household electricity market:

What does it mean for me?

Consumers can now choose their electricity provider.

Previously, the 10 regional utilities, including Tokyo Electric Power Co. and Kansai Electric Power Co., were the sole providers for their areas. But with deregulation, a wide range of companies can sell power. As of March 25, 266 firms had registered to become electricity providers.

Consumers should benefit as providers compete on price and incentives.

Users can also choose providers by the way they generate electricity, such as picking those that avoid nuclear or use renewables.

How will rate plans differ?

Many new players claim their rates will be lower than those charged by the regional utilities.

Tokyo Gas Co., a major gas supplier in the Kanto region and one of the new electricity providers, says a household that uses 4,700 kilowatt-hours a year can save ¥8,500 a year by switching to its plan from the one offered by Tepco.

There may be conditions attached. Tokyo Gas clients need to get their gas from the company to qualify for a ¥270 monthly discount.

Cellphone carrier KDDI Corp. is entering the market. It will return up to 5 percent of monthly power rates in the form of electronic cash credits, but only to its cellphone subscribers.

Will switching provider entail rewiring my home?

No. The new suppliers will use a household's existing power cables.

However, electricity meters will be replaced, at no charge, with so-called smart meters.

Is there a risk of brownouts with small providers?

Basically, no.

Electricity quality will not change, and if a new provider comes up short for some reason, other companies will supply power to make up for the shortage.

Why are so many firms getting involved?

Some operators say electricity supply is not that profitable. But it is a good chance for energy-related firms to expand their businesses, while companies in other fields see electricity provision as a way to draw customers to their core pursuits.

"As an energy business operator, we always wanted to be a one-stop provider of gas and electricity," said Kawori Koya of the Residential Sales Strategy Department at Tokyo Gas.

Tokyo Gas dominates the household gas market in Kanto and is widely expected to become a strong player in the electricity market.

It also provides electricity for large-scale business users, whose market is already liberalized, so it is only natural for it to enter the household market, Koya said.

As consumers focus on prices and companies' reputation in choosing their provider, she said Tokyo Gas has an edge because its rates are some of the lowest and the firm has established a name as a reliable gas provider.

Tokyo Gas said that as of Feb. 24, it had about 54,000 contracts from customers waiting to jump ship from Tepco.

It aims to have a 10 percent market share in Kanto by 2020.

Firms whose main businesses are unrelated to power supply include KDDI and rival cellphone carrier SoftBank, railway operator Tokyu Corp. and travel agency H.I.S.

Takiguchi, senior manager at Japan Research Institute, said these firms will use their electricity supply to promote their main businesses.

"Electricity is something that everybody uses, so they can approach a wide range of customers," Takiguchi said.

Will regional utilities be able to retain their market share?

Possibly. Tepco spokesman Kiyomitsu Kawamoto says while it is true the market environment has changed, Tepco sees the liberalization of the household market as an opportunity, since regional utilities will be able to sell electricity outside their boundaries.

Kawamoto admits that when it comes to price, the newcomers are ahead. Utilities were required to get government approval for their rates and therefore could not set a high profit margin. They have already been lowering their prices, leaving little room for further cuts, he said.

He said Tepco, which has about 20 million household customers, needs a strategy that does not focus on rates alone.

Tepco has partnered with more than 15 firms to provide benefits. For example, SoftBank subscribers can receive discounts on their phone bills.

As well as promoting such deals with partners, Tepco believes its customer service know-how, which the firm has built up over decades, is a strong selling point.

In some countries, shaking up the market resulted in higher prices. Will this happen in Japan?

Takiguchi said rates may rise: Market liberalization has started with way too many players, so prices will fall in the short term due to competition, but a lot of players will not survive and will drop out.

“The competition will become weaker, and the competition to lower . . . rates will also weaken,” he said.

He also said Japan’s push to boost costly renewable energy, such as solar and wind power, could lead to higher rates.

An accident that "should have been preventable"

04.04.2016_No65 / News in Brief

Tepco: ‘We Should Recognise The Fact That We Could Not Prevent An Accident That Should Have Been Preventable’

<http://www.nucnet.org/all-the-news/2016/04/04/tepco-we-should-recognise-the-fact-that-we-could-not-prevent-an-accident-that-should-have-been-preventable-II>

Comment & People

4 Apr (NucNet): There were three main inefficiencies – **poor safety consciousness, insufficient technical capabilities and poor communication** – that contributed to the March 2011 accident at Fukushima-Daiichi, Takafumi Ihara, nuclear power programme manager at Tepco’s London office, told NucNet in an interview.

He also said that Tepco produced a two-part nuclear safety reform plan focusing on safety at the operational and managerial levels in 2013.

The full interview is online for NucNet subscribers: <http://bit.ly/1Yaly9a>

Deregulation: First setback

April 1, 2016

Electricity reforms in Japan hit glitch on 1st day, power trading surges

<http://www.asahi.com/ajw/articles/AJ201604010051.html>

REUTERS

The biggest-ever shake-up of Japan's energy industry hit a glitch on its first day as trading was halted for eight-and-a-half hours on a new electricity product, although overall turnover on the beefed up power exchange surged 60 percent.

A communication connection between the exchange and the national electricity grid monitor set up to ensure smooth transmission and trading of power for consumers broke down late on Thursday, stopping trade in one-hour-ahead blocks of electricity, according to officials and statements.

The one-hour-ahead, or intraday, product was introduced as part of the overhaul of the industry, where regional utilities are losing their last remaining monopoly rights and the \$70 billion (8 trillion yen) retail market is opened to all competitors.

Efficient spot trading of electricity is seen as an important step for the changes to be successful.

The outage did not cause disruptions to power supplies and had little impact on the electricity market, said the Organization for Cross-regional Coordination of Transmission Operators, Japan (OCCTO).

Trading in the intraday product on the Japan Electric Power Exchange (JEPX) was stopped between 10 p.m. Thursday and 6:30 a.m. Friday Japan time, said OCCTO, which was set up last year to monitor the market and ensure stable supplies. The new product trades 24 hours a day.

Trading for day-ahead supplies for Friday on JEPX, the exchange's traditional product, surged to 47 million kilowatt hours (kWh), up 60.6 percent from the same day a year earlier, JEPX said.

Day-ahead contracts weren't affected by the glitch.

Before the changes, JEPX trading typically accounted for around 1-2 percent of overall electricity supplies in Japan, but the increase in volume will be seen as encouraging to those who argue building liquidity is crucial to ensure a competitive market.

The average price of the exchange's day-ahead DA-24 spot index was 7.43 yen per kWh for Friday, down 38 percent from 11.99 yen the same day a year earlier and up 9.9 percent from 6.76 yen on March 31, according to the JEPX website.

Utilities unite

April 5, 2016

4 utilities to form alliance over nuclear crisis management, safety measures

<http://mainichi.jp/english/articles/20160405/p2a/00m/0na/025000c>

Four power companies -- **Kansai Electric Power Co., Kyushu Electric Power Co., Chugoku Electric Power Co. and Shikoku Electric Power Co.** -- are set to **form an alliance for their nuclear crisis management and safety measures**, it has been learned.

The four utilities are aiming to improve the safety of their nuclear facilities, reduce the costs of taking safety steps and develop new technology by jointly handling work to decommission their nuclear reactors and taking safety measures necessary for restarting their idled reactors. It will be the first time for major domestic power companies to form an alliance for nuclear power-related projects.

Following the outbreak of the nuclear crisis at the Fukushima No. 1 nuclear power plant in March 2011, the government introduced new regulatory standards to require utilities to adopt stricter safety measures. The cost for utilities to take safety measures for each one of their nuclear reactors is ballooning to about 100 billion yen.

With the retail electricity market being fully liberalized earlier this month and competition among power suppliers intensifying, the business environment of major power companies is becoming even severer. Therefore, the four utilities will aim to reduce costs of taking safety measures and share expertise by jointly working to deal with issues of common concern, such as decommissioning work. The four utilities intend to jointly develop new technology in the future.

The four power companies are in the final stage of talks in the direction of forging an alliance pact as early as the end of this month. The four power companies have already decided to decommission a total of five nuclear reactors. They are: Kansai Electric's No. 1 and No. 2 reactors at the Mihama Nuclear Power Plant in Fukui Prefecture; the No. 1 reactor at Shikoku Electric's Ikata Nuclear Power Plant in Ehime Prefecture; the No. 1 reactor at Chugoku Electric's Shimane Nuclear Power Station; and the No. 1 reactor at Kyushu Electric's Genkai Nuclear Power Plant in Saga Prefecture.

As a first step, the four utilities are likely to start sharing with each other as early as the end of fiscal 2016 the technology and personnel necessary to decommission those five reactors. As for safety measures, the four companies are also expected to share quake-resistant and fire-resistant technologies.

Objective and scientific?

April 4, 2016

Fukushima students reach out to tell truth about radiation

<http://www.asahi.com/ajw/articles/AJ201604040044.html>

By YURI OIWA/ Staff Writer

Struck by ignorance about the 2011 nuclear disaster, high school science club members in Fukushima Prefecture enlisted the help of fellow students around Japan and abroad for a comparative study on radiation doses.

The results surprised even those living in the prefecture that hosts the Fukushima No. 1 nuclear power plant.

“The individual doses (of external radiation exposure in high school students) were almost equal inside and outside of Fukushima Prefecture, and in European areas,” Haruka Onodera, 18, said in English at the Foreign Correspondents’ Club of Japan (FCCJ) in Tokyo on Feb. 8.

A German correspondent asked her, “Would you declare Fukushima now safe?”

“Actually, **we didn’t measure the doses in people living in the contaminated areas**, so we can’t say all of Fukushima is safe,” Onodera answered, often pausing in thought in the middle of her words and phrases. “But I hope we will send (personal dosimeters) to contaminated areas and help do risk management for people living there in the future.”

Onodera, a third-year student of Fukushima High School and member of the physics and radiation division of the school’s Super Science Club, also showed explanatory slides at the FCCJ news conference titled, “Fukushima and radiation monitoring. The goal of the project is to show the realities of Fukushima Prefecture to the rest of the world.

The club’s physics and radiation division started the project in summer 2014. **It involved 216 high school students and teachers in Japan and abroad carrying personal dosimeters for two weeks.**

Six high schools in Fukushima Prefecture--Fukushima, Adachi, Aizu Gakuho, Iwaki, Asaka and Tamura--and another six located elsewhere in Japan--including in Gifu, Kanagawa, Nara and Hyogo prefectures--were involved in the project.

They were joined by 14 high schools from France, Poland and Belarus.

According to the measurements taken by the students, the annual radiation doses in Fukushima Prefecture ranged between 0.63 and 0.97 millisievert. For elsewhere in Japan, the range was from 0.55 to 0.87 millisievert, while in Europe, the annual doses were between 0.51 and 1.1 millisieverts.

The similar levels of external doses are believed to be partly attributable to the lower level of natural background radiation in Fukushima Prefecture compared with that in western Japan. That finding came from an analysis of a database on the radioactive content of soil in areas surrounding the different high schools across Japan.

Onodera, who was seated next to Ryugo Hayano, a professor of physics with the University of Tokyo, at the FCCJ news conference, had also presented the study results last year to a workshop of high school students in France and a conference on Fukushima foodstuffs held on the sidelines of an international food exposition in Italy.

Two second-year students of the Super Science Club--Minori Saito, 17, and Yuya Fujiwara, 17--gave a talk at a workshop organized in Date, Fukushima Prefecture, by the International Commission on Radiological Protection late last year.

First- and second-year students who are members of the club, joined by eight high school students from France, visited peach farmers and shiitake mushroom growers in Fukushima Prefecture in summer last year. It was part of a program for studying the current state of Fukushima from diverse views.

The students wanted to address global audiences after they were shocked by how little was known about the actual state of Fukushima Prefecture.

“Can humans live in Fukushima?” a French high school student asked the Fukushima students over Skype as part of an international exchange program in 2014.

That prompted the Japanese students to determine the actual situation on their own, and compare it with circumstances elsewhere in Japan and abroad. Hayano advised them to undertake the endeavor when he visited Fukushima High School to give a talk.

The findings of the study were surprising. Most of the Fukushima students expected the doses in Fukushima would be the highest, even by a large margin.

The students also studied how behavior affected the dose levels.

The Fukushima High School students were being exposed to lower radiation levels when they were at school than when they were at home. They believe the school's concrete buildings provided a more effective shield from radiation sources than the wooden houses did.

By contrast, students attending Ena High School in Gifu Prefecture were exposed to more radiation when they were at school, where granite, containing radiation sources, is used in the buildings.

Their analysis results were published in November in a British scientific journal on radiological protection. Onodera was involved in writing the research paper.

"The experience has brought home to me how important it is to address reality **objectively and scientifically**," she said.

Onodera said she was growing more interested in basic sciences and dreams of doing research on molecular biology at university.

"We hope to solicit help from people in evacuation zones within Fukushima Prefecture, and from high schools in countries we have yet to address, in further broadening our study," said Takashi Hara, a teacher and adviser to the science club's physics and radiation division.

Questions remain about courts' decisions

April 7, 2016

Editorial: Questions remain over high court decision on Sendai nuke plant

http://mainichi.jp/english/articles/20160407/p2a/00m/0na/006000c*

The Miyazaki branch of the Fukuoka High Court has dismissed an appeal by residents near the Sendai Nuclear Power Plant in Kagoshima Prefecture against a lower court decision that rejected their demand that operations at the power station be provisionally suspended.

- **[Related]** High court rejects residents' call to halt reactors in southwest Japan

The appeal court upheld a decision handed down by the Kagoshima District Court decision in April 2015 on the grounds that there is no irrationality in the new regulatory standards that the Nuclear Regulation Authority (NRA) set following the March 2011 outbreak of the Fukushima nuclear crisis, endorsing the restart of the power plant operated by Kyushu Electric Power Co.

However, questions remain over the appeal court's evaluation of evacuation plans for local residents in case of a serious nuclear accident at the plant as well as countermeasures against volcanic eruptions.

In the latest decision, the Miyazaki branch of the Fukuoka High Court stated that the safety that must be ensured at nuclear plants should be judged based on social norms, noting that it is impossible to

completely eliminate risks of accidents at such power stations. The court then evaluated the quake-resistance of the plant, measures to protect the power station from possible volcanic eruptions and local governments' evacuation plans for residents -- which were key points of contention -- and concluded that the plant poses no specific risks of causing serious damage to nearby residents.

However, the myth of the infallible safety of atomic power stations has collapsed with the crisis at the tsunami-ravaged Fukushima No. 1 Nuclear Power Plant. Needless to say, the operators of nuclear plants must draw up and implement countermeasures on the assumption that serious accidents could occur. Therefore, evacuation plans for local residents in case of an accident are crucial. It is the responsibility of local governments that host or are situated near atomic power plants to work out evacuation plans for local residents. However, such plans are not subject to safety evaluations by the NRA under its new regulatory standards. Evacuation plans should be covered by NRA screening in order to ensure their efficacy.

However, the appeal court ruled that even if evacuation plans are to lack efficacy, it would not mean that operations at nuclear plants pose an immediate threat to the lives and health of local residents. The court stated that it is a matter of legislative policy, and therefore not irrational, that evacuation plans are not subject to the new regulatory standards.

However, serious questions should be raised over whether it is appropriate under social norms to give the green light for reactivation of nuclear plants even though evacuation plans are inadequate.

Last month, the Otsu District Court issued a provisional injunction ordering Kansai Electric Power Co. to suspend operations at the No. 3 and 4 reactors at its Takahama Nuclear Power Plant in Fukui Prefecture. In its decision, the court said, "It is the national government's duty in the principle of faith and trust to work out regulatory standards that take into consideration evacuation plans." This is a more sensible idea. The high court criticized the NRA for evaluating the impact of volcanoes on nearby nuclear plants on the premise that the timing and scale of volcanic eruptions is predictable.

At the same time, however, the court concluded that it is common sense that risks of massive volcanic eruptions that local residents point out can be ignored, noting that the possibility of such disasters is not taken into account in construction and other regulations.

However, many members of the public are apparently doubtful of treating nuclear plants, which could seriously affect wide areas if an accident were to occur, in the same way as ordinary structures.

Social consensus has not been formed on risks of accidents at nuclear power stations as even courts are divided over evaluations of such dangers.

The government and electric power companies that operate atomic power plants should take public concerns about nuclear accidents seriously and hold in-depth discussions on the issue.

Court decisions divided over risk evaluations of nuclear reactors

<http://mainichi.jp/english/articles/20160407/p2a/00m/0na/009000c>

April 7, 2016 (Mainichi Japan)

Japanese courts have been divided in their decisions over residents' petitions for provisional injunctions ordering the suspension of nuclear reactors filed across the country, and the fate of reactor reactivation is likely to remain in the hands of judicial rulings.

- **【Related】** Local residents decry court's ruling to not halt restart of Sendai nuclear plant
- **【Related】** News Navigator: Is Sendai Nuclear Power Plant safe under new standards?

On April 6, the Miyazaki branch of the Fukuoka High Court approved the operation of the No. 1 and 2 reactors at the Sendai Nuclear Power Plant in Kagoshima Prefecture, dismissing residents' petition for a provisional injunction ordering the suspension of the reactors.

Unlike the Otsu District Court's injunction in March ordering the No. 3 and 4 reactors at the Takahama nuclear plant in Fukui Prefecture be halted, the Fukuoka High Court branch acknowledged that social norms do not call for a "zero risk" over the possibility of nuclear accidents.

After the Fukushima No. 1 nuclear power plant meltdowns in March 2011, there were nine court decisions over injunction requests for nuclear reactors. Of them, three decisions ordered the reactors be halted -- the aforementioned Otsu District Court decision, the May 2014 Fukui District Court decision over the Oi nuclear plant in Fukui Prefecture, and the same court's April 2015 decision over the Takahama plant.

In response to the April 6 decision by the Fukuoka High Court's Miyazaki branch, petitioners are set to consider whether to appeal it to seek the Supreme Court's decision. There are other pending petitions and lawsuits over nuclear reactors across the country, including the one over the No. 3 reactor at the Ikata nuclear plant in Ehime Prefecture, which operator Shikoku Electric Power Co. is seeking to restart this coming summer.

Court decisions over nuclear reactors are split over how far accident risks carried by nuclear reactors are tolerated by social norms. The Fukuoka High Court branch's decision pointed out that unpredictable risks would remain even if the scientific and technical knowledge reflected in the new regulatory standards adopted by the Nuclear Regulation Authority (NRA) is updated, and concluded that "while risks remain, it cannot be said there is a concrete danger" -- in defiance of the Otsu District Court's decision that called for a zero nuclear accident risk.

Courts were also divided in their opinions over resident evacuation plans. The Fukuoka High Court's Miyazaki branch ruled in favor of Kyushu Electric Power Co., the operator of the Sendai plant, on the grounds that the central government has approved the utility's nuclear evacuation plans, saying, "Even if the plans lack in rationality and effectiveness, they are not recognized to immediately infringe on residents' personal rights."

With regard to the NRA's volcano risk evaluation guide premised on detecting signs of major eruptions, the high court branch raised questions by saying, "We must say eruption predictions are difficult and unreasonable." The high court branch, however, went on to state, "The danger of catastrophic eruptions can be ignored" -- again defying a zero risk theory.

At a regular press conference on April 6, NRA Chairman Shunichi Tanaka refuted the high court branch's decision, saying, "It is the NRA's view that elaborate observations should be made for early predictions of eruptions and prompt responses should be made," ruling out the possibility of reviewing its volcano risk evaluation guide.

Shigeyuki Suto, professor of the Faculty of Law at Waseda University, criticized the decision by the Fukuoka High Court's Miyazaki branch, saying, "The decision lacks in an attitude that questions from the public point of view whether the new regulatory standards drawn up by a group of experts are reasonable or not. The decision that the nuclear reactors (at the Sendai plant) are not subject to immediate suspension even if resident evacuation plans are insufficient was also a sheer formality."

Safety rules hamper training...

April 5, 2016

Tighter rules hamper nuclear power studies

http://www3.nhk.or.jp/nhkworld/en/news/20160405_27/

Nuclear energy academics in Japan say tighter rules introduced for all of the country's reactors after the Fukushima Daiichi disaster hamper their efforts to train students.

Members of the Atomic Energy Society of Japan visited the government's Atomic Energy Commission on Tuesday.

They say all 12 of Japan's research reactors at universities and other institutes have been offline due to the rules. Some of the reactors are small-output types.

The rules require all operators, including those with such reactors, to take stricter measures against earthquakes and tsunami.

University of Tokyo Professor Mitsuru Uesaka said about 1,700 students and researchers used research reactors before the 2011 accident. But he said some now have to go overseas to use nuclear facilities, or give up on their studies.

The Nuclear Regulation Authority is trying to speed up its screening process for restarting research reactors. But universities are delayed in preparing for screening due to staff and budget shortages.

The academics plan to propose that the government introduce different criteria for research reactors depending on their output.

Court decision ignores Fukushima lessons

April 7, 2016

EDITORIAL: Reactor ruling ignores lessons, anxiety from Fukushima crisis

<http://www.asahi.com/ajw/articles/AJ201604070026.html>

A court ruling concerning nuclear reactor operations raises serious doubts about whether the court rightly recognized the gravity of the damage and the harsh realities caused by the 2011 accident at the Fukushima No. 1 nuclear plant.

The Miyazaki branch of the Fukuoka High Court on April 6 rejected an appeal by Kyushu residents seeking an injunction to shut down the No. 1 and No. 2 reactors of the Sendai nuclear plant run by Kyushu Electric Power Co. in Satsuma-Sendai, Kagoshima Prefecture. They are the only two reactors currently operating in Japan.

The ruling in essence said the Nuclear Regulation Authority's (NRA) new safety standards, established after the disaster at the Fukushima plant, reflect the lessons learned from the triple meltdown and cannot

be described as unreasonable. It also dismissed the plaintiffs' argument that the design of the Sendai plant underestimates the safety risks posed by possible major earthquakes.

This ruling stands in sharp contrast with the Otsu District Court's decision in March that raised doubts about the NRA's safety standards and ordered the suspension of operations of two reactors at Kansai Electric Power Co.'s Takahama nuclear plant in Fukui Prefecture.

What happened in Fukushima has created strong anxiety among Japanese about the safety of nuclear power generation. From this point of view, it is obvious which of the two rulings really echoed the public sentiment about nuclear safety.

Symptomatic of the two courts' different stances toward public concerns are their views about evacuation plans.

The new nuclear safety standards do not address issues related to evacuation plans.

The Otsu District Court raised questions about this fact and contended that the government is obliged to develop new regulatory standards based on a broader perspective that also address evacuation plans.

The Miyazaki branch acknowledged there are legitimate concerns about the existing plan for emergency evacuations.

The plaintiffs argued that the plan would be unable to deal with a situation that requires an immediate and massive evacuation. They also said the number of buses available to transport local residents during nuclear crises would be insufficient.

But the court nevertheless dismissed the plaintiffs' claim that operating the Sendai reactors violates their personal rights. The court pointed out that at least an emergency evacuation plan was in place.

Following the accident in Fukushima, many residents could not smoothly flee for their safety, leading to serious confusion.

The high court's decision did not give due consideration to this fact.

Volcanoes, including the highly active Sakurajima, are located around the Sendai nuclear plant.

The NRA has established guidelines concerning the risks to nuclear plants posed by volcanic eruptions.

The high court judged the guidelines, based on the assumption that the timing and scale of eruptions can be accurately predicted, to be "irrational."

Yet the court said the probability of an eruption triggering a catastrophic nuclear accident was so low that the risk can be ignored unless solid grounds for thinking otherwise are shown.

The court acknowledged the NRA's flawed approach to dealing with the safety risk posed by volcanic eruptions. But it said the widely accepted view in society is that the risk can be ignored because of the low probability of such eruptions actually occurring.

Can this be described as an opinion based on serious reflection on the fact that unforeseen circumstances occurred at the Fukushima plant?

The exact causes of the nuclear disaster are not yet clear, and around 100,000 people are still living as evacuees.

That explains why various opinion polls show a majority of respondents expressing negative views about plans to restart reactors.

The court ruling that endorses the NRA's new safety standards does not translate into public support of the government's policy to bring idled reactors back on stream.

The sharply different court rulings on reactor operations should be regarded as a sign that the knotty question of how to secure safety at nuclear plants remains unsolved.

TEPCO official had "personal knowledge" of standard

April 12, 2016

TEPCO official knew standard for meltdown at Fukushima

<http://www.asahi.com/ajw/articles/AJ201604120056.html>

THE ASAHI SHIMBUN

A Tokyo Electric Power Co. senior official has admitted to knowing the criteria to assess reactor meltdowns during the onset of the 2011 Fukushima nuclear accident.

However, it took the company two months to make the declaration and another five years to "discover" its operational manual, which would have allowed it to declare a meltdown.

Until February this year, TEPCO had justified the delay in that it did not have the "basis to determine" such an occurrence. It announced Feb. 24 that it discovered a guideline in its operational manual.

TEPCO admitted that meltdowns had occurred in May 2011, two months after the disaster.

Yuichi Okamura, a senior director on nuclear power generation, said in a news conference on April 11 that he knew of the standard, although emphasizing it was only his "personal knowledge." He did not elaborate on whether he knew the existence of the operational manual, or whether he shared his "personal knowledge" with other staff members.

"I, in fact, knew it (the criteria)," said Okamura. "I learned it while working in the field of nuclear technology with the company for over 20 years."

According to Okamura, at the time of the accident at the Fukushima No. 1 nuclear power plant, he was directing the pumping of water into the cooling pool of spent nuclear fuel rods of the No. 4 reactor. He said he was not in a position to make a declaration whether a meltdown had occurred.

He made the admission in response to a question asking his personal understanding of the situation at the onset of the crisis.

Okamura declined to comment on whether he is being questioned by a third-party panel investigating the accident.

In February, TEPCO revealed that it did not realize for the past five years that there was a clear guideline in the operational manual to assess that a meltdown in a reactor had occurred. The standard requires the company to declare a meltdown when damage to a reactor core exceeds 5 percent.

TEPCO took two months to declare the triple meltdowns at the Fukushima plant, triggered by the Great East Japan Earthquake and tsunami on March 11, 2011. It had initially maintained that the reactors suffered "core damage" rather than meltdowns.

NRA apologises for lack of news after quake

April 18, 2016 (Mainichi Japan)

Nuclear watchdog head apologizes for lack of news on plants after quake

<http://mainichi.jp/english/articles/20160418/p2a/00m/0na/017000c>

Japanese version

The head of the Nuclear Regulation Authority (NRA) apologized at a meeting on April 18 for the lack of news on the state of nuclear plants in the wake of deadly earthquakes in Kumamoto Prefecture.

- **【Kumamoto Earthquake Special】**

"We must humbly reflect on this," NRA Chairman Shunichi Tanaka said.

At the meeting, the NRA confirmed that none of the recent earthquakes had created shocks large enough to trigger automatic shutdowns at nearby nuclear power plants. "Currently there is no problem with safety" at the plants, Tanaka said.

The largest shocks recorded at nearby nuclear plants in gal, a unit of acceleration, were 8.6 at the Sendai Nuclear Power Plant in Kagoshima Prefecture, 20.3 at the Genkai Nuclear Power Plant in Saga Prefecture, 10 at the Ikata Nuclear Power Plant in Ehime Prefecture and 2 at the Shimane Nuclear Power Plant in Shimane Prefecture.

Power utilities have safety standards in place so that a nuclear reactor will automatically turn off when quake-related ground acceleration reaches 140 to 190 gal for sideways movement and 70 to 90 gal for vertical movement.

The risks of "normalizing" radiation

Lessons from Fukushima and Chernobyl

<http://www.beyondnuclear.org/chernobyl30-fukushima5/>

The Risks of "Normalizing" Radiation: A Special Event

Leading international experts and compelling short films will headline a May 3rd Beyond Nuclear event in Washington, DC to mark the anniversaries of the Chernobyl and Fukushima nuclear disasters. Full program.

Beyond Nuclear and the Goethe-Institut, DC will co-host an afternoon and evening program that will mark the 5th anniversary of Fukushima and the 30th anniversary of Chernobyl. The legacy of both nuclear power plant disasters has included a marked increase in radiation-induced diseases and mutations, as found by some of the world's leading researchers, several of whom will be speaking at the event. The event takes place at the Goethe-Institut, DC, 1990 K St. NW (event entrance on 20th St.) The afternoon panel presentations run from 2pm to 5pm. The evening program is 7:30pm to 9pm. All events are free and open to the public. No registration required.

Dr. Timothy Mousseau, has conducted landmark research on wildlife and plant matter around both the Chernobyl and Fukushima sites. He has found significant alterations in plant decay and radiation-induced changes in wildlife including shortened life spans, smaller brain sizes, male infertility and cataracts.

Dr. Wladimir Wertelecki, has pioneered work on the deleterious effects of disaster-related radiation on long-term child development, particularly in relation to the radiological contamination spread by the Chernobyl nuclear disaster. Dr Wertelecki has focused on teratogenesis – changes caused by environmental interference to a developing fetus, a fetus with with normal genes, as distinguished from gene mutations, inherited from parents.

Dr. Yuri Hiranuma, a Japanese doctor based in the U.S. has studied thyroid issues among post-Fukushima children. She has a particular focus on how affected people are coping (or not coping) with the disaster; how inefficient and dysfunctional the government agencies are at managing the problem; and the apparent systematic underestimation and dismissal of health effects. In June 2014 she co-authored a critique of the UNSCEAR 2013 report on the Fukushima disaster.

Additional speakers include: Lucas Hixson, who has taken radiation measurements at Chernobyl; and Beyond Nuclear experts Cindy Folkers, Kevin Kamps and Paul Gunter. Two short documentaries -- *Alone in the Zone*, on Fukushima, and *Champion in Chernobyl*, featuring tennis legend Maria Sharapova -- will be screened to open the evening program. Both the afternoon and evening programs will include discussion with the audience.

The event includes a special exhibition of Chernobyl and Fukushima photos by Gabriela Bulisova and Robert Knoth. For more information, email info@beyondnuclear.org

Takahama restart: Safety concerns growing

April 21, 2016

Fears grow as Takahama reactors near restart

Staff Writer

Kansai Electric Power Co.'s Takahama No. 1 and 2 reactors are over 40 years old, but the utility has applied for a 20-year extension. On Wednesday, the Nuclear Regulation Authority officially gave the reactors the green light, signaling they meet the fundamental safety standards needed for reactivation. Although additional tests and inspections are needed before the reactors can resume operation, the potential first-ever restart of two units that are more than four decades old has neighboring communities worried.

The Sea of Japan coastal city of Maizuru, Kyoto Prefecture, parts of which lie 5 km from Takahama, would be on the front lines of any disaster response in the event of an accident, and Mayor Ryozo Tatami expressed specific concerns Wednesday.

"At present, has the safety of the plant been confirmed? We need scientific and technological explanations. The No. 1 and 2 reactors were envisioned and constructed to operate for 40 years," Tatami said. "We also need documentation from when the plant was originally built that proves it's possible to operate the reactor for 60 years, especially since the core cannot be replaced."

Caution by Tatami in particular over restarting Takahama Nos. 1 and 2 could impact the stance of other Kansai leaders.

A small part of northern Shiga Prefecture lies within 30 km of Takahama, and Gov. Taizo Mikazuki expressed concern this week about running old reactors that could leak radiation into Lake Biwa, as well as the problem of storing additional nuclear waste generated by the reactors.

While gaining approval for restarts from heavily pro-nuclear Takahama and Fukui Prefecture is expected to be relatively easy, Kepeco is certain to face calls from other Kansai-area prefectures to provide detailed explanations of why it needs to restart two aging reactors before permission for their restart is given.

It is also likely to face questions about whether the utility and NRA are cutting corners in order to make the July 7 deadline for formal permission to restart. If that deadline is missed, the reactors are supposed to be scrapped.

Quakes & nuke safety

Source : IEEE

<http://spectrum.ieee.org/energywise/energy/nuclear/kyushu-earthquake-swarm-raises-concerns-over-nuclear-plant-safety>

Kyushu Earthquake Swarm Raises Concerns Over Nuclear Plant Safety

By John Boyd

Posted 21 Apr 2016 | 14:00 GMT

The populous island of Kyushu in southwest Japan has been shaken by hundreds of earthquakes and aftershocks over the past eight days, and there is no immediate end in sight to Mother Nature's upheavals. The tremors have impacted manufacturing for some companies in the auto and electronics industries, while concerns are growing over the safety of Japan's two active nuclear reactors (the only two presently online), **which are located about 120 km south of where the main shaking is occurring.**

Image: NRA, Japan

The first major quake, 6.5 in magnitude, struck on April 14. A second more disastrous tremor measuring 7.3 hit the area at 1:25 am on Thursday, April 16, injuring thousands of people, and killing dozens. Water, electricity and gas services have been disrupted. Buildings, roads, and bridges have been destroyed, complicating search, rescue and aid efforts for emergency workers and the Japan Self-Defense Force. The quakes are occurring inland, so there are no tsunami warnings.

As the quakes continue, fears are growing over the safety of two nuclear reactors in the Sendai Nuclear Plant operated by Kyushu Electric Power Co. (Kyuden). According to the Japan Times, citizens' fears are rising, while **mayors from more than 100 cities have called on the central government "to re-evaluate the way earthquake safety standards for nuclear power plants are calculated."**

Following the Fukushima Daiichi Nuclear Plant accident in March 2011, all 50 or so nuclear plants in Japan were shut down. The two Sendai reactors were authorized by Japan's Nuclear Regulation Authority (NRA) to start up again this year after fulfilling strict new safety requirements, but now they face the possibility of another shutdown if the quakes continue and citizens fears increase further.

To try and head off such an outcome, Kyuden was quick to prominently display messages in Japanese and English on its website stating that "Sendai Nuclear Power Station is safely in operation. ... No abnormalities have been confirmed there."

It has also published details on seismic intensity and maximum acceleration of ground motion measured in gals [PDF] the plant experienced during the April 16 temblor—the values coming far below the figures for automatic shutdown.⁴

The NRA agrees with the operator's stance, saying in a news release [PDF] issued April 18, "To date, no issues regarding the safety of the following facility [including Sendai Nuclear Power Station] were found resulting from the earthquakes, and their operation status have not changed from before the earthquakes."

But the NRA has been criticized for not providing sufficient information on the impact of the earthquakes. In a press conference on April 18 reported by the jiji wire service, NRA chairman Shunichi Tanaka admitted they could do a better job. "We will decide whether to stop the operations of nuclear power plants based on scientific and technological standards," Tanaka told the press. "Under the current circumstances, we do not see any safety problems."

Auto and electronics manufacturers' facilities in the region also absorbed major damage and the impacts are being felt up and down the supply chain.

Toyota reports that it is suspending production of vehicles at most of its assembly plants due to parts shortages from Kyushu suppliers hit by the earthquakes, while Honda has halted work in its Kumamoto Factory, which manufactures motorbikes and general-purpose engines.

Because of damage to buildings and manufacturing lines, Sony has stopped operations at its Semiconductor Manufacturing Kumamoto Technology Center, which produces image sensors for digital cameras and micro-display devices. Two other Sony semiconductor plants in the region also suffered temporary disruptions in production.

It's an open secret that Sony supplies Apple with CMOS image sensors for its iPhones. When press reports suggested such sensor shipments might be affected, Sony quickly issued a press release stating, "Although some of the manufacturing equipment at Nagasaki Technology Center, which is Sony's main facility for smartphone image sensor production, and (at) Oita Technology Center ... had been temporarily halted, the affected equipment has been sequentially restarted from April 17, and production resumed."

NRA itself defies basic 40-year rule

April 21, 2016

Nuclear watchdog's green light for aging reactors waters down 40-year rule

<http://mainichi.jp/english/articles/20160421/p2a/00m/0na/008000c>

The Nuclear Regulation Authority (NRA) has given approval to operating two aging reactors at the Takahama Nuclear Power Plant in Fukui Prefecture beyond 40 years, defying the basic rule of limiting the service life of reactors to four decades.

The No. 1 and 2 reactors at the nuclear plant operated by Kansai Electric Power Co. passed the NRA's safety screenings on April 20, making them the first reactors aged over 40 years that have cleared the new regulatory standards introduced after the 2011 Fukushima nuclear disaster.

Both reactors went online back in the 1970s -- the No. 1 reactor in November 1974 and the No. 2 reactor in November 1975. The 40-year rule, which is mentioned in the revised nuclear reactor regulation law that came into force in 2013, was introduced with the understanding that the operational life of reactors 40 years of age could be extended by up to 20 years just once if the NRA granted permission, but only in exceptional cases.

Kansai Electric Power Co. needed to obtain approval by July 7 for its construction plan elaborating on designs. It also needed approval for extending the operational life of the aging reactors. The NRA, however, agreed to postpone some screening work until after that deadline.

Screenings on the quake resistance of primary cooling systems, including steam generators, are expected to take several years. The NRA's decision to push back those screenings has paved the way for the aging reactors to operate beyond their designated 40-year life.

The NRA says that even if valid data is not obtained during screenings after that deadline, the reactors will be allowed to operate beyond 40 years if the facilities are reinforced and re-examined.

After the NRA issued an initial approval in February for extending the operational life of the Takahama reactors beyond 40 years, it received such public comments as, "Anything could be allowed if screenings can come later." However, the NRA argues that there will be no legal problems with its green light to extend operation of the Takahama reactors.

Meanwhile, Kansai Electric Power Co. has replaced 60 percent of a total of 1,300 kilometers of cables at the No. 1 and 2 reactors with flameproof cables. For the parts where it is difficult to replace cables, the utility has presented measures to prevent the spread of fire, such as wrapping cables with fireproof material. The NRA has approved this alternative solution.

There are four other aging reactors in the country, where the same types of cables as those at the Takahama plant are in place. **These old cables were said to be posing "the biggest obstacle in extending the service life of reactors,"** according to a senior power company official. However, the NRA's latest decision may likely set a precedent for watering down the 40-year rule, which was introduced by the former administration led by the Democratic Party of Japan.

Quake-prone country must remain on guard

April 28, 2016

Editorial: Quake-prone Japan must remain on guard against nuclear accident
<http://mainichi.jp/english/articles/20160428/p2a/00m/0na/019000c>

In earthquake-prone Japan, a major temblor could strike anywhere, at any time. Moreover, such a quake is impossible to predict -- a fact that was thrust upon us by the recent Kumamoto Earthquake.

- **【Kumamoto Earthquake Special】**
-

【Related】 Regulator says fault below central Japan reactor may be active
Following two deadly earthquakes measuring a maximum 7 on the Japanese intensity scale with a widening focal region, many people no doubt felt concerned about the safety of the Sendai Nuclear Power Plant in Kagoshima Prefecture operated by Kyushu Electric Power Co. Concern has been also raised over Shikoku Electric Power Co.'s Ikata Nuclear Power Plant, across the ocean from Oita Prefecture. Of course, these are not the only places at risk of quakes. Yet the government is moving ahead with plans to restore nuclear power in Japan. Can Japan coexist with nuclear power plants? The recent earthquakes provide a chance for us to consider this matter.

The magnitude-6.5 quake that hit Kumamoto Prefecture on the evening of April 14, which was focused in the Hinagu fault zone, registered a maximum 7 on the Japanese intensity scale. Another magnitude-7.3 quake focused in the Futagawa fault zone to the north, which occurred in the predawn hours of April 16, also registered a 7 on the intensity scale. After these quakes, seismic activity spread to the Aso district and to the northeast, and strong shaking has been felt over a wide area, from Kumamoto Prefecture to Oita Prefecture.

When will this seismic activity subside? Could it get worse? Will it affect the Mount Aso volcano? The limitations of seismology and volcanology prevent us from answering these questions with certainty. The Nuclear Regulation Authority (NRA) decided at a special meeting on April 18 not to halt operation of the Sendai Nuclear Power Plant. The effects of shaking on nuclear power plants are measured in gal, a unit of acceleration defined as one centimeter per second squared. The maximum acceleration measured at the plant during the recent quakes was 8.6 gal. In a safety assessment, the plant was deemed able to withstand up to 620 gal. At the time of screening, officials judged that even if a magnitude 8.1 quake were to occur in the Futagawa and Hinagu fault zones, ground acceleration would not exceed 150 gal.

Considering these figures alone, there seems to be no problem with safety. But the projected scenario is only applicable for earthquakes whose scales fall within what has been envisioned.

Responding to the latest quakes, the Japan Meteorological Agency and experts repeatedly expressed their views that that was no precedent of a magnitude-6.5 level inland quake being followed by an even bigger quake, and that they could think of no other cases wherein seismic activity had occurred in three separate locations at the same time. The government's Earthquake Research Committee also expressed the view that the Futagawa fault was longer than originally thought.

There are 2,000 known active faults in Japan. The latest quakes occurred along active faults that were previously known to scientists, but there have been past cases wherein quakes exceeding magnitude 7 have occurred along unknown active faults, including the 2000 Tottori earthquake and the 2008 Iwate-Miyagi inland earthquake.

Hokuriku Electric Power Co.'s Shika nuclear plant is said to have active faults lying beneath it, and decisions regarding this plant -- as well as others in similar situations -- must be made from the viewpoint of safety. This does not apply only to inland quakes, moreover. The massive earthquake that occurred five years ago on a plate boundary in the Pacific Ocean off Japan's Tohoku region greatly exceeded experts' predictions. We cannot imagine, therefore, that all earthquakes will remain within the scales envisioned by nuclear power companies and the NRA.

Furthermore, just because a nuclear power plant has passed the regulatory authority's screening does not necessarily mean it is safe -- and other threats exist in addition to earthquakes. The NRA itself acknowledges this, and such dangers must be considered as realistic possibilities. In this sense, preparation for an accident is indispensable -- but we cannot say that presently existing measures are adequate.

The latest earthquakes caused a bridge to collapse, triggered mudslides, and sank roads -- thereby cutting off transportation routes in various areas. A bullet train also derailed. If a nuclear accident occurs at the same time as such a natural disaster, will plans to evacuate residents proceed as planned? Concerns remain. Such damage would likely also hamper efforts to bring a nuclear accident under control, while continuing aftershocks would additionally hinder the accident response.

Kyushu Electric has withdrawn plans to build a seismically-isolated emergency response center at the Sendai nuclear plant. We would like power company officials to consider whether they have let their guard down over the threat of earthquakes.

April 26 marked 30 years since the Chernobyl nuclear disaster in the former Soviet Union. At the time, Japan judged that the accident had occurred due to unique circumstances there, and that a similar accident would not occur in Japan. Consequently, countermeasures were neglected to be implemented here. When the Fukushima nuclear disaster occurred 25 years later, insufficiencies in Japan's safety countermeasures were blatant.

Five years have now passed since the outbreak of the disaster at the Fukushima No. 1 Nuclear Power Plant, and the government has indicated that it will proceed to reactivate nuclear reactors. It has also in effect accepted the reactivation of aging reactors -- originally envisaged as an extremely rare exception to a new rule setting the life of nuclear reactors at 40 years, after which they were to be decommissioned. We fear that there is a re-emergence of a safety myth stating that an accident like the one in Fukushima will never happen again. We cannot approve of a gradual slip back to nuclear power.

Thirty years after the Chernobyl nuclear catastrophe, the disaster is still a long way from being brought under control. The concrete sarcophagus that was built at the time of the accident to contain radioactive materials has deteriorated significantly, and construction of a new shelter is proceeding. In Fukushima, meanwhile, nearly 100,000 people remain evacuated from their hometowns. There is no clear outlook for decommissioning of the reactors, which is expected to take 40 to 50 years. And people suffer from anxiety about the effects of radiation.

Though the chance of a disaster may be small, nuclear accidents are different from other types of calamities in that they can rob people of a future. Meanwhile, risks such as terrorist acts targeting nuclear power plants have come into the global spotlight.

As a country prone to earthquakes and one that has suffered a severe nuclear disaster, Japan must not forget to remain on guard.

Kepeco says Sendai plant is safe

April 29, 2016

Kyushu Electric assures public that nuclear plant is safe

<http://www.asahi.com/ajw/articles/AJ201604290059.html>

THE ASAHI SHIMBUN

Kyushu Electric Power Co. brushed aside safety concerns expressed in thousands of phone calls and e-mails, saying its Sendai nuclear plant in Kagoshima Prefecture faces no danger from the quakes rattling the southern main island.

The Nuclear Regulation Authority also supports the utility's stance that there is no need to shut down the nuclear plant, even as a safety precaution during the seismic activity.

"Nuclear power is energy defined as necessary in the nation's basic energy plan," Kyushu Electric President Michiaki Uryu said at a news conference in Fukuoka on April 28. "We are operating (the Sendai plant) after confirming its safety and concluding that there is no problem with continuing to operate it." The news conference was held to announce the utility's earnings for fiscal 2015, which included its first net profit in five years.

Two reactors at the Sendai plant in Satsuma-Sendai—the only ones running in the nation—cleared tougher nuclear safety regulations set after the 2011 Fukushima disaster.

Kagoshima Prefecture lies immediately south of Kumamoto Prefecture, where most of the earthquake activity has occurred since April 14.

The reactors at the Sendai plant must be shut down when ground acceleration in a horizontal direction of 160 gal is registered on the basement floor of the reactor auxiliary building.

When the largest quake in the series, a magnitude-7.3 temblor that struck Kumamoto Prefecture on April 16, ground acceleration of up to 8.6 gal was recorded at the Sendai plant. No irregularities have been detected at the nuclear plant, according to Kyushu Electric.

Although the figure is well below the level that requires an emergency shutdown, concerned citizens maintain that the utility should suspend operations as an extra precaution for an event unforeseen by authorities.

Over a week from April 15, the day after a magnitude-6.5 earthquake struck Kumamoto Prefecture, Fukuoka-based Kyushu Electric was flooded with about 5,000 e-mails and phone calls seeking a halt to operations at the Sendai plant.

Kyushu Electric officials acknowledge that without the Sendai nuclear plant, the company would still have enough electricity to supply Kyushu this summer, even if it proves to be one of the hottest in recent years. But the utility is eager to keep the Sendai plant online because running a nuclear power plant is cheaper than buying the fuel needed to operate a thermal power plant.

Kyushu Electric had relied on nuclear energy for 40 percent of its electricity supply before the Fukushima disaster, one of the highest ratios among the regional power companies.

Kyushu Electric's bottom line was hit hard after all reactors in Japan were shut down as a precaution following the meltdowns at the Fukushima plant.

But since the restart of the Sendai plant, which a Kyushu Electric senior official called a "powerful card," the company has been saving 10 billion yen (\$92.6 million) to 13 billion yen a month in operating expenses.

Uryu is already pushing plans for the company's Genkai nuclear plant in Saga Prefecture.

"We are striving to achieve a restart of the Genkai plant as early as possible," he told the news conference. The NRA stands firm on its decision that the Sendai plant is safe amid the series of the quakes and that it does not need to order a suspension of operations.

"There are no compelling scientific grounds," NRA Chairman Shunichi Tanaka said after an emergency meeting about the plant's operations on April 18. "We are not going to shut down the plant just because of calls from the public or politicians. What has been going on is within our expectations."

According to Kyushu Electric, the Sendai plant is designed to withstand a maximum ground acceleration of 620 gal. This figure was determined after experts studied various scenarios based on geological features at the plant and surrounding areas.

The company also studied the possible impact from a magnitude-8.1 earthquake that strikes in connection with the Futagawa and Hinagu fault lines. Seismologists say those two fault lines slipped in Kumamoto Prefecture, triggering the ongoing seismic activity.

For an earthquake of that size, Kyushu Electric projected a maximum ground acceleration of about 160 gal.

Even if the Sendai plant loses its ability to cool the reactors after powerful earthquakes, the operator is believed to be prepared to prevent a severe accident involving the release of radioactive substances by cooling the reactors using fire engines, power supply vehicles and other sources under the new regulations.

But those erring on the side of caution note that the magnitude-9.0 Great East Japan Earthquake on March 11, 2011, spawned a tsunami that Tokyo Electric Power Co., operator of the Fukushima No. 1 plant, was clearly unprepared for.

And two earthquakes 28 hours apart in the recent series of temblors both measured a maximum intensity of 7 on the Japanese seismic scale in Kumamoto Prefecture, an event unprecedented in Japan.

In the heavily damaged town of Mashiki in Kumamoto Prefecture, power supply vehicles, which were operating in recovery efforts after the April 14 earthquake, were toppled in the more powerful earthquake two days later. **Roads were severed, and a railway network was paralyzed over a wide area.**

Residents sought refuge outdoors and in their cars, fearing the strong aftershocks could collapse buildings used as evacuation centers.

Critics questioned whether workers trying to prevent a possible quake-induced crisis at the Sendai plant would be able to continue with their efforts if another powerful earthquake struck the plant. They also voiced concerns about government evacuation guidelines in the event of a nuclear accident, namely instructions to residents living within a 5-30 kilometer radius of a damaged plant to remain indoors.

NRA chief Tanaka said such a situation was unlikely to occur at the Sendai plant.

“There is no active geological fault beneath the Sendai plant,” he said at a news conference on April 27.

“The plant is also designed to be quake-proof, so people do not need to worry about those things.”

More damages for TEPCO

April 28, 2016

TEPCO must pay 31 million yen damages over evacuee deaths

<http://www.asahi.com/ajw/articles/AJ201604280048.html>

THE ASAHI SHIMBUN

April 28, 2016 at 15:55 JST

A court ordered Tokyo Electric Power Co. to pay 31 million yen (\$279,279) in damages to be split among the families of two elderly men who died after being evacuated from a hospital following the 2011 Fukushima nuclear disaster.

The plaintiffs had demanded a total of 66.4 million yen in compensation, but Presiding Judge Tetsuro Nakayoshi at the Tokyo District Court agreed with TEPCO in an April 27 ruling that factors other than the nuclear accident also contributed to the untimely deaths.

Tadashi Abe, 98, and Yoshio Henmi, 73, were hospitalized at Futaba Hospital in Okuma, Fukushima Prefecture, which is 4.6 kilometers from the Fukushima No. 1 nuclear power plant where disaster struck following a blackout triggered by the powerful quake and tsunami of March 11, 2011.

Abe was rescued from the hospital March 14 by Self-Defense Forces members, but he died two days later at a makeshift evacuation center in the prefecture.

Henmi was evacuated from the hospital March 16 to be moved to another hospital. He died that day. “(The two) died from the burden of being forced to travel for a long distance and for an extended period of time after the nuclear accident,” said a lawyer representing the plaintiffs.

Abe had to travel about 230 kilometers in eight hours while Henmi was ferried about 80 kilometers, according to court documents.

But the court ruled less damages should be awarded as the deaths were partly caused by hypothermia that was contracted due to the lack of heating after the power outage caused by the quake and tsunami. About 50 people who were left behind at the hospital and affiliated nursing facility had died by the end of April because their evacuation was delayed.

The court's ruling was the first in connection with lawsuits filed against TEPCO by relatives of seven people who died or went missing in the aftermath of the disaster.

A 73-year-old sister-in-law of Henmi voiced relief after the court decision.

“I finally got something that was bothering me off my chest,” she said. “I regret letting him die such a lonely death.”

Fumio Shinkai, a lawyer representing the plaintiffs, however, expressed frustration over the ruling.

“It is regrettable that the ruling did not take into account peculiarities of a nuclear accident,” he said at a news conference.

The lawyers argued that the court should give consideration to damages stemming from a nuclear power plant, which was believed to be safe prior to the accident, and the sufferings they went through while evacuating.

Shinkai noted that the ruling did not refer to those points they had argued in court and that the amount of damages the district court ordered is similar to that of a fatal traffic accident.

TEPCO said in a statement: “We offer heart-felt prayers to those who died after they were forced to evacuate in the wake of the nuclear accident. After studying the court decision, we will continue to respond sincerely.”

When the nuclear accident unfolded, there were 338 patients at the hospital. On March 12, when a hydrogen explosion occurred at the nuclear facility, 209 patients who were able to walk on their own were transported by bus to evacuation centers and other facilities.

IAEA Mission Report

27.04.2016_No82 / News in Brief

Japan's Regulator Releases IAEA Mission Report

<http://www.nucnet.org/all-the-news/2016/04/27/japan-s-regulator-releases-iaea-mission-report>

Security & Safety

27 Apr (NucNet): Japan's Nuclear Regulation Authority (NRA) **needs to attract competent and experienced staff, and develop skills relevant to nuclear and radiation safety through education, training, research and**

increased international cooperation, according to the text of an International Atomic Energy Agency report released by the NRA.

The Integrated Regulatory Review Service (IRRS) mission report says **Japan must amend relevant legislation with the aim of allowing the NRA to improve the effectiveness of its inspections.**

The report says authorities **should continue and strengthen the promotion of safety culture including "a questioning attitude".**

The NRA has demonstrated independence and transparency since it was set up in 2012, but **needs to further strengthen its technical competence** in light of the planned restart of nuclear reactors following the March 2011 Fukushima-Daiichi accident, the report says.

Greater priority needs to be given to the oversight of the implementation of radiation protection measures, and requirements and guidance need to be developed for emergency preparedness and response.

In January 2016 the IRRS team carried out a 12-day mission to assess Japan's regulatory framework for nuclear and radiation safety, which was modified following the Fukushima-Daiichi accident.

The modifications included the establishment of the NRA.

The report is online: <http://bit.ly/21f60TX>

Conceal information to avoid causing panic?

May 2, 2016

NHK president rapped over remarks on nuclear power reporting

<http://mainichi.jp/english/articles/20160502/p2a/00m/0na/014000c>

NHK President Katsuto Momii has come under fire from journalism experts and from within his organization over his recent remarks on how the public broadcaster should report on nuclear power after the Kumamoto earthquakes, in which he was quoted as saying that reports "should be based on official announcements so as not to unnecessarily stir up residents' anxiety."

Momii reportedly made the controversial remarks during an April 20 meeting of the public broadcaster's disaster policy headquarters following the powerful earthquakes in Kumamoto Prefecture.

Asked about the authenticity of his comment during a House of Representatives Internal Affairs and Communications Committee session on April 26, Momii said what he meant by "official announcements" was "basically about figures," explaining that NHK would report figures measured by radiation monitoring devices set around nuclear plants as well as views presented by the Nuclear Regulation Authority. He added, "It seems a little strange to spread (information that would trigger) concern and anxiety among locals without grounds in terms of avoiding unnecessary confusion."

In response to Momii's comment, former Kyodo News reporter and Doshiha University journalism professor Jun Oguro pointed out that official announcements failed to provide information necessary for evacuation to local residents at the time of the Fukushima nuclear disaster following the 2011 Great East Japan Earthquake.

"It is odd to conceal information just because some believe that it could cause panic. Broadcasters should offer various types of information, making clear the sources of their information," Oguro argued, adding,

"Viewers who are on the receiving end of information will sort out what they need. If broadcasters concealed information they had, their journalistic responsibility would be called into question." He further criticized the NHK president, saying, "His attitude is almost as if he doesn't trust NHK reporters or viewers."

In response to the president's controversial remarks, Masatoshi Nakamura, chairman of NHK's largest union, the Japan Broadcasting Labor Union, released a comment on the organization's website on April 25, saying, "As a public broadcaster, its reporting is based on facts uncovered through interviews and research." He went on to say, "The confirmation of 'facts' does not come upon announcements or acknowledgment by administrative bodies. The 'facts' are unveiled through NHK's independent research efforts."

A middle-ranking NHK employee working on the ground told the Mainichi Shimbun, "We have been told by our seniors that those in power do not reveal things that are inconvenient to them. We should deliver objective facts learned from public entities, scientists, private organizations and other sources that we believe are necessary." The employee added, "It is extremely dangerous to put restrictions on sources at one's own discretion and depend solely on information provided by the authorities. The NHK president should think about the role of news reporting."

A NHK producer appeared appalled at Momii's remarks, saying, "He really doesn't get what a news organization is." At the same time, the producer said, "This (kind of situation) is to be expected as long as the system allows NHK's governors, who are appointed by the prime minister, to pick its president. Unless changes are made to the Broadcast Act (that sets regulations regarding operation of NHK), there will be no fundamental improvement." The producer stressed the importance of constructive criticism from outside NHK since it is difficult for its employees who are the subject of regulation under the Broadcast Act to voice criticism about the organization.

Do not change war-renouncing Constitution

May 3, 2016

52% opposed to amending Japan Constitution's pacifist Article 9: Mainichi poll

<http://mainichi.jp/english/articles/20160503/p2a/00m/0na/003000c>

Some 52 percent of Japanese citizens are opposed to changing the Constitution's war-renouncing Article 9, against 27 percent answering in favor, a recent Mainichi Shimbun poll suggested.

Meanwhile, an about equal number of respondents said they supported or were opposed to amending the Constitution in general, at 42 percent each.

With the enactment of new security laws that allow Japan to exercise the right to collective self-defense, resistance to changing Article 9 remains strongly rooted. In a Mainichi Shimbun poll taken in April last year, 55 percent of respondents said they didn't think that Article 9 should be amended, while 27 percent said they thought it should be.

Among supporters of the current Cabinet, 59 percent were in favor of amending the Constitution, while 27 percent were opposed. Forty-two percent were in support of amending Article 9 while 38 percent were

opposed. Among those not supporting the Cabinet, 26 percent supported amending the Constitution in general and 61 percent opposed. Twelve percent of this group supported amending Article 9, while 71 percent opposed doing so.

Prime Minister Shinzo Abe hopes to build a two-thirds majority of lawmakers in favor of amendments in both houses of the Diet -- the ration required by Article 96 to submit a motion to alter the Constitution. Forty-seven percent of respondents to the Mainichi poll said they did not hope constitutional reformers would get a two-thirds majority in the House of Councillors in the upcoming election, while 34 percent said they did.

The poll was conducted on April 16 and April 17. May 3 is Constitution Day, the 69th anniversary of the enactment of Japan's Constitution.

Ex-fishermen (Bikini atoll) sue Govt.

May 9, 2016

Ex-fishers sailing near Bikini Atoll file suit

http://www3.nhk.or.jp/nhkworld/en/news/20160509_23/

Former Japanese fishermen and their family members have filed a lawsuit against the government of Japan.

The men were on fishing boats near the site of a US hydrogen bomb test more than 60 years ago and say they may have been exposed to radiation.

The United States conducted the test on Bikini Atoll in 1954. 23 crewmembers from Fukuryu Maru No.5 were found to have been exposed to fallout from the test. One of them died 6 months later.

Supporters of the plaintiffs in the lawsuit say about 1,000 Japanese fishing boats were operating in nearby waters at the time.

45 plaintiffs filed the suit on Monday at the Kochi district court.

They are demanding the Japanese government pay about 18,000 dollars in compensation for each former crewmember. They say the government failed to monitor their radiation levels even after it learned about the case of the Fukuryu Maru No.5.

83-year-old Yutaka Kuwano is one of the plaintiffs. He was 21 years old at the time of the test, and was fishing for tuna near the atoll.

He was diagnosed with stomach cancer 12 years ago after developing symptoms such as nose bleeds and

an abnormally high number of white blood cells.

The health ministry released records on the incident two years ago. They show crews on several boats other than Fukuryu Maru No.5 had higher than usual levels of radiation.

Decommissioning suspended to avoid risks during G7 meeting

May 13, 2016

Tepco to put some Fukushima decommissioning work on hold during G-7 summit

<http://www.japantimes.co.jp/news/2016/05/13/national/tepco-put-fukushima-decommissioning-work-hold-g-7-summit/#.VzYtwORdeot>

by Reiji Yoshida

Staff Writer

The majority of decommissioning work at the damaged Fukushima No. 1 nuclear plant will be put on hold while **the Group of Seven summit takes place in Shima, Mie Prefecture, on May 26 to 27**, according to Tokyo Electric Power Co.

Satoshi Togawa, a spokesman for Tepco, told The Japan Times on Friday that the planned suspension was **a precaution to reduce "risks" that could disturb the meeting** of leaders from the seven major advanced nations.

Such risks could include **unexpected leaks of contaminated water from tanks or airborne radioactive material monitoring alarms being triggered**, Togawa said.

Tepco will continue other essential operations, such as injecting water to keep melted nuclear fuel cool and processing contaminated water, Togawa said.

The spokesman said the suspension was not designed to reduce the risk of terrorism.

"We have made the decision without any request from the government," he said.

A 2011 massive earthquake and ensuing tsunami knocked out critical cooling functions for three of six reactors at the plant, triggering a triple meltdown.

The decommissioning effort, which involves some 7,000 workers, is expected to take more than 40 years.

Questions raised about Japanese emergency handling

U.S. expert questions if Japan applying 2011 lessons at Kumamoto

<http://mainichi.jp/english/articles/20160514/p2g/00m/0dm/067000c>

May 14, 2016 (Mainichi Japan)

NEW YORK (Kyodo) -- A former U.S. government expert on emergency management has questioned whether Japan is applying the lessons from the 2011 massive earthquake and tsunami in its northeast to its response to the recent temblors in Kumamoto Prefecture.

- **【Related】** Over 10,000 people still in shelters 1 month after Kumamoto quakes

Leo Bosner, 69, who worked for the U.S. Federal Emergency Management Agency for 29 years, is concerned that an integrated response may not have been in place in Japan for the quakes that jolted the southwestern prefecture a month ago.

"I discovered many problems" when studying "Japan's disastrous response" to the 2011 calamity and "I have not really heard of any major improvements," he told Kyodo News in a recent interview. "So I am a little concerned that these problems may be continuing."

"It is too early to make a definitive evaluation of the response to the Kumamoto disaster, but recent news headlines have indicated possible problem areas," he said, identifying such areas as questions about the use of the U.S. military's Osprey aircraft to language barriers for foreigners.

Bosner said the existence of no unified system for major disaster response in Japan could cause even the best-intended efforts to bog down.

"For example, various towns, prefectures and organizations may send food and other supplies to a disaster area, but if there is a shortage of people at the disaster site to sort out and distribute the supplies, the supplies don't get distributed to those in need in a timely manner," he said.

He also cited Japan's lack of full-time, permanent, professional disaster management staff and of a strong connection between the governmental and nongovernmental response to disasters as other big problems.

"One thing to me that is a major barrier is that in the Japan government offices, people change the job every two years...so there is no time to build up an expertise," he said.

"I really think that if the Japanese government wants to do a strong job in disasters, they need to somehow establish a permanent staff who will stay involved over the years," he said.

"In Japan, because everything is so spread out in the government and not working together, in my view, it is very inefficient," he said. "I think if Japan could centralize this function more, it would be cheaper."

Bosner also proposed transferring officials in or between the central and regional governments while always working as disaster management specialists.

"My thought was, 'What if some worked in the Japan national government in Tokyo for two years as a disaster planner?' But then let's say when he rotated he would go to some other industry but would still be a disaster planner in that industry and then maybe if he rotated to a prefecture to a city, he would be a disaster planner in that prefecture or that city."

"If they did this, in about five or 10 years, Japan would have a real network of experienced disaster planners who understood the system and could work together. But right now they don't have this."

He said the United States integrated all the functions to respond to disasters into FEMA and turned a weak agency into one that properly works.

The administration of President Bill Clinton turned FEMA around, but that of George W. Bush downsized it, which backfired later when Hurricane Katrina hit the southern part of the United States in 2005.

"Under the Bush administration, very honestly, he just appointed political friends to be in charge of FEMA who did not know anything about disasters."

"So when Katrina came, they could not give the orders, they could not make the decisions, they did not know what to do. It was terrible. For those of us who worked at FEMA, it was so disappointing because we were helpless."

Bosner said that if there is "a political will" rather than increased budgets, Japan will be able to have a better system to respond to disasters just as the United States did.

"In Japan, there are plenty of people, in my view, who would be excellent for running a Japan FEMA or managing it...if the ministers of the Cabinet of the prime minister agree and say, 'We must do this'," he said. "But until they make that decision, nothing can happen."

Bosner served as an emergency management expert at FEMA from 1979 to 2008. He stayed in Japan from 2000 to 2001 studying that country's emergency management system. His current job includes being an adjunct lecturer in the Emergency Medical Systems Graduate School of Tokyo's Kokushikan University.

More questions about Japanese disaster preparedness

May 8, 2016

Media show Kumamoto was woefully ill-prepared for disabled evacuees

<http://www.japantimes.co.jp/community/2016/05/08/voices/media-show-kumamoto-woefully-ill-prepared-disabled-evacuees/#.VzgtNuRdeot>

by Michael Gillan Peckitt

As someone who scours the media in Japan for mentions of issues surrounding disability, I have been impressed by the reporting of the Kumamoto earthquakes. In the Japanese media, the issue of disability often gets overlooked, so it was heartening to see that a number of newspapers had focused on the difficulties disabled people face when disaster strikes.

However, far less heartening was the story that subsequently unfolded about Kumamoto Prefecture's pre-quake planning — or lack thereof — and post-quake measures for disabled evacuees. The Mainichi Shimbun, reporting the day after the biggest quake on the night on April 16, highlighted the situation of two people with disabilities who had to evacuate their homes and take refuge in a shelter: Kiyofumi Sakamoto, aged 66, paralyzed down the left side of his body since a brain hemorrhage, and Tomiko Baba, aged 84, who has Parkinson's.

Sakamoto, a resident of Mashiki, had to evacuate to a local elementary school. Since his adapted nursing-care bed could not be moved inside the emergency shelter, he had been sleeping on cardboard. His wife, 63-year-old Kikuko, had been changing his diapers and helping him bathe, a task made all the more difficult by the loss of electricity.

Baba had difficulty using the toilet at the shelter, since she uses a wheelchair. Baba's daughter said of her mother, "She's unstable emotionally, and seems to be unable to relax and get to sleep." The pair had to spend at least one night in a car, risking economy-class syndrome.

Sakamoto's and Baba's ordeals, it is easy to imagine, must be similar to those suffered by many of the elderly and disabled affected by the earthquake, and I applaud the Mainichi for raising awareness of this. However, even in those early stages, there were signs that things could have been planned better.

"The Kumamoto municipal government opened 10 shelters on April 16 that would be easier for individuals with disabilities to navigate, but as of April 17, only 13 people were utilizing them," the Mainichi reported. "The reason appears to be a lack of knowledge about their existence, so municipal officials are going around regular emergency shelters to inform disabled evacuees."

In an article published by The Japan Times on April 20, Tatsue Yamazaki, an associate professor of disaster nursing at Tokyo Medical University, expressed her concern about the lack of awareness on the ground in Kumamoto about the specific needs of certain groups of evacuees.

“Governments should create shelters for people with special needs, including the sick, the disabled and pregnant women,” Yamasaki said, referring to so-called welfare evacuation centers — centers that local governments are required by law to designate for use by the more vulnerable members of society in the event of a disaster.

“The need for such shelters was intensively discussed after the Great East Japan Earthquake of 2011, but local government officials I talked with in Kumamoto had no idea that such shelters were needed,” she said.

Almost a week later, on April 26, The Japan News reported: “In Kumamoto, where the number of evacuees is highest, only 37, or 20 percent, of the 176 facilities designated as welfare evacuation centers by the city government have actually admitted these types of evacuees.”

So what happened? It appears that these specially designated centers were unable to adequately serve the people they were supposed to partly, of course, due to damage caused by the quakes, but more worryingly, also because they were, prior to the quakes, already working at full capacity or lacked the staff required to offer a basic level of care.

Asked why none of its five welfare evacuation centers had taken in any elderly or disabled evacuees, a Mashiki town government worker said: “Every evacuation center is filled with general evacuees. We can’t even dispatch caretakers, and no facility is serving as a welfare evacuation center.”

As a disabled person living in Japan (who, coincidentally, is also married to a woman with a disability), I find the situation facing people with disabilities in the Kumamoto quake zone disturbing. I understand that before earthquakes occur, there is only so much you can do to prepare for them, and that it will always be a difficult task to attend to the needs of disabled people in a disaster zone. However, the scale of the apparent lack of resources to accommodate disabled people after the quakes is shocking.

Being a resident with a particular severity of disability here, I am in possession of a “physical disability certificate” — a certificate obtained by registering my disability status at my local ward welfare office. By registering, I have the right to receive certain benefits, and the first time I applied for this, I had to submit a report from a physician that confirmed my status as a disabled person — a perfectly reasonable request. I had assumed that such a rigorous process meant that the local city ward would at least have some knowledge of my needs as a disabled person, as the local welfare office has my address and information about my disability. Is it not then reasonable to expect that in the event of a major disaster, local government would at least know of the whereabouts and the specific needs of disabled people to whom local disaster relief services may have to attend — and would have prepared accordingly?

Has Japan learnt any lessons from 3/11?

May 17, 2016

U.S. disaster expert sees 3/11 weaknesses laid bare in Kyushu

<http://www.japantimes.co.jp/news/2016/05/17/national/u-s-disaster-expert-sees-311-weaknesses-laid-bare-kyushu/#.Vztck-Rdeov>

Kyodo

A former U.S. government expert on emergency management has questioned whether Japan is applying lessons learned the hard way after the 2011 tsunami to its response to the Kyushu quakes.

Leo Bosner, 69, who worked for the U.S. Federal Emergency Management Agency for 29 years, says an integrated response may not have been in place for the disaster last month.

He said he identified multiple problems when studying Japan's "disastrous" response to the 2011 disaster and believes there have been no major improvements. "I am a little concerned that these problems may be continuing," he said.

"It is too early to make a definitive evaluation of the response to the Kumamoto disaster, but recent news headlines have indicated possible problem areas," he said, adding that these range from resorting to the U.S. military for airlift of supplies to the language barrier for foreigners.

Bosner said the lack of a unified system for disaster response in Japan could cause even the best-intended efforts to become bogged down.

"For example, various towns, prefectures and organizations may send food and other supplies to a disaster area, but if there is a shortage of people at the disaster site to sort out and distribute the supplies, the supplies don't get distributed to those in need in a timely manner," he said.

Other problems, he said, include Japan's lack of full-time, permanent, professional disaster management staff and of a strong connection between the governmental and nongovernmental response to disasters.

"One thing to me that is a major barrier is that in the Japan government offices, people change the job every two years . . . so there is no time to build up an expertise," Bosner said.

"I really think that if the Japanese government wants to do a strong job in disasters, they need to somehow establish a permanent staff who will stay involved over the years," he said.

"In Japan, because everything is so spread out in the government and not working together, in my view, it is very inefficient," he said. "I think if Japan could centralize this function more, it would be cheaper."

Bosner also proposed transferring officials in or between the central and regional governments while always working as disaster management specialists.

"My thought was, 'What if some worked in the Japan national government in Tokyo for two years as a disaster planner?' But then let's say when he rotated he would go to some other industry but would still be a disaster planner in that industry and then maybe if he rotated to a prefecture, to a city, he would be a disaster planner in that prefecture or that city.

"If they did this, in about five or 10 years, Japan would have a real network of experienced disaster planners who understood the system and could work together. But right now they don't have this."

Bosner said the United States integrated all the functions to respond to disasters into FEMA and turned a weak agency into one that works properly.

The administration of President Bill Clinton turned FEMA around, but that of George W. Bush downsized it, which backfired when Hurricane Katrina hit in 2005.

Bush "just appointed political friends to be in charge of FEMA who did not know anything about disasters," he said.

“So when Katrina came, they could not give the orders, they could not make the decisions, they did not know what to do. It was terrible. For those of us who worked at FEMA, it was so disappointing because we were helpless.”

Bosner said that if there is “a political will” rather than increased budgets, Japan will be able to have a better system to respond to disasters just as the United States did.

“In Japan, there are plenty of people, in my view, who would be excellent for running a Japan FEMA or managing it . . . if the ministers of the Cabinet of the prime minister agree and say, ‘We must do this,’ ” he said. “But until they make that decision, nothing can happen.”

Bosner served as an emergency management expert at FEMA from 1979 to 2008. He stayed in Japan from 2000 to 2001 studying its emergency management system. His current job includes being an adjunct lecturer in the Emergency Medical Systems Graduate School of Tokyo’s Kokushikan University.

Koizumi in California in support of US sailors

May 19, 2016

Former Prime Minister Koizumi backs U.S. sailors suing over Fukushima radiation

<http://www.japantimes.co.jp/news/2016/05/18/national/former-prime-minister-koizumi-backs-u-s-sailors-suing-over-fukushima-radiation/#.Vz10GuRdeot>

Former Prime Minister Junichiro Koizumi speaks at a news conference Tuesday in Carlsbad, California. | KYODO

Kyodo

CARLSBAD, CALIFORNIA – Former Prime Minister Junichiro Koizumi said Tuesday he stands behind a group of former U.S. sailors suing the operator of the Fukushima No. 1 nuclear plant, who claim health problems they now suffer were caused by exposure to radiation after three reactors melted down in the days after a devastating earthquake and tsunami in March 2011.

– Former Prime Minister Junichiro Koizumi said Tuesday he stands behind a group of former U.S. sailors suing the operator of the Fukushima No. 1 nuclear plant, who claim health problems they now suffer were caused by exposure to radiation after three reactors melted down in the days after a devastating earthquake and tsunami in March 2011.

Koizumi made the remarks at a news conference in Carlsbad, California, with some of the plaintiffs in a lawsuit brought in the United States in 2012 against plant operator Tokyo Electric Power Co., which has renamed itself Tokyo Electric Power Company Holdings Inc.

The plaintiffs include crew members of the U.S. aircraft carrier Ronald Reagan, which provided humanitarian relief along the tsunami-battered coastline in a mission dubbed Operation Tomodachi. “Those who gave their all to assist Japan are now suffering from serious illness. I can’t overlook them,” Koizumi said.

The former prime minister spent Sunday through Tuesday meeting with roughly 10 of the plaintiffs, asking about the nature of the disaster relief they undertook and about their symptoms.

“I learned that **the number of sick people is still increasing, and their symptoms are worsening,**” he told the news conference.

Koizumi called on those in Japan, both for and against nuclear power, to come together to think of ways to help the ailing U.S. servicemen.

The group of about 400 former U.S. Navy sailors and Marines alleges the utility, known until recently as Tepco, did not provide accurate information about the dangers of radioactive material being emitted from the disaster-struck plant.

This led the U.S. military to judge the area as being safe to operate in, resulting in the radiation exposure, the group claims.

One of the plaintiffs at the news conference, Daniel Hair, said Koizumi’s involvement made him feel for the first time that Japan is paying serious attention to their plight.

According to lawyers for the group, seven of its members have died so far, including some from leukemia.

Koizumi, who served as prime minister between 2001 and 2006, came out in opposition to nuclear power in the wake of the 2011 disaster. He has repeatedly urged the administration of Prime Minister Shinzo Abe to halt its efforts to restart dormant reactors across Japan.

Bid-rigging...again

May 17, 2016

Oi Electric face fines over bid-rigging for Tepco equipment

<http://www.japantimes.co.jp/news/2016/05/17/business/fujitsu-oi-electric-face-fines-bid-rigging-tepco-equipment/#.VztcPORdeot>

JJI

The Fair Trade Commission plans to order Fujitsu Ltd. and Oi Electric Co. to pay a total of ¥400 million in fines for repeated bid-rigging in selling communications equipment to Tokyo Electric Power Co., according to informed sources.

The FTC also plans to issue a cease-and-desist order to the two electronics makers to prevent future misconduct, the sources said Tuesday.

In May last year, the FTC raided Fujitsu, Oi Electric, NEC Corp. and two other companies over the alleged bid-rigging.

Of the five companies, NEC is expected to escape the fines because it voluntarily reported its violation. The sources said the companies have been engaged for years in bid-rigging for Tepco contracts.

In February, Fujitsu, Oi Electric and NEC were raided by the FTC over similar suspicious contracts with Chubu Electric Power Co.

Introduction

Koide Hiroaki (66) has emerged as an influential voice and a central figure in the anti-nuclear movement since the nuclear meltdown at Fukushima Daiichi of March 11, 2011. He spent his entire career as a nuclear engineer working towards the abolition of nuclear power plants. His powerful critique of the "nuclear village" and active involvement in anti-nuclear movements "earned him an honorable form of purgatory as a permanent assistant professor at Kyoto University."¹ Koide retired from Kyoto University in the spring of 2015, but continues to write and act as an important voice of conscience for many who share his vision of the future free from nuclear energy and weapons. He has authored 20 books on the subject. Professor Kasai Hirotaka and I visited his office at Kyoto University's Research Reactor Institute in Kumatori, Osaka, on December 26th, 2014 for this interview. We believe that the contents of the interview, which offer new information about the degree of radioactive contamination and invaluable insight into Koide's ethical and political stance as a scientist, remain crucial for our critical reflection on ecological destruction, the violation of human rights, and individual responsibility. Professor Robert Stolz, the translator of this interview and the author of *Bad Water* (Duke University Press, 2015), provides a historical perspective on the interview in a separate article. KH

Interview

The Fukushima Disaster and Government and Corporate Response

Hirano: How does the Fukushima accident compare with the bombing of Hiroshima or Chernobyl in its scale? What are the possible effects of this yet unknown exposure?

Koide: Let's start with the scale of the accident: It was a core meltdown involving the release of various kinds of radioactive material. Radioactive noble gas isotopes were also released, as were iodine, cesium, strontium, and other radioactive material. The noble gas isotopes have a short half-life and so at this stage they are all gone. Iodine, too, is gone. So now four years since the accident the materials that are still a problem are cesium-137, strontium-90, and tritium; really, it's these three.²

Now, as for the scale of the accident, I think it would be best to compare these three radionuclides. Today the main contamination of Japanese soil is the radionuclide cesium-137 [Cs-137 or ¹³⁷Cs]. The ocean is largely contaminated

with strontium-90 [Sr-90 or ^{90}Sr] and tritium [T or ^3H]. Right now the main culprit adding to the exposure of the people in Japan is Cs-137, so I think it's best to use Cs-137 as a standard for measuring the scale of the accident. But we simply don't know with any precision how much Cs-137 was released. That's because **all the measuring equipment was destroyed at the time of the accident**. How much Cs-137 was released into the air? How much was spilled in the sea? We just don't know.

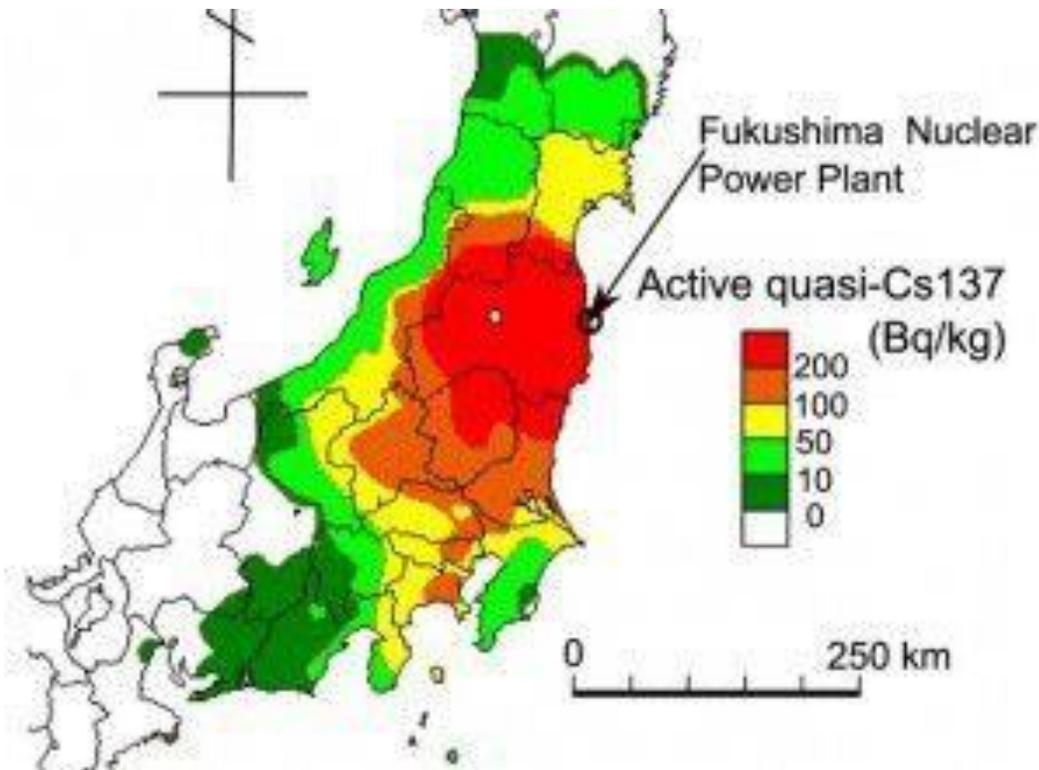

Still, the Japanese government has reported estimates to the IAEA [International Atomic Energy Agency]. According to those estimated levels, reactors 1, 2, and 3 had been in operation on March 11, 2011, and all three suffered meltdowns. Those three reactors released 1.5×10^{16} Becquerels of Cs-137, which would make it a release of 168 times more radioactive material than the Hiroshima bombing. And this is only material released into the atmosphere—at least according to Japanese government estimates.

But I myself think the government's numbers are an underestimate. Various experts and institutes from around the world have offered several of their own estimates. There are those that are lower than the Japanese government's numbers and those that are higher, some two or three times higher than the government's numbers. According to these other estimates I think that the release of Cs-137 into the atmosphere could be around 500 times the Hiroshima bombing.

Now for what has been washed into the sea. That number is likely not much different from the levels released into the atmosphere. Even today we are unable to prevent this release. And so if we combine the amount of Cs-137 released in the air and the ocean together, we get an estimate several hundred times the Hiroshima levels. And some estimates suggest the Fukushima accident could be as much as one-thousand Hiroshimas.

Now to compare this with other accidents: The amount released into the atmosphere from the explosion during the accident at the Chernobyl nuclear plant was 800 to 1000 times the Hiroshima levels. Put simply, these estimates place Fukushima on par with Chernobyl.

Worse than any of these, however, is atmospheric testing. From the 1950s to the 1960s atmospheric testing of nuclear weapons had already released Cs-137 into the air more than sixty times the numbers released even by the Japanese government for Fukushima. Of course Fukushima is an incredible tragedy, but considered from the earth as a whole it is a rather small accident.

Hirano: I want to ask in more detail about the effect of Cs-137 on the human body and the environment.

Koide: Cesium is an alkaline metal. From the human body's perspective, cesium closely resembles potassium. The body contains enormous amounts of potassium. It is essential for humans. It's everywhere in our bodies. Especially our flesh and muscles are full of potassium. And because of this, when cesium is released into the environment, the body deals with cesium as it does with the alkaline metal potassium, which is to say that it is taken into the body and accumulates there.

Strontium is an earth metal. The body treats it like calcium. As you know calcium is a human body building block that accumulates in our bones. Strontium, too, is taken into and collects in the bones. Just as cesium is taken in and is transported to the flesh and muscle.

Hirano: Comparing the releases from nuclear tests by the US and the USSR during the Cold War period, you said that the Fukushima accident was small. So in what way should we think about Fukushima: is it best to consider it a Japanese problem, or to consider it from a global perspective?

Koide: The amount of products of nuclear fission released during atmospheric testing was enormous, and these particles continue to expose humans to radiation. I'm a bit older than you and I recall in my childhood being told not to let the rain fall on me at the time of the testing. In this way everyone on earth has been exposed (*hibaku*/ 被曝). And because of this testing, historically speaking, cancer rates have slowly risen; I believe this increase in cancer is due to the exposure suffered during the atmospheric testing. Now the radioactive material released from Fukushima has been dispersed across the globe and so once again everyone on earth has been exposed to additional radiation. I think we can expect cancer rates to rise once again.

Atmospheric nuclear testing released all of the radioactive material in the explosions, which entered the stratosphere. Between the stratosphere and the troposphere there is the tropopause, and every year come spring all that material dispersed in the stratosphere breaks through the tropopause and falls to earth. So that material, though initially dispersed in the stratosphere, eventually falls to earth evenly, everywhere. Actually, it might not be accurate to say that it falls evenly on the earth. The majority of the testing was done in the temperate regions of the northern hemisphere, such as Nevada and the Semipalatinsk test site [in Kazakhstan], so that the northern hemisphere—as the site of most of the testing—is heavily contaminated, and within that the temperate region is heavily contaminated. Still, I can say the atmospheric testing overall has caused global contamination.

My focus now is to figure out how to deal with the acute and heavy contamination from Fukushima. I know something needs to be done right there in that specific place. That contamination will disperse and be diffused across the globe. Once dispersed, the amount of radioactive material from Fukushima will be small when compared with the atmospheric testing. Which is not to say it is not harmful. An increase in cancer will be the result. I mention that for humanity as a whole; the atmospheric tests were worse.

Now, strontium-90 [Sr-90] has been leaking from Fukushima into the ocean, so it will eventually reach the United States, especially the west coast. This much we are sure of. But to answer your question, the amount of dispersed cesium and strontium released by the atmospheric tests is tens of times greater than the Fukushima levels. Because the west coast of the US is already contaminated from the atmospheric testing, though the dispersed contamination from Fukushima will reach US shores, for people living on the US west coast, the Fukushima accident—and this is perhaps awful to say—contamination from Fukushima is hardly worth considering. Historically a much greater event has already taken place.

Hirano: To put that another way, the current Fukushima accident gives us a chance to reconsider the enormity of the past contamination from US and Soviet atmospheric tests, which has not been openly discussed.

Koide: Yes, that's exactly right. In fact, it is the masses of people who need to realize the impact of the contamination on them. In the case of the Fukushima disaster, for example, they need to be aware that some radioactive material is reaching the North American coast, and the prevailing westerly winds will carry anything released into the atmosphere to the US. Those earlier numbers from the Japanese government indicate that the levels for Cs-137 in the atmosphere are 168 times those of the Hiroshima bombing. I've been told that level is 1.5×10^{16} Becquerels [Bq]. These exponents can be a pain to process, so if we think of it in peta-units—which is 10^{15} —we get essentially 15 petabecquerels [PBq].

That said, while we are not really sure this is the number, we do know that a portion of this material will ride the prevailing winds across the Pacific Ocean. On the other hand, closer to the ground, the winds will be east, south, and

north, and therefore this other portion will fall on Japan—and we can investigate the actual levels here: how much fell on this town, on this prefecture? Adding these up, it seems to be only 2.4 PBq. Which is to say of the total fifteen PBq, 2.4, or roughly only 16%, fell on Japanese soil. If the totals are higher, still a smaller share of the total contamination will have fallen on Japan compared with the Pacific, with the largest portion falling on the west coast of the United States.

So why don't we hear complaints from the US? Why are there no calls for compensation? Whenever someone asks me this, I simply say that there just aren't any such complaints. Why is this so? Well the levels released by the US during the atmospheric testing were tens of times greater than Fukushima. They are the criminals, so they cannot ask for compensation from Japan. The U.S. government does not want to have to reflect on its own past, and I think they are eager to completely avoid bringing up anything like that conversation. That is why I believe it is so important that those who have been exposed to radioactive contamination realize what atmospheric testing has done to them.

Kasai: I'd like to get back to the moment of the accident in some detail. On March 11, 2011 we had the East Japan Disaster (meaning the earthquake and tsunami off Tohoku). You've already talked about the string of accidents at the nuclear plant. At the moment the accident was taking place, you were following the response by the Japanese government and the Tokyo Electric Power Company (TEPCO) in real time. What did you see in those initial moments?

Koide: It was truly a disastrous response. On the 11th I was in the laboratory in Kyoto as March was my month to work in the radiation-controlled area.³ It was normal workday hours and various tasks kept me busy working within the controlled area. Of course there is no TV or anything like that in the work space. That night there was a meeting so I came out to attend and that's when I saw the images of the Sendai airport being swept away by the tsunami. The report said that there had been a devastating earthquake and tsunami. Then I wondered about the safety of the nuclear plants.

Right then, there really was no more information. We had scheduled a nuclear safety issues seminar for the 18th. I've participated in hundreds of these seminars. Participants from the Ukraine had just arrived on the 11th. We promised to go out drinking after they arrived and so that night I went out. There was no more TV, and while there was a vague unease among us, that's how we spent the time.

The next day I learned that all power at Fukushima had been lost and I knew things were not going to be simple. Then at noon on the 12th the roof of reactor one was blown off; at that point any expert must have known there had

been a reactor meltdown. So I was certain of a core meltdown and because once it has gone this far, there is no going back, it was time to call for anyone who could evacuate to do so. I thought we were at that stage on the 12th. Yet neither the government nor TEPCO said a single word about a core meltdown; they announced that the incident merited a 3 or 4 on the International Nuclear Event Scale. I remember thinking "You've got to be kidding! There's already been a meltdown. This is at least a level 6 or 7." But neither the government nor TEPCO gave any indication of this and there was no word of it in the media either.

One by one there were explosions at reactors 3, 4, and 2. As an expert in nuclear power, I understood there was absolutely nothing that could be done. I thought people needed to be evacuating, but still the Japanese government didn't make the call. Government officials had set up at an off-site center near a power plant in Fukushima—at first they announced evacuation inside two kilometers, then that expanded to three, five, ten, and finally twenty km. After that nothing was done. The offsite center was supposed to coordinate the emergency response in the event of an accident, but it turned out that every one of the officials fled. They left the employees behind and fled. The Japanese government's response was indescribably cruel.

Kasai: It seems the very words "meltdown" (メルtdown) and "core meltdown" (*roshin yōyū*/炉心熔融) were strictly forbidden.

Koide: Exactly.

Kasai: I was in Japan watching on TV. What shocked me was all the nuclear power experts explaining the incident in the studio. I suppose it was a satellite relay, but when reactor number three exploded on our screens they were giving their analyses of the explosion in real time. There were experts on TV saying that the reactor had a blast valve that was used successfully. Even hearing that, an average viewer might think something was amiss. But having physicists, experts on radiation, on TV saying these things, well, even the average viewer wouldn't buy that explanation. In a broad sense, nuclear experts like yourself played several roles in the media and government.

Koide: Yes, that's clearly true for pronuclear experts. They all tended to tell a story that underestimated the accident. Immediately after the accident public announcements and information were restricted. As a result individual opinions or statements were strictly forbidden and nearly all experts remained silent, so even basic information was not broadcast. Though I'd made statements from the nuclear lab beginning on the 12th, it is likely there were instructions from the Ministry of Science and Education to silence me. The head of the lab convened several meetings where he told each of us not to make any statement, that the lab would toe the official line when dealing with the mass media. I thought this was wrong and said that anyone who was asked a question by the media should answer it, further saying that if I were asked a question, I had a responsibility to answer. Since then I've continued to make statements in the media. Still the large majority of nuclear researchers were not able to do this.

As a result it was the pronuclear researchers who monopolized the interpretations - exactly. So as they went to the TV studios I think each was told: "Today, it's your turn to go to the studio." I think that's how they played their part and handled the media.

Kasai: With respect to controlling information, would you say your experience with the head of the nuclear lab shows how the professional organizations exert pressure on the universities?

Koide: Yes, I would. The head of the lab opened a conference with all the other laboratories—even I went. There he said that any statements to the media should be on message and come only from the information office.

Kasai: So pressure came from academic conferences.

Koide: Yes, there was pressure coming from the academic conference side as well. Take for example something like a conference on nuclear power. From the very start it was never a real discussion; it was a meeting of powerful and vocal spokesmen for the nuclear community or village (*genshiryoku kyōdōtai*/原子力共同体 or *genshiryoku mura*/原子力村), which is to say the group of pronuclear government officials and private companies mainly centered around the LDP and Toshiba, Hitachi, Mitsubishi, and other pronuclear manufacturers of power plants—and of course their supporters in the media. Thus as an organization the conference was predisposed to underestimate the accident and to then promote that underestimation.

Hirano: Immediately after the accident you testified in the Diet presenting data indicating the seriousness of the disaster and demanding that the government terminate the operation of all the power plants.⁴

Koide: I did.

Hirano: After that it seems you weren't again asked to speak publicly, or given the opportunity to offer more detailed thoughts on the situation.

Koide: By "speak publicly" you mean in the Diet or in some other official government setting?

Hirano: Yes, and also in the media.

Koide: With respect to the media, I've never really had any confidence in them. Since the accident, I've been overwhelmingly busy and haven't accepted a single invitation from TV stations.

Hirano: I see. So there were invitations.

Koide: There have been many calls saying, "come down to the studio." But I always tell them that I am too busy for this sort of thing. I'd say, if you come to my office, we could meet. Many did come by, even back then. But as everyone knows, in television you might talk for an hour and none of it makes it on air, or if it does, it's maybe thirty seconds.

Hirano: Right, and only the convenient parts.

Koide: That's it and there's really nothing that can be done about it. There was, however, one outlet for which I was extremely grateful: the daily radio program called Tanemaki Journal (種まきジャーナル).⁵ There I could go on every day and offer my thoughts live. I wish it could have continued, but it was completely and totally smashed. What a world we live.

Kasai: So, on the subject of standards used for assessing the danger posed by radiation for the human body and the environment: What are your thoughts on how the government deals with this issue?

Koide: They are absolutely not dealing with it at all. I think you already know this but in Japan the average person is not supposed to be exposed to more than one milliSievert per year—that's set by law. Why is that the level decided on? Because exposure to radiation is dangerous. If exposure weren't dangerous, if low levels of exposure were safe, there'd be no problem even without that legal limit. But exposure to radiation is dangerous—this is the conclusion of all research. So every nation in the world has set legal limits for exposure.

For people like me who get paid to work with radiation, it's not really possible to observe the 1mSv/yr limit [1mSv/yr]. We're told that in exchange for our salaries, we accept exposure to twenty milliSieverts a year. That's the standard I work under in my job. But the current Japanese government has now stated that if contamination is under 20mSv/yr somewhere, that place is safe to return to—safe to return to even for children. This is way beyond common sense.

Hirano: What is the basis of this claim? Why would the government announce these numbers and forcefully declare these areas safe to return to? What's the basis for the government's numbers?

Koide: The basis for those numbers...for example the government says that organizations like the IAEA or the ICRP [International Commission on Radiological Protection] suggest that in emergencies during which the 1mSv/yr standard cannot be maintained standards should be set between twenty and 100mSv/yr. The government seizes on this and declares that since the IAEA and the ICRP have said this, that 20mSv/yr is therefore a safe level—usually adding that membership in both the IAEA and the ICRP is voluntary anyway. But because these organizations have said this is no reason to break Japanese law. If Japan is a nation governed by the rule of law at all, surely this means that the very people who make the laws should also follow them—that should be obvious. But these guys have declared 20mSv/yr safe even for children. There is absolutely no way I can consent to this.

Hirano: So there is no scientific basis for these levels.

Koide: Well... the danger corresponds to the amount of exposure—you probably know this—so for a country that has declared its intention to maintain the 1mSv/yr standard to then turn around and ask people to endure twenty times that level, there is no scientific basis for that declaration. That's a social decision.

But if you want to inquire as to why, as I've mentioned to you, some 2.4 petaBecquerels of radioactive material have fallen on Japan, that material has been dispersed, contaminating Tohoku, Kanto, and western Japan. So in addition to the law setting the legal limit for exposure at 1mSv/yr, there is another law that states that absolutely nothing may be removed from a radioactive management area in which the levels exceed 40,000 Becquerels per square meter. So the question becomes how many places or how much area has been contaminated beyond 40,000 Bq/m²? And according to the investigations, that answer is 140,000 km². The entirety of Fukushima prefecture has been contaminated to where all of it must be declared a radioactivity management area. Indeed, while centered on

Fukushima, parts of Chiba and Tokyo have also been contaminated. The number of people living in what must be called a radiation-controlled area is in the millions, and could exceed ten million.

For me, if Japan is in fact a nation governed by the rule of law, I believe the government has the responsibility to evacuate these entire communities. Instead of taking a proper action to secure people's livelihood, the government decided to leave them exposed to the real danger of radiation. In my view, Fukushima should be declared uninhabitable and the government and TEPCO should bear a legal responsibility for the people displaced and dispossessed by the nuclear disaster. That's what I think, but if that were to be done, it would likely bankrupt the country. I think that even though it could bankrupt Japan, the government should have carried out the evacuation to set an example of what the government is supposed to do. But obviously those in and around the LDP certainly didn't agree. They've decided to sacrifice people and get by taking on as little burden as possible. So they've made the social decision to force people to endure their exposure. In my view, this is a serious crime committed by Japan's ruling elite.

I would like people to know just how many thousands of people live in this abnormal situation where even nuclear scientists like me are not allowed to enter, not to mention, drink the water. It is strange that this issue has been left out of all debate over the effects of the radioactive exposure. We must be aware that contemporary Japan continues to operate outside the law in abandoning these people to their fate by saying it's an extraordinary situation. Under such circumstances, I think, there are a multitude of symptoms of illnesses in contaminated areas. But if we're talking about any given symptom, it's hard to say since we just don't have any good epidemiological studies, or even any good data. But there will surely be symptoms, namely cancer and leukemia.

However little exposure to radiation is, it causes cancer and leukemia—this is the conclusion of all current science. These symptoms are said to become visible 5 years after the initial exposure. But because radiation is not the sole cause of cancer or leukemia establishing a direct causal relationship is extremely difficult. For this very reason we need to continue to investigate the state of exposure by conducting rigorous epidemiological studies. But this government wishes instead to hide the damage so I'm afraid no such study is on the horizon. In addition, I have heard about many cases of nose bleeding, severe headaches, and extreme exhaustion. And I am truly concerned about small children and young people living in Fukushima as they are most vulnerable to exposure.

Hirano: So what is your view of the actual damages of radiation exposure on human health?

Koide: On the evening of the Fukushima dai-ichi reactor accident of March 11, 2011, a Radiation Emergency Declaration was announced. The Declaration suspended existing Japanese law concerning exposure to radiation. Though Japanese law sets the limit for exposure for the general population at one milliSievert a year [1mSv/yr], the new permissible level would be 20 mSv/yr. That Emergency Declaration is still in effect. It is common knowledge that even low levels of exposure are dangerous. Including even infants in this newly imposed 20mSv/yr standard will obviously lead to various diseases. Further, because the monitoring equipment was destroyed at the time of the accident we do not have accurate data on the exposure levels of the residents. Numerous cases of thyroid cancer have been found. The prevalence of thyroid cancer is dozens of times that of normal incidence. Pro-nuclear groups say those numbers are the result of the screening process itself, not the effect of radiation exposure. Which is to say that this was the first major screening of that population and so it was natural that many cases of thyroid cancer would be found. Put differently, what they are saying is that they have never conducted a thorough study of radiation exposure and its impact on human health. Science should acknowledge what it already knows and what it does not. If it is true that there is no established scientific data, a properly scientific approach would be to carry out a thorough investigation. To deny the damage to health by exposure to radiation without such an investigation is absolutely at odds with the scientific spirit. Prof. Tsuda at Okayama University has already conducted a detailed study on the outbreak of thyroid cancer, showing an epidemiological-like outbreak. Just as happened at Chernobyl, as time passes it is clear there will be more and more instances of all kinds of illnesses.

Hirano: In your books you've often stated that there is no uncontaminated food. But for most Japanese, such basic knowledge seems limited to food from Fukushima, and nearby parts of Ibaraki, Gumma, Chiba, Miyagi. For food produced outside these areas, do you think it's necessary to have strict testing of food that is sold and consumed? What is to be done? Do you think food from outside these areas should also be subject to strict testing before being sent to market and consumed?

Koide: Right, as we discussed earlier, before the Fukushima accident the entire globe was already contaminated with radiation. This means that Tohoku or Kanto or Kansai food, all of it, has been contaminated with radiation—radiation from atmospheric tests. Beyond this, contamination from the 1986 Chernobyl accident reached Japan on the prevailing westerly winds, meaning that all Japanese food was contaminated. And on top of all this, with the Fukushima disaster, as I mentioned, it is not that a thick layer of contamination has dispersed to every corner of the globe from Fukushima, but that this thick layer of contamination is right now centered on Fukushima.

So if we were to carefully measure the levels of food contamination, we'd more or less find moving out from the highest levels in Fukushima to say western Japan or Kyushu, that the numbers would gradually decline to the lower levels received from the atmospheric tests. Right now the people of Fukushima have been abandoned in the areas of the highest levels of radiation. And abandoned people have to find a way to live. Farmers produce agricultural goods, dairy farmers produce dairy products, and ranchers produce meat; these people must do so in order to live. They are not the ones to be blamed at all.

As the Japanese state is absolutely unreliable in this matter, these people have no choice but to go on producing food in that place, all the while suffering further exposure. So I don't think we can throw out the food they produce there under those conditions. Inevitably someone has to consume that food—I suggest it be fed to the pronuclear lobby (laughs). We should serve all of the most heavily contaminated food at say the employee cafeteria at TEPCO or in the cafeteria for Diet members in the Diet building. But that isn't nearly enough. We must carefully inspect the food, and once we've determined what foods have what levels of contamination, once that is fully measured and delineated, then those who have the corresponding levels of responsibility should eat it, should be given it.

Now of course strict levels of responsibility cannot really be allotted one by one to individuals that way, so when it comes to this food, I would propose devising a "60 and over" system. The most contaminated foods could only be eaten by those 60 years old and older, and from there also have food for "50 and over," "40 and over," "30 and over" - giving the best food to children. For example, school lunches would get the most uncontaminated food available—there'd still be contamination from the atmospheric tests—but food with only those levels would be given to children and only adults would receive the contaminated food. That would be my proposal.

My proposal would first be a precise measurement, starting from Fukushima and then of course including western Japan and Kyushu, to sort out the levels and then determine the relative burdens. I am aware that this is a controversial proposal, but each one of us, especially those who built postwar Japan, bears responsibility for allowing our society to be heavily dependent on nuclear energy without carefully reflecting on the risks and consequences of it. And more importantly, we have the responsibility for protecting children.

Kasai: Recently, that idea has been suggested in Nishio Masamichi's *Radioactive Archipelago* (*Hibaku retto*/ 『被ばく列島』). You've just stressed that though the first step must be a rigorous measurement, right now that is simply impossible.

Koide: Right, completely impossible.

Kasai: So, that's true of water as well. First I don't think most people know how to measure the levels in water. You've already said how the current minimum standards are worthless, that below a certain threshold it would be displayed as "ND" (Not Detectable). For example, for tap water, up to 20 Becquerels would be posted as "ND," exactly as if there was no radiation detected at all. Yet even with all these doubts on measurement, we must start with it, though it's a dizzyingly long road ahead. But what do you think can be done to change this situation for the better?

Koide: Right now Japan has a standard of 100Bq/kg for general foodstuffs. Before the Fukushima disaster, Japanese foodstuffs were contaminated—by the atmospheric tests—at a level of 0.1Bq/kg. Of course there were some foods with less contamination and some with more. Still, roughly speaking it was 0.1Bq/kg. So when you're talking 100 Bq/kg that's allowing 1,000 times the [pre-Fukushima] levels.

As I said before, any exposure is absolutely dangerous. And the dangers increase corresponding to an increase in levels of exposure; this is the conclusion of all research. 100 Bq/kg is dangerous, 99 is dangerous, as is 90, and 50, and 10—they are all dangerous. 10 Bq/kg is 100 times the pre-Fukushima levels.

So I think it's necessary to precisely measure the levels of contamination. As many people are living in a state of anxiety, groups like consumers' cooperatives and other sorts of organizations are trying to measure the contamination on their own. But the measuring devices that these groups are able to get, such as the ones called NAI,

these devices can only measure levels above 20Bq/kg. While this means that they can measure levels as little as one-fifth of the national thresholds, from my perspective even this lower level is far too high.

And the worst thing that could happen is thinking that any contamination below the detectable limits of these machines, meaning below 20Bq/kg, would be misunderstood as being free of contamination, and then having the Fukushima prefectural government actively using this data as good news: "measurements below the detectable limits of the device must be clean; we can even serve this food in school cafeterias," or PR campaigns announcing "Fukushima produce is safe." Of course it would be totally outrageous and unthinkable and yes I think every effort should be made to serve the least contaminated food in school cafeterias—but the reality is that any food tested below detectable levels is distributed to schools as safe produce.

I think we need to stop this situation, and technically speaking, I think several germanium semiconductor detectors must be deployed instead. But a germanium detector would cost from \$100,000 to \$200,000. And in order to use it, the detector needs to be kept at 150 degree below zero Celsius. So these are not devices that the average citizen is going to be able to use.

So no matter how dedicated any individual citizen may be, there are real limitations when it comes to measuring radiation levels. If you ask me what should be done, for example when faced with Cs-137 or Sr-90, what should be done about these contaminants? Well these contaminants were produced in a nuclear reactor at TEPCO's Fukushima Daiichi plant and it means that they are unmistakably TEPCO's property. And if their private property is found to have contaminated other areas they have undeniable responsibility for it. So I think this is something that is required of TEPCO. I think it is TEPCO's responsibility to precisely measure which foods have been contaminated, and to what extent, and then to report the results to the public. I think this is something the public should demand. After TEPCO the government also has responsibility—they gave their seal of approval to TEPCO after all. So the public should also demand that the government precisely measure the levels and publish the results.

Because there are limits to what one can do on one's own, I think we need a movement that forces the government and TEPCO to take responsibility for the precise measurement of the contamination.

Hirano: Some have raised doubts over precisely this kind of rigorous measurement citing possible damage caused by rumors or misinformation (*fūhyōhigai*/風評被害), but to me this sort of criticism is tainted with a sort of "national morality" discourse (*kokumin dōtokuron*/国民道徳論).

Koide: Yes, I think so.

Hirano: There seems to be a very strong sense of dividing people into those who are seen as patriotic and those who are seen as un-Japanese (*hikokumin*/非国民).

Koide: For me, I've been making statements on the Fukushima contamination. These statements have been denounced and even made some angry with me. But the contamination is real. For a long time now I've been the kind of person who would rather hear the truth, no matter how awful, than to remain ignorant. I am absolutely not going to hide the truth; no matter how much criticism I have to take I am going to diligently report the truth. Yeah, a lot of people get angry with me. (Laughs).

Kasai: On this point, this year saw the publishing of Kariya Tetsu's manga series *Oi shinbo: Fukushima no shinjitsu* (『美味しんぼ – 福島の実』).⁶ It would seem a kind of political campaign was developed to attack it. What is your take on this?

Koide: The editors sent me a copy and I've read it. It's an awesome manga. In this day and age we just don't have this kind of detailed manga on this problem and I am grateful for it. And more, *Oi shinbo* talks about the nosebleeds [caused by radiation]. The nosebleeds are real. Lots of Fukushima residents are said to be suffering from nosebleeds. Itokawa, the mayor of Futaba machi, has shown us proof. One of my acquaintances often talks about the nosebleeds. It was true at Chernobyl, too. But nosebleeds have not been definitively and scientifically linked to exposure to radiation.⁷ Still there is no denying that it is real and happening. So even if current science is unable to explain it, it's for science to ask just what is going on? Science has a duty to explain this, to tell the truth without obfuscation. No matter the reasons, we should be allowed to tell the truth. So for me I don't think there is anything wrong with this part of *Oi shinbo*.

Kasai: I think *Oi shinbo* clearly exposed the politically constructed narratives "damage from rumor or misinformation" and "emotional bonds" (*kizuna*/絆) as fictions, and so for this reason it appears it had to be crushed.

Koide: Exactly. But Kariya, the author of *Oi shinbo*, is not one of the criminals responsible for the Fukushima disaster. Rather the government officials who caused the Fukushima disaster are the criminals. Yet it is these same government bureaucrats who now come out and complain that this manga is out of order. I say, "No, it's you who are out of order. We need to send you to prison right now."

But isn't it always the case that a criminal who has committed a crime remains unquestioned and so starts bashing those who are telling the truth? When that happens I think the problem is precisely this word you just used "emotional bonds." Since Fukushima, I have come to hate this word. (Laughs).

Hirano: "Bonds" seems to be the new nationalism, doesn't it?

Koide: Yes, yes it does.

Hirano: You've often said that the Japanese economy and the people's lifestyle would be fine even without a single nuclear power plant. In fact, since the government shut all the nuclear reactors down, the people have experienced no real trouble at all. In addition, considered in light of world standards we still have material riches and a lifestyle of surplus. Given this, what are your thoughts on the call to restart the reactors? For what purpose, what reason do you think the government has?⁸

Koide: First of all, the power companies don't want to go bankrupt. In other words, the heads of the power companies do not want to take personal responsibility. For example, if the reactors are restarted and there's an accident, are the heads of the power companies going to be punished? We already know that they will not be. Even after the Fukushima disaster neither the chairman, nor the CEO, nor anyone below—not a single person—was punished.⁹ It certainly looks as if the reactors are restarted and there's an accident, the heads of the power companies would not be required to take any responsibility. The heads of the power companies, from Kyushu Electric to Kansai Electric, have received this message loud and clear.

What's more, if the nuclear power plants are idled and not allowed to restart, then all the capital they represent becomes a non-performing asset. And of course this is anathema to anyone in management.

Hirano: If we could return to a technical discussion specifically how to decommission a reactor. As have others in your field you've already stated that a full end game cannot be envisioned yet. Still could you talk about what makes this issue so difficult?

Koide: By decommissioning you mean the endpoint of the Fukushima reactors?

Hirano: Yes, what does it mean for Fukushima dai-ichi?

Koide: When we say decommission we basically mean: How do we fully contain the radiation? At least I think that's the main point. Now this is impossible if we don't know the status of the melted core. Though it's been four years since the disaster we simply do not know where the core is or in what state it is.

This is a situation that only happens in nuclear accidents. However large a chemical plant explosion may be there'd probably be an initial fire, but usually after several days, perhaps weeks you'd still be able to go on site and investigate. You'd be able to see just how things broke down. And in some situations might even be able to fix them. But with an accident at a nuclear plant you cannot even go on site four years later—probably not even ten years later.

Hirano: Because the contamination is so severe that no one can come close to it.

Koide: Yes. For humans going there means instant death, so the only way at all is to use robots. But robots are extremely vulnerable to radiation. Consider, robots receive their instructions through series of 1s and 0s, so should the radiation switch a 0 to a 1 you'd end up with completely different instructions. Essentially robots are useless. Even if you are able to send them in they can never return. Because this has been the case up to now, the only way left in the end might be to use robots that try to avoid exposure or that are built as much as possible to withstand exposure, but that is no simple thing.

So it means until we figure out what to do it would still take many years. Once you understand this fact you can start thinking about what can be done. And at the very least the "road map" devised by the government and TEPCO is the most absolutely optimistic road map that there could be. They are convinced that the melted core fell through the bottom of the pressure vessel and now lie at the bottom of the containment vessel—basically piling up like nuggets of the melted core. There's no way this would be the case. (Laughs).

As the severity of the disaster became clear, water was repeatedly thrown on the reactors. This water would evaporate and dissipate continuously. That was the actual situation. There is no way that the melted core would have stayed as slimy liquid and then piled up like so many little nuggets. It should have been scattered all over the place.

This is how the government and TEPCO's roadmap goes: The buns would stay at the bottom of the containment vessel, above which is the reactor pressure vessel—a steel pressure furnace. With the furnace floor broken open, there is a hollow at the bottom through which the melted core must have leaked.

So at some point both the containment vessel and the pressure vessel would be filled with water and they'll be able to see the nuggets of melted core by looking from above down into the water. They say the nuggets (the fallen material), yes, that they sit some thirty to forty meters below the water's surface, that they'll eventually be able to grab and remove them. This is all it takes, according to the government and TEPCO's roadmap. Not a chance. This simply cannot be done.

Hirano: Obviously we can't confirm or really say anything definitive about the situation in the reactors, but what do you think has happened?

Koide: I simply don't know. But as I have mentioned, this whole "nugget" scenario is just not the case, and so I think the materials are scattered all over the place. Though the containment vessel is made of steel, if the melted core has come in contact with that steel, just as it ate through the floor of the pressure vessel, it could possibly have melted through the containment vessel. Depending on how things developed this, too, is a possibility. Unfortunately, I simply do not know.

Hirano: If that is in fact the situation, what steps are necessary?

Koide: First, as we talked about earlier, radiation must be prevented from being released into the environment. As I consider this task as "decommissioning" or the final containment of the accident, I think in order to prevent the release into the environment you must do whatever you can starting from the worst-case scenario.

There are situations in which the containment vessel can suffer a melt-through. I think this likely has already happened. And if it has happened what should be done? Outside the reactor there flows ground water. If the melted core were to come in contact with the ground water, the whole situation would be unmanageable. While this may have already have happened, in order to get any kind of control over the situation, some sort of barrier must be built to prevent the melted core from reaching the ground water. I've been saying this since May 2011—and they have not done a thing.

Kasai: This barrier would be an ice dam, a wall of super-chilled soil.

Koide: That's the most recent idea. But it simply cannot be done successfully. It would cost billions of dollars. And it would fail. And when it did fail they'd say there's nothing to be done but build a concrete wall. No matter how foolish an idea may be, they'll just keep moving from failure to failure.

But really, for the construction companies that's a good thing. I think Kashima would be the ones to build the super-chilled earth wall, for some billions of dollars. And if it doesn't work—they wouldn't have to take responsibility. Next they'd build an impermeable concrete wall. Several huge construction firms (*zenekon*/ゼネコン) would be contracted and would all make billions.

But considered from the perspective of actually ending the disaster, it would be a series of failures. Personally, I think an underground, impermeable wall needs to be built immediately. They are not going to be able to remove the material. All that can be done is to contain it. Underground the wall needs to be strengthened; above ground the only choice is some sort of sarcophagus like the one they built over Chernobyl. But even this would take dozens of years—I'll probably be dead by then.

Kasai: There are temporary tanks sitting on land for this water, but they are starting to leak. What should be done about this contaminated water? There's not enough space for all of it on land; it cannot be controlled; and every year the volume grows larger.

Koide: The radioactive water has penetrated the coastline around the Fukushima Daiichi. Underground water in the large area of Fukushima has been seriously contaminated. And at some point those contaminated water tanks will fail. I thought we must do everything that we possibly could. Already in March of 2011 there was some 100,000 tons of contaminated water. Even then I proposed moving it but didn't get anywhere with it. Now there's up-to 400,000 tons. In the near—meaning not too distant—future there will be nothing left but to release it into the sea.¹⁰ The water contains plutonium 239 and its release into the Ocean has both local and global impacts. A microgram of plutonium can cause death if inhaled.

Interview with Koide Hiroaki (2)

Kasai: It appears that they are already moving toward that direction a little at a time aren't they.

Koide: The Nuclear Regulatory Committee has been hinting at the possibility of releasing it into the ocean.

Kasai: They have been trying to persuade the fishing cooperatives and others to allow the release.

Koide: Yes, they have.

Kasai: Something that has not been much of a topic of discussion today is decontamination. It has become a rather large industry, in other words, "the exposure industry" (*hibaku sangyō*/被曝産業). Do you think decontamination is really meaningful and effective?

Koide: Yes, I do. And we must do it. But, to say that because we've decontaminated some area that the whole issue is resolved, or that people may safely live in a decontaminated place—I think that is a real problem.

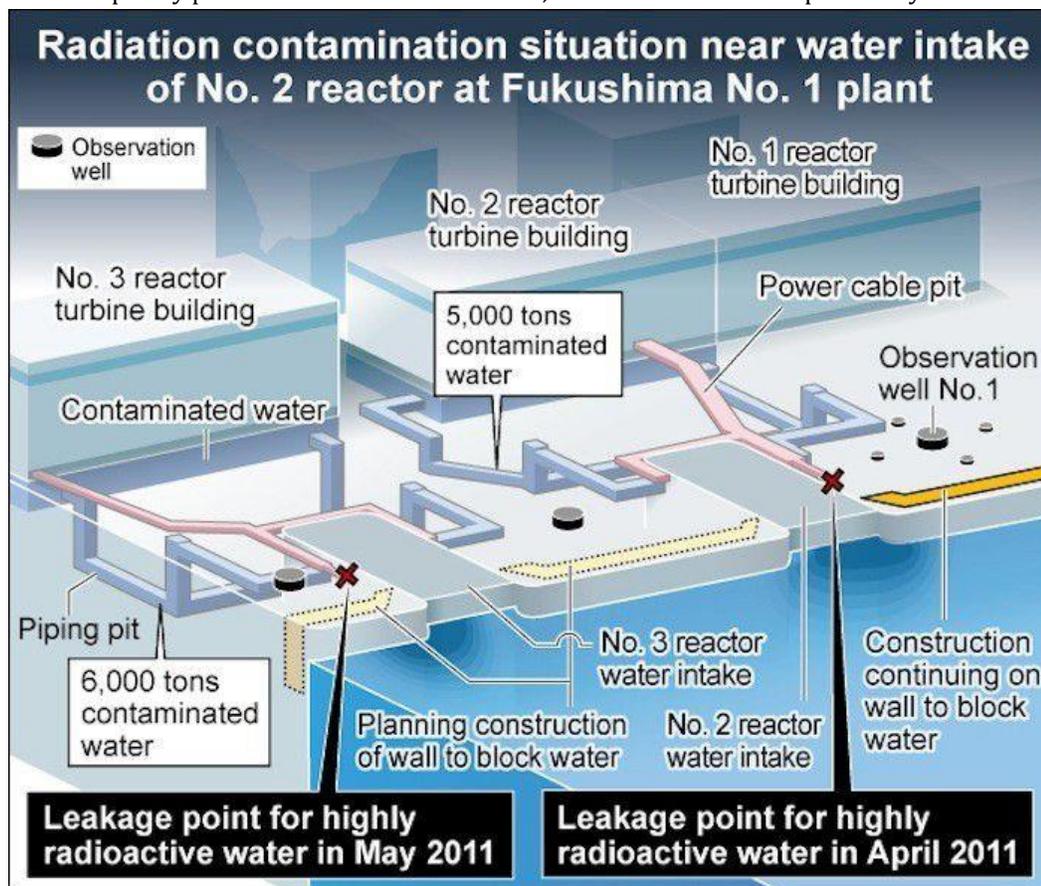

First, fundamentally, people must not be forced to live in contaminated areas that must be decontaminated. First must come complete evacuation. The state must take on the responsibility to allow whole communities to evacuate. Of course, they did not do this.

Briefly, I use the word "decontamination" (*josen*/除染), which is a compound word written with the characters for "remove" and "stain." But this is something that cannot be completed when it comes to radiation, so the original sense of the word "removal of contaminants" is impossible. But as long as people are abandoned in the contaminated areas, I believe all possible actions should be taken to lessen their exposure. It is essential that the contamination be removed as far away as possible, to be transported far from where people live. For this reason I prefer to call it "[toxic] relocation" (*isen*/移染).

But even if this is done, that does not mean that the radiation has been erased. This stuff contaminates everything from mountains to what have you, it gets into the space of people's lives. When that happens it must be removed. But removal merely means moving it around—it does not mean eliminating it. It means another job is waiting to handle the contaminated materials that get moved around.

Right now the authorities say they want various prefectures and other local governments to build a temporary storage and bury the accumulated contamination there.

We talked about this before, but the contaminants themselves were clearly formerly in the reactor at TEPCO's Fukushima Daiichi plant and are therefore also clearly TEPCO's property. So while it is residents who are doing the hard work of collecting all these contaminants, I think it would be right and just for these contaminants to be returned to TEPCO. Earlier prof. Kasai told us the contaminants were being called "no-one's property" (*mushubutsu*/無主物), but I say in all seriousness, the conclusion of my logic here is to say to TEPCO: "Hey, this is your crap" and return it to them. That way the residents are not forced to accept the stuff, TEPCO is. The best solution is to return all of the material back to the Fukushima Daiichi plant, but that is not possible. Right now that place is a battlefield between poorly paid workers and the radiation, so I don't see this as a possibility.

What I would most like to do is have TEPCO's headquarters buried under all the radiation, but whenever I say this people just laugh. (laughs)

I do have a second proposal. Fifteen kilometers south of Fukushima Daiichi [Fukushima 1] is the Fukushima dai-ni [Fukushima 2] nuclear plant. There is a lot of wide open space there. So first off we would return the Fukushima 1

contamination to TEPCO there. I think there would be enough space, but if there were not, the rest could be taken to TEPCO's Kashiwazaki Kariya nuclear plant. It's the world's largest nuclear plant and so there is a lot of space. I think turning that place into a nuclear waste site is a good idea.

Lately I've been invited to Kashiwazaki¹¹ and talked about it. I think I've become a hated man there. (Laughs). But I think taking full responsibility for various actions is the most important thing. And when it comes to this particular disaster no one has greater responsibility than TEPCO. As I think it important for one to take full responsibility, if Fukushima 2 doesn't work out, then Kashiwazaki Kariya is the only other option.

Hirano: State expenditures for decontamination have supposedly reached one trillion yen.

Koide: It's more than that.

Hirano: This summer I spent some time in Iitate village. Of course at the time the place was crawling with decontamination workers. It was a truly bizarre scene. I had the feeling of running around on a moonscape. Of course there were no residents there—just decontamination workers in strange gear, trucks running all over the place.

Looking at that scene, being shown the actual work of decontamination, it seemed to be an excruciatingly slow—even endless—endeavor. I mean they were scrubbing everything with small brushes. I was able to ask the workers a few questions—off the record. Many were people from Hokkaido, Okinawa, and Fukushima who had lost their homes. It was a collection of modern day migrant workers and victims of disaster. They said that they work for just 15,000 yen a day.

I asked them if they thought their work was doing any good. They said they needed the money and honestly had no way of knowing if this sort of minute and delicate work would remove the contamination.

Was this a mistake? Is scrubbing everything by hand and then dumping it all in the ground really the only way to decontaminate an area?

Koide: Well I think both that it is and it isn't effective. For example, when they first started the decontamination work, what they did was blasting everything with high-pressure water hoses. That's bad. All that does is get all the contamination moving around. It's really just dispersing it.

Some of my colleagues have said that is a bad method. Be it a roof or a wall, you shouldn't just douse it with water. To really remove the contamination, you would first cover it with something that could prevent the escape of radioactivity then knock down the radiated structure, tear it all off, and then fold it up and collect it all. I think that's probably true. But it takes a long time.

I think there are effective ways of doing it and I think there are ineffective ways. Still it is fundamentally impossible to erase the contamination and so it must be moved. The only thing we should be doing is thinking about the easiest way to relocate it all.

Hirano: That's the meaning of "effective" in this situation isn't it.

Koide: Right. So the current method may be rather small in scale. But for me even small-scale methods are necessary. As long as people are living there everything is necessary.

Of course, there's legitimate criticism over the fact that this is a decontamination business and that the large construction companies are getting rich, but again, for me, as long as there are abandoned people still living there it all must be done.

Hirano: It was really a shock going there and seeing it. To see those workers and, honestly, their lack of conviction for the work. It was a really weird scene. No real enthusiasm, but rather one day after the other, contingent labor. The media has reported that the workers come from a few particular prefectures, but actually being there and talking to them, I could really get a true sense of the structure of economic inequality in Japan, that this sort of work found this kind of person, a person coming from economically precarious and socially marginalized backgrounds. In fact, you come to understand that decontamination work depends on these people.

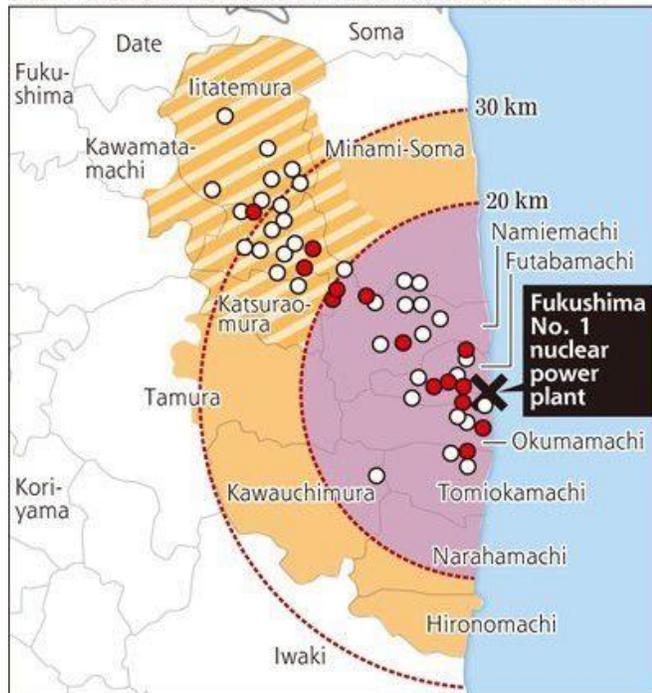

For example, decontamination, or your preferred "relocation," couldn't those jobs be made more equitable—say by requiring TEPCO office workers, especially executives, to do it?

Koide: I've said that.

Hirano: You have? (Laughs).

Kasai: So...about the airborne radiation dosage and the soil contamination, there is a public entity that measures and publishes the airborne levels. But the soil contamination is not measured. I remember reading about Chernobyl that the soil contamination levels are the standard by which one gets the right to evacuation and refuge. But Japan only measures the air. And there are those who doubt the accuracy of the levels recorded. I thought the soil contamination had not been measured yet, but from what you mentioned earlier, we do know the extent of the contamination, don't we?

Soil contaminated with cesium-137

- more than 3 million becquerels per square meter
- 1 million to 3 million becquerels per square meter
- no-entry zone
- ▨ expanded evacuation zone
- emergency evacuation preparation zone

Koide: Yes, we do.

Kasai: The actual levels?

Koide: With respect to soil contamination we more or less know the extent of it. We largely know which prefectures, which towns, and which villages—as well as how badly—have been contaminated. Four years after the disaster it has moved around. Radiation moves through the environment; it has a material existence and also does die out. I'm sure much has changed since immediately following the accident.

We have the data necessary to draw a map of the situation immediately following the accident, but we don't have the data necessary to draw a map of the contamination today. That said, we basically know the extent of the soil contamination.

Kasai: Who is it that is making these measurements?

Koide: It is basically the Ministry of Education, Culture, Sports, Science and Technology. Some local governments took part as well. Some independent groups, as well as some local governments, took part in taking measurements back then. But for us the number one data source is the US military.

Hirano: I see; how is that?

Koide: They worked at truly amazing speed-and accuracy.

Hirano: Sorry if this next thought seems a bit of a tangent, but right after the accident both the US and Japan were looking at the same data. But their interpretations of it were extremely far apart. The US ordered all of its personnel to evacuate an area 80 km from Fukushima. While Japan's largest evacuation zone was 20 km. Where does this disparity in evacuation zones come from? They are both looking at the same data. How do they arrive at such definitive and divergent judgments?

Koide: Well...and this was true for me, too, any nuclear specialist would have known on March 11th-March 12th at the latest-that there had been a meltdown. And this means, quite simply, that control had been lost. And once control is lost you simply don't know what is going to happen next-or that's what you must think at the time. Disaster preparedness must always imagine the worst-case scenario. If you don't plan for the worst-case scenario it will be too late. What the US did was believe there had been a worst-case scenario-a meltdown-and so moved to take care of its people. That's why they ordered an 80 km evacuation. I think this was the correct strategy. Japan didn't do this. Japan was always thinking of the ideal, the best case scenario. They had to be thinking they could still get control and based their policy on that optimistic assumption. So they only declared a 20 km evacuation zone. I would say that from this conclusion two things may unfold: one is their desire to see this as a best-case scenario and the other is their inability to deal with it.

Hirano: What do you mean by their inability?

Koide: In a word, the Japanese state is incapable of functioning adequately when dealing with a disaster. That's why they evacuated those within 20 km by bus but when it came to the 30 km zone they told those who could easily evacuate to do so and for all others to merely close their doors and windows.

Hirano: So there was no emergency management.

Koide: None. There simply is not a single person in the Japanese government who had thought an accident like this was possible. They all immediately fled the off-site center and so there was absolutely no emergency management—there couldn't be. And because management was now impossible, there were no announcements. Even if they had declared an 80 km evacuation zone there were no emergency shelters. They had made no preparations, so there was nothing to be done.

Hirano: Last summer I interviewed Murakami Tetsuya 12 Just as the accident was happening he reached out to the government. But he got no response. He went to the prefecture. No response from them either. In the end he just used his own judgment. So really there was essentially zero emergency management in place. His thoughts at the time were to get the whole village to emigrate; that really there was nothing to do but to buy land and move to Hokkaido. He said these were his actual plans at the time. In fact, it would seem that the myth of safety has so totally permeated the bureaucracy that there really is no one who thinks about these things—wouldn't you say?

Koide: That's right. Not a single nuclear expert or policy maker ever seriously considered the possibility of an accident like this. I knew accidents were possible, and that when they happened the damage would be enormous; I had been commenting on the possibility, referring to some results of simulations. But still I would have thought the kind of disaster that happened at Fukushima was some kind of impossible nightmare—yet it actually happened. It was like the worse nightmare becoming a reality. And if even I thought this then all those pronuclear people surely never gave it a moment's thought. And so when it actually happened, no one had thought about, let alone built a system to deal with it.

II The Responsibility of the Scientist and the Citizen

Kasai: In your books and lectures you often express strong respect for Tanaka Shōzō.¹³ Can you connect what you've just said to this as well?

Koide: Sure. I first became aware of Shōzō when I was in the student movement during the 1970s This was a time when there was close attention paid to Japan's many pollution incidents, such as at Minamata. Personally I was working on nuclear power, but it was a time when, like it or not, we learned of all the harm that came along with building Japan into a modern nation. What I got from Shōzō was this epiphany that just like the Minamata disease right there before our eyes these sorts of pollution incidents went way back in Japanese history. With Japan's decision to cast off Asia and follow the West after the Meiji Ishin of 1868 came these sorts of incidents, and the question within that was just how should one live? I learned the way Shōzō lived his life. I thought: Wow, it is possible to live that way; I must do it. Unfortunately I am completely unable to do so, but I never stop thinking that Shōzō's was a wonderful way to live a life.

Hirano: Going back to an earlier discussion. You've repeatedly talked about the government's responsibility, scientists' responsibility, and individual responsibility. It would seem that this word "responsibility" is an extremely important keyword for you. You often emphasize it in your writing, too. What I want to ask concerns the issue of scientists' special responsibility, a particular social responsibility. Scientists are often thought of as technicians, but this is not really the case. As a result, I feel you've pursued an intense interrogation of yourself as a scientist. As you've said you are not going to enter politics, could you connect this discussion of scientific responsibility to your earlier discussion of doing all that has fallen to you personally to do? How should we think about these two things?

Koide: I am in science and as such I have to take on the responsibility of a scientist—Just as a politician must take political responsibility. I think I mentioned this to you the last time, but I am an absolute individualist (*tetteiteki na kojinhugisha*/徹底的な個人主義者). I don't want to be constrained by anyone. I want to be able to decide my own life for myself. But because I've made this choice by myself I must also take full responsibility for that choice.

It's two sides of the same coin. I don't take orders from anyone. And this means that I alone bear the responsibility.

It's really as simple as saying: I'm a scientist and so I have the responsibility of a scientist.

Hirano: On this way of thinking about responsibility: "Who is the subject responsible?"—this way of thinking about it seems to be quite absent in contemporary Japan.

Koide: Right. People living in Japan today have not made decisions as individuals. They just "go with the flow;" as long as they follow the "authorities" whom they believe will guarantee the happiness of their individual selves. This seems true of education, too. Go to a slightly better school; get into a slightly better company; grow a bit more rich, a bit more grand. I think everyone is swept up in this current, and it's really senseless.

I think it is extremely important that each and every individual live out their individuality. The absolute worst thing is for everyone to become blindly obedient to the "authorities," yet this is the Japan we find ourselves in today. And so no one takes any responsibility. Living in such a society it is too easy to say, "It can't be helped." Everyone is thus able to blame the society as a whole; "It can't be helped." And so no one takes any individual responsibility.

The most extreme and obvious example was the war. Everyone would say: "It's not my fault; I was deceived. The military were the culprits." Saying this allows people to remain at a distance, indifferent. It is bad news for a nation when its citizens have only this view of responsibility.

Hirano: You've declared, "I am an absolute individualist." Personally I am very interested in that statement. So could you speak a bit more concretely about the meaning of your individualism for how one lives a life? In other words, could you explain just what you mean by this "individualism?"

That is, in Japan being individualistic is more often a way to say egotistical; a sort of disregard of others. One should pursue one's own interests—in English the word is "selfish" — egocentric — pursue your own egotistic advantage. Now this seems completely different from the way you use the term. Could you speak directly to this difference?

Koide: I think you've just done so.

Hirano: Did I? (Laughs). So that's it then, just as I said? Still it's clearly not selfishness.

Koide: No, I don't think it's about interests.

Hirano: It's about values isn't it?

Koide: Yes, it's about personal values. You and I are different people. I am different again from Mr. Kasai. Why? Well our genetic information is different. I received a bundle of information from my parents. You and Mr. Kasai, too, are influenced by your genetic information. Every one of the over one hundred million Japanese is a unique human being; and every one of the over 7.3 billion people on earth are unique individuals.

History may keep moving on, and there is a big, wide world here on this planet earth. That said, right now, at this moment, and right now, in this place, I exist as an irreplaceable being. It is nothing but an absolute truth. You normally live in Los Angeles, but right now at this moment you are a person who is here. Mr. Kasai has come down from Tokyo. While acknowledging all the implications of being within the flow of history, we are all right here, right now.

In other words, every single individual human being has a different way of living a life; they are each unique. They have each lived a life that absolutely no one else could have lived. It is a real loss if they don't live up to their full potential. Those are my thoughts.

So for my own unique self, and so for your own unique self, and Mr. Kasai's own unique self, none of us should be compelled by someone else to do something (*meirei o sarete*/命令されて). If we don't live our lives according to the will coming from deep within ourselves, that's a real loss; we must all live with our values coming from within ourselves.

I am going to retire next March, but though I am the lowest ranked employee here— above me are assistant professors and professors — because of the peculiar arrangements of working where I do, I am not compelled to take orders from anyone. I am the lowest ranked so of course there is also no one below me to order around. So I am in a position where I never take nor give orders. For me this is the ideal position to be in.

And so I can live out my own life according to my own values; I'm allowed to live a life that suits me. Now I found myself in this position largely by accident, and then chose to continue to live my life this way. Related to this, I am a human being and so will make mistakes, but these mistakes will be things that I have chosen, things that I have personally done so there is nothing to do but to take responsibility for them. This is what I mean when I say that responsibility is an extremely important word.

Hirano: Well, you've exhaustively criticized this competitive society. You've said that this competitive society has ruined Japan and destroyed life based on what you call responsibility.

Koide: Yes. Everyone is running towards the exact same goal. It's ludicrous. You want to go that way; I want to go this way. I think this would be the ideal society. Full mutual recognition is a good thing.

Hirano: Does your view come from your personal experience? In your books you state that you were a really conscientious student when you were younger (laughs).

Koide: (laughs) Well, yes.

Hirano: You studied extremely hard. Did everything extremely hard. You continued this in your nuclear research in college believing that a new energy source was cheap and good for everyone. You must have thought this was a great thing.

Koide: That's right.

Hirano: But you eventually noticed that it was all wrong. So on this, from deep in your own experience, it's an individual history, an individual experience, in one sense it's connected to your current individualism, to how you live your life focused on the important things to you.

Koide: I think that's right. So, well, when I was young, in my late teens, I was consumed by the dream of nuclear power. I devoted my life to it. That was all a mistake—it did not take me too long to realize that.

Hirano: When did it happen? In graduate school?

Koide: My third year in university.

Hirano: Third year—so as an undergraduate.

Koide: Yes, I came to this realization in the latter half of my undergraduate studies. It was foolish and I curse myself for it, but I didn't quit. To this day I've lived my life as someone who made that wrong choice, and there is nothing to do but make amends for that choice.

At a minimum I wanted to get rid of nuclear power before there was a bad accident. I guess I've lived with this wish for over forty years—but that wish stayed out of reach. And here we have had the accident so my life has been for nothing. You could say that thing I wanted most to do has been denied. Really, what have I lived for? I think about that from time to time.

As this was my choice I have to accept it. So while the meaning of my life may have been lost, still I was able to live my own life as I pleased, without submitting to the orders of others and without ordering others around—for this I am grateful. My hopes were never realized. History is full of that kind of thing. Likely very few people see their hopes fulfilled. And while in my case they were rejected, I was able to live the life I wanted and that is a life to be grateful for.

Hirano: In a way, it's just how Tanaka Shōzō lived his life isn't it?

Koide: Yes it is. That is what I like about Shōzō.

Hirano: On that point. His life, too, was a defeat.

Koide: Complete and total defeat.

Hirano: Still, he used all sorts of means, and followed all the way through on his beliefs.

Hirano: So getting back to Fukushima, it seems when it comes to the life choices of the so-called Japanese elites, they seem caught in a system in which they will succeed and become famous by crushing their individuality and subsuming it under some organization in order to get ahead in a society and achieve fame and status. And the education system seems to be promoting this lifestyle where these sorts of people are created through intense competition. I think the very end result of this social and educational system was revealed, and it exploded in an explicit and ugly manner through various problems the Fukushima disaster has posed.

Koide: Yes, I think so. You said it.

Hirano: I see. In one sense it would have been possible even for these Japanese elites to make their personal responsibility clear and take appropriate actions only if they had lived a life based on individualism as you suggested.

Koide: Yes I think such a possibility exists, but unfortunately in Japan today that possibility has been completely crushed. It was abundantly clear from the Fukushima disaster that no one in this country is going to take responsibility.

Hirano: You've already talked about how TEPCO and the government made huge mistakes in dealing with the problem immediately after the accident. What do you see as the definitive mistake that led to this disaster?

Koide: There's a ton of them. Any specialist would have known right away there had been a meltdown, and that everyone needed to be evacuated immediately. And evacuating to 20 km away is totally inadequate. Iitate village some 40-50 km away received an enormous amount of contamination and was neglected for over a month. Soma residents evacuated to Iitate, this kind of stupidity cannot stand, the government's criminal mistakes.

“The Fukushima Nuclear Disaster is a Serious Crime”: Interview with Koide Hiroaki
福島核災害は明らかに深刻な犯罪である—小出裕章氏に聞く
Katsuya Hirano **and** Hirotaka Kasai

Introduction

Koide Hiroaki (66) has emerged as an influential voice and a central figure in the anti-nuclear movement since the nuclear meltdown at Fukushima Daiichi of March 11, 2011. He spent his entire career as a nuclear engineer working towards the abolition of nuclear power plants. His powerful critique of the "nuclear village" and active involvement in anti-nuclear movements "earned him an honorable form of purgatory as a permanent assistant professor at Kyoto University."¹ Koide retired from Kyoto University in the spring of 2015, but continues to write and act as an important voice of conscience for many who share his vision of the future free from nuclear energy and weapons. He has authored 20 books on the subject. Professor Kasai Hirotaka and I visited his office at Kyoto University's Research Reactor Institute in Kumatori, Osaka, on December 26th, 2014 for this interview. We believe that the contents of the interview, which offer new information about the degree of radioactive contamination and invaluable insight into

Koide's ethical and political stance as a scientist, remain crucial for our critical reflection on ecological destruction, the violation of human rights, and individual responsibility. Professor Robert Stolz, the translator of this interview and the author of *Bad Water* (Duke University Press, 2015), provides a historical perspective on the interview in a separate article. KH

Interview

The Fukushima Disaster and Government and Corporate Response

Hirano: How does the Fukushima accident compare with the bombing of Hiroshima or Chernobyl in its scale? What are the possible effects of this yet unknown exposure?

Koide: Let's start with the scale of the accident: It was a core meltdown involving the release of various kinds of radioactive material. Radioactive noble gas isotopes were also released, as were iodine, cesium, strontium, and other radioactive material. The noble gas isotopes have a short half-life and so at this stage they are all gone. Iodine, too, is gone. So now four years since the accident the materials that are still a problem are cesium-137, strontium-90, and tritium; really, it's these three.²

Now, as for the scale of the accident, I think it would be best to compare these three radionuclides. Today the main contamination of Japanese soil is the radionuclide cesium-137 [Cs-137 or ¹³⁷Cs]. The ocean is largely contaminated with strontium-90 [Sr-90 or ⁹⁰Sr] and tritium [T or ³H]. Right now the main culprit adding to the exposure of the people in Japan is Cs-137, so I think it's best to use Cs-137 as a standard for measuring the scale of the accident.

But we simply don't know with any precision how much Cs-137 was released. That's because **all the measuring equipment was destroyed at the time of the accident.**

How much Cs-137 was released into the air? How much was spilled in the sea? We just don't know.

Still, the Japanese government has reported estimates to the IAEA [International Atomic Energy Agency]. According to those estimated levels, reactors 1, 2, and 3 had been in operation on March 11, 2011, and all three suffered meltdowns. Those three reactors released 1.5×10^{16} Becquerels of Cs-137, which would make it a release of 168 times more radioactive material than the Hiroshima bombing. And this is only material released into the atmosphere—at least according to Japanese government estimates.

But I myself think the government's numbers are an underestimate. Various experts and institutes from around the world have offered several of their own estimates. There are those that are lower than the Japanese government's numbers and those that are higher, some two or three times higher than the government's numbers. According to these other estimates I think that the release of Cs-137 into the atmosphere could be around 500 times the Hiroshima bombing.

Now for what has been washed into the sea. That number is likely not much different from the levels released into the atmosphere. Even today we are unable to prevent this release. And so if we combine the amount of Cs-137 released in the air and the ocean together, we get an estimate several hundred times the Hiroshima levels. And some estimates suggest the Fukushima accident could be as much as one-thousand Hiroshimas. Now to compare this with other accidents: The amount released into the atmosphere from the explosion during the accident at the Chernobyl nuclear plant was 800 to 1000 times the Hiroshima levels. Put simply, these estimates place Fukushima on par with

Chernobyl.

Worse than any of these, however, is atmospheric testing. From the 1950s to the 1960s atmospheric testing of nuclear weapons had already released Cs-137 into the air more than sixty times the numbers released even by the Japanese government for Fukushima. Of course Fukushima is an incredible tragedy, but considered from the earth as a whole it is a rather small accident.

Hirano: I want to ask in more detail about the effect of Cs-137 on the human body and the environment.

Koide: Cesium is an alkaline metal. From the human body's perspective, cesium closely resembles potassium. The body contains enormous amounts of potassium. It is essential for humans. It's everywhere in our bodies. Especially our flesh and muscles are full of potassium. And because of this, when cesium is released into the environment, the body deals with cesium as it does with the alkaline metal potassium, which is to say that it is taken into the body and accumulates there.

Strontium is an earth metal. The body treats it like calcium. As you know calcium is a human body building block that accumulates in our bones. Strontium, too, is taken into and collects in the bones. Just as cesium is taken in and is transported to the flesh and muscle.

Hirano: Comparing the releases from nuclear tests by the US and the USSR during the Cold War period, you said that the Fukushima accident was small. So in what way should we think about Fukushima: is it best to consider it a Japanese problem, or to consider it from a global perspective?

Koide: The amount of products of nuclear fission released during atmospheric testing was enormous, and these particles continue to expose humans to radiation. I'm a bit older than you and I recall in my childhood being told not to let the rain fall on me at the time of the testing. In this way everyone on earth has been exposed (*hibaku*/ 被曝). And because of this testing, historically speaking, cancer rates have slowly risen; I believe this increase in cancer is due to the exposure suffered during the atmospheric testing. Now the radioactive material released from Fukushima has been dispersed across the globe and so once again everyone on earth has been exposed to additional radiation. I think we can expect cancer rates to rise once again.

Atmospheric nuclear testing released all of the radioactive material in the explosions, which entered the stratosphere. Between the stratosphere and the troposphere there is the tropopause, and every year come spring all that material dispersed in the stratosphere breaks through the tropopause and falls to earth. So that material, though initially dispersed in the stratosphere, eventually falls to earth evenly, everywhere. Actually, it might not be accurate to say that it falls evenly on the earth. The majority of the testing was done in the temperate regions of the northern hemisphere, such as Nevada and the Semipalatinsk test site [in Kazakhstan], so that the northern hemisphere-as the site of most of the testing-is heavily contaminated, and within that the temperate region is heavily contaminated. Still, I can say the atmospheric testing overall

has caused global contamination.

My focus now is to figure out how to deal with the acute and heavy contamination from Fukushima. I know something needs to be done right there in that specific place. That contamination will disperse and be diffused across the globe. Once dispersed, the amount of radioactive material from Fukushima will be small when compared with the atmospheric testing. Which is not to say it is not harmful. An increase in cancer will be the result. I mention that for humanity as a whole; the atmospheric tests were worse. Now, strontium-90 [Sr-90] has been leaking from Fukushima into the ocean, so it will eventually reach the United States, especially the west coast. This much we are sure of. But to answer your question, the amount of dispersed cesium and strontium released by the atmospheric tests is tens of times greater than the Fukushima levels. Because the west coast of the US is already contaminated from the atmospheric testing, though the dispersed contamination from Fukushima will reach US shores, for people living on the US west coast, the Fukushima accident—and this is perhaps awful to say—contamination from Fukushima is hardly worth considering. Historically a much greater event has already taken place.

Hirano: To put that another way, the current Fukushima accident gives us a chance to reconsider the enormity of the past contamination from US and Soviet atmospheric tests, which has not been openly discussed.

Koide: Yes, that's exactly right. In fact, it is the masses of people who need to realize the impact of the contamination on them. In the case of the Fukushima disaster, for example, they need to be aware that some radioactive material is reaching the North American coast, and the prevailing westerly winds will carry anything released into the atmosphere to the US. Those earlier numbers from the Japanese government indicate that the levels for Cs-137 in the atmosphere are 168 times those of the Hiroshima bombing. I've been told that level is 1.5×10^{16} Becquerels [Bq]. These exponents can be a pain to process, so if we think of it in peta-units—which is 10^{15} —we get essentially 15 petabecquerels [PBq]. That said, while we are not really sure this is the number, we do know that a portion of this material will ride the prevailing winds across the Pacific Ocean. On the other hand, closer to the ground, the winds will be east, south, and north, and therefore this other portion will fall on Japan—and we can investigate the actual levels here: how much fell on this town, on this prefecture? Adding these up, it seems to be only 2.4 PBq. Which is to say of the total fifteen PBq, 2.4, or roughly only 16%, fell on Japanese soil. If the totals are higher, still a smaller share of the total contamination will have fallen on Japan compared with the Pacific, with the largest portion falling on the west coast of the United States. So why don't we hear complaints from the US? Why are there no calls for compensation? Whenever someone asks me this, I simply say that there just aren't any such complaints. Why is this so? Well the levels released by the US during the atmospheric testing were tens of times greater than Fukushima. They are the criminals, so they cannot ask for compensation from Japan. The U.S. government does not want to have to reflect on its own past, and I think they are eager to completely avoid bringing up anything like that conversation. That is why I believe it is so important that those who have been exposed to radioactive contamination realize what atmospheric testing has done to them.

Kasai: I'd like to get back to the moment of the accident in some detail. On March 11, 2011 we had the East Japan Disaster (meaning the earthquake and tsunami off Tohoku). You've

already talked about the string of accidents at the nuclear plant. At the moment the accident was taking place, you were following the response by the Japanese government and the Tokyo Electric Power Company (TEPCO) in real time. What did you see in those initial moments?

Japan's Nuclear Map and Epicenter of the Earthquakes of 3.11

Koide: It was truly a disastrous response. On the 11th I was in the laboratory in Kyoto as March was my month to work in the radiation-controlled area.³ It was normal workday hours and various tasks kept me busy working within the controlled area. Of course there is no TV or anything like that in the work space. That night there was a meeting so I came out to attend and that's when I saw the images of the Sendai airport being swept away by the tsunami. The report said that there had been a devastating earthquake and tsunami. Then I wondered about the safety of the nuclear plants.

Right then, there really was no more information. We had scheduled a nuclear safety issues seminar for the 18th. I've participated in hundreds of these seminars. Participants from the Ukraine had just arrived on the 11th. We promised to go out drinking after they arrived and so that night I went out. There was no more TV, and while there was a vague unease among us, that's how we spent the time.

The next day I learned that all power at Fukushima had been lost and I knew things were not going to be simple. Then at noon on the 12th the roof of reactor one was blown off; at that point any expert must have known there had been a reactor meltdown. So I was certain of a core meltdown and because once it has gone this far, there is no going back, it was time to call for anyone who could evacuate to do so. I thought we were at that stage on the 12th.

Yet neither the government nor TEPCO said a single word about a core meltdown; they announced that the incident merited a 3 or 4 on the International Nuclear Event Scale. I remember thinking "You've got to be kidding! There's already been a meltdown. This is at least a level 6 or 7." But neither the government nor TEPCO gave any indication of this and there was no word of it in the media either.

One by one there were explosions at reactors 3, 4, and 2. As an expert in nuclear power, I understood there was absolutely nothing that could be done. I thought people needed to be evacuating, but still the Japanese government didn't make the call. Government officials had set up at an off-site center near a power plant in Fukushima—at first they announced evacuation inside two kilometers, then that expanded to three, five, ten, and finally twenty km. After that nothing was done. The offsite center was supposed to coordinate the emergency response in the event of an accident, but it turned out that every one of the officials fled. They left the employees behind and fled. The Japanese government's response was indescribably cruel.

Kasai: It seems the very words "meltdown" (メルtdown) and "core meltdown" (*roshin yōyū*/炉心熔融) were strictly forbidden.

Koide: Exactly.

Kasai: I was in Japan watching on TV. What shocked me was all the nuclear power experts explaining the incident in the studio. I suppose it was a satellite relay, but when reactor number three exploded on our screens they were giving their analyses of the explosion in real time. There were experts on TV saying that the reactor had a blast valve that was used successfully. Even hearing that, an average viewer might think something was amiss. But having physicists, experts on radiation, on TV saying these things, well, even the average viewer wouldn't buy that explanation. In a broad sense, nuclear experts like yourself played several roles in the media and government.

Koide: Yes, that's clearly true for pronuclear experts. They all tended to tell a story that underestimated the accident. Immediately after the accident public announcements and information were restricted. As a result individual opinions or statements were strictly forbidden and nearly all experts remained silent, so even basic information was not broadcast. Though I'd made statements from the nuclear lab beginning on the 12th, it is likely there were instructions from the Ministry of Science and Education to silence me. The head of the lab convened several meetings where he told each of us not to make any statement, that the lab would toe the official line when dealing with the mass media. I thought this was wrong and said that anyone who was asked a question by the media should answer it, further saying that if I were asked a question, I had a responsibility to answer. Since then I've continued to make statements in the media. Still the large majority of nuclear researchers were not able to do this.

As a result it was the pronuclear researchers who monopolized the interpretations - exactly. So as they went to the TV studios I think each was told: "Today, it's your turn to go to the studio." I think that's how they played their part and handled the media.

Kasai: With respect to controlling information, would you say your experience with the head of the nuclear lab shows how the professional organizations exert pressure on the universities?

Koide: Yes, I would. The head of the lab opened a conference with all the other laboratories—even I went. There he said that any statements to the media should be on message and come only from the information office.

Kasai: So pressure came from academic conferences.

Koide: Yes, there was pressure coming from the academic conference side as well. Take for example something like a conference on nuclear power. From the very start it was never a real discussion; it was a meeting of powerful and vocal spokesmen for the nuclear community or village (*genshiryoku kyōdōtai*/原子力共同体 or *genshiryoku mura*/原子力村), which is to say the group of pronuclear government officials and private companies mainly centered around the LDP and Toshiba, Hitachi, Mitsubishi, and other pronuclear manufacturers of power plants—and of course their supporters in the media. Thus as an organization the conference was predisposed to underestimate the accident and to then promote that underestimation.

Hirano: Immediately after the accident you testified in the Diet presenting data indicating the seriousness of the disaster and demanding that the government terminate the operation of all the power plants.⁴

Koide: I did.

Hirano: After that it seems you weren't again asked to speak publicly, or given the opportunity to offer more detailed thoughts on the situation.

Koide: By "speak publicly" you mean in the Diet or in some other official government setting?

Hirano: Yes, and also in the media.

Koide: With respect to the media, I've never really had any confidence in them. Since the accident, I've been overwhelmingly busy and haven't accepted a single invitation from TV stations.

Hirano: I see. So there were invitations.

Koide: There have been many calls saying, "come down to the studio." But I always tell them that I am too busy for this sort of thing. I'd say, if you come to my office, we could meet. Many did come by, even back then. But as everyone knows, in television you might talk for an hour and none of it makes it on air, or if it does, it's maybe thirty seconds.

Hirano: Right, and only the convenient parts.

Koide: That's it and there's really nothing that can be done about it. There was, however, one outlet for which I was extremely grateful: the daily radio program called Tanemaki Journal (種まきジャーナル).⁵ There I could go on every day and offer my thoughts live. I wish it could have continued, but it was completely and totally smashed. What a world we live.

Kasai: So, on the subject of standards used for assessing the danger posed by radiation for the human body and the environment: What are your thoughts on how the government deals with this issue?

Koide: They are absolutely not dealing with it at all. I think you already know this but in Japan the average person is not supposed to be exposed to more than one milliSievert per year—that's set by law. Why is that the level decided on? Because exposure to radiation is dangerous. If exposure weren't dangerous, if low levels of exposure were safe, there'd be no problem even without that legal limit. But exposure to radiation is dangerous—this is the conclusion of all research. So every nation in the world has set legal limits for exposure.

For people like me who get paid to work with radiation, it's not really possible to observe the 1mSv/yr limit [1mSv/yr]. We're told that in exchange for our salaries, we accept exposure to twenty milliSieverts a year. That's the standard I work under in my job. But the current Japanese government has now stated that if contamination is under 20mSv/yr somewhere, that place is safe to return to—safe to return to even for children. This is way beyond common sense.

Hirano: What is the basis of this claim? Why would the government announce these numbers and forcefully declare these areas safe to return to? What's the basis for the government's numbers?

Koide: The basis for those numbers...for example the government says that organizations like the IAEA or the ICRP [International Commission on Radiological Protection] suggest that in emergencies during which the 1mSv/yr standard cannot be maintained standards should be set between twenty and 100mSv/yr. The government seizes on this and declares that since the IAEA and the ICRP have said this, that 20mSv/yr is therefore a safe level—usually adding that membership in both the IAEA and the ICRP is voluntary anyway. But because these organizations have said this is no reason to break Japanese law. If Japan is a nation governed by the rule of law at all, surely this means that the very people who make the laws should also follow them—that should be obvious. But these guys have

declared 20mSv/yr safe even for children. There is absolutely no way I can consent to this.

Hirano: So there is no scientific basis for these levels.

Koide: Well... the danger corresponds to the amount of exposure—you probably know this—so for a country that has declared its intention to maintain the 1mSv/yr standard to then turn around and ask people to endure twenty times that level, there is no scientific basis for that declaration. That's a social decision.

But if you want to inquire as to why, as I've mentioned to you, some 2.4 petaBecquerels of radioactive material have fallen on Japan, that material has been dispersed, contaminating Tohoku, Kanto, and western Japan. So in addition to the law setting the legal limit for exposure at 1mSv/yr, there is another law that states that absolutely nothing may be removed from a radioactive management area in which the levels exceed 40,000 Becquerels per square meter.

So the question becomes how many places or how much area has been contaminated beyond 40,000 Bq/m²? And according to the investigations, that answer is 140,000 km². The entirety of Fukushima prefecture has been contaminated to where all of it must be declared a radioactivity management area. Indeed, while centered on Fukushima, parts of Chiba and Tokyo have also been contaminated. The number of people living in what must be called a radiation-controlled area is in the millions, and could exceed ten million.

For me, if Japan is in fact a nation governed by the rule of law, I believe the government has the responsibility to evacuate these entire communities. Instead of taking a proper action to secure people's livelihood, the government decided to leave them exposed to the real danger of radiation. In my view, Fukushima should be declared uninhabitable and the government and TEPCO should bear a legal responsibility for the people displaced and dispossessed by the nuclear disaster. That's what I think, but if that were to be done, it would likely bankrupt the country. I think that even though it could bankrupt Japan, the government should have carried out the evacuation to set an example of what the government is supposed to do. But obviously those in and around the LDP certainly didn't agree. They've decided to sacrifice people and get by taking on as little burden as possible. So they've made the social decision to force people to endure their exposure. In my view, this is a serious crime committed by Japan's ruling elite.

I would like people to know just how many thousands of people live in this abnormal situation where even nuclear scientists like me are not allowed to enter, not to mention, drink the water. It is strange that this issue has been left out of all debate over the effects of the radioactive exposure. We must be aware that contemporary Japan continues to operate outside the law in abandoning these people to their fate by saying it's an extraordinary situation. Under such circumstances, I think, there are a multitude of symptoms of illnesses in contaminated areas. But if we're talking about any given symptom, it's hard to say since we just don't have any good epidemiological studies, or even any good data. But there will surely be symptoms, namely cancer and leukemia. However little exposure to radiation is, it causes cancer and leukemia—this is the conclusion of all current science. These symptoms are said to become visible 5 years after the initial exposure. But because radiation is not the sole cause of cancer or leukemia establishing a direct causal relationship is extremely difficult. For this very reason we need to continue to investigate the state of exposure by conducting rigorous

epidemiological studies. But this government wishes instead to hide the damage so I'm afraid no such study is on the horizon. In addition, I have heard about many cases of nose bleeding, severe headaches, and extreme exhaustion. And I am truly concerned about small children and young people living in Fukushima as they are most vulnerable to exposure.

Hirano: So what is your view of the actual damages of radiation exposure on human health?

Koide: On the evening of the Fukushima dai-ichi reactor accident of March 11, 2011, a Radiation Emergency Declaration was announced. The Declaration suspended existing Japanese law concerning exposure to radiation. Though Japanese law sets the limit for exposure for the general population at one milliSievert a year [1mSv/yr], the new permissible level would be 20 mSv/yr. That Emergency Declaration is still in effect. It is common knowledge that even low levels of exposure are dangerous. Including even infants in this newly imposed 20mSv/yr standard will obviously lead to various diseases. Further, because the monitoring equipment was destroyed at the time of the accident we do not have accurate data on the exposure levels of the residents. Numerous cases of thyroid cancer have been found. The prevalence of thyroid cancer is dozens of times that of normal incidence. Pro-nuclear groups say those numbers are the result of the screening process itself, not the effect of radiation exposure. Which is to say that this was the first major screening of that population and so it was natural that many cases of thyroid cancer would be found. Put differently, what they are saying is that they have never conducted a thorough study of radiation exposure and its impact on human health. Science should acknowledge what it already knows and what it does not. If it is true that there is no established scientific data, a properly scientific approach would be to carry out a thorough investigation. To deny the damage to health by exposure to radiation without such an investigation is absolutely at odds with the scientific spirit. Prof. Tsuda at Okayama University has already conducted a detailed study on the outbreak of thyroid cancer, showing an epidemiological-like outbreak. Just as happened at Chernobyl, as time passes it is clear there will be more and more instances of all kinds of illnesses.

Hirano: In your books you've often stated that there is no uncontaminated food. But for most Japanese, such basic knowledge seems limited to food from Fukushima, and nearby parts of Ibaraki, Gumma, Chiba, Miyagi. For food produced outside these areas, do you think it's necessary to have strict testing of food that is sold and consumed? What is to be done? Do you think food from outside these areas should also be subject to strict testing before being sent to market and consumed?

Koide: Right, as we discussed earlier, before the Fukushima accident the entire globe was already contaminated with radiation. This means that Tohoku or Kanto or Kansai food, all of it, has been contaminated with radiation—radiation from atmospheric tests. Beyond this, contamination from the 1986 Chernobyl accident reached Japan on the prevailing westerly winds, meaning that all Japanese food was contaminated. And on top of all this, with the Fukushima disaster, as I mentioned, it is not that a thick layer of contamination has dispersed to every corner of the globe from Fukushima, but that this thick layer of contamination is right now centered on Fukushima.

So if we were to carefully measure the levels of food contamination, we'd more or less find moving out from the highest levels in Fukushima to say western Japan or Kyushu,

that the numbers would gradually decline to the lower levels received from the atmospheric tests. Right now the people of Fukushima have been abandoned in the areas of the highest levels of radiation. And abandoned people have to find a way to live. Farmers produce agricultural goods, dairy farmers produce dairy products, and ranchers produce meat; these people must do so in order to live. They are not the ones to be blamed at all.

As the Japanese state is absolutely unreliable in this matter, these people have no choice but to go on producing food in that place, all the while suffering further exposure. So I don't think we can throw out the food they produce there under those conditions. Inevitably someone has to consume that food—I suggest it be fed to the pronuclear lobby (laughs). We should serve all of the most heavily contaminated food at say the employee cafeteria at TEPCO or in the cafeteria for Diet members in the Diet building. But that isn't nearly enough. We must carefully inspect the food, and once we've determined what foods have what levels of contamination, once that is fully measured and delineated, then those who have the corresponding levels of responsibility should eat it, should be given it. Now of course strict levels of responsibility cannot really be allotted one by one to individuals that way, so when it comes to this food, I would propose devising a "60 and over" system. The most contaminated foods could only be eaten by those 60 years old and older, and from there also have food for "50 and over," "40 and over," "30 and over" - giving the best food to children. For example, school lunches would get the most uncontaminated food available—there'd still be contamination from the atmospheric tests—but food with only those levels would be given to children and only adults would receive the contaminated food. That would be my proposal.

My proposal would first be a precise measurement, starting from Fukushima and then of course including western Japan and Kyushu, to sort out the levels and then determine the relative burdens. I am aware that this is a controversial proposal, but each one of us, especially those who built postwar Japan, bears responsibility for allowing our society to be heavily dependent on nuclear energy without carefully reflecting on the risks and consequences of it. And more importantly, we have the responsibility for protecting children.

Kasai: Recently, that idea has been suggested in Nishio Masamichi's *Radioactive Archipelago* (*Hibaku retto*/ 『被ばく列島』). You've just stressed that though the first step must be a rigorous measurement, right now that is simply impossible.

Koide: Right, completely impossible.

Kasai: So, that's true of water as well. First I don't think most people know how to measure the levels in water. You've already said how the current minimum standards are worthless, that below a certain threshold it would be displayed as "ND" (Not Detectable). For example, for tap water, up to 20 Becquerels would be posted as "ND," exactly as if there was no radiation detected at all. Yet even with all these doubts on measurement, we must start with it, though it's a dizzyingly long road ahead. But what do you think can be done to change this situation for the better?

Koide: Right now Japan has a standard of 100Bq/kg for general foodstuffs. Before the Fukushima disaster, Japanese foodstuffs were contaminated—by the atmospheric tests—at a level of 0.1Bq/kg. Of course there were some foods with less contamination and some with more. Still, roughly speaking it was 0.1Bq/kg. So when you're talking 100

Bq/kg that's allowing 1,000 times the [pre-Fukushima] levels.

As I said before, any exposure is absolutely dangerous. And the dangers increase corresponding to an increase in levels of exposure; this is the conclusion of all research. 100 Bq/kg is dangerous, 99 is dangerous, as is 90, and 50, and 10—they are all dangerous. 10 Bq/kg is 100 times the pre-Fukushima levels.

So I think it's necessary to precisely measure the levels of contamination. As many people are living in a state of anxiety, groups like consumers' cooperatives and other sorts of organizations are trying to measure the contamination on their own. But the measuring devices that these groups are able to get, such as the ones called NAI, these devices can only measure levels above 20Bq/kg. While this means that they can measure levels as little as one-fifth of the national thresholds, from my perspective even this lower level is far too high.

And the worst thing that could happen is thinking that any contamination below the detectable limits of these machines, meaning below 20Bq/kg, would be misunderstood as being free of contamination, and then having the Fukushima prefectural government actively using this data as good news: "measurements below the detectable limits of the device must be clean; we can even serve this food in school cafeterias," or PR campaigns announcing "Fukushima produce is safe." Of course it would be totally outrageous and unthinkable and yes I think every effort should be made to serve the least contaminated food in school cafeterias—but the reality is that any food tested below detectable levels is distributed to schools as safe produce.

I think we need to stop this situation, and technically speaking, I think several germanium semiconductor detectors must be deployed instead. But a germanium detector would cost from \$100,000 to \$200,000. And in order to use it, the detector needs to be kept at 150 degree below zero Celsius. So these are not devices that the average citizen is going to be able to use.

So no matter how dedicated any individual citizen may be, there are real limitations when it comes to measuring radiation levels. If you ask me what should be done, for example when faced with Cs-137 or Sr-90, what should be done about these contaminants? Well these contaminants were produced in a nuclear reactor at TEPCO's Fukushima Daiichi plant and it means that they are unmistakably TEPCO's property. And if their private property is found to have contaminated other areas they have undeniable responsibility for it. So I think this is something that is required of TEPCO. I think it is TEPCO's responsibility to precisely measure which foods have been contaminated, and to what extent, and then to report the results to the public. I think this is something the public should demand. After TEPCO the government also has responsibility—they gave their seal of approval to TEPCO after all. So the public should also demand that the government precisely measure the levels and publish the results.

Because there are limits to what one can do on one's own, I think we need a movement that forces the government and TEPCO to take responsibility for the precise measurement of the contamination.

Hirano: Some have raised doubts over precisely this kind of rigorous measurement citing possible damage caused by rumors or misinformation (*fūhyōhigai*/風評被害), but to me this sort of criticism is tainted with a sort of "national morality" discourse (*kokumin dōtokuron*/国民道徳論).

Koide: Yes, I think so.

Hirano: There seems to be a very strong sense of dividing people into those who are seen as patriotic and those who are seen as un-Japanese (*hikokumin*/非国民).

Koide: For me, I've been making statements on the Fukushima contamination. These statements have been denounced and even made some angry with me. But the contamination is real. For a long time now I've been the kind of person who would rather hear the truth, no matter how awful, than to remain ignorant. I am absolutely not going to hide the truth; no matter how much criticism I have to take I am going to diligently report the truth. Yeah, a lot of people get angry with me. (Laughs).

Kasai: On this point, this year saw the publishing of Kariya Tetsu's manga series *Oi shinbo: Fukushima no shinjitsu* (『美味しんぼ – 福島の実』).⁶ It would seem a kind of political campaign was developed to attack it. What is your take on this?

Koide: The editors sent me a copy and I've read it. It's an awesome manga. In this day and age we just don't have this kind of detailed manga on this problem and I am grateful for it. And more, *Oi shinbo* talks about the nosebleeds [caused by radiation]. The nosebleeds are real. Lots of Fukushima residents are said to be suffering from nosebleeds. Itokawa, the mayor of Futaba machi, has shown us proof. One of my acquaintances often talks about the nosebleeds.

It was true at Chernobyl, too. But nosebleeds have not been definitively and scientifically linked to exposure to radiation.⁷ Still there is no denying that it is real and happening. So even if current science is unable to explain it, it's for science to ask just what is going on? Science has a duty to explain this, to tell the truth without obfuscation. No matter the reasons, we should be allowed to tell the truth. So for me I don't think there is anything wrong with this part of *Oi shinbo*.

Kasai: I think *Oi shinbo* clearly exposed the politically constructed narratives "damage from rumor or misinformation" and "emotional bonds" (*kizuna*/絆) as fictions, and so for this reason it appears it had to be crushed.

Koide: Exactly. But Kariya, the author of *Oi shinbo*, is not one of the criminals responsible for the Fukushima disaster. Rather the government officials who caused the Fukushima disaster are the criminals. Yet it is these same government bureaucrats who now come out and complain that this manga is out of order. I say, "No, it's you who are out of order. We need to send you to prison right now."

But isn't it always the case that a criminal who has committed a crime remains unquestioned and so starts bashing those who are telling the truth? When that happens I think the problem is precisely this word you just used "emotional bonds." Since Fukushima, I have come to hate this word. (Laughs).

Hirano: "Bonds" seems to be the new nationalism, doesn't it?

Koide: Yes, yes it does.

Hirano: You've often said that the Japanese economy and the people's lifestyle would be fine even without a single nuclear power plant. In fact, since the government shut all the nuclear reactors down, the people have experienced no real trouble at all. In addition, considered in light of world standards we still have material riches and a lifestyle of surplus. Given this, what are your thoughts on the call to restart the reactors? For what purpose, what reason do you think the government has?⁸

Koide: First of all, the power companies don't want to go bankrupt. In other words, the

heads of the power companies do not want to take personal responsibility. For example, if the reactors are restarted and there's an accident, are the heads of the power companies going to be punished? We already know that they will not be. Even after the Fukushima disaster neither the chairman, nor the CEO, nor anyone below—not a single person—was punished.⁹ It certainly looks as if the reactors are restarted and there's an accident, the heads of the power companies would not be required to take any responsibility. The heads of the power companies, from Kyushu Electric to Kansai Electric, have received this message loud and clear.

What's more, if the nuclear power plants are idled and not allowed to restart, then all the capital they represent becomes a non-performing asset. And of course this is anathema to anyone in management.

Hirano: If we could return to a technical discussion specifically how to decommission a reactor. As have others in your field you've already stated that a full end game cannot be envisioned yet. Still could you talk about what makes this issue so difficult?

Koide: By decommissioning you mean the endpoint of the Fukushima reactors?

Hirano: Yes, what does it mean for Fukushima dai-ichi?

Koide: When we say decommission we basically mean: How do we fully contain the radiation? At least I think that's the main point. Now this is impossible if we don't know the status of the melted core. Though it's been four years since the disaster we simply do not know where the core is or in what state it is.

This is a situation that only happens in nuclear accidents. However large a chemical plant explosion may be there'd probably be an initial fire, but usually after several days, perhaps weeks you'd still be able to go on site and investigate. You'd be able to see just how things broke down. And in some situations might even be able to fix them. But with an accident at a nuclear plant you cannot even go on site four years later—probably not even ten years later.

Hirano: Because the contamination is so severe that no one can come close to it.

Koide: Yes. For humans going there means instant death, so the only way at all is to use robots. But robots are extremely vulnerable to radiation. Consider, robots receive their instructions through series of 1s and 0s, so should the radiation switch a 0 to a 1 you'd end up with completely different instructions. Essentially robots are useless. Even if you are able to send them in they can never return. Because this has been the case up to now, the only way left in the end might be to use robots that try to avoid exposure or that are built as much as possible to withstand exposure, but that is no simple thing.

So it means until we figure out what to do it would still take many years. Once you understand this fact you can start thinking about what can be done. And at the very least the "road map" devised by the government and TEPCO is the most absolutely optimistic road map that there could be. They are convinced that the melted core fell through the bottom of the pressure vessel and now lie at the bottom of the containment vessel—basically piling up like nuggets of the melted core. There's no way this would be the case. (Laughs).

As the severity of the disaster became clear, water was repeatedly thrown on the reactors. This water would evaporate and dissipate continuously. That was the actual situation. There is no way that the melted core would have stayed as slimy liquid and then piled up like so many little nuggets. It should have been scattered all over the place.

This is how the government and TEPCO's roadmap goes: The buns would stay at the bottom of the containment vessel, above which is the reactor pressure vessel—a steel pressure furnace. With the furnace floor broken open, there is a hollow at the bottom through which the melted core must have leaked.

So at some point both the containment vessel and the pressure vessel would be filled with water and they'll be able to see the nuggets of melted core by looking from above down into the water. They say the nuggets (the fallen material), yes, that they sit some thirty to forty meters below the water's surface, that they'll eventually be able to grab and remove them. This is all it takes, according to the government and TEPCO's roadmap. Not a chance. This simply cannot be done.

Hirano: Obviously we can't confirm or really say anything definitive about the situation in the reactors, but what do you think has happened?

Koide: I simply don't know. But as I have mentioned, this whole "nugget" scenario is just not the case, and so I think the materials are scattered all over the place. Though the containment vessel is made of steel, if the melted core has come in contact with that steel, just as it ate through the floor of the pressure vessel, it could possibly have melted through the containment vessel. Depending on how things developed this, too, is a possibility. Unfortunately, I simply do not know.

Hirano: If that is in fact the situation, what steps are necessary?

Koide: First, as we talked about earlier, radiation must be prevented from being released into the environment. As I consider this task as "decommissioning" or the final containment of the accident, I think in order to prevent the release into the environment you must do whatever you can starting from the worst-case scenario.

There are situations in which the containment vessel can suffer a melt-through. I think this likely has already happened. And if it has happened what should be done? Outside the reactor there flows ground water. If the melted core were to come in contact with the ground water, the whole situation would be unmanageable. While this may have already have happened, in order to get any kind of control over the situation, some sort of barrier must be built to prevent the melted core from reaching the ground water. I've been saying this since May 2011—and they have not done a thing.

Kasai: This barrier would be an ice dam, a wall of super-chilled soil.

Koide: That's the most recent idea. But it simply cannot be done successfully. It would cost billions of dollars. And it would fail. And when it did fail they'd say there's nothing to be done but build a concrete wall. No matter how foolish an idea may be, they'll just keep moving from failure to failure.

But really, for the construction companies that's a good thing. I think Kashima would be the ones to build the super-chilled earth wall, for some billions of dollars. And if it doesn't work—they wouldn't have to take responsibility. Next they'd build an impermeable concrete wall. Several huge construction firms (*zenekon*/ゼネコン) would be contracted and would all make billions.

But considered from the perspective of actually ending the disaster, it would be a series of failures. Personally, I think an underground, impermeable wall needs to be built immediately. They are not going to be able to remove the material. All that can be done is to contain it. Underground the wall needs to be strengthened; above ground the only choice is some sort of sarcophagus like the one they built over Chernobyl. But even this

would take dozens of years—I'll probably be dead by then.

Kasai: There are temporary tanks sitting on land for this water, but they are starting to leak. What should be done about this contaminated water? There's not enough space for all of it on land; it cannot be controlled; and every year the volume grows larger.

Koide: The radioactive water has penetrated the coastline around the Fukushima Daiichi. Underground water in the large area of Fukushima has been seriously contaminated. And at some point those contaminated water tanks will fail. I thought we must do everything that we possibly could. Already in March of 2011 there was some 100,000 tons of contaminated water. Even then I proposed moving it but didn't get anywhere with it. Now there's up-to 400,000 tons. In the near—meaning not too distant—future there will be nothing left but to release it into the sea.¹⁰ The water contains plutonium 239 and its release into the Ocean has both local and global impacts. A microgram of plutonium can cause death if inhaled.

Contaminated Water Tanks

Kasai: It appears that they are already moving toward that direction a little at a time aren't they.

Koide: The Nuclear Regulatory Committee has been hinting at the possibility of releasing it into the ocean.

Kasai: They have been trying to persuade the fishing cooperatives and others to allow the release.

Koide: Yes, they have.

Kasai: Something that has not been much of a topic of discussion today is decontamination. It has become a rather large industry, in other words, "the exposure industry" (*hibaku sangyō*/被曝産業). Do you think decontamination is really meaningful and effective?

Koide: Yes, I do. And we must do it. But, to say that because we've decontaminated some area that the whole issue is resolved, or that people may safely live in a decontaminated place—I think that is a real problem.

First, fundamentally, people must not be forced to live in contaminated areas that must be decontaminated. First must come complete evacuation. The state must take on the responsibility to allow whole communities to evacuate. Of course, they did not do this.

Briefly, I use the word "decontamination" (*josen*/除染), which is a compound word written with the characters for "remove" and "stain." But this is something that cannot be completed when it comes to radiation, so the original sense of the word "removal of contaminants" is impossible. But as long as people are abandoned in the contaminated areas, I believe all possible actions should be taken to lessen their exposure. It is essential that the contamination be removed as far away as possible, to be transported far from where people live. For this reason I prefer to call it "[toxic] relocation" (*isen*/移染).

But even if this is done, that does not mean that the radiation has been erased. This stuff contaminates everything from mountains to what have you, it gets into the space of people's lives. When that happens it must be removed. But removal merely means

moving it around—it does not mean eliminating it. It means another job is waiting to handle the contaminated materials that get moved around.

Right now the authorities say they want various prefectures and other local governments to build a temporary storage and bury the accumulated contamination there.

We talked about this before, but the contaminants themselves were clearly formerly in the reactor at TEPCO's Fukushima Daiichi plant and are therefore also clearly TEPCO's property. So while it is residents who are doing the hard work of collecting all these contaminants, I think it would be right and just for these contaminants to be returned to TEPCO. Earlier prof. Kasai told us the contaminants were being called "no-one's property" (*mushubutsu*/無主物), but I say in all seriousness, the conclusion of my logic here is to say to TEPCO: "Hey, this is your crap" and return it to them. That way the residents are not forced to accept the stuff, TEPCO is. The best solution is to return all of the material back to the Fukushima Daiichi plant, but that is not possible. Right now that place is a battlefield between poorly paid workers and the radiation, so I don't see this as a possibility.

What I would most like to do is have TEPCO's headquarters buried under all the radiation, but whenever I say this people just laugh. (laughs)

I do have a second proposal. Fifteen kilometers south of Fukushima Daiichi [Fukushima 1] is the Fukushima dai-ni [Fukushima 2] nuclear plant. There is a lot of wide open space there. So first off we would return the Fukushima 1 contamination to TEPCO there. I think there would be enough space, but if there were not, the rest could be taken to TEPCO's Kashiwazaki Kariya nuclear plant. It's the world's largest nuclear plant and so there is a lot of space. I think turning that place into a nuclear waste site is a good idea.

Lately I've been invited to Kashiwazaki¹¹ and talked about it. I think I've become a hated man there. (Laughs). But I think taking full responsibility for various actions is the most important thing. And when it comes to this particular disaster no one has greater responsibility than TEPCO. As I think it important for one to take full responsibility, if Fukushima 2 doesn't work out, then Kashiwazaki Kariya is the only other option.

Hirano: State expenditures for decontamination have supposedly reached one trillion yen.

Koide: It's more than that.

Hirano: This summer I spent some time in Iitate village. Of course at the time the place was crawling with decontamination workers. It was a truly bizarre scene. I had the feeling of running around on a moonscape. Of course there were no residents there—just decontamination workers in strange gear, trucks running all over the place. Looking at that scene, being shown the actual work of decontamination, it seemed to be an excruciatingly slow—even endless—endeavor. I mean they were scrubbing everything with small brushes. I was able to ask the workers a few questions—off the record. Many were people from Hokkaido, Okinawa, and Fukushima who had lost their homes. It was a collection of modern day migrant workers and victims of disaster. They said that they work for just 15,000 yen a day.

I asked them if they thought their work was doing any good. They said they needed the money and honestly had no way of knowing if this sort of minute and delicate work would remove the contamination.

Was this a mistake? Is scrubbing everything by hand and then dumping it all in the ground really the only way to decontaminate an area?

Decontamination Workers

Koide: Well I think both that it is and it isn't effective. For example, when they first started the decontamination work, what they did was blasting everything with high-pressure water hoses. That's bad. All that does is get all the contamination moving around. It's really just dispersing it.

Some of my colleagues have said that is a bad method. Be it a roof or a wall, you shouldn't just douse it with water. To really remove the contamination, you would first cover it with something that could prevent the escape of radioactivity then knock down the radiated structure, tear it all off, and then fold it up and collect it all. I think that's probably true. But it takes a long time.

I think there are effective ways of doing it and I think there are ineffective ways. Still it is fundamentally impossible to erase the contamination and so it must be moved. The only thing we should be doing is thinking about the easiest way to relocate it all.

Hirano: That's the meaning of "effective" in this situation isn't it.

Koide: Right. So the current method may be rather small in scale. But for me even small-scale methods are necessary. As long as people are living there everything is necessary. Of course, there's legitimate criticism over the fact that this is a decontamination business and that the large construction companies are getting rich, but again, for me, as long as there are abandoned people still living there it all must be done.

Hirano: It was really a shock going there and seeing it. To see those workers and, honestly, their lack of conviction for the work. It was a really weird scene. No real enthusiasm, but rather one day after the other, contingent labor. The media has reported that the workers come from a few particular prefectures, but actually being there and talking to them, I could really get a true sense of the structure of economic inequality in Japan, that this sort of work found this kind of person, a person coming from economically precarious and socially marginalized backgrounds. In fact, you come to understand that decontamination work depends on these people.

For example, decontamination, or your preferred "relocation," couldn't those jobs be made more equitable—say by requiring TEPCO office workers, especially executives, to do it?

Koide: I've said that.

Hirano: You have? (Laughs).

Kasai: So...about the airborne radiation dosage and the soil contamination, there is a public entity that measures and publishes the airborne levels. But the soil contamination is not measured. I remember reading about Chernobyl that the soil contamination levels are the standard by which one gets the right to evacuation and refuge. But Japan only

measures the air. And there are those who doubt the accuracy of the levels recorded. I thought the soil contamination had not been measured yet, but from what you mentioned earlier, we do know the extent of the contamination, don't we?

Koide: Yes, we do.

Kasai: The actual levels?

Koide: With respect to soil contamination we more or less know the extent of it. We largely know which prefectures, which towns, and which villages—as well as how badly—have been contaminated. Four years after the disaster it has moved around. Radiation moves through the environment; it has a material existence and also does die out. I'm sure much has changed since immediately following the accident. We have the data necessary to draw a map of the situation immediately following the accident, but we don't have the data necessary to draw a map of the contamination today. That said, we basically know the extent of the soil contamination.

Kasai: Who is it that is making these measurements?

Koide: It is basically the Ministry of Education, Culture, Sports, Science and Technology. Some local governments took part as well. Some independent groups, as well as some local governments, took part in taking measurements back then. But for us the number one data source is the US military.

Hirano: I see; how is that?

Koide: They worked at truly amazing speed-and accuracy.

Hirano: Sorry if this next thought seems a bit of a tangent, but right after the accident both the US and Japan were looking at the same data. But their interpretations of it were extremely far apart. The US ordered all of its personnel to evacuate an area 80 km from Fukushima. While Japan's largest evacuation zone was 20 km. Where does this disparity in evacuation zones come from? They are both looking at the same data. How do they arrive at such definitive and divergent judgments?

Koide: Well...and this was true for me, too, any nuclear specialist would have known on March 11th-March 12th at the latest-that there had been a meltdown. And this means, quite simply, that control had been lost. And once control is lost you simply don't know what is going to happen next-or that's what you must think at the time. Disaster preparedness must always imagine the worst-case scenario. If you don't plan for the worst-case scenario it will be too late. What the US did was believe there had been a worst-case scenario-a meltdown-and so moved to take care of its people. That's why they ordered an 80 km evacuation. I think this was the correct strategy. Japan didn't do this. Japan was always thinking of the ideal, the best case scenario. They had to be thinking they could still get control and based their policy on that optimistic assumption. So they only declared a 20 km evacuation zone. I would say that from this conclusion two things may unfold: one is their desire to see this as a best-case scenario and the other is their inability to deal with it.

Hirano: What do you mean by their inability?

Bags containing contaminated soil. This apocalyptic scene extends infinitely in the villages near the Fukushima dai-ichi

Koide: In a word, the Japanese state is incapable of functioning adequately when dealing with a disaster. That's why they evacuated those within 20 km by bus but when it came to the 30 km zone they told those who could easily evacuate to do so and for all others to merely close their doors and windows.

Hirano: So there was no emergency management.

Koide: None. There simply is not a single person in the Japanese government who had thought an accident like this was possible. They all immediately fled the off-site center and so there was absolutely no emergency management—there couldn't be. And because management was now impossible, there were no announcements. Even if they had declared an 80 km evacuation zone there were no emergency shelters. They had made no preparations, so there was nothing to be done.

Hirano: Last summer I interviewed Murakami Tetsuya¹² Just as the accident was happening he reached out to the government. But he got no response. He went to the prefecture. No response from them either. In the end he just used his own judgment. So really there was essentially zero emergency management in place. His thoughts at the time were to get the whole village to emigrate; that really there was nothing to do but to buy land and move to Hokkaido. He said these were his actual plans at the time. In fact, it would seem that the myth of safety has so totally permeated the bureaucracy that there really is no one who thinks about these things—wouldn't you say?

Koide: That's right. Not a single nuclear expert or policy maker ever seriously considered the possibility of an accident like this. I knew accidents were possible, and that when they happened the damage would be enormous; I had been commenting on the possibility, referring to some results of simulations. But still I would have thought the kind of disaster that happened at Fukushima was some kind of impossible nightmare—yet it actually happened. It was like the worse nightmare becoming a reality. And if even I thought this then all those pronuclear people surely never gave it a moment's thought. And so when it actually happened, no one had thought about, let alone built a system to deal with it.

II The Responsibility of the Scientist and the Citizen

Kasai: In your books and lectures you often express strong respect for Tanaka Shōzō.¹³ Can you connect what you've just said to this as well?

Koide: Sure. I first became aware of Shōzō when I was in the student movement during the 1970s This was a time when there was close attention paid to Japan's many pollution incidents, such as at Minamata. Personally I was working on nuclear power, but it was a time when, like it or not, we learned of all the harm that came along with building Japan into a modern nation. What I got from Shōzō was this epiphany that just like the Minamata disease right there before our eyes these sorts of pollution incidents went way back in Japanese history. With Japan's decision to cast off Asia and follow the West after the Meiji Ishin of 1868 came these sorts of incidents, and the question within that was just how should one live? I learned the way Shōzō lived his life. I thought: Wow, it is possible to live that way; I must do it. Unfortunately I am completely unable to do so, but I

never stop thinking that Shōzō's was a wonderful way to live a life.

Hirano: Going back to an earlier discussion. You've repeatedly talked about the government's responsibility, scientists' responsibility, and individual responsibility. It would seem that this word "responsibility" is an extremely important keyword for you. You often emphasize it in your writing, too. What I want to ask concerns the issue of scientists' special responsibility, a particular social responsibility. Scientists are often thought of as technicians, but this is not really the case. As a result, I feel you've pursued an intense interrogation of yourself as a scientist. As you've said you are not going to enter politics, could you connect this discussion of scientific responsibility to your earlier discussion of doing all that has fallen to you personally to do? How should we think about these two things?

Koide: I am in science and as such I have to take on the responsibility of a scientist—just as a politician must take political responsibility. I think I mentioned this to you the last time, but I am an absolute individualist (*tetteiteki na kojishugisha*/徹底的な個人主義者). I don't want to be constrained by anyone. I want to be able to decide my own life for myself. But because I've made this choice by myself I must also take full responsibility for that choice.

It's two sides of the same coin. I don't take orders from anyone. And this means that I alone bear the responsibility. It's really as simple as saying: I'm a scientist and so I have the responsibility of a scientist.

Hirano: On this way of thinking about responsibility: "Who is the subject responsible?"—this way of thinking about it seems to be quite absent in contemporary Japan.

Koide: Right. People living in Japan today have not made decisions as individuals. They just "go with the flow;" as long as they follow the "authorities" whom they believe will guarantee the happiness of their individual selves. This seems true of education, too. Go to a slightly better school; get into a slightly better company; grow a bit more rich, a bit more grand. I think everyone is swept up in this current, and it's really senseless.

I think it is extremely important that each and every individual live out their individuality. The absolute worst thing is for everyone to become blindly obedient to the "authorities," yet this is the Japan we find ourselves in today. And so no one takes any responsibility. Living in such a society it is too easy to say, "It can't be helped." Everyone is thus able to blame the society as a whole; "It can't be helped." And so no one takes any individual responsibility.

The most extreme and obvious example was the war. Everyone would say: "It's not my fault; I was deceived. The military were the culprits." Saying this allows people to remain at a distance, indifferent. It is bad news for a nation when its citizens have only this view of responsibility.

Hirano: You've declared, "I am an absolute individualist." Personally I am very interested in that statement. So could you speak a bit more concretely about the meaning of your individualism for how one lives a life? In other words, could you explain just what you mean by this "individualism?"

That is, in Japan being individualistic is more often a way to say egotistical; a sort of disregard of others. One should pursue one's own interests—in English the word is "selfish" — egocentric — pursue your own egotistic advantage. Now this seems completely

different from the way you use the term. Could you speak directly to this difference?

Koide: I think you've just done so.

Hirano: Did I? (Laughs). So that's it then, just as I said? Still it's clearly not selfishness.

Koide: No, I don't think it's about interests.

Hirano: It's about values isn't it?

Koide: Yes, it's about personal values. You and I are different people. I am different again from Mr. Kasai. Why? Well our genetic information is different. I received a bundle of information from my parents. You and Mr. Kasai, too, are influenced by your genetic information. Every one of the over one hundred million Japanese is a unique human being; and every one of the over 7.3 billion people on earth are unique individuals. History may keep moving on, and there is a big, wide world here on this planet earth. That said, right now, at this moment, and right now, in this place, I exist as an irreplaceable being. It is nothing but an absolute truth. You normally live in Los Angeles, but right now at this moment you are a person who is here. Mr. Kasai has come down from Tokyo. While acknowledging all the implications of being within the flow of history, we are all right here, right now.

In other words, every single individual human being has a different way of living a life; they are each unique. They have each lived a life that absolutely no one else could have lived. It is a real loss if they don't live up to their full potential. Those are my thoughts. So for my own unique self, and so for your own unique self, and Mr. Kasai's own unique self, none of us should be compelled by someone else to do something (*meirei o sarete*/命令されて). If we don't live our lives according to the will coming from deep within ourselves, that's a real loss; we must all live with our values coming from within ourselves.

I am going to retire next March, but though I am the lowest ranked employee here—above me are assistant professors and professors — because of the peculiar arrangements of working where I do, I am not compelled to take orders from anyone. I am the lowest ranked so of course there is also no one below me to order around. So I am in a position where I never take nor give orders. For me this is the ideal position to be in.

And so I can live out my own life according to my own values; I'm allowed to live a life that suits me. Now I found myself in this position largely by accident, and then chose to continue to live my life this way. Related to this, I am a human being and so will make mistakes, but these mistakes will be things that I have chosen, things that I have personally done so there is nothing to do but to take responsibility for them. This is what I mean when I say that responsibility is an extremely important word.

Hirano: Well, you've exhaustively criticized this competitive society. You've said that this competitive society has ruined Japan and destroyed life based on what you call responsibility.

Koide: Yes. Everyone is running towards the exact same goal. It's ludicrous. You want to go that way; I want to go this way. I think this would be the ideal society. Full mutual recognition is a good thing.

Hirano: Does your view come from your personal experience? In your books you state that you were a really conscientious student when you were younger (laughs).

Koide: (laughs) Well, yes.

Hirano: You studied extremely hard. Did everything extremely hard. You continued this in

your nuclear research in college believing that a new energy source was cheap and good for everyone. You must have thought this was a great thing.

Koide: That's right.

Hirano: But you eventually noticed that it was all wrong. So on this, from deep in your own experience, it's an individual history, an individual experience, in one sense it's connected to your current individualism, to how you live your life focused on the important things to you.

Koide: I think that's right. So, well, when I was young, in my late teens, I was consumed by the dream of nuclear power. I devoted my life to it. That was all a mistake—it did not take me too long to realize that.

Hirano: When did it happen? In graduate school?

Koide: My third year in university.

Hirano: Third year—so as an undergraduate.

Koide: Yes, I came to this realization in the latter half of my undergraduate studies. It was foolish and I curse myself for it, but I didn't quit. To this day I've lived my life as someone who made that wrong choice, and there is nothing to do but make amends for that choice. At a minimum I wanted to get rid of nuclear power before there was a bad accident. I guess I've lived with this wish for over forty years—but that wish stayed out of reach. And here we have had the accident so my life has been for nothing. You could say that thing I wanted most to do has been denied. Really, what have I lived for? I think about that from time to time.

As this was my choice I have to accept it. So while the meaning of my life may have been lost, still I was able to live my own life as I pleased, without submitting to the orders of others and without ordering others around—for this I am grateful. My hopes were never realized. History is full of that kind of thing. Likely very few people see their hopes fulfilled. And while in my case they were rejected, I was able to live the life I wanted and that is a life to be grateful for.

Hirano: In a way, it's just how Tanaka Shōzō lived his life isn't it?

Koide: Yes it is. That is what I like about Shōzō.

Hirano: On that point. His life, too, was a defeat.

Koide: Complete and total defeat.

Hirano: Still, he used all sorts of means, and followed all the way through on his beliefs.

Hirano: So getting back to Fukushima, it seems when it comes to the life choices of the so-called Japanese elites, they seem caught in a system in which they will succeed and become famous by crushing their individuality and subsuming it under some organization in order to get ahead in a society and achieve fame and status. And the education system seems to be promoting this lifestyle where these sorts of people are created through intense competition. I think the very end result of this social and educational system was revealed, and it exploded in an explicit and ugly manner through various problems the Fukushima disaster has posed.

Koide: Yes, I think so. You said it.

Hirano: I see. In one sense it would have been possible even for these Japanese elites to make their personal responsibility clear and take appropriate actions only if they had lived a life based on individualism as you suggested.

Koide: Yes I think such a possibility exists, but unfortunately in Japan today that

possibility has been completely crushed. It was abundantly clear from the Fukushima disaster that no one in this country is going to take responsibility.

Hirano: You've already talked about how TEPCO and the government made huge mistakes in dealing with the problem immediately after the accident. What do you see as the definitive mistake that led to this disaster?

Koide: There's a ton of them. Any specialist would have known right away there had been a meltdown, and that everyone needed to be evacuated immediately. And evacuating to 20 km away is totally inadequate. Iitate village some 40-50 km away received an enormous amount of contamination and was neglected for over a month.

Soma residents evacuated to Iitate, this kind of stupidity cannot stand, the government's criminal mistakes.

The Hosokawa family of Iitate Village continues to live in the heavily radiated area to look after their horses (2014). More than a dozen horses died since 2011.

Kasai: I'm deeply taken by your previous discussion on responsibility. It's really a story of something with no owner. A golf course that has had to close because it is considered contaminated with radiation from TEPCO's plant has recently sued. TEPCO's top attorneys argued in defense that the radiation is not their property, which would make it no one's property and therefore TEPCO is not responsible. It seems the opposite of what you've just said about responsibility, to be sure, yet this declaration of complete lack of responsibility, once passed through the logic and system of the courts, these lawyers have arrived at precisely this conclusion. It is not a question of individual responsibility; it is a problem of the social system. Lack of any responsibility is the basis of the entire social system. What are your thoughts on this?

Koide: It's exactly as you say. This is what it has come to. I couldn't care less about a country like that. But in order to overcome this situation, it's something I mentioned earlier, but there is no way but for rather foolish citizens to get smarter. Only each individual standing up for his or her own way is going to do it.

Hirano: You've also talked about "responsibility for being fooled." You've said that even the deceived are guilty and stressed that they too must take responsibility. How do you think about this at the individual level? For example, you've often stated that there should be a new food labeling system put in place by which especially the generation that agreed to build the reactors would be obliged to eat the contaminated food—would this be an example of taking individual responsibility for you?

Koide: Yes, that's exactly what I mean. So, because I think that every Japanese adult has responsibility for both allowing the rampant development of nuclear power and the Fukushima disaster, I said that they should be the ones to eat the contaminated food. And so that this disaster may never happen again, nuclear power must be eliminated—of course there should be no question of restarting the reactors. Yet, what I've just said is not really a widespread idea. Slowly all the reactors are being restarted.

Hirano: So in that sense Japanese citizens' responsibility is increasing in that they are allowing the restart of the reactors.

Koide: I think the nuclear power issue is precisely analogous to the war.

Hirano: Indeed, as with the damage of misinformation and national morality discourse we talked about and the pressure that comes from those hints of someone being somehow "un-Japanese," it seems to really resemble the war.

Koide: I think so, yes.

Hirano: I'd like to ask more about the responsibility for being misled. Up to now the reason most would say that nuclear power has been allowed is the myth of safety—a myth invented by the coordination of the government, TEPCO, and the media. So Japanese citizens have been robbed of being told the truth, of having the chance to know the truth.

Koide: That's true.

Hirano: So the likely response to your position would be that it's unjust to blame those who were robbed of the chance to know the truth. How would you answer this challenge?

Koide: I also said that the current situation is just like during the war. Then, too, the media only reported the information coming from imperial headquarters: The Japanese military enjoyed nothing but a string of victories. We were all told that because of the emperor Japan was a divine country and therefore could not lose. You would go to school and there would be the emperor's portrait hanging on the wall. There was a place where the emperor was enshrined right there on school grounds. Every child was taught that the emperor was present there.

In such a country it wasn't strange to think that Japan would win the war. But those who knew more about the world, including of course those in the military, knew that Japan could not win. Still they said nothing. And so everyone was swept along with the current. But history is harsh, and in the end Japan was battered. And people at that time said, "Ah, we've been misled. The military are the culprits." But even within all of this there were those who resisted the war. The number of people tortured and killed by the Special Higher Police was huge. And those people, too, were labeled as "un-Japanese" and ostracized from society by the majority of the population. Whole families, whole groups of people were obliterated.

So those who lived then were duped, they were given false information. But should they say that's where their responsibility ends? I would respond that even if they were duped, the duped still bear the responsibility of the duped. How did each and every one of them live their lives during the war? How did they deal with the information they were being given? I think we need to include these kinds of questions when we interrogate ourselves over taking responsibility. Now if you say this people get angry but I think without question the emperor has absolute responsibility for the war. We ended up moving on without trying to pursue the emperor's war responsibility.

Even today you'll see people happily shouting "Tennō heika banzai," Long Live the Emperor. At midnight NHK will broadcast the Japanese flag flapping in the wind. I can't stand that and so don't watch TV. Most Japanese get happy when they hear 'honorable' addresses by His Majesty the Emperor or news about the imperial family. From the bottom of my heart I think we should have pursued his war crimes and punished him with whatever it takes, including execution. I have been saying this and people get very angry.

I am told not to criticize the emperor. They say if I do I'll harm the anti-nuclear movement.

Hirano: Even people in the anti-nuclear movement warn you about things like that? A critical reference to the emperor's wartime responsibility could be fatally divisive for the movement?

Koide: Those roots are that strong when you talk about war responsibility. But as I have mentioned to you, I feel at the bottom of my heart that each and every individual must take personal responsibility for how he or she lived his or her life. That's the reason why I wanted the emperor to take his responsibility as a person.

We must build such a country. Even the duped and the lied to have responsibility as individual human beings. It's true for those who lived through the war, and it's true for those who promote nuclear power in Japan today—indeed it's true for everyone on earth. Each one, should they be deceived, is responsible for being deceived.

Hirano/Kasai: Well we've gone on long today and heard some really important things. Thank you very much.

5

"Tanemaki Journal," an Osaka based radio show by Mainichi Broadcasting Station, began to air critical evaluations of the Fukushima incident immediately after March 11th.

Tanemaki Journal invited Koide as a commentator on a daily basis and he offered astute and up-to-date comments on the disaster. Despite, or perhaps because of, its popularity, according to some reports, the radio program was shut down in July 2012 under pressure from Kansai Electric Power Company which was a major sponsor of the TV station MBS. When Mainichi announced the termination of Tanemaki, listeners protested outside the company's office. The program won a Sakata Memorial Journalism Award in March 2012.

6

Kariya Tetsu, *Oi Shinbo 111 Fukushima no shinjitsu* (Tokyo: Shōgakukan, 2014). The episode was published in April 28th, 2014 in a popular comic book. After returning from their visit to Fukushima, Protagonist and his father began to feel very dull and

experienced nosebleeds. The episode developed into a social and political issue as it came under attack by conservative politicians and media for stirring up "damage by rumor."

7

Oi Shinbo discusses the theory that nosebleeds may be the result of ionizing radiation that converts H₂O in the nasal passages to the hydroxyl radical HO which can then form hydrogen peroxide (H₂O₂), see Kariya, *Oi Shinbo*, 111: 240-48.

8

Kyushu Electric Power Co. (KEPCO) reactivated the No. 1 reactor in August 2015 and No. 2 in October in the same year. Abe Shinzō's government expressed confidence in the safety the restart by calling the new safety measure "the world toughest." According to the Japan Times, the government plans to have nuclear power account for 20 to 22 percent of the country's total electricity supply by 2030, compared with roughly 30 percent before the disaster at the Fukushima complex. The government continues with the policy despite the overwhelming public opposition against the reactivation of the reactors and the clear evidence that Japanese economy is sustainable without nuclear energy.

9

Mutō Ruiko and Fukushima residents filed a lawsuit against TEPCO and the Japanese government officials, seeking criminal responsibility for the Fukushima nuclear accident. Muto's interview will be published in the Asia-Pacific Journal this year.

10

In September 2015, TEPCO released its first 850 tons of filtered radioactive groundwater into the sea. This is a part of TEPCO's "subdrain plan" that was approved in late July, 2015, after a year-long battle with local fishermen who opposed the release fearing that it would pollute the ocean and contaminate the marine life. 300 tons of contaminated water is being generated at the plant daily. TEPCO has yet to deal with remaining 680,000 tons of highly contaminated water that was used to cool the reactors during the 2011 meltdown.

11

Kashiwazaki is a city in Niigata prefecture.

12

The Tokaimura nuclear accident occurred on September 30th 1999, resulting in two deaths. It was the worst civilian nuclear radiation accident in Japan prior to the Fukushima Daiichi nuclear disaster of 2011. The criticality accident happened in a uranium processing facility operated by JCO, a subsidiary of Sumitomo Metal Mining Co. in the village of Tokai, Ibaraki Prefecture. Both the national and the prefectural governments failed to deal promptly with the accident due to the lack of evacuation plan and Tatsuya Murakai, then the mayor of the Tokaimura, decided to evacuate villagers from the affected area. 27 workers, who contained the crisis, were exposed to radioactivity.

13

Tanaka Shōzō (1841-1913) is considered to be Japan's first environmentalist. Tanaka is well known for his activism in connection with pollution caused by waste from the Ashio Copper Mine in Tochigi prefecture. From the mid-1880s, the Watarase river near the mine became heavily contaminated by mine waste and in 1890 a large flood carried

poisonous waste from the mine into surrounding fields and villages. Tanaka took the cause to the National Diet as a member of the House of Representatives, but it ended with little success. In 1900, Tanaka and villagers in the valley of the Watarase river planned a mass protest in Tokyo, but were stopped and dispersed by government troops. He resigned from the Diet in 1901 and made a direct appeal to Emperor Meiji. He became the supporter of local autonomy and developed his own anti-war, anti-imperialist, and environmental philosophy. He died of cancer in Yanaka village in 1913.

Introduction

Koide Hiroaki (66) has emerged as an influential voice and a central figure in the anti-nuclear movement since the nuclear meltdown at Fukushima Daiichi of March 11, 2011. He spent his entire career as a nuclear engineer working towards the abolition of nuclear power plants. His powerful critique of the "nuclear village" and active involvement in anti-nuclear movements "earned him an honorable form of purgatory as a permanent assistant professor at Kyoto University."¹ Koide retired from Kyoto University in the spring of 2015, but continues to write and act as an important voice of conscience for many who share his vision of the future free from nuclear energy and weapons. He has authored 20 books on the subject. Professor Kasai Hiroataka and I visited his office at Kyoto University's Research Reactor Institute in Kumatori, Osaka, on December 26th, 2014 for this interview. We believe that the contents of the interview, which offer new information about the degree of radioactive contamination and invaluable insight into Koide's ethical and political stance as a scientist, remain crucial for our critical reflection on ecological destruction, the violation of human rights, and individual responsibility. Professor Robert Stolz, the translator of this interview and the author of *Bad Water* (Duke University Press, 2015), provides a historical perspective on the interview in a separate article. KH Interview

The Fukushima Disaster and Government and Corporate Response

Hirano: How does the Fukushima accident compare with the bombing of Hiroshima or Chernobyl in its scale? What are the possible effects of this yet unknown exposure?

Koide: Let's start with the scale of the accident: It was a core meltdown involving the release of various kinds of radioactive material. Radioactive noble gas isotopes were also released, as were iodine, cesium, strontium, and other radioactive material. The noble gas isotopes have a short half-life and so at this stage they are all gone. Iodine, too, is gone. So now four years since the accident the materials that are still a problem are cesium-137, strontium-90, and tritium; really, it's these three.²

Now, as for the scale of the accident, I think it would be best to compare these three radionuclides. Today the main contamination of Japanese soil is the radionuclide cesium-137 [Cs-137 or ¹³⁷Cs]. The ocean is largely contaminated with strontium-90 [Sr-90 or ⁹⁰Sr] and tritium [T or ³H]. Right now the main culprit adding to the exposure of the people in Japan is Cs-137, so I think it's best to use Cs-137 as a standard for measuring the scale of the accident.

But we simply don't know with any precision how much Cs-137 was released. That's because **all the measuring equipment was destroyed at the time of the accident**. How much Cs-137 was released into the air? How much was spilled in the sea? We just don't know.

Still, the Japanese government has reported estimates to the IAEA [International Atomic Energy Agency]. According to those estimated levels, reactors 1, 2, and 3 had been in operation on March 11, 2011, and all three suffered meltdowns. Those three reactors released 1.5×10^{16} Becquerels of Cs-137, which would make it a release of 168 times more radioactive material than the Hiroshima bombing. And this is only material released into the atmosphere—at least according to Japanese government estimates.

But I myself think the government's numbers are an underestimate. Various experts and institutes from around the world have offered several of their own estimates. There are those that are lower than the Japanese government's numbers and those that are higher, some two or three times higher than the government's numbers. According to these other estimates I think that the release of Cs-137 into the atmosphere could be around 500 times the Hiroshima bombing.

Now for what has been washed into the sea. That number is likely not much different from the levels released into the atmosphere. Even today we are unable to prevent this release. And so if we combine the amount of Cs-137 released in the air and the ocean together, we get an estimate several hundred times the Hiroshima levels. And some estimates suggest the Fukushima accident could be as much as one-thousand Hiroshimas.

Now to compare this with other accidents: The amount released into the atmosphere from the explosion during the accident at the Chernobyl nuclear plant was 800 to 1000 times the Hiroshima levels. Put simply, these estimates place Fukushima on par with Chernobyl.

Worse than any of these, however, is atmospheric testing. From the 1950s to the 1960s atmospheric testing of nuclear weapons had already released Cs-137 into the air more than sixty times the numbers released even by the Japanese government for Fukushima. Of course Fukushima is an incredible tragedy, but considered from the earth as a whole it is a rather small accident.

Hirano: I want to ask in more detail about the effect of Cs-137 on the human body and the environment.

Koide: Cesium is an alkaline metal. From the human body's perspective, cesium closely resembles potassium. The body contains enormous amounts of potassium. It is essential for humans. It's everywhere in our bodies. Especially our flesh and muscles are full of potassium. And because of this, when cesium is released into the environment, the body deals with cesium as it does with the alkaline metal potassium, which is to say that it is taken into the body and accumulates there.

Strontium is an earth metal. The body treats it like calcium. As you know calcium is a human body building block that accumulates in our bones. Strontium, too, is taken into and collects in the bones. Just as cesium is taken in and is transported to the flesh and muscle.

Hirano: Comparing the releases from nuclear tests by the US and the USSR during the Cold War period, you said that the Fukushima accident was small. So in what way should we think about Fukushima: is it best to consider it a Japanese problem, or to consider it from a global perspective?

Koide: The amount of products of nuclear fission released during atmospheric testing was enormous, and these particles continue to expose humans to radiation. I'm a bit older than you and I recall in my childhood being told not to let the rain fall on me at the time of the testing. In this way everyone on earth has been exposed (*hibaku*/ 被曝). And because of this testing, historically speaking, cancer rates have slowly risen; I believe this increase in cancer is due to the exposure suffered during the atmospheric testing. Now the radioactive material released from Fukushima has been dispersed across the globe and so once again everyone on earth has been exposed to additional radiation. I think we can expect cancer rates to rise once again.

Atmospheric nuclear testing released all of the radioactive material in the explosions, which entered the stratosphere. Between the stratosphere and the troposphere there is the tropopause, and every year come spring all that material dispersed in the stratosphere breaks through the tropopause and falls to earth. So that material, though initially dispersed in the stratosphere, eventually falls to earth evenly, everywhere. Actually, it might not be accurate to say that it falls evenly on the earth. The majority of the testing

was done in the temperate regions of the northern hemisphere, such as Nevada and the Semipalatinsk test site [in Kazakhstan], so that the northern hemisphere—as the site of most of the testing—is heavily contaminated, and within that the temperate region is heavily contaminated. Still, I can say the atmospheric testing overall has caused global contamination.

My focus now is to figure out how to deal with the acute and heavy contamination from Fukushima. I know something needs to be done right there in that specific place. That contamination will disperse and be diffused across the globe. Once dispersed, the amount of radioactive material from Fukushima will be small when compared with the atmospheric testing. Which is not to say it is not harmful. An increase in cancer will be the result. I mention that for humanity as a whole; the atmospheric tests were worse. Now, strontium-90 [Sr-90] has been leaking from Fukushima into the ocean, so it will eventually reach the United States, especially the west coast. This much we are sure of. But to answer your question, the amount of dispersed cesium and strontium released by the atmospheric tests is tens of times greater than the Fukushima levels. Because the west coast of the US is already contaminated from the atmospheric testing, though the dispersed contamination from Fukushima will reach US shores, for people living on the US west coast, the Fukushima accident—and this is perhaps awful to say—contamination from Fukushima is hardly worth considering. Historically a much greater event has already taken place.

Hirano: To put that another way, the current Fukushima accident gives us a chance to reconsider the enormity of the past contamination from US and Soviet atmospheric tests, which has not been openly discussed.

Koide: Yes, that's exactly right. In fact, it is the masses of people who need to realize the impact of the contamination on them. In the case of the Fukushima disaster, for example, they need to be aware that some radioactive material is reaching the North American coast, and the prevailing westerly winds will carry anything released into the atmosphere to the US. Those earlier numbers from the Japanese government indicate that the levels for Cs-137 in the atmosphere are 168 times those of the Hiroshima bombing. I've been told that level is 1.5×10^{16} Becquerels [Bq]. These exponents can be a pain to process, so if we think of it in peta-units—which is 10^{15} —we get essentially 15 petabecquerels [PBq].

That said, while we are not really sure this is the number, we do know that a portion of this material will ride the prevailing winds across the Pacific Ocean. On the other hand, closer to the ground, the winds will be east, south, and north, and therefore this other portion will fall on Japan—and we can investigate the actual levels here: how much fell on this town, on this prefecture? Adding these up, it seems to be only 2.4 PBq. Which is to say of the total fifteen PBq, 2.4, or roughly only 16%, fell on Japanese soil. If the totals are higher, still a smaller share of the total contamination will have fallen on Japan compared with the Pacific, with the largest portion falling on the west coast of the United States.

So why don't we hear complaints from the US? Why are there no calls for compensation? Whenever someone asks me this, I simply say that there just aren't any such complaints. Why is this so? Well the levels released by the US during the atmospheric testing were tens of times greater than Fukushima. They are the criminals, so they cannot ask for compensation from Japan. The U.S. government does not want to have to reflect on its own past, and I think they are eager to completely avoid bringing up anything like that conversation. That is why I believe it is so important that those who have been exposed to radioactive contamination realize what atmospheric testing has done to them.

Kasai: I'd like to get back to the moment of the accident in some detail. On March 11, 2011 we had the East Japan Disaster (meaning the earthquake and tsunami off Tohoku). You've already talked about the string of accidents at the nuclear plant. At the moment the accident was taking place, you were following the response by the Japanese government and the Tokyo Electric Power Company (TEPCO) in real time. What did you see in those initial moments?

Japan's Nuclear Map and Epicenter of the Earthquakes of 3.11

Koide: It was truly a disastrous response. On the 11th I was in the laboratory in Kyoto as March was my month to work in the radiation-controlled area.³ It was normal workday hours and various tasks kept me busy working within the controlled area. Of course there is no TV or anything like that in the work space. That night there was a meeting so I came out to attend and that's when I saw the images of the Sendai airport being swept away by the tsunami. The report said that there had been a devastating earthquake and tsunami. Then I wondered about the safety of the nuclear plants.

Right then, there really was no more information. We had scheduled a nuclear safety issues seminar for the 18th. I've participated in hundreds of these seminars. Participants from the Ukraine had just arrived on the 11th. We promised to go out drinking after they arrived and so that night I went out. There was no more TV, and while there was a vague unease among us, that's how we spent the time.

The next day I learned that all power at Fukushima had been lost and I knew things were not going to be simple. Then at noon on the 12th the roof of reactor one was blown off; at that point any expert must have known there had been a reactor meltdown. So I was certain of a core meltdown and because once it has gone this far, there is no going back, it was time to call for anyone who could evacuate to do so. I thought we were at that stage on the 12th.

Yet neither the government nor TEPCO said a single word about a core meltdown; they announced that the incident merited a 3 or 4 on the International Nuclear Event Scale. I remember thinking "You've got to be kidding! There's already been a meltdown. This is at least a level 6 or 7." But neither the government nor TEPCO gave any indication of this and there was no word of it in the media either.

One by one there were explosions at reactors 3, 4, and 2. As an expert in nuclear power, I understood there was absolutely nothing that could be done. I thought people needed to be evacuating, but still the Japanese government didn't make the call. Government officials had set up at an off-site center near a power plant in Fukushima—at first they announced evacuation inside two kilometers, then that expanded to three, five, ten, and finally twenty km. After that nothing was done. The offsite center was supposed to coordinate the emergency response in the event of an accident, but it turned out that every one of the officials fled. They left the employees behind and fled. The Japanese government's response was indescribably cruel.

Kasai: It seems the very words "meltdown" (メルトダウン) and "core meltdown" (*roshin yōyū*/炉心熔融) were strictly forbidden.

Koide: Exactly.

Kasai: I was in Japan watching on TV. What shocked me was all the nuclear power experts explaining the incident in the studio. I suppose it was a satellite relay, but when reactor number three exploded on our screens they were giving their analyses of the explosion in real time. There were experts on TV saying that the reactor had a blast valve that was used successfully. Even hearing that, an average viewer might think something was amiss. But having physicists, experts on radiation, on TV saying these things, well, even the average viewer wouldn't buy that explanation. In a broad sense, nuclear experts like yourself played several roles in the media and government.

Koide: Yes, that's clearly true for pronuclear experts. They all tended to tell a story that underestimated the accident. Immediately after the accident public announcements and information were restricted. As a result individual opinions or statements were strictly forbidden and nearly all experts remained silent, so even basic information was not broadcast.

Though I'd made statements from the nuclear lab beginning on the 12th, it is likely there were instructions from the Ministry of Science and Education to silence me. The head of the lab convened several meetings where he told each of us not to make any statement, that the lab would toe the official line when dealing with the mass media. I thought this was wrong and said that anyone who was asked a question by the media should answer it, further saying that if I were asked a question, I had a responsibility to answer. Since then I've continued to make statements in the media. Still the large majority of nuclear researchers were not able to do this.

As a result it was the pronuclear researchers who monopolized the interpretations - exactly. So as they went to the TV studios I think each was

told: "Today, it's your turn to go to the studio." I think that's how they played their part and handled the media.

Kasai: With respect to controlling information, would you say your experience with the head of the nuclear lab shows how the professional organizations exert pressure on the universities?

Koide: Yes, I would. The head of the lab opened a conference with all the other laboratories—even I went. There he said that any statements to the media should be on message and come only from the information office.

Kasai: So pressure came from academic conferences.

Koide: Yes, there was pressure coming from the academic conference side as well. Take for example something like a conference on nuclear power. From the very start it was never a real discussion; it was a meeting of powerful and vocal spokesmen for the nuclear community or village (*genshiryoku kyōdōtai*/原子力共同体 or *genshiryoku mura*/原子力村), which is to say the group of pronuclear government officials and private companies mainly centered around the LDP and Toshiba, Hitachi, Mitsubishi, and other pronuclear manufacturers of power plants—and of course their supporters in the media. Thus as an organization the conference was predisposed to underestimate the accident and to then promote that underestimation.

Hirano: Immediately after the accident you testified in the Diet presenting data indicating the seriousness of the disaster and demanding that the government terminate the operation of all the power plants.⁴

Koide: I did.

Hirano: After that it seems you weren't again asked to speak publicly, or given the opportunity to offer more detailed thoughts on the situation.

Koide: By "speak publicly" you mean in the Diet or in some other official government setting?

Hirano: Yes, and also in the media.

Koide: With respect to the media, I've never really had any confidence in them. Since the accident, I've been overwhelmingly busy and haven't accepted a single invitation from TV stations.

Hirano: I see. So there were invitations.

Koide: There have been many calls saying, "come down to the studio." But I always tell them that I am too busy for this sort of thing. I'd say, if you come to my office, we could meet. Many did come by, even back then. But as everyone knows, in television you might talk for an hour and none of it makes it on air, or if it does, it's maybe thirty seconds.

Hirano: Right, and only the convenient parts.

Koide: That's it and there's really nothing that can be done about it. There was, however, one outlet for which I was extremely grateful: the daily radio program called Tanemaki Journal (種まきジャーナル).⁵ There I could go on every day and offer my thoughts live. I wish it could have continued, but it was completely and totally smashed. What a world we live.

Kasai: So, on the subject of standards used for assessing the danger posed by radiation for the human body and the environment: What are your thoughts

on how the government deals with this issue?

Koide: They are absolutely not dealing with it at all. I think you already know this but in Japan the average person is not supposed to be exposed to more than one milliSievert per year—that's set by law. Why is that the level decided on? Because exposure to radiation is dangerous. If exposure weren't dangerous, if low levels of exposure were safe, there'd be no problem even without that legal limit. But exposure to radiation is dangerous—this is the conclusion of all research. So every nation in the world has set legal limits for exposure.

For people like me who get paid to work with radiation, it's not really possible to observe the 1mSv/yr limit [1mSv/yr]. We're told that in exchange for our salaries, we accept exposure to twenty milliSieverts a year. That's the standard I work under in my job. But the current Japanese government has now stated that if contamination is under 20mSv/yr somewhere, that place is safe to return to—safe to return to even for children. This is way beyond common sense.

Hirano: What is the basis of this claim? Why would the government announce these numbers and forcefully declare these areas safe to return to? What's the basis for the government's numbers?

Koide: The basis for those numbers...for example the government says that organizations like the IAEA or the ICRP [International Commission on Radiological Protection] suggest that in emergencies during which the 1mSv/yr standard cannot be maintained standards should be set between twenty and 100mSv/yr. The government seizes on this and declares that since the IAEA and the ICRP have said this, that 20mSv/yr is therefore a safe level—usually adding that membership in both the IAEA and the ICRP is voluntary anyway. But because these organizations have said this is no reason to break Japanese law. If Japan is a nation governed by the rule of law at all, surely this means that the very people who make the laws should also follow them—that should be obvious. But these guys have declared 20mSv/yr safe even for children. There is absolutely no way I can consent to this.

Hirano: So there is no scientific basis for these levels.

Koide: Well... the danger corresponds to the amount of exposure—you probably know this—so for a country that has declared its intention to maintain the 1mSv/yr standard to then turn around and ask people to endure twenty times that level, there is no scientific basis for that declaration. That's a social decision.

But if you want to inquire as to why, as I've mentioned to you, some 2.4 petaBecquerels of radioactive material have fallen on Japan, that material has been dispersed, contaminating Tohoku, Kanto, and western Japan. So in addition to the law setting the legal limit for exposure at 1mSv/yr, there is another law that states that absolutely nothing may be removed from a radioactive management area in which the levels exceed 40,000 Becquerels per square meter.

So the question becomes how many places or how much area has been contaminated beyond 40,000 Bq/m²? And according to the investigations, that answer is 140,000 km². The entirety of Fukushima prefecture has been contaminated to where all of it must be declared a radioactivity management area. Indeed, while centered on Fukushima, parts of Chiba and Tokyo have also been contaminated. The number of people living in what must be called a radiation-controlled area is in the millions, and could exceed ten million. For me, if Japan is in fact a nation governed by the rule of law, I believe the government has the responsibility to evacuate these entire communities. Instead of taking a proper action to secure people's livelihood, the government decided to leave them exposed to the real danger of radiation. In my view, Fukushima should be declared uninhabitable and the government and TEPCO should bear a legal responsibility for the people displaced and dispossessed by the nuclear disaster. That's what I think, but if that were to be done, it would likely bankrupt the country. I think that even though it could bankrupt Japan, the government should have carried out the evacuation to set an example of what the government is supposed to do. But obviously those in and around the LDP certainly didn't agree. They've decided to sacrifice people and get by taking on as little burden as possible. So they've made the social decision to force people to endure their exposure. In my view, this is a serious crime committed by Japan's ruling elite. I would like people to know just how many thousands of people live in this abnormal situation where even nuclear scientists like me are not allowed to enter, not to mention, drink the water. It is strange that this issue has been left out of all debate over the effects of the radioactive exposure. We must be aware that contemporary Japan continues to operate outside the law in abandoning these people to their fate by saying it's an extraordinary situation. Under such circumstances, I think, there are a multitude of symptoms of illnesses in contaminated areas. But if we're talking about any given symptom, it's hard to say since we just don't have any good epidemiological studies, or even any good data. But there will surely be symptoms, namely cancer and leukemia. However little exposure to radiation is, it causes cancer and leukemia—this is the conclusion of all current science. These symptoms are said to become visible 5 years after the initial exposure. But because radiation is not the sole cause of cancer or leukemia establishing a direct causal relationship is extremely difficult. For this very reason we need to continue to investigate the state of exposure by conducting rigorous epidemiological studies. But this government wishes instead to hide the damage so I'm afraid no such study is on the horizon. In addition, I have heard about many cases of nose bleeding, severe headaches, and extreme exhaustion. And I am truly concerned about small children and young people living in Fukushima as they are most vulnerable to exposure.

Hirano: So what is your view of the actual damages of radiation exposure on human health?

Koide: On the evening of the Fukushima dai-ichi reactor accident of March 11, 2011, a Radiation Emergency Declaration was announced. The Declaration suspended existing Japanese law concerning exposure to radiation. Though Japanese law sets the limit for exposure for the general population at one milliSievert a year [1mSv/yr], the new permissible level would be 20 mSv/yr. That Emergency Declaration is still in effect. It is common knowledge that even low levels of exposure are dangerous. Including even infants in this newly imposed 20mSv/yr standard will obviously lead to various diseases. Further, because the monitoring equipment was destroyed at the time of the accident we do not have accurate data on the exposure levels of the residents. Numerous cases of thyroid cancer have been found. The prevalence of thyroid cancer is dozens of times that of normal incidence. Pro-nuclear groups say those numbers are the result of the screening process itself, not the effect of radiation exposure. Which is to say that this was the first major screening of that population and so it was natural that many cases of thyroid cancer would be found. Put differently, what they are saying is that they have never conducted a thorough study of radiation exposure and its impact on human health. Science should acknowledge what it already knows and what it does not. If it is true that there is no established scientific data, a properly scientific approach would be to carry out a thorough investigation. To deny the damage to health by exposure to radiation without such an investigation is absolutely at odds with the scientific spirit. Prof. Tsuda at Okayama University has already conducted a detailed study on the outbreak of thyroid cancer, showing an epidemiological-like outbreak. Just as happened at Chernobyl, as time passes it is clear there will be more and more instances of all kinds of illnesses.

Hirano: In your books you've often stated that there is no uncontaminated food. But for most Japanese, such basic knowledge seems limited to food from Fukushima, and nearby parts of Ibaraki, Gumma, Chiba, Miyagi. For food produced outside these areas, do you think it's necessary to have strict testing of food that is sold and consumed? What is to be done? Do you think food from outside these areas should also be subject to strict testing before being sent to market and consumed?

Koide: Right, as we discussed earlier, before the Fukushima accident the entire globe was already contaminated with radiation. This means that Tohoku or Kanto or Kansai food, all of it, has been contaminated with radiation—radiation from atmospheric tests. Beyond this, contamination from the 1986 Chernobyl accident reached Japan on the prevailing westerly winds, meaning that all Japanese food was contaminated. And on top of all this, with the Fukushima disaster, as I mentioned, it is not that a thick layer of contamination has dispersed to every corner of the globe from Fukushima, but that this thick layer of contamination is right now centered on Fukushima.

So if we were to carefully measure the levels of food contamination, we'd

more or less find moving out from the highest levels in Fukushima to say western Japan or Kyushu, that the numbers would gradually decline to the lower levels received from the atmospheric tests. Right now the people of Fukushima have been abandoned in the areas of the highest levels of radiation. And abandoned people have to find a way to live. Farmers produce agricultural goods, dairy farmers produce dairy products, and ranchers produce meat; these people must do so in order to live. They are not the ones to be blamed at all.

As the Japanese state is absolutely unreliable in this matter, these people have no choice but to go on producing food in that place, all the while suffering further exposure. So I don't think we can throw out the food they produce there under those conditions. Inevitably someone has to consume that food—I suggest it be fed to the pronuclear lobby (laughs). We should serve all of the most heavily contaminated food at say the employee cafeteria at TEPCO or in the cafeteria for Diet members in the Diet building. But that isn't nearly enough. We must carefully inspect the food, and once we've determined what foods have what levels of contamination, once that is fully measured and delineated, then those who have the corresponding levels of responsibility should eat it, should be given it.

Now of course strict levels of responsibility cannot really be allotted one by one to individuals that way, so when it comes to this food, I would propose devising a "60 and over" system. The most contaminated foods could only be eaten by those 60 years old and older, and from there also have food for "50 and over," "40 and over," "30 and over" - giving the best food to children. For example, school lunches would get the most uncontaminated food available—there'd still be contamination from the atmospheric tests—but food with only those levels would be given to children and only adults would receive the contaminated food. That would be my proposal.

My proposal would first be a precise measurement, starting from Fukushima and then of course including western Japan and Kyushu, to sort out the levels and then determine the relative burdens. I am aware that this is a controversial proposal, but each one of us, especially those who built postwar Japan, bears responsibility for allowing our society to heavily dependent on nuclear energy without carefully reflecting on the risks and consequences of it. And more importantly, we have the responsibility for protecting children.

Kasai: Recently, that idea has been suggested in Nishio Masamichi's *Radioactive Archipelago (Hibaku retto)* / 『被ばく列島』). You've just stressed that though the first step must be a rigorous measurement, right now that is simply impossible.

Koide: Right, completely impossible.

Kasai: So, that's true of water as well. First I don't think most people know how to measure the levels in water. You've already said how the current minimum standards are worthless, that below a certain threshold it would be displayed as "ND" (Not Detectable). For example, for tap water, up to 20

Becquerels would be posted as "ND," exactly as if there was no radiation detected at all. Yet even with all these doubts on measurement, we must start with it, though it's a dizzyingly long road ahead. But what do you think can be done to change this situation for the better?

Koide: Right now Japan has a standard of 100Bq/kg for general foodstuffs. Before the Fukushima disaster, Japanese foodstuffs were contaminated—by the atmospheric tests—at a level of 0.1Bq/kg. Of course there were some foods with less contamination and some with more. Still, roughly speaking it was 0.1Bq/kg. So when you're talking 100 Bq/kg that's allowing 1,000 times the [pre-Fukushima] levels.

As I said before, any exposure is absolutely dangerous. And the dangers increase corresponding to an increase in levels of exposure; this is the conclusion of all research. 100 Bq/kg is dangerous, 99 is dangerous, as is 90, and 50, and 10—they are all dangerous. 10 Bq/kg is 100 times the pre-Fukushima levels.

So I think it's necessary to precisely measure the levels of contamination. As many people are living in a state of anxiety, groups like consumers' cooperatives and other sorts of organizations are trying to measure the contamination on their own. But the measuring devices that these groups are able to get, such as the ones called NAI, these devices can only measure levels above 20Bq/kg. While this means that they can measure levels as little as one-fifth of the national thresholds, from my perspective even this lower level is far too high.

And the worst thing that could happen is thinking that any contamination below the detectable limits of these machines, meaning below 20Bq/kg, would be misunderstood as being free of contamination, and then having the Fukushima prefectural government actively using this data as good news: "measurements below the detectable limits of the device must be clean; we can even serve this food in school cafeterias," or PR campaigns announcing "Fukushima produce is safe." Of course it would be totally outrageous and unthinkable and yes I think every effort should be made to serve the least contaminated food in school cafeterias—but the reality is that any food tested below detectable levels is distributed to schools as safe produce.

I think we need to stop this situation, and technically speaking, I think several germanium semiconductor detectors must be deployed instead. But a germanium detector would cost from \$100,000 to \$200,000. And in order to use it, the detector needs to be kept at 150 degree below zero Celsius. So these are not devices that the average citizen is going to be able to use.

So no matter how dedicated any individual citizen may be, there are real limitations when it comes to measuring radiation levels. If you ask me what should be done, for example when faced with Cs-137 or Sr-90, what should be done about these contaminants? Well these contaminants were produced in a nuclear reactor at TEPCO's Fukushima Daiichi plant and it means that they are unmistakably TEPCO's property. And if their private property is found to have contaminated other areas they have undeniable responsibility

for it. So I think this is something that is required of TEPCO. I think it is TEPCO's responsibility to precisely measure which foods have been contaminated, and to what extent, and then to report the results to the public. I think this is something the public should demand. After TEPCO the government also has responsibility—they gave their seal of approval to TEPCO after all. So the public should also demand that the government precisely measure the levels and publish the results.

Because there are limits to what one can do on one's own, I think we need a movement that forces the government and TEPCO to take responsibility for the precise measurement of the contamination.

Hirano: Some have raised doubts over precisely this kind of rigorous measurement citing possible damage caused by rumors or misinformation (*fūhyōhigai*/風評被害), but to me this sort of criticism is tainted with a sort of "national morality" discourse (*kokumin dōtokuron*/国民道徳論).

Koide: Yes, I think so.

Hirano: There seems to be a very strong sense of dividing people into those who are seen as patriotic and those who are seen as un-Japanese (*hikokumin*/非国民).

Koide: For me, I've been making statements on the Fukushima contamination. These statements have been denounced and even made some angry with me. But the contamination is real. For a long time now I've been the kind of person who would rather hear the truth, no matter how awful, than to remain ignorant. I am absolutely not going to hide the truth; no matter how much criticism I have to take I am going to diligently report the truth. Yeah, a lot of people get angry with me. (Laughs).

Kasai: On this point, this year saw the publishing of Kariya Tetsu's manga series *Oi shinbo: Fukushima no shinjitsu* (『美味しんぼ – 福島の実』).⁶ It would seem a kind of political campaign was developed to attack it. What is your take on this?

Koide: The editors sent me a copy and I've read it. It's an awesome manga. In this day and age we just don't have this kind of detailed manga on this problem and I am grateful for it. And more, *Oi shinbo* talks about the nosebleeds [caused by radiation]. The nosebleeds are real. Lots of Fukushima residents are said to be suffering from nosebleeds. Itokawa, the mayor of Futaba machi, has shown us proof. One of my acquaintances often talks about the nosebleeds.

It was true at Chernobyl, too. But nosebleeds have not been definitively and scientifically linked to exposure to radiation.⁷ Still there is no denying that it is real and happening. So even if current science is unable to explain it, it's for science to ask just what is going on? Science has a duty to explain this, to tell the truth without obfuscation. No matter the reasons, we should be allowed to tell the truth. So for me I don't think there is anything wrong with this part of *Oi shinbo*.

Kasai: I think *Oi shinbo* clearly exposed the politically constructed narratives

"damage from rumor or misinformation" and "emotional bonds" (*kizuna*/絆) as fictions, and so for this reason it appears it had to be crushed.

Koide: Exactly. But Kariya, the author of *Oi shinbo*, is not one of the criminals responsible for the Fukushima disaster. Rather the government officials who caused the Fukushima disaster are the criminals. Yet it is these same government bureaucrats who now come out and complain that this manga is out of order. I say, "No, it's you who are out of order. We need to send you to prison right now."

But isn't it always the case that a criminal who has committed a crime remains unquestioned and so starts bashing those who are telling the truth? When that happens I think the problem is precisely this word you just used "emotional bonds." Since Fukushima, I have come to hate this word. (Laughs).

Hirano: "Bonds" seems to be the new nationalism, doesn't it?

Koide: Yes, yes it does.

Hirano: You've often said that the Japanese economy and the people's lifestyle would be fine even without a single nuclear power plant. In fact, since the government shut all the nuclear reactors down, the people have experienced no real trouble at all. In addition, considered in light of world standards we still have material riches and a lifestyle of surplus. Given this, what are your thoughts on the call to restart the reactors? For what purpose, what reason do you think the government has?⁸

Koide: First of all, the power companies don't want to go bankrupt. In other words, the heads of the power companies do not want to take personal responsibility. For example, if the reactors are restarted and there's an accident, are the heads of the power companies going to be punished? We already know that they will not be. Even after the Fukushima disaster neither the chairman, nor the CEO, nor anyone below—not a single person—was punished.⁹ It certainly looks as if the reactors are restarted and there's an accident, the heads of the power companies would not be required to take any responsibility. The heads of the power companies, from Kyushu Electric to Kansai Electric, have received this message loud and clear. What's more, if the nuclear power plants are idled and not allowed to restart, then all the capital they represent becomes a non-performing asset. And of course this is anathema to anyone in management.

Hirano: If we could return to a technical discussion specifically how to decommission a reactor. As have others in your field you've already stated that a full end game cannot be envisioned yet. Still could you talk about what makes this issue so difficult?

Koide: By decommissioning you mean the endpoint of the Fukushima reactors?

Hirano: Yes, what does it mean for Fukushima dai-ichi?

Koide: When we say decommission we basically mean: How do we fully contain the radiation? At least I think that's the main point. Now this is impossible if we don't know the status of the melted core. Though it's been

four years since the disaster we simply do not know where the core is or in what state it is.

This is a situation that only happens in nuclear accidents. However large a chemical plant explosion may be there'd probably be an initial fire, but usually after several days, perhaps weeks you'd still be able to go on site and investigate. You'd be able to see just how things broke down. And in some situations might even be able to fix them. But with an accident at a nuclear plant you cannot even go on site four years later—probably not even ten years later.

Hirano: Because the contamination is so severe that no one can come close to it.

Koide: Yes. For humans going there means instant death, so the only way at all is to use robots. But robots are extremely vulnerable to radiation.

Consider, robots receive their instructions through series of 1s and 0s, so should the radiation switch a 0 to a 1 you'd end up with completely different instructions. Essentially robots are useless. Even if you are able to send them in they can never return. Because this has been the case up to now, the only way left in the end might be to use robots that try to avoid exposure or that are built as much as possible to withstand exposure, but that is no simple thing.

So it means until we figure out what to do it would still take many years. Once you understand this fact you can start thinking about what can be done. And at the very least the "road map" devised by the government and TEPCO is the most absolutely optimistic road map that there could be. They are convinced that the melted core fell through the bottom of the pressure vessel and now lie at the bottom of the containment vessel—basically piling up like nuggets of the melted core. There's no way this would be the case. (Laughs).

As the severity of the disaster became clear, water was repeatedly thrown on the reactors. This water would evaporate and dissipate continuously. That was the actual situation. There is no way that the melted core would have stayed as slimy liquid and then piled up like so many little nuggets. It should have been scattered all over the place. This is how the government and TEPCO's roadmap goes: The buns would stay at the bottom of the containment vessel, above which is the reactor pressure vessel—a steel pressure furnace. With the furnace floor broken open, there is a hollow at the bottom through which the melted core must have leaked.

So at some point both the containment vessel and the pressure vessel would be filled with water and they'll be able to see the nuggets of melted core by looking from above down into the water. They say the nuggets (the fallen material), yes, that they sit some thirty to forty meters below the water's surface, that they'll eventually be able to grab and remove them. This is all it takes, according to the government and TEPCO's roadmap. Not a chance. This simply cannot be done.

Hirano: Obviously we can't confirm or really say anything definitive about

the situation in the reactors, but what do you think has happened?

Koide: I simply don't know. But as I have mentioned, this whole "nugget" scenario is just not the case, and so I think the materials are scattered all over the place. Though the containment vessel is made of steel, if the melted core has come in contact with that steel, just as it ate through the floor of the pressure vessel, it could possibly have melted through the containment vessel. Depending on how things developed this, too, is a possibility. Unfortunately, I simply do not know.

Hirano: If that is in fact the situation, what steps are necessary?

Koide: First, as we talked about earlier, radiation must be prevented from being released into the environment. As I consider this task as "decommissioning" or the final containment of the accident, I think in order to prevent the release into the environment you must do whatever you can starting from the worst-case scenario.

There are situations in which the containment vessel can suffer a melt-through. I think this likely has already happened. And if it has happened what should be done? Outside the reactor there flows ground water. If the melted core were to come in contact with the ground water, the whole situation would be unmanageable. While this may have already have happened, in order to get any kind of control over the situation, some sort of barrier must be built to prevent the melted core from reaching the ground water. I've been saying this since May 2011—and they have not done a thing.

Kasai: This barrier would be an ice dam, a wall of super-chilled soil.

Koide: That's the most recent idea. But it simply cannot be done successfully. It would cost billions of dollars. And it would fail. And when it did fail they'd say there's nothing to be done but build a concrete wall. No matter how foolish an idea may be, they'll just keep moving from failure to failure. But really, for the construction companies that's a good thing. I think Kashima would be the ones to build the super-chilled earth wall, for some billions of dollars. And if it doesn't work—they wouldn't have to take responsibility. Next they'd build an impermeable concrete wall. Several huge construction firms (*zenekon*/ゼネコン) would be contracted and would all make billions.

But considered from the perspective of actually ending the disaster, it would be a series of failures. Personally, I think an underground, impermeable wall needs to be built immediately. They are not going to be able to remove the material. All that can be done is to contain it. Underground the wall needs to be strengthened; above ground the only choice is some sort of sarcophagus like the one they built over Chernobyl. But even this would take dozens of years—I'll probably be dead by then.

Kasai: There are temporary tanks sitting on land for this water, but they are starting to leak. What should be done about this contaminated water?

There's not enough space for all of it on land; it cannot be controlled; and every year the volume grows larger.

Koide: The radioactive water has penetrated the coastline around the

Fukushima Daiichi. Underground water in the large area of Fukushima has been seriously contaminated. And at some point those contaminated water tanks will fail. I thought we must do everything that we possibly could. Already in March of 2011 there was some 100,000 tons of contaminated water. Even then I proposed moving it but didn't get anywhere with it. Now there's up-to 400,000 tons. In the near—meaning not too distant—future there will be nothing left but to release it into the sea.¹⁰ The water contains plutonium 239 and its release into the Ocean has both local and global impacts. A microgram of plutonium can cause death if inhaled.

Contaminated Water Tanks

Kasai: It appears that they are already moving toward that direction a little at a time aren't they.

Koide: The Nuclear Regulatory Committee has been hinting at the possibility of releasing it into the ocean.

Kasai: They have been trying to persuade the fishing cooperatives and others to allow the release.

Koide: Yes, they have.

Kasai: Something that has not been much of a topic of discussion today is decontamination. It has become a rather large industry, in other words, "the exposure industry" (*hibaku sangyō*/被曝産業). Do you think decontamination is really meaningful and effective?

Koide: Yes, I do. And we must do it. But, to say that because we've decontaminated some area that the whole issue is resolved, or that people may safely live in a decontaminated place—I think that is a real problem. First, fundamentally, people must not be forced to live in contaminated areas that must be decontaminated. First must come complete evacuation. The state must take on the responsibility to allow whole communities to evacuate. Of course, they did not do this.

Briefly, I use the word "decontamination" (*josen*/除染), which is a compound word written with the characters for "remove" and "stain." But this is something that cannot be completed when it comes to radiation, so the original sense of the word "removal of contaminants" is impossible. But as long as people are abandoned in the contaminated areas, I believe all possible actions should be taken to lessen their exposure. It is essential that the contamination be removed as far away as possible, to be transported far from where people live. For this reason I prefer to call it "[toxic] relocation" (*isen*/移染).

But even if this is done, that does not mean that the radiation has been erased. This stuff contaminates everything from mountains to what have you, it gets into the space of people's lives. When that happens it must be removed. But removal merely means moving it around—it does not mean

eliminating it. It means another job is waiting to handle the contaminated materials that get moved around.

Right now the authorities say they want various prefectures and other local governments to build a temporary storage and bury the accumulated contamination there.

We talked about this before, but the contaminants themselves were clearly formerly in the reactor at TEPCO's Fukushima Daiichi plant and are therefore also clearly TEPCO's property. So while it is residents who are doing the hard work of collecting all these contaminants, I think it would be right and just for these contaminants to be returned to TEPCO. Earlier prof. Kasai told us the contaminants were being called "no-one's property" (*mushubutsu*/無主物), but I say in all seriousness, the conclusion of my logic here is to say to TEPCO: "Hey, this is your crap" and return it to them. That way the residents are not forced to accept the stuff, TEPCO is. The best solution is to return all of the material back to the Fukushima Daiichi plant, but that is not possible. Right now that place is a battlefield between poorly paid workers and the radiation, so I don't see this as a possibility.

What I would most like to do is have TEPCO's headquarters buried under all the radiation, but whenever I say this people just laugh. (laughs)

I do have a second proposal. Fifteen kilometers south of Fukushima Daiichi [Fukushima 1] is the Fukushima dai-ni [Fukushima 2] nuclear plant. There is a lot of wide open space there. So first off we would return the Fukushima 1 contamination to TEPCO there. I think there would be enough space, but if there were not, the rest could be taken to TEPCO's Kashiwazaki Kariya nuclear plant. It's the world's largest nuclear plant and so there is a lot of space. I think turning that place into a nuclear waste site is a good idea. Lately I've been invited to Kashiwazaki¹¹ and talked about it. I think I've become a hated man there. (Laughs). But I think taking full responsibility for various actions is the most important thing. And when it comes to this particular disaster no one has greater responsibility than TEPCO. As I think it important for one to take full responsibility, if Fukushima 2 doesn't work out, then Kashiwazaki Kariya is the only other option.

Hirano: State expenditures for decontamination have supposedly reached one trillion yen.

Koide: It's more than that.

Hirano: This summer I spent some time in Iitate village. Of course at the time the place was crawling with decontamination workers. It was a truly bizarre scene. I had the feeling of running around on a moonscape. Of course there were no residents there-just decontamination workers in strange gear, trucks running all over the place. Looking at that scene, being shown the actual work of decontamination, it seemed to be an excruciatingly

slow—even endless—endeavor. I mean they were scrubbing everything with small brushes. I was able to ask the workers a few questions—off the record. Many were people from Hokkaido, Okinawa, and Fukushima who had lost their homes. It was a collection of modern day migrant workers and victims of disaster. They said that they work for just 15,000 yen a day.

I asked them if they thought their work was doing any good. They said they needed the money and honestly had no way of knowing if this sort of minute and delicate work would remove the contamination.

Was this a mistake? Is scrubbing everything by hand and then dumping it all in the ground really the only way to decontaminate an area?

Decontamination Workers

Koide: Well I think both that it is and it isn't effective. For example, when they first started the decontamination work, what they did was blasting everything with high-pressure water hoses. That's bad. All that does is get all the contamination moving around. It's really just dispersing it.

Some of my colleagues have said that is a bad method. Be it a roof or a wall, you shouldn't just douse it with water. To really remove the contamination, you would first cover it with something that could prevent the escape of radioactivity then knock down the radiated structure, tear it all off, and then fold it up and collect it all. I think that's probably true. But it takes a long time.

I think there are effective ways of doing it and I think there are ineffective ways. Still it is fundamentally impossible to erase the contamination and so it must be moved. The only thing we should be doing is thinking about the easiest way to relocate it all.

Hirano: That's the meaning of "effective" in this situation isn't it.

Koide: Right. So the current method may be rather small in scale. But for me even small-scale methods are necessary. As long as people are living there everything is necessary.

Of course, there's legitimate criticism over the fact that this is a decontamination business and that the large construction companies are getting rich, but again, for me, as long as there are abandoned people still living there it all must be done.

Hirano: It was really a shock going there and seeing it. To see those workers and, honestly, their lack of conviction for the work. It was a really weird scene. No real enthusiasm, but rather one day after the other, contingent labor. The media has reported that the workers come from a few particular prefectures, but actually being there and talking to them, I could really get a true sense of the structure of economic inequality in Japan, that this sort of work found this kind of person, a person coming from economically precarious and socially marginalized backgrounds. In fact, you come to

understand that decontamination work depends on these people. For example, decontamination, or your preferred "relocation," couldn't those jobs be made more equitable—say by requiring TEPCO office workers, especially executives, to do it?

Koide: I've said that.

Hirano: You have? (Laughs).

Kasai: So...about the airborne radiation dosage and the soil contamination, there is a public entity that measures and publishes the airborne levels. But the soil contamination is not measured. I remember reading about Chernobyl that the soil contamination levels are the standard by which one gets the right to evacuation and refuge. But Japan only measures the air. And there are those who doubt the accuracy of the levels recorded. I thought the soil contamination had not been measured yet, but from what you mentioned earlier, we do know the extent of the contamination, don't we?

Koide: Yes, we do.

Kasai: The actual levels?

Koide: With respect to soil contamination we more or less know the extent of it. We largely know which prefectures, which towns, and which villages—as well as how badly—have been contaminated. Four years after the disaster it has moved around. Radiation moves through the environment; it has a material existence and also does die out. I'm sure much has changed since immediately following the accident.

We have the data necessary to draw a map of the situation immediately following the accident, but we don't have the data necessary to draw a map of the contamination today. That said, we basically know the extent of the soil contamination.

Kasai: Who is it that is making these measurements?

Koide: It is basically the Ministry of Education, Culture, Sports, Science and Technology. Some local governments took part as well. Some independent groups, as well as some local governments, took part in taking measurements back then. But for us the number one data source is the US military.

Hirano: I see; how is that?

Koide: They worked at truly amazing speed-and accuracy.

Hirano: Sorry if this next thought seems a bit of a tangent, but right after the accident both the US and Japan were looking at the same data. But their interpretations of it were extremely far apart. The US ordered all of its personnel to evacuate an area 80 km from Fukushima. While Japan's largest evacuation zone was 20 km. Where does this disparity in evacuation zones come from? They are both looking at the same data. How do they arrive at such definitive and divergent judgments?

Koide: Well...and this was true for me, too, any nuclear specialist would have known on March 11th-March 12th at the latest-that there had been a meltdown. And this means, quite simply, that control had been lost. And once control is lost you simply don't know what is going to happen next-or that's what you must think at the time. Disaster preparedness must always imagine the worst-case scenario. If you don't plan for the worst-case scenario it will be too late. What the US did was believe there had been a worst-case scenario-a meltdown-and so moved to take care of its people. That's why they ordered an 80 km evacuation. I think this was the correct strategy. Japan didn't do this. Japan was always thinking of the ideal, the best case scenario. They had to be thinking they could still get control and based their policy on that optimistic assumption. So they only declared a 20 km evacuation zone. I would say that from this conclusion two things may unfold: one is their desire to see this as a best-case scenario and the other is their inability to deal with it.

Hirano: What do you mean by their inability?

Bags containing contaminated soil. This apocalyptic scene extends infinitely in the villages near the Fukushima dai-ichi

Koide: In a word, the Japanese state is incapable of functioning adequately when dealing with a disaster. That's why they evacuated those within 20 km by bus but when it came to the 30 km zone they told those who could easily evacuate to do so and for all others to merely close their doors and windows.

Hirano: So there was no emergency management.

Koide: None. There simply is not a single person in the Japanese government who had thought an accident like this was possible. They all immediately fled the off-site center and so there was absolutely no emergency management—there couldn't be. And because management was now impossible, there were no announcements. Even if they had declared an 80 km evacuation zone there were no emergency shelters. They had made no preparations, so there was nothing to be done.

Hirano: Last summer I interviewed Murakami Tetsuya ¹² Just as the accident was happening he reached out to the government. But he got no response. He went to the prefecture. No response from them either. In the end he just used his own judgment. So really there was essentially zero emergency management in place. His thoughts at the time were to get the whole village to emigrate; that really there was nothing to do but to buy land and move to Hokkaido. He said these were his actual plans at the time. In fact, it would seem that the myth of safety has so totally permeated the bureaucracy that there really is no one who thinks about these things—wouldn't you say?

Koide: That's right. Not a single nuclear expert or policy maker ever

seriously considered the possibility of an accident like this. I knew accidents were possible, and that when they happened the damage would be enormous; I had been commenting on the possibility, referring to some results of simulations. But still I would have thought the kind of disaster that happened at Fukushima was some kind of impossible nightmare—yet it actually happened. It was like the worse nightmare becoming a reality. And if even I thought this then all those pronuclear people surely never gave it a moment's thought. And so when it actually happened, no one had thought about, let alone built a system to deal with it.

II The Responsibility of the Scientist and the Citizen

Kasai: In your books and lectures you often express strong respect for Tanaka Shōzō.¹³ Can you connect what you've just said to this as well?

Koide: Sure. I first became aware of Shōzō when I was in the student movement during the 1970s. This was a time when there was close attention paid to Japan's many pollution incidents, such as at Minamata. Personally I was working on nuclear power, but it was a time when, like it or not, we learned of all the harm that came along with building Japan into a modern nation. What I got from Shōzō was this epiphany that just like the Minamata disease right there before our eyes these sorts of pollution incidents went way back in Japanese history. With Japan's decision to cast off Asia and follow the West after the Meiji Ishin of 1868 came these sorts of incidents, and the question within that was just how should one live? I learned the way Shōzō lived his life. I thought: Wow, it is possible to live that way; I must do it. Unfortunately I am completely unable to do so, but I never stop thinking that Shōzō's was a wonderful way to live a life.

Hirano: Going back to an earlier discussion. You've repeatedly talked about the government's responsibility, scientists' responsibility, and individual responsibility. It would seem that this word "responsibility" is an extremely important keyword for you. You often emphasize it in your writing, too. What I want to ask concerns the issue of scientists' special responsibility, a particular social responsibility. Scientists are often thought of as technicians, but this is not really the case. As a result, I feel you've pursued an intense interrogation of yourself as a scientist. As you've said you are not going to enter politics, could you connect this discussion of scientific responsibility to your earlier discussion of doing all that has fallen to you personally to do? How should we think about these two things?

Koide: I am in science and as such I have to take on the responsibility of a scientist—just as a politician must take political responsibility. I think I mentioned this to you the last time, but I am an absolute individualist (*tetteiteki na kojishugisha*/徹底的な個人主義者). I don't want to be constrained by anyone. I want to be able to decide my own life for myself. But because I've made this choice by myself I must also take full responsibility for that choice.

It's two sides of the same coin. I don't take orders from anyone. And this means that I alone bear the responsibility. It's really as simple as saying: I'm

a scientist and so I have the responsibility of a scientist.

Hirano: On this way of thinking about responsibility: "Who is the subject responsible?"—this way of thinking about it seems to be quite absent in contemporary Japan.

Koide: Right. People living in Japan today have not made decisions as individuals. They just "go with the flow;" as long as they follow the "authorities" whom they believe will guarantee the happiness of their individual selves. This seems true of education, too. Go to a slightly better school; get into a slightly better company; grow a bit more rich, a bit more grand. I think everyone is swept up in this current, and it's really senseless. I think it is extremely important that each and every individual live out their individuality. The absolute worst thing is for everyone to become blindly obedient to the "authorities," yet this is the Japan we find ourselves in today. And so no one takes any responsibility. Living in such a society it is too easy to say, "It can't be helped." Everyone is thus able to blame the society as a whole; "It can't be helped." And so no one takes any individual responsibility. The most extreme and obvious example was the war. Everyone would say: "It's not my fault; I was deceived. The military were the culprits." Saying this allows people to remain at a distance, indifferent. It is bad news for a nation when its citizens have only this view of responsibility.

Hirano: You've declared, "I am an absolute individualist." Personally I am very interested in that statement. So could you speak a bit more concretely about the meaning of your individualism for how one lives a life? In other words, could you explain just what you mean by this "individualism?" That is, in Japan being individualistic is more often a way to say egotistical; a sort of disregard of others. One should pursue one's own interests—in English the word is "selfish" — egocentric — pursue your own egotistic advantage. Now this seems completely different from the way you use the term. Could you speak directly to this difference?

Koide: I think you've just done so.

Hirano: Did I? (Laughs). So that's it then, just as I said? Still it's clearly not selfishness.

Koide: No, I don't think it's about interests.

Hirano: It's about values isn't it?

Koide: Yes, it's about personal values. You and I are different people. I am different again from Mr. Kasai. Why? Well our genetic information is different. I received a bundle of information from my parents. You and Mr. Kasai, too, are influenced by your genetic information. Every one of the over one hundred million Japanese is a unique human being; and every one of the over 7.3 billion people on earth are unique individuals.

History may keep moving on, and there is a big, wide world here on this planet earth. That said, right now, at this moment, and right now, in this place, I exist as an irreplaceable being. It is nothing but an absolute truth. You normally live in Los Angeles, but right now at this moment you are a person who is here. Mr. Kasai has come down from Tokyo. While

acknowledging all the implications of being within the flow of history, we are all right here, right now.

In other words, every single individual human being has a different way of living a life; they are each unique. They have each lived a life that absolutely no one else could have lived. It is a real loss if they don't live up to their full potential. Those are my thoughts.

So for my own unique self, and so for your own unique self, and Mr. Kasai's own unique self, none of us should be compelled by someone else to do something (*meirei o sarete*/命令されて). If we don't live our lives according to the will coming from deep within ourselves, that's a real loss; we must all live with our values coming from within ourselves.

I am going to retire next March, but though I am the lowest ranked employee here— above me are assistant professors and professors — because of the peculiar arrangements of working where I do, I am not compelled to take orders from anyone. I am the lowest ranked so of course there is also no one below me to order around. So I am in a position where I never take nor give orders. For me this is the ideal position to be in.

And so I can live out my own life according to my own values; I'm allowed to live a life that suits me. Now I found myself in this position largely by accident, and then chose to continue to live my life this way. Related to this, I am a human being and so will make mistakes, but these mistakes will be things that I have chosen, things that I have personally done so there is nothing to do but to take responsibility for them. This is what I mean when I say that responsibility is an extremely important word.

Hirano: Well, you've exhaustively criticized this competitive society. You've said that this competitive society has ruined Japan and destroyed life based on what you call responsibility.

Koide: Yes. Everyone is running towards the exact same goal. It's ludicrous. You want to go that way; I want to go this way. I think this would be the ideal society. Full mutual recognition is a good thing.

Hirano: Does your view come from your personal experience? In your books you state that you were a really conscientious student when you were younger (laughs).

Koide: (laughs) Well, yes.

Hirano: You studied extremely hard. Did everything extremely hard. You continued this in your nuclear research in college believing that a new energy source was cheap and good for everyone. You must have thought this was a great thing.

Koide: That's right.

Hirano: But you eventually noticed that it was all wrong. So on this, from deep in your own experience, it's an individual history, an individual experience, in one sense it's connected to your current individualism, to how you live your life focused on the important things to you.

Koide: I think that's right. So, well, when I was young, in my late teens, I was consumed by the dream of nuclear power. I devoted my life to it. That was all

a mistake—it did not take me too long to realize that.

Hirano: When did it happen? In graduate school?

Koide: My third year in university.

Hirano: Third year—so as an undergraduate.

Koide: Yes, I came to this realization in the latter half of my undergraduate studies. It was foolish and I curse myself for it, but I didn't quit. To this day I've lived my life as someone who made that wrong choice, and there is nothing to do but make amends for that choice.

At a minimum I wanted to get rid of nuclear power before there was a bad accident. I guess I've lived with this wish for over forty years—but that wish stayed out of reach. And here we have had the accident so my life has been for nothing. You could say that thing I wanted most to do has been denied. Really, what have I lived for? I think about that from time to time.

As this was my choice I have to accept it. So while the meaning of my life may have been lost, still I was able to live my own life as I pleased, without submitting to the orders of others and without ordering others around—for this I am grateful. My hopes were never realized. History is full of that kind of thing. Likely very few people see their hopes fulfilled. And while in my case they were rejected, I was able to live the life I wanted and that is a life to be grateful for.

Hirano: In a way, it's just how Tanaka Shōzō lived his life isn't it?

Koide: Yes it is. That is what I like about Shōzō.

Hirano: On that point. His life, too, was a defeat.

Koide: Complete and total defeat.

Hirano: Still, he used all sorts of means, and followed all the way through on his beliefs.

Hirano: So getting back to Fukushima, it seems when it comes to the life choices of the so-called Japanese elites, they seem caught in a system in which they will succeed and become famous by crushing their individuality and subsuming it under some organization in order to get ahead in a society and achieve fame and status. And the education system seems to be promoting this lifestyle where these sorts of people are created through intense competition. I think the very end result of this social and educational system was revealed, and it exploded in an explicit and ugly manner through various problems the Fukushima disaster has posed.

Koide: Yes, I think so. You said it.

Hirano: I see. In one sense it would have been possible even for these Japanese elites to make their personal responsibility clear and take appropriate actions only if they had lived a life based on individualism as you suggested.

Koide: Yes I think such a possibility exists, but unfortunately in Japan today that possibility has been completely crushed. It was abundantly clear from the Fukushima disaster that no one in this country is going to take responsibility.

Hirano: You've already talked about how TEPCO and the government made

huge mistakes in dealing with the problem immediately after the accident. What do you see as the definitive mistake that led to this disaster?

Koide: There's a ton of them. Any specialist would have known right away there had been a meltdown, and that everyone needed to be evacuated immediately. And evacuating to 20 km away is totally inadequate. Iitate village some 40-50 km away received an enormous amount of contamination and was neglected for over a month.

Soma residents evacuated to Iitate, this kind of stupidity cannot stand, the government's criminal mistakes.

The Hosokawa family of Iitate Village continues to live in the heavily radiated area to look after their horses (2014). More than a dozen horses died since 2011.

Kasai: I'm deeply taken by your previous discussion on responsibility. It's really a story of something with no owner. A golf course that has had to close because it is considered contaminated with radiation from TEPCO's plant has recently sued. TEPCO's top attorneys argued in defense that the radiation is not their property, which would make it no one's property and therefore TEPCO is not responsible. It seems the opposite of what you've just said about responsibility, to be sure, yet this declaration of complete lack of responsibility, once passed through the logic and system of the courts, these lawyers have arrived at precisely this conclusion. It is not a question of individual responsibility; it is a problem of the social system. Lack of any responsibility is the basis of the entire social system. What are your thoughts on this?

Koide: It's exactly as you say. This is what it has come to. I couldn't care less about a country like that. But in order to overcome this situation, it's something I mentioned earlier, but there is no way but for rather foolish citizens to get smarter. Only each individual standing up for his or her own way is going to do it.

Hirano: You've also talked about "responsibility for being fooled." You've said that even the deceived are guilty and stressed that they too must take responsibility. How do you think about this at the individual level? For example, you've often stated that there should be a new food labeling system put in place by which especially the generation that agreed to build the reactors would be obliged to eat the contaminated food—would this be an example of taking individual responsibility for you?

Koide: Yes, that's exactly what I mean. So, because I think that every Japanese adult has responsibility for both allowing the rampant development of nuclear power and the Fukushima disaster, I said that they

should be the ones to eat the contaminated food. And so that this disaster may never happen again, nuclear power must be eliminated—of course there should be no question of restarting the reactors. Yet, what I've just said is not really a widespread idea. Slowly all the reactors are being restarted.

Hirano: So in that sense Japanese citizens' responsibility is increasing in that they are allowing the restart of the reactors.

Koide: I think the nuclear power issue is precisely analogous to the war.

Hirano: Indeed, as with the damage of misinformation and national morality discourse we talked about and the pressure that comes from those hints of someone being somehow "un-Japanese," it seems to really resemble the war.

Koide: I think so, yes.

Hirano: I'd like to ask more about the responsibility for being misled. Up to now the reason most would say that nuclear power has been allowed is the myth of safety—a myth invented by the coordination of the government, TEPCO, and the media. So Japanese citizens have been robbed of being told the truth, of having the chance to know the truth.

Koide: That's true.

Hirano: So the likely response to your position would be that it's unjust to blame those who were robbed of the chance to know the truth. How would you answer this challenge?

Koide: I also said that the current situation is just like during the war. Then, too, the media only reported the information coming from imperial headquarters: The Japanese military enjoyed nothing but a string of victories. We were all told that because of the emperor Japan was a divine country and therefore could not lose. You would go to school and there would be the emperor's portrait hanging on the wall. There was a place where the emperor was enshrined right there on school grounds. Every child was taught that the emperor was present there.

In such a country it wasn't strange to think that Japan would win the war. But those who knew more about the world, including of course those in the military, knew that Japan could not win. Still they said nothing. And so everyone was swept along with the current.

But history is harsh, and in the end Japan was battered. And people at that time said, "Ah, we've been misled. The military are the culprits." But even within all of this there were those who resisted the war. The number of people tortured and killed by the Special Higher Police was huge. And those people, too, were labeled as "un-Japanese" and ostracized from society by the majority of the population. Whole families, whole groups of people were obliterated.

So those who lived then were duped, they were given false information. But should they say that's where their responsibility ends? I would respond that even if they were duped, the duped still bear the responsibility of the duped. How did each and every one of them live their lives during the war? How did they deal with the information they were being given? I think we need to include these kinds of questions when we interrogate ourselves over taking

responsibility. Now if you say this people get angry but I think without question the emperor has absolute responsibility for the war. We ended up moving on without trying to pursue the emperor's war responsibility. Even today you'll see people happily shouting "Tennō heika banzai," Long Live the Emperor. At midnight NHK will broadcast the Japanese flag flapping in the wind. I can't stand that and so don't watch TV. Most Japanese get happy when they hear 'honorable' addresses by His Majesty the Emperor or news about the imperial family. From the bottom of my heart I think we should have pursued his war crimes and punished him with whatever it takes, including execution. I have been saying this and people get very angry. I am told not to criticize the emperor. They say if I do I'll harm the anti-nuclear movement.

Hirano: Even people in the anti-nuclear movement warn you about things like that? A critical reference to the emperor's wartime responsibility could be fatally divisive for the movement?

Koide: Those roots are that strong when you talk about war responsibility. But as I have mentioned to you, I feel at the bottom of my heart that each and every individual must take personal responsibility for how he or she lived his or her life. That's the reason why I wanted the emperor to take his responsibility as a person.

We must build such a country. Even the duped and the lied to have responsibility as individual human beings. It's true for those who lived through the war, and it's true for those who promote nuclear power in Japan today—indeed it's true for everyone on earth. Each one, should they be deceived, is responsible for being deceived.

Hirano/Kasai: Well we've gone on long today and heard some really important things. Thank you very much.

5

"Tanemaki Journal," an Osaka based radio show by Mainichi Broadcasting Station, began to air critical evaluations of the Fukushima incident immediately after March 11th. Tanemaki Journal invited Koide as a commentator on a daily basis and he offered astute and up-to-date comments on the disaster. Despite, or perhaps because of, its popularity, according to some reports, the radio program was shut down in July 2012 under pressure from Kansai Electric Power Company which was a major sponsor of the TV station MBS. When Mainichi announced the termination of Tanemaki, listeners protested outside the company's office. The program won a Sakata Memorial Journalism Award in March 2012.

6

Kariya Tetsu, *Oi Shinbo 111 Fukushima no shinjitsu* (Tokyo: Shōgakukan, 2014). The episode was published in April 28th, 2014 in a popular comic book. After returning from their visit to Fukushima, Protagonist and his father began to feel very dull and experienced nosebleeds. The episode developed into a social and political issue as it came under attack by conservative politicians and media for stirring up "damage by rumor."

7

Oi Shinbo discusses the theory that nosebleeds may be the result of ionizing radiation that converts H₂O in the nasal passages to the hydroxyl radical HO which can then form hydrogen peroxide (H₂O₂), see Kariya, *Oi Shinbo*, 111: 240-48.

8

Kyushu Electric Power Co. (KEPCO) reactivated the No. 1 reactor in August 2015 and No. 2 in October in the same year. Abe Shinzō's government expressed confidence in the safety the restart by calling the new safety measure "the world toughest." According to the Japan Times, the government plans to have nuclear power account for 20 to 22 percent of the country's total electricity supply by 2030, compared with roughly 30 percent before the disaster at the Fukushima complex. The government continues with the policy despite the overwhelming public opposition against the reactivation of the reactors and the clear evidence that Japanese economy is sustainable without nuclear energy.

9

Mutō Ruiko and Fukushima residents filed a lawsuit against TEPCO and the Japanese government officials, seeking criminal responsibility for the Fukushima nuclear accident. Muto's interview will be published in the Asia-Pacific Journal this year.

10

In September 2015, TEPCO released its first 850 tons of filtered radioactive groundwater into the sea. This is a part of TEPCO's "subdrain plan" that was

approved in late July, 2015, after a year-long battle with local fishermen who opposed the release fearing that it would pollute the ocean and contaminate the marine life. 300 tons of contaminated water is being generated at the plant daily. TEPCO has yet to deal with remaining 680,000 tons of highly contaminated water that was used to cool the reactors during the 2011 meltdown.

11

Kashiwazaki is a city in Niigata prefecture.

12

The Tokaimura nuclear accident occurred on September 30th 1999, resulting in two deaths. It was the worst civilian nuclear radiation accident in Japan prior to the Fukushima Daiichi nuclear disaster of 2011. The criticality accident happened in a uranium processing facility operated by JCO, a subsidiary of Sumitomo Metal Mining Co. in the village of Tokai, Ibaraki Prefecture. Both the national and the prefectural governments failed to deal promptly with the accident due to the lack of evacuation plan and Tatsuya Murakami, then the mayor of the Tokaimura, decided to evacuate villagers from the affected area. 27 workers, who contained the crisis, were exposed to radioactivity.

13

Tanaka Shōzō (1841-1913) is considered to be Japan's first environmentalist. Tanaka is well known for his activism in connection with pollution caused by waste from the Ashio Copper Mine in Tochigi prefecture. From the mid-1880s, the Watarase river near the mine became heavily contaminated by mine waste and in 1890 a large flood carried poisonous waste from the mine into surrounding fields and villages. Tanaka took the cause to the National Diet as a member of the House of Representatives, but it ended with little success. In 1900, Tanaka and villagers in the valley of the Watarase river planned a mass protest in Tokyo, but were stopped and dispersed by government troops. He resigned from the Diet in 1901 and made a direct appeal to Emperor Meiji. He became the supporter of local autonomy and developed his own anti-war, anti-imperialist, and environmental philosophy. He died of cancer in Yanaka village in 1913.

Perspective on Koide's interview

Nuclear Disasters: A Much Greater Event Has Already Taken Place

Robert Stolz

3/11 and Japanese Resilience Five Years Later

March 15, 2016

Volume 14 | Issue 6 | Number 3

Koide Hiroaki has dedicated his career to preventing a nuclear disaster in Japan. That disaster has now happened. As we learn in this wide-ranging and important interview, the accident often referred to as 3/11 was enormous and in many ways unprecedented. The full scope of the disaster is still unknown, but is clearly on the scale of Chernobyl, placing the amount of radioactive material released into the atmosphere possibly up to 1,000 times the Hiroshima bombing of 1945. Professor Koide's reporting in his many books, interviews, and radio programs is essential reading for anyone wishing to learn the nature and extent of the radiological event of March 2011 and beyond. But early in the interview we learn something else. For while in ways unprecedented, 3/11 is also a part of a historical series of nuclear exposures from the Trinity test in the New Mexico desert in July 1945, to the Castle-Bravo Lucky Dragon Incident of 1954, to Semipalatinsk, to Chernobyl, and to the next sure-to-happen event.¹ In fact, while it is clear that the urgent social, political, and medical task right now is the acute contamination of land, air, sea, and bodies by the Fukushima dai-ichi meltdowns, as Prof. Koide says, as bad as Fukushima is, "a much greater event has already taken place." His immediate reference is **the enormous amount radioactive material released in the atmospheric testing from 1945 to 1980.**²

Though many decades in the past, these radioactive releases at the height of the Cold War continue to contaminate the entire globe. Originally, huge amounts of radioactive material, several times greater than Chernobyl or Fukushima, were released into the air and dispersed by the prevailing winds and jet stream before falling on the oceans and land contaminating huge areas of the earth-especially in the main test sites in the South Pacific, the US West, and Kazakhstan. But some of this released material breached the tropopause, the soft barrier between the troposphere and the stratosphere, escaping the troposphere before becoming trapped aloft in the stratosphere. Recently it has been discovered that major spring thunderstorms-and notably the 2010 eruption of Eyjafjallajökull in Iceland- regularly rise high enough to breach the tropopause. Radioactive particles, mostly plutonium and Cesium-137, now decades old, attach to the storms and fall back to earth as a fresh contamination of material from atmospheric testing. As prof. Koide points out this means that **the entire earth has been and continues to be exposed to radiation from these tests.** Following the widely accepted model of radiation exposure as damaging at all levels-the

linear, no threshold model (LNT)-it follows that this exposure led to a rise of damage to global health, especially childhood thyroid cancer, leukemia, and other health effects.³

But 3/11 is not only one in a series of radiation contaminations dating back to the birth of the atomic age. These nuclear disasters are also part of a larger historical series of toxic events dating back to the birth of the industrial age. Prof. Koide himself notes the parallels of his own work with the Japanese anti-pollution activist Tanaka Shōzō's (1841-1913) fight against the pollution of the Watarase and Tone rivers north of Tokyo by the Ashio Copper Mine in the 1890s. Fukushima must be seen in the context of these other toxic events, one in a series which, though the particular pollutant may have been different, all share a family resemblance: **each names a particular site of industrial capitalist production that results in the contamination of a space that in turn requires the sacrifice of that region for future use and the loss of the means of life by any who live in the area.** The list of these national sacrifice zones is long and growing: Ashio, Minamata, Grassy Narrows, Ontario, Hinkley, California, the Gulf of Mexico Hypoxic Zone, Bikini Atoll, the "downwind" sections of the Great Basin of eastern California, Nevada, and western Utah,⁴ Hanford, Washington and Ozersk, Kazakhstan,⁵ Chernobyl. The list now includes a region some 20km around Fukushima dai-ichi.

Tanaka Shōzō glimpsed the logic of the national sacrifice zone in 1902 when he fought against the Japanese state's seizing of the village of Yanaka and displacing its residents in order to build a flood control reservoir. For Tanaka, this enormous re-making of the Watarase and Tone rivers signaled no less than converting an entire watershed that had served as a centuries-long source of production and sustenance into a sink of contaminants: "If [the pollution] continues too long, the river's headwaters will trickle out from a poisoned mountain of foul rocks and polluted soil that wholly penetrates the water, forming a second [toxic] nature (*dai ni no tensei o nashi*); once this happens there will be no saving anyone."⁶ This event was the turning point in Japan's environmental history, one that was repeated across the globe in the 19-20th centuries. **The insatiable drive for more powerful energy sources to fuel more economic growth is everywhere hitting barriers, creating more and more national sacrifice zones on larger and larger scales.**

The growing toxicity of daily life stretches from the local and personal in the toxic working environments of computer production and waste disposal to the truly global. With global warming, ocean acidification, bioaccumulation of mercury, desertification, and countless other alarming trends we risk sacrificing the earth itself as these trends combine to make the earth less and less amenable to increased or even stable production of the means of subsistence. 2002 marked an uptick in global food prices that has continued to this day, reversing a centuries long trend of cheaper food—a trend that drove much of the economic progress since the nineteenth century. Global food prices in 2014 were 127% of 2002⁷ and show few signs of stopping their rise. The implications for increasing toxicity and undemocratic politics in an era of unprecedented rising food prices are dire, as the motivation to dig deeper for water and nutrients will require even greater projects that demand ever greater chemical and energy inputs.

The Cosmic Horror of Hoshanō sekai

Even so the nuclear question remains special—a culmination or apotheosis of this longer trend. As we learn in the interview, a nuclear disaster is different from other contaminations. Because of the very nature of radiation, namely its spatial and temporal scales, in many ways we lack a language adequate to a world lorded over by radiation. The literary genre called Cosmic Horror of Algernon Blackwood or H. P. Lovecraft has long attempted to grasp the frightening realities of unleashing a force that operates on such a-human scales and temporalities as plutonium-239 (half-life over 24,000 years) or uranium-235 (half-life over 700 million years). The Horror writer and arch-pessimist Thomas Ligotti perhaps comes closest to describing the implications of unleashing truly astronomical forces into human everyday life when he

writes: "Such is the motif of supernatural horror: Something terrible in its being comes forward and makes its claim as a shareholder in our reality, or what we think is our reality and ours alone. It may be an emissary from the grave, or an esoteric monstrosity.... It may be the offspring of a scientific experiment with unintended consequences.... Or it may be a world unto itself of pure morbidity, one suffused with a profound sense of doom without a name - Edgar Allan Poe's world."⁸ In our present of 2016 the sense of doom does have a name: Hoshanō sekai-Radiation's World. Radiation's World announces that the earth-or at least large parts of it-is no longer exclusively ours. We have rendered huge spaces of the planet off limits for time periods beyond any scale of recorded history.⁹ Parallel to but different than the rapacious depletion of the natural world from forests to cod stocks to fossil fuels that took millennia to build up but are consumed in decades, as we mine deeper temporalities in pursuit of open ended consumption we have also unleashed anti-human temporalities incompatible with continued production or consumption.¹⁰ It is these spaces that are now ruled by radiation and are no longer part of human society. Like the old Horror trope, **we have unleashed forces that we cannot contain.** But unlike Horror, there is no discrete monster to kill at the end.¹¹ Pessimism is surely called for.

Though our world of cosmic horror may have a name, hoshanō sekai likely does not have a politics. At Ashio, Tanaka fought the re-engineering of the watershed by building different relations to the river in the doomed village of Yanaka, a politics he called Yanaka Studies (*Yanakagaku*). In the post-war period the physician and activist Harada Masazumi called his effort to rebuild the fishing village poisoned by methyl mercury effluent Minamata Studies (*Minamatagaku*). And globally there is the Salvagepunk movement to reclaim abandoned urban zones by reassembling of collapsing infrastructure from Detroit to the Parisian banlieues.¹² But the very nature of radiation thwarts this process. There cannot be an Atomic Punk. The 20 km zone around the Fukushima plant has been appropriated by radiation and will not be re-appropriated by humans for decades - the site itself remains off limits for much longer. Because the monitoring equipment was destroyed by the accident itself, the oft-cited maximum recorded doses of 25 mSv/yr cover only the first four months of the disaster and only include external radiation. Adding internal radiation through inhaling radioactive dust or consumption of radioactive food and water means the levels are necessarily higher. Further, current readings take only the readings in the air and not in the soil or water.¹³ A purely technical fix seems unlikely as even robots may not safely venture onto the reactor site, putting a pessimistic spin on the term post-human. The contamination has its own lifespan; it can only be moved and hopefully contained, in some cases for millennia. Populations cannot safely repopulate the area no matter what alternative politics they may practice. **As prof. Koide and many others note, there is nothing to do but cede the ground to radiation and relocate.**

Though a long planned Cold War prelude to the remilitarization of Japan, the new State Secrets Law of 2014 was predictably used first to control the information on the levels of contamination outside the 20km exclusion zone. And thus the long historical trend linking toxicity and undemocratic politics is renewed and extended. **It is likely this very nexus of toxicity and undemocratic politics that is the source of the repetition compulsion at the core of the historical series of national sacrifice zones.** Just as the existence of nuclear weapons requires a national security state, the existence of nuclear power presupposes appropriation of the kind resisted since Ashio. In short, the nuclear reactors instantiate a fundamentally untenable social relation to nature-and thus a fundamentally untenable social relation to life itself. What is called for is a new environmental regime based on an ecologically sound everyday life. This is Tanaka's Yanaka Studies. It is the physician Harada Masazumi's Minamata Studies, and it is a yet to be formed Fukushima Studies. But a Fukushima Studies must start, as Prof. Koide tells us, with the immediate end to nuclear power. **Though radiation contamination does not have a technical fix, it may have a political one.** As Prof. Koide says, Germany has done just this: declared an end to nuclear

power.¹⁴ This is the necessarily political decision that can then be the basis of a new energy regime. This is not easy, but it is possible. The encouraging grassroots politicization of "electricity conservation" (setsuden) of recent years has shown the feasibility of just such a new energy regime in Japan, one without nuclear power or increased imports of polluting coal and oil. But this trend is countered by others. In the face of strong anti-nuclear protests, the Abe government has already restarted reactors in Kyushu, and just as Prof. Koide feared in his discussion of the 2014 LDP election, the government has plans to restart the others moving towards a Japanese energy regime hardly changed from before the Fukushima disaster. Prof. Koide's career was not able to prevent the disaster. But his message still points the way to a better future. With the popular mood turned into a political movement-a movement that the 2014 election shows is not yet currently on the horizon-a less toxic, more democratic society is surely possible. More, it is necessary.

More compensation for TEPCO

May 26, 2016

TEPCO ordered to pay compensation over 2 Fukushima evacuee deaths

<http://mainichi.jp/english/articles/20160526/p2a/00m/0na/013000c>

Tokyo Electric Power Co. (TEPCO) was ordered to pay compensation over the deaths of two evacuees from the Fukushima nuclear disaster in rulings at the Tokyo District Court on May 25.

The court, presided over by Judge Yuko Mizuno, ordered that a total of around 30 million yen be paid in the two cases to the relatives of evacuees Masami Fujiyoshi, who died at age 97, and a woman who died at age 86. Fujiyoshi was a patient at Futaba Hospital in Okuma, Fukushima Prefecture, and the woman was a patient at an adjacent, related facility for the elderly. Both died after being evacuated by bus around 230 kilometers away to the city of Iwaki. They were among around 50 patients at the facilities who died after the disaster.

The rulings are the third and fourth concerning patients evacuated from Futaba Hospital or related facilities. Just as in the first and second rulings, the latest rulings recognized a causal relationship between the nuclear disaster and the deaths of the evacuees.

Plaintiffs in the two newer cases had sought a total of about 66 million yen in compensation. In each of the latest cases the court set the compensation to be paid at 20 million yen, then reduced this by around 20 to 30 percent based on the evacuees' pre-existing conditions unrelated to the nuclear disaster. TEPCO released a comment saying, "We will check the ruling and respond to it sincerely."

The chosen few

May 31, 2016

TEPCO reveals only handful knew meltdown manual existed

<http://www.asahi.com/ajw/articles/AJ201605310068.html>

THE ASAHI SHIMBUN

Although a manual existed that outlined the criteria for a meltdown, Tokyo Electric Power Co. admitted that only five or so employees at its main office knew of it at the onset of the 2011 nuclear crisis.

Those employees belonged to a section that manages the manual at the company's Tokyo headquarters, TEPCO said at a news conference on May 30.

The utility has been under fire for the delay in acknowledging in May 2011 that triple meltdowns took place at the Fukushima No. 1 nuclear power plant, two months after they actually occurred following the Great East Japan Earthquake and tsunami.

TEPCO had maintained that the reactors at the plant suffered "core damage," rather than more serious meltdowns.

Explaining the delay, the company initially cited a lack of guidelines for determining a meltdown.

But TEPCO admitted in February this year that the company manual did contain entries defining a meltdown, although the company said it was unaware of the descriptions for the past five years. The criteria requires the company to declare a meltdown when damage to a reactor core passes 5 percent.

Takafumi Anegawa, chief nuclear officer with TEPCO, told the news conference that a third-party panel will investigate why it took the company five years to disclose the existence of the manual.

In April, a TEPCO senior official admitted that he knew of the criteria when the crisis was unfolding at the plant.

Govt. withholds report on health effects of Chernobyl

June 4, 2016

Japanese gov't withheld report on Chernobyl disaster's health effects

<http://mainichi.jp/english/articles/20160604/p2a/00m/0na/006000c>

The Japanese government has withheld an investigative report it compiled on health effects from the 1986 Chernobyl nuclear catastrophe despite spending 50 million yen on the survey in the wake of the Fukushima nuclear disaster, it has been learned.

The government's investigation into the aftereffects of the Chernobyl disaster began in November 2012 -- the year after the meltdowns at the Fukushima No. 1 Nuclear Power Plant -- under the then Democratic Party of Japan (DPJ)-led administration, and was completed in March 2013 after the Liberal Democratic Party returned to power.

The investigative report denies local documents that confirmed far more serious health hazards from the Chernobyl accident in the former Soviet Union than those recognized by international organizations. An expert familiar with information disclosure points out that the report "should be publicized as a resource for verification from a critical point of view, considering that public money was spent on it" amid sharply divided opinions over nuclear power in Japan.

The investigation was budgeted by the Ministry of Education, Culture, Sports, Science and Technology and was commissioned to a Tokyo-based consulting firm funded by power companies. **A committee set up to evaluate the survey results was chaired by Nagasaki University professor emeritus Shigenobu Nagataki, who formerly served as chairman of the Radiation Effects Research Foundation.** The investigative team primarily examined and assessed two local reports -- "Twenty-five years after the Chernobyl accident: Safety for the future" and "Chernobyl: Consequences of the catastrophe for people and the environment."

The "Safety for the future" report, which was compiled by Ukraine's Ministry of Emergencies in 2011, points out that the ratio of healthy workers dealing with post-disaster work in Chernobyl plunged from 67.6 percent in 1988 to 5.4 percent in 2008. The latter report, which was put together by local researchers in 2009, estimates that a total of 985,000 people died from the effects of the Chernobyl disaster between April 1986 and December 2004 after their constant exposure to radiation following the disaster triggered cancer, heart and vein disorders and other ailments.

Both reports claim far more serious health hazards than those recognized by international organs, and gained much public attention here in Japan after the reports were highly publicized in the wake of the 2011 Fukushima disaster.

The Japanese government report's assessment panel examined the two reports with regard to 124 parts concerning blood and lymphatic disorders and analyzed whether radiation dose assessments were carried out where radiation exposure was linked to health damage. The committee also conducted an on-site investigation and concluded that it couldn't find any resources with which they could determine the relationship between exposure doses and health damage, based on scientific grounds.

Subsequently, **the science ministry department that was in charge of the survey was moved to the secretariat of the Nuclear Regulation Authority (NRA) in April 2013, and the Japanese government's report was not released. The NRA secretariat eventually placed the report in the National Diet Library by way of the Environment Ministry.**

Nagataki told the Mainichi Shimbun, "After we filed the investigation report with the science ministry, the ministry department in charge was shifted to the NRA secretariat, leaving us no clues as to what has become of the report. I felt uncomfortable when I heard the report was kept at the National Diet Library, but I also thought it would be inappropriate for us to demand that the report be released."

A source close to the government told the Mainichi, "The investigation was decided upon under the DPJ administration, and we had to use up the budget. As the government changed hands, we had no intention of proactively publicizing the report." Another government insider said, **"Nondisclosure of the report**

was also intended to avoid causing fear among people in Fukushima. It was also aimed at preventing harmful rumors."

Make March 11 International Day of Global Ethics

Received from Mitsuhei Murata:

Comment on the attached Joint Statement promoting March 11 as an International Day of Global Ethics

A new international system is needed to minimize the consequences of nuclear accidents. Fukushima is revealing the limitations of a government facing a national crisis, its longevity being but of a few years. Nuclear accidents have shown the necessity of coping with their consequences quasi-permanently.

By dint of procrastination, the government of a country where a severe nuclear accident has broken out, could avert the crucial duty to make maximum efforts to cope with the accident by an operation of diversion with the collaboration of the media.

I would like to urge the international community to take up this new problem. Fukushima is now a global security issue.

We need a new system to cope with it.

To supplement this argument, it will help to take up the existence of the IAEA which is given the incompatible mission of preventing the nuclear proliferation and the promotion of nuclear power generation. This organization is known to protect the interests of electric companies. It minimizes the consequences of a nuclear accident and the dangers of radiation. Fully aware of this serious defect, the member states continue to tolerate its existence. This is due to the limitations of the governments of the member states that do not dare to take up a challenging issue that could not easily be solved during their tenure of office.

Now that it is established that nuclear accidents constitute a most serious global security issue, we need a special international system that obliges governments to carry out prescribed duties.

In this connection, an epoch-making development has taken place. It is the attached Joint Statement, calling for the reform of the IAEA. It has been supported by Former President of the Swiss Confederation Moritz Leuenberger, Former Japanese Prime Minister Morihiro Hosokawa and Professor Ernst von Weizsäcker.

**Joint Statement
promoting March 11 as an International Day of Global Ethics**

The lesson of Fukushima is that we should not use any scientific technology susceptible of causing such damage that human society cannot endure, irrespective of the figures of probability of accident, unless the risk is completely zero.

Any conduct that permits radioactive contamination would create incalculable harm to mankind and the earth almost permanently. It should be condemned as lacking ethics and responsibility.

Japan, alas, has been the victim of both military and civil use of nuclear energy. After Fukushima, Japan is not only suffering from radioactive contamination, but also is encountering not easily surmountable difficulties to bring the disastrous consequences of the accident under control.

It is recognized clearly that nuclear technology is indivisible and cannot be separated between the military and the civilian sectors. We believe that Japan now has the historical mission to plead for the complete nuclear abolition, both military and civil. It is the lesson of Fukushima.

From this point of view, we would like to propose the following:

- 1. The I.A.E.A .that is given an incompatible mission of preventing nuclear proliferation and promoting nuclear power generation should be reformed.**
- 2. International control over the safety of existing nuclear plants must be strengthened.**

The present crisis confronting mankind is a crisis of civilization. We should transform this civilization – the civilization of power based on ‘paternal culture’ – into a civilization of harmony based on ‘maternal culture’ that gives the supreme value to life.

The deeply-rooted cause of the crisis confronting mankind is the universally prevalent lack of ethics. It is against fundamental ethics to abuse and exhaust natural resources that belong to future generations and leave behind permanently poisonous waste and enormous financial debts. Nature and resources of the world are being exploited without regard for the consequences.

Without establishing global ethics, we cannot create future civilization of mankind that leaves behind the beautiful planet for succeeding generations.

In this spirit, we stand for convening a United Nations Ethics Summit and creating an International Day of Global Ethics as is called upon by WFUCA. We fully support the official declaration of WFUCA to make 3.11 the UNESCO World Day of Global Ethics, inviting the international community to support this idea. We believe that this Summit will pave the way toward the vision of President Obama for the” World without Nuclear Weapons”.

This International Day for Global Ethics will allow us every year to renew our determination never to resort to war as a solution to conflict.

We must prepare to make the short term sacrifices in our lifestyles for the long term safety of mankind and the earth without nuclear energy. Natural and renewable energies could constitute the basis for a new civilization based on ethics and solidarity that respects the environment and the interests of future generations.

Only the Fukuryu Maru?

June 5, 2016

Fukuryu Maru got health-damaging dose from 1954 H-bomb tests, ministry claims

http://www.japantimes.co.jp/news/2016/06/05/national/fukuryu-maru-got-health-damaging-dose-1954-h-bomb-tests-ministry-claims/#.V1R_ZuRdeot

Kyodo

No other Japanese ship was exposed to health-damaging radiation from the 1954 U.S. hydrogen bomb tests in the Pacific Ocean aside from the Fukuryu Maru No. 5, which was contaminated by fallout from one of the tests at Bikini Atoll, according to a recently released health ministry study.

“We were not able to confirm that the exposures (of other vessels) were around the levels that would have had an impact on their health,” a health ministry team said in a report last week, adding that the maximum estimated external exposure was far below the international threshold of 100 millisieverts at which an increased risk of cancer is expected.

The study began after the health ministry disclosed **an abundance of records in September 2014 that were related to radiation checks conducted on ships that were in the vicinity of Bikini Atoll in the Marshall Islands when the United States conducted its hydrogen bomb tests there in 1954.**

With the disclosure, the ministry also retracted its earlier, long-held position that the radiation testing records no longer existed.

Supporters of the former Fukuryu Maru fishermen said that the health ministry’s new study wasn’t thorough enough.

“The government study is only checking radiation exposures from the first of the six tests held,” said Masatoshi Yamashita, 71, an executive at a civic group who’s been researching the Bikini Atoll case for over 30 years. “It’s not enough.”

While the story of the tuna trawler also known as the Lucky Dragon is well known for the fatal H-bomb fallout that rained down on its deck following the test on March 1, 1954, details about the radiation exposure received by other ships that were in the vicinity at the time have largely been a mystery.

This is the first time that the government has come up with an estimate of the radiation received by other ships’ crews, the Health, Labor and Welfare Ministry said.

Earlier this year, a group of former crew members from those ships applied for workers’ compensation for cancer and other diseases that they say were caused by exposure to the atomic tests.

The report, however, says the health ministry team did not find clear signs that the radiation had affected the white and red blood cell counts of those who were exposed, based on blood tests and other data contained in the records disclosed in 2014.

It also reported that the maximum external exposure stood at 1.12 millisieverts, and claimed that internal exposure is likely to have been “quite small in comparison to the external exposure,” based on other exposure studies related to the Fukuryu Maru’s crew and to residents of the Marshall Islands.

All 23 members of the Fukuryu Maru began developing acute symptoms of radiation sickness shortly after the trawler was showered by fallout from the Castle Bravo H-bomb test on March 1, 1954.

One member of the fishing boat died about six months later at the age of 40.

Stigma attached to cancer

June 7, 2016

Fukushima woman speaks out about her thyroid cancer

<http://www.asahi.com/ajw/articles/AJ201606070049.html>

THE ASSOCIATED PRESS

KORIYAMA, Fukushima Prefecture--She's 21, has thyroid cancer, and wants people in her prefecture in northeastern Japan to get screened for it. That statement might not seem provocative, but her prefecture is Fukushima, and of the 173 young people with confirmed or suspected cases since the 2011 nuclear meltdowns there, **she is the first to speak out.**

That near-silence highlights the fear Fukushima thyroid-cancer patients have about being the "nail that sticks out," and thus gets hammered.

The thyroid-cancer rate in the northern Japanese prefecture is many times higher than what is generally found, particularly among children, but the Japanese government says more cases are popping up because of rigorous screening, not the radiation that spewed from Fukushima No. 1 power plant.

To be seen as challenging that view carries consequences in this rigidly harmony-oriented society. **Even just having cancer that might be related to radiation carries a stigma** in the only country to be hit with atomic bombs.

"There aren't many people like me who will openly speak out," said the young woman, who requested anonymity because of fears about harassment. "That's why I'm speaking out so others can feel the same. I can speak out because I'm the kind of person who believes things will be OK."

She has a quick disarming smile and silky black hair. She wears flip-flops. She speaks passionately about her new job as a nursery school teacher. But she also has deep fears: Will she be able to get married? Will her children be healthy?

She suffers from the only disease that the medical community, including the United Nations Scientific Committee on the Effects of Atomic Radiation, has acknowledged is clearly related to the radioactive iodine that spewed into the surrounding areas after the only nuclear disaster worse than Fukushima's, the 1986 explosion and fire at Chernobyl, Ukraine.

Though international reviews of Fukushima have predicted that cancer rates will not rise as a result of the meltdowns there, **some researchers believe the prefecture's high thyroid-cancer rate is related to the accident.**

The government has ordered medical testing of the 380,000 people who were 18 years or under and in Fukushima prefecture at the time of the March 2011 tsunami and quake that sank three reactors into

meltdowns. About 38 percent have yet to be screened, and the number is a whopping 75 percent for those who are now between the ages of 18 and 21.

The young woman said she came forward because she wants to help other patients, especially children, who may be afraid and confused. She doesn't know whether her sickness was caused by the nuclear accident, but plans to get checked for other possible sicknesses, such as uterine cancer, just to be safe.

"I want everyone, all the children, to go to the hospital and get screened. They think it's too much trouble, and there are no risks, and they don't go," the woman said in a recent interview in Fukushima. "My cancer was detected early, and I learned that was important."

Thyroid cancer is among the most curable cancers, though some patients need medication for the rest of their lives, and all need regular checkups.

The young woman had one cancerous thyroid removed, and does not need medication except for painkillers. But she has become prone to hormonal imbalance and gets tired more easily. She used to be a star athlete, and snowboarding remains a hobby.

A barely discernible tiny scar is on her neck, like a pale kiss mark or scratch. She was hospitalized for nearly two weeks, but she was itching to get out. It really hurt then, but there is no pain now, she said with a smile.

"My ability to bounce right back is my trademark," she said. "I'm always able to keep going."

She was mainly worried about her parents, especially her mother, who cried when she found out her daughter had cancer. Her two older siblings also were screened but were fine.

Many Japanese have deep fears about genetic abnormalities caused by radiation. Many, especially older people, assume all cancers are fatal, and even the young woman did herself until her doctors explained her sickness to her.

The young woman said her former boyfriend's family had expressed reservations about their relationship because of her sickness. She has a new boyfriend now, a member of Japan's military, and he understands about her sickness, she said happily.

A support group for thyroid cancer patients was set up earlier this year. The group, which includes lawyers and medical doctors, has refused all media requests for interviews with the handful of families that have joined, saying that kind of attention may be dangerous.

When the group held a news conference in Tokyo in March, it connected by live video feed with two fathers with children with thyroid cancer, but their faces were not shown, to disguise their identities. They criticized the treatment their children received and said they're not certain the government is right in saying the cancer and the nuclear meltdowns are unrelated.

Hiroyuki Kawai, a lawyer who also advises the group, believes patients should file Japan's equivalent of a class-action lawsuit, demanding compensation, but he acknowledged more time will be needed for any legal action.

"The patients are divided. They need to unite, and they need to talk with each other," he said in a recent interview.

The committee of doctors and other experts carrying out the screening of youngsters in Fukushima for thyroid cancer periodically update the numbers of cases found, and they have been steadily climbing.

In a news conference this week, they stuck to the view the cases weren't related to radiation. Most disturbing was a cancer found in a child who was just 5 years old in 2011, the youngest case found so far. But the experts brushed it off, saying one wasn't a significant number.

"It is hard to think there is any relationship," with radiation, said Hokuto Hoshi, a medical doctor who heads the committee.

Shinsyuu Hida, a photographer from Fukushima and an adviser to the patients' group, said fears are great not only about speaking out but also about cancer and radiation.

He said that when a little girl who lives in Fukushima once asked him if she would ever be able to get married, because of the stigma attached to radiation, he was lost for an answer and wept afterward.

"They feel alone. They can't even tell their relatives," Hida said of the patients. "They feel they can't tell anyone. They felt they were not allowed to ask questions."

The woman who spoke to AP also expressed her views on video for a film in the works by independent American filmmaker Ian Thomas Ash.

She counts herself lucky. About 18,000 people were killed in the tsunami, and many more lost their homes to the natural disaster and the subsequent nuclear accident, but her family's home was unscathed.

When asked how she feels about nuclear power, she replied quietly that Japan doesn't need nuclear plants. Without them, she added, maybe she would not have gotten sick.

Ash's video interview:

The importance of words

June 16, 2016

Panel: Use of words 'core meltdown' banned

http://www3.nhk.or.jp/nhkworld/en/news/20160616_32/

A panel report says a former president of Tokyo Electric Power Company had instructed its officials not to use the words "core meltdown" in explaining the accident at the Fukushima Daiichi nuclear plant. The panel says the president banned use of the words following what he said was **an instruction from the prime minister's office**.

TEPCO admitted meltdowns at 3 of its reactors at the Fukushima plant 2 months after the March 2011 accident. It had instead explained that the reactors' cores had been damaged.

A third-party panel was set up by the utility in March to investigate responses to the accident. It submitted the probe results on Thursday.

The panel report says then-TEPCO president Masataka Shimizu instructed a vice president, who was attending a news conference 3 days after the accident, not to use the words "core meltdown."

The report says the ban was conveyed to the vice president through a public relations officer and that it was explained as an instruction from the prime minister's office.

But the panel says it did not carry out investigations of the prime minister's office and that it could not gain details of the instruction through interviews with Shimizu and other officials. Such details include which member of the prime minister's office gave it and how.

Another panel set up by the Niigata prefectural government has also been investigating TEPCO's handling of the accident.

TEPCO earlier told the Niigata panel that it did not use the words "core meltdown" because there is no concise definition of them and that using the words may have given misleading information.

The third-party panel referred to the fact that it took more than 2 months for TEPCO to admit core meltdowns.

The panel report says it cannot say this was improper because TEPCO officials could not determine whether core meltdowns had taken place by inspecting the reactors at that time.

But the report also says core meltdowns were being mentioned within the company at that time and that it could have admitted the phenomena externally.

A panel jointly set up by Niigata Prefecture and TEPCO is expected to carry out further investigations of the matter.

Core meltdown & denials

June 17, 2016

DPJ leaders deny urging cover-up of Fukushima meltdown

<http://www.asahi.com/ajw/articles/AJ201606170063.html>

THE ASAHI SHIMBUN

Former government leaders vehemently rejected suggestions in a report that they were pulling the strings behind a suspected meltdown cover-up when the Fukushima nuclear disaster was unfolding in 2011.

The report, compiled by an investigation panel commissioned by Tokyo Electric Power Co., operator of the crippled nuclear power plant, said Masataka Shimizu, who was TEPCO president at the time of the accident, instructed employees not to use the term "meltdown," leading to a delay in the official announcement.

But the report also implied that Shimizu was acting on orders from high up in the government.

Yukio Edano, who was chief Cabinet secretary of the Democratic Party of Japan-led government when the Great East Japan Earthquake and tsunami triggered the nuclear crisis on March 11, 2011, described the report as preposterous.

"As far as I know, it is unthinkable for government officials back then to ask TEPCO to do such a thing,"

Edano, now the secretary-general of the opposition Democratic Party, told reporters on June 16.

He accused the panel of merely skimming the surface of the matter and sidestepping the truth behind the instructions to avoid using the term "meltdown."

"It is utterly irresponsible for the panel to say that it did not uncover that (Shimizu) was instructed by who and what," he said.

The third-party panel of legal experts said in the report released on June 16 that it can be assumed that Shimizu understood that he was requested by the prime minister's office to seek its approval beforehand if the company were to announce the "meltdown."

The panel also said it would be difficult to conclude that TEPCO's delay in declaring the meltdown was a "deliberate cover-up."

"Since TEPCO released information on radiation levels inside the reactors and other related data at that time, just not using the term meltdown cannot be described as an act of a deliberate cover-up," the panel said.

TEPCO declared the meltdown at three reactors at the Fukushima No. 1 plant in May 2011, two months after it occurred.

According to the report, Shimizu entered the chief Cabinet secretary's office, which is located at the prime minister's office building, by himself on March 13, 2011. The following day, Sakae Muto, vice president of TEPCO, explained the conditions of the reactors at the plant.

During the news conference, Shimizu handed a memo to Muto through a TEPCO public relations official, telling him not to use the word "meltdown" on the instructions of the prime minister's office, according to the panel.

Naoto Kan, who was prime minister at the time of the disaster, denied giving the instruction to TEPCO.

"I myself have never given directions to TEPCO not to use the expression 'meltdown,'" Kan, a member of the Democratic Party, said in a statement.

One reason for the lack of clarity in the report is that Shimizu, who was interviewed twice for a total of four hours, said, "I do not remember very well" with regard to who gave what instructions.

Another TEPCO employee interviewed by the panel said Shimizu "was under tremendous pressure and must not have a detailed recollection."

The panel interviewed about 60 former and current TEPCO officials but no government officials and bureaucrats who were involved in dealing with the crisis.

"Our authority to investigate is limited, and it is difficult (to uncover the entire truth) in such a short time," said Yasuhisa Tanaka, the lawyer who headed the investigation.

Tanaka and another panel member, Zenzo Sasaki, a former prosecutor at the Tokyo District Public Prosecutors Office, were also in charge of the third-party investigation into the accident conducted in 2013.

That investigation, based on interviews of TEPCO officials, came under fire for "only arbitrarily presenting TEPCO's argument that is convenient to the company."

The findings by the latest panel showed TEPCO officials looking into the nuclear disaster were aware of Shimizu's order not to use "meltdown," but TEPCO's in-house investigation team did not include it in its report in 2012, apparently believing it was not significant enough to mention.

"TEPCO's efforts to share information inside the company were insufficient," Tanaka said. "It lacked consideration for local governments, which should have been top priority."

The revelation that Shimizu ordered the avoidance of "meltdown" fueled feelings of distrust toward TEPCO among local governments hosting TEPCO nuclear power plants.

"We are still in this stage of the investigation even five years after the accident," said Toshitsuna Watanabe, mayor of Okuma, which co-hosts the crippled Fukushima plant.

Hirohiko Izumida, governor of Niigata Prefecture, home to TEPCO's Kashiwazaki-Kariwa nuclear power plant, called for a further investigation to reveal the whole picture of the Fukushima disaster.

"We need to step up efforts to uncover what has not been sufficiently investigated before," he said.

"TEPCO, as an organization, should make a sincere response without hiding anything."

The latest panel was established in March at the request of the Niigata prefectural government's technology committee, which aims to determine why TEPCO waited until May 2011 to announce the triple meltdown.

TEPCO initially said it did not have the criteria for defining and determining a meltdown.

But it announced in February this year that the company "found" an in-house manual that explained whether a meltdown was taking place.

Japan lawmaker denies pressuring TEPCO not to say 'meltdown'

June 17, 2016 (Mainichi Japan)

<http://mainichi.jp/english/articles/20160617/p2g/00m/0dm/062000c>

TOKYO (AP) -- A Japanese opposition leader who was a senior official during the 2011 Fukushima nuclear plant crisis denied Friday that he or the prime minister at the time pressured the president of Tokyo Electric Power Co. not to use the term "meltdown."

- **【Related】** TEPCO head banned use of 'meltdown' in describing Fukushima crisis

Democratic Party Secretary-General Yukio Edano called a special news conference to refute a finding in a new report that then-TEPCO President Masataka Shimizu apparently came under political pressure not to use the word. The report did not find direct evidence of that.

"The fact that I or then-Prime Minister (Naoto) Kan ordered or requested then-President Shimizu to avoid using the term 'meltdown' under any circumstance does not exist," Edano said. He said the timing of the report was suspicious ahead of an Upper House election next month.

The report released Thursday by a team of three lawyers appointed by TEPCO found that an instruction from Shimizu to avoid using the term "meltdown" delayed full public disclosure of the status of the nuclear plant, which suffered three reactor meltdowns after a major earthquake and tsunami hit the northeastern Japanese coast on March 11, 2011.

The utility used the less serious phrase "core damage" for two months after the disaster.

TEPCO reported to authorities three days after the tsunami that the damage, based on a computer simulation, involved 25 to 55 percent of the fuel but did not say it constituted a "meltdown," the report said. Yet the company's internal manual defined a meltdown as damage to more than 5 percent of the fuel. In May 2011, TEPCO finally used "meltdown" after another computer simulation showed fuel in one reactor had almost entirely melted and fallen to the bottom of the primary containment chamber, and that the two other reactor cores had melted significantly.

TEPCO has been accused of softening its language to cover up the seriousness of the disaster, though the investigation found TEPCO's delayed acknowledgement did not break any law.

In the 70-page report, the lawyers said Shimizu instructed his deputy not to use the word "meltdown" during news conferences immediately after the crisis. TEPCO's vice president at the time, Sakae Muto, used the phrase "possibility of meltdown" until March 14, 2011.

Video of a news conference that day shows a company official rushing over to Muto when he was about to respond to a question, showing him a memo and hissing into his ear, "The prime minister's office says never to use this word."

Yasuhisa Tanaka, the lawyer who headed the investigation, said interviews of 70 former and current TEPCO officials, including Muto and Shimizu, showed that Muto had planned to use the word "meltdown" until he saw the memo, which has not been found.

"Mr. Shimizu's understanding was the term 'meltdown' could not be used without permission from the prime minister's office," Tanaka said at a news conference at TEPCO headquarters. "The notion that the word should be avoided was shared company-wide. But we don't believe it was a cover-up."

Edano criticized the report as "inadequate and unilateral," and said the team didn't talk to him or Kan. Tanaka said his investigation, which did not interview any government officials, could not track down what exactly happened between Shimizu and the prime minister's office.

The Nuclear and Industrial Safety Agency, Japan's nuclear regulatory unit at the time, was also reluctant to use the word. Two spokesmen were replaced between March 12 and 13, 2011, after suggesting meltdowns had occurred.

TEPCO has said the delay in confirming the meltdowns didn't affect the company's response to the emergency.

The issue surfaced earlier this year in a separate investigation in which TEPCO acknowledged that a company manual had been overlooked, reversing its earlier position that it had no internal criteria for a meltdown. TEPCO has eliminated the definition of a meltdown from the manual in revisions after the Fukushima disaster.

Kan denies ordering ban on using 'meltdown'

http://www3.nhk.or.jp/nhkworld/en/news/20160617_23/

Former prime minister Naoto Kan has denied telling anyone to avoid using the word "meltdown" in the aftermath of the Fukushima nuclear accident.

Kan released a statement on Friday. He was prime minister at the time of the March 2011 accident.

In the statement, Kan says he never gave instructions to Tokyo Electric Power Company or the now-defunct Nuclear and Industrial Safety Agency to avoid using "meltdown" or its Japanese equivalent.

Kan says the TEPCO panel should clarify who gave such an order. He says people from the utility were in the prime minister's office at the time, in addition to politicians and bureaucrats who were dealing with the accident.

Kan says what TEPCO describes as a "third-party" panel never questioned him about the issue. He went on to say that lawyers and other panel members were chosen by the utility, so they were not independent at all.

Kan said the most important point in verifying the details of the nuclear accident is to disclose all the testimonies that TEPCO officials gave to a government inquiry, as well as the recordings of teleconferences held during the crisis.

Was it TEPCO's chief?

June 17, 2016

TEPCO head blamed for late mention of 'meltdown'

<http://www.asahi.com/ajw/articles/AJ201606170001.html>

June 17, 2016 at 10:15 JST

An outside investigation team appointed by the operator of Japan's damaged Fukushima No. 1 nuclear power plant said Thursday that an instruction from the company's then-president to avoid using the term "meltdown" delayed the full disclosure of the status of three reactors.

Tokyo Electric Power Co. described the condition of the three reactors as less serious "core damage" for two months after a March 2011 earthquake and tsunami destroyed the plant.

The panel of three TEPCO-commissioned lawyers said the company used the milder term despite knowing that the damage far exceeded its meaning because of the instructions by then-President Masataka Shimizu. The report said he was apparently under pressure from the prime minister's office, but that the panel did not find direct evidence of that.

Naoto Kan, who was prime minister when the nuclear accident occurred, has issued a statement that he had never given any instruction for TEPCO to refrain from using the term.

TEPCO reported to the authorities on March 14, 2011, that the damage, based on a computer simulation, involved 25 to 55 percent of the fuel but did not say it constituted a "meltdown," the report said. The company's internal manual defined a "meltdown" as a core condition with damage exceeding 5 percent of the fuel.

In May 2011, TEPCO finally used the description after another computer simulation showed fuel in one reactor had almost entirely melted and fallen to the bottom of the primary containment chamber, and that the two other reactor cores had melted significantly.

TEPCO has been accused of softening its language to cover up the seriousness of the disaster. But the investigation found TEPCO's delayed acknowledgement did not break any law.

In the 70-page report, the lawyers said Shimizu instructed his deputy not to use the word "meltdown" during news conferences immediately after the crisis when officials were peppered with questions about the reactor conditions. TEPCO's vice president at the time, Sakae Muto, had used the phrase "possibility of meltdown" until March 14, 2011.

Video of a news conference that day shows a company official rushing over to Muto when he was about to respond to a question about the conditions of the reactors, showing him a memo and hissing into his ear, "The prime minister's office says never to use this word."

Yasuhisa Tanaka, the lawyer who headed the investigation, said interviews of 70 former and current TEPCO officials, including Muto and Shimizu, showed that Muto had planned to use the word "meltdown" until he saw the memo, which has since not been found.

"Mr. Shimizu's understanding was the term 'meltdown' could not be used without permission from the prime minister's office," Tanaka told a news conference at TEPCO headquarters. "The notion that the word should be avoided was shared company-wide. But we don't believe it was a cover-up."

The Nuclear and Industrial Safety Agency, Japan's nuclear regulatory unit at the time of the accident, was also reluctant to use the word. Two spokesmen were replaced between March 12 and 13, 2011, after suggesting meltdowns had occurred.

Government and parliamentary investigations have suggested officials, seeking to play down the severity of the Fukushima nuclear crisis, resisted using the term. Tanaka said his investigation, which did not interview government officials, could not track down what exactly happened between Shimizu and the prime minister's office.

The prime minister's office has denied putting any pressure on TEPCO and the safety agency over language. But previous investigations of the accident show it demanded they coordinate with the office and unify approaches before making any announcement.

TEPCO has said the delay in confirming the meltdown didn't affect the company's emergency response at the plant. Although the reactors have been stabilized significantly, the company is still struggling with the plant's decades-long decommissioning.

Delays in the announcement of meltdowns surfaced earlier this year in a separate investigation in which TEPCO acknowledged that a company manual had been overlooked, reversing its earlier position that it had no internal criteria for a meltdown. TEPCO has eliminated the definition of a meltdown from the manual that was revised after the Fukushima accident.

Tepco chief likely banned use of 'meltdown' under government pressure: report

<http://www.japantimes.co.jp/news/2016/06/16/national/tepcO-chief-likely-banned-use-meltdown-government-pressure-report/#.V2L1NaJddLN>

by Kazuaki Nagata

Staff Writer

The president of Tokyo Electric Power Co. during the Fukushima nuclear crisis told employees not to publicly use the term "meltdown," apparently in response to government pressure, a third party report released Thursday said.

The report, compiled by three lawyers, said it is highly likely the government at the time pressured Masataka Shimizu, then Tepco's president when the monstrous earthquake and tsunami disabled the Fukushima No. 1 nuclear power plant on March 11, 2011, about the utility's disclosures in the early stages of the crisis.

The report said someone in the government, then headed by Prime Minister Naoto Kan of the Democratic Party of Japan, was unhappy Tepco had revealed a photo of the blown-up building for reactor No. 1 on March 12 without telling the government in advance.

The Prime Minister's Office then called Shimizu the same day. After Shimizu returned to Tepco's Tokyo headquarters, he told his fellow executives that they needed to check with the Prime Minister's Office whenever disclosing information to the public, according to the report.

The report also said Shimizu sent a note on March 14 to Vice President Sakae Muto, who was overseeing the plant and holding a news conference, to warn him not to say meltdown.

"Considering this fact, it is presumable that the Prime Minister's Office requested Shimizu to be careful about admitting to a meltdown in public," the report said.

The panel thought this was a critical point that required further investigation but was unable to track down a specific bureaucrat who made such a request. Yasuhisa Tanaka, who headed the panel, said it conducted hearings with 60 Tepco employees but did not talk to anyone from the government side.

Tepco did not acknowledge that a reactor meltdown had occurred until May 15, 2011 — two months after the fact.

Asked whether Tepco was intentionally covering up the meltdowns, Tanaka said that was probably not the utility's intention at the time.

"Looking at the situation back then, we think it was difficult for Tepco to use the term meltdown because even the Nuclear and Industrial Safety Agency couldn't use it" due to apparent government pressure, Tanaka said.

The Nuclear and Industrial Safety Agency was Japan's nuclear watchdog at that time.

The panel spent about three months investigating why Tepco could not publicly reveal the meltdowns occurred earlier than it did.

In February, nearly five years after the crisis, Tepco announced it should have declared the meltdowns earlier, citing the existence of a company manual that listed what constitutes a meltdown. The manual says that meltdown is a state in which 5 percent or more of the fuel rods is damaged.

As of March 14, 2011, Tepco estimated that 55 percent of the fuel rod assemblies in reactor No. 1 and 25 percent of those in reactor No. 3 were damaged but did not declare that they had melted until May that year.

Niigata Prefecture has been pressuring Tepco to look into why it took about two months for the utility to admit to a meltdown.

Niigata hosts Tepco's Kashiwazaki-Kariwa nuclear plant, which the firm desperately wants to restart, but Niigata Gov. Hirohiko Izumida has stressed that he won't give the green light until the Fukushima crisis has been thoroughly investigated.

Tepco had explained to Niigata that it did not use the term meltdown because there was no clear definition of it. But it found the manual in February, which contradicted the explanation and led to the third-party investigation.

The report said that workers at the Fukushima plant were apparently following the manual but seemed to avoid using the term meltdown, presumably because there was a common understanding within the company not to use it.

Tokyo Electric changed its name in April to Tokyo Electric Power Company Holdings Inc

No cover-up, says Tanaka

June 17, 2016

Report stating TEPCO avoided use of term 'core meltdown' seen as limited

<http://mainichi.jp/english/articles/20160617/p2a/00m/0na/019000c>

June 17, 2016 (Mainichi Japan)

The head of a third-party commission probing Tokyo Electric Power Co. (TEPCO)'s handling of the Fukushima nuclear disaster said June 16 that he did not see the company's in-house ban on the term "core meltdown" following the outbreak of the disaster as part of a cover-up.

- **【Related】** What's behind TEPCO ban on term 'core meltdown' after Fukushima crisis?
- **【Related】** TEPCO head banned use of 'meltdown' in describing Fukushima crisis
- **【Related】** Japan lawmaker denies pressuring TEPCO not to say 'meltdown'

"I do not perceive that the company intentionally hid it," lawyer Yasuhisa Tanaka said in a news conference on June 16. "We have not deemed that there was a cover-up."

However, the commission questioned only about 60 TEPCO employees, and its report in many parts echoed the claims TEPCO had made, underscoring the limits of a probe within the company.

It was Niigata Gov. Hirohiko Izumida who grilled TEPCO over its delay in acknowledging that there had been meltdowns at the Fukushima No. 1 Nuclear Power Plant. Niigata Prefecture houses the Kashiwazaki-Kariwa Nuclear Power Plant operated by TEPCO, and debate continues over the possibility of bringing the plant's reactors back online. The Niigata Prefectural Government formed its own technical committee and sought an explanation from TEPCO. During this process, it emerged in February this year that there existed a manual at TEPCO providing standards for determining whether there had been a core meltdown. Instructions from then TEPCO President Masataka Shimizu to avoid using the term "core meltdown" also came to light.

Questions earlier arose over whether TEPCO intentionally hid the manual. The third-party panel's report stated that TEPCO employees responding to the Niigata Prefecture technical committee didn't realize that the manual contained standards for ascertaining a core meltdown, while employees who knew about it didn't know that this was an issue for the technical committee. The report said TEPCO's response was imprecise and insufficient, but judged it could not be accepted that the way TEPCO acted was intentional or deliberate.

In the June 16 news conference, Tanaka repeated statements siding with TEPCO, saying, "If (TEPCO's) report documents had stated that there had been a core meltdown, we may have ended up all over the place."

The third-party panel investigated whether there had been any pressure from the prime minister's office regarding TEPCO's avoidance of the term "core meltdown," but questioned only TEPCO employees and did not approach any official from the administration of then Prime Minister Naoto Kan or the now-defunct Nuclear and Industrial Safety Agency.

"As opposed to Diet investigation committees, there was no binding force and we could only question people voluntarily," Tanaka said.

The third-party commission was formed by three lawyers including former public prosecutor Zenzo Sasaki, who recently investigated a money scandal involving Tokyo Gov. Yoichi Masuzoe.

Niigata University professor emeritus Masaaki Tateishi, a member of the technical committee of the Niigata Prefectural Government, said of the report, "I felt that it merely went along the lines of TEPCO's explanations to date, other than clarifying the responsibility of Mr. Shimizu. I wanted it to go deeper into the predisposition of TEPCO."

What's behind all this?

June 17, 2016

Questions remain about 'meltdown' ban

http://www3.nhk.or.jp/nhkworld/en/news/20160617_12/

Further investigations will be conducted to learn why the operator of the Fukushima Daiichi nuclear plant did not use the term "meltdown" soon after the March 2011 accident.

It took more than 2 months for Tokyo Electric Power Company to admit that the cores of 3 of the reactors had melted down.

A panel set up by TEPCO reported on Thursday that the utility's former president, Masataka Shimizu, had instructed employees not to use the term "meltdown."

The panel said this came after what the president said were instructions from the prime minister's office.

But the panel did not carry the investigation to the prime minister's office. It is not known who in the office issued the instructions.

Panel chairman Yasuhisa Tanaka told reporters that he can speculate that TEPCO faced difficulty using the term at the time, even when officials of the now-defunct Nuclear and Industrial Safety Agency could not use the word. He added that he does not think TEPCO intentionally covered up the fact under such circumstances.

TEPCO says it will continue its joint investigation with a panel set up by Niigata Prefecture, which hosts another TEPCO nuclear plant.

Tama University Professor Yasuhide Yamauchi, a member of the Niigata panel, says he wants to find out why the term "meltdown," was avoided, its impact on society and whether the avoidance was intentional.

What's behind TEPCO ban on term 'core meltdown' after Fukushima crisis?

<http://mainichi.jp/english/articles/20160617/p2a/00m/0na/013000c>

Tokyo Electric Power Co. (TEPCO)'s then President Masataka Shimizu instructed staff not to use the term "core meltdown" when describing the disaster at the Fukushima No. 1 Nuclear Power Plant in 2011, according to a report by a third-party investigative committee of TEPCO that was made public on June 16.

- **【Related】** TEPCO exec says he knew standards for judging meltdown before Fukushima disaster
- **【Related】** Nuclear watchdog slams TEPCO over long overdue 'discovery' of meltdown manual

The report acknowledged that the instructions were conveyed widely within TEPCO by telephone and other means. It hinted that there had been "pressure" from the prime minister's office through a request for TEPCO to provide the content of announcements in advance, but it remained unclear whether the office had any involvement in clamping down on the use of "core meltdown."

What, then, prompted TEPCO to seal off the term? According to the report, the move was triggered by a hydrogen explosion at the building of the Fukushima nuclear plant's No. 1 reactor on the afternoon of March 12, 2011, the day after the plant was crippled by the massive Great East Japan Earthquake and tsunami.

The prime minister's office was aware of the explosion from TV images. But when TEPCO went ahead and held a news conference, publicly releasing a photograph of the explosion without contacting the prime minister's office for many hours, then Prime Minister Naoto Kan and other government officials got furious. Shimizu was called to the prime minister's office on March 13 and was told to contact the office in advance when announcing important accident information.

The removal of a senior official of the then Nuclear and Industrial Safety Agency from a public relations position on March 13 after he acknowledged a core meltdown in a news conference without first contacting the prime minister's office is also thought to have influenced TEPCO.

On the evening of March 14, when then TEPCO vice president Sakae Muto was giving a news conference, a memo from Shimizu was passed to him by a company employee, saying, "By instruction of the prime minister's office, don't use 'core meltdown.'" Hints of pressure from the prime minister's office had emerged during a teleconference beforehand, with Shimizu saying reports to the prime minister's office should be made "properly, in advance."

Shimizu's position was conveyed within the company by phone and other means. The report concluded that "an understanding was shared within TEPCO that statements acknowledging a meltdown should be avoided."

After that Muto and TEPCO employees switched to the term "core damage." The report pointed out, "If the memo had not been passed over, vice president Muto may have responded differently."

The third-party investigative committee searched for the memo, which was said to be handwritten, but did not find it. The committee questioned Shimizu on two occasions over a period of about four hours, but the report concluded, "His memory has faded and clear facts could not be confirmed."

However, it quoted a TEPCO employee who was summoned in April by then Minister of Economy, Trade and Industry Banri Kaieda as saying that Kaieda had told him, "There doesn't appear to be a clear definition of a core meltdown, so let's make it the melting of fuel pellets." After that, a fax was distributed within the company saying, "'Melting of fuel pellets' is to be used. This is because 'core meltdown' conveys the image that the whole core has melted, like the China syndrome."

This was in spite of a manual that was "discovered" at TEPCO in February this year, nearly five years after the meltdowns. The manual defined a core meltdown as having occurred when over 5 percent of the reactor core had been damaged. This being the case, TEPCO could have judged as early as March 14, 2011, three days after the outbreak of the disaster, that core meltdowns had occurred.

The third-party panel report stated that quite a few of some 55 TEPCO employees in charge of TEPCO external reports had checked the manual, and rejected TEPCO's claim that "nobody had noticed" it until its "discovery."

"It would have been natural to list 'core meltdowns' in reports, but the company avoided this," the report stated.

On June 16, Democratic Party Secretary-General Yukio Edano, who was Chief Cabinet Secretary at the time of the meltdowns, told reporters in Yokkaichi, Mie Prefecture, on June 16 that he had never issued any orders to avoid use of the phrase "core meltdown."

"Neither I or then Prime Minister Kan made any such request to TEPCO," he said, adding, "During news conferences at the time I myself acknowledged core meltdowns. Putting the brakes on (the use of the term) would have been out of the question."

Fukushima Pref. protests TEPCO's actions

http://www3.nhk.or.jp/nhkworld/en/news/20160617_31/

Fukushima Prefecture has protested to Tokyo Electric Power Company after a panel found that the utility's former president ordered its employees not to use the word "meltdown" after the 2011 nuclear accident.

The head of TEPCO's nuclear power and plant division, Masaki Mori, reported the findings on Friday to the prefecture's nuclear safety section chief Nobuyuki Kanno.

Mori said the panel concluded that the utility should have informed municipalities and residents that a meltdown had occurred at the Fukushima Daiichi plant. He apologized for causing trouble and concern.

Kanno said he cannot help but think that TEPCO had a culture which repressed saying anything inconvenient.

He said the utility's attitude is extremely regrettable, as it ignored the residents' deep sense of anxiety.

Kanno urged TEPCO to explain what it plans to do to prevent a recurrence.

Questions remain

June 18, 2016

EDITORIAL: Extent of TEPCO cover-up over meltdown must be clarified

<http://www.asahi.com/ajw/articles/AJ201606180026.html>

A panel investigating Tokyo Electric Power Co.'s response to the triple meltdown during the 2011 Fukushima nuclear disaster revealed an unpardonable breach of trust by the operator of the stricken Fukushima No. 1 nuclear power plant.

But there is still a lot more work to be done by the panel to uncover the full scope of the utility's apparent meltdown cover-up.

Immediately after the catastrophic accident at the Fukushima nuclear plant, then TEPCO President Masataka Shimizu instructed employees not to use the term "meltdown," leading to a delay in the official announcement, according to a report compiled by the investigation panel commissioned by the company. A reactor meltdown, or the melting of nuclear fuel in the core of a reactor, is about as bad as it gets.

The panel's report suggests that in the middle of this unprecedented nuclear disaster the top official of the plant operator was trying to conceal the severity of what was unfolding from the public, including people living in areas around the plant.

For four long years, TEPCO kept giving false explanations about the delay in the announcement of the reactor meltdowns to Niigata Prefecture, which was demanding the truth of what happened. The company claimed it did not have the criteria for defining and determining a meltdown. The firm also said no in-house instruction was given to employees telling them not to use the term.

In February this year, however, the company said it had "found" an in-house manual that spelled out such criteria and set up the third-party panel of legal experts to get to the truth about the delayed announcement of the meltdowns.

With the revelations made in its report, can the panel claim it has accomplished its mission?

We have to say the answer is "no," although the disclosure of the former TEPCO president's instruction concerning the meltdowns is definitely a step forward.

What is particularly baffling is the opinion about the president's instruction voiced by Yasuhisa Tanaka, the former president of the Sendai High Court who headed the investigation. "We cannot say for certain that there was a deliberate cover-up by the company," Tanaka said during a news conference.

At the time of the accident, a reactor meltdown was defined by the nuclear disaster special measures law as an emergency situation that must be reported. The conditions of the reactors at the Fukushima plant fulfilled TEPCO's criteria, which say a meltdown means that 5 percent or more of the core of a reactor has been damaged.

But the utility initially denied that a meltdown was happening, while the president instructed employees not to use the term. If this was not a cover-up, what was it?

Also questionable is the panel's suggestion that the TEPCO chief was probably acting on requests from the prime minister's office in giving the instruction. The panel interviewed about 60 former and current TEPCO officials, but no government officials or bureaucrats who were involved in dealing with the crisis. In explaining the panel's failure to interview key government officials, Tanaka said, "Our authority to investigate is limited, and it is difficult (to uncover the entire truth) in such a short time." But the panel didn't even request interviews with them.

Both Naoto Kan, who was then prime minister, and Yukio Edano, who was chief Cabinet secretary, rejected the allegations that the government told TEPCO not to declare a meltdown.

As for the related requests made by Niigata Prefecture, TEPCO says it will continue its joint efforts with the prefectural government to uncover the facts.

The company has a responsibility to clarify the broad picture of the accident and publish the findings of its probe. But the Diet has its own role to play.

Whether the prime minister's office actually asked TEPCO not to declare a reactor meltdown is not the only remaining mystery about the exchanges between the government and the company during the crisis. Only some fragments of information about the communications between the two sides have been revealed.

A Diet investigation committee has drawn up a report on its inquiry into the accident. But there are still many questions that the Diet should try to answer by using its right to investigate state affairs.

We need to learn all vital lessons from the devastating nuclear accident so as to avoid making the same mistakes.

That requires unearthing all the related facts first. It is our responsibility to tackle this challenge for future generations.

--The Asahi Shimbun, June 18

The strength of pro-nuclear lobbying

June 21, 2016

EDITORIAL: License renewal of aging reactors betrays promise, fuels concerns

<http://www.asahi.com/ajw/articles/AJ201606210041.html>

The Nuclear Regulation Authority on June 20 approved 20-year operating extensions for two reactors at the Takahama nuclear power plant in Fukui Prefecture, both of which had been in service for more than 40 years.

Kansai Electric Power Co., which operates the plant, plans to restart the No. 1 and the No. 2 reactors as early as autumn 2019 after taking the required additional safety measures.

Following the disaster at the Fukushima No. 1 nuclear power plant in 2011, Asahi Shimbun editorials have been arguing for phasing out nuclear power generation in two to three decades.

We believe high-risk or aging reactors should be decommissioned while allowing the minimum number of necessary reactors to continue operations.

The NRA's decision for the two aging reactors has raised serious concerns that license renewals could be approved for many reactors judged deemed capable of operating profitably by utilities. We are opposed to the decision.

One source of worry is the stance of the nuclear safety watchdog itself.

One challenge at the Takahama plant is making electric cables less vulnerable to fires. The NRA has accepted Kansai Electric Power's plan to cover cables with a fire-resistant sheet in places where it is difficult to replace them with flame-retardant cables.

The NRA has also allowed the utility to delay required earthquake-resistance tests that involve the actual shaking of important equipment within the containment vessels of the reactors.

The regulator has given the go-ahead to the company's plan to carry out such tests after taking the additional safety measures.

The licenses for reactor operations can be renewed only once for up to an additional 20 years. But this provision was introduced to prevent emergencies, such as serious power crunches.

The NRA itself described its permission for extended reactor operation as an "extremely exceptional" measure and "hard to obtain."

An even more serious problem is the stance of Prime Minister Shinzo Abe's government toward nuclear power generation.

In response to the Fukushima nuclear disaster, the Democratic Party of Japan-led government revised the law to set 40 years as the lifespan of nuclear reactors.

The revision was made amid broad public consensus on lowering the nation's dependence on nuclear power.

Initially, the Abe government, inaugurated in December 2012, also repeatedly promised to reduce Japan's dependence on nuclear power generation as much as possible.

But the Abe administration has since gradually switched its position to maintaining nuclear power generation. It has even designated nuclear power as one of the core energy sources for the nation.

The administration's recent refrain is: "Reactors that have been judged safe by the NRA will be restarted."

The NRA, for its part, emphasizes that its mandate is limited to assessing the safety of individual reactors.

The existence of an appropriate and workable evacuation plan is not a factor checked in the watchdog's safety inspections.

The NRA has also avoided directly addressing the risks involved in the concentration of nuclear power plants in certain regions, such as Fukui Prefecture, where the Takahama plant is located.

In March, the Otsu District Court issued an injunction to suspend operations of the No. 3 and the No. 4 reactors at the Takahama plant, which had just been restarted.

The court's decision reflects one important lesson from the Fukushima meltdowns: One key factor behind the accident was the tradition of leaving policy decisions about nuclear power regulation entirely to experts.

The revision to the law to establish the 40-year legal lifespan for nuclear reactors was based on an agreement among the DPJ, Abe's Liberal Democratic Party, now the ruling party, and the LDP's junior coalition partner, Komeito.

The government must not be allowed to betray its promise to the public to reduce Japan's reliance on nuclear power while using the NRA as a cover to obscure its policy shift.

The Abe administration should offer a clear and detailed explanation about its position on the 40-year life rule.

INSIGHT: 40-year safety principle erodes in pro-nuclear lobbying

<http://www.asahi.com/ajw/articles/AJ201606210073.html>

By MASANOBU HIGASHIYAMA/ Staff Writer

Cries of disapproval rang out from the spectators' gallery when Shunichi Tanaka, chairman of the Nuclear Regulation Authority (NRA), announced the decision to allow two aging reactors to continue running for 20 more years.

"Don't you know that the operating period is 40 years, in principle?" someone shouted at Tanaka at the NRA meeting on June 20.

In the name of safety, the law on nuclear reactor regulations was revised after the 2011 Fukushima nuclear disaster to limit the operating period of a reactor to 40 years, in principle. The idea was to phase out old reactors because of the difficulties in taking safety measures for such aging equipment.

When Tanaka assumed the post of NRA chairman in September 2012, he said at a news conference, "The designs (of reactors) of 40 years ago are insufficient to maintain their safety."

But through lobbying by pro-nuclear politicians, this 40-year cutoff point is now seen as the time when utilities should seek approval for extending their reactor operations.

The NRA even gave special treatment to Kansai Electric Power Co. in its application for the 20-year operating extensions of the No. 1 and No. 2 reactors at the Takahama nuclear power plant in Fukui Prefecture. These two reactors have already been in operation for 40 years.

When the law was revised, a stipulation was added over concerns that a continued decommissioning of 40-year-old reactors could lead to a shortage of electricity in Japan. The stipulation said the operating period of 40 years can be extended by up to 20 years--only once--if the NRA approves.

It was designed as an emergency measure against a possible energy crunch.

Then Prime Minister Yoshihiko Noda of the Democratic Party of Japan-led government said, "The extension is limited only to exceptional cases."

However, the safety principle behind the law started to erode after the Liberal Democratic Party regained control of the government in December 2012.

At a Cabinet meeting in 2014, the LDP-led government decided on a basic energy plan, which read, "Nuclear power is an important baseload electricity source."

In summer 2015, the economy ministry said nuclear power will account for 20 percent to 22 percent of total electricity generation in fiscal 2030.

To achieve those percentage figures, operations of at least 10 nuclear reactors had to be extended because of the difficulties in building new reactors, expanding their power generation capabilities or replacing old reactors with new ones.

Under such circumstances, Kansai Electric Power applied to the NRA in April 2015 for extended operations of the Takahama plant's No. 1 and No. 2 reactors, whose operations started in 1974 and 1975, respectively.

Members of the LDP's project team and local government leaders pushed for the extensions. They asserted that they could not accept the decommissioning of two reactors just because the 40-year operation period has run out.

The NRA initially pushed back, saying it could halt the safety screenings of the two reactors, one of which was already more than 40 years old.

Yet the lobbying continued, and the NRA ended up putting top priority on the screenings.

During the screenings, Kansai Electric Power was given preferential treatment. For example, the NRA said that required quake-resistance tests on important reactor equipment can be done after the utility completes its construction work.

The NRA's approval came 14 months after Kansai Electric Power submitted the application for the extensions.

Tadahiro Katsuta, associate professor of nuclear power policies at Meiji University, suggested that these supposed "exceptional cases" could become the norm.

"Unpredictable problems could take place (at nuclear power plants). That's why the principle of 40 years was decided as a safety standard to protect human lives," Katsuta said. "But '40 years' has now become just a term on when to obtain approval for an extension of reactor operations."

One critic in the gallery at the June 20 meeting mentioned legal action against the NRA's decision.

"(Even if the extension is approved,) the operation will be suspended again by a court," the critic yelled.

At a news conference held later, Tanaka said: "Words such as 'in principle' or 'exception' are political messages. Society decides whether to decrease nuclear reactors or not."

T'was a cover-up

June 21, 2016

Editorial: Probe into Fukushima nuke plant's 'meltdown' cover-up lacks credibility

<http://mainichi.jp/english/articles/20160621/p2a/00m/0na/012000c>

A third-party panel set up by Tokyo Electric Power Co. (TEPCO) to investigate a 2011 accident at its tsunami-hit Fukushima No. 1 Nuclear Power Plant has released a report that then TEPCO President Masataka Shimizu had ordered that the company never use the phrase, "reactor core meltdown."

- **【Fukushima & Nuclear Power】**

It is highly problematic for the head of a company that caused a serious accident, which could threaten the lives and health of people, to issue an order that could be taken as covering up the seriousness of the disaster. The vice president in charge of the nuclear power business and other executives, as well as some employees, deserve criticism that they followed such an instruction.

Considering that the cover-up allegations surfaced more than five years after the outbreak of the nuclear disaster, it is difficult to believe that TEPCO has regained the public's confidence in itself.

The term "Reactor core meltdown" is scientifically a vague phrase. Still, TEPCO's in-house manual on nuclear power generation states that if over 5 percent of the core of a reactor is damaged, it should be recognized as a meltdown. If TEPCO had followed this definition, the company could have deemed three days after the outbreak of the crisis that core meltdowns had occurred in the plant's No. 1 and 3 reactors. However, it was not until two months later that TEPCO officially admitted that meltdowns had occurred at the power station. Furthermore, it was as late as this past February that the existence of the in-house manual came to light.

TEPCO had initially claimed that it was unaware of the existence of the manual but a certain number of employees knew about the manual. The utility had also explained that the firm did not make a clear decision not to admit that meltdowns occurred at the Fukushima plant. However, since the president issued such an order, it is natural to suspect that the firm covered up the meltdowns.

Questions should also be raised over the way the third-party investigative panel conducted the probe. Its investigative report suggests that Shimizu issued the order under pressure from the prime minister's office. "It is assumed that the company understood that it had been asked by the prime minister's office to exercise caution about publicly acknowledging that reactor core meltdowns occurred," the report states. However, the panel had failed to even question the then prime minister or chief Cabinet secretary. The panel later explained that it had neither the authority nor the time to question these top officials.

It is extremely sloppy that the panel suggested that there was political intervention into TEPCO's response to the accident based only on presumptions, as it is an important point. It could give the public the impression that the panel shifted the blame away from TEPCO to the prime minister's office.

Moreover, the report says it cannot be recognized that the company had intentionally concealed the existence of the definition of reactor core meltdowns in the manual for five years, hinting that the panel sided with the power company. As such, it is difficult to trust the panel.

These problems apparently remind the public that there are limits to investigations by third-party panels, such as those conducted into money scandals involving former Tokyo Gov. Yoichi Masuzoe and House of Representatives member Yuko Obuchi. Even if these bodies are called "third-party" fact-finding panels, it is highly questionable how far they are independent since these are set up by those involved in scandals. Those involved in wrongdoing should not use third-party panels they set up to justify their practices or evade responsibility.

June 21, 2016

TEPCO: Delay in declaring 'meltdown' was a cover-up

<http://www.asahi.com/ajw/articles/AJ201606210075.html>

THE ASSOCIATED PRESS

The utility that ran the Fukushima nuclear plant has acknowledged its delayed disclosure of the meltdowns at three reactors was tantamount to a cover-up and apologized for it.

Tokyo Electric Power Co. President Naomi Hirose's apology Tuesday followed the revelation that an investigation had found Hirose's predecessor instructed officials during the March 2011 disaster to avoid using the word "meltdown."

TEPCO instead described the reactors' condition as less serious "core damage" for two months after the earthquake and tsunami wrecked the plant, even though utility officials knew meltdowns had occurred. An investigative report released last week said TEPCO's former president instructed officials to use the milder description under alleged pressure from the Prime Minister's Office, though it found no proof. Former officials at the Prime Minister's Office denied the allegation.

Safety: What costs?

June 20, 2016

Kansai Electric gets Takahama reactor life extension, but enormous costs remain

<http://mainichi.jp/english/articles/20160621/p2a/00m/0na/015000c>

The Nuclear Regulation Authority may have approved a 20-year operational life extension for the No. 1 and 2 reactors at Kansai Electric Power Co.'s Takahama Nuclear Power Plant in Fukui Prefecture, but the utility's efforts to make nuclear energy its core business still faces many challenges.

- **【Related】** Japan nuclear regulator OKs additional 20-yr run for aging reactors
- **【Related】** Fukushima & Nuclear Power

For example, **upgrading safety measures for the aging reactors is projected to take more than three years and cost upwards of 200 billion yen, even if the price of improvements shared by the entire plant is subtracted. Meanwhile, there is a growing possibility that the units will be halted again by litigation.**

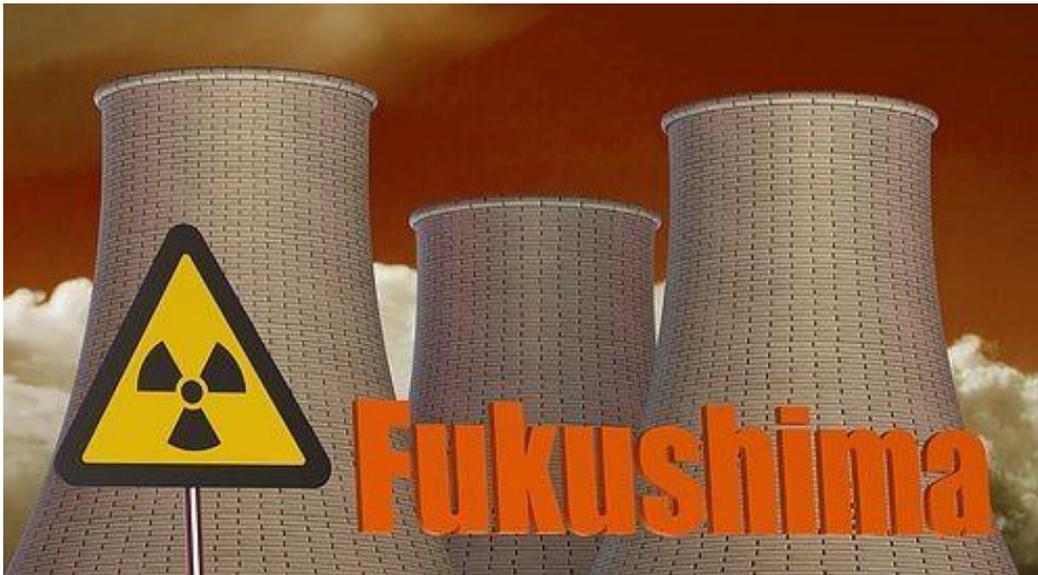

Construction of a quake-resistant emergency services building to house a disaster response team and the plant's emergency response office has already begun. Among the projects yet to get started are giant

reinforced concrete domes that would cover the reactor containment vessels to prevent radiation from escaping in case of an accident. Also on the construction list is replacing seawater pipes now running through earth to the No. 2 reactor with pipes running through bedrock.

However, the construction costs do not end there. Among counter-terrorism measures, Kansai Electric still needs to build a control room that will allow staff to manage cooling and decompression at a safe distance from the reactors. **Among the nine reactors the utility is looking to restart, the total cost for implementing safety measures for just seven is estimated at 730 billion yen. The costs will certainly increase further.**

Meanwhile, the Otsu District Court has already ordered provisional injunctions suspending the Takahama plant's No. 3 and 4 reactors, which are significantly younger than units 1 and 2. This has made litigation against operation of the aging reactors all the more likely. Residents of 14 prefectures, including Fukui and Aichi, in mid-April filed suit with the Nagoya District Court, demanding a halt to the operational life extension for the No. 1 and 2 reactors.

Cynicism and contempt

June 21, 2016

Fukushima 3/11 Breeds Cynicism

by Robert Hunziker

There's an old saying "disasters bring out the best in people," but Fukushima 3/11 of March 11, 2011 has put an exclamation point on cynicism rather than heartfelt concern.

Similar to America's experience of outright lies by its government about the Iraqi Massacre, the blowback of cynicism and contempt bring forth a strain of populism, rejecting establishment, attracting lowly dishonorable politics, as America gooses-up an abomination!

Fukushima's a horror story of hidden agendas, lies, scare tactics, and harsh secrecy laws, yet it's held up as a icon of safe nuclear power by clever mastery of pro-nuke Oceania Newspeak, which, in the novel 1984 penalized "rebellious thoughts" as illegal, similar to Japan's 2013 secrecy law wherein the "act of leaking itself" is bad enough for prosecution, regardless of what, how, or why, off to jail for 10 years. These decadent precepts are hard to accept with a straight face.

However, the day is fast approaching when the pro-nukie crowd, which claims Fukushima 3/11 caused few, if any, major radiation casualties, will be forced to "munch on their own words." As time passes, it becomes ever more obvious that pro-nuke arguments, supporting big fat cumbersome nuclear power plants, metaphorically, hang by fingertips on an electric fence.

As an aside, it is rumored, thru the grapevine in Japan, that hospitals have been instructed to categorize, and officially report, patients' radiation symptoms as "stress-related cases." Hmm!

As for pro-nuclear news:

"In spite of this whole theatrical drama the result was...nobody killed or injured, and no indication of long term negative radiation effects on people. So the lesson of Fukushima is that nuclear power is much safer than people thought," Kelvin Kemm, *The Lesson of Fukushima – Nuclear Energy is Safe*, Cfact, Feb. 16, 2015.

Another example:

"No one has been killed or sickened by the radiation — a point confirmed last month by the International Atomic Energy Agency. Even among Fukushima workers, the number of additional cancer cases in coming years is expected to be so low as to be undetectable, a blip impossible to discern against the statistical background noise," George Johnson, *When Radiation Isn't the Real Risk*, New York Times, Sept. 21, 2015

And, one more:

"There were no cases of radiation sickness among plant workers, because their radiation doses were too low to produce sickness," Georgetown Radiation Expert, *Author Reflects on 5th Anniversary of Fukushima Meltdown*, Georgetown University Medical Center, Newswise, Feb. 23, 2016.

Bunk! To the contrary, not only have several independent sources in Japan reported cover ups of Fukushima worker deaths, bodies incinerated with ashes hidden in Buddhist temples, and instances of hair falling out, nose bleeding, and assorted serious ailments unique to radiation poisoning, now several deaths of U.S. sailors may be closely linked to this disaster that a pro-nuclear crowd claims demonstrates how "safe" nuclear power really is.

Thus, begging the question: Are the pro-nukites liars and/or are they being lied to, or what's up? Who knows, and who really cares which, but their published articles, grandstanding nuclear power, are prominent throughout mainstream big time, and small time, magazines and newspapers and hyperspace, Oceania redux.

Whereas, in vivid contrast to this pro-nuke claptrap, one of Japan's most eminent former prime ministers Junichiro Koizumi (2001-06) declares support for the U.S. sailor's TEPCO lawsuit, more on this later. Additionally, PM Koizumi has repeatedly urged PM Abe to halt efforts to restart Japan's nuclear reactors. He is the second former Japanese prime minister, including PM Naoto Kan (2010-11), to plea for a halt to nuclear power. They claim nuclear power is not safe!

Luckily for the nuclear power industry, Abe is the prime minister.

Yet, there's a festering problem, prevalence of radiation-poisoned deaths:

“The ashes of half a dozen unidentified laborers ended up at a Buddhist temple in this town just north of the crippled Fukushima nuclear plant. Some of the dead men had no papers, others left no emergency contacts. Their names could not be confirmed and no family members had been tracked down to claim their remains. They were simply labeled “decontamination troops” — unknown soldiers in Japan’s massive cleanup campaign to make Fukushima livable again five years after radiation poisoned the fertile countryside,” Mari Yamaguchi, *Fukushima ‘Decontamination Troops’ Often Exploited, Shunned*, AP & ABC News, Minamisona, Japan, March 10, 2016.

And, here’s another:

“It’s a real shame that the authorities hide the truth from the whole world, from the UN. We need to admit that actually many people are dying. We are not allowed to say that, but TEPCO employees also are dying. But they keep mum about it,” Katsutaka Idogawa, former mayor of Futaba (Fukushima Prefecture), *Fukushima Disaster: Tokyo Hides Truth as Children Die, Become Ill from Radiation – Ex-Mayor*, RT, April 21, 2014.

And, one more:

Mako Oshidori, director of Free Press Corporation/Japan, investigated several unreported worker deaths, and interviewed a former nurse who quit TEPCO: “I would like to talk about my interview of a nurse who used to work at the Fukushima Daiichi Nuclear Power Plant (NPP) after the accident... He quit his job with TEPCO in 2013, and that’s when I interviewed him... As of now, there are multiple NPP workers that have died, but only the ones who died on the job are reported publicly. Some of them have died suddenly while off work, for instance, during the weekend or in their sleep, but none of their deaths are reported.”

“Not only that, they are not included in the worker death count. For example, there are some workers who quit the job after a lot of radiation exposure... and end up dying a month later, but none of these deaths are either reported, or included in the death toll. This is the reality of the NPP workers,” (*The Hidden Truth about Fukushima by Mako Oshidori*, delivered at the international conference Effects of Nuclear Disasters on Natural Environment and Human Health held in Germany, 2014 co-organized by International Physicians for Prevention of Nuclear War).

Still and all, PM Abe insists upon fireside chats with pro-nuke campers whilst reopening nuclear power plants even though Japan survived just fine for five years without. He appears to have ants in his pants, pushing hard to restart the ole nuke plants A-SAP.

Meanwhile, in another universe, former PM Koizumi supports the lawsuit of U.S. sailors aboard the USS Ronald Reagan that participated in Operation Tomodachi, providing humanitarian relief after the March 11th Fukushima meltdowns. Allegedly, they were assured that radiation levels were okay!

“There is no excuse for Tokyo Electric Power Co. not to give the 400 U.S. sailors and marines who are now suing the company the proper facts. Things are looking especially good for the plaintiffs now that former Prime Minister Junichiro Koizumi is backing the lawsuit over the Fukushima radiation,” *Support for U.S. Sailor’s Tepco Suit*, The Japan Times, June 17, 2016.

“Undoubtedly, Koizumi was convinced to help the sailors because they now suffer from radiation poisoning. He said: “Those who gave their all to assist Japan are now suffering from serious illness. I can’t overlook them,” Ibid.

According to lawyers representing the sailors, Charles Bonner & Cabral Bonner & Paul Garner, Esq., Sausalito, CA, seven sailors have already died, including some from leukemia.

With passage of time, the number of plaintiffs and numbers of deaths grows as the latency effect of radiation sets in. Thus, over time, the latency effect works against the pro-nuclear squawk talk that “all’s clear.”

Initially, the lawsuit represented less than 200 sailors but over time, the latency effect brings forward 400 sailors claiming radiation-poison complications, including leukemia, ulcers, gall bladder removal, brain cancer, brain tumors, testicular cancer, uterine bleeding, thyroid illness, stomach ailments, and premature deaths. These are youngsters.

The lawsuit process has been exacting for the young sailors: "Lindsey Cooper, for example. The woman who started the whole thing was torn apart on a CNN program by atomic energy experts and was later mocked on conservative radio shows," Alexander Osang, *Uncertain Radiological Threat: US Navy Sailors Search for Justice After Fukushima Mission*, Spiegel Online International, Feb. 5, 2015.

As it happens, it's not disasters that turn people's stomachs as much as cover-ups and lying, bringing forth cynicism, contempt, and ultimately populist blowback as people get fed up with establishment politics.

It is very likely that, similar to American populist blowback, Japan will meet the same fate.

On second thought:

"There is one thing that really surprised me here in Europe. It's the fact that people here think Japan is a very democratic and free country." (Mako Oshidori, director/Free Press Corporation/Japan, speech in Germany)

Fukushima village reaches out to single-parent families after evacuation order lifted

<http://mainichi.jp/english/articles/20160619/p2a/00m/0na/004000c>

KAWAUCHI, Fukushima -- The municipal government here, where an evacuation order, issued following the 2011 outbreak of the Fukushima nuclear crisis, was lifted on June 14, is encouraging single-parent families in urban areas to move to the village in a bid to put the brakes on its population decline and aging.

- **【Related】** Evacuation order for Fukushima village to be lifted in June

To that end, the Kawauchi Municipal Government plans to provide up to 800,000 yen in subsidies to each single-parent family that moves to the village.

"It's possible to live more comfortably in the village than in Tokyo and other urban areas," says an official of the municipal government in charge of the program.

A total of 51 people in 19 households in the Ogi and Kainosaka districts in eastern Kawauchi were affected by the evacuation order that was lifted on June 14. Most of these people have no plans to return home.

Evacuation orders had been lifted in all areas in the village apart from Ogi and Kainosaka by October 2014. Nevertheless, only about 1,800 of some 3,000 residents who had lived in the village before the disaster had returned by April 1 this year.

Approximately 40 percent of those who have returned are elderly people aged 65 or over.

As countermeasures against population decline and aging, the Kawauchi Municipal Government has decided to offer financial incentives to encourage single-parent households outside the village, including those in urban areas, to move in.

Specifically, **the municipal government will provide 600,000 yen to each single-parent household that will live in the village to help them buy a car and move into their new home, and 50,000 yen per person (for up to four people) to cover miscellaneous expenses.**

The maximum amount of the subsidies is 800,000 yen for a family comprising a parent and three children. The municipal government will introduce full-time jobs at companies operating in the village to those who move there, and provide a subsidy to cover half of the rent of privately owned apartments (up to 20,000 yen).

The municipal government will organize a two-day tour for those who are interested in the program July 29-30, and will begin to accept applicants for the tour as early as this week.

The village will use grants from the national government, which are part of measures to revitalize local economies, to finance the program. Under the program, the municipal government is considering accepting five to 10 new residents a year through fiscal 2017, and about 15 residents per year beyond that.

Moreover, **a consultative council encouraging single-parent families to move into the village will be set up with the participation of a local women's association. Elderly women living in the village will support new residents' childrearing. Day care services are provided for free in the village.**

TEPCO's apologies for the umpteenth time

June 28, 2016

TEPCO chief apologizes to shareholders for cover-up

http://www3.nhk.or.jp/nhkworld/en/news/20160628_22/

The president of Tokyo Electric Power Company has apologized to shareholders for concealing reactor meltdowns at its Fukushima Daiichi plant in 2011.

The utility did not officially admit to the meltdowns until more than 2 months after the accident, which was caused by a massive earthquake and tsunami.

The firm's investigative panel revealed earlier this month that the then-president had instructed officials not to use the words "core meltdown."

Incumbent president Naomi Hirose on Tuesday spoke before about 1,200 people at the annual shareholders meeting in Tokyo.

He said he takes the results of the investigative panel seriously and thorough measures will be taken to prevent recurrences. They include performing drills to improve the effectiveness of emergency notification, and strengthening information-sharing.

Shareholders submitted 10 proposals to be taken up at the meeting. They include an early restart of offline nuclear reactors to lower electricity bills, and the abolition of the nuclear power business out of concerns of accidents.

A shareholder said that since the firm's nuclear reactors are undergoing safety screenings by the regulator, it would be safe to switch them back on.

Another said the firm's attitude regarding compensation toward Fukushima and the restart of nuclear reactors are showing no signs of improvement.

Press Release (Jun 21,2016)

TEPCO APOLOGIZES FOR PREVIOUS LEADERSHIP'S FAILURE TO ACKNOWLEDGE MELTDOWN DURING FUKUSHIMA ACCIDENT

http://www.tepco.co.jp/en/press/corp-com/release/2016/1300509_7763.html

Responding to recent report of an investigating committee, TEPCO restates its commitment to provide comprehensive, accurate and understandable information, while making safety the utmost priority to ensure a safe and secure society

TOKYO, June 21, 2016 In its first response to the June 16 report of the committee investigating the belated acknowledgment that a meltdown had taken place at Fukushima Daiichi NPS in March 2011, TEPCO said it is clear from the report that its previous leadership gave instructions not to use the word "meltdown" in public statements.

"We deeply regret that our previous leadership failed to live up to the standards of transparency and thoroughness that we strive to meet today," said TEPCO President Naomi Hirose (who was not the company's leader at the time of the accident). "We sincerely apologize for it," he said.

In more recent years, through the creation of the Nuclear Reform Monitoring Committee and many other changes, TEPCO has worked to improve the timeliness, thoroughness, and clarity of its communication with the public, both inside Japan and internationally. President Hirose stressed that TEPCO has been learning this lesson and breaking from its past, as it works to build trust with the public and with government through the implantation of its Nuclear Safety Reform Plan. Improvements in communication represent an important element of that Plan, which is overseen both by the company's Nuclear Safety Oversight Office and by an independent Nuclear Reform Monitoring Committee chaired by the former head of the U.S. Nuclear Regulatory Commission.

"We deeply regret the shortcomings of the past," President Hirose said, "but **it is important to recognize that they do not represent the TEPCO of today while making safety the utmost priority to ensure a safe and secure society.**"

Re-use of contaminated soil allowed by Environment Ministry

Ministry green-lights reuse of radioactive soil for public works projects

<http://mainichi.jp/english/articles/20160701/p2a/00m/0na/006000c>

July 1, 2016

The Ministry of the Environment formally decided on June 30 to allow limited use of radioactively contaminated soil in public works projects, but sidestepped estimates from a closed-door meeting that the soil may have to be monitored for up to 170 years.

- **【Related】** Reuse of radioactive soil approved despite 170-year safety criteria estimate

The ministry decided that soil could be reused for embankments as long as the radioactivity of cesium it contained did not exceed 8,000 becquerels per kilogram. Under the Act on the Regulation of Nuclear Source Material, Nuclear Fuel Material and Reactors, contaminated soil can be used freely if the level of radioactivity is 100 becquerels per kilogram or less.

It earlier emerged that the ministry calculated in a closed-door meeting that some soil would have to be monitored for 170 years -- well beyond the life of embankments. However, in its basic policy the ministry simply stated, "Safety and administration methods will be examined during verification processes in the future."

It is expected that up to around 22 million cubic meters of waste contaminated with radioactive material from the Fukushima nuclear disaster will end up piled up at an interim storage facility straddling the border between the Fukushima Prefecture towns of Okuma and Futaba. The central government plans to dispose of the waste for good outside the prefecture by March 2045, but hopes to reuse as much of it as possible to reduce the amount.

Under the ministry's basic policy, reuse of the soil will be limited to public works where the body in charge of administering it is clearly established, and the radiation dose at a distance of 1 meter is no more than 0.01 millisieverts per year. When using contaminated soil with a level of radioactivity of 8,000 becquerels per kilogram, it would be placed under at least 50 centimeters of cover soil, which would then be covered with sand and asphalt.

During the closed-door meeting, it was calculated that it would take 170 years for the radioactivity of tainted soil to naturally decrease from 5,000 to 100 becquerels per kilogram -- much longer than the durability of soil mounds, at 70 years.

Parties very vague on energy future of Japan

July 3, 2016

Parties vague on atomic power pledges in run-up to Upper House election

<http://www.japantimes.co.jp/news/2016/07/03/national/politics-diplomacy/parties-vague-atomic-power-pledges-run-upper-house-election/#.V3lba6Jdeot>

JJI

The election pledges issued by the top political parties show they are **divided and uninformed about how fast Japan should reduce its dependence on atomic power and what its energy goals for 2030 should be.**

As the pivotal July 10 Upper House election approaches, the parties clearly differ over the government's fiscal 2030 energy mix, which states that Japan will be procuring 20 to 22 percent of its electricity from nuclear reactors by that time.

Five years after the Fukushima disaster shattered Japan's nuclear safety myth, the ruling Liberal Democratic Party is promoting nuclear power as a stable, low-cost energy source, and says it intends to slowly reduce Japan's atomic dependency.

Komeito, its coalition ally, pledges to create a society that does not rely on nuclear power. Although it is opposed to building new reactors, it won't oppose the restarting of those idled in the wake of the triple core meltdown in Fukushima. Komeito also advocates a very gradual move away from nuclear energy. The ruling coalition parties' positions reflect the government's goal: to lower Japan's dependency on atomic power around 6 points from 28.6 percent — the level it was at before the Fukushima disaster hobbled the industry in March 2011.

Both aim to bring new and old reactors online if they pass the Nuclear Regulation Authority's safety screenings, because more than 30 will be needed to achieve the government's targeted energy mix. In the opposition camp, the Democratic Party has vowed to rid Japan of nuclear reactors by the 2030s. While the top opposition party will accept reactor restarts, its policy is to strictly maintain the 40-year basic operating limit on reactors. The DP believes its goal will be achievable if no new reactors are built. The Japanese Communist Party and the Social Democratic Party flatly oppose restarting any nuclear reactors.

Another, Osaka Ishin no Kai, says reactors should not be restarted unless local agreements are enshrined in law as a precondition.

All of the major parties, however, refuse to elaborate on how they will ensure the expansion of alternative energy sources, which are being choked off by Japan's old and divided power grid.

In line with the government's target, the LDP and Komeito have promised to almost double the proportion of renewable energy to 22 to 24 percent by fiscal 2030. The DP's goal is 30 percent and the JCP's goal is 40 percent.

Since no party has provided hard details on how to further the use of renewable energy and what that will cost, voters need to watch whether the parties will offer any convincing explanations about their pledges during the campaign for the Upper House election.

Risk of illegal dumping

Piles of black bags containing radioactive soil are seen at a temporary storage site in Minamisoma, Fukushima Prefecture, on June 11, 2016. The Environment Ministry is set to conduct a demonstration experiment there possibly later this year, in which radiation doses will be measured on mounds using soil generated from decontamination work. (Mainichi)

July 5, 2016

Reuse of radioactive soil feared to trigger illegal dumping

<http://mainichi.jp/english/articles/20160705/p2a/00m/0na/012000c>

An Environment Ministry decision to allow reuse of radioactively contaminated soil emanating from the Fukushima nuclear disaster in public works projects has prompted experts to warn against possible dumping of such soil under **fake recycling**.

- **【Related】** Ministry green-lights reuse of radioactive soil for public works projects
- **【Related】** Reuse of radioactive soil approved despite 170-year safety criteria estimate
- **【Related】** Photo Journal: Radioactive soil storage

The ministry formally decided on June 30 to allow limited use of soil generated from decontamination work after the Fukushima No. 1 nuclear power plant disaster in mounds under road pavements and other public works projects, as long as the soil contains no more than 8,000 becquerels per kilogram of radioactive cesium. The decision was made despite questions raised during a closed meeting of the ministry over incompatibility with the decontamination criteria for farmland soil.

The Act on the Regulation of Nuclear Source Material, Nuclear Fuel Material and Reactors sets the safety criteria for recycling metals and other materials generated from the decommissioning of nuclear reactors at no more than 100 becquerels per kilogram, and requires materials whose radiation levels exceed that level to be buried underground as "radioactive waste." The figure of 100 becquerels is derived from the International Commission on Radiological Protection's standards that annual radiation exposure of up to 0.01 millisieverts poses negligible health risks.

However, **the Fukushima disaster has disseminated radioactive materials outside the crippled nuclear plant across far wider areas than expected.** Under the special measures law on decontamination of radioactive materials, which was fully put into force in January 2012, waste whose radiation levels top 8,000 becquerels per kilogram is called "designated waste" and must be treated by the government, while waste with radiation levels of 8,000 becquerels or lower can be treated in the same way as regular waste. The figure of 8,000 becquerels comes from the upper limit of annual radiation exposure doses for ordinary citizens under the reactor regulation law, which is set at 1 millisievert. Regarding the double safety standards of 100 becquerels and 8,000 becquerels, the Environment Ministry had earlier explained that the former is for "reuse" and the latter for "waste disposal."

However, **the recent Environment Ministry decision to allow the reuse of contaminated soil in public works projects runs counter to its earlier explanation.** The ministry is trying to reconcile that difference by insisting that the radiation levels of tainted soil could be kept under 100 becquerels if mounds using such soil were covered with concrete and other materials to shield radiation. During a closed meeting of the ministry that discussed the matter, some attendants raised questions over **inconsistencies with the decontamination criteria for farmland soil.**

In April 2011, in the aftermath of the Fukushima meltdowns, the Ministry of Agriculture, Forestry and Fisheries restricted rice planting in paddies whose radiation levels topped 5,000 becquerels per kilogram of soil. While the restriction was effective for just one year, the same criteria has been in place for ensuing decontamination, where surface soil of more than 5,000 becquerels is removed and surface soil under that level is replaced with deeper layers.

It is inconsistent to strip away soil of more than 5,000 becquerels while recycling soil with the same level of radiation. However, attendants of the closed meeting never discussed the matter in detail, nor did the issue come up for discussion at an open meeting.

The radioactivity concentration of contaminated soil is higher than that of earthquake debris, whose treatment caused friction across the country on the heels of the Fukushima crisis. Therefore, officials attending an open meeting of the ministry discussed the introduction of incentives for users of tainted soil, with one saying, "Unless there are motives for using such soil, regular soil would be used instead." Kazuki Kumamoto, professor at Meiji Gakuin University specializing in environmental policy, criticized the ministry's move, saying, "There is a high risk for inverse onerous contracts, in which dealers take on contaminated soil in exchange for financial benefits." There have been a series of incidents involving such contracts, in which waste was pressed upon dealers under the guise of "recycled materials," such as backfill material called ferrosilt and slag generated from iron refining.

"If contaminated soil was handed over under inverse onerous contracts, there is a risk that such soil could be illegally dumped later. Reuse of tainted soil would lead to dispersing contamination," Kumamoto said.

Nukes: People fear utilities - and Gov't - can't be trusted

July 6, 2016

As I See It: Has nothing been learned from TEPCO's 'meltdown' cover-up?

<http://mainichi.jp/english/articles/20160706/p2a/00m/0na/008000c>

The March 14, 2011 press conference at the Tokyo Electric Power Co. (TEPCO) head office in Tokyo in which then TEPCO vice president Sakae Muto (second from right) was reportedly told by then company president Masataka Shimizu not to use the expression "core meltdown." (Mainichi)

A third-party panel set up by Tokyo Electric Power Co. (TEPCO) to investigate the company's cover-up of the core meltdowns that occurred at its Fukushima No. 1 Nuclear Power Plant following the March 11, 2011 Great East Japan Earthquake and tsunami revealed in a report last month that then TEPCO president Masataka Shimizu had ordered the company not to use the term "meltdown" to describe what had occurred. The report also stated that the organizational cover-up took place against a backdrop of "what is presumed to be a request that came from the prime minister's office."

- **【Related】** TEPCO head apologizes for ban of term 'meltdown' in Fukushima crisis
- **【Related】** What's behind TEPCO ban on term 'core meltdown' after Fukushima crisis?
- **【Related】** TEPCO head banned use of 'meltdown' in describing Fukushima crisis

Then Chief Cabinet Secretary Yukio Edano has objected to the report, saying that the very people who were involved, himself included, were not consulted by the panel before it drew its conclusion. Edano also said that he sent a letter of protest to TEPCO seeking an apology and a retraction of the report.

There are many missing pieces to the investigative report, but without a doubt, TEPCO acted irresponsibly toward local residents. A meltdown refers to a severe incident in which nuclear fuel melts and leeches out. If the facts had been revealed to the public, they could have fled further and avoided going outdoors. TEPCO bears a heavy responsibility for exposing local residents to risks more dangerous than they would have been otherwise.

On March 14, 2011, three days after the nuclear crisis broke out, then TEPCO vice president Sakae Muto was in the midst of a press conference when a company PR official passed him a handwritten note indicating that a core meltdown had taken place, and whispered into his ear that "the prime minister's office has instructed that this expression not be used." The third-party investigative panel concluded that this message was from then TEPCO president Shimizu. In accordance with the instructions, Muto and TEPCO used the term "core damage," a word with a less serious connotation than core meltdown, making the incident seem less severe than it actually was.

The residents of the Fukushima Prefecture town of Namie -- the northerly neighbor of the town of Futaba, one of the two towns that the stricken nuclear plant straddles -- were forced to evacuate without crucial information. According to the Namie Municipal Government, some 8,000 of the town's 21,000 or so residents evacuated on March 12, 2011, to the town's Tsushima district, further northwest of the nuclear plant. At the time, however, the wind had been blowing in that direction, putting the residents directly in the path of radioactive materials being emitted in massive amounts from the crippled nuclear plant. Local resident Hidezo Sato, 71, evacuated from the town center and stayed at a community center in Tsushima until March 15. "There were other evacuees who said we should be fleeing farther away, but I didn't think the situation was that grave," he recalls. "If we'd known there'd been a core meltdown, it would've determined how we evacuated." The community center where he was taking refuge was overflowing with people. Not knowing that he was downwind from the troubled nuclear plant, Sato sat by a fire outdoors. He also saw children going into grassy areas, where radioactive materials are known to collect.

"I would've avoided going outdoors had I known there'd been a meltdown," says Yoko Hashimoto, 64, who also evacuated to the Tsushima district. "Five years have passed since the disaster broke out, and I'm worried that I'll start seeing the health effects of radiation exposure. Why wasn't the meltdown

announced right away?" It is only natural for residents whose safety was all but ignored by TEPCO to feel anger toward the utility. **The power company had always emphasized the happy coexistence of its nuclear plants and local communities. Yet when a serious incident took place, the local residents were neglected. This more than explains why the residents are distrustful and angry.**

It wasn't until at least two months later that TEPCO admitted that core meltdowns had occurred. And even then, it was only because the then Nuclear and Industrial Safety Agency, which has since been disbanded, demanded an overall report on the disaster. Moreover, it wasn't until February of this year that TEPCO announced that it had discovered an internal company manual stipulating that damage to 5 percent or more of nuclear fuel be defined as a nuclear meltdown. Until then, the utility had cited the fact that it didn't have any standards by which to define nuclear meltdowns as its excuse for delaying the announcement that such a phenomenon had occurred. But indeed, according to the manual, then vice president Muto could have said at the press conference on March 14, 2011, that a nuclear meltdown had taken place.

Hirota Hirose, professor emeritus at Tokyo Woman's Christian University and an expert in disaster risk studies, says that **while local residents may have been thrown into confusion if information about the core meltdown had been made public, the merits of them evacuating farther away and reducing their exposure to radiation would have outweighed the possible risks of panic.** "The physical and psychological damage that residents have suffered because information was not provided to them are far greater." He adds, "Regardless of whether or not TEPCO actually received instructions from the prime minister's office (not to use the expression 'core meltdown'), it should have decided on its own to release accurate information. TEPCO lacks awareness and responsibility as the operator of nuclear plants that are at risk of creating serious crises."

There is still much more room for improvement in TEPCO's attitude toward its responsibilities. After the report on the meltdown cover-up was released, TEPCO President Naomi Hirose was asked at a press conference how the utility expected to work with the prime minister's office if another serious incident were to occur. He refused to respond in clear-cut terms, instead stating, "That's a difficult question to answer in general terms."

On the one hand, the third-party investigative panel should be praised for digging up the fact that then TEPCO president Shimizu instructed the cover-up. On the other hand, however, **the probe into the utility's relationship with the prime minister's office is insufficient.** Residents harbor distrust toward not just TEPCO, but the government as well. Local residents will remain unconvinced unless further investigation into the extent and the manner in which the government interfered with the nuclear crisis is conducted. Core meltdowns are not a problem specific to TEPCO. Whenever there's a problem surrounding a nuclear plant, it often turns out that similar things are taking place at other plants run by other utilities. Can we say that TEPCO's latest case is an isolated event? **There's a fear that when a nuclear accident takes place, we won't be able to trust the power companies involved to provide us with appropriate information that respects and reflects the needs of affected residents.** If utilities are going to restart halted nuclear reactors and extend the number of years its aging reactors are allowed to operate, they must take away important lessons from the Fukushima crisis and be prepared to disseminate information to the public from their standpoint. (By Mirai Nagira, Science and Environment News Department)

"Look... 20 years down the road"

EDITORIAL: The power of a vote can affect Japan's nuclear energy policy

<http://www.asahi.com/ajw/articles/AJ201607060033.html>

July 6, 2016 at 13:40 JST

With brutal heat forecast for this summer, the government is not calling for power-saving efforts this year. This is a break from tradition that started in summer 2011 after the disastrous accident at the Fukushima No. 1 nuclear power plant, operated by Tokyo Electric Power Co., in March that year.

Only two nuclear reactors are currently running in Japan, both at the Sendai nuclear plant operated by Kyushu Electric Co. But the government determined that the nation's power supply will not fall short this summer, largely because **energy-saving practices have become well-established in private homes and businesses over the last five years, including the widespread use of energy-efficient LED lighting.**

Japan appears to have become less dependent on nuclear power generation since the Fukushima disaster. Nowadays, the subject is debated less frequently, and anti-nuclear demonstrators have shrunk in number. In the campaign for the July 10 Upper House election, too, the nation's nuclear policy is hardly a hot topic of debate for the ruling and opposition parties.

But we need to re-examine whether the government is moving toward maintaining or abolishing its current nuclear policy.

Looking 20 to 30 years ahead, The Asahi Shimbun has consistently advocated a "zero nuclear power generation society" in its editorials. Our basic thinking is to approve the restart of offline reactors for the time being when urgent power needs exist. But at the same time, high-risk and antiquated reactors should be decommissioned, starting with the oldest and the most dangerous.

Abe administration's piecemeal restart of reactors

Since the current Abe administration was inaugurated in December 2012, its track record has made the direction of its nuclear policy quite clear.

The administration initially stressed a "decrease in reliance on nuclear power generation." But within less than six months, it put the Nuclear Regulation Authority (NRA) in the forefront to justify a switch to the policy of "restarting nuclear reactors once their safety has been confirmed."

In the Basic Energy Plan of 2014, nuclear power is positioned as "an important base load power source." One year later, the administration announced its decision to formulate a policy that would make nuclear energy account for 20 to 22 percent of the nation's power supply in fiscal 2030. This target cannot be attained unless more than 30 nuclear reactors, out of the 54 that existed before the Fukushima disaster, are brought into operation.

In fact, starting with the Sendai reactors last summer, the government has been proceeding, bit by bit, with the restart of idle reactors. So far, four units have gone back on line. This month, the No. 3 reactor at the Ikata nuclear plant operated by Shikoku Electric Power Co. is scheduled to resume operations. Twenty reactors are currently under inspection.

Furthermore, the NRA has approved the extension of operations of the 40-plus-year-old No. 1 and No. 2 reactors at the Takahama nuclear plant, operated by Kansai Electric Power Co. Put plainly, even the "40-year rule," set for averting disasters by decommissioning old reactors, is about to lose teeth.

Abe stresses nuclear power as "a low-cost and stable energy source." But as deregulation in the power industry eliminates regional monopolies while electricity charges become less subject to rigid rate

structures, nuclear power generation could actually become a burden to operators for the huge costs needed to maintain safety and dismantle old reactors.

For this reason, the government is coming up with what may be called new initiatives to protect the nuclear power industry.

The Ministry of Economy, Trade and Industry is working on a policy under which the government will buy electricity generated at nuclear power stations at a set price to encourage sustained investment in nuclear power generation.

Another plan under consideration is to decrease the financial responsibility of nuclear power plant operators for accident compensation and increase the government's responsibility instead. This goes in the opposite direction from industry deregulation.

Parties need to clarify positions on nuclear power

Many Upper House election candidates running on the ruling coalition ticket are keeping their opinions on nuclear power generation to themselves, leaving all policy decisions to the government. But some of the same candidates are also starting to call for the construction of new, safer reactors to counter the argument of people opposed to extended operations of old reactors.

Should the ruling coalition win the Upper House election, there is no doubt that it will add momentum to the Abe administration's move to return to nuclear power generation.

The opposition camp, with some minor exceptions, is united in opposing nuclear power generation. The Democratic Party and three other parties share the policy of "realizing a society that does not depend on nuclear power generation."

However, the parties differ in the method and speed with which they propose to reduce the nation's dependence on nuclear energy. While the parties are sharply focused on issues related to Abenomics, the national security legislation and constitutional revision, nuclear power generation tends to remain less discussed.

Will Japan keep relying on nuclear power? Or does it aim to eventually end this reliance by switching aggressively to sustainable energy development?

Because the answer spells a fundamental difference in the future of the nation's energy policy, every party owes it to the voting public to explain its position clearly and engage in serious debate.

In disaster-affected areas of Fukushima Prefecture, the government's evacuation orders are being lifted one by one, but there is a long way to go before the affected citizens can rebuild their lives. For them, the March 2011 disaster is still a dire reality they must face every day.

Looking at the future

For voters not directly affected by the nuclear disaster, five years may be enough time for their interest to wane.

But electricity is indispensable to everyone's daily life and work. An immediate and crucial political issue is how to secure the necessary infrastructure, and at what cost.

Since April, it has become possible for private households to choose their electricity supplier, giving people a greater chance to exercise their free will. Still, every ballot cast carries weight. The outcome of the Upper House election can either accelerate or put the brakes on the Abe administration's nuclear energy policy.

We need to look at 10 years and 20 years down the road, not just today and tomorrow, when we think about the nation's energy policy, especially regarding nuclear power.

--The Asahi Shimbun, July 6

Kagoshima gubernatorial election

July 6, 2016

VOX POPULI: As elections loom we must not be complacent over nuclear power

<http://www.asahi.com/ajw/articles/AJ201607060036.html>

The Tokyo gubernatorial election is getting a lot of media coverage, but I believe that Kagoshima's impending choice of governor deserves just as much attention.

The prefecture is home to Japan's sole nuclear power station currently in operation.

Yuichiro Ito, 68, who supported the restart of the Sendai nuclear power station, operated by Kyushu Electric Power Co., is seeking re-election as Kagoshima's governor.

Running against him is Satoshi Mitazono, 58, who is demanding the Sendai plant's "temporary suspension of operation" in his campaign pledge. This is Mitazono's first bid for the governorship.

Ito declared in his speech in late June, "The sort of situation that forces you all to evacuate will never arise."

But **Mitazono insists, "The plant's operation must be suspended while the active fault is being studied, and then we must review the current evacuation routes."**

According to an Asahi Shimbun opinion poll, Ito and Mitazono are "evenly matched in a dead heat."

However, this election is not really about nuclear power generation. **The key issue is whether the incumbent governor should be allowed to seek a fourth term.**

Even though Kagoshima voters recognize nuclear power generation as an important matter, it appears to have been eclipsed by more immediate, day-to-day concerns.

After the Fukushima disaster of March 2011, Koichiro Nakamuki, 66, who lives about three kilometers from the Sendai plant, organized an independent evacuation program with 20 other households in his community. The group conducts regular drills.

Nakamuki feels that drills organized by the local administrative authorities are only half-baked. He is hoping that the gubernatorial election campaign will help stimulate public debate on nuclear power generation.

But the subject is hardly a focal issue of the imminent Upper House election, either. **I don't know if that's because people have already begun to forget the Fukushima disaster, or if nuclear power generation is too much of a hot-button issue for candidates who want to play it safe.**

The government's policy of limiting the duration of nuclear power plant operations to 40 years is already becoming toothless, and procedures for restarting offline reactors are proceeding without much ado.

Who should decide the nation's nuclear power generation policy? It would be disappointing to leave the decision to experts and power companies alone.

I hope the upcoming elections will encourage voters to give serious thought to their energy needs in their daily lives.

--The Asahi Shimbun, July 6

Satoshi Mitazono wins governor race in Kagoshima

July 11, 2016

Advocate of halting atomic reactors wins Kagoshima governor race

July 10, 2016 (Mainichi Japan)

KAGOSHIMA (Kyodo) -- Satoshi Mitazono, who has pledged to halt nuclear reactors operating in the prefecture, won the Kagoshima gubernatorial election Sunday, beating incumbent Yuichiro Ito, who agreed to the restart of a nuclear plant in the southwestern prefecture.

The 58-year-old Mitazono, a former TV Asahi Corp. commentator, was backed by the main opposition Democratic Party, the Social Democratic Party and some conservatives who typically support the ruling Liberal Democratic Party but were opposed to the incumbent.

Ito, 68, was seeking a fourth four-year term with the support of the LDP and its junior coalition partner Komeito. He admitted defeat.

The fate of Kyushu Electric Power Co.'s Sendai nuclear power plant in the prefecture was one of the contentious issues during the election campaign.

The Sendai plant's Nos. 1 and 2 units are the only reactors operating in Japan after the government imposed tougher safety rules following the 2011 earthquake and tsunami that triggered meltdowns at the Fukushima Daiichi nuclear power plant in northeastern Japan.

Mitazono claimed that the operation of the reactors should be temporarily halted for safety checks following a series of powerful earthquakes that hit the southwestern main island of Kyushu in April, while Ito argued that the plant's safety has been secured.

Mitazono told reporters, "It's the top leadership's role to create momentum toward a nuclear power-free society,"

"We cannot run a nuclear power station unless its safety is ensured," he said.

Voter turnout stood at 56.77 percent, up 12.92 percentage points from the previous election in 2012, according to the prefectural election management committee.

Nuclear-free society advocate set to win Kagoshima governor race

<http://www.japantimes.co.jp/news/2016/07/10/national/politics-diplomacy/nuclear-free-society-advocate-set-win-kagoshima-governor-race/#.V4Na4aJdeou>

Kyodo

- Jul 10, 2016

KAGOSHIMA – Anti-nuclear advocate Satoshi Mitazono was heading for victory in the Kagoshima gubernatorial race Sunday, beating incumbent Yuichiro Ito, who agreed to the resumption of reactors at a power plant in the prefecture, a projection showed.

The 58-year-old Mitazono is a former TV Asahi Corp. commentator. He ran as an independent backed by the main opposition Democratic Party and the Social Democratic Party as well as some conservatives who typically support the ruling Liberal Democratic Party but were opposed to the incumbent.

Ito, 68, with the support of the LDP and its junior coalition partner Komeito, was seeking his fourth four-year term.

One of the contentious issues in the race was the fate of Kyushu Electric Power Co.'s Sendai nuclear power plant in the prefecture.

The Sendai plant's No. 1 and No. 2 units are the only reactors operating in the country after the government imposed tougher safety rules following the 2011 earthquake and tsunami that triggered meltdowns at the Fukushima No. 1 nuclear power plant.

Mitazono demanded that plant operations be temporarily suspended for safety checks in the wake of a series of strong earthquakes that hit central Kyushu in April, while Ito argued that the plant's safety had been secured.

"We will not activate any reactors the safety of which is not guaranteed," he told reporters on Sunday.

And now "alarming" governor

July 12, 2016

New governor's Sendai plant shutdown pledge alarms utility

<http://www.asahi.com/ajw/articles/AJ201607120060.html>

THE ASAHI SHIMBUN

Kyushu Electric Power Co.'s Sendai nuclear power plant in Satsuma-Sendai in Kagoshima Prefecture (Asahi Shimbun file photo)

Concern is growing among Kyushu Electric Power Co. and the central government over the new Kagoshima governor's pledge to request a reassessment of the Sendai nuclear plant's safety in light of the recent Kumamoto quakes.

Satoshi Mitazono, a former political reporter with TV Asahi Corp., was elected on his campaign pledge to build a "society without nuclear energy" in the July 10 gubernatorial race, defeating incumbent Yuichiro Ito.

Mitazono, 58, wants to suspend operations at the plant for a review of its emergency evacuation plan and to re-examine its safety features.

A top Kyushu Electric executive expressed bewilderment over Mitazono's proposal.

"A governor has no legal authority to order a halt," the official said. "On what legal basis can the plant be shut down?"

But Mitazono's calls reflect local residents' mounting concerns over the Sendai plant in Satsuma-Sendai, Kagoshima Prefecture, after a series of strong tremors rocked neighboring Kumamoto Prefecture starting in mid-April.

The company allows prefectural officials to inspect the nuclear plant site, and request for it to take corrective measures based on their findings under an agreement with the prefectural and Satsuma-Sendai city governments over safety issues.

Kyushu Electric, based in Fukuoka, would likely be forced to respond in one way or another when the governor asks for the suspension of the plant, regardless of legal authority.

With two reactors in operation, Sendai is the only nuclear power station back online in the nation after it cleared the new safety regulations implemented after the 2011 Fukushima nuclear disaster.

After Mitazono emerged as the winner on July 10, Kyushu Electric's closing stock price dropped more than 7 percent, compared to July 8, reflecting the company's potentially gloomy prospects.

The two reactors at the Sendai plant are scheduled to be shut down in October or later for a regular check. An official with the Ministry of Economy, Trade and Industry, which oversees the nuclear industry, said it would take a prolonged period before the plant could be restarted if a review of the evacuation plan or other demands were made.

A senior Kyushu Electric official concurred that it would not be easy to go back online on a regular time schedule if such demands were made.

"It would be difficult to reactivate the reactors amid the opposition of the local government hosting the plant," the official said.

NHK Board of Governors chair admits conservative lobby group, nuke power connections

<http://mainichi.jp/english/articles/20160713/p2a/00m/0na/002000c>

NHK Board of Governors Chairman Susumu Ishihara is seen at a news conference on June 28, 2016, in Tokyo's Shibuya Ward. (Mainichi)

NHK Board of Governors Chairman Susumu Ishihara said on July 12 that he needs to re-evaluate his outside commitments after admitting prominent roles in both a conservative group pushing for constitutional revision and a pro-nuclear power lobby.

Ishihara admitted to reporters after the public broadcaster's Board of Governors meeting that day that he is an honorary adviser to the Fukuoka chapter of the Nippon Kaigi (Japan Conference) conservative lobby group and also co-leader of the National Nuclear Union, an association for the promotion of nuclear power.

"If I look at the situation in its entirety, I can see that I need to re-evaluate things," Ishihara said in response to a reporter's question.

NHK President Katsuto Momii's term ends in January next year, and Ishihara also revealed that the Board of Governors would establish a committee at its next meeting on July 26 to nominate potential successors to head the public broadcaster.

Kansai Electric appeals

July 14, 2016

Kansai Electric files appeal against ruling on Takahama reactors

<http://www.japantimes.co.jp/news/2016/07/14/national/crime-legal/kansai-electric-files-appeal-ruling-takahama-reactors/#.V4fSM6Jdeot>

Kyodo

OSAKA – Kansai Electric Power Co. on Thursday appealed against a district court ruling that upheld an injunction on the operation of two reactors at its Takahama nuclear power plant.

After filing the appeal with the Osaka High Court, Kansai Electric said the Otsu District Court's decision on Tuesday to reject its request to suspend the injunction was "totally unacceptable" because it was made despite a detailed explanation on the safety of the reactors at the Fukui Prefecture plant.

In the decision, the district court rejected the utility's arguments, upholding the injunction it issued in March even though the No. 3 and 4 reactors had cleared a set of new safety requirements imposed after the 2011 Fukushima nuclear crisis.

The injunction, the first of its kind affecting operating reactors in Japan, dealt a blow to the government's renewed push for nuclear power generation despite lingering safety concerns among the public.

In both decisions, issued in March and on Tuesday, the court said meeting the new nuclear safety regulations did not necessarily guarantee the safety of the two reactors and that Kansai Electric should provide further explanation.

"We will make an all-out effort to prove the safety of the two reactors so the (injunction) is rescinded soon," Kansai Electric said in a statement.

Currently, only two reactors at Kyushu Electric Power Co.'s Sendai plant in Kagoshima Prefecture are operating in Japan.

The Takahama plant's Nos. 3 and 4 reactors were reactivated in January and February, respectively, after the Sendai reactors resumed operation.

But the injunction forced the No. 3 unit to be taken offline on March 10, while the No. 4 unit had already been suspended due to equipment trouble.

July 14, 2016

Kansai Electric appeals against halt of reactors

http://www3.nhk.or.jp/nhkworld/en/news/20160714_38/

The Kansai Electric Power Company has appealed against a court injunction that blocks the restart of 2 reactors at its Takahama nuclear plant in central Japan.

On Tuesday the Otsu District Court in Shiga Prefecture issued a fresh injunction to suspend the operations of the No. 3 and No. 4 reactors at the plant in neighboring Fukui Prefecture.

In March, the Otsu District Court issued an injunction to suspend the operations of the 2 reactors. It was the first injunction for reactors in operation. Residents in Shiga Prefecture sought the injunction.

Kansai Electric then filed an objection to cancel the injunction.

But the district court on Tuesday pointed out that the utility had not given an adequate explanation that the regulations, which were introduced after the 2011 Fukushima Daiichi nuclear accident, will serve as a measure to prevent fatal accidents.

The court said that clearing new regulations does not necessarily guarantee the safety of the reactors.

The utility on Thursday filed an objection with the Osaka High Court.

The court will hold hearings to consider the opinions of Kansai Electric and Shiga residents.

A Kansai Electric official told reporters on Thursday that the company will do all it can to nullify the injunction, calling it extremely unreasonable.

The official said the district court demanded virtually a zero risk by citing the fears and anxieties about new regulations and the safety of the Takahama plant from the court's own point of view.

End of inquiry into leak of documents

July 15, 2016

NRA secretariat discontinues probe into leak of internal training documents

<http://mainichi.jp/english/articles/20160715/p2a/00m/0na/010000c>

The Secretariat of the Nuclear Regulation Authority (NRA) has discontinued its probe into the leak of internal materials used in the training of newly recruited employees to outsiders without confirming how the information leaked, it has been learned.

- **【Related】** NRA secretariat doesn't know how nuclear files leaked

Although the materials do not contain any confidential information that affects the safety of nuclear plants, the NRA secretariat's lax attitude toward managing internal information as a key government organization that deal with nuclear technology will likely be called into question.

The leaked information is comprised of documents totaling about 3,800 pages, including a textbook used for a training session for new comers in April and May 2014, and the video footage of the session totaling about 74 hours.

It came to light in March 2015 that at least some of the information had leaked outside. In October that year, the Mainichi Shimbun confirmed the leakage and the secretariat acknowledged the incident. The NRA secretariat set up a fact-finding team, conducted an in-house investigation and probed a translation company that the organization commissioned to translate its documents into English, but failed to identify the route through which the information had leaked.

Govt. information belongs to the public

July 5, 2016

EDITORIAL: Parties should address Diet's inept oversight of state secrets

<http://www.asahi.com/ajw/articles/AJ201607050043.html>

In some cases, the government has good reason to keep certain pieces of information secret. But that doesn't change the fact that information gained by the government belongs in principle to the public. It is therefore important for the legislature to have adequate power to monitor the executive branch's activities concerning information it has acquired.

Unfortunately, we cannot say that the Diet, which represents the public, is sufficiently performing its responsibility as the people's watchdog of the government.

On Dec. 6, 2013, the Diet passed the Abe administration's controversial state secrets protection bill into law. Prime Minister Shinzo Abe's initiative to ensure the secrecy of what the government deems sensitive information caused a bitter division among the public.

Two days before the law was enacted, Abe announced the establishment of two organs to monitor government operations related to state secrets: the Independent Public Records Management Secretary and a Cabinet committee responsible for checking the qualification assessments of government employees who deal with state secrets.

The following day, four parties--the Liberal Democratic Party and its junior coalition partner, Komeito, plus the Japan Restoration Party and Your Party--agreed to set up monitoring bodies within the Diet as well.

All these actions were taken immediately before the Upper House vote on the secrecy legislation. Their effectiveness is in serious doubt.

The two institutions set up within the government are actually internal organizations that are not independent of the government.

The Boards of Oversight and Review of Specially Designated Secrets of both Diet houses are intended as independent watchdogs, the only institutions that can monitor the implementation of the state secrets law from outside the government.

But their ability to monitor the government's moves to classify or declassify specific information is highly questionable if their first annual reports published at the end of March are any indication.

Most of the accounts contained in the government's record book about the designation of specific pieces of information as state secrets were too vague to help the boards judge whether the designation was appropriate or not. One typical description about classified information in the document is "information provided by a foreign country."

When members of the boards asked ministry officials for more detailed information, the officials often simply refused.

The boards' efforts to carry out their missions were also unsatisfactory.

The Lower House board failed to make any judgment about the government's decisions to classify specific information.

Instead, it only called for improvements in the way the law was implemented as its "opinion" without issuing more powerful "recommendations."

While pushing for the enactment of the state secrets protection law, the Abe administration also created the National Security Council and then led the Diet to pass national security legislation.

With these moves, the administration has sought to expand the government's discretion in making and implementing security policy decisions, including those related to the operations of the Self-Defense Forces, while concentrating related powers in the prime minister's office.

The Diet, which is supposed to check such government policy decisions, is dominated by the ruling camp. It is unacceptable to leave the Diet's ability to monitor the government's handling of information in such poor shape.

The situation raises concerns that the government could indefinitely expand the scope of discretionary security policy decisions made behind closed doors without being exposed to public scrutiny.

The Abe administration has put off important steps under the security legislation in an apparent attempt to prevent negative repercussions in the July 10 Upper House election.

If, for example, the government decides to deploy SDF troops overseas after the election, the Diet will unlikely be able to extract necessary information from the government to judge the appropriateness of the deployment.

The ruling and opposition parties should spend more time during the election campaign addressing the question of how to enhance the Diet's monitoring capabilities after the election.

Will Mitazono remain firm?

July 18, 2016

EDITORIAL: New Kagoshima governor must clarify stance on nuclear reactors

<http://www.asahi.com/ajw/articles/AJ201607180019.html>

Satoshi Mitazono, governor-elect of Kagoshima Prefecture, said during the election campaign, "Operations at the nuclear plant should be suspended temporarily for another (safety) check." The southern prefecture hosts the Sendai nuclear power plant, the only one currently operating in Japan.

The 58-year-old former TV Asahi Corp. commentator, who ran for office as a first-time, independent candidate, defeated incumbent Governor Yuichiro Ito, 68, who had approved the reactor restarts at the nuclear plant operated by Kyushu Electric Power Co.

Ito was seeking a fourth term. Many believe Mitazono won the election because of his criticism of how Ito had held the same office for so many consecutive terms.

But Mitazono's election pledge to temporarily halt the Sendai nuclear plant, in response to the recent series of strong earthquakes in neighboring Kumamoto Prefecture, was probably no less relevant, given the spreading anxiety among the public.

During the first week following the onset of the quakes, Kyushu Electric received 5,000 e-mails and phone calls asking for a halt to the Sendai reactor operations.

Immediately after he was elected, Mitazono reiterated that he will request a temporary suspension with Kyushu Electric, but he has yet to provide more details on the matter.

A temporary shutdown was certainly one of his election pledges, but he did not bring that to the fore during the campaign. Suspicion seems to be arising in the minds of Kagoshima Prefecture's public, including both proponents and opponents of nuclear energy.

The governor has no legal authority to shut down an active nuclear reactor. But the No. 1 and No. 2 reactors of the Sendai nuclear plant, which went back online in summer and autumn last year, are expected to go offline for routine inspections in autumn and winter.

Kyushu Electric does not need to obtain the governor's approval to reactivate the reactors once the checkups are over, but the utility cannot totally ignore the governor's intentions, which, therefore, will set higher hurdles for the reactor restarts.

Mitazono should continue to firmly talk about his own beliefs.

Some speculate he is probably working out strategies to deal with Kyushu Electric and the prefectural assembly, which upheld the nuclear restarts. But the first and most basic thing he must do is provide an explanation to the prefecture's public.

During the gubernatorial election campaign, Mitazono promised to shut down operations of the Sendai nuclear plant, conduct a check on its facilities and review the emergency evacuation plans. He also pledged to set up a panel of experts to discuss nuclear power issues.

The Kumamoto quakes, which caused many roads and bridges to collapse, were followed by aftershocks that gradually approached the Sendai nuclear plant. People in Kagoshima Prefecture were worried that an earthquake striking near the nuclear plant could tear up emergency evacuation routes.

Mitazono's pledge indicated a readiness to address those anxieties.

Niigata and Shizuoka prefectures are among the local governments that have already set up panels similar to the expert panel on nuclear power issues being floated by Mitazono.

Although the central government's Nuclear Regulation Authority is in charge of safety screenings of nuclear reactors being planned for restarts, **it is essential for local governments to play an active role in defending their own residents without leaving the matter up to experts.**

Given that Mitazono was elected after pledging to temporarily halt the nuclear plant, the incoming governor should explain his thoughts carefully and continue his efforts to ease the anxieties of Kagoshima Prefecture's residents.

TEPCO to pay for rumor-caused damages

July 21, 2016

TEPCO ordered to pay for 'false rumors' from Fukushima crisis

<http://www.asahi.com/ajw/articles/AJ201607210042.html>

A court ordered Tokyo Electric Power Co. to pay compensation to a golf course operator for lost revenue caused by "false rumors" from the disaster at the utility's Fukushima No. 1 nuclear power plant.

Although TEPCO argued that the golf course in northern Tochigi Prefecture, 115 kilometers from the nuclear plant, was safe from radiation exposure, the Tokyo District Court on July 20 said TEPCO must still cover 19.6 million yen (\$183,000) of the golf course operator's losses in 2011.

"This is an epoch-making judgment that appropriately recognizes damages caused by false rumors," said Kiyohisa Arai, the lawyer who represented the golf course operator.

The plaintiffs, who demanded 86.4 million yen in compensation, argued that the triple meltdown at the Fukushima plant in March 2011 led to a prolonged decline in customers.

According to the ruling, sales at the golf course in March 2011 plummeted 62 percent compared with the figure for March 2010, and monthly revenues continued to decline year-on-year.

TEPCO argued that "the golf course was located far away from the power plant, and there were no concerns of being exposed to radiation there."

Tochigi Prefecture lies south of Fukushima Prefecture, where the stricken nuclear plant is located.

However, the court ruled that rumors were enough to keep customers away from the golf course in the six months following the nuclear accident.

"A significant number of users avoided visiting the facility because sufficient scientific knowledge on the amount of radiation and exposure from the accident was not available at the time," the ruling said.

The court held TEPCO responsible for covering 30 percent to 50 percent of the company's monthly losses from March to August 2011.

"Road damages from the Great East Japan Earthquake and the social atmosphere of the time that led people to refrain from taking part in leisure activities also had an effect on visitor turnout," the court ruled.

TEPCO ordered to pay for rumor-caused damages

http://www3.nhk.or.jp/nhkworld/en/news/20160721_01/

A Japanese court has ordered Tokyo Electric Power Company, or TEPCO, to compensate a golf course operator for damages caused by rumors after the Fukushima Daiichi nuclear accident in 2011.

This is the first ruling in Japan that recognizes rumor-caused damages related to a nuclear accident.

The golf course operator's suit claimed that revenues from its course in Tochigi Prefecture, north of Tokyo, dropped due to harmful rumors related to the nuclear accident.

TEPCO argued that there was no danger from radiation because the golf course is more than 100 kilometers from the nuclear plant.

In the ruling on Wednesday, Tokyo District Court presiding judge Tetsuro Nakayoshi said the public did not have sufficient knowledge about radiation around the time of the accident.

He noted that it was not unreasonable for ordinary people to worry about health risks.

The court determined that harmful rumors were responsible for 30 to 50 percent of the decline in

revenue for more than 5 months following the accident.

The court ordered the utility to pay about 180,000 dollars in compensation.

TEPCO says the company will deal with the matter sincerely after studying the ruling.

In Chiba radioactive is no longer radioactive...

July 22, 2016

Designation of radioactive waste to be lifted

http://www3.nhk.or.jp/nhkworld/en/news/20160721_30/

Japan's Environment Ministry plans to lift the designation of radioactive waste for some ash and sludge tainted by the Fukushima Daiichi nuclear accident.

The ministry says the radioactivity of the waste in Chiba City near Tokyo has dropped below the government-set level 5 years after the crisis.

The case is the first among municipalities storing radioactive waste from the accident's fallout.

Many municipalities, mostly in eastern Japan, store waste with radioactivity levels above the government-set level of 8,000 becquerels per kilogram. The waste includes ash from incineration plants, rice straw and sewage sludge.

More than 5 years after the crisis, the government decided to allow waste with radioactivity levels below the threshold to be dumped as ordinary waste.

At the end of June, Chiba City applied for the lifting of the designation for some 7 tons of waste in the city.

State Minister of the Environment Shinji Inoue is to meet Chiba City Mayor Toshihito Kumagai on Friday to formally announce the change.

Gov't to lift special designation on 7.7 tons of radioactive waste in Chiba

<http://mainichi.jp/english/articles/20160722/p2a/00m/0na/021000c>

The Environment Ministry will lift the designation of 7.7 metric tons of waste stored in the city of Chiba that is contaminated with radioactive materials from the crippled Fukushima No. 1 nuclear plant as "specified waste," **allowing it to be disposed of as regular trash**, ministry officials said.

- **【Related】** Reuse of radioactive soil feared to trigger illegal dumping

The decision, which is to be executed on July 23, comes after the level of radioactive cesium in the waste dropped below the government's standard of 8,000 becquerels per kilogram. It will be the first time for the ministry to lift the "specified waste" designation from waste tainted with radioactive substances from the Fukushima nuclear disaster.

Though the move will enable waste to be disposed of as ordinary trash, **the Chiba Municipal Government is likely to store the waste, as it fears that disposal would cause anxiety to local residents and disposal businesses.**

State Minister of the Environment Shinji Inoue met with Chiba Mayor Toshihito Kumagai on July 22 to notify him of the decision.

The Chiba Municipal Government retains 3.5 tons of zeolite and 4.2 tons of incinerated ash at a waste disposal facility in the city's Mihama Ward. The amount of radioactive cesium contained in the waste was above the government-set standard as of March 2014. However, measurements conducted by the municipal government in June show that the radioactive cesium levels in the zeolite and ash had fallen to 6,100 becquerels and 4,020 becquerels per kilogram, respectively.

The Environment Ministry worked out rules this past April under which the designation of radioactively contaminated waste is lifted based on the level of radioactive cesium in the waste.

The city of Chiba asked the ministry to lift the designation in June.

The ministry intends to build a specified waste disposal facility in each prefecture, and the city of Chiba hosts one candidate site for Chiba Prefecture. **The municipal government urged the lifting of the designation, partly to make it easier for the city to refuse to host such a facility, as it would be without the designated waste in the city.**

Luring people back

July 24, 2016

Fukushima banks hope to lure nuclear evacuees back by reopening branches

<http://www.japantimes.co.jp/news/2016/07/24/business/fukushima-banks-hope-to-lure-nuclear-evacuees-back-by-reopening-branches/#.V5SVwaJdeov>

JJI

FUKUSHIMA – Regional banks in Fukushima Prefecture are reopening outlets in radiation-contaminated areas to help lure residents back more than five years after the triple core meltdown at the Fukushima No. 1 power plant laid waste to the region in March 2011.

Residents have been slow to return despite the phased lifting of evacuation orders in cleaned-up areas, so regional banks are eager to play a trailblazing role by allowing residents to use their branches as places to socialize.

Abukuma Shinkin Bank, based in Minamisoma, reopened its Odaka branch there in March 2013 and the branch in the town of Namie on July 12.

The evacuation order for the central part of Namie is expected to be lifted by the end of next March, but there are still structures that collapsed from the March 11, 2011, Great East Japan Earthquake.

“We’ll put the light on in the town where people do not live,” said Yoshihiro Ota, president of Abukuma Shinkin, stressing the significance of reopening the Namie branch.

Abukuma Shinkin became the first financial institution to reopen a branch in Namie, which sits next to the town of Futaba, one of the two municipalities that host the crippled Fukushima No. 1 plant, which lost all power after being swamped by tsunami spawned by the temblor. The plant is run by Tokyo Electric Power Co. Holdings Inc.

“We hope our branch, where local people can stop by freely and enjoy chatting, will become a place that can console them,” said Takahiro Abe, chief of the Namie branch.

“Being the first to reopen a branch in the town will hopefully allow us to attract people and see rises in deposits and loans,” Abe added.

In April, Toho Bank, based in the city of Fukushima, restarted its branch in Naraha, another town close to the Fukushima No. 1 plant.

Although the evacuation order for Naraha was lifted last September, only 8.1 percent of its residents had returned as of July 4.

“Financial institutions are indispensable regional infrastructure,” said Hiroshi Yamaka, chief of Toho Bank’s Naraha branch. “Regional banks have a major role to play in helping residents return home.”

But it is not easy to achieve industrial revival in contaminated areas neglected by the long evacuation.

A male business owner who visited Abukuma Shinkin’s Namie branch on the day it reopened said, “The bank told me that they will lend me money, but I can’t decide on new investment because I’m old and there’s no one I can hand over my business to.”

Trust in NRA has been shaken

July 25, 2016

Editorial: Doubts about nuclear plant's quake resistance shake trust in NRA

<http://mainichi.jp/english/articles/20160725/p2a/00m/0na/006000c>

Trust in Japan's nuclear watchdog, the Nuclear Regulation Authority (NRA), has been jolted. At hand is an issue raised by Kunihiro Shimazaki, former acting chairman of the NRA. Shimazaki pointed out that Kansai Electric Power Co. underestimated the maximum shaking that could occur during an earthquake at its Oi Nuclear Power Plant in Fukui Prefecture.

- **【Related】** NRA to scrap recalculated quake ground motion data for Oi nuclear plant
- **【Related】** Ex-NRA bigwig demands recalculation of Oi nuclear plant quake estimate
- **【Related】** Nuclear authority says Oi plant's quake hazard not underestimated

Shimazaki is an authority on seismology, having formerly served as president of the Seismological Society of Japan. While serving in the NRA, he handled screening of power companies' earthquake predictions for nuclear power plants including the Oi nuclear plant.

After he stepped down two years ago, he re-examined data and found the method of calculating standard ground motion (the maximum shaking that would occur during an earthquake) was inappropriate in some cases, depending on the type of fault. This could lead power companies to underestimate figures, he apparently found in his research.

If Shimazaki's argument is correct, the Oi Nuclear Power Plant could come under pressure to provide even greater reinforcement against quakes.

The NRA had for the most part accepted Kansai Electric's data, but following the claim by Shimazaki, a new calculation on ground motion was performed using a method differing from that adopted by the power company. As the figure was below that presented by Kansai Electric, it determined that the utility had not underestimated the shaking, and during a regular meeting on July 13, it decided against revising Kansai Electric's figure.

Shimazaki, however, objected, saying that the recalculated figure should have greatly surpassed the original figure for standard ground motion. The reason is that during screening, the outcome of calculations is normally multiplied by 1.5 to provide an added element of safety, but this wasn't done. The new calculation was performed by the secretariat of the NRA. A member of the secretariat who talked with Shimazaki admitted that the renewed calculation was repeatedly stretched, and had "no accuracy." The member added, "It's not known how much leeway should be given." It couldn't be helped if the secretariat were accused of adopting its approach to avoid criticism that the estimate for envisaged damage was too low. The fact that the NRA accepted without questions its secretariat's explanation that Kansai Electric's estimate was sufficient raises doubts about its competence.

There are no experts on seismology among the NRA's five commissioners. NRA Chairman Shunichi Tanaka has expressed the opinion that the calculated figure for standard ground motion at the Oi Nuclear Power Plant doesn't have to be reviewed. We worry whether quake resistance has been calculated properly.

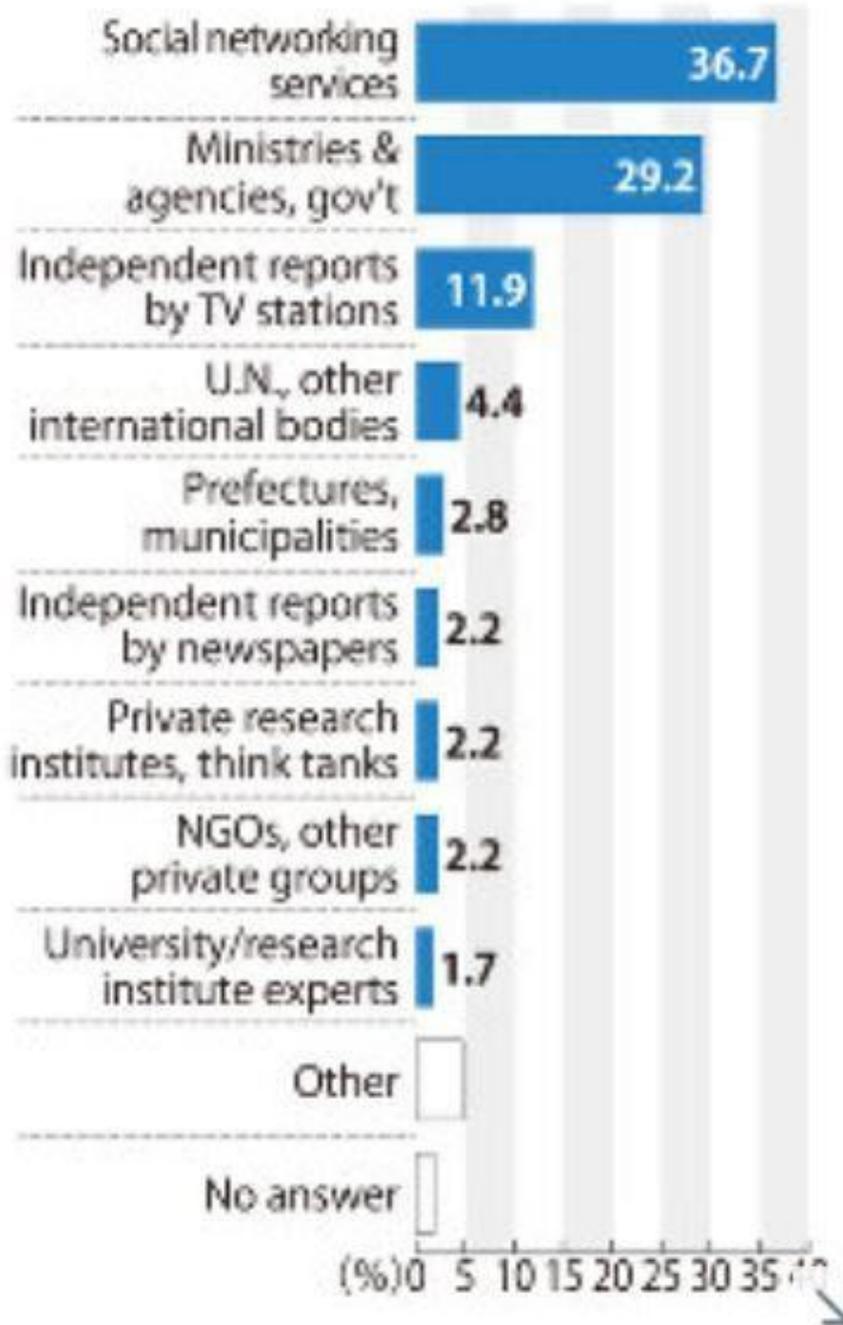

Shimazaki has suggested to the NRA that it listen to a wide range of opinions from experts in seismology and incorporate the good ones into its screening. Even if experts differ in their evaluations of Shimazaki's research results, his suggestion to the NRA itself is appropriate.

Tanaka, however, commented, "We don't have the leeway to do that and it's not our job to do it either." We can only be skeptical about such a stance.

The NRA is supposed to be the final fortress in ensuring nuclear safety. We hope that it will try to make improvements to methods of calculating quake resistance of its own accord.

Credibility of government very low

Least reliable source of information on nuclear accidents

July 26, 2016

Gov't cited as second-least reliable source of info on nuclear accidents: survey

Respondents to a survey in Shizuoka Prefecture, which houses Chubu Electric Power Co.'s Hamaoka Nuclear Power Plant, have cited the government as the second-least reliable source of information on nuclear accidents.

A total of 29.2 percent of respondents in the survey by Hirotsada Hirose, a professor emeritus at Tokyo Women's Christian University, cited the central government and its ministries and agencies as the least reliable source of information in the event of a nuclear accident. The figure was topped only by "social networking services (SNS), at 36.7 percent, highlighting deep-rooted mistrust in the government as a source of information.

Conducted between May and June, the survey targeted the city of Omaezaki, where the Hamaoka Nuclear Power Plant stands, and 10 municipalities within a 31-kilometer radius of the plant, designated as urgent protective action planning zones (UPZs). A total of 360 people between the ages of 18 and 79 were interviewed directly by researchers.

The respondents were asked to choose from nine sources of information, not including nuclear power companies, which would be responsible for the incidents. Besides SNS and the central government and its ministries and agencies, the next most commonly cited unreliable sources of information were "independent reports by TV stations" at 11.9 percent, and "international organizations such as the United Nations," at 4.4 percent. "Independent reports by newspapers" came in at 2.2 percent.

When asked for the "most reliable" source, respondents' top answer was "prefectures and municipalities," at 41.4 percent, while "the government, its ministries and agencies," was selected by 11.7 percent of respondents.

"If the credibility level of the government is this low, it could have a negative effect during evacuations. If the government is moving to restart nuclear reactors, then it first should make an effort to clear away the sense of mistrust," Hirose said.

Business attitudes shifting regarding nukes

Japan business lobby says Abe govt can't rely on nuclear energy

TOKYO, July 22 | By Osamu Tsukimori and Aaron Sheldrick

<http://uk.reuters.com/article/japan-energy-idUKL4N19N1D4>

Japan's use of nuclear power is unlikely to meet a government target of returning to near pre-Fukushima levels and the world's No.3 economy needs to get serious about boosting renewables, a senior executive at a top business lobby said.

Under Prime Minister Shinzo Abe's energy policies, nuclear is supposed to supply a fifth of energy generation by 2030, but Teruo Asada, vice chairman of **the Japan Association of Corporate Executives**, said Japan was unlikely to get anywhere near this.

The influential business lobby has issued a proposal urging Tokyo to remove hurdles for renewable power amid the shaky outlook for nuclear power after the 2011 Fukushima disaster.

The move shows how business attitudes are now shifting as reactor restarts get held up by legal challenges, safety issues and public scepticism.

"We have a sense of crisis that Japan will become a laughing stock if we do not encourage renewable power," said Asada, who is also chairman of trading house Marubeni Corp.

Long dependent on imported fossil fuels, Japan's government and big business actively promoted nuclear energy despite widespread public opposition.

The government wants nuclear to make up 20-22 percent of electricity supply by 2030, down from 30 percent before Fukushima. So far, however, only two out of 42 operable reactors have started and the newly elected governor of the prefecture where they are located has pledged to shut them.

Renewables supplied 14.3 percent of power in the year to March 2016 and the government's 2030 target is 22-24 pct.

"In the very long term, we have to lower our dependence on nuclear. Based on current progress, nuclear power reliance may not reach even 10 percent," said Asada, adding the association wanted measures to encourage private investment in renewables and for public funding of infrastructure such as transmission lines.

The influential business lobby has a membership of about 1,400 executives from around 950 companies. Andrew DeWit, a professor at Rikkyo University in Tokyo focusing on energy issues, said the push signaled "a profound change in thinking among blue-chip business executives."

"Many business leaders have clearly thrown in the towel on nuclear and are instead openly lobbying for Japan to vault to global leadership in renewables, efficiency and smart infrastructure."

When asked about the association's proposals, an industry ministry official said the government was maintaining its nuclear target.

"The Japanese government will aim for the maximum introduction of renewable energy but renewable energy has a cost issue," said Yohei Ogino, a deputy director for energy policy.

But three sources familiar with official thinking told Reuters in May that Japan will cut reliance on nuclear power when it releases an updated energy plan as early as next year.

Following the nuclear reactor meltdowns at Fukushima in 2011, Japan has had some success in overcoming one of the world's worst peacetime energy crises, partly due to lower oil prices and liquefied natural gas (LNG) prices.

Japan has also promoted renewables but most investment has been in solar and in recent years it has cut incentives.

"There are **too many hurdles for other sources of renewable power**," Asada said.

(Editing by Ed Davies)

Sendai shutdown: Mitazono ready for fight

July 29, 2016

New Kagoshima governor ready for Sendai plant shutdown fight

THE ASAHI SHIMBUN

<http://www.asahi.com/ajw/articles/AJ201607290046.html>

KAGOSHIMA--Satoshi Mitazono repeated his assertion that operations at Sendai nuclear power plant in the prefecture should be suspended at his first news conference as Kagoshima governor on July 28.

He said that he will make the request to Kyushu Electric Power Co., the operator of the plant, “between late August and early September.”

“As long as residents in the prefecture are feeling anxious due to the Kumamoto earthquakes, I strongly urge Kyushu Electric to temporarily halt the operations of the reactors and conduct another inspection,” Mitazono, a former TV journalist, said.

The new governor raised his voice as he made the remarks in response to a question about the suspension of the No. 1 and No. 2 reactors at the Sendai plant in Satsuma-Sendai, the only units in Japan currently in service.

Mitazono was elected as Kagoshima’s governor on July 10. The suspension of the Sendai plant’s operation for additional safety checks was one of his campaign pledges.

Although a governor has no legal authority to order a halt, Mitazono said, “Whether or not a governor has that authority and making a request to a utility are a separate issue.”

Regarding the method for how he will make the request and its contents, Mitazono said, “I will sum up the ideas while exchanging opinions with various people.”

Mitazono also referred to the possible decommissioning of the two reactors at the Sendai plants, which have been in operation for more than 30 years.

He plans to establish an expert panel to discuss nuclear plant-related issues in the near future including the decommissioning of the aging reactors.

The governor also expressed his view that “the construction of a new reactor would be difficult,” in reference to the proposed No. 3 unit that Kyushu Electric is planning to add at the plant.

During the news conference, he also said that he plans to increase the number of radiation monitoring posts around the Sendai plant from 73 to about 100.

The devices measure radiation levels near the plant and serve as a barometer for issuing an evacuation order to residents at the time of a nuclear accident.

“I want to install many high-performance ones,” Mitazono said.

Liberalisation: Profitable for whom?

July 27, 2016

The fraud called retail electricity liberalization

<http://www.japantimes.co.jp/opinion/2016/07/27/commentary/japan-commentary/fraud-called-retail-electricity-liberalization/#.V5nDpqJdeou>

Sentaku Magazine

Three months have passed since the retail sale of electric power was fully liberalized. Approximately 300 companies have since entered the business of generating and selling electricity, and more than 1 million consumers have signed contracts with them, switching from the major power companies that have monopolized each region.

Some of those consumers may be feeling satisfied with new lower power rates, but their satisfaction could be short-lived. They may well end up shouldering the huge cost of the liberalization program.

There are hidden costs related to generating and supplying electricity that consumers never catch sight of because they are not listed on their monthly bills. These hidden costs are so huge that they could erase any benefits to consumers.

The Organization for Cross-Regional Coordination of Transmission Operations (OCCTO) issues weekly reports on how the liberalization of electricity retail is proceeding. It says that as of June 10, about 1.11 million consumers had concluded contracts with new power suppliers. Though this number may seem impressive, it accounts for a mere 2 percent of the total number of the nation's households. If this percentage figure is taken as a yardstick, the liberalization of power retail can be termed a total failure. How much savings have accrued to those 1 million plus consumers as a result of changing their power suppliers? It is still too early to come up with an exact answer because electricity bills usually go up sharply in the winter and summer months. But assuming the new contracts have resulted in an annual average saving of ¥10,000, as indicated by many websites' comparison of differences in power charges, the total savings come to about ¥11.1 billion.

But this figure is only an illusion, because huge investments were made in preparation for liberalization and the money needed for those investments is being collected from all of the power consumers in the name of fees for using transmission lines.

One case that illustrates such big investments is the installation of what is known as a "smart meter," a device that measures the amount of electricity consumed in real time and communicates the data to a power company for monitoring and billing. This device had been on the market even before liberalization but is now a must-have. A smart meter must be installed in every household in principle when its electricity supplier is changed. Tokyo Electric Power Co., which serves 20 million households, initially budgeted ¥21.9 billion for three years from 2012 to 2014 to install smart meters. Although a regulatory body reduced the sum by ¥6.5 billion, the balance still means that Tepco spent around ¥5 billion annually in the name of liberalizing the retail of electricity.

Other major power companies also invested huge sums to install smart meters. The total sum budgeted by the nine other regional power companies for that purpose averaged ¥62 billion a year. Even if it is assumed that 10 percent of that was slashed by the regulatory body, it still leaves a total of some ¥55 billion a year. When the amount spent by Tepco is added, as much as ¥60 billion has been spent every year for installing smart meters.

This sum more than offsets the cost effectiveness of liberalization. The estimated savings of ¥11.1 billion accruing to consumers is an overblown figure if various marketing devices to lure consumers are taken into account. This figure is likely to dwindle from next year on, showing that it is difficult for consumers to benefit.

Worse still, smart meters have become an impediment to, rather than a necessary tool for, the liberalization of electricity retail. The meters were originally meant to accumulate data, which then would be transmitted to power retailers via the major regional power monopolies. Only through this process will it become possible to calculate charges for individual customers.

After the liberalization got underway, however, it surfaced that it is impossible to collect the necessary data. The regional monopolies blame the manufacturers of the smart meters for supplying faulty products. But the monopolies, which bought the smart meters, aren't free of blame. They will have to bear the cost of parts replacement and repairs, which in turn will be passed on to consumers in the form of increased expenses for transmitting electricity.

Since their installation will continue beyond 2020, there will be no limits to rising costs related to smart meters. Any savings accruing to consumers by switching suppliers will easily be wiped out by this increased cost.

The smart meter is not the only thing causing a huge waste of money in connection with the liberalization. For example, in preparation for the liberalization program, OCCTO purchased an exchange system built by Hitachi Ltd. for use in the power wholesale exchange. The cost was low at about ¥1.6 billion, but when transactions started, the system proved to be unworkable, necessitating major repairs.

OCCTO also functions as a new provider of jobs for ex-bureaucrats of the Ministry of Economy, Industry and Trade (METI) who are seeking post-retirement jobs. An ex-METI official already secured the post of OCCTO secretary-general — a position from which the official can intervene in OCCTO's personnel affairs. The body is staffed by about 150 people, including those seconded from the major power companies. It is difficult to say that the body is functioning properly because former METI officials are in powerful positions. An insider says OCCTO is made up of an undisciplined group of people with no coordination among them and that experts originally from the power companies, who are the only professionals in the body, have proven useless.

OCCTO's annual budget stands at a whopping ¥4.5 billion, including the salaries of its personnel. The budget is expected to surge because the body plans to spend an additional ¥3.5 billion to develop a new exchange system. All these sums, of course, are to be shouldered by consumers.

The government has spent huge sums of taxpayer money in connection with the liberalization of electricity retail. While the sum spent on publicity has remained less than ¥100 million, the government has earmarked ¥2.2 billion in the current fiscal year for subsidies to renovate hydroelectric plants and ¥12 billion for technological development of next-generation thermal power plants. These types of funds are used almost exclusively by major power companies, as if they are being rewarded for cooperating with the liberalization.

When all the figures cited above are added together, the total comes to around ¥80 billion and is bound to keep on rising every year. And this money is charged to consumers while they are unaware of it. Compared with the large amounts of money thus collected from consumers, an annual saving of ¥10,000 resulting from changing one's power supplier is just a mirage.

This is an abridged translation of an article from the July issue of Sentaku, a monthly magazine covering political, social and economic scenes. English articles of the magazine can be read at www.sentaku-en.com.

How much will it cost to restart?

July 31, 2016

Extra safety precautions balloon costs to restart reactors

<http://www.asahi.com/ajw/articles/AJ201607310028.html>

THE ASAHI SHIMBUN

Eleven operators of nuclear power plants expect to spend more than 3 trillion yen (\$32 billion) to safeguard their facilities, revealing the continuing skyrocketing costs, an Asahi Shimbun survey has found. The overall costs will likely grow even further in the coming years as many of the plants applying for a restart did not include expenses to build centers to deal with a terrorist attack, required under the new regulations set after the 2011 Fukushima disaster.

The latest survey, conducted in June, found the combined spending on safety precautions totaled 3.32 trillion yen, up about 935 billion yen from a similar survey a year ago.

The estimate was partly updated to implement measures to continue to operate reactors past the 40 years of their lifespan.

Some companies had to bolster their plants to withstand an earthquake more powerful than the one previously forecast to hit the sites, in line with the Nuclear Regulation Authority's recommendation. The survey covered 10 regional utilities operating nuclear power plants and Electric Power Development Co., known as J-Power, which is building a nuclear plant in Oma, Aomori Prefecture.

The first of the series of cost studies was conducted in January 2013, followed by one done annually.

The results of the studies showed that the cost to update safety precautions soared between 600 billion yen and 900 billion yen annually to meet the new regulations, which took effect in 2013.

Kansai Electric Power Co.' spending grew by 2.5-fold to 730 billion yen from last year's 285 billion yen, the most of all surveyed.

The surge resulted from the company's plan to operate three reactors at two of its nuclear plants beyond their 40-year lifespans.

As for the construction of anti-terrorism facilities, only five of 16 plants that have filed their applications to restart with the NRA include figures for such facilities in their estimate.

A terrorism response center is expected to cost tens of billions of yen per plant, likely pushing up the overall costs into the hundreds of billions of yen.

Although companies believe that they can recoup their investments once their plants go back online after the NRA's examination, it is unclear whether events will transpire as envisioned.

Kansai Electric has been ordered to suspend the operation of reactors at its Takahama plant in Fukui Prefecture following a court injunction in March.

Unforeseen problems could force operators to shut down their reactors for a prolonged period, experts say.

Storage facilities & Government promises

August 5, 2016

Japan's new environment minister pledges to build trust, contaminated waste storage facility in Fukushima

<http://www.japantimes.co.jp/news/2016/08/05/national/japans-new-environment-minister-pledges-build-trust-contaminated-waste-storage-facility-fukushima/#.V6WC-KJdeos>

by Kazuaki Nagata
Staff Writer

Newly appointed Environment Minister Koichi Yamamoto said Friday he will further efforts to build trust with people in Fukushima Prefecture to facilitate a stalled project to build a temporary nuclear storage facility.

The 2011 triple meltdown at the Fukushima No. 1 nuclear power plant has contaminated a large part of the prefecture while massive amounts of radioactive waste have been generated by decontamination work.

The government is planning to construct a huge temporary storage site near the Fukushima plant, but needs more than 2,300 landowners to agree to use their property for the project. So far it has only secured about 4.9 percent of the 1,600 hectares of land needed, owned by 234 people.

Although the government says it plans to store the waste for 30 years, no other areas have volunteered to host a final disposal site, leading many local residents to fear that the Fukushima site will end up being permanent.

"I'm aware that getting landowners' consent is a very tough issue," said Yamamoto, 68, a veteran Liberal Democratic Party lawmaker, during a media interview.

Yamamoto has learned from ministry officials that the situation is improving, and hopes to accelerate the momentum.

Storing contaminated waste at the site is crucial for Fukushima's reconstruction work, which is currently stalled due to large amounts of waste piling up around the prefecture.

Meanwhile, some landowners are reportedly questioning the government's commitment on this matter, as environment ministers have already changed four times since Prime Minister Shinzo Abe took office in December 2012.

But Yamamoto said the ministers have handled affairs properly. "This administration has been led by the LDP, so of course we have continuity and even (if) the minister changes (often), we share the same thoughts," said Yamamoto.

He said 99 percent of the handover information he received from his predecessor, Tamayo Marukawa, was about Fukushima-related issues. "I have to make efforts to go to Fukushima often to make stronger connections than Marukawa did," he said. Yamamoto plans to visit the temporary storage facility on Tuesday.

The government hopes to begin construction of the temporary storage site in October, the ministry said.

TEPCO in court

August 5, 2016

TEPCO in court fight vs. family of dementia patient missing in Fukushima nuke crisis

<http://mainichi.jp/english/articles/20160805/p2a/00m/0na/003000c>

Tokyo Electric Power Co. (TEPCO) has declared at the Tokyo District Court it has no responsibility to pay compensation to the family of a dementia patient who went missing during the opening days of the crisis at the utility's Fukushima No. 1 nuclear power plant.

TEPCO has generally admitted responsibility for the deaths of hospital patients during the evacuation of the areas around the nuclear plant in March 2011. However, in the case of the woman, who went missing at the age of 88, the utility has stressed that it "cannot recognize that the nuclear accident led to the disappearance." The family insists that the woman would not have gone missing if the nuclear accident had not occurred. A ruling is expected on Aug. 10.

According to the family's suit and other sources, the missing woman is originally from the former town of Odaka (now part of the city of Minamisoma), Fukushima Prefecture, and was admitted to Futaba Hospital in the prefectural town of Okuma after being diagnosed with dementia in 2006.

In-patients at Futaba Hospital were evacuated by March 16, 2011 following the nuclear accident five days before, but the woman could not be found. Staff returned to the hospital briefly in April when the exclusion zone around the plant was opened for temporary visits, and confirmed four patients had died in the facility. However, the missing woman was not among them.

Based on a statement submitted by the woman's family, the Soma branch of the Fukushima Family Court declared that she had "left the hospital alone after the earthquake, ended up wandering through a virtually uninhabited landscape, and encountered deadly dangers." The court ruled she had disappeared, and was legally dead. The family filed a suit against TEPCO in February 2014 demanding 44 million yen in compensation.

In court, TEPCO has asserted that the woman likely "wandered out of the hospital due to the earthquake itself," not the nuclear crisis. The utility pointed out that the electronic locks in the hospital wing where the woman was living all opened right after the quake, allowing her to wander away. However, attorney for the plaintiffs Fumio Shinkai responded, "The town of Okuma was vacated and a search could not be conducted because of the (nuclear) accident. It's impossible to say that the accident had nothing to do with the woman's disappearance."

Shinkai also represents six other families pursuing lawsuits against TEPCO over the deaths of family members at Futaba Hospital. The utility has broadly recognized it has a responsibility to pay compensation for these deaths, but is disputing the amounts.

According to the 71-year-old niece of the missing dementia patient, the woman moved to Tokyo when she was young to work as a dressmaker, and returned to her hometown in Fukushima Prefecture about 20 years ago. She was admitted to Futaba Hospital after her dementia progressed, but she was otherwise healthy when the nuclear disaster struck.

"It's very sad that she still hasn't been found," her niece told the Mainichi Shimbun. "I can't agree with what TEPCO is asserting."

Reuse of radioactive soil intended to cut costs

August 3, 2016

Reuse of radioactive soil could cut costs by 1.5 trillion yen: ministry estimate

<http://mainichi.jp/english/articles/20160803/p2a/00m/0na/014000c>

Behind the Environment Ministry's controversial decision to allow reuse of highly radioactive soil emanating from the Fukushima nuclear disaster in public works projects was an estimate that the reuse could cut the costs of reducing radiation levels of such soil by over 1.5 trillion yen, it has been learned. The estimate in question was presented during a closed-door meeting of the ministry in January and stated that reuse of radioactive soil generated from Fukushima decontamination work could cut the cost for purifying such soil from 2.9127 trillion yen in case the levels of radioactive cesium are reduced to 100

becquerels per kilogram to 1.345 trillion yen in case the cesium levels are cut down to 8,000 becquerels per kilogram. The estimate calls the latter option "reasonable from economic and social points of view." The Environment Ministry decided in June to allow reuse of soil with radioactive cesium of no more than 8,000 becquerels per kilogram in mounds under road pavements and other public works projects. The decision sparked criticism that it runs counter to the safety standards of 100 becquerels or less for recycling metals generated from the decommissioning of nuclear reactors under the Act on the Regulation of Nuclear Source Material, Nuclear Fuel Material and Reactors. The ministry has insisted that the radiation levels of tainted soil used in road mounds can be held down from 8,000 becquerels to around 100 becquerels by covering those mounds with concrete among other measures.

A ministry working group on safety evaluation of radiation effects held **closed-door meetings** over the issue on six occasions between January and May this year. In June, the Mainichi Shimbun reported that an estimate presented to one of those meetings stated, "For example, it will take 170 years for radiation levels to reduce to 100 becquerels if tainted soil of 5,000 becquerels is put to reuse," sparking controversy. In response, **the ministry on Aug. 1 released the minutes of the closed-door meetings and other documents on its website.**

At the second meeting of the working group on Jan. 27, the copies of a document titled "About reasonable radioactivity concentrations of recycled materials" were handed out to attendants. The document, which was drawn up by the Japan Atomic Energy Agency, includes an estimate that the cost for reducing the radiation levels of tainted soil to 100 becquerels for recycling would reach 2.9127 trillion yen, with a volume reduction rate of 40 percent, adding that 40 percent of contaminated soil could not be put to reuse. Meanwhile, the estimate says it would cost 2.1185 trillion yen to drop the radiation levels of tainted soil to 3,000 becquerels, with a volume reduction rate of 0.5 percent, while it would cost 1.345 trillion yen to decrease the radiation levels of soil to 8,000 becquerels, with a volume reduction rate of 0.2 percent. The latter option could make 99.8 percent of tainted soil available for reuse, the estimate says.

"Considering economic and social factors, it is appropriate to set the radioactivity concentration of recycled materials at several thousand becquerels," the document stated. A note of caution in the document states, "Apart from this, it is necessary to project the cost for final disposal (of tainted soil)." A ministry official in charge of the issue told the Mainichi Shimbun, "The document was produced in response to a request by a member of the working group. As the document states, it is difficult to (set the standards for reusing tainted soil) at 100 becquerels from a realistic point of view."

Researching psychological effects of nuclear disaster

August 7, 2016

Japanese researchers to study Chernobyl disaster

http://www3.nhk.or.jp/nhkworld/en/news/20160807_15/

NHK has learned that a Japanese research team will study the psychological impact of the 1986 Chernobyl nuclear accident.

The team wants to use the findings to help those affected by the nuclear accident in Fukushima Prefecture, as they are likely to have been exposed to stress for a long time.

Researchers from Fukushima, Nagoya and Hiroshima Universities will begin a survey later this month. They plan to interview about 2,000 people in Ukraine about their stress and anxiety levels.

They will ask 54 questions, including how worried people were about the impact of radiation at the time of the accident, and how concerned they are now.

The researchers will compare the findings with the results of a similar study in Fukushima Prefecture.

Fukushima University Professor Yuji Tsutsui says the Ukraine survey may indicate what kind of measures will be needed to help people who have been **psychologically affected** by the Fukushima nuclear accident.

Mihama: What happened to 40-year rule?

August 4, 2016 (Mainichi Japan)

40-year rule for Japan's nuclear reactors sidelined as Mihama unit passes screening

<http://mainichi.jp/english/articles/20160804/p2a/00m/0na/012000c>

The aging No. 3 reactor at Mihama Nuclear Power Plant in Fukui Prefecture, which Kansai Electric Power Co. is attempting to keep running beyond a designated 40-year lifespan for Japan's reactors, has cleared government screening under new safety standards.

- **【Related】** NRA's Takahama reactor approval a blow to 40-year lifespan rule
- **【Related】** 4 utilities to form alliance over nuclear crisis management, safety measures
- **【Related】** Editorial: 40-year reactor life rule must prevail over profitability

The idled reactor, which started operating in December 1976, needs two additional sets of approval by the end of November before it can be restarted, but it has cleared the first hurdle in a process that could see the reactor kept in operation up until 2036.

It is the third time a reactor has effectively been given a pass for operating beyond the 40-year limit, indicating that the 40-year rule is being hollowed out.

In the wake of the meltdowns at the Fukushima No. 1 Nuclear Power Plant following the March 2011 Great East Japan Earthquake and tsunami, a change to Japanese law set the life of Japan's nuclear reactors at 40 years in principle. Under legislation, it is possible to extend the life of each reactor once for an additional 20 years, but such a move is designated as an "exception."

It had been thought that extending the life of the Mihama reactor would be difficult due to its old design and the deadline for screening, but Kansai Electric set apart 165 billion yen for safety measures and overcame these difficulties.

The power company raised the estimate for standard ground motion at the No. 3 reactor -- a measure of the maximum level of shaking that it would be subjected to during an earthquake -- to 993 gals, 1.3 times higher than the original figure. A gal is a unit of acceleration, with 1 gal defined as 1 centimeter per second squared. The company also announced major design changes, including the conversion of a storage rack for spent nuclear fuel at the reactor, whose design was old and was deemed unable to endure the maximum level of shaking, into a movable system, and the renewal of structures supporting nuclear fuel within the reactor.

There are no movable racks at other nuclear power plants in Japan, but the Nuclear Regulation Authority (NRA) judged that the design was suitable. Work to confirm whether new structures within the reactor would be able to withstand shaking was delayed until after the screening deadline.

Extended operation of the Mihama No. 3 reactor will be permitted by the end of November, and the power company hopes to restart the reactor as early as the spring of 2020. Shunichi Tanaka, chairman of the NRA, has stated, "If power companies are prepared to make any level of investment, then 40 years is not an issue."

His comment indicates that the extension of the operating life of reactors as an "exception" would be permitted if the utility spent money on safety measures.

Lifespan of ageing reactors should not be extended

August 8, 2016

Editorial: Japan should phase out aging nuclear reactors

<http://mainichi.jp/english/articles/20160808/p2a/00m/0na/009000c>

Moves by the Nuclear Regulation Authority (NRA) to give the green light to the extension of operations at aging nuclear reactors have raised serious questions about the safety of atomic power plants. The extension of the lifespan of nuclear reactors, which had been regarded as an exception, now happens regularly.

The recent moves represent a departure from the new safety regulations on atomic power stations, which were enforced by drastically reviewing older regulations by learning lessons from the crisis at the tsunami-hit Fukushima No. 1 Nuclear Power Plant.

The NRA approved a draft screening document that effectively recognizes the No. 3 reactor at the Mihama Nuclear Power Plant in Fukui Prefecture -- which its operator Kansai Electric Power Co. (KEPCO) intends to continue running even after its 40-year lifespan -- meets new safety standards. If the reactor passes additional screening tests by the end of November 2016, KEPCO can continue operating the reactor until 2036 at the latest.

This is the third aging nuclear reactor for which the NRA has approved the extension of operations

following the No. 1 and 2 reactors at KEPCO's Takahama plant for which the authority gave the green light in June.

Following the outbreak of the Fukushima nuclear crisis in March 2011, legislation was amended to limit the lifespan of nuclear reactors to 40 years, in principle, with the aim of reducing the risks of accidents involving aging reactors. By the time of the outbreak of the nuclear disaster, about 35 to 40 years had passed since Fukushima No. 1 plant's No. 1, 2 and 3 reactors, where meltdowns occurred, began operations.

The then administration led by the Democratic Party of Japan (DPJ) explained that the 40-year lifespan was set based on the time it is estimated to take before the reactor pressure vessel has deteriorated after being exposed to neutrons.

Apart from the DPJ, which was subsequently reorganized into the Democratic Party earlier this year, the then opposition Liberal Democratic Party (LDP) and Komeito voted for a bill to revise the relevant legislation. A clause allowing for the lifespan to be extended only once by up to 20 years as an exception upon the NRA's approval was incorporated into the law.

Since Japan is an earthquake-prone country and has numerous volcanos, it is highly risky to continue relying on nuclear plants. Therefore, many members of the public apparently deemed that the 40-year rule was reasonable.

To enhance the safety of nuclear plants and phase out nuclear power, the government and electric power companies that operate atomic power stations should stick to the 40-year rule.

Experts have pointed out that there are limits to enhancing the safety of aging nuclear reactors, noting that it is technically difficult to change the basic design of the facilities and their arrangement although their parts can be replaced with new ones. The need to hand over maintenance techniques from generation to generation also poses a serious challenge.

If the risks involving such aging reactors are taken seriously, screenings of applications for the extension of operations at aging nuclear plants should be far stricter than those for the younger nuclear plants.

However, the NRA appears to have helped KEPCO pass the screening for the extension of the lifespans of the utility's Takahama and Mihama plants.

July 2016 was the deadline for permitting the extension of the lifespan of the Takahama plant, and late November is the deadline for the Mihama power station shortly before the 40th year will have passed since the start of its operation.

Since the screening periods for the Takahama and Mihama nuclear plants were limited, the NRA prioritized inspections on these plants over other power stations, concentrating its personnel on the screening of these power stations.

Moreover, the NRA postponed experiments of exposing key devices at these power stations to vibrations to test their quake resistance until after the permission of the extension of their lifespan is granted in order to prevent time from running out for the screening.

The NRA says that it would not revoke its permission even if the experiments were to find that the plants were not sufficiently quake resistant, and instead reconfirm their safety after their operator takes additional safety measures. Some members of the NRA criticized the move saying that redoing the safety confirmation would damage the public's understanding of the NRA.

It has been pointed out that cables that are easy to burn are used in aging nuclear plants. The new regulatory standards require nuclear plant operators to make all cables fire retardant. However, it takes a long time and costs much money to replace all cables at atomic power stations with flame-retardant cables. The NRA requires KEPCO to cover cables that are difficult to be replaced with flame-retardant ones

with fire-proof sheets. However, questions remain as to whether the measure will ensure the same level of safety as the use of flame-retardant cables.

NRA Chairman Shunichi Tanaka had said when he assumed his post that it's "extremely difficult to extend" the operation of aging reactors beyond the 40-year limit. However, he has since changed his view to the effect that "**technical challenges can be overcome if necessary money is spent.**" **He appears as if he were speaking on behalf of power companies.**

It has been decided to decommission six aging reactors following the outbreak of the Fukushima nuclear disaster in March 2011, in addition to those operated by Tokyo Electric Power Co., the operator of the crippled Fukushima plant. However, all these nuclear reactors are small-scale ones, each with an output of approximately 300,000 to 500,000 kilowatts.

In contrast, Mihama's No. 3 and Takahama's No. 1 and 2 reactors have an output capacity of about 800,000 kilowatts, larger than those that are set to be decommissioned. KEPCO estimates that it will spend over 200 billion yen for the Takahama reactors and 165 billion yen for the Mihama reactor as funds to implement safety measures. Despite such huge costs, KEPCO is determined to extend the lifespans of these plants because the plants will be effective in increasing the company's profitability since fuel costs for nuclear plants are far lower than those for thermal power stations. If Takahama's No. 1 and 2 reactors are put online, it is estimated to push up the company's profits by about 9 billion yen a month.

Fifteen reactors across the country, including Mihama's No. 3 reactor, are to surpass their 40-year lifespan over the next decade. Utilities are likely to apply for permission to extend the lifespan of many of these reactors if they deem that the extension will be profitable for the companies even if safety measures cost the operators massive amounts of money. The extension of the lifespans of the Mihama and Takahama plants will serve as role models for such efforts.

As such, decisions on whether to decommission aging reactors will be effectively left to the discretion of power companies based on economic principles, reducing the exceptional clause in the law to a mere facade.

The provision for the 40-year lifespan was incorporated in the legislation to prioritize the safety of nuclear plants over power companies' profits.

Furthermore, the government of Prime Minister Shinzo Abe has established a goal of setting the ratio of nuclear power to Japan's entire power supply at 20 to 22 percent in fiscal 2030. If the 40-year rule were to be thoroughly observed, the ratio would be around 15 percent even if all the existing reactors and those under construction were to be fully in operation. This will encourage power companies to extend the lifespans of their nuclear plants

Such a policy cannot respond to the wishes of numerous members of the general public to build a society that will not rely on atomic power at an early date. As a country that has experienced a severe nuclear accident, Japan should phase out nuclear power rather than extending the lifespan of aging reactors.

Listen to anti-nuke calls

August 6, 2016

EDITORIAL: If Abe is serious, he should listen in earnest to anti-nuke calls

<http://www.asahi.com/ajw/articles/AJ201608060027.html>

August 6, 2016 at 16:50 JST

“(We can choose) a future in which Hiroshima and Nagasaki are known not as the dawn of atomic warfare, but as the start of our own moral awakening.” That was how Barack Obama wound up his 17-minute-long public address during his historic visit to Hiroshima on May 27.

He was the first sitting U.S. president to visit the city leveled by the world's first atomic bombing. The 71st anniversary of that event fell on Aug. 6. Nagasaki suffered the same fate as Hiroshima three days later, on Aug. 9, 1945.

Obama's visit to Hiroshima was a benchmark event. Even so, nuclear stockpiles around the world are still in excess of 15,000 warheads. A world without nuclear weapons remains a distant dream.

Action is needed to carve out the future. In this regard, there are particularly high expectations for the role of Japan, which experienced the ravages of atomic bombings.

But the people of Hiroshima and Nagasaki are increasingly suspicious of the central government's intentions. In their view, the government seems to be obstructing the global trend for trying to eradicate nuclear weaponry.

Prime Minister Shinzo Abe, who accompanied Obama during his Hiroshima visit, pledged that he would “continue to make incessant efforts” toward realizing a world without nuclear weapons.

But what precisely is he determined to do, we wonder. The key question here is that of a concrete vision.

TOKYO EMBARRASSED BY TALK OF ‘NO FIRST USE’

The Washington Post reported last month that the Obama administration is considering changes in its nuclear policy.

Notably, a declaration of “no first use” is reportedly being weighed as an option. The term refers to a country's pledge that it will not be the first to use nuclear arms unless it comes under nuclear attack from another nation. China and India, among the world's nuclear weapon states, have adopted that policy.

“No first use” is expected to significantly reduce the role of nuclear arms in security policy. It is also believed to be highly effective in urging other nuclear weapon states to engage in nuclear disarmament.

Ten U.S. Democratic senators have called on Obama to declare “no first use.” The mayors of Hiroshima and Nagasaki have sent a letter to Obama to express their support for the potential nuclear policy changes, saying such moves would “mark an important step toward realizing a world without nuclear weapons.”

But Tokyo appears to be embarrassed by this. Foreign Minister Fumio Kishida said only that Japan and the United States “should remain closely in touch” over the matter. When the Obama administration reviewed its nuclear policy in 2010, it stopped short of declaring “no first use” out of consideration for Japan and other U.S. allies.

At the United Nations, meantime, there is growing momentum to outlaw nuclear arms, which are inhumane weapons, under international law.

A U.N. working group, which has been discussing the matter since February in Switzerland, is holding its final session this month. The working group's chairman has worked out a draft report that says, “A majority of States expressed support for the commencement of negotiations ... in 2017.”

Japan is one country that is not part of that “majority of States.” Tokyo has reiterated at the working group's sessions that the time is not ripe for declaring nuclear weapons illegal in view of the current security climate.

Seventy-one years after the A-bombings, the very country that suffered the nuclear attacks is trying to block the trend for nuclear disarmament.

PERSISTENT DEPENDENCE ON NUCLEAR UMBRELLA

The backdrop here is Japan's dependence on the "nuclear umbrella," under which it relies on the nuclear arsenal of the United States to deter attacks from other countries.

Tokyo believes Japan must stay under the nuclear umbrella, not the least because it has to face up to China, which is pursuing a rapid military buildup, and to North Korea, which has repeatedly conducted nuclear tests and test-firings of missiles.

No approval can be given to a "no first use" policy and a prospective treaty to ban nuclear weapons, both of which would erode the deterrent potential of the nuclear umbrella, according to Tokyo's position. Let us remember, however, that nuclear deterrence theory is a relic of the Cold War period. The government of Japan has not ruled out a possible use of nuclear weapons by the United States. That is broadly at odds with the sentiment of the Japanese public, which does not want a repeat of the ravages of a nuclear attack.

As long as deterrence theory is adhered to, other nuclear weapon states will also stick to their reliance on nuclear arsenals, which means the risk of a nuclear war would never diminish.

It goes without saying that the security climate should be taken into account from a tough viewpoint. Many experts believe, however, that conventional war potential--basically that of Japan and the United States--alone is functioning as a sufficient deterrent on North Korea and China.

"We must have the courage to escape the logic of fear, and pursue a world without (nuclear weapons)," Obama said in his Hiroshima address.

Kazumi Matsui, the mayor of Hiroshima, cited that passage in his Aug. 6 Peace Declaration, and added, "We need to fill our policymakers with the passion to ... create a security system based on trust and dialogue."

Courage and passion: These qualities are probably expected from the government of Japan more than anything else. Tokyo should start striving to seek a security policy that does not rely on the nuclear umbrella and begin holding talks with Washington to achieve that goal.

Abe has attended the peace ceremonies in Hiroshima and Nagasaki every year. He has also had opportunities to hold dialogue with representatives of A-bomb survivors.

But the residents of Hiroshima and Nagasaki strongly distrust Abe. The prime minister has not only rushed through policies that undermine the pacifist principles of the Constitution, such as lifting Japan's self-imposed ban on the right to exercise collective self-defense and enacting new security legislation. He has been less than willing to listen to earnest pleas. In 2014, for example, he used the phrase, "It's a matter of opinion," to dismiss concerns expressed by an A-bomb survivor.

POIGNANT CALLS FROM A-BOMBED CITIES

The Nagasaki Peace Declaration to be released Aug. 9 is expected to include, for the first time in two years, a demand for enacting a law to set down Japan's three non-nuclear principles--not possessing, not producing and not permitting the introduction into Japan, of nuclear weapons.

Sumiteru Taniguchi, an 87-year-old A-bomb survivor, strongly called, during a drafting committee meeting, for the inclusion of that passage.

"Those who never experienced that abominable war are trying to have the (pacifist) Constitution amended," Taniguchi said. "As a survivor of the A-bomb, I have to continue calling out loud as long as I am alive."

Poignant calls from the A-bombed cities represent the starting point of efforts to realize a world without nuclear arms. If Abe wishes, as he says he does, to lead initiatives to have nuclear weapons abolished, the first thing he should do is to face up in earnest to the calls of people in Hiroshima and Nagasaki and seek out a way to go hand in hand with them.

--The Asahi Shimbun, Aug. 6

"Unreasonable cancer diagnosis"

<https://www.ippnw.de/atomenergie/gesundheit/artikel/de/unvernuenftige-krebsdiagnosen-in-f.html>

"Unvernünftige Krebsdiagnosen" in Fukushima

Wie die Fukushima Medical University ihre eigene Studie sabotiert [in German]

In the last bulletin of IPPNW, Dr. Alex Rosen describes how the Fukushima Medical University – who is in charge of the survey on thyroid cancers among Fukushima children – is sabotaging its own work. A manoeuvre of manipulation. A professor of the University is going round schools in the Prefecture, carrying this message : “It is important to offer options to participate or not participate in the examination, after parents and children reach the understanding about the meaning and limitations of the examination.”

See [in english] : **【Thyroid Cancer in Fukushima】 How the Thyroid Examination Should Be: “Respecting a Wish Not to Participate in the Examination”**

<http://fukushimavoice-eng2.blogspot.fr/2016/06/thyroid-cancer-in-fukushimahow-thyroid.html?m=1>

« ...The article describes how Midorikawa is "accommodating" wishes of those children who do not want to participate in the thyroid examination that might lead to "unreasonable diagnosis of thyroid cancer." The "unreasonableness" is apparently based on the opinion of Fukushima Medical University that the thyroid cancer cases found during the first 4 years after the Fukushima Daiichi nuclear power plant accident are *not* due to radiation effects but simply a result of mass screening. In other words, these diagnoses are considered "unreasonable" because these cancers might never have been found until later in life without the mass screening. »

Ikata restart: Serious concerns remain

August 17, 2016

Editorial: Grave concerns remain over restart of Ikata nuclear plant

<http://mainichi.jp/english/articles/20160817/p2a/00m/0na/012000c>

Shikoku Electric Power Co. has restarted the No. 3 reactor at its Ikata Nuclear Power Plant in Ikata, Ehime Prefecture, and begun generating and transmitting electric power. It is the fifth reactor that has been reactivated after passing safety screenings by the Nuclear Regulation Authority (NRA) -- following the No. 1 and 2 reactors at Kyushu Electric Power Co.'s Sendai plant in Kagoshima Prefecture and the No. 3 and 4 reactors at Kansai Electric Power Co.'s Takahama plant in Fukui Prefecture.

- **【Related】** Ikata nuclear plant's No. 3 reactor begins generating power
- **【Related】** Shikoku Electric restarts reactor under post-Fukushima regulations
- **【Related】** 4 radiation protection shelters near Ikata nuke plant located in landslide risk areas

Ehime Gov. Tokihiro Nakamura told a news conference, "The best possible safety measures have been taken at the plant. An accident similar to that in Fukushima will never happen." His remarks appear to signify that the myth of the infallible safety of atomic power stations, which had been prevalent in the electric power industry and the government until the outbreak of the Fukushima nuclear crisis in March 2011, have been revived.

In particular, serious concerns remain about the Ikata plant from the viewpoint of preventing a nuclear disaster.

The biggest problem is that the power station is situated at the base of the Sadamisaki Peninsula, which is 40 kilometers long from east to west and about 800 meters wide at its narrowest location. Approximately 4,700 people live in areas west of the nuclear plant, but should a nuclear accident occur at the station, the escape route for local residents could be blocked.

Moreover, the median tectonic line fault, one of Japan's largest active faults, is situated only about six to eight kilometers off the nuclear plant. A powerful Nankai Trough quake is feared to hit Shikoku Island where the power station is located. A complex disaster of a powerful earthquake and a nuclear accident could happen. The ground in some areas of the Sadamisaki Peninsula is fragile.

Under evacuation plans worked out by the prefectural and municipal governments, residents of areas west of the plant would escape from the peninsula in cars or boats if a nuclear accident were to occur. However, if a complex disaster were to hit the peninsula, there are fears that residents might not be able to flee by land or sea. In such a situation, residents would be required to stay indoors at home or in evacuation shelters to avoid being exposed to radiation.

However, if the area were to be hit twice by a temblor registering 7 on the 7-point Japanese intensity scale just like in the Kumamoto Earthquake, it would be difficult to continue staying indoors.

Public evacuation shelters are not absolutely safe. There are seven radiation proof facilities in the town of Ikata. However, four of them are located in landslide caution zones.

The Ikata plant is Japan's only nuclear plant using mixed oxide (MOX)-fuel consisting of plutonium and uranium since operations at the Takahama Nuclear Power Plant have been suspended in response to a court order. It has been pointed out that MOX-fuel makes control rods more ineffective than conventional nuclear fuel. Furthermore, specifically how to dispose of spent MOX-fuel has not yet been determined.

Local bodies hosting nuclear plants are obligated to work out evacuation plans for local residents in case of a nuclear accident. Even if such plans are inadequate, the NRA still approves reactivation of nuclear plants because such plans are neither subject to screening by the NRA nor a precondition for restarting atomic power stations. A system under which a third-party organization would check the efficacy of evacuation plans before restarting nuclear plants needs to be established.

Shikoku Electric Power estimates that the operation of Ikata plant's No. 3 reactor will increase the company's annual profits by some 25 billion yen. However, power companies across the country have leeway to supply electricity to households and businesses this summer. There is no need to make haste to restart idled nuclear plants from the viewpoint of ensuring a stable supply of electric power.

The government and power companies' attempts to rely on nuclear plants while indefinitely postponing countermeasures against a possible complex disaster are unacceptable.

Five years to get rid off radioactivity...

August 18, 2016

LDP sets goal of lifting evacuation orders near Fukushima plant in 5 years

<http://mainichi.jp/english/articles/20160818/p2a/00m/0na/021000c>

The ruling Liberal Democratic Party (LDP) on Aug. 17 decided on a target of lifting evacuation orders for radioactively contaminated areas near the crippled Fukushima nuclear plant in the next five years, with the goal to be combined with proposals from Komeito and put forward to Prime Minister Shinzo Abe within the month.

The plan would create "recovery bases" in each of the municipalities that are currently still off-limits due to contamination from the Fukushima No. 1 Nuclear Power Plant meltdowns. Until this month no policy had been put forward by the national government on how to handle the decontamination of the so-called "difficult-to-return" areas and the return of evacuees, but on Aug. 5 the LDP and Komeito gave a draft of the policies to the governments of these municipalities.

Under the policies, the parties propose that the municipal governments meet with the prefectural government and create plans for setting up the recovery bases. The national government would then evaluate the plans. The current "difficult-to-return" areas would not be redefined before having their evacuation orders lifted.

A draft outline of the proposal that will be made to the prime minister was also shown. It included a suggestion to transfer to interim storage facilities an amount of contaminated soil equivalent to the amount at homes and schools in affected areas by fiscal 2020.

Mysteriously missing fuel

The Mysteriously Obtuse Case Of The Missing Fukushima Fuel

<http://www.activistpost.com/2016/08/mysteriously-obtuse-case-missing-fukushima-fuel.html>

By Richard Wilcox, PhD

“Nature knows no indecencies; man invents them.” – Mark Twain

As the world forever hurtles toward Armageddon, the Fukushima nuclear disaster has largely faded from the front pages. But the issue is far from resolved. Radiation from nuclear accidents is not easily dispelled with estimates of clean-up time at Fukushima ranging from 40 to 500 years, and nearly six years have already passed. Even safely stored nuclear material is dangerous for 100,000 years (1).

Elvis Has Left The Building

The major question regarding the situation at Japan’s Fukushima Dai-ichi (no.1 nuclear power plant) regards the location of the melted fuel at reactor units 1, 2 and 3.

Recent evidence of the location of the fuel in unit 2 was disputed, with Tokyo Electric Co. (Tepco) and the mainstream media taking one view and independent scientists taking another. Is the melted fuel still inside the container in the reactor building, or has it leaked out and is now penetrating in scattered areas laterally and vertically into the ground?

Large amounts of melted fuel could reach the ground water, and even the aquifer which is ultimately connected to the Tokyo water supply.

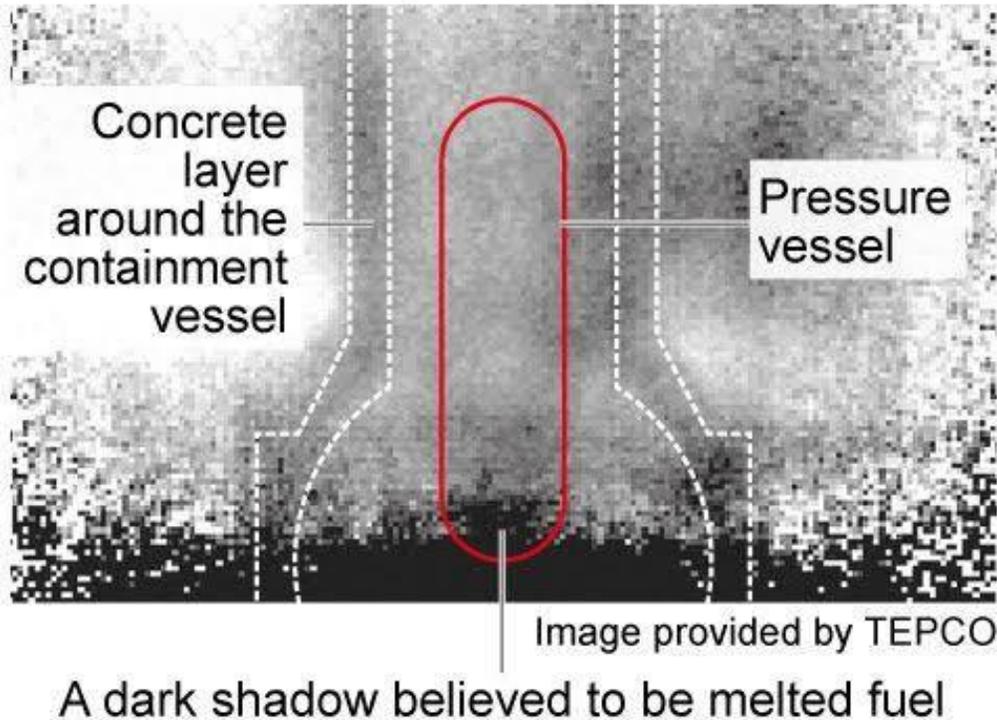

Let’s compare two assessments on this important issue based on the use of “Muon tomography”:

According to the *Asahi Shimbun* (newspaper) version of reality which relies solely on the Tepco report: Most of the nuclear fuel inside the No. 2 reactor at the Fukushima No. 1 nuclear power plant apparently did not melt through the pressure vessel (2).

Large amounts of melted fuel could reach the ground water, and even the aquifer which is ultimately connected to the Tokyo water supply.

Let’s compare two assessments on this important issue based on the use of “Muon tomography”:

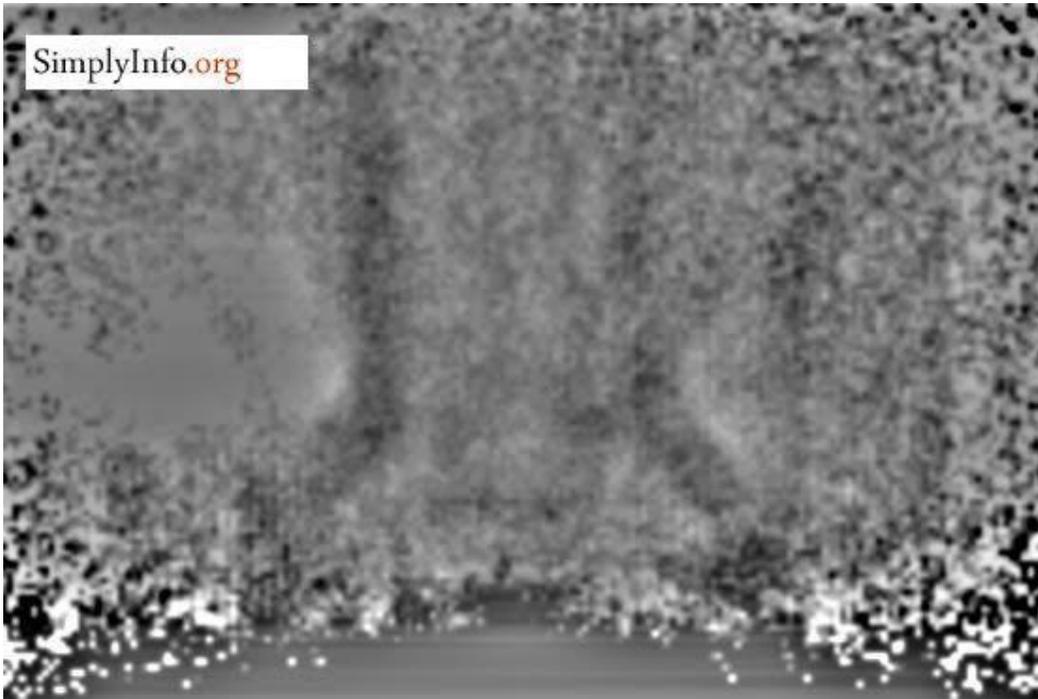

A tomographic image of the No. 2 reactor at the Fukushima No. 1 nuclear power plant

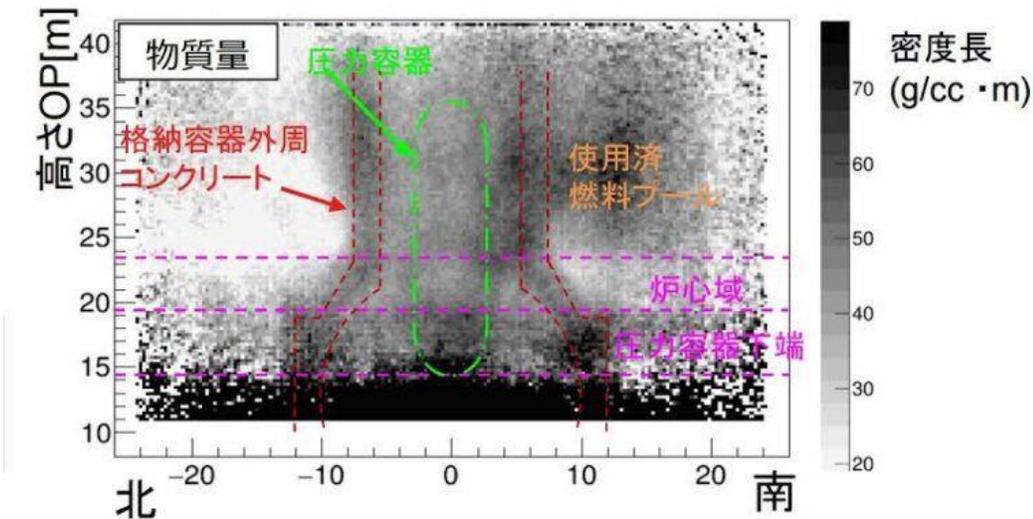

Is it that simple? Tepco's record of reliability has become rather tarnished over the years.

Note that in the graphic image above, the word "believed" is used, which reinforces the word "apparently" used in the text of the article referring to the uncertainty of the location of the melted fuel. However, the title of the article is more confident, stating that "most fuel was contained." The title is blatantly misleading and since most readers just skim the news, that will be what they take away from the report. On the other hand, the independent scientists at the *Simply Info* website differ about the location of the fuel in relation to the container, the "Reactor Pressure Vessel" (RPV):

Tepco's superimposed mask demarcates the bottom head too low including fuel inside the rpv which according to the refined image is clearly shown below the bottom head...." **there is no fuel in the bottom of the RPV in any significant amount**" (3).

This graphic indicates that a different method was used by these scientists to view the location of the melted fuel.

In this graphic the Simply Info scientists argue that the container drawing was placed too low in the Tepco version, whereas in their version, it is higher, making it less obvious that the fuel is in the container. Careful reading of this article reveals that Tepco's analysis, as so glibly presented by the mainstream media, was based on technological smoke and mirrors, clearly intended to deceive. Tepco and the media should report on the range of plausible possibilities, not only the small slice of reality they wish the public to see (4; 5).

So will the *Asahi Shimbun* correct their fallacious reporting? Both the *Japan Times* and the *Asahi Shimbun* are heavily owned and controlled by foreign investors and media. The *Asahi* shares offices with the *New York Times* in Tokyo and many Japanese English dailies rely on Western news wires such as the agenda driven, oligarchic news sources, *Reuters* and the *Associated Press* (6).

Decommissioning Or Out Of Commission?

In fact, in over five years much progress has been made to control the situation at the destroyed Fukushima nuclear plant. Much of the rubble has been cleaned up and fresh coats of paints are on the buildings, but the place is still intensely radioactive, and no human can approach the specific reactor meltdown sites.

The second major issue at Dai-ichi concerns the future plans for the decommissioning of the plant. All along Tepco has said they will retrieve the melted fuel and complete decommissioning within 40 years. In fact the technology to retrieve the fuel has not yet been invented. Not only is it impossible for human workers to approach the area, but even robots break down due to the radiation short circuiting their wires.

It was recently revealed that Japan is still considering an option that many people feel would be very dangerous in the long term, and that is the “sarcophagus” solution (7). The only time this has been tried is at Chernobyl — it looks like a high-tech barn placed over the site (8). Unlike Chernobyl where the ground is rock hard, at Fukushima the ground is akin to a wet sponge with soft topsoil, so while covering it will reduce radioactive atmospheric fallout, the radiation will continue to leak downwards to the aquifer and outwards to the ocean unless appropriate engineering measures are taken.

Nevertheless, progress is slow with efforts “underway to develop the equipment needed to retrieve corium (melted fuel) samples from inside the containment structures of units 1-3 at the plant. No solid time frame” has yet been mentioned (9).

The Nuclear Story

In an interesting aside, the best documentary film on Fukushima I have seen so far, *Fukushima: A Nuclear Story* was released in 2015 (10). It is an Italian production but with English narration and subtitles. The plot follows journalist Pio d’Emilio during the nuclear crisis as he tries to uncover the real situation in Fukushima. The film is engaging and educational at the same time, covering new ground and combining dramatic events as they unfold at the time with scientific explanations done in an entertaining, “manga” comic book style.

The film emphasizes the near catastrophe of Tepco’s panic during the accident, and the courage and wisdom of then prime minister Naoto Kan, and the Fukushima 50, led by the plant manager Masao Yoshida whose snap judgement literally “saved the world.”

The film raises one very interesting piece of information that I did not know about which is that it was only the luck of the pool fuel gate at unit 4 *not closing*, in other words, malfunctioning, which allowed water in to cool the scorching fuel rods. Had that not occurred, the fuel rods could have caught fire spreading massive radiation for hundreds of miles.

Note that had the Fukushima accident happened at night or on the weekend there would have been far fewer workers at the plant to tackle the problem, possibly leading to a completely out-of-control situation.

The Ice Wall Cometh...

The “ice wall” that Tepco built in order to freeze the ground around the plant to block water flow in and out of the plant, continues to have problems. It is a very expensive operation to build and maintain, prone to technical problems and no one really knows when or if it will ever be fully implemented (i.e., taxpayer boondoggle) (11; 12). Even if the ice wall operates as intended it will not stop all of the water flow allowing some to be contaminated (13).

Is this why the sarcophagus option is still on the table? Critics have argued that the ice wall was poorly conceived from the start because it did not address dealing with the source of water flow which is at the water shed above the plant in the nearby mountains (Tepco balked at the project due to the high cost).

Japan Nuke News

Various nuclear related issues pop up from time to time around country. Since the nuclear accident in 2011, the overwhelming public sentiment has been strongly anti nuclear, despite efforts by the Abe administration to downplay the accident and restart as many of the reactors around the country as possible. The logic of the restarts against public opinion is in order to satisfy the big banks who have financed Japanese utility company operations while reactors have remained idle (expensive but not profit producing) over the past years.

Ever since the hugely destructive earthquakes earlier in 2016 on the island of Kyushu, nuclear plant restarts along the path of the fault line, which basically travels through the middle of the entire country, have been in doubt. Still we see for example in Shikoku that nuclear reactors are restarting despite local opposition (14).

Although prime minister Abe keeps pushing for resumption of nuclear operations, he probably would not want to work at the Fukushima nuclear disaster clean up site himself. It was recently reported by Japanese scientists that insoluble radioactive cesium has been detected in workers exposed to high levels of radiation at the plant (15).

Indeed, the wildlife in Fukushima prefecture has long been reported to be contaminated with radiation, recently a wild boar was detected with massive levels of radiation in its body (16). This is an indication of the general contamination of the environment there.

This doesn't stop the Fukushima tourist board from advertising how safe and wonderful life is there. In order to drum up tourist dollars the national government has carried out a massive public relations campaign despite the lingering possibility of numerous radioactive hotspots in the area (17; 18).

Trump Threatens Nuclear Cartel

Maybe things will change a bit if Donald Trump can be elected president in the United States. Trump has promised to reduce US military presence in Japan and let them sort out their own military affairs. This does not bode well for the US-Japan military racket which siphons off billions of dollars in tax revenue to satisfy the greed of both country's military industrial complexes, which are intensely tied up with the nuclear weapons and power industries (20).

Isn't it ironic that the bogeyman of North Korea which is constantly conjured by Japan to justify its own growth in militarism, obtained its original nuclear weapon technology from Britain, a supposed Japan ally (21).

Funny old world ain't it.

Nuclear pollution is not healthy for children and other living things

** Special thanks to the Simply Info website for their continuous work on the Fukushima issue; and to Activist Post for their continued reporting.*

TEPCO apologises

August 25, 2016

TEPCO apologizes to Niigata for meltdown cover-up

http://www3.nhk.or.jp/nhkworld/en/news/20160825_21/

A top official of the operator of the Fukushima Daiichi nuclear power plant has apologized to the Niigata Prefecture governor for having concealed the 2011 reactor meltdowns for more than two months.

Takafumi Anegawa, Managing Executive Officer of the Tokyo Electric Power Company, met Niigata Governor Hirohiko Izumida on Thursday.

In February this year, TEPCO admitted the utility could have ascertained there was a meltdown three days after its occurrence if utility workers had followed an in-house manual. It was also later found that TEPCO's then-president had instructed officials not to use the words "core meltdown."

The prefecture, which hosts another TEPCO nuclear power plant on the Japan Sea coast, has put together a panel of experts to study the utility's handling of the Fukushima accident.

Anegawa told the governor that TEPCO apologizes for not having presented a report based on an adequate investigation.

Izumida said information on meltdowns is critical for residents living near nuclear power plants to decide whether to flee or not. He said the prefecture expresses regret that TEPCO has not admitted its meltdown cover-up for five years.

Later this month, a joint panel set up by Niigata Prefecture and TEPCO plans to begin a detailed investigation.

Governor Izumida said additional probes are necessary to find out what in-house problems TEPCO had.

The governor said it is too soon to discuss resuming operations at the nuclear plant in his prefecture without a complete review of the Fukushima accident.

Is Japan's nuclear industry really back on its feet?

Japan's big 'nuclear restart' overtaken by conservation and renewables

http://www.theecologist.org/News/news_analysis/2987971/japans_big_nuclear_restart_overtaken_by_conservation_and_renewables.html

Jim Green

12th August 2016

For all Japan's talk of 43 'operable' nuclear reactors, only two are actually running, writes Jim Green, as renewables and a 12% fall in demand eat into the power market. And while Japan's 'nuclear village' defends safety standards, the IAEA, tasked with promoting nuclear power worldwide, has expressed deep concerns over the country's weak and 'fragmented' safety regulation.

As renewables continue to become cheaper and more ubiquitous, customers will be increasingly tempted by Japan's extremely high electricity prices to make and store their own electricity and to drop off the grid altogether.

According to the World Nuclear Association, Japan has 43 'operable' power reactors (they are 'operational' according to the IAEA), three under construction, nine 'on order or planned', and three 'proposed'.

The numbers suggest that Japan's nuclear industry is finally getting back on its feet after the Fukushima disaster - but nothing could be further from the truth.

Before considering the industry's current problems, a little historical context from the World Nuclear Industry Status Report 2016:

"[I]t has been 17 years since Japan's nuclear output peaked at 313 TWh in 1998. The noticeably sharp decline during 2002-2003, amounting to a reduction of almost 30%, was due to the temporary shutdown of all 17 of Tokyo Electric Power Company's (TEPCO) reactors - seven at Kashiwazaki Kariwa and six at Fukushima Daiichi and four at Fukushima Daini.

"The shutdown was following an admission from TEPCO that its staff had deliberately falsified data for inclusion in regulatory safety inspections reports. During 2003, TEPCO managed to resume operations of five of its reactors.

"The further noticeable decline in electrical output in 2007 was the result of the extended shutdown of the seven Kashiwazaki Kariwa reactors, with a total installed capacity of 8 GWe, following the Niigata Chuetsu-oki earthquake in 2007. TEPCO was struggling to restart the Kashiwazaki Kariwa units, when the Fukushima earthquake occurred."

How many of Japan's reactors are really 'operable'?

Nuclear power accounted for 29% of electricity generation in Japan in 2010, down from the historic peak of 36% in 1998, and plans were being developed to increase nuclear's share to 50%. But all of Japan's reactors were shut down in the aftermath of the Fukushima disaster. Reactors didn't power a single light-bulb from September 2013 to August 2015.

Japan had 55 operable reactors before Fukushima (including the ill-fated Monju fast reactor). In addition to the six reactors at Fukushima Daiichi, the permanent shutdown of another six reactors has been confirmed - all of them smallish (<559 MWe) and all of them ageing (grid connections between 1969 and 1977): Kansai Electric's Mihama 1 and 2, Kyushu Electric's Genkai 1, Shikoku's Ikata 1, JAPC's Tsuruga 1, and Chugoku Electric's Shimane 1.

So Japan now has 43 'operable' or 'operational' reactors, and it isn't hard to identify some with little or no prospect of ever restarting, such as the four Fukushima Daini reactors (or Monju for that matter).

Two reactors at Sendai in Kagoshima Prefecture were restarted in August and October 2015. And that's it - only two of Japan's 43 'operable' or 'operational' reactors are actually operating. Moreover an anti-nuclear candidate, Satoshi Mitazono, was elected governor of Kagoshima Prefecture in early July 2016 and he announced that he will seek the shut-down of the two Sendai reactors - he can prevent their restart after they shut down for inspection later this year.

As of 1 July 2016, 11 utilities had applied to the Nuclear Regulatory Authority (NRA) for safety assessments of a total of 26 reactors, including seven reactors that have completed the assessment process. Apart from whatever hurdles the NRA might put in their way, there are other obstacles: citizen-led lawsuits; local political and public opposition; economic factors, in particular the questionable economics of large investments to upgrade and restart aging reactors; and the impact of electricity deregulation and intensified market competition.

It's anyone's guess how many reactors might restart, but the process will continue to be drawn out - the only strong candidate for restart this year is the Ikata 3 reactor in Ehime Prefecture.

The government's current energy policy calls for a 22-24% nuclear share of electricity generation by 2030. That is less than half of the pre-Fukushima plans for future nuclear growth (the 50% target), and considerably lower than the 29% nuclear share in 2010. Currently, nuclear power - the two Sendai reactors - account for less than 1%.

To reach the 20-22% target would require the operation of around 35 reactors by 2030, which seems highly improbable.

Cheap renewables picking up high-level support

The use of both fossil fuels and renewables has increased since the Fukushima disaster, while energy efficiency has made the task considerably easier - national power consumption in 2015 was 12% below the 2010 level.

The *World Nuclear Industry Status Report* comments on energy politics in Japan:

"Japanese utilities are insisting on, and the government has granted and reinforced, the right to refuse cheaper renewable power, supposedly due to concerns about grid stability - hardly plausible in view of their far smaller renewable fractions than in several European countries - but apparently to suppress competition. The utilities also continue strenuous efforts to ensure that the imminent liberalization of the monopoly-based, vertically integrated Japanese power system should not actually expose utilities' legacy plants to real competition.

"The ability of existing Japanese nuclear plants, if restarted, to operate competitively against modern renewables (as many in the U.S. and Europe can no longer do) is unclear because nuclear operating costs are not transparent. However, the utilities' almost complete suppression of Japanese wind power suggests they are concerned on this score.

"And as renewables continue to become cheaper and more ubiquitous, customers will be increasingly tempted by Japan's extremely high electricity prices to make and store their own electricity and to drop off the grid altogether, as is already happening, for example, in Hawaii and Australia."

The Japan Association of Corporate Executives, with a membership of about 1,400 executives from around 950 companies, recently issued a statement urging Tokyo to remove hurdles holding back the expansion of renewable power - which supplied 14.3 percent of power in Japan in the year to March 2016.

The statement also notes that the outlook for nuclear is *"uncertain"* and that the 20–22% target could not be met without an improbably high number of restarts of idled reactors along with numerous reactor lifespan extensions beyond 40 years.

Andrew DeWit, a professor at Rikkyo University in Tokyo, said the push signalled *"a profound change in thinking among blue-chip business executives."* DeWit added:

"Many business leaders have clearly thrown in the towel on nuclear and are instead openly lobbying for Japan to vault to global leadership in renewables, efficiency and smart infrastructure."

Safety concerns - the case of Takahama

The restart of the Takahama 3 and 4 reactors in Fukui Prefecture is indicative of the nuclear industry's broader problems. Kansai Electric Power Company (KEPCO) first applied to the NRA for permission to restart the reactors in July 2013. In February 2015, the NRA gave its permission for KEPCO to make the required safety upgrades. The restart process was delayed by an injunction imposed by the Fukui District Court in April 2015, but the ruling was overturned in December 2015.

Takahama 3 was restarted in late January 2016, and TEPCO was in the process of resolving technical glitches affecting the start-up of Takahama 4, when the Otsu District Court in neighbouring Shiga Prefecture ruled on 9 March 2016 that the reactors must be shut down in response to a petition by 29 citizens.

The court found that investigations of active fault lines and other safety issues were not thorough enough, it expressed doubts regarding the plant's ability to withstand a tsunami, and it questioned emergency response and evacuation plans. Citizens and NGOs also questioned the use of arbitrary figures in KEPCO's safety analysis, and fire protection.

Nuclear Engineering International reported on 2 February 2016:

"While there are plans on paper to evacuate some Fukui residents to Hyogo, Kyoto, and Tokushima prefectures, many municipalities there have no detailed plans for receiving evacuees. Kyoto Governor Keiji Yamada said he did not feel adequate local consent had been obtained, citing concerns about evacuation issues. Shiga Governor Taizo Mikazuki said there was a lack of sufficient disaster planning."

On July 12, the Otsu District Court rejected KEPCO's appeal and upheld the injunction preventing the operation of Takahama 3 and 4. KEPCO plans to appeal the decision to the Osaka High Court.

Meanwhile, KEPCO is considering whether it is worth investing in upgrades required for the restart of the Takahama 1 and 2 reactors. The NRA controversially approved 20-year lifespan extensions for the two reactors (grid connected in 1974 and 1975), but citizens have initiated a lawsuit to keep them shut down.

Japan's 'lax' and 'inadequate' regulatory regime

While safety and regulatory standards have improved in the aftermath of Fukushima, there are still serious problems. Citizens and NGOs have raised countless concerns, but criticisms have also come from other quarters.

When the NRA recently approved lifespan extensions for two Takahama reactors, a former NRA commissioner broke his silence and said *"a sense of crisis"* over safety prompted him to go public and urge more attention to earthquake risks. Kunihiro Shimazaki, a commissioner from 2012 to 2014, said: *"I cannot stand by without doing anything. We may have another tragedy ..."*

Professor Yoshioka Hitoshi, a Kyushu University academic who served on the government's 2011-12 Investigation Committee on the Accident at the Fukushima Nuclear Power Stations, said in October 2015: *"Unfortunately, the new regulatory regime is ... inadequate to ensure the safety of Japan's nuclear power facilities. The first problem is that the new safety standards on which the screening and inspection of facilities are to be based are simply too lax. While it is true that the new rules are based on international standards, the international standards themselves are predicated on the status quo.*

"They have been set so as to be attainable by most of the reactors already in operation. In essence, the NRA made sure that all Japan's existing reactors would be able to meet the new standards with the help of affordable piecemeal modifications - back-fitting, in other words."

Even the IAEA has slammed the feeble NRA

An International Atomic Energy Agency (IAEA) review in early 2016 made the following recommendations (among others) regarding the NRA:

- To attract competent and experienced staff, and develop competencies relevant to nuclear and radiation safety.
- To amend relevant legislation with the aim of allowing NRA to improve the effectiveness of its inspections. The NRA inspection programme *"needs significant improvement in certain areas. NRA inspectors should be legally allowed to have free access to any site at any time. The decision process for initiating reactive inspections should be shortened."*
- To strengthen the promotion of safety culture including a questioning attitude.
- To give greater priority to the oversight of the implementation of radiation protection measures.
- To develop requirements and guidance for emergency preparedness and response in relation to radiation sources.

The IAEA further noted that the NRA's enforcement provisions are inadequate:

"There is no clear written enforcement policy in place at the NRA. There is no documented process in place at NRA for determining the level of sanctions. NRA inspectors have no power to enforce corrective actions if there is an imminent likelihood of safety significant event. They are required to defer to NRA headquarters. ... NRA processes for enforcement are fragmented and some processes are not documented.

"NRA needs to establish a formal Enforcement Policy that sets forth processes clearly addressing items such as evaluation of the severity level of non-conformances, sanctions for different levels of non-conformances, processes for issuance of Orders, and expected actions of NRA inspectors if significant safety issues develop."

As the industry declines, expect new safety cutbacks

The narrative from government and industry is that safety and regulatory standards in Japan are now adequate - or they soon will be once teething problems with the new regime are sorted out. NRA Chair Shunichi Tanaka claims that Japanese regulatory standards are *"the strictest in the world."*

But Japan's safety and regulatory standards aren't strict. Improvements are ongoing - such as NRA actions in response to the IAEA report, and reports that legislation will be revised to allow unscheduled inspections of nuclear sites. But improvements are slow, partial and piecemeal and there are forces pushing in the other direction. An Associated Press report states that nuclear laws will be revised in 2017 but not enacted until 2020.

Reactor lifespan extensions beyond 40 years were meant to be *"limited only to exceptional cases"* according to then Prime Minister Yoshihiko Noda, speaking in 2012. Extensions were considered an emergency measure against a possible energy crunch. But lifespan extensions have been approved in the absence of an energy crunch, and more will likely follow.

If Japan's nuclear history is any guide, already flawed safety and regulatory standards will be weakened over time. Signification elements of Japan's corrupt 'nuclear village' are back in control just a few years

after the Fukushima disaster. Add to that aging reactors, and utilities facing serious economic stress and intense competition, and there's every reason to be concerned about nuclear safety in Japan.

Tomas Kåberger, Professor of Industrial Energy Policy at Chalmers University of Technology in Sweden, noted in the foreword to the latest edition of the World Nuclear Industry Status Report:

"A nuclear industry under economic stress may become an even more dangerous industry. Owners do what they can to reduce operating costs to avoid making economic loss. Reduce staff, reduce maintenance, and reduce any monitoring and inspection that may be avoided.

"While a stated ambition of 'safety first' and demands of safety authorities will be heard, the conflict is always there and reduced margins of safety may prove to be mistakes."

Dr Jim Green is the national nuclear campaigner with Friends of the Earth Australia and editor of the Nuclear Monitor newsletter, where this article was originally published. Nuclear Monitor, published 20 times a year, has been publishing deeply researched, often critical articles on all aspects of the nuclear cycle since 1978. A must-read for all those who work on this issue!

Sometimes referendums do work

August 18, 2016

Former town mayor recalls town referendum that booted plans for nuclear plant

<http://www.japantimes.co.jp/news/2016/08/18/national/former-town-mayor-recalls-town-referendum-booted-plans-nuclear-plant/#.V7WdM6jdeos>

JJI

NIIGATA – Residents of the town of Maki, Niigata Prefecture, made the right decision 20 years ago, according to Takaaki Sasaguchi.

The town was Japan's first ever to hold a referendum over a plan to build a nuclear power plant and firmly knocked it down.

"I'm proud that we opened our future through the referendum," the former town mayor, 68, said in an interview. "Our choice not to allow a nuclear plant to be built in our town was not wrong."

Maki no longer exists as a discrete entity as it has since been absorbed into the city of Niigata.

But memories run strong of what people power achieved, and in light of the Fukushima disaster what it may have prevented.

In 1971, Tohoku Electric Power Co. unveiled plans to construct a nuclear plant in the town. The facility was to generate electricity from a central 825,000-kw reactor of boiling-water design.

But as land appropriation and other work got underway, opposition strengthened.

Sasaguchi and his colleagues set up a group aimed at holding a referendum so that residents could decide for themselves.

He was elected mayor in January 1996, and the Maki government then established a municipal ordinance for a referendum.

Referendum day was Aug. 4 that year, and 12,478 residents voted against the plan. Those in favor totaled 7,904.

Voter turnout was 88.29 percent in Japan's first local referendum over a nuclear power station. Following the result, Mayor Sasaguchi decided to reject the nuclear plant construction, and a plot of land that the town owned within the proposed site was sold off to residents who had opposed the plans. Those in favor of the plant sued, but in December 2003 they lost the case and later that month Tohoku Electric threw in the towel.

Sasaguchi accuses Japan's government of not encouraging respect for local voices back then.

A pro-nuclear push made it difficult for Maki residents to speak up.

"The most important thing in the referendum was that residents showed their intentions and made a choice," Sasaguchi recalls.

The referendum result drew heavy media coverage, and the town was praised for choosing the democratic process.

Sasaguchi says it also brought the town together.

"I think Maki residents probably wanted to bring their town, which had been upset by the nuclear project, back to being a normal community," he said.

The town was merged into the city of Niigata in 2005, and the referendum began to be forgotten.

However, the March 2011 nuclear crisis in neighboring Fukushima Prefecture reminded ex-Maki residents of the significance of their vote back in 2006.

They told Sasaguchi the same tragedy could have happened to them if they had allowed a nuclear plant to be built.

Meanwhile, Sasaguchi notes that Tokyo Electric Power Co. has filed for Nuclear Regulation Authority safety checks for two of the seven reactors at its Kashiwazaki-Kariwa nuclear power station in Niigata Prefecture.

"Even if the NRA endorses the safety, the issue of the nuclear waste disposal site remains unresolved," he said.

The central government still has not identified a long-term disposal site for high-level waste.

"The Japanese government should put into force a policy that doesn't depend on nuclear power plants as soon as possible," he said.

Tourism as usual

A guide to Japan's prefectures and major cities

JAPAN SHOWCASE|Tokyo

Tokyo to Fukushima: Route to enjoy modern, old Japan

July 29, 2016

<http://showcase.japantimes.co.jp/tokyo/news/?key=tokyo1>

Known as the gateway to the great northeastern Tohoku region of Japan, Fukushima Prefecture features natural landscapes wholly different from those of Tokyo. Rather than neon and skyscraper dominated skylines, rugged peaks, crater lakes and ancient forests define Fukushima, an area that is especially picturesque in autumn. After seeing the sights in the capital, a trip north to see a different side of Japan is well worth the journey.

Seeing Tokyo on foot is a real pleasure as the city boasts a vast array of greenery from verdant parks to manicured gardens, and atmospheric old neighborhoods dotted with centuries-old temples. The Tokyo retail experience is unlike any other, with something for every budget and taste, including the well-heeled, vintage goods hunters, trendsetters and traditional arts and crafts lovers.

One popular Tokyo destination is Miraikan (The National Museum of Emerging Science and Innovation), where visitors can learn about cutting-edge technology, space science and many other things related to science and innovation. The museum, in the Odaiba bay-front area, is like a sophisticated amusement park, entertaining children and adults alike.

Known for their cleanliness, efficiency and punctuality, dozens of shinkansen depart Tokyo daily for Fukushima. From Tokyo, take the Tohoku Shinkansen for about 80 minutes to Koriyama Station, Fukushima Prefecture, and change to the Ban-etsu West Line to Aizu-Wakamatsu Station. The city of Aizu-Wakamatsu is blessed with a rich natural environment that includes the nearby Mount Bandai and Lake Inawashiro. It's a city where samurai influences remain strong today.

The city's samurai spirit centers around Tsuruga-jo Castle, otherwise known as Aizu-Wakamatsu Castle. The original structure was built in the 14th century and, after suffering damage in various conflicts, has been rebuilt by many different lords, as Aizu is an important central location from which to rule the Tohoku area.

After sightseeing, relaxing in an *onsen* hot spring at a *ryokan* traditional Japanese-style inn is a great way to end the day and begin the evening. The Higashiyama Onsen area in Aizu is believed to have healing waters and is considered one of the three best onsen areas in Tohoku.

Just 30 to 40 minutes from Higashiyama Onsen, Ouchi-juku was once an area full of inns during the Edo Period. It contains many Edo-style houses with straw rooftops, transporting tourists back in time. Ouchi-juku was in 1981 designated by the state as a preservation area to maintain these important traditional structures. Today, it is a popular tourist destination with many small inns, souvenir shops, as well as soba and other traditional Japanese restaurants. The people in the area have a custom of eating soba with *negi* leeks in place of chopsticks.

Japan's disaster-hit regions look to 'Pokemon Go' to draw tourists

<http://www.japantimes.co.jp/news/2016/08/10/national/japans-disaster-hit-regions-look-pokemon-go-draw-tourists/#.V6weCKJdeos>

Kyodo

Four disaster-hit prefectures are counting on the frenzy sparked by "Pokemon Go" to draw more tourists. Officials from Kumamoto, Iwate, Miyagi and Fukushima prefectures said Wednesday they will use the popular augmented-reality game to encourage more people to visit and thereby spur reconstruction. The four prefectures plan to work out details with the Japanese unit of U.S. game developer Niantic Inc. They hope that tourist destinations in their regions will serve as "Pokestops," where players collect items, as well as "gyms," where they battle their Pokemon characters.

"I hope young people will have the opportunity to understand the reality facing the disaster-hit prefectures," Miyagi Gov. Yoshihiro Murai told reporters.

"Pokemon Go" entices players to hunt down Pokemon superimposed on real sites, in a system that uses GPS to determine players' locations.

Murai contacted the developer over potential collaboration.

Iwate Gov. Takuya Tasso expressed hope that domestic and foreign tourists will visit coastal areas that were damaged by the tsunami.

Since the game was released in July, Japanese fans have downloaded it in large numbers, braving the scorching summer heat outdoors to play.

But “Pokemon Go” has also led the government to issue safety warnings amid concerns about injuries and accidents among fixated players.

Separately, the Tottori Prefectural Government is trying to capitalize on the game as a way to rejuvenate the local economy.

It is encouraging players to visit the Tottori Sand Dunes, touting the site as a “safe place” to enjoy the game.

How will Kyushu Electric respond?

August 27, 2016

EDITORIAL: Kyushu Electric in spotlight after governor calls for shutdown

<http://www.asahi.com/ajw/articles/AJ201608270026.html>

Newly elected Kagoshima Governor Satoshi Mitazono on Aug. 26 asked Kyushu Electric Power Co. to immediately shut down two reactors at its Sendai nuclear power plant for a fresh safety inspection. The two reactors at the Sendai plant in Satsuma-Sendai, Kagoshima Prefecture, are the only ones online in Japan.

Mitazono asked the utility to expand its support for the local government's plans for emergency evacuations during severe nuclear accidents while rigorously inspecting the plant equipment and systems.

Mitazono's move was a response to public concerns about the safety of the plant following a series of earthquakes that rocked neighboring Kumamoto Prefecture in April.

A prefectural governor has no power to order the suspension of the operation of an online reactor. But while stumping for the July election, Mitazono promised a temporary halt to the Sendai reactors. The incumbent had allowed the reactors to be restarted.

Kyushu Electric ought to embrace the safety concerns that the governor has raised.

Mitazono cited seven priority items for the inspection of the equipment he requested, including the reactor pressure vessel and the containment vessel. He also called on the utility to investigate active faults around the nuclear plant and provide accurate information with regard to the safety of the reactors in a timely manner so as to prevent any erosion of trust between local residents and the operator.

In asking the utility to step up its support for the evacuation plans, Mitazono referred to the views and opinions he heard during his inspection of roads and medical and welfare facilities around the plant.

The steps envisioned by Mitazono are necessary for preventing nuclear accidents and minimizing damage when an accident does occur.

Kyushu Electric responded to Mitazono's requests by saying it will “carefully check their content and deal with them.”

But the company has shown no sign of changing its position that the safety concerns are groundless, as the reactors were **brought back on stream after clearing safety checks by the Nuclear Regulation Authority.**

But the situation changed dramatically after a string of earthquakes in Kumamoto Prefecture, including two powerful temblors that registered a maximum of 7 on the Japanese seismic intensity scale.

The company should realize that this created huge anxiety among local residents and prompted Mitazono to make his request.

Even though Mitazono is not empowered to make the utility accept his requests, both central authorities and the electric power industry are sufficiently alarmed that the head of the government of a prefecture where a nuclear plant is located has called for a halt to the operations of reactors.

The prevailing view is that Kyushu Electric will refuse to shut down the reactors right now and continue operating them until their next regular inspections, which are slated for October and December, respectively.

After the regular inspections, however, the utility will find it difficult to restart the reactors if the governor refuses to approve it because of the company's unsatisfactory response to his requests.

It seems the only option for Kyushu Electric is to offer convincing answers to the safety concerns Mitazono has raised.

Mitazono is not alone in voicing concerns about the safety of nuclear reactors. Niigata Governor Hirohiko Izumida has taken a critical view of Tokyo Electric Power Co.'s plan to restart two of the seven reactors at the Kashiwazaki-Kariwa nuclear plant in Niigata Prefecture.

It is still fresh in our memory that the Otsu District Court in March ordered Kansai Electric Power Co. to shut down two reactors at its Takahama plant that had just been brought back online.

Is the electric power industry willing to make sincere responses to these warnings about nuclear safety from local government and the judiciary?

How Kyushu Electric responds to Mitazono's requests will be a litmus test of the industry's attitude.

Governor to call on Kyushu Elec. to halt nuclear plant operation

<http://mainichi.jp/english/articles/20160826/p2g/00m/0dm/049000c>

FUKUOKA (Kyodo) -- The governor of Kagoshima Prefecture on Friday afternoon is set to request Kyushu Electric Power Co. suspend two reactors at its Sendai nuclear plant in the southwestern Japan prefecture, sources close to the matter said.

Gov. Satoshi Mitazono, who was elected on an antinuclear platform last month, is expected to make the request regarding the plant's Nos. 1 and 2 reactors -- two of only three reactors currently operating in the country -- at his meeting with the utility's President Michiaki Uriu, slated at the prefectural government office at 3 p.m.

The former TV commentator is likely to call on the utility to re-examine safety measures for the complex, citing increasing concerns among citizens about nuclear power security after huge earthquakes hit nearby prefectures in April, according to the sources.

Kyushu Electric is expected to prepare its answer to the request by early September.

Governors have no legal power to suspend operation of nuclear power plants.

Regardless of the governor's request, the Nos. 1 and 2 reactors are scheduled to be taken offline for regular checks on Oct. 6 and Dec. 16, respectively.

Governor to seek suspension of nuclear reactors

http://www3.nhk.or.jp/nhkworld/en/news/20160826_05/

Kagoshima Prefecture's new governor on Friday will ask the operator of a nuclear power plant to suspend its operation in order to re-check its safety.

The 2 reactors at the plant in southwestern Japan went online last year for the first time under the government's new regulations.

Satoshi Mitazono plans to request the suspension of the Sendai plant in his meeting with senior officials of Kyushu Electric Power Company.

He will also ask the utility to fully disclose information in the event of an accident and promote renewable energy.

Mitazono won in the election last month. He insisted on the campaign trail that the plant should be temporarily halted for safety re-checks as worries among residents have been growing since the April earthquakes in neighboring Kumamoto Prefecture.

After taking office, Mitazono visited Satsumasendai City, where the plant is located, to check evacuation measures to be implemented for residents in the event of a nuclear disaster. He also studied the timing to ask for the plant's suspension and the specific content of his request.

Kyushu Electric Power currently plans to suspend the 2 reactors for regular inspections. Number One will go offline in October and Number Two in December.

Governors have no legal authority to order reactors offline. Attention is focused on how the firm will react to Mitazono's request.

Icewall: Japan's "Hail Mary play"

August 30, 2016

Japan's 'Hail Mary' at Fukushima Daiichi: An Underground Ice Wall

http://www.nytimes.com/2016/08/30/science/fukushima-daiichi-nuclear-plant-cleanup-ice-wall.html?emc=edit_th_20160830&nl=todaysheadlines&nid=32427321&r=0

By MARTIN FACKLERAUG. 29, 2016

FUKUSHIMA DAIICHI NUCLEAR POWER STATION — The part above ground doesn't look like much, a few silver pipes running in a straight line, dwarfed by the far more massive, scarred reactor buildings nearby. More impressive is what is taking shape unseen beneath: an underground wall of frozen dirt 100 feet deep and nearly a mile in length, intended to solve a runaway water crisis threatening the devastated Fukushima Daiichi Nuclear Power Station in Japan.

Officially named the Land-Side Impermeable Wall, but better known simply as the ice wall, the project sounds like a fanciful idea from science fiction or a James Bond film. But it is about to become a reality in an ambitious, and controversial, bid to halt an unrelenting flood of groundwater into the damaged reactor buildings since the disaster five years ago when an earthquake and a tsunami caused a triple meltdown. Built by the central government at a cost of 35 billion yen, or some \$320 million, the ice wall is intended to seal off the reactor buildings within a vast, rectangular-shaped barrier of man-made permafrost. If it becomes successfully operational as soon as this autumn, the frozen soil will act as a dam to block new groundwater from entering the buildings. It will also help stop leaks of radioactive water into the nearby Pacific Ocean, which have decreased significantly since the calamity but may be continuing.

However, the ice wall has also been widely criticized as an expensive and overly complex solution that may not even work. Such concerns re-emerged this month after the plant's operator announced that a section that was switched on more than four months ago had yet to fully freeze. Some also warn that the wall, which is electrically powered, may prove as vulnerable to natural disasters as the plant itself, which lost the ability to cool its reactors after the 45-foot tsunami caused a blackout there.

The reactor buildings are vulnerable to an influx of groundwater because of how the operator, Tokyo Electric Power Co., or Tepco, built the plant in the 1960s, by cutting away a hillside to place it closer to the sea, so the plant could pump in water more easily. That also put the buildings in contact with a deep layer of permeable rock filled with water, mostly rain and melted snow from the nearby Abukuma Mountains, that flows to the Pacific.

The buildings managed to keep the water out until the accident on March 11, 2011. Either the natural disasters themselves, or the explosive meltdowns of three of the plant's six reactors that followed, are believed to have cracked the buildings' basements, allowing groundwater to pour in. Nearly 40,000 gallons of water a day keep flooding into the buildings.

Once inside, the water becomes highly radioactive, impeding efforts to eventually dismantle the plant. During the accident, the uranium fuel grew so hot that some of it is believed to have melted through the reactor's steel floors and possibly into the basement underneath, though no one knows exactly where it lies. The continual flood of radioactive water has prevented engineers from searching for the fuel. Since the accident, five robots sent into the reactor buildings have failed to return because of high radiation levels and obstruction from debris.

The water has also created a waste-management nightmare because Tepco must pump it out into holding tanks as quickly as it enters the buildings, to prevent it from overflowing into the Pacific. The company says that it has built more than 1,000 tanks that now hold more than 800,000 tons of radioactive water, enough to fill more than 320 Olympic-size swimming pools.

On a recent visit to the plant, workers were busily erecting more durable, welded tanks to replace the temporary ones thrown up in a hurry during the early years after the accident, some of which have leaked. Every available patch of space on the sprawling plant grounds now appears to be filled with 95-foot tanks. “We have to escape from this cycle of ever more water building up inside the plant,” said Yuichi Okamura, a general manager of Tepco’s nuclear power division who guided a reporter through Fukushima Daiichi. About 7,000 workers are employed in the cleanup.

The ice wall is a high-technology bid to break that cycle by installing what might be the world’s largest freezer. Pipes almost 100 feet long have been sunk into the ground at roughly three-foot intervals, and filled with a brine solution supercooled to minus 30 degrees Celsius, or minus 22 Fahrenheit. Each pipe is supposed to freeze a column of soil about a foot and a half in radius, large enough to reach the ice column created by its neighboring pipes and form a seamless barrier.

Engineers with the wall’s builder, the construction giant Kajima Corp., estimate that it will take about two months for the soil around a pipe to fully freeze. Solidifying the entire wall, which consists of 1,568 such underground pipes, will require 30 large refrigeration units and consume enough electricity to light more than 13,000 Japanese homes for a year.

The technique of using frozen barriers to block groundwater has been used to build tunnels and mines around the world, but not on this scale. And certainly not on the site of a major nuclear disaster.

Since the start, the project has attracted its share of skeptics. Some say buried obstacles at the plant, including tunnels that linked the reactor buildings to other structures, will leave holes in the ice wall, making it more like a sieve. Others question why such an exotic solution is necessary when a traditional steel or concrete wall might perform better.

Some call the ice wall a flashy but desperate gambit to tame the water problem, after the government and Tepco were initially slow to address it. Adding to the urgency is the 2020 Olympics, which Prime Minister Shinzo Abe of Japan helped win for Tokyo three years ago by assuring the International Olympic Committee that the water troubles at Fukushima Daiichi were under control.

“It’s a Hail Mary play,” said Azby Brown, a Japan-based researcher for Safecast, an independent radiation-monitoring group. “Tepco underestimated the groundwater problem in the beginning, and now Japan is trying to catch up with a massive technical fix that is very expensive.”

Supporters and skeptics alike will soon learn if that gambit will succeed. After two years of work, Kajima finished installing the pipes and refrigerator units to create the ice wall in February. At the end of March, it switched on part of the ice wall for the first time — roughly half a mile that runs between the reactor buildings and the Pacific. Most of the other, uphill side of the wall was activated in mid-June.

Kajima is freezing the wall in stages under orders from the Nuclear Regulation Authority, Japan’s nuclear watchdog. The authority is concerned that cutting off the groundwater too suddenly might lead to a reversal of flows, causing the radioactive water accumulated inside the reactor buildings to start pouring out into the surrounding soil, possibly reaching the Pacific. It has told Kajima to leave a half-dozen “gateways” in the uphill side that will not be closed until much of the contaminated water is drained from the buildings.

This month, Tepco told the nuclear agency that the seaside segment of the ice wall had frozen about 99 percent solid. It says a few spots have failed to solidify because they contain buried rubble or sand left from the plant’s construction a half-century ago, which now allow groundwater to flow through so quickly that it will not freeze.

Tatsuhiro Yamagishi, a spokesman for Tepco, said the company was trying to plug these holes in the ice wall with quick-drying cement. “We have started to see some progress in temperature decrease,” he said. Even if the cement helps make the ice wall watertight, skeptics question how long it can last. They point out that such frozen barriers are usually temporary against groundwater at construction sites. They say the brine solution used to chill the pipes is highly corrosive, which could make them break or leak. It is also unclear whether the system could break down under the stresses of operating in a high-radiation environment where another earthquake could lead to another power loss.

“Why build such an elaborate and fragile wall when there is a more permanent solution available?” said Sumio Mabuchi, a former construction minister who has called for building a slurry wall, a trench filled with liquid concrete that is commonly used to block water.

Isao Abe, a Kajima engineer overseeing the ice wall, said his company had made the wall more durable by installing underground pipes that are easy to replace if they corrode. He also said the ice wall was self-sealing, meaning that if another earthquake caused cracks, any incoming water would freeze right away, restoring the wall. He also said it would take months for the wall to thaw, giving engineers ample time to restore power even if the plant has another outage.

Mr. Abe said the wall was intended to operate until 2021, giving Tepco five more years to find and plug the holes in the reactor buildings, though skeptics say this difficult task will require more time. Mr. Abe also pointed out that the ice wall was part of a broader strategy for containing the radioactive water. Before installing the ice wall, Kajima also built a conventional steel wall underground along the plant’s border with the Pacific last year.

Tepco says that wall has already stopped all measurable leaks of radioactive materials into the sea.

However, some scientists say that radioactive water may still be seeping through layers of permeable rock that lie deep below the plant, emptying into the Pacific far offshore. They say the only way to eliminate all leaks would be to repair the buildings once and for all.

Even if the ice wall works, Tepco will face the herculean task of dealing with the huge amounts of contaminated water that have accumulated. The company has installed filtering systems that can remove all nuclear particles but one, a radioactive form of hydrogen known as tritium. The central government and Tepco have yet to figure out what to do with the tritium-laced water; proposals to dilute and dump it into the Pacific have met with resistance from local fishermen, and risk an international backlash.

For now, the only visible sign that the freezing has begun are silver-dollar-size patches of ice that have formed on top of the aboveground, silver pipes. At one spot, the No. 4 reactor building loomed, an enormous cube six stories tall with concrete sides that showed large gashes left by the tsunami.

“The water is here, just three meters beneath our feet,” said Mr. Okamura, the Tepco general manager, who stood near the pipes wearing a white protective suit, goggles and a surgical mask. **“It still flows into the building, unseen, without stopping.”**

Icewall & unwarranted optimism

August 30, 2016

EDITORIAL: Is Fukushima ice wall project still viable despite early failure?

<http://www.asahi.com/ajw/articles/AJ201608300031.html>

A government-backed, large-scale project to reduce the amount of contaminated water produced daily at the crippled Fukushima No. 1 nuclear power plant has become bogged down.

The project involves creating a frozen wall of soil around reactor buildings at the plant to stop the flow of groundwater into the facilities.

The Agency for Natural Resources and Energy, part of the Ministry of Economy, Trade and Industry, and Tokyo Electric Power Co., which operates the nuclear plant, have adopted this approach as the centerpiece of the efforts to reduce the volume of polluted water.

But the project has failed to produce the expected results.

The work to build a frozen soil wall around the No. 1 to No. 4 reactor buildings was completed in June. Nearly three months on, however, there remain unfrozen parts through which groundwater enters the facilities.

The total daily amount of groundwater, which becomes contaminated with radioactive materials within the reactor buildings, has remained unchanged at about 400 cubic meters.

At the Nuclear Regulation Authority's meeting to assess the effectiveness of the approach, some outside experts even said the project has failed.

Still, TEPCO didn't change its plans to proceed with the project, taking additional steps such as **injecting cement into the unfrozen parts.**

At a recent news conference, Economy, Trade and Industry Minister Hiroshige Seko said that the work to freeze soil around the reactor buildings had been progressing. He stressed he would keep "instructing" TEPCO.

On the assumption that the envisioned frozen soil wall will be successfully constructed, TEPCO has estimated the daily production of contaminated water will fall to about 250 cubic meters in September and decline further to about 150 cubic meters in January.

If the amount fails to decrease as expected, there will be serious effects on eliminating most of the radioactive materials from contaminated water and installing tanks to store processed water. That means the entire plan for solving the problem of contaminated water will be in a precarious state.

Is the frozen wall of earth project really still viable?

To date, some 34.5 billion yen (\$337 million) of taxpayer money has been poured into the project. Daily freezing costs additional money.

It is unacceptable to continue spending human and financial resources as well as time to keep the project running without a solid prospect of success.

The Agency for Natural Resources and Energy and TEPCO should determine by a certain deadline whether the project has succeeded or failed.

They should also work out an alternative plan in the event the project fails, as the NRA has repeatedly called for.

There has been no instance of building such a large frozen soil wall in Japan. But the energy agency and TEPCO dared to attempt this approach at the site of one of the biggest nuclear accidents in world history.

While the approach has the advantage of a relatively short construction period, **many experts, including NRA officials, have warned from the outset about utilizing it at the Fukushima plant.**

Some experts pointed out that completely freezing soil would be difficult because an enormous amount of groundwater is flowing fast around the plant.

Others said building an impermeable wall through civil engineering work would be a more reliable way to reduce the groundwater entering the buildings.

The energy agency decided to allow the frozen wall method in the face of such skepticism.

The proposed frozen soil wall is only a means to reduce the amount of contaminated water. But the energy agency and TEPCO seem to be viewing the success of this method as the goal.

What is the most effective and reliable way to prevent a second environmental pollution catastrophe by contaminated water containing large amounts of radioactive materials?

The agency and the utility should address this question with a broad perspective that is not distorted by unwarranted optimism.

The Fukushima shock

Background: August 31, 2016

Sometimes, when politicians are out of government, they seem to see things with clearer eyes. Here are Stéphane Dion's striking comments about the Fukushima tragedy in October 2014, when his party (the Liberal Party of Canada) was in opposition -- and not even the "official" opposition!

No mention of Canadian or American reactors, though. Or that Japan's reactors were of American design,

Gordon Edwards.

The Fukushima Shock

By Stéphane Dion, National Newswatch, Oct 24 2014

<http://tinyurl.com/zghov4t>

Stéphane Dion was Canada's Minister of Intergovernmental Affairs between 1996 and 2003, and Minister of Environment for 2004-2005. He is currently [August 2016] Canada's Minister of Foreign Affairs (since November 4, 2015).

Seeing Fukushima's evacuated area is quite a shock. It is one thing to imagine it, another to see the consequences of the nuclear disaster with your own eyes.

Imagine: your home, your car, your property, your neighbourhood suddenly becoming forbidden areas.

You are not allowed to go there except perhaps for an hour or two, from time to time. Although the surrounding woods are as green and the ocean as blue as ever, an invisible blanket of death covers everything. You can't feel it, you can't smell it but it is there and will be for decades, perhaps longer.

Going back home would put your health at risk. You are not even sure you escaped the danger zone in time. You fear for your family's as well as your own health. The specter of cancer haunts you constantly.

What does the future hold for you? Leukemia? Thyroid cancer? A deformed baby?

If you are allowed to stay home – because your neighbourhood is deemed to be distant enough from the danger zone – you are warned to not let your children play outdoors. Arenas are being built and designated for that purpose.

Your daughter is heartbroken: she was going to marry a young man from another area but the wedding has been cancelled – an irradiated mother-to-be is not wanted.

You are a farmer but are not allowed to sell your produce, now unfit for human consumption.

You are a fisherman but the area where you once casted your nets is now banned.

Those are but a few of the multiple aspects of the nightmare being lived by the denizens of Fukushima Prefecture, Northern Japan. On March 11, 2011, a magnitude 9 earthquake triggered a huge tsunami that threw fifteen meter waves at the region, claiming 1,599 lives, destroying everything in its path and causing a nuclear accident of a magnitude unequalled since the 1986 Chernobyl disaster. Three reactors suffered a catastrophic meltdown and a fourth was damaged, spewing radiation in the atmosphere and ocean and contaminating a 30,000 square kilometer area – 8 percent of Japan's total land area. As a result of that nuclear disaster, 300,000 Fukushima Prefecture residents were evacuated. 130,000 are still forbidden to go home.

I met some of those families while in Japan from September 30 to October 8, 2014, when I was invited by the Swiss section of the Green Cross to take stock of the consequences of the Fukushima nuclear disaster. The Green Cross was founded in 1993 by Mikhail Gorbachev, following the Rio Summit. It is active in some thirty countries and one of its many noteworthy features is the attention it pays to environmental safety and security – including victims of nuclear accidents. The Green Cross is very involved in Fukushima, helping the displaced families as best it can.

The Swiss section of the Green Cross gathered some thirty environmentalists and political figures from America, Europe and Asia to study the consequences of the Fukushima disaster. We travelled to a section of the evacuated area, the *Resident Restriction Zone*, taking all necessary precautions. The most dangerous area, the *No Return Zone*, cannot be visited – no decontamination has been done there. On a supposedly decontaminated street in the small town of Tomioka, we were told to get back on the bus after ten minutes because the radiation level was too high. We visited abandoned houses and businesses and witnessed the ongoing decontamination work which employs five to six thousand workers every day. Safety and security rules are two to five times stricter than those that were put in place by the Russian, Bielorrussian and Ukrainian authorities following the Chernobyl accident. Cancer cases have been identified but direct causal links with the nuclear accident may not even be identifiable before 2016. The scientists who spoke to us on the health impacts of radiation are not all of the same mind on the issue, even though these impacts have been studied since the Hiroshima and Nagasaki bombings. But assuming we accept their most optimistic assessments, what does it change? Even if you are told that the radiation might be less harmful, less likely to induce cancer in the long term than what had previously been believed, **would you wholeheartedly accept to live in an irradiated region?**

When the authorities distribute pamphlets in schools explaining that radiation is not that much of a problem, they raise more controversy than they provide reassurance. So people seek information on their own. They talk about the relative harmfulness of caesium 137, cobalt 60, plutonium 239, strontium 90... However, as it stands, psychosocial impacts have killed more people than radiation: some 1,660 lives have been lost to posttraumatic stress disorder, chronic anxiety, depression, family dislocation, precarious living conditions, displacement and suicide resulting from evacuation.

We met with the Fukushima region local authorities and Members of Parliament from the ruling party in Tokyo. We were told about the measures that have been taken to help and compensate displaced persons, and to carry out food and drinking water inspection, site decontamination, radiation level monitoring and management of fast accumulating radioactive wastes and contaminated soil.

The cooling water used in the Daiichi plant reactors needs to be stored somewhere. It is estimated that if all goes well, some thirty years will be needed to remove the radioactive fuel from the reactors. In the meantime, a way must be found to prevent the fuel from leaking again into the ground and ocean. All that calls for highly trained personnel and huge expenses including, paradoxically, for electrical power. But to what avail? **Some municipal representatives told us that the technology is not up to par and that radioactive leaks continue to happen, contaminating the Pacific Ocean waters and fish stocks.**

Interim solutions are still being applied to a problem that will be around for decades and risks affecting many neighbouring populations in Japan and elsewhere.

Following the Fukushima accident, Japan shut down its 54 nuclear reactors. These accounted for over a quarter (29 percent) of Japan's electrical power production. This energy source had to be replaced with wind and solar energy but above all, by imported hydrocarbons – natural gas and coal. A consequence of this increased reliance on hydrocarbons is that Japan, which had committed to a 25% *reduction* of its greenhouse gas emissions by 2020 compared to 1990 levels, now forecasts a 3 percent *increase*. The Members of Parliament I met told me that the Japanese Government will not commit to a new reduction target for 2030 until the future of nuclear energy is settled.

It costs almost as much to keep the nuclear plants dormant as when they were running. For the time being, the government is thinking of restarting two nuclear reactors in Southern Japan, based on what it believes to be an extremely prudent and thorough scientific assessment. But quite understandably, that perspective raises much resistance and apprehension in the population.

One of the most unfortunate consequences of the Fukushima disaster is a weakening, in a large segment of Japan's population, of the trust between the people and their government. The Japanese appeared to me as I imagined them: smiling, courteous, hardworking, inventive, disciplined and very respectful of authority. Historically, in previous occurrences of the type of natural disaster that regularly strikes the country – typhoons, earthquakes, volcanic eruptions – they have viewed the government as a protective father or mother figure. But after the Fukushima nuclear accident, for the first time, the government's good faith has been cast into doubt. Hadn't it promised that such an accident would never happen? The failures of Japan's Nuclear Safety Commission and the now proven falsifications perpetrated by the Tokyo Electric Power Company (TEPCO) – owner of the power plant – have been pointed out. To avert a panic, the government kept making reassuring statements which were cast into doubt and perceived as a form of manipulation, generating a feeling of resentment and bitterness that is still very strong today.

Yet even in adversity, humour – or at least bitter irony – finds its place. Some Japanese will tell you the story of the TEPCO scientist who, in an attempt to reassure the population, went as far as to declare: "Smiling people are not affected by radiation. Only worried people are. That has been proved in animal testing."

It would be hard to find a country that combines, better than Japan, strong organization skills, individual and collective discipline, social cohesion and technological expertise. Japan thought it was immune to nuclear disaster. Yet it happened, albeit as a result of an unprecedented natural disaster. What country can feel assured that it would have dealt better with the consequences of such a crisis than Japan? When you think that some much less organized or politically stable countries than Japan also want their own nuclear plants, how can you not think that we are rolling the dice? Explosive dice!

Fukushima is here to testify to the damage an overly reckless humankind can inflict on itself. Will we know how to draw the right conclusions?

Izumida will not run in gubernatorial election

August 31, 2016

Niigata Pref. nuclear power opponent governor won't stand for re-election

<http://mainichi.jp/english/articles/20160831/p2a/00m/0na/008000c>

NIIGATA -- Gov. Hirohiko Izumida has retracted his announcement that he will run in the upcoming gubernatorial election to seek a fourth term.

- **【Related】** Nuclear watchdog finds 3 nuclear plants guilty of 'malicious' safety violations

Since Izumida has adopted a cautious stance toward the restarting of the Kashiwazaki-Kariwa Nuclear Power Plant in Niigata Prefecture, **his decision not to run in the election will likely have a huge impact on the issue.** All seven reactors at the power station, owned by Tokyo Electric Power Co., have been idle since March 2012 in the wake of the 2011 Great East Japan Earthquake, tsunami and the ensuing crisis at the Fukushima No. 1 nuclear plant.

The campaign for the Oct. 16 Niigata gubernatorial election is to kick off on Sept. 29.

Izumida's decision not to run in the election is linked to his criticism of a report in the Niigata Nippo regional daily over a dispute involving a subsidiary of a shipping company funded by the prefectural government.

In an interview with news organizations, Izumida said, "It's important to have prefectural residents know the facts, but I feel my appeal never reached the residents. Even if I requested the newspaper to correct its report, the daily would never do so, which prompted me to abandon running in the race."

At a prefectural assembly session in February this year, Izumida announced that he would run in the gubernatorial election to seek a fourth four-year term. However, his retraction of his candidacy leaves Nagaoka Mayor Tamio Mori, 67, who heads the Japan Association of City Mayors, as the only person who has announced his candidacy.

It came to light this past July that Japan Shipping Exchange Inc., an arbitration organization, had ordered a shipping company's subsidiary funded by the prefectural government to pay 160 million yen to a South Korean company following a dispute over the purchase of a ferry.

The Niigata Nippo published a series of articles holding the Niigata Prefectural Government responsible for the case.

In response, the prefectural government has dismissed the accusations saying, "The daily's coverage is incorrect," and repeatedly urged the newspaper to correct its reports.

The Niigata Nippo is set to release a statement to express its views on the case.

Dave Klein finds excuses for TEPCO not to have used the word meltdown in early days

September 3, 2016

Expert plays down Tepco president's order not to use the term 'meltdown' in 2011 nuclear crisis

<http://www.japantimes.co.jp/news/2016/09/03/national/expert-plays-tepco-presidents-order-not-use-term-meltdown-2011-nuclear-crisis/#.V8wTNaJdeos>

Kyodo

The **head of a panel of international nuclear experts** Friday played down the importance of the decision by Tokyo Electric to not use the term “core meltdown” in describing the situation at the Fukushima No. 1 nuclear complex in the early days of the March 2011 disaster.

“They were trying to bring the reactor into a safe situation,” Dale Klein, head of the panel of five experts called the Nuclear Reform Monitoring Committee, which is overseeing Tokyo Electric Power Company Holdings Inc.’s nuclear safety efforts, said at a new conference.

“Their focus was on safety or safe operation, not necessarily a choice of words,” he said.

Klein, a former U.S. Nuclear Regulatory Commission chairman, referred to the instruction by then-President Masataka Shimizu to not use the term “core meltdown,” which was revealed in June by a third-party commission that had investigated the utility’s handling of the nuclear disaster.

Klein said that U.S. nuclear regulators also “typically do not use the word meltdown.”

On March 11, 2011, a powerful earthquake and tsunami crippled the seaside power station in Fukushima Prefecture, leading to nuclear meltdowns at three of the six reactors due to a loss of power.

Kyushu Electric will not halt plant

September 5, 2016

Kagoshima governor expresses regret

http://www3.nhk.or.jp/nhkworld/en/news/20160905_21/

The Governor of Kagoshima Prefecture Satoshi Mitazono has called Kyushu Electric Power Company's position extremely regrettable.

Mitazono had asked the operator of the Sendai nuclear power plant to suspend its 2 reactors and conduct another safety check after powerful earthquakes hit neighboring Kumamoto Prefecture in April.

Mitazono said he will soon make another request to the power company, after discussing the matter with officials and experts.

Kyushu Electric nixes governor's request to halt nuclear plant

THE ASAHI SHIMBUN

<http://www.asahi.com/ajw/articles/AJ201609050044.html>

KAGOSHIMA--Kyushu Electric Power Co. on Sept. 5 knocked back a request by Kagoshima Governor Satoshi Mitazono to immediately shut down its Sendai nuclear power plant in light of recent earthquakes in the region.

Mitazono, who was elected in July on a campaign pledge to suspend the reactor operations for a safety review, submitted his request to Kyushu Electric on Aug. 26, citing concerns about active faults around the facility.

Michiaki Uriu, president of Kyushu Electric, delivered the company's response to Mitazono in person at the Kagoshima prefectural government office.

He said the two reactors at the Sendai nuclear plant would continue to generate electricity until mandatory safety inspections are carried out later this year.

The utility did, however, promise to give stronger backing to the prefectural government's review of evacuation plans and provide more information about the plant to local residents in the event of a natural disaster or nuclear accident.

Uriu told Mitazono, "We understand your concerns in all seriousness and plan to take steps to reduce the anxiety felt by Kagoshima residents."

Mitazono expressed dismay at Kyushu Electric's decision and indicated he may submit another request to shut down the plant "if the need arises."

"I strongly requested that in the wake of the earthquakes in Kumamoto the nuclear plant should be stopped for another inspection," Mitazono said. "I wish you could abandon the mind-set that nuclear plants are infallibly safe."

In his August request, Mitazono called for an immediate suspension of the nuclear plant operations and a further safety examination on grounds that residents of Kagoshima had become more concerned after a series of earthquakes from April hit Kumamoto Prefecture bordering Kagoshima to the north.

Kyushu Electric argued that the prefectural governor does not have the legal authority to suspend nuclear plant operations, which the utility said were vital for stable corporate performance.

The company also feared that if it went along with the request it could jeopardize operations at other nuclear plants around Japan.

The Sendai plant's No. 1 reactor will undergo a periodic safety inspection from Oct. 6, and the No. 2 reactor from Dec. 16.

Kyushu Electric said the inspections will incorporate seven factors asked for by Mitazono, including the reactor pressure vessel.

The utility also said it will undertake special additional inspections covering aspects not included in the governor's request, such as whether bolts on equipment had loosened.

The company pledged to provide additional vehicles to the 16 that elderly residents can use to evacuate in the event of an accident at the plant. The offer represents the company's commitment to providing support for the planned revision of evacuation plans.

But it rejected Mitazono's request for a study of active faults in the vicinity of the Sendai plant on the grounds that a considerable number of such studies had already been conducted.

Utility will not suspend reactors despite request

http://www3.nhk.or.jp/nhkworld/en/news/20160905_20/

The operator of the Sendai nuclear power plant in southwestern Japan says it will not suspend the plant's reactors despite a request by the governor of Kagoshima Prefecture to do so in order to recheck their safety.

The operator says it will instead conduct special inspections at the same time the reactors undergo regular inspections.

On Monday, the president of Kyushu Electric Power Company Michiaki Uriu handed a written reply to Governor Satoshi Mitazono.

It was in response to a request by the governor to stop the plant in light of rising concerns among residents after strong quakes hit neighboring Kumamoto Prefecture.

Two reactors at the Sendai plant went back online last year after the government imposed stricter regulations following the 2011 accident at the Fukushima Daiichi plant.

In his reply, Uriu said during the special inspections workers will check the equipment and the functioning of facilities that the governor is requesting.

He said the inspections will be conducted at the same time as the regular inspections which are scheduled from October for the No.1 reactor, and December for the No.2 reactor.

Other measures outlined in the reply include increasing the number of quake observation points around the plant by about 10 and preparing more vehicles to evacuate people from nearby social welfare facilities.

The document also said the utility will disclose more information on the state of the plant after an earthquake strikes.

Mitazono called Uriu's reply extremely regrettable. **The governor said he will make another request after further consideration.**

Abe lied about the situation in Fukushima, says Koizumi

September 7, 2016

Former Japan PM accuses Abe of lying over Fukushima pledge

<https://www.theguardian.com/environment/2016/sep/07/former-japan-pm-junichiro-koizumi-accuses-abe-lying-over-fukushima-pledge>

Junichiro Koizumi disputes current leader's description of situation at stricken nuclear power plant as being under control.

Justin McCurry in Tokyo

Japan's former prime minister Junichiro Koizumi has labelled the country's current leader, Shinzo Abe, a "liar" for telling the international community that the situation at the wrecked Fukushima Daiichi nuclear power plant is under control.

Koizumi, who became one of Japan's most popular postwar leaders during his 2001-06 premiership, has used his retirement from frontline politics to become a leading campaigner against nuclear restarts in Japan in defiance of Abe, a fellow conservative Liberal Democratic party (LDP) politician who was once regarded as his natural successor.

Abe told members of the International Olympic Committee (IOC) in Buenos Aires in September 2013 that the situation at Fukushima Daiichi nuclear power plant was "under control", shortly before Tokyo was awarded the 2020 Games.

IOC officials were concerned by reports about the huge build-up of contaminated water at the Fukushima site, more than two years after the disaster forced the evacuation of tens of thousands of residents.

"When [Abe] said the situation was under control, he was lying," Koizumi told reporters in Tokyo. "It is not under control," he added, noting the problems the plant's operator, Tokyo Electric Power (Tepco), has experienced with a costly subterranean ice wall that is supposed to prevent groundwater from flowing into the basements of the damaged reactors, where it becomes highly contaminated.

"They keep saying they can do it, but they can't," Koizumi said. He went on to claim that Abe had been fooled by industry experts who claim that nuclear is the safest, cleanest and cheapest form of energy for resource-poor Japan.

"He believes what he's being told by nuclear experts," Koizumi said. "I believed them, too, when I was prime minister. I think Abe understands the arguments on both sides of the debate, but he has chosen to believe the pro-nuclear lobby."

After the Fukushima crisis, Koizumi said he had "studied the process, reality and history of the introduction of nuclear power, and became ashamed of myself for believing such lies".

Abe has pushed for the restart of Japan's nuclear reactors, while the government says it wants nuclear to account for a fifth of Japan's total energy mix by 2030. Just three of the country's dozens of nuclear reactors are in operation, and two will be taken offline later this year for maintenance.

Koizumi, 74, has also thrown his support behind hundreds of US sailors and marines who claim they developed leukaemia and other serious health problems after being exposed to Fukushima radiation plumes while helping with relief operations – nicknamed Operation Tomodachi (friend) – following the 11 March 2011 earthquake and tsunami.

In 2012 the service personnel launched a lawsuit accusing Tepco of failing to prevent the accident and of lying about the levels of radiation from the stricken reactors, putting US personnel at risk.

Most of the 400 plaintiffs were aboard the USS Ronald Reagan, a nuclear-powered aircraft carrier that was anchored off Japan's north-east coast while helicopters flew emergency supplies to survivors of the tsunami, which killed almost 19,000 people.

Medical experts, however, said the sailors would have received only small, non-harmful doses of radiation; a US defence department report published in 2014 said no link had been established between the sailors' health problems and their exposure to low doses of Fukushima radiation.

Koizumi, who met several of the sick servicemen in San Diego in May, plans to raise \$1m by the end of next March to help cover the sailors' medical expenses.

“I felt I had to do something to help those who worked so hard for Japan,” he said. “That won’t be enough money, but at least it will show that Japan is grateful for what they did for us.”

Despite his opposition to Abe’s pro-nuclear policies, Koizumi was complimentary about his performance as prime minister during his second time in office in the past decade.

“As far as nuclear power is concerned, we are totally at odds,” Koizumi said. “But I think he’s reflected on the mistakes he made during his first time as leader and is doing a much better job second time around.”

In political longevity terms, Abe’s performance could hardly be worse. He resigned in September 2007 after less than a year in office, following a series of ministerial scandals, a debilitating bowel condition and a disastrous performance by the LDP in upper house elections.

Koizumi's anti-nuclear conviction

September 7, 2016

Despite dwindling momentum, Koizumi pursues anti-nuclear goals

http://www.japantimes.co.jp/news/2016/09/07/national/politics-diplomacy/despite-dwindling-momentum-koizumi-pursues-anti-nuclear-goals/#.V8_1vDVdeos

by Ayako Mie
Staff Writer

While Japan's once-charged anti-nuclear movement struggles to retain its momentum five years after the 2011 Fukushima catastrophe, former Prime Minister Junichiro Koizumi remains doggedly determined to attain his goal of ending the country's reliance on atomic energy.

On Wednesday, he renewed his pledge to help ill U.S. veterans whose conditions they claim are linked to the release of radioactive plumes from the Fukushima No. 1 nuclear plant.

Koizumi, who is opposed to Prime Minister Shinzo Abe's pro-nuclear stance, says Japan can be put on a sustainable path without atomic power.

"The nuclear power industry says safety is their top priority, but profit is in fact what comes first,"

Koizumi told an audience of more than 180 who had gathered for his news conference at the Foreign Correspondents' Club of Japan in Tokyo. "Japan can grow if the country relies more renewable energy."

As part of his anti-nuclear push, the 74-year-old former leader set up a fund in July to help U.S. sailors with conditions such as leukemia that they say was caused by radioactive fallout from Fukushima No. 1. He said the fund has raised about ¥40 million so far, with a goal of topping ¥100 million by next March 31.

In May, Koizumi visited Carlsbad, California, to speak to several veterans with health conditions who had taken part in Operation Tomodachi while aboard the aircraft carrier USS Ronald Reagan.

Those veterans had provided humanitarian assistance and disaster relief to the Tohoku region after quake and tsunami of March 11, 2011, at the request of the Japanese government.

"After talking to the sailors, I thought it would not be enough for me to simply say 'I'm sorry' and leave," Koizumi said, explaining the impetus for setting up the fund. "Words alone would not be enough and I thought that I had to do something."

Currently, about 400 U.S. veterans are taking part in a class-action lawsuit in California against Tokyo Electric Power Company Holdings Inc., operator of the stricken plant. The lawsuit says that some suffer from leukemia, testicular cancer and thyroid problems, or have experienced rectal and gynecological bleeding.

However, a 2014 report by the U.S. Defense Department determined that there were no causal relationship between radiation exposure during Operation Tomodachi and their illnesses.

Koizumi noted that while expressing sympathy for the veterans, a Foreign Ministry official had even said that there was nothing the Japanese government could do.

"I'm not a doctor, but using common sense one can infer their conditions were caused by radiation, since strong and healthy sailors just don't find tumors or suffer from conditions like nasal hemorrhages," Koizumi said.

He was a backer of nuclear power while leader between 2001 and 2006.

But Fukushima changed all that.

After the disaster, he became one of the most outspoken opponents of atomic energy, calling the often-repeated mantra of "clean, safe, cheap" nuclear power a lie. With the shift, he set up a foundation with former Prime Minister Morihiro Hosokawa in 2014 to call for an immediate phasing out of nuclear power to be replaced with a renewable energy policy.

Yet, Abe's government sees nuclear energy as a key plank in his bid to export infrastructure and hopes to restart the nation's reactors so that nuclear can supply 20 to 22 percent of Japan's electricity by 2030. Currently, two reactors at the Sendai power plant in Kagoshima Prefecture and one reactor at the Ikata plant in Ehime Prefecture are operating.

On Wednesday a request by Kagoshima Gov. Satoshi Mitazono to suspend power generation at the Sendai plant was snubbed by operator Kyushu Electric Power Co.

Japanese and Chinese communists don't agree on nuke ban

September 6, 2016

Japanese, Chinese communists clash over nuclear ban

JJI

<http://www.japantimes.co.jp/news/2016/09/06/national/politics-diplomacy/japanese-chinese-communists-clash-nuclear-ban/#.V88N2TVdeos>

Japanese and Chinese communists fought fiercely over whether to include a ban on nuclear weapons in a joint statement issued at the **International Conference of Asian Political Parties in Malaysia last week**. During the three-day meeting through Saturday, the Japanese Communist Party insisted on adopting a statement in line with a draft that called for promptly holding negotiations to conclude a nuclear weapons ban treaty, according to Akira Koike, head of the JCP secretariat. But the Communist Party of China labeled the draft as hegemonic, saying it forced a certain position. The JCP rejected the criticism, but the wording in question was eventually removed, as demanded by the CPC.

"It was very unjustifiable," Koike told a news conference Monday in Tokyo. "Such a development had never been seen since the normalization of ties between the two parties in 1998."

The JCP has submitted a written protest to the forum, saying that one delegation's behavior was out of the norm and extremely autocratic, Koike revealed.

"Controlled release" of contaminated water safer than uncontrolled...

September 6, 2016

Tepco adviser says treated Fukushima water safe for release into Pacific Bloomberg

<http://www.japantimes.co.jp/news/2016/09/06/national/science-health/tepco-adviser-says-treated-fukushima-water-safe-release-pacific/#.V88NkTVdeov>

Treated water from the Fukushima No. 1 nuclear plant is **safe to be released under controlled circumstances into the Pacific Ocean**, according to an independent Tepco adviser.

"It is much better to do a controlled release in my view than to have an accidental release," Dale Klein, a former chairman of the U.S. Nuclear Regulatory Commission, said in an interview in Tokyo. "I get nervous about just storing all that water when you have about 1,000 tanks. You have all the piping, all the valves, everything that can break."

More than five years after the meltdowns at Fukushima No. 1, Tokyo Electric Power Company Holdings Inc. continues to struggle to contain the radiation-contaminated water that inundates the plant.

About 300 tons of water — partly from the nearby hills — flows into the reactor buildings daily, mixing with melted fuel and becoming tainted, according to Tepco. For perspective, that’s roughly the amount of water contained in one lane of an Olympic-size swimming pool.

The water is currently pumped out of the buildings and purified, lowering its radioactive content with a system called Advanced Liquid Processing System, or ALPS. **The treated water, which still contains a radioactive element known as tritium,** is then stored in one of roughly 1,000 tanks at the site.

What to do with the treated water remains a headache for Tepco.

The utility was urged by the International Atomic Energy Agency in May 2015 to consider discharging the water into the ocean.

In early 2014, Klein, an independent adviser to Tepco, criticized the company’s progress in managing the water situation, saying at the time that the task distracted it from other important challenges associated with the cleanup.

Tepco will cooperate with the government, local authorities and fishermen regarding what to do with the tritium water, spokesman Tatsuhiro Yamagishi said.

As of July 28, Tepco stored 668,352 tons of treated water at Fukushima No. 1, while 188,462 tons of untreated water was waiting in a second set of tanks to be processed by ALPS, according to Yamagishi.

The government agency overseeing handling of the treated water has not decided whether to go ahead with an ocean release because it needs to “weigh any potential impact on society,” according to an official who asked to not be named, citing internal policy.

“I hope the government will help move toward a decision,” Klein said.

Nuclear power plants routinely and safely release diluted concentrations of tritium-laced water, according to the U.S. Nuclear Regulatory Commission.

Release of the “water will not be a safety issue, but it will be an emotional issue,” Klein said. “A lot of people are not going to know what tritium is and they’re just going to perceive that the water is glowing in the dark.”

Disappointing

Kagoshima governor hints at dropping action to halt nuclear reactors

<http://www.japantimes.co.jp/news/2016/09/09/national/kagoshima-governor-hints-dropping-action-halt-nuclear-reactors/#.V9LNWzVdeos>

Kyodo

KAGOSHIMA – Kagoshima Gov. Satoshi Mitazono suggested Friday he may give up on his pursuit to have Kyushu Electric Power Co. immediately suspend the operation of two reactors at its nuclear power plant in the southwestern prefecture after the utility’s president again rejected the request.

“Thinking realistically, time is short before (the reactors will go through) regular checkups,” Mitazono said when asked by reporters whether he will ask the utility again to immediately halt the operation of the reactors.

A roughly two-month-long regular checkup is scheduled to begin for the Nos. 1 and 2 reactors at the Sendai plant from Oct. 6 and from Dec. 16, respectively, during which the plant's operation will be suspended.

Mitazono's remarks came after he received a written rejection from Kyushu Electric President Michiaki Uriu, who instead promised additional safety measures.

"I've been calling for the early suspension. It's regrettable," Mitazono, elected on an anti-nuclear platform in July, told Uriu in a meeting at the Kagoshima Prefectural Government office building.

Kyushu Electric said in writing that its rejection reflected the Nuclear Regulation Authority's view that there was no need to suspend operations of the two-reactor complex in Satsumasendai.

The utility presented a plan to conduct special checkups prior to the scheduled start of regular checks, prepare additional vehicles to help evacuate residents living within 30 kilometers of the nuclear complex in case of a nuclear accident and help remove fallen trees and other objects on evacuation roads when they are blocked after earthquakes and other disasters.

As for the enhanced safety steps, Mitazono said his calls for the reactors' immediate suspension have contributed to advancing the complex's safety "a few steps forward."

Mitazono has been calling for the immediate suspension of the two reactors at the Sendai complex, citing local worries about the plant's safety after major earthquakes rocked neighboring Kumamoto Prefecture and its vicinity in April.

Currently, the two Sendai reactors and one reactor at Shikoku Electric Power Co.'s Ikata plant in Ehime Prefecture are operating in Japan after passing tougher safety checks introduced in the wake of the Fukushima nuclear crisis triggered by a powerful earthquake and tsunami in March 2011.

Prefectural governors have no legal power to suspend the operation of reactors.

Forcing (customers of) new power suppliers to pay for decommissioning

September 8, 2016

Gov't may shift nuke accident, reactor decommissioning costs onto new power suppliers

<http://mainichi.jp/english/articles/20160908/p2a/00m/0na/006000c>

The government is moving to bill new electricity suppliers for a portion of nuclear reactor decommissioning costs and compensation payments related to the Fukushima nuclear disaster, it was learned on Sept. 7.

- **【Related】** Consumer affairs minister suggests move away from nuclear power following deregulation
- **【Related】** Editorial: Make consumer benefits focal point of electricity market deregulation

After decades under regional utility monopolies, the electricity supply market was opened to competition in April this year. The government apparently fears that the old monopolies such as Tokyo Electric Power

Co. (TEPCO) lose too many customers to new suppliers and they may no longer be able to cover the high costs of decommissioning old reactors or compensate the victims of nuclear accidents, hence the move to shift some of the financial burden onto new market entrants.

However, these costs were originally supposed to be covered by the nine big utilities, and the government's moves would essentially transfer that burden onto the Japanese people, making a clash more than likely.

Under the current system, large utilities must cover nuclear reactor operating expenses -- including eventual decommissioning -- from electricity bill income. Also, TEPCO receives monies to cover Fukushima nuclear disaster compensation claims from the government-licensed Nuclear Damage Compensation and Decommissioning Facilitation Corp. (NDF), which is in turn funded by all the large utility companies.

The new system being considered by the government would spread the financial burden of nuclear accident compensation and reactor decommissioning to new electricity suppliers, lightening the load on the big utilities. The government estimates the total cost for reactor decommissioning plus Fukushima nuclear disaster compensation paid before the NDF was established at some 8 trillion yen. The new power suppliers would likely pass on their share of these costs to their customers, resulting in monthly power bills up to about 200 yen higher than at present for an average three-person household.

However, forcing customers of the new electricity firms to pay for the old utilities to decommission their reactors and for TEPCO's nuclear disaster liabilities runs counter to the goals of liberalizing the electricity market, which was intended to push down prices through competition. It would also in essence be **corporate welfare** for the big utilities operating nuclear plants.

A sub-committee to debate the new system will be established under the Advisory Committee for Natural Resources and Energy reporting to the minister of economy, trade and industry. The committee will decide on what direction to take by the end of this year, with an eye to submitting a bill to revise the Electricity Business Act to the ordinary Diet session next year.

Abe lied about the situation in Fukushima (2)

September 7, 2016

Koizumi: Abe's Fukushima 'under control' pledge was a lie

<http://www.asahi.com/ajw/articles/AJ201609070073.html>

REUTERS

Prime Minister Shinzo Abe's promise that the crippled Fukushima nuclear plant was "under control" in his successful pitch three years ago for Tokyo to host the 2020 Olympic Games "was a lie," former Prime Minister Junichiro Koizumi said on Wednesday.

Koizumi, one of Japan's most popular leaders during his 2001-2006 term, became an outspoken critic of nuclear energy after a March 2011 earthquake and tsunami triggered meltdowns at Tokyo Electric Power Co.'s (TEPCO) Fukushima No. 1 nuclear power plant, the worst nuclear disaster since Chernobyl in 1986.

Abe gave the assurances about safety at the Fukushima plant in his September 2013 speech to the International Olympic Committee to allay concerns about awarding the Games to Tokyo. The comment met with considerable criticism at the time.

"Mr. Abe's 'under control' remark, that was a lie," Koizumi, now 74 and his unruly mane of hair turned white, told a news conference where he repeated his opposition to nuclear power.

"It is not under control," Koizumi added, citing as an example TEPCO's widely questioned efforts to build the world's biggest "ice wall" to keep groundwater from flowing into the basements of the damaged reactors and getting contaminated.

"They keep saying they can do it, but they can't," Koizumi said. Experts say handling the nearly million tons of radioactive water stored in tanks on the Fukushima site is one of the biggest challenges.

Koizumi also said he was "ashamed" that he had believed experts who assured him that nuclear power was cheap, clean and safe and that resource-poor Japan had to rely on nuclear energy.

After the Fukushima crisis, Koizumi said, "I studied the process, reality and history of the introduction of nuclear power and became ashamed of myself for believing such lies."

All Japan's nuclear plants--which had supplied about 30 percent of its electricity--were closed after the Fukushima disaster and utilities have struggled to get running again in the face of a skeptical public. Only three are operating now.

Abe's government has set a target for nuclear power to supply a fifth of energy generation by 2030.

The meltdowns in three Fukushima reactors spewed radiation over a wide area of the countryside, contaminating water, food and air. More than 160,000 people were evacuated from nearby towns.

High time to put an end to Monju once "dream reactor"

September 4, 2016

Monju and the nuclear fuel cycle

<http://www.japantimes.co.jp/opinion/2016/09/04/editorials/monju-nuclear-fuel-cycle/#.V8wUC6Jdeos>

Media reports that the government is finally weighing whether to pull the plug on the Monju fast-breeder reactor in Tsuruga, Fukui Prefecture, due to the massive cost needed to restart the long-dormant facility, should come as no surprise. Once touted as a "dream reactor" for an energy-scarce country that produces more plutonium than it consumes as fuel, Monju has been a nightmare for national nuclear power policy for the past two decades. The sole prototype reactor for this kind of technology has been in operation a mere 250 days since it first reached criticality in 1994. It has mostly been offline since a 1995 sodium coolant leak and fire. Its government-backed operator has been declared unfit by nuclear power regulators to run the trouble-prone reactor, and the education and science ministry, in charge of the project, has not been able to find a viable solution.

More than ¥1 trillion in taxpayer money has so far been spent on Monju, and maintenance alone costs ¥20 billion a year. Restarting the reactor under the Nuclear Regulation Authority's new safety standards would cost another several hundred billion yen, including the expense of replacing its long-unused fuel as well as its aging components — though there would still be no guarantee that it would complete its mission of commercializing fast-breeder reactor technology.

The Abe administration may think that writing off the ill-fated costly project, even with the projected ¥300 billion cost of decommissioning the facility over 30 years, will help win more public support for its policy of seeking to reactivate the nation's conventional reactors — most of which remain idled in the wake of the 2011 meltdowns at Tokyo Electric Power's Fukushima No. 1 plant — once they've cleared the NRA screening. Public concerns over the safety of nuclear energy remain strong after the Fukushima disaster, with media surveys showing a large portion of respondents still opposed putting the idled reactors back online.

If it is going to decide to decommission the Monju reactor, however, the government should also rethink its pursuit of the nuclear fuel cycle — in which spent fuel from nuclear power plants is reprocessed to extract plutonium for reuse as fuel. Monju, which runs on plutonium-uranium mixed oxide (MOX) fuel, has been a core component of the program. As Monju remained dormant for more than 20 years, the government and power companies have shifted the focus of the policy to using MOX fuel at regular nuclear power plants. The No. 3 reactor at Shikoku Electric Power's Ikata plant in Ehime Prefecture, which resumed operation in August, runs on MOX fuel. The government apparently thinks the Monju program is no longer essential to the policy.

But the nuclear fuel cycle itself has proven elusive, and some say the policy has already collapsed. It is still nowhere in sight when the nuclear fuel reprocessing plant in Rokkasho, Aomori Prefecture — another key component in the program and whose construction began in 1993 — will be ready for operation. After its scheduled completion in 1997 has been delayed by more than 20 times due to a series of technical glitches and other problems, its construction cost has ballooned three times the original projection to ¥2.2 trillion.

If indeed the Rokkasho facility is completed and starts reprocessing spent fuel from power plants across the country, the Ikata power plant is currently the only one in operation that consumes plutonium-uranium fuel. It's not clear how many more will be up and running in the years ahead given the slow pace of restarting the idled reactors, and the Rokkasho facility operating without a sufficient number of reactors using MOX fuel would only add to Japan's stockpile of unused plutonium — which has already hit 48 tons.

If it's the cost problem that's finally spelling doom for the Monju project, the government and power companies should also consider the cost-efficiency of the nuclear fuel cycle program, including the extra cost of reprocessing spent fuel into MOX fuel. They should also think about whether the program is compatible with the government's stated policy — though its commitment may be in doubt — of seeking to reduce Japan's dependency on nuclear power as an energy source.

Monju has drifted on for years after its future was clearly in doubt. A decision now to terminate the project seems sensible. Such a decision should also prompt the government to stop and consider whether its nuclear fuel cycle still makes sense.

All's well in Fukushima's paradise

September 10, 2016

Study draws a blank on thyroid cancer and 2011 nuclear disaster

<http://www.asahi.com/ajw/articles/AJ201609100031.html>

By TERU OKUMURA/ Staff Writer

Researchers have found no correlation between radiation exposure and the incidence rate of thyroid cancer among 300,000 children living in Fukushima Prefecture at the time of the 2011 nuclear disaster. But the team at Fukushima Medical University, which carried out the study, cautioned that the health of local children should continue to be monitored to be more definitive.

“At the present stage, we have found no evidence pointing to any relationship between doses of external radiation resulting from the nuclear accident and the thyroid cancer rate,” said Tetsuya Ohira, a professor of epidemiology at the university. “But we need to continue to look into the situation.”

The study involves 300,476 children in Fukushima Prefecture who were aged 18 or younger when the Fukushima No. 1 nuclear power plant went into a triple meltdown in March 2011 after the Great East Japan Earthquake and tsunami.

The children underwent the first round of health checks between October 2011 and June 2015.

Of the total, 112 were tentatively diagnosed as having thyroid cancer.

There are two types of radiation exposure: external exposure in which a person is exposed to radiation in the atmosphere, and internal exposure in which a person is exposed through the intake of contaminated food, water and air.

For the study, municipalities in the prefecture were classified into three groups based on the estimate for residents' external exposure. That data was obtained during a prefecture-wide health survey carried out after the disaster occurred.

The first group is a zone where people with an accumulative dose of 5 millisieverts or more represented 1 percent or more of the population there. The second group is a zone where people with an accumulative dose of up to 1 millisievert account for 99.9 percent or more of the population. The third group is a zone that falls into neither of the other two groups.

The scientists looked at the incidence rate for thyroid cancer in each group and concluded there is almost no difference among the groups.

The number of subjects diagnosed with thyroid cancer was 48 per 100,000 people in the first group, 41 in the second group and 36 in the third group.

The finding was similar to a separate survey in which researchers looked into the possible association among 130,000 or so children whose radiation exposure had been estimated.

Hokuto Hoshi, head of a health survey panel set up at the prefectural government after the nuclear disaster, said he will closely follow the results of future studies to offer a more conclusive finding.

“The outcome of the recent study provides one indication in making any overall judgment,” said Hoshi, who also serves as vice chairman of the Fukushima Medical Association. “The study is substantial and we are going to pay attention to the findings of further studies.”

All's well in Fukushima's paradise (2)

"Prevalence of thyroid cancer for the location groups were 48/100,000 for the highest dose area, 36/100,000 for the middle dose area, and 41/100,000 for the lowest dose area."

<http://journals.lww.com/md->

[journal/Abstract/2016/08300/Comparison_of_childhood_thyroid_cancer_prevalence.15.aspx#](http://journals.lww.com/md-journal/Abstract/2016/08300/Comparison_of_childhood_thyroid_cancer_prevalence.15.aspx#)

Abstract: The 2011 Great East Japan Earthquake led to a subsequent nuclear accident at the Fukushima Daiichi Nuclear Power Plant. In its wake, we sought to examine the association between external radiation dose and thyroid cancer in Fukushima Prefecture. We applied a cross-sectional study design with 300,476 participants aged 18 years and younger who underwent thyroid examinations between October 2011 and June 2015. Areas within Fukushima Prefecture were divided into three groups based on individual external doses ($\geq 1\%$ of 5mSv, $< 99\%$ of 1mSv/y, and the other). The odds ratios (ORs) and 95% confidence intervals of thyroid cancer for all areas, with the lowest dose area as reference, were calculated using logistic regression models adjusted for age and sex. Furthermore, the ORs of thyroid cancer for individual external doses of 1 mSv or more and 2mSv or more, with the external dose less than 1mSv as reference, were calculated. Prevalence of thyroid cancer for the location groups were 48/100,000 for the highest dose area, 36/100,000 for the middle dose area, and 41/100,000 for the lowest dose area. Compared with the lowest dose area, age-, and sex-adjusted ORs (95% confidence intervals) for the highest-dose and middle-dose areas were 1.49 (0.36–6.23) and 1.00 (0.67–1.50), respectively. The duration between accident and thyroid examination was not associated with thyroid cancer prevalence. There were no significant associations between individual external doses and prevalence of thyroid cancer. External radiation dose was not associated with thyroid cancer prevalence among Fukushima children within the first 4 years after the nuclear accident.

Comments from the webmaster: There seems to be a mistake in the way the groups were presented in the precedent article

Study draws a blank on thyroid cancer and 2011 nuclear disaster

<http://www.asahi.com/ajw/articles/AJ201609100031.html>

According to the above abstract, it should read:

group 1: 48/100.000

group 2: 36/100.000

group 3: 41/100.000

More importantly, what we are talking about here is the possible effect of **external** radiation. Has the dose of internal radiation (inhaled or ingested by the children) not been taken into account at all in this study?

TEPCO admits security awareness (at F. Daini) has been decreasing

September 13, 2016

NRA: TEPCO kept alarm silent at Fukushima Daini

http://www3.nhk.or.jp/nhkworld/en/news/20160912_26/

Japan's nuclear regulator has issued a warning to Tokyo Electric Power Company after a legal violation was found at its Fukushima Daini nuclear plant. **The utility had deactivated the alarm of an entry sensor.**

The Nuclear Regulation Authority says the violation was found during an inspection at the plant last October. **The warning sound on a detector preventing intrusions from outside was disabled.**

TEPCO officials told the authority that the alarm was turned off after the detector was repeatedly activated by moving objects other than people. The officials said the workers in charge of security at the plant had made the decision.

The officials told the authority that they found the alarm had been switched off on a daily basis. **They admitted that security awareness had been decreasing.**

The authority on Monday warned TEPCO that alternative measures to ensure security were not sufficient. They said disabling the alarm was a legal violation that could become a serious problem.

The authority also instructed the utility to prevent a recurrence.

TEPCO officials say the company will take thorough measures including training its employees and improving problem solving methods.

The purpose of deregulation

September 14, 2016

Power retail deregulation

<http://www.japantimes.co.jp/opinion/2016/09/14/editorials/power-retail-deregulation/#.V9o6hzVdeov>

The increase in the number of customers of new entrants to the electricity retail market following the market deregulation in April appears to be slowing down rapidly. It may be too early to judge whether this endangers **the purpose of the deregulation — to introduce greater competition in power retail and benefit consumers through lower charges and better and more diverse services.** Still, the government should assess the situation and see what more needs to be done to ensure a competitive environment in the market previously dominated by regional monopolies.

Capping a series of market liberalization since the late 1990s, electricity retail to small-scale users such as households and small shops was opened up for new entrants to the business in April, enabling consumers to choose the power suppliers they want, no longer bound by the contracts with 10 big power firms that each monopolized supply to the region they service. The deregulation led more than 300 new entrants to the power retail market from various non-electricity sectors, ranging from city gas suppliers such as Tokyo Gas and Osaka Gas, oil wholesalers like JX Nippon Oil & Energy and telecom carriers such as SoftBank. Some of the new power suppliers have been established by local governments.

More than five months on, households across the country that have switched power supply contracts to new entrants account for less than 3 percent of the total, according to the Organization for Cross-Regional

Coordination of Transmission Operations, which adjusts electricity supply and demand on a nationwide basis. Most of the customers of the new suppliers are concentrated in the greater Tokyo area and the Kansai region — with roughly 60 percent of them in the area formerly monopolized by Tokyo Electric Power and 20 percent in the area serviced by Kansai Electric Power — likely a reflection of the still limited number of new market entrants in other parts of the country.

To crack open a market that has been dominated by regional monopolies for decades, the new suppliers offer various new plans to attract customers — in most cases packaging at discount their own services such as gas and mobile phones with power supply to households. Some of the plans enable customers to accumulate points usable for shopping in accordance with their payment of electricity charges. Some of the new suppliers sell electricity that to a large portion has been generated by renewable sources such as solar and wind.

The market liberalization seemed to generate enough consumer interest. In April alone, roughly 820,000 households switched their contracts to new suppliers. But the pace of increase has since slackened, with the number standing at around 1.5 million as of the end of July.

Slow growth in the number of customers spells trouble for many of the new entrants to the business.

Unless there are enough customers and sales for the new participants in the market, the purpose of the deregulation — to develop a full-scale power retail market — may be at risk. Experiences in other advanced economies that have already liberalized retail electricity do not seem to bode well for Japan — **in many countries the market deregulation resulted in major power companies dominating the market over time.**

A survey by Mitsubishi Research Institute quotes consumers as saying that they do not consider switching contracts to new power suppliers because they think that the procedure is too cumbersome, that it's hard to see the benefits of the plans offered by the new firms and that electricity charges would not go down significantly after all.

The new power suppliers can address some of this skepticism on the part of the consumers through their own efforts, such as simplifying the procedures for switching to their services and improving the way they publicize their plans. On the other hand, there will be limits to the discounts they can offer against the services of the major power firms. A household is generally said to save up to about ¥1,000 a month in electricity charges by switching the power supply contract to one of the new suppliers. That relatively modest amount may not be as attractive for consumers as, for example, discount smartphone services. There will be various things that can and should be done to promote development of the power retail market in this country. The government, for its part, should further establish a market environment that facilitates competition between the major power firms and new entrants to the business. One idea would be to expand an electricity wholesale market where small suppliers that do not have power-generation facilities can procure electricity for retail.

Reform of the nation's electricity business is not yet complete. Separation of the former regional monopolies' power-generation facilities and power transmission and distribution segments is planned in 2020. The key will be **ensuring fair access to the electricity transmission and distribution networks to all power retailers so that they compete on an equal footing.** The government must not lose track of the purpose of the power sector reforms in proceeding with these measures.

6.000 workers every day at Kashiwazaki-Kariwa plant

September 16, 2016

TEPCO keeps thousands on the clock at idled Kashiwazaki-Kariwa plant, hoping for restart

<http://www.japantimes.co.jp/news/2016/09/16/national/tepc-keeps-thousands-clock-idled-kashiwazaki-kariwa-plant-hoping-restart/#.V9un-DVdeou>

by Emi Urabe

Bloomberg

More than 6,000 workers cycle through the world's biggest nuclear plant every day **to operate and maintain a facility that hasn't sold a kilowatt of electricity in more than four years.**

The buzz at Tokyo Electric Power Co. Holdings Inc.'s Kashiwazaki-Kariwa plant plays out daily across Japan, where utilities employ thousands of workers and spend billions of dollars awaiting the green light to restart commercial operations. With only three of the country's 42 operable reactors running, they're betting a central government committed to nuclear power will win over local officials and a wary public who don't believe enough has been done to guarantee safety since the worst meltdown disaster since Chernobyl.

"Even though operating expenses of nongenerating reactors remain high, utilities would prefer to keep them open while there is any chance they can restart," said James Taverner, a Tokyo-based analyst at IHS Markit Ltd. "Utilities have already committed significant expenditure for plants to meet new safety standards, and decommissioning costs are considerable."

The nine biggest regional utilities spent more than ¥1.5 trillion (\$14.6 billion) on their nuclear plants during the year to March, according to Bloomberg calculations based on the latest earnings reports. Over that same period, those plants accounted for just 1.1 percent of the nation's electricity.

Nuclear-related costs accounted for 9 percent of all operating expenses at the utilities in the previous fiscal year, according to the calculations. That includes personnel and maintenance, as well as waste disposal and contributions to the nation's nuclear damage compensation system.

The burden of paying for nuclear facilities producing little electricity has been softened by price declines in recent years for coal, natural gas and oil, which are also used as fuels for power generation. Tepco sees itself swinging to a net loss as fossil fuel prices recover, **making the restart of Kashiwazaki-Kariwa key to profitability,** Naomi Hirose, the company's president, said in an interview earlier this year.

Costs for operating the country's nuclear facilities were slightly higher before the March 2011 Fukushima disaster, at about ¥1.7 trillion a year, when atomic energy accounted for nearly 30 percent of Japan's electricity mix. Tokyo Electric estimates that restarting one of the newest reactors at Kashiwazaki-Kariwa — known as KK — would boost net income by as much as ¥10 billion a month.

Tepco's plant, the world's biggest with about 8.2 gigawatts of generating capacity, has seven reactors at a facility spread across more than 1,000 acres (400 hectares) in Niigata Prefecture.

Workers clad in jumpsuits and loaded down with manuals convene daily in a mock-up of the reactor control room, preparing for the restart of the plant under new safety guidelines imposed after the Fukushima meltdowns.

"Everyday, this room is full of workers, from fresh employees to old veterans, sharpening their skills," Nobuyuki Suzuki, a deputy manager in the company's human resources development group, said at the KK plant last month. "Operators at this facility are required to go through training here on a regular schedule."

About three-fourths of the Tepco employees and contract workers at the plant are from the prefecture hosting the facility, making it **one of the area's biggest economic drivers**.

The plant is an economic windfall for the region, employing thousands of workers and supporting restaurants, shops and even taxi companies, according to Masayoshi Oota, an official from the village of Kariwa. "If the (reactors) were to disappear, then so would the economic benefit," he said.

The nuclear energy industry employs more than 80,000 engineers, construction workers and operators, according to a report published by the Ministry of Economy, Trade and Industry last year.

To boost confidence in the giant facility's safety, Tokyo-based Tepco has spent ¥470 billion on flood barriers, a 15-meter seawall and a reservoir the size of 30 Olympic-size swimming pools to supply water in the event a reactor pump fails.

KK's restart is far from assured. The plant was forced to shut for 21 months following a strong earthquake in July 2007. Though some units eventually restarted, all were shuttered again after the March 2011 Fukushima debacle started, for safety checks.

There is skepticism among the public. The restart of nuclear reactors is opposed by 53 percent of Japanese and supported by just 30 percent, according to a nationwide poll conducted earlier this year by the Mainichi newspaper.

Local courts and governments have been some of the biggest roadblocks to restarting more reactors, crimping Prime Minister Shinzo Abe's goal of deriving as much as 22 percent of the nation's energy needs from nuclear by 2030. Goldman Sachs Group Inc. lowered its price target on six Japanese power utilities this month on risk of delays in restarting operations or renewed shutdowns.

"While some reactors have been restarted, the method to shut them down again (is) evolving," Goldman analyst Hiroyuki Sakaida wrote in a report dated Sept. 14. "We think it will be difficult to fully price in nuclear restarts and restored dividends until fundamental solutions are found to resolve the economic uncertainty surrounding nuclear power operations."

Should the plant clear the necessary regulatory, legal and political hurdles and resume operations, Tepco plans to maintain the facility's workforce at current levels, a reflection of how many workers are needed even during a period called cold shutdown.

"Right now we are focused on the nation's regulatory review of the plant," said Chikashi Shitara, facility chief at KK. "Even though the plant isn't running, there is still a lot we must do."

Chiba nuke waste "not radioactive"

July 22, 2016

7.7 tons of Chiba's Fukushima waste won't be deemed radioactive anymore, clearing way for general disposal

http://www.japantimes.co.jp/news/2016/07/22/national/7-7-tons-of-chibas-fukushima-waste-wont-be-deemed-radioactive-anymore-clearing-way-for-general-disposal/#.V5Rh5RHr1_8

JJI

CHIBA – The government on Friday informed the city of Chiba that the radioactive designation for 7.7 tons of Fukushima-tainted waste stored in the city will be lifted on Saturday, allowing it to be treated as general garbage.

State Minister of the Environment Shinji Inoue conveyed the decision to Chiba Mayor Toshihito Kumagai during a meeting at City Hall in Chiba Prefecture's capital.

The decision came after it was found that the radioactive activity of cesium in the waste had fallen below the state-set limit of 8,000 becquerels per kilogram.

It will be the first time for such a designation to be lifted for such waste.

The waste was part of the aftermath of the massive earthquake and subsequent tsunami of March 2011, which triggered a triple core meltdown at the Fukushima No. 1 power plant. The defunct plant is owned by Tokyo Electric Power Holdings Inc.

Some 3,700 tons of designated radioactive waste created by the man-made meltdowns, including incineration ash, is stored in Chiba. The 7.7 tons in question is sitting in a garbage disposal facility in Mihama Ward in Chiba.

The lifting of the designation will allow the city to dispose of the waste in the same way as general waste. But Kumagai has expressed his intention to keep it in storage for the time being.

As of the end of March, 172,899 tons of such designated waste was being stored in Chiba, Tokyo and 10 other prefectures in eastern Japan.

7,7 Tonnen Fukushima-Müll "nicht-radioaktiv"

13.09.2016

Im Juli 2016 informierte die japanische Regierung die Stadt Chiba, dass für 7,7 Tonnen radioaktive Abfälle, die durch die Atomkatastrophe von Fukushima verursacht worden waren, die Kennzeichnung „radioaktiv“ aufgehoben wird. Bei dem strahlenden Müll handelt es sich vor allem um kontaminiertes Erdreich und Dekontaminationsabfälle. Die Entscheidung beruht darauf, dass die Cäsium-Radioaktivität mittlerweile unter den staatlichen Grenzwert von 8.000 Becquerel pro Kilogramm gefallen war. Zum Vergleich: normales oberflächliches Erdreich hat eine Cäsium-Konzentration von 10-110 Becquerel pro Kilogramm. Nach der Atomkatastrophe von Fukushima wurden im ganzen Land radioaktiv kontaminierte Flächen abgetragen und gemeinsam mit anderen verseuchte Materialien in großen Mengen zusammengetragen. Da Stauraum für den strahlenden Müll in der Präfektur Fukushima knapp wurde, begann man, ihn auch in andere Präfekturen zu transportieren. Chiba liegt ca. 200 Kilometer südlich von Fukushima, in der Nähe von Tokio.

Die Gesamtmenge der in Chiba, Tokio und 10 anderen Präfekturen im östlichen Japan als radioaktiv gekennzeichnete Abfälle wurden Ende März 2016 mit 172.899 Tonnen angegeben. Durch die

Entscheidung können die Abfälle nun formal als allgemeiner, nicht-radioaktiver Müll behandelt werden. Der Bürgermeister von Chiba, Toshihito Kumagai, hat zwar die Absicht bekundet, sie auf absehbare Zeit weiterhin in dem bisherigen Lager zu belassen, aber die Gefahr besteht, dass radioaktiver Müll in den normalen Abfallverwertungskreislauf eingespeist wird. So würden nicht nur zahlreiche MitarbeiterInnen der Abfallentsorgung mit erhöhten Strahlenwerten belastet werden, sondern auch die Allgemeinbevölkerung. Hausmülldeponien sind nicht adäquat für die Lagerung von radioaktiven Stoffen ausgelegt so könnten strahlende Partikel wie Cäsium, Tritium oder Strontium über viele Jahrzehnte ins Grundwasser und die Umgebung abgegeben werden. Zudem werden große Mengen des Mülls verbrannt, so dass auch eine erneute Freisetzung der radioaktiven Stoffe in die Atmosphäre droht. Man weiß heute, dass jede auch noch so geringe Menge an Strahlung mit einer Erhöhung des Krebsrisikos einhergeht und so sind staatliche Grenzwerte nur ein schwacher Trost für die Menschen, die in der Nähe von Mülldeponien leben, in denen strahlender Müll aus Fukushima gelagert oder verbrannt wird. Ein ähnliches Problem existiert derzeit auch in Deutschland, wo die strahlenden Abfälle der zurückgebauten Atomkraftwerke ebenfalls „freigemessen“ und anschließend in die normale Abfallverwertung eingespeist werden sollen. Die IPPNW setzt sich entschieden gegen diese Ausbreitung radioaktiver Materialien in der Umwelt ein.

TEPCO wants more help from Govt.

Panel to examine options for wrecked Fukushima plant

<http://www.japantimes.co.jp/news/2016/09/20/business/panel-examine-options-wrecked-fukushima-plant/#.V-DkJzVdeos>

Kyodo

A panel of experts will discuss reforms at Tokyo Electric Power Company Holdings Inc., including the costly plans to scrap its Fukushima No. 1 nuclear power plant, Industry minister Hiroshige Seko said Tuesday.

The costs of decommissioning the plant, ravaged by the 2011 triple meltdown, is **expected to far exceed the initial estimate of ¥2 trillion**, prompting the government to review its financial aid to the utility with the help of the private sector.

The government-appointed panel will meet for the first time in early October and draft proposals by year-end, Seko said, as Tepco plans to revise its business plan, compiled in 2014, possibly early next year. Members of the panel include Akio Mimura, head of the Japan Chamber of Commerce and Industry, and other senior officials of major business groups. Tepco President Naomi Hirose will also join as an observer.

The utility's business has been pressured by the **costs of cleaning up contaminated areas and compensating those affected by the accident.**

The **growing costs of scrapping the plant as well as increased competition in the sector** led the company to seek fresh government assistance in July.

Trying to dispel rumors about Fukushima food

September 21, 2016

'Farm inns' near Fukushima nuke plant see surge in guests

<http://mainichi.jp/english/articles/20160921/p2a/00m/0na/016000c>

NIHONMATSU, Fukushima -- The number of "farm inns" run by local residents here in the Towa district, dozens of kilometers from the crippled Fukushima No. 1 Nuclear Power Plant, has steadily been increasing to accommodate a rising number of visitors and guests.

The farm inns are being run **to dispel groundless rumors about local farm products being tainted with radioactive substances** from the nuclear power station. Four farm inns opened in 2012, one year after the outbreak of the nuclear crisis, and there are currently 24 farm inns in the Towa district about 40 kilometers northwest of the nuclear complex. Two more farm inns are expected to open in the future. Guests of the inns can enjoy working on farms and cuisine using local ingredients so that they can feel assured of the safety of locally-produced products. The farm inns are gaining popularity and attracting **more than 1,000 guests a year**, as people visit and stay there to enjoy both lodging and local cuisine, **thinking that such activities will help disaster-stricken communities recover.**

The Towa district is a rural area **in the mountains**. The area's population has halved to about 6,500 over the last 50 years as it suffered from depopulation and the nuclear accident promoted local residents to stop farming.

The situation was such that local residents focused on farm inns. That's because demand for lodging facilities increased in the Towa district facing evacuation zones around the nuclear power plant as work to assess radiation levels and other radiation-related projects began in the evacuation districts. A non-profit organization comprised of local residents played a coordinating role and recruited farmers to run inns there. Most of the people who initially used the farm inns were researchers and administrative officers. But currently, many college students and company employees use them for training. A total of 1,106 people stayed at the inns in 2015.

On the evening of Sept. 8, about two dozen students of Tokyo-based Daito Bunka University stayed at six farm inns there for a seminar camp. The inns served their specialty dishes in an effort **to show the students that local farm products have been shipped after clearing radiation checks.**

The "Tanbo" farm inn run by Masatoshi Muto, a 65-year-old vegetable farmer, served home-made meals using special vegetables such as cucumbers and carrots. Male students said they liked the food because the vegetables were so fresh. Muto said he had felt depressed at times when he was told by some people that "we don't want to eat food from Fukushima." But he said, "I feel uplifted when I see our guests enjoy eating." Hironao Takahashi, a 19-year-old sophomore who stayed at the inn, said, "I've come to know that they check their products carefully before shipping them. From now on, I would like to see the foodstuff with my own eyes and judge without being influenced by rumors."

Tatsuhiko Ono, a 62-year-old vegetable farmer and a key figure in the group of farm inn operators, said, "Even if we show scientific data, we cannot easily persuade people about the safety of our products unless they come and visit production sites." The value of total vegetable shipments from the entire Towa district

remains about 80 percent of pre-disaster levels, he said. "We hope that people who visit our farm inns will send a message about the attractiveness of the Towa district."

Monju & the "structure of irresponsibility"

September 22, 2016

EDITORIAL: Scrap not only Monju but also 'structure of irresponsibility'

<http://www.asahi.com/ajw/articles/AJ201609220026.html>

In a long overdue move, the central government on Sept. 21 decided to review the Monju prototype fast-breeder nuclear reactor in Fukui Prefecture with an eye toward decommissioning.

Monju has remained mostly offline for more than two decades. Bringing it online would require hundreds of billions of yen more in safety and other measures.

It would be unpardonable to spend huge sums of additional taxpayers' money on the prototype reactor when calls for early commercialization of the technology is practically nonexistent.

The central government should tackle a mountain of unresolved problems, including providing explanations to host local governments, in steadily moving toward decommissioning Monju.

The 1 trillion yen (\$9.9 billion) spent on the Monju program has delivered meager achievements. Officials were too late in deciding to scrap the reactor.

Japan should bid farewell to the "structure of irresponsibility" that allowed the program to drag on.

The government set up a predecessor of the Japan Atomic Energy Commission and the Science and Technology Agency, now part of the education and science ministry, in 1956 to push the development of nuclear energy. In the same year, the government said in its first long-term plan: "A goal will be set for domestic production of breeder-type power reactors, mainly from the viewpoint of effective use of atomic fuel resources."

A fast-breeder reactor, which would have generated more plutonium than it burns, embodied a technology dreamed of by many nations of the world.

Monju falls in the second stage of the evolution process: from an experimental reactor to a prototype reactor to a demonstration reactor and to the final goal of a commercial reactor.

Construction began in earnest in 1985, and the first criticality was reached in 1994, but sodium coolant leaked in 1995.

Monju's operator had insisted there would be no sodium leaks, although similar accidents had occurred overseas. It tried to cover up or falsify facts to play down the damage after the leak, thereby losing confidence of society.

In the meantime, a number of other countries successively abandoned development of fast-breeder reactors, as the technological difficulties and the costliness became clearer.

When Monju was brought back online in 2010, its operator appeared to have been given an opportunity to bring forth research results. But a refueling apparatus fell into the reactor vessel soon afterward.

It was also revealed that safety maintenance checks had been skipped for as many as 10,000 pieces of equipment.

Despite the problems, Monju has been kept on “life support” at an annual maintenance cost of about 20 billion yen because outside bodies have failed to fulfill their function of conducting checks on the program. The Japan Atomic Energy Commission, relevant ministries and agencies, and researchers in the field of nuclear power formed a single community, whereas the national Diet, whose role includes debating budgets, would not touch on the matter.

This time around, the government held a meeting of relevant Cabinet ministers to come up with the decommissioning policy. The decision deserves to be called a step forward if political circles intend to handle the matter responsibly.

But many concerns linger. The government decided to stick with its nuclear fuel recycling program and set up a new council toward developing a new fast reactor in the aftermath of Monju’s decommissioning.

Such a plan runs the risk of following in Monju’s footsteps.

Nuclear power administration should be acceptable to broad layers of the public. Putting Monju’s decommissioning plan into practice and reviewing Japan’s entire nuclear fuel recycling program should be seen as key steps toward that goal.

Where is the truth?

September 24 2016

Canada activist found guilty of harassing scientists over Fukushima fallout

http://www.japantimes.co.jp/news/2016/09/23/national/crime-legal/canada-activist-found-guilty-harassing-scientists-fukushima-fallout/#.V-Yv_DVdeos

by Alastair Wanklyn
Staff Writer

A Canadian environmental activist who waged a sustained online campaign against two prominent marine scientists was found guilty of criminal harassment by a court in Victoria, British Columbia, on Thursday. The court heard that Dana Durnford, 54, threatened violence against **Jay Cullen, of the University of Victoria, and Ken Buesseler, of Woods Hole Oceanographic Institution in Massachusetts**, and accused them of underplaying the extent of damage to Pacific ecosystems from the 2011 Fukushima disaster.

Durnford was sentenced to three years’ probation.

“I expected and was pleased with the judge’s ruling,” Cullen said after the verdict. “Mr. Durnford, on many occasions, threatened physical violence against scientists and others who have focused their attention and expertise to better understand how the Fukushima nuclear disaster has affected the marine environment and human health. Such behavior is criminal.”

Buesseler also welcomed the ruling. Threatening violence is “never an appropriate response to scientific findings you might disagree with,” he said.

Durnford, a former professional diver, has a large online presence.

His unscripted videos, recorded in a mock television studio, present what he purports to be research that contradicts mainstream scientific findings.

He alleges collusion between the global scientific establishment and the nuclear industry over the dangers presented by the nuclear industry and, in particular, the Fukushima debacle.

Durnford, of Powell River, British Columbia, did not respond to phone calls and an email for comment on Friday.

In a video apparently recorded shortly before the trial began this week, he alluded to trouble meeting court-related costs.

“They bankrupted us in these court proceedings in order to silence us,” he told viewers.

Forget nuclear fuel cycle project

September 23, 2016

Editorial: Gov't should admit nuclear fuel cycle project has failed

<http://mainichi.jp/english/articles/20160923/p2a/00m/0na/013000c>

The government has decided to carry out a fundamental review of the fate of the Monju prototype fast-breeder nuclear reactor in Tsuruga, Fukui Prefecture, operated by the Japan Atomic Energy Agency (JAEA), with an eye to eventually decommissioning the troubled reactor. The government will make a final decision on the matter by the end of this year after consulting with concerned local governments.

- **【Related】** Japan moves step closer to scrapping trouble-prone Monju reactor

Over 1 trillion yen in taxpayers' money has been invested in Monju. However, operations at the reactor have almost completely been suspended for more than 20 years because of a series of accidents and other problems. Hundreds of billions of yen would reportedly be needed to restart Monju. Still, there are no prospects that the operation of the reactor would produce any results. It is only natural, therefore, that the government intends to decommission the reactor. At the same time, the government's responsibility for repeatedly delaying a decision on the fate of the trouble-plagued reactor should be seriously called into question.

The government has promoted the nuclear fuel cycle project, in which plutonium extracted from spent nuclear fuel is mixed with uranium to produce mixed oxide fuel, or MOX fuel, to be used at nuclear reactors, as part of national policy. A fast-breeder reactor, which produces more plutonium than that consumed, is the core facility of the nuclear fuel cycle project along with a spent nuclear fuel reprocessing plant.

We cannot help but raise serious questions over a decision that the government made at a recent meeting of Cabinet ministers concerned with nuclear energy policy to continue the nuclear fuel cycle project and research and development of fast reactors, while moving toward decommissioning Monju.

There are numerous challenges to putting the nuclear fuel cycle into practical use from the viewpoints of technology, economic efficiency and security. The completion of a nuclear fuel reprocessing plant, under construction in the Aomori Prefecture village of Rokkasho, has been repeatedly postponed. Doesn't the government's latest decision reflect its true intention to scrap the Monju reactor -- the core facility in the nuclear fuel cycle project -- in a bid to deflect criticism against continuing the already failed project?

The government claims that plutonium extracted from spent nuclear fuel in the cycle project should be regarded as semi-domestically produced energy, and would contribute to energy security. However, continuing the nuclear fuel cycle project means that Japan would remain dependent on atomic power in the country's energy policy.

One of the lessons learned from the Fukushima nuclear crisis is that there are high risks involving a quake-prone country relying on nuclear power. Japan needs to phase out atomic power. The government should take the opportunity to decommission Monju and put an end to the nuclear fuel cycle project. Monju uses liquid sodium, which is flammable if exposed to air or water, as coolant. Its maintenance requires more advanced technology than conventional reactors that use water as a cooling agent. Monju has hardly been operated since a sodium leak accident in December 1995. Nevertheless, approximately 20 billion yen is spent on maintenance of the reactor each year.

It came to light that JAEA failed to inspect many parts of Monju, prompting the Nuclear Regulation Authority (NRA) to advise the reactor's regulator, the Education, Culture, Sports, Science and Technology Ministry, in November 2015 to replace the JAEA with another body as the operator of the reactor. In response, the ministry has proposed to set up a new entity to operate Monju with cooperation from the private sector including power companies. However, major utilities have no intention of playing a key role in operating such a body amid intensifying competition in the industry following deregulation of the power market.

Furthermore, the Monju reactor must meet the new regulatory standards, which the NRA set after the outbreak of the Fukushima nuclear disaster, before being restarted. The government estimates that some 580 billion yen would be needed for work to remodel the reactor, such as reinforcement of the facility to make it quake-resistant. A huge amount of additional costs have also fueled calls for scrapping the reactor. After Monju is shut down, the focus will be on how to consume plutonium extracted by reprocessing spent nuclear fuel. Japan has already stockpiled about 48 metric tons of surplus plutonium both in the country and overseas, including that generated as a result of commissioning British and French entities to reprocess spent nuclear fuel. This is despite the fact that the Japanese government has repeatedly pledged to the international community that it will never possess surplus plutonium to prevent such a substance from being used by terrorists or converted to nuclear weapons.

The Federation of Electric Power Companies of Japan had worked out a plan to use MOX fuel at conventional nuclear power plants and intended to introduce such fuel to 16 to 18 reactors across the country. However, the plan was scrapped after the outbreak of the Fukushima nuclear crisis. Currently, the No. 3 reactor at Shikoku Electric Power Co.'s Ikata plant is the only reactor using MOX fuel, and much of the surplus plutonium has not been used as planned.

The government intends to continue research and development of fast reactors in cooperation with a French organization at ASTRID, a new fast breeder that France is planning to build. However, there is no guarantee that the ASTRID project will progress smoothly.

In fact, the assessment of the nuclear fuel cycle project, which the government's Japan Atomic Energy Commission made following the outbreak of the nuclear disaster, shows it is more economically efficient to directly dispose of spent nuclear fuel than reprocessing such waste.

Japan, despite being a non-nuclear power, can reprocess spent nuclear fuel under the Japan-U.S. agreement on peaceful use of nuclear energy that went into force in 1988. The accord is set for renewal in 2018. It remains to be seen, however, as to how the next U.S. administration, to be launched following the November presidential race, will respond to the issue.

In the meantime, the biggest challenge to reviewing the nuclear fuel cycle project perhaps is how to deal with local bodies that have hosted relevant facilities.

Local governments that host Monju are urging the government to retain the prototype reactor. Aomori Prefecture, where the reprocessing plant is situated, has agreed that spent nuclear fuel would be brought into the facility on the assumption that the nuclear fuel cycle project is promoted. If the project was to be abandoned, Aomori Prefecture could end up being a nuclear waste dump site, but power companies cannot easily take over spent nuclear fuel, either.

The government should exercise wisdom to solve these problems rather than insisting on continuing the nuclear fuel cycle project.

Local agreement may be needed to restart Fukushima Daini plant

September 24, 2016

Japan mulls legislation requiring local government approval for restarting Fukushima No. 2 nuclear plant

<http://www.japantimes.co.jp/news/2016/09/24/national/japan-mulls-legislation-requiring-local-government-approval-restarting-fukushima-no-2-nuclear-plant/#.V-YueTVdeos>

JJI

The Japanese government is considering legislation to oblige Tokyo Electric Power Company Holdings Inc. to obtain approval from local governments if it applies for restarting its Fukushima No. 2 nuclear power station, Jiji Press learned Friday.

The legislation is also expected to stipulate that the plant be decommissioned if Tepco fails to win such approval and is unable to submit an application for its restart within three years after the law takes effect, sources said.

It will be a special measure under the nuclear reactor regulation law, which does not require local government approval for restarting reactors.

The government aims to submit the legislation to the extraordinary session of the Diet that will be convened on Monday, the sources said.

All the No. 1 to No. 4 reactors at the Fukushima No. 2 plant have been offline since the March 2011 earthquake and tsunami led to a triple meltdown at the Fukushima No. 1 nuclear power station.

Although three of the four reactors at the No. 2 plant lost cooling functions temporarily in the 2011 disaster, they avoided severe accidents such as a core meltdown.

Tepco has not clarified what to do with the No. 2 plant. It is working on decommissioning the stricken No. 1 plant.

The Fukushima prefectural government and its assembly have been calling for scrapping the No. 2 plant. The legislation could force Tepco to decommission the No. 2 plant because it raises further hurdles for resuming operations.

The government has yet to decide on details of the legislation, including the scope of local governments whose approval would be necessary for reactor restarts, the sources said.

The government allows the restart of nuclear reactors that pass the Nuclear Regulation Authority's screening based on the stricter safety standards introduced after the accident at the Fukushima No. 1 plant.

But the government sees a need for taking special measures for the No. 2 plant because it is located near the No. 1 plant, which caused severe damage to Fukushima Prefecture, the sources said.

What happened to documents used for the 2012 NAHC report?

September 25, 2016

Records of Diet's Fukushima investigation still under wraps

<http://www.asahi.com/ajw/articles/AJ201609250019.html>

By AKIRA MINAMI/ Staff Writer

Five years after the accident at the Fukushima No. 1 nuclear power plant, the Diet is still sitting on a trove of raw documents and testimonies of more than 1,100 individuals who were on the front lines during the crisis.

The cache was compiled by the Fukushima Nuclear Accident Independent Investigation Commission, which released a report of its findings that totaled about 600 pages in July 2012.

The documents collected by that commission, including the testimonies of 1,167 individuals, have still not been released to the public more than four years after its disbandment.

Yasunori Sone, a political science professor at Tokyo's Keio University, said the documents should, in principle, be released to the public because the investigation was conducted by the Diet on behalf of the people.

"The Fukushima Nuclear Accident Independent Investigation Commission was the first established in the Diet with the authority to carry out a thorough investigation," Sone said. "Disclosure rules should be decided on quickly because it will serve as a precedent for future commissions."

However, the documents submitted to the commission by the central government as well as Tokyo Electric Power Co., operator of the Fukushima plant, remain in storage at the National Diet Library, along with more than 900 hours of questioning of the 1,167 individuals, many of whom worked to bring the accident under control.

Some of the testimony was given on condition that it would not be released.

For that reason, after the commission disbanded, the rules and administration committees of the two chambers of the Diet were to have established rules for disclosing the commission records.

The commission had left behind a record of its investigation as well as the source of the documents it had accumulated because it felt that it would be helpful when the documents were eventually released.

"It will be possible to learn about the background to the nuclear accident from new reports or books that are written based on the documents," said Kiyoshi Kurokawa, a professor emeritus at the University of Tokyo, who chaired the commission. "A fundamental point to not repeating mistakes is to learn from one's past errors."

Discussions within the rules and administration committees were disrupted when then Prime Minister Yoshihiko Noda dissolved the Lower House in November 2012 and called a snap election.

The December election brought the Liberal Democratic Party and its junior coalition partner, Komeito, back in control of government.

A multiparty group of lawmakers who were seeking to end dependence on nuclear energy asked that the rules and administration committees resume work on establishing disclosure rules. However, a subcommittee held one session that focused on presenting the opinions of members.

"Both the ruling and opposition parties are hesitant about releasing the documents because there is the possibility that they contain contents that are disadvantageous to the LDP, which had pushed nuclear energy, and the then Democratic Party of Japan, which had to deal with the nuclear accident," said a member of that multiparty group.

The disclosure of the documents is not the only area in which the Diet has been less than aggressive.

In its report, the commission included seven recommendations, including the establishment of **a new independent investigation committee**, made up mainly of experts from the private sector, to conduct further studies into unanswered questions about the accident.

However, the rules and administration committees have yet to discuss the possibility of establishing such an investigative committee.

The commission also recommended the establishment of special committees in both chambers of the Diet to oversee the nuclear regulatory structure.

In 2013, a Special Committee for Investigation of Nuclear Power Issues was established separately in the two chambers.

However, **those special committees have been turned into venues to promote nuclear energy.** For example, committee members who were originally from labor unions of the electric power companies or who represented districts where nuclear plants were based criticized the Nuclear Regulation Authority for its strict standards regarding the resumption of operations at nuclear plants.

In a similar manner, the special committees also asked for a review of the rule that limited nuclear plants to a maximum 40-year operating life.

Tomoko Abe, a Democratic Party member who serves as secretary-general of the multiparty group seeking zero nuclear power generation, said, **"Although there are some issues regarding the nuclear accident that have become clearer with the passage of time, the arena for looking into those issues has been closed off.** It is the responsibility of the legislative branch to set up a structure that will continue to examine the nuclear accident."

Integrating fuels units

September 29, 2016

Hitachi, Toshiba, Mitsubishi Heavy may integrate nuclear fuel units

<http://www.japantimes.co.jp/news/2016/09/29/business/hitachi-toshiba-mhi-eye-uniting-struggling-nuclear-fuel-businesses/#.V-z0m8ldeos>

Kyodo

Hitachi Ltd., Toshiba Corp. and Mitsubishi Heavy Industries Ltd. are considering integrating their nuclear fuel businesses, sources said Thursday. The tie-up could come in the spring.

Their nuclear businesses have been in the doldrums since the 2011 meltdowns at the Fukushima No. 1 nuclear power plant, which led to most plants being kicked into shutdown.

Integrating the fuel units would reduce costs and is seen as bolstering their respective financial standings.

The units that would be merged are Nuclear Fuel Industries Ltd., in which Toshiba holds a majority stake through U.S. subsidiary Westinghouse Electric, the Japanese unit of Global Nuclear Fuel, a joint venture of Hitachi, Toshiba and General Electric, and Mitsubishi Nuclear Fuel Co., an affiliate of Mitsubishi Heavy.

The three companies are studying a range of options, including placing the nuclear fuel business units under a new holding company, the sources said.

Toshiba and Mitsubishi Heavy separately said while various options are under consideration, no decision has been made yet.

The government introduced tougher safety standards in the wake of the Fukushima crisis, and most nuclear reactors have remained idle since then.

The only ones currently on line — after they passed the new safety checks — are the No. 1 and No. 2 reactors at Kyushu Electric Power Co.'s Sendai plant and the No. 3 reactor at the Ikata plant, which is operated by Shikoku Electric Power Co.

Still, Japan's nuclear industry is not alone in experiencing difficulties. Nuclear plant construction has slowed globally, shrinking profits at companies like French nuclear energy giant Areva.

Although the government maintains that Japan needs nuclear power, it is likely to be forced to look at what can be done to keep the sector afloat at a time when it is burning through cash.

TEPCO wants to expand and diversify its business

September 29, 2016

TEPCO taps IoT to expand business

http://www3.nhk.or.jp/nhkworld/en/news/20160929_03/

Tokyo Electric Power Company has decided to team up with another Japanese firm to **develop a low-cost thermal power generation system using "Internet of Things" technology.**

TEPCO is planning to work with Mitsubishi Hitachi Power Systems, a company formed in 2014 that integrated the thermal power generation operations of Mitsubishi Heavy Industries and Hitachi.

The companies plan to jointly develop a system utilizing IoT, which connects various appliances through the Internet. It would collect and analyze data from sensors attached to turbines, boilers, and other equipment and automatically control the operation in the most efficient way. It is expected to reduce greenhouse gas emissions.

The companies plan to test the new system at a plant in the Philippines. They hope to eventually make inroads into power plants in other Southeast Asian countries, where demand for power is growing.

TEPCO is struggling to decommission its crippled Fukushima Daiichi nuclear power plant. Compensation for the 2011 nuclear accident is burdening its finances. The utility is also facing competition after deregulation ended TEPCO's monopoly in the power-retail market in Tokyo and neighboring areas.

The utility plans to **diversify its business** through various tie-ups.

New firms to pay for decommissioning?

September 28, 2016

New power firms may have to pay some costs for nuke reactor decommissioning

<http://mainichi.jp/english/articles/20160928/p2a/00m/0na/015000c>

The Economy, Trade and Industry Ministry has begun discussions on a plan to have new smaller electric power companies shoulder part of the costs of decommissioning nuclear reactors, officials said.

- **【Related】** Gov't may shift nuke accident, reactor decommissioning costs onto new power suppliers
- **【Related】** News Navigator: How does the liberalized electricity market work?
- **【Related】** Editorial: Make consumer benefits focal point of electricity market deregulation

This is due to fears that nine major power companies that operate nuclear plants and the Japan Atomic Power Co. alone cannot fully foot the costs of decommissioning their reactors in the future.

The government intends to draw a conclusion on the plan by the end of the year, but the move could spark criticism that nuclear plant operators would be given preferential treatment.

The industry ministry convened the first meeting of an advisory panel on electric power system reform on Sept. 27 to discuss challenges to the liberalization of the power market. At the meeting, the ministry proposed that the costs of decommissioning nuclear reactors be added to power grid usage fees that new power supplies pay to major utilities.

If new power companies add the costs of reactor decommissioning to electricity charges, consumers will be required to shoulder such additional costs.

The industry ministry has worked out the plan, which could be viewed as a relief measure for major utilities, because the business environment surrounding these companies has worsened following the liberalization of the power market and criticism of nuclear power in the wake of the outbreak of the Fukushima nuclear crisis.

The costs of decommissioning a nuclear reactor are about 10 times that for a thermal power generator. The operators of nuclear plants use part of their income from electricity charges to save enough money to dismantle their reactors in the future.

However, if the liberalization of the electricity market progresses, a growing number of consumers could switch to new power suppliers and the prices of electric power could further decline because of intensifying competition, making it more difficult for major utilities to secure enough funds to decommission their nuclear reactors.

The suspension of operations at most atomic power stations is also adversely affecting major power companies.

Power companies could secure enough funds to decommission nuclear reactors if they saved money on the assumption that the rate of utilizing such plants stood at 76 percent and that the lifespan of each reactor was 40 years.

However, the suspension of operations at many nuclear plants has been prolonged and power companies are being forced to decommission some reactors earlier than planned, as a result of which they have been unable to secure enough funds.

Under these circumstances, major power companies are insisting that new power companies should shoulder part of the decommissioning costs.

"Customers of new electric power firms previously used power generated by nuclear plants operated by major utilities. We would like these customers to shoulder a fair share of the costs for reactor decommissioning," an official of one major power company said.

Major power suppliers have asked the executive branch of the government and ruling Liberal Democratic Party (LDP) legislators to consider their requests.

The government has shown consideration to major power companies that are being forced to shoulder the expenses of changes in Japan's energy policy -- such as market liberalization and stepped up safety regulations -- following the outbreak of the Fukushima nuclear crisis in 2011.

A working group within an advisory committee to the industry ministry called on the government in March 2015 to consider a system that would take advantage of the pricing system for power transmission and distribution to help power companies cover decommissioning costs.

However, new power suppliers are opposed to the move. "It'd be unreasonable for new electric power companies that don't have nuclear plants to shoulder the costs of those facilities," said an executive of a Kansai-based new power supplier.

Ennet Corp. President and CEO Tsutomu Takeda told the panel on Sept. 27, "We can't convince our customers unless you (the government and major power companies) explain how much it will cost to decommission a reactor."

An executive of a new power company based in the Tokyo metropolitan area said, "It'd be difficult to gain understanding from our customers who have switched from major power companies following the outbreak of the nuclear disaster."

In response, the industry ministry will consider setting up a market in which power is traded and encouraging major utilities to supply less expensive power generated by nuclear power and coal-fired thermal power plants to the market. The ministry is aiming to allow new power companies to procure less expensive power from the power transaction market in a bid to persuade them to shoulder part of the costs of decommissioning nuclear reactors.

Under the old power supply system in which major utilities enjoyed regional monopolies, power companies were able to secure funds to build and decommission nuclear plants solely by using electricity charges, allowing them to take advantage of low fuel costs for nuclear plants.

With the liberalization of the power market, however, nuclear power plants have lost their edge.

The government has postponed discussions on whether to go ahead with the construction of new nuclear power plants.

The system proposed lately could give preferential treatment to nuclear plants and encourage power companies to build more atomic power stations.

In-depth debate needs to be held on whether nuclear plants will be consistent with the policy of liberalizing the power market.

Making newcomers pay: Is that fair?

September 29, 2016

EDITORIAL: Costs of reactor scrapping really nothing to do with new players

<http://www.asahi.com/ajw/articles/AJ201609290032.html>

An expert panel set up by the industry ministry to figure out ways to fund the cost of scrapping nuclear reactors is set to consider an idea that seems to have no chance of being accepted by consumers. The group of experts advising the Ministry of Economy, Trade and Industry held its first meeting Sept. 27. The members will weigh a proposal to force new players in the power supply market to shoulder a portion of the costs of decommissioning nuclear reactors operated by established electric utilities. The new electricity providers were created out of power market deregulation and operate no nuclear power plants. They use the transmission grids controlled by the big utilities when they sell their customers electricity they generate or buy from others.

The proposal would raise the charges for using the grids to force the new power providers to pay part of the costs of reactor decommissioning. This would result in a portion of the costs being passed on to the customers of the smaller power firms through higher electricity bills.

The scope of the power market liberalization was expanded this spring to households.

Japan's power market used to be tightly regulated, with all households required to buy electricity from one of the large utilities monopolizing the regional markets. As a result, most Japanese consumers have been using electricity generated by nuclear power plants.

So, the proponents of the proposal say, even consumers who have started buying power from new providers should shoulder part of the costs of shutting down and dismantling reactors. This is an argument that gives a privileged status to nuclear power generation.

Apply this argument to other essential public utilities like running water and gas.

Imagine this: You subscribe to the services of a new gas supplier after moving to a new location and then receive a bill from the previous supplier for the costs of disposing of your now unused equipment. Would you agree to pay the bill?

The aim of power deregulation is to promote competition in the market by encouraging new entrants to challenge established utilities. This also allows consumers to choose their power supplies on the basis of lower prices, better environmental performances and other reasons.

If newcomers are required to foot a part of the bill for decommissioning reactors, the conditions in the market for both competition among players and the choices by consumers will be distorted.

Why has such an unreasonable idea been put on the table, in the first place?

The costs of decommissioning reactors operated by major utilities have been shouldered by their customers through higher electricity rates.

But the system to pass on decommissioning costs to consumers through rate hikes will have to be scrapped sooner or later due to market deregulation.

The proposal is aimed at securing a source of funds to finance the costly process by creating a system to raise the fees newcomers pay for using the power grids.

As they are losing customers to new power suppliers due to market liberalization, established utilities are obviously concerned about their financial future.

As they discuss the issue, the members of the expert panel will take account of the plans to dismantle the reactors at the disaster-stricken Fukushima No. 1 nuclear power plant.

Decommissioning an ordinary reactor costs around 80 billion yen (\$789 million) even if it is a large one. But the process will be far costlier for the reactors at the Fukushima plant that melted down in 2011. The extra costs for the reactors have been estimated in the range of several to more than a dozen trillion yen per unit. So the Fukushima decommissioning is a totally different story.

In a July news conference, Tokyo Electric Power Co., which operated the crippled nuclear plant, asked for support.

It has been decided that another expert panel will discuss aid to the utility for the work along with plans to restructure its organization and operations.

The first order of business for the panel is to make rigorous estimates of the costs involved.

The proposed system to force new power suppliers to bear part of the costs of decommissioning reactors could provide financial support to nuclear power generation by big utilities. At the same time, it could serve as a disincentive for many newcomers' investment in renewable energy sources.

That is an unacceptable situation.

Extra 83 billion dollar bill for Fukushima

September 21, 2016

Public to get new \$83-billion bill for Fukushima, reactor expenses

<http://www.asahi.com/ajw/articles/AJ201609210045.html>

THE ASAHI SHIMBUN

The government plans to make the public pay an additional 8.3 trillion yen (about \$83 billion) to decommission reactors at the crippled Fukushima nuclear plant and provide compensation for evacuees of the 2011 disaster, sources said.

The public's money will also be used for the future decommissioning of reactors at other nuclear plants, they said on Sept. 20.

The burden will also affect families that switched from nuclear power generating utilities to new electric power companies after the liberalization of the electricity retail market for families in April this year.

Major utilities that operate nuclear plants are, in principle, required to secure funds through electricity charges to decommission their reactors. Tokyo Electric Power Co., operator of the stricken Fukushima No. 1 nuclear plant, is no exception.

Under the reforms of the power industry, the new electric power companies, which do not operate nuclear plants, were exempt from shouldering any burden related to nuclear power.

But the industry ministry wants to change that arrangement.

Even people in the ruling coalition and the government are criticizing the plan as an attempt to ease the burden of utilities that had long held regional monopolies.

"The plan will damage the basic idea of the reforms," said Taro Kono, former chairman of the National Public Safety Commission and a lawmaker of the ruling Liberal Democratic Party.

To realize the plan, the Ministry of Economy, Trade and Industry aims to submit revisions to the Electricity Business Law to the next year's ordinary Diet session.

A government-approved organization is procuring funds from major electric power companies to assist in the eventual decommissioning of the reactors at the Fukushima No. 1 plant.

However, TEPCO has asked the government for additional support because more money will be needed for the lengthy operation.

The costs to decommission the reactors at the Fukushima plant are expected to soar to 6 trillion yen from the current estimate of 2 trillion yen, according to in-house documents of the industry ministry.

The ministry also needs an additional 3 trillion yen to cover compensation payments for evacuees from the 2011 nuclear disaster and 1.3 trillion yen to decommission reactors of other nuclear plants in the future, according to the documents.

To get the new electric power companies to pay part of the 8.3 trillion yen, the ministry plans to increase power grid "usage fees," which are paid to major electric power companies.

"It is necessary to collect costs from all of the people fairly," said a high-ranking official of the ministry.

Some of the consumers switched to new electric power companies because they did not want to continue using electricity produced by nuclear power plants.

But the ministry official pointed out that those consumers had been using nuclear-generated electricity until March.

New electric power companies, which do not have their own power grids, have concluded contracts with only 2 percent of all households in Japan.

The ministry is concerned that if more families switch from nuclear plant operators to the new companies, it could become difficult to secure sufficient funds to cover reactor decommissioning costs.

Under the ministry's plan, a standard family of three in areas covered by TEPCO will be required to pay an additional 180 yen every month. In areas covered by other major electric power companies, the corresponding figure will be about 60 yen.

Why don't you totally eliminate nukes?

October 3, 2016

Japan Political Pulse: A helping hand following radiation misfortune

<http://mainichi.jp/english/articles/20161003/p2a/00m/0na/021000c>

Recently former Prime Minister Junichiro Koizumi, 74, was seen talking to 62-year-old Prime Minister Shinzo Abe. Their encounter was recorded on a photo page of the Sept. 29 issue of the weekly magazine Shukan Bunshun.

- **【Fukushima & Nuclear Power】**

The scene was Aoyama Funeral Hall in Tokyo, where they had attended the Sept. 15 funeral of former Liberal Democratic Party (LDP) Secretary-General Koichi Kato and were waiting for their cars to arrive. For about 90 seconds the "master and disciple" stood side by side. Below are the details of Koizumi's comments and the prime minister's reaction, which didn't appear in Shukan Bunshun.

Koizumi: "Why don't you totally eliminate nuclear power plants?"

Abe: (Faint smile, bow)

Koizumi: "Having zero nuclear power plants is cheaper. Why don't you understand such a simple thing? It's all lies, what the Ministry of Economy, Trade and Industry is saying. The things advocates of nuclear power plants are saying -- they're all lies. Don't be fooled."

Abe: (Wry smile, bows again, and with head kept low heads to official vehicle)

Koizumi is currently pouring his efforts into a fund to support those who say they were affected by radiation during "Operation Tomodachi," a U.S. Armed Forces operation to support Japan in the wake of the March 2011 Great East Japan Earthquake and tsunami.

Over 400 soldiers from the USS Ronald Regan aircraft carrier and accompanying ships complained of ill-health after helping in rescue efforts following their urgent dispatch to the seas off Fukushima Prefecture in the wake of the earthquake, tsunami and ensuing meltdowns at the Fukushima No. 1 Nuclear Power Plant. Some of them are said to have died from causes including leukemia.

The aircraft carrier fleet worked intermittently in a radiation plume from the stricken power plant between March 13 and 17, 2011. After returning home from Japan, a stream of soldiers developed ailments including brain tumors and thyroid cancer. The nuclear plant's operator, Tokyo Electric Power Co. (TEPCO), and the Japanese and U.S. governments acknowledged that they had been exposed to low-level radiation, but do not accept a causal relationship between exposure and their illnesses.

Koizumi learned that some soldiers had left the military at a young age, had no insurance and couldn't pay their medical fees. It was in May this year that the former prime minister traveled to the United States and directly inquired about their circumstances.

Former soldiers earlier filed a lawsuit against parties including TEPCO, and oral arguments over whether jurisdiction of the case should lie in Japan or the United States were heard in an appeals court in California on Sept. 1. At the time, a Japanese government adviser is said to have supported an agent for TEPCO, stating that radiation exposure is the responsibility of the U.S. military.

Koizumi, who read a note on the hearing (carried in the Sept. 9 issue of the magazine *Shukan Kinyobi*), responded immediately.

"This is embarrassing. They were relief efforts for Japan, right? The American judge is said to have been appalled," he was quoted as saying.

On July 5, Koizumi appeared in a news conference with figures including former Prime Minister Morihiro Hosokawa, 78, and Tsuyoshi Yoshiwara, 61, an adviser at The Johnan Shinkin Bank, to announce the start of fundraising activities to help the U.S. soldiers. Koizumi himself approached the Japan Business Federation (Keidanren) but was turned away on the grounds that TEPCO is a member of the federation. Reinforcements have nevertheless appeared on the funding front. Japanese architect Tadao Ando, 75, posed the following question: "Mr. Koizumi, will you come to Osaka and give a lecture? I'll assemble 1,000 people. With a fee of 10,000 yen per person, that'll bring in 10 million yen."

When Koizumi appeared at the lecture in August, 1,300 people turned up. The same style of lecture is due to be held in Tokyo on Nov. 16, organized by the head of a group of managers of small- and medium-sized enterprises. Additionally, the president of a solar power generation company provided 10 million yen. Through these efforts, the total has climbed to 50 million yen. Koizumi apparently hopes to amass 100 million yen by next spring.

The connection between radiation exposure and the development of illness is delicate. There's a possibility of developing cancer, but there are doubts about whether a person would suddenly die, experts say.

On Sept. 7, Koizumi spoke at the Foreign Correspondents Club of Japan in Tokyo's Yurakucho district. He was asked if it was responsible to talk about damage from radiation exposure without presenting scientific evidence.

Below is the gist of his reply:

"I'm no longer a member of the government. I'm a civilian. There are people who are actually suffering. It's common sense for me to support them."

Fundraising and service instead of criticism; denial of the perception of saying, "Radiation exposure is the responsibility of the U.S. military" to protect nuclear power policies ... I support this form of common sense from our former prime minister. (By Takao Yamada, Special Senior Writer)

Two titles, one article: Govt. will be involved longer than planned

October 2, 2016

Government likely to retain grip on beleaguered Tepco

http://www.japantimes.co.jp/news/2016/10/02/business/japanese-government-considers-longer-support-tepco/#.V_IJ7Mldeos

Kyodo

The government might stay involved in the management of Tokyo Electric longer than planned, given the ballooning costs of scrapping the Fukushima No. 1 nuclear power plant, sources close to the matter said. The delay in reactivating the Kashiwazaki-Kariwa nuclear plant in Niigata Prefecture, the main pillar of the utility's reconstruction plan, is another factor prompting the government rethink, the sources said Saturday. It had planned to end state control next April.

The government is leading the business operations of struggling Tokyo Electric Power Co. Holdings, which is facing huge compensation payments and other problems from the 2011 Fukushima nuclear disaster, because it has acquired 50.1 percent of the firm's voting rights via the state-backed Nuclear Damage Compensation and Decommissioning Facilitation Corp.

Some bureaucrats at the Ministry of Economy, Trade and Industry have been dispatched to Tepco. Tepco said in a business plan in 2014 that it would turn itself from a "temporarily publicly managed" company to a self-managed one starting next April.

The industry ministry will hold the first panel meeting Wednesday to discuss additional government support for the utility.

Tepco faces swelling costs for decommissioning the Fukushima No. 1 plant and compensating those affected beyond the previously estimated ¥11 trillion (\$108 billion). Two reactors at the Kashiwazaki-Kariwa plant are under prolonged safety examinations by nuclear regulators.

The prospect of restarting the giant plant is also being complicated by impending changes in the leadership of the Niigata Prefectural Government, which hosts it.

To restart the plant, approval from the Niigata governor is needed.

Hirohiko Izumida, the current governor, was cautious about restarting the reactors because of Tepco's failure to fully examine the cause of the Fukushima disaster. He withdrew his bid for re-election at the end of August.

Of the four candidates running for the Oct. 16 election, former Nagaoka Mayor Tamio Mori, 67, backed by the Liberal Democratic Party-Komeito ruling coalition, and Ryuichi Yoneyama, a 49-year-old doctor, are leading the race. Yoneyama has said he will follow Izumida's stance and is opposed to any discussion of restarts unless the Fukushima disaster is thoroughly explained.

Tepco's new business plan, including the revised schedule for ending state control, is expected to be compiled next January.

October 2, 2016

Japanese government considers longer support for Tepco

http://www.japantimes.co.jp/news/2016/10/02/business/japanese-government-considers-longer-support-tepco/#.V_DKt8ldeos

Kyodo

The Japanese government is considering staying involved in Tokyo Electric Power Co.'s business management longer than currently planned, given larger-than-expected costs for scrapping the Fukushima No. 1 nuclear power plant, sources close to the matter said Saturday.

A delay in the process for reactivating the Kashiwazaki-Kariwa nuclear power plant in Niigata Prefecture, a main pillar of the utility's reconstruction plan, is another factor prompting the government to think it would be too soon to end state control next April as initially planned, they said.

The government is leading business operations of the utility, which is facing huge compensation payments and other problems from the 2011 Fukushima nuclear disaster, as it has acquired 50.1 percent of the firm's voting rights through the state-backed Nuclear Damage Compensation and Decommissioning Facilitation Corp.

Some bureaucrats of the Ministry of Economy, Trade and Industry are dispatched to Tepco.

Tepco said in a business plan in 2014 it would turn itself from a "temporarily publicly managed" company to a self-managed one starting next April.

The industry ministry will hold the first panel meeting Wednesday to discuss additional government support for the utility.

Tepco faces swelling costs for decommissioning the Fukushima No. 1 plant and compensating those affected beyond the previously estimated ¥11 trillion (\$108 billion). Two reactors at the Kashiwazaki-Kariwa plant are under prolonged safety examinations by nuclear regulators.

Tepco's new business plan, including the revised schedule for ending state control, is expected to be compiled next January.

India-Japan to sign nuclear pact

October 1, 2016

Abe, Modi look to ink civil nuclear pact at November meeting

<http://www.japantimes.co.jp/news/2016/10/01/national/japan-india-look-ink-civil-nuclear-pact-november-meeting/#.V--dgcldeos>

Kyodo

A meeting between Prime Minister Shinzo Abe and Indian counterpart Narendra Modi is set to be held in Tokyo in mid-November, with a civil nuclear cooperation pact likely to be signed, according to a source close to bilateral ties.

The pact would pave the way for Japan to export nuclear power plant technology to the fast-growing Asian economy. But it would be Japan's first signing of a civil nuclear cooperation pact with a country that has not joined the Nuclear Non-Proliferation Treaty.

To ensure the nuclear technology transferred to India, considered a de facto nuclear weapons state, will not be used for military purposes, the pact will include a clause to halt Japanese cooperation with India if New Delhi conducts a nuclear test, the source said. Abe and Modi reached a basic agreement on the pact during a meeting last December.

One of the key issues in the negotiations has been how Japan, as the only country to have suffered nuclear bombings, can ensure India will not resume nuclear tests. Plutonium made by reprocessing spent fuel in a nuclear power plant can be used to make nuclear weapons.

Earlier, other diplomatic sources said that under a provision in the pact, Japan will permit Indian power producers to reprocess spent fuel at designated facilities on the condition the country accepts comprehensive inspections by the International Atomic Energy Agency.

Such “advanced consent” will be withdrawn, however, if threats to national security or issues regarding the protection of nuclear materials arise, the sources said.

India has accepted the Japanese stipulation that nuclear tests be regarded as such a threat, the sources said.

Following the signing of the treaty, the Japanese government will seek swift approval from the Diet to promote Japanese corporate participation in building nuclear power plants in India.

Aside from nuclear cooperation, Abe wants to strengthen coordination with India in maritime security as China continues to elevate its activities in the East and South China seas and the Indian Ocean.

The leaders are expected to confirm that they will deepen defense cooperation, such as through joint maritime exercises involving Japan, India and the United States, and affirm the importance of the rule of law.

Abe is also likely to convey Japan’s concerns about the increase in Chinese activity around the Senkaku Islands, which are administered by Japan but claimed by China and Taiwan.

It will be Modi’s first visit to Japan since August 2014.

Ikata new mayor steamroll anti-nuclear rival

October 3, 2016

Nuclear-power advocate elected Ikata mayor in landslide

http://www.japantimes.co.jp/news/2016/10/03/national/nuclear-power-advocate-elected-ikata-mayor-landslide/#.V_IKaMldeos

Kyodo, Staff Report

An advocate of atomic power plants has steamrolled his anti-nuclear rival in the Ikata, Ehime Prefecture, mayoral election, garnering more than seven times as many votes as his opponent.

Sunday’s election followed the resignation of the former mayor, who had backed the recent restart of the Ikata nuclear power plant’s No. 3 reactor.

The previous mayor resigned in August after being hospitalized.

New Mayor Kiyohiko Takakado, a 58-year-old former member of the prefectural assembly, had the backing of the former mayor and all 16 members of the town’s assembly. During the campaign he vowed to continue the policies of his predecessor, Kazuhiko Yamashika.

His rival, 59-year-old Naohito Nishii of the Japanese Communist Party, had urged the town not remain dependent on nuclear power. He was backed by the JCP's local chapter as well as anti-nuclear citizens' groups.

Nishii was trounced in the election, garnering just 765 votes to Takakado's 5,451 in a race with 71.45 percent voter turnout.

"I will completely carry out safety measures for the nuclear power plant," Takakado said after his victory was assured. "I will also tackle the issues of the town's aging population and depopulation."

Shikoku Electric Power Co. reactivated the Ikata plant's No. 3 reactor in August. It was the first time in more than five years that the reactor was switched on since it was suspended for a routine safety inspection in April 2011.

It is the only reactor in Japan currently burning mixed uranium-plutonium oxide (MOX) fuel. It was the nation's fifth reactor that was rebooted under the stricter safety regulations introduced in July 2013 based on the 2011 catastrophe at the Fukushima No. 1 plant operated by Tokyo Electric Power Co. Holdings Inc. Besides Ikata, the only nuclear plant currently in operation in Japan is Kyushu Electric Power Co.'s Sendai facility in Kagoshima Prefecture.

Yamashita, the former mayor, resigned Aug. 29 after being hospitalized in April.

The Ehime Shimbun reported at the time that he had suffered a stroke that resulted in him having problems speaking.

Niigata gubernatorial election & nuke safety

October 3, 2016

EDITORIAL: Niigata governor candidates must debate nuclear safety in earnest

<http://www.asahi.com/ajw/articles/AJ201610030020.html>

Official campaigning for the upcoming Niigata gubernatorial election started on Sept. 29, setting the stage for debate on the safety of a nuclear power plant in the prefecture.

The issue of the safety of the Kashiwazaki-Kariwa nuclear power plant has gained even more traction as Niigata Governor Hirohiko Izumida, who has been cautious about approving Tokyo Electric Power Co.'s plan to restart the idled plant, has announced he will not seek re-election.

The Nuclear Regulation Authority's safety inspections of the offline reactors, which the electric utility is seeking to bring back online, are in their final stages.

The election inevitably revolves around whether the new governor should allow TEPCO to proceed with the plan if the NRA gives the green light.

Four independent rookie candidates are running for the poll. But the race is effectively shaping up as a one-on-one battle between Tamio Mori, the former mayor of the city of Nagaoka in the prefecture supported by the ruling Liberal Democratic Party and its junior coalition partner, Komeito, and Ryuichi Yoneyama, a doctor backed by the Japanese Communist Party, the Social Democratic Party and the People's Life Party & Taro Yamamoto and Friends.

Some 460,000 people live within 30 kilometers of the Kashiwazaki-Kariwa nuclear plant. The candidates should announce their proposals to protect the safety of these residents during campaigning for the Oct. 16 election.

Plans to ensure the safe and smooth evacuations of residents living around nuclear power plants when a serious accident occurs are described as the last safety net for nuclear power plants.

The governors of prefectures where nuclear plants are located, as the chiefs of the local governments, have to take on a huge responsibility for the safety of local residents.

Izumida has insisted that he wouldn't start discussions on any plan to restart a reactor in his prefecture unless the 2011 disaster at the Fukushima No. 1 nuclear power plant, also operated by TEPCO, is fully reviewed and explained.

He has undertaken his own investigation of the catastrophic accident by setting up an expert committee within the prefectural government.

Izumida has also criticized the fact that the new nuclear safety standards introduced after the 2011 accident don't require plans for evacuating local residents. He has been calling on the central government to improve the standards.

In 2002, it was revealed that TEPCO had covered up damage at its nuclear power plants including the Kashiwazaki-Kariwa plant. The magnitude-6.8 Niigata Chuetsu-oki offshore earthquake, which rocked Niigata Prefecture in July 2007, triggered a fire and resulted in small leaks of radiation at the plant.

Many people in the prefecture along the Sea of Japan remain deeply concerned about the safety of the nuclear plant and distrustful of TEPCO.

Izumida has responded to the concerns by raising issues about nuclear safety.

In the gubernatorial race, Yoneyama has cast himself as the candidate to carry on Izumida's legacy.

"I will take over the (nuclear power) policy of Izumida and won't start discussions on any reactor restart unless the Fukushima disaster is fully reviewed and explained," he has said.

Mori, who has been critical of Izumida's political approach, has taken a different stance toward the issue. "I will put the top priority on the safety of people in the prefecture and rigorously examine the conclusion the NRA reaches (in its safety inspection)," he has said.

The difference in position on the issue between the two candidates is likely to be a key factor for Niigata voters at the polls.

The governors of prefectures hosting nuclear power plants have the "right to consent" to a plan to restart a reactor. But this is only a conventional right based on safety agreements with the electric utilities involved and has no legal basis.

When new Kagoshima Governor Satoshi Mitazono, who took office in July, asked Kyushu Electric Power Co. to suspend the operation of its Sendai nuclear power plant in the prefecture, he was criticized for undermining the central government's energy policy.

But the criticism is off the mark. When a nuclear accident occurs, the local communities around the plant suffer the most.

To allay anxiety among residents in areas around nuclear plants, the local governments concerned, through negotiations with the operators of the plants, have established systems and rights that allow them to become involved in safety efforts.

The Fukushima disaster has only increased anxiety among residents around nuclear power plants.

The chief of the local government in an area home to a nuclear plant has every right to refuse to entrust the safety of local residents entirely to the utility and the central government.

Niigata Prefecture is not an area where TEPCO supplies power, but it has been bearing the risks involved in the operation of a massive nuclear power plant that generates electricity for the Tokyo metropolitan area.

The gubernatorial election will be a choice that directly affects the central government's energy policy. We are eager to see the candidates engaged in meaningful debate on the safety of the nuclear plant based on a national perspective.

Should new power suppliers be made to pay for decommissioning?

October 4, 2016

Editorial: Making new power suppliers pay for reactor decommissioning costs unacceptable

<http://mainichi.jp/english/articles/20161004/p2a/00m/0na/014000c>

The government is discussing a plan to shift part of the costs for decommissioning nuclear reactors onto new power companies that have forayed into the electricity retail market following its full liberalization this past spring.

- **【Related】** Gov't may shift nuke accident, reactor decommissioning costs onto new power suppliers
- **【Related】** New power firms may have to pay some costs for nuke reactor decommissioning
- **【Related】** News Navigator: How does the liberalized electricity market work?

The controversial scheme allows major utilities that operate nuclear power plants to pass part of those costs onto new entrants, which will then be tacked onto electricity bills. Such a proposal can only distort fair competition in the liberalized market.

Meanwhile, there is no time to waste in efforts to decommission nuclear reactors in order to achieve the goal of phasing out nuclear power. The government should discuss the cost-sharing issue while drawing a road map toward a nuclear power phase-out. Just easily passing those costs onto new entrants makes no sense.

An expert panel to the Ministry of Economy, Trade and Industry is tasked with discussing the plan to partially shift the decommissioning costs to new power suppliers, and the government is poised to draw a conclusion by the end of the year.

It is estimated to cost around 80 billion yen to dismantle a major reactor. Major power companies have been accumulating funds to that end over a 40-year period, but they will still need to save a total of some 1.2 trillion yen to complete the task.

Major utilities have heretofore amassed those funds by tacking part of the costs onto electricity bills. However, revenues from those channels could dwindle following the liberalization of the electricity

market in April, where new entrants are luring consumers with cheaper bills. The plan to shift part of the decommissioning costs onto new entrants was devised to address this financial challenge.

The government insists that consumers who have switched to new power companies should also bear decommissioning costs because they had previously used power generated at major utilities' nuclear plants. However, consumers have already shouldered their fair share of the burden through the electricity bills onto which part of those costs have been tacked. It is unfair for them to have to share yet additional burdens.

It would be understandable if new power companies are made to shoulder part of the decommissioning costs when they purchase power generated by major utilities. The government is apparently trying to fend off criticism by creating a new market where new suppliers can procure power generated at nuclear plants at cheaper prices.

However, there are consumers who are willing to use electricity generated at non-nuclear power plants or by other means. The liberalization of the power market is catering to their needs by allowing them to freely choose which utility to contract. This may also be why the government has instructed power companies to announce their energy source ratio. It would be impossible to gain public understanding if they were to be charged additional costs across the board.

The government has asserted that nuclear power costs less than other power generation methods, including the decommissioning costs. However, the move to shift part of decommissioning costs onto new entrants has raised questions about the legitimacy of that claim.

The government has also begun discussions over the costs for decommissioning the disaster-stricken Fukushima No. 1 Nuclear Power Plant. While Tokyo Electric Power Co. (TEPCO), the operator of the plant, is planning to shoulder 2 trillion yen of the burden, the overall cost is certain to largely top that amount. There is a proposal to ask new power suppliers operating in TEPCO's service areas to shoulder part of the decommissioning expenses, but it is irrational to pass on the snowballing costs stemming from the nuclear disaster to those new companies. More careful discussions are called for over the matter.

In any case, the issue of how to deal with the colossal amount of decommissioning costs is unavoidable. The government should squarely deliberate whether and how the public should bear the costs after setting forth a clear goal for a phase-out of nuclear power.

Monju stills raises many fundamental questions

October 4, 2016

Nuclear cash cow Monju now a liability for residents as plant faces ax

http://www.japantimes.co.jp/news/2016/10/04/national/nuclear-cash-cow-monju-now-liability-residents-plant-faces-ax/#.V_PmH8ldeos

by Eric Johnston
Staff Writer

KYOTO – In February 1983, Mayor Koichi Takagi of Tsuruga, Fukui Prefecture, spoke to residents in the town of Shiga, Ishikawa Prefecture, who were hoping the town would be chosen as the site for a new nuclear power plant.

Tsuruga already hosted two conventional reactors and, just a couple weeks before Takagi's visit to Shiga, preparations began for the construction of a new fast-breeder reactor called Monju, named after the bodhisattva of wisdom. An old Japanese saying goes: "out of the counsel of three comes the wisdom of Monju," meaning that, by putting their heads together, even those of ordinary intelligence can think up an idea as good as one from Monju.

Takagi, who also served as head of a nationwide group of mayors whose towns and villages hosted nuclear plants, had some sage advice for his audience. He said nuclear plants were a cash cow and that the media just sensationalized reports of mishaps.

Thirty-three years later, the Monju plant appears heading for the scrap heap. Its history has been one of controversy and scandals, including a 1995 sodium leak and fire, and subsequent cover-up attempt. Last month, the government decided on an overhaul of the Monju project, looking to decommission the idle facility.

Tsuruga is unhappy that the cash cow, which meant billions of yen to the local economy over the decades, is drying up, while the central government faces questions about the entire future of Japan's nuclear fuel cycle program.

Monju began as a policy decision made nearly a half century ago in reaction to what was seen as a worldwide problem in the conventional nuclear industry, a scarcity of uranium for conventional nuclear plants.

"According to the industry vision of the middle of the 1970s, plutonium-fueled breeder reactors were supposed to replace uranium-fueled light water reactors in order to save what was thought to be scarce natural uranium resources in a world with rapidly expanding nuclear power programs," said Mycle Schneider, a Canada-based nuclear energy consultant.

"The International Atomic Energy Agency then forecasted over 4,000 conventional reactors in the world for the year 2000. In reality, only one-tenth of the plants was built, more uranium resources were identified, and the uranium price plunged."

Decommissioning Monju is expected to take three decades, once it finally gets under way. But a host of fundamental questions remain about not only Monju but also Japan's nuclear fuel-recycling program, in which Monju was to have played a critical role.

On a practical level, these questions begin with how much the entire decommissioning process will cost. In 2012, the Science, Education, and Technology Ministry estimated that it would require at least ¥300 billion.

But that estimate does not include how much the central government might have to spend in Tsuruga and Fukui Prefecture over the coming years on various forms of public works projects in exchange for smooth local political cooperation in scrapping Monju. Over ¥1 trillion has already been spent on the plant.

Fukui residents and politicians are sure to raise strong objections if the central government concludes the only viable option for the tons of high-level radioactive waste generated by Monju's decommissioning process is to store at least part of it within the prefecture.

With three conventional nuclear reactors in the prefecture scheduled to be scrapped by midcentury, Gov. Issei Ishikawa has warned he will not tolerate having Fukui serve as a nuclear garbage dump. He has demanded that waste generated from decommissioning be disposed of outside the prefecture.

Adding Monju to the list of reactors to be decommissioned means seeking further local cooperation. That may only come after guarantees of more central government support, in the form of tax money, to help Fukui bear the burden of the decommissioning.

Meanwhile, question marks are cast over the remainder of Japan's nuclear fuel recycling program, especially the Rokkasho Reprocessing Plant in Aomori Prefecture. However, experts say it is unlikely to get the ax anytime soon.

“Terminating Rokkasho and plutonium policy remains a long way off due to the vested interests and impacts this would have on nuclear power. But the Monju decision is a major step along that path,” said Shaun Burnie, senior nuclear specialist with Greenpeace Germany, who follows Japan's nuclear power policy closely.

“In immediate terms, (Monju's decommissioning) will not impact the use of MOX fuel in light water reactors. That's more affected by the lack of operating reactors with Ikata No. 3 being the only MOX-fueled reactor operating; Rokkasho justification will be based on using MOX fuel in LWR's most particularly at Oma.”

The Oma nuclear power plant in Aomori Prefecture, which is scheduled to start operating in fiscal 2024, will run 100 percent on MOX fuel.

For many in Fukui who have long opposed Monju, there are also concerns about not shutting down the entire nuclear fuel recycling program and suspicions that despite the government's policy of not possessing, manufacturing or introducing nuclear weapons, Prime Minister Shinzo Abe's government wants to keep that option open, as a diplomatic tool at least, via the fuel recycling program.

“Japan has about 48 tons of plutonium stockpiled domestically and in Europe, and we need to be careful. **The plutonium could be converted into nuclear weapons,** and we need to make sure it's not used for this purpose,” said Tetsuen Nakajima, abbot of Myotsu-ji, a Shingon Omuro temple in Wakasa Bay in Fukui Prefecture, and a long-time anti-nuclear activist.

Such suspicions remain because Abe has in the past said he believes the possession of “small” nuclear weapons would not violate the Constitution. Members of his Cabinet, notably Defense Minister Tomomi Inada, who is from Fukui, have also argued previously for a national debate on the matter.

Finally, experts question what the government's intentions are for a new committee on fast-breeder reactors it plans to form by year-end. The new committee will be centered in the Ministry for Economy, Trade and Industry, and the Education, Science and Technology Ministry, and will include nuclear power-related government agencies and representatives from the utilities and firms in the sector.

Keiji Kobayashi, a former nuclear physics instructor and fast-breeder expert at Kyoto University Research Reactor Institute, is a longtime opponent of Monju. He says Japan might not be done entirely with fast-breeder reactors.

“Plans for the committee include clarifying a goal on the development of a demonstration reactor and creating a detailed road (map) to achieving that goal,” he said. “Does that mean another reactor will be built? There are unanswered questions about what will happen to not only Monju but the fast-breeder reactor program in general.”

Kobayashi was referring to the possibility of Japan participating in France's Advanced Sodium Technological Reactor for Industrial Demonstration (ASTRID) program to develop next generation fast-breeder reactor technology via research at a demonstration reactor for research purposes.

Burnie of Greenpeace Germany says ASTRID is still in the planning stage, over budget and behind schedule, and that the prospects for it being built in France are dim. In addition, while **Japan's METI backs the idea of a demonstration reactor with French cooperation,** the education ministry is reportedly more

skeptical, noting that France closed its Super Phoenix fast breeder reactor in 1997 after numerous accidents, including, like Monju, sodium leaks.

If nukes are so cheap, why ask Govt. to pick up tab?

October 4, 2016

Perspectives: Asking gov't to pick up Fukushima disaster tab is irresponsible

<http://mainichi.jp/english/articles/20161004/p2a/00m/0na/018000c>

The Federation of Electric Power Companies of Japan (FEPC) has informally requested that the government cover the additional costs for compensation and decontamination work in the wake of the disaster at the Fukushima No. 1 Nuclear Power Plant. **Electric power companies, however, have to date explained that nuclear power is cheap. The stance of asking the government to pick up the tab cannot avoid being branded as irresponsible.**

Nuclear power companies are unhappy about the situation. They say that nuclear power was promoted as a government policy, but in the event of an accident the operators are the ones who have to take responsibility. Other major utilities besides Tokyo Electric Power Co. (TEPCO) take the view that it is unreasonable to lay the responsibility for the disaster at TEPCO's plant onto them.

But major power companies have raked in huge profits by operating nuclear power plants. It cannot be denied that they have relied on the myth of nuclear safety and had been lax in adopting measures to cope with a potential disaster. While they may not have expected the cost of compensation and decontamination following the Fukushima disaster to swell to such a large amount, it is nevertheless irrational to lay the financial burden on the government's shoulders. If the government takes on the responsibility, it will eventually come out of taxpayers' pockets.

While the government initially puts up the funds through the Nuclear Damage Compensation and Decommissioning Facilitation Corp., the final mechanism is for power companies to cover the cost. The FEPC's move goes against the spirit of this system.

Calls to limit Govt's support to TEPCO

October 5, 2016

Calls grow to curb further govt. support to TEPCO

http://www3.nhk.or.jp/nhkworld/en/news/20161005_32/

Members of a panel looking at how to cover costs from the 2011 Fukushima Daiichi accident say government support to the operator should be limited.

Economic leaders and academic experts attended the first meeting on Wednesday of a committee set up by the industry ministry to discuss decommissioning and compensation costs.

Officials said the government has earmarked about 87 billion dollars for compensation and decontamination work, and that operator Tokyo Electric Power Company has set aside about 19 billion dollars to scrap the crippled reactors.

But they said these funds could fall well short of the amount that will be needed. Many participants said the utility must bear the increased financial burden through business restructuring and management reforms to curb additional government support.

TEPCO President Naomi Hirose, who took part in the meeting as an observer, warned that his company could become insolvent if it is forced to post the ballooning decommissioning costs as a debt.

He argued that a special accounting rule should be created to avoid a possible insolvency.

Before the next meeting is held, the government plans to show how much the cost of decommissioning the reactors is projected to grow.

Hirose told reporters after the meeting that his company should be the first to foot the bill, and that the firm will consider what should be done to absorb the cost.

Decontamination and compensation costs to reach 8 trillion yen

October 7, 2016

Federation estimates Fukushima nuke plant cleanup costs, redress may rise to ¥8 trillion

Kyodo

An industry group has estimated costs for decontamination work at the disaster-struck Fukushima nuclear plant and compensation for nuclear damage to be around ¥8 trillion (\$77.10 billion) more than the current official projection, a source said Thursday.

The Federation of Electric Power Companies of Japan, which consists of the country's 10 electric power companies, has informally asked Prime Minister Shinzo Abe's government to use state funds to cover the extra costs, the source also said.

The costs are supposed to be covered by the utilities, including Tokyo Electric Power Company Holdings Inc., operator of the crippled Fukushima No. 1 nuclear power plant, where three reactors melted down in the aftermath of the March 2011 quake-tsunami disaster. The government is cautious about using taxpayer money to deal with the issue, the source said.

Under the current estimate, compensation payments are projected to total ¥5.4 trillion, while decontamination costs are forecast to reach ¥2.5 trillion.

Tepco and other nuclear power plant operators have paid contributions for compensation payments to a state-backed fund. As for decontamination costs, the fund will seek to retrieve that money by selling Tepco shares that it owns.

540 billion yen to restart Monju?

October 8, 2016

Resuming Monju reactor operations may cost over ¥540 billion

http://www.japantimes.co.jp/news/2016/10/08/national/resuming-monju-reactor-operations-may-cost-%c2%a5540-billion/#.V_iqNcldeos

JJI

The cost of resuming operations at Japan's trouble-plagued Monju prototype fast-breeder nuclear reactor is estimated to top ¥540 billion (\$5.2 billion), the science ministry says.

The estimate was presented Friday at a meeting of government and private-sector officials who discussed the fate of the reactor in Tsuruga, Fukui Prefecture.

More than ¥1 trillion (\$9.7 billion) has been spent on Monju, but it has only operated for a total of 250 days in the past 20 years due to a series of problems, including a leak of sodium coolant.

The government is considering options, including decommissioning the reactor. It plans to make a decision by the end of this year.

The ministry said the costs may far exceed ¥540 billion if the safety screening process by regulators is lengthy. The estimate does not include expenses for decommissioning the reactor.

The science ministry wants Monju to be maintained while the industry ministry is opposed to the idea.

Opposition to keeping Monju in place is expected to grow if a massive amount of money is needed for it to go back online.

The meeting brought together science minister Hirokazu Matsuno and industry minister Hiroshige Seko as well as nuclear industry executives, including Satoru Katsuno, chairman of the Federation of Electric Power Companies of Japan.

Nukes: What of security and transparency?

October 11, 2016

Toyama tritium researcher's data targeted in cyberattacks

http://www.japantimes.co.jp/news/2016/10/11/national/crime-legal/toyama-tritium-researchers-data-targeted-cyberattacks/#.V_zN0sldeos

JJI

Research data and personal information may have been stolen from a personal computer belonging to a researcher of tritium, a radioactive isotope of hydrogen, at the University of Toyama's Hydrogen Isotope Research Center, the university said.

In addition to research data, hackers may have stolen personal information such as email addresses on some 1,500 people, including other researchers, the school said Monday.

Most of the possibly affected research data were those that have already been published or were slated to be published, and no highly confidential information was compromised, it said.

According to the university, **two staff members of the center received emails containing a virus in November 2015 and a PC of one of them, a member of the teaching staff, was infected. The PC continued questionable communications with an outside party for about six months.**

The center learned of the virus infection in June following an alert from an outside organization.

The university, based in the city of Toyama, briefed the education ministry on the cyberattacks in mid-June. Earlier in October, it started informing researchers who may have been affected.

The center conducts research on hydrogen, deuterium and tritium, including their use for energy.

Tritium is regarded as a candidate for fuel in nuclear fusion reactors, and is also one of the contaminants in the water building up at the Fukushima No. 1 nuclear plant.

October 11, 2016

Fears of nuclear data leak after university's research unit hacked

<http://mainichi.jp/english/articles/20161011/p2a/00m/0na/010000c>

The University of Toyama's Hydrogen Isotope Research Center came under cyber-attack and information on research results related to the Fukushima nuclear crisis, as well as personal information on nearly 1,500 researchers and others, is feared to have leaked, it has been learned.

A spokesperson for the center, known for its research on tritium that can be used as fuel for a nuclear fusion reactor, explained, "The research results have already been published and there was no sensitive research data." The research results include those on methods of disposing of contaminated water from the crippled Fukushima No. 1 Nuclear Power Plant.

According to officials of the University of Toyama, two researchers' personal computers came under attack in November 2015. A part-time researcher specializing in tritium science and technology had their computer infected with a virus after opening a file attached to an email sent in by someone under the disguise of a friend. Up until June this year, at least 1,000 compressed files were created by remote control and a total of four rounds of massive communications were carried out. The hacking came to light after an external organization alerted the university.

The investigation by the university found that **most of the 59,318 files stored in the computers had apparently leaked out. Yet the university has not been able to confirm the content of 17,612 files among all of the files in question,** officials said.

The university reported the incident to the Education, Culture, Sports, Science and Technology Ministry and Toyama Prefectural Police **in June this year** when the data leak came to light. **But the university had not informed relevant organizations about the problem until Oct. 7.** Takayuki Abe, head of the Hydrogen Isotope Research Center, said, "It took time to closely examine the situation."

TEPCO and the Tokyo blackout

October 13, 2016

TEPCO launching emergency power cable inspections

http://www3.nhk.or.jp/nhkworld/en/news/20161013_32/

Tokyo Electric Power Company says it will launch emergency inspections of the same type of power cable that caught fire on Wednesday.

The fire resulted in a massive blackout in parts of Tokyo.

Officials from TEPCO told reporters on Thursday that the same type of cable that ignited at its underground facility near Tokyo had been laid over a distance of 1,416 kilometers as of the end of 2012.

They said that more than 70 percent of this cable, stretching 1,008 kilometers, was at least 35 years old.

That includes sections between western parts of Tokyo and Niiza City in Saitama Prefecture where the fire broke out.

Cable aged 50 years or older accounted for a distance of 40 kilometers.

TEPCO officials said that the cable consists of a copper wire and multiple layers of paper, impregnated with oil, wrapping the copper core. The paper serves as an insulator to prevent short circuits.

They said damage to the insulator could result in power leakage and fire, and that oil used in the paper could then catch on fire and spread to other cables.

They said the emergency inspections to check the high-voltage transmission lines for possible oil leakages and degradation will be complete by Friday.

The industry ministry has instructed other power companies across the country to launch emergency inspections of their underground cables.

TEPCO chief offers apology over Tokyo blackout

http://www3.nhk.or.jp/nhkworld/en/news/20161013_19/

The president of Tokyo Electric Power Company has apologized for an extensive blackout that struck Tokyo on Wednesday.

President Naomi Hirose visited the Ministry of Economy, Trade and Industry and met with Minister Hiroshige Seko on Thursday.

Power transmission cables at a TEPCO facility just outside Tokyo caught fire and caused the blackout that affected more than 580,000 households.

Hirose said the incident caused trouble to a great number of people. He announced that his company will launch emergency inspections of cables.

Seko pointed out that TEPCO failed to hold a news conference in a timely fashion and called for better communication from the company.

He also said his ministry finds it problematic that the power company only visually inspected the cables once a year even though they were in use for more than 35 years.

The minister called on TEPCO to thoroughly investigate the cause of the fire and to submit a report on preventive measures.

The TEPCO president pledged to get to the bottom of the incident and make every effort to fully disclose the outcome of the investigation.

TEPCO yet to determine cause of cable fire

http://www3.nhk.or.jp/nhkworld/en/news/20161013_30/

Japanese police and firefighters have suspended their investigation into what caused Wednesday's fire at a power transmission facility near Tokyo, which led to a blackout in parts of the capital.

The fire at an unmanned underground facility housing power cables caused a temporary electricity outage affecting over 580,000 houses in Tokyo on Wednesday afternoon.

Its operator, Tokyo Electric Power Company, suspects that aging insulation materials used for the 35-year-old cables may have caused the fire. TEPCO said no problems were reported with the cables during an annual check in June.

Police and fire department personnel, accompanied by industry ministry and utility officials, entered the

6-meter-deep concrete facility on Thursday afternoon to start an onsite investigation.

They stopped the day's inspections later in the afternoon, as the heat and water inside hampered their work.

The temperature of the concrete walls was as high as 60 degrees Celsius, forcing investigators to leave every half an hour or so while the facility was cooled down. The cables were soaked in water in many places.

The inspectors said they will pump the water out and wait for the temperature to come down before resuming their investigation.

TEPCO to determine cause of cable fire

http://www3.nhk.or.jp/nhkworld/en/news/20161013_03/

The widespread power outage in Tokyo on Wednesday has been linked to a fire involving underground cables installed 35 years ago. Those copper wires were wrapped in layers of paper seeped in oil to prevent electrical leakage.

More than 580-thousand households and offices lost power temporarily.

The cause of the fire is not known, but Tokyo Electric Power Company says it is investigating in order to prevent a recurrence.

Utility officials say when insulation covering a cable sustains damage, the resulting leakage of electricity can lead to a fire.

They add the cables in question are visually inspected once a year, and the last check was performed in June.

October 12, 2016

Blackout in Tokyo after fire damages cables

http://www3.nhk.or.jp/nhkworld/en/news/20161012_35/

A blackout hit parts of Tokyo on Wednesday afternoon following a fire involving underground power cables. Tokyo Electric Power Company attributed the power outage to the fire, and said 586,000 households were affected.

The fire broke out at one of TEPCO's underground facilities in Niiza City, Saitama Prefecture, near Tokyo.

The utility said underground cables were damaged, and that it is investigating how the fire started.

The company finished rerouting the power supply in about an hour.

The fire was almost extinguished about 4 hours later.

No injuries have been reported.

Government offices in central Tokyo were affected due to the power failure. The Tokyo High Court and District Court were without power for about 30 minutes and officials had to reschedule some trials.

Traffic lights were out at about 200 locations, and police officers were deployed to control traffic.

The power outage also disrupted train services in Tokyo, and left some people trapped in elevators.

New lawsuit against TEPCO

October 12n, 2016

Family of Fukushima woman who killed herself to sue TEPCO

<http://mainichi.jp/english/articles/20161012/p2a/00m/0na/006000c>

FUKUSHIMA -- Two family members of a woman in her 80s who killed herself two years after the outbreak of the Fukushima nuclear crisis are planning to file a lawsuit with the Fukushima District Court against nuclear plant operator Tokyo Electric Power Co. (TEPCO), demanding about 62 million yen in damages over her death, it has been learned.

The family members will argue that the woman ended her own life because she was forced to evacuate from her home in the Fukushima Prefecture village of Iitate in the wake of the nuclear accident, sources close to the bereaved family say.

According to a lawyer for the bereaved family, the woman and her family took shelter in a housing facility rented by the Fukushima Prefectural Government in April 2011 -- a month after the outbreak of the nuclear disaster -- because the central government designated the Iitate village as an evacuation zone. The woman tended to stay holed up in her home and developed what appeared to be symptoms of depression due to stress from living away from home, the lawyer said. When her husband died in August 2012, she sat in front of a family Buddhist altar and said things like "I want to go to where he (her deceased husband) is soon." On March 26, 2013, she hanged herself in her home.

The woman's daughter said, "If she had not been forced to evacuate, she wouldn't have killed herself." Meanwhile, officials of TEPCO's public relations department declined to comment on the matter.

Govt may have to submit withheld documents on 3/11

October 14, 2016

Judges may order gov't to submit redacted report in lawsuit over Fukushima disaster

<http://mainichi.jp/english/articles/20161014/p2a/00m/0na/005000c>

A judge presiding at a trial over the Fukushima nuclear crisis said the judges in charge will decide by the end of this year on whether to order the government to submit some of its investigation committee's reports on the disaster that have been withheld.

Presiding Judge Akihiko Otake at the Tokyo District Court made the remark on Oct. 13 during an oral proceeding of the suit filed by shareholders of Tokyo Electric Power Co. (TEPCO), the operator of the crippled nuclear plant, to clarify the responsibility of former TEPCO board members over the disaster.

Otake also said the judges in charge will conduct an in camera review on other documents, part of which has been blacked out before they were disclosed, to deem whether the measure is appropriate.

Specifically, the judges will examine documents recording statements by the now deceased Masao Yoshida, who headed the Fukushima No. 1 Nuclear Power Plant at the time of the outbreak of the disaster in March 2011, and those by two officials of the then Nuclear and Industrial Safety Agency.

The documents were disclosed after the names of individuals and some other information were blacked out. **The court said it has already ordered the Cabinet Office to submit the documents with the blacked-out parts unveiled.** The Cabinet Office has reportedly responded that it intends to comply with the order by the end of this week.

Only Fukushima apples

October 16, 2016

Fukushima apples to be used during World Cocktail Championships in bid to repair tarnished reputation

<http://www.japantimes.co.jp/news/2016/10/16/national/fukushima-apples-used-world-cocktail-championships-bid-repair-tarnished-reputation/#.WANUI8ldeos>

Fukushima Minpo

More than five years after the Fukushima nuclear disaster, efforts by local farmers to regain consumer trust in their produce are finally paying off, with apples grown in the city of Fukushima chosen to be used in the annual World Cocktail Championships, which kicks off on Tuesday in Tokyo.

During the contest, which will run through Thursday at the Imperial Hotel, Fukushima-grown apples will be used in the fruit-cutting event scheduled for Wednesday. **Several varieties of fruit will be used in the competition, but for apples, only those from Fukushima will be used.**

The planned appearance of apples from the disaster-hit prefecture is due to a joint effort by the Fukushima Fruit Thanks Project, a group of fruit farmers from the northern region of the prefecture and Yoshikazu Suda, a bartender in Tokyo's Ginza district who also hails from the prefecture. Suda, who runs the Ginza Zenith bar, is from the city of Date. Since the triple-meltdown at the Fukushima No. 1 nuclear power plant, Suda has been working in cooperation with the farmers group to promote produce from the area.

As an executive director of the Nippon Bartenders Association and a director of a Ginza bar association, Suda saw the upcoming world championships as a great way to help promote fruit from the prefecture, which have experienced poor sales due to ongoing fears over radiation contamination.

Knowing the superior quality of Fukushima-grown fruit, Suda pitched the use of apples grown in the city of Fukushima for the competition.

"I'd be happy if using apples this time would be one way to help the reconstruction of my hometown," Suda said.

During the competition, apples grown by Chusaku Anzai, who operates a fruit farm in the city of Fukushima, will be used.

"I want to convey the greatness of Fukushima fruit to bartenders from around the world," said Anzai, 67, who is also vice chair of the farmers group.

To prepare for shipping, Anzai meticulously checked the condition of each apple at his farm earlier this month.

Some 500 bartenders from 53 countries will gather in Tokyo to take part in the championships, which will be held in Japan for the first time in 20 years.

Fukushima Mayor Kaoru Kobayashi has high hopes for the event and sees it as a chance to tout Fukushima as one of the nation's top fruit producers.

"It'll be a great opportunity to show the charm of Fukushima," Kobayashi said.

This section, appearing every third Monday, focuses on topics and issues covered by the Fukushima Minpo, the largest newspaper in Fukushima Prefecture. The original article was published on Oct. 5.

Decommissioning means big money. Taxpayers beware!

October 15, 2016

Fukui poised to benefit from decision to scrap Monju

<http://www.japantimes.co.jp/news/2016/10/15/national/fukui-poised-benefit-decision-scrap-monju/#.WAJdL8ldeos>

by Eric Johnston

Staff Writer

Big money pull a million strings Big money hold the prize

Big money weave a mighty web

Big money draw the flies

— Rush, "The Big Money"

Last month's announcement that the Monju experimental fast-breeder reactor in Tsuruga, Fukui Prefecture, would likely be decommissioned was an acknowledgement of what had been obvious for

decades. Namely, that Monju was too fraught with technical and political problems to have ever stood a chance of success.

For Kansai, the decision brought a feeling of relief among those concerned about a plutonium-producing plant in their backyard, but a feeling of “now what?” among everyone else. No political leader in Osaka, Kyoto, Nara or Kobe either wistfully eulogized or passionately protested the recommendation that Monju, which has cost more than ¥1 trillion, be scrapped. In Fukui, however, it was a different story.

For more than four decades, Fukui’s leaders have finessed the art of extracting (extorting?) as much money from Tokyo as possible in exchange for cooperation in continuing not only Monju but also 13 commercial nuclear reactors, a concentration of nuclear power plants said to be the densest in the world.

Massive amounts of tax money were funneled into the prefecture by the Liberal Democratic Party for all sorts of uses. Some were noble (construction of modern train stations, schools, hospitals and social welfare facilities). Some were corrupt (propaganda museums that played down the risks of nuclear power, all expense-paid “study” tours to Europe’s nuclear reactor towns for local residents that included sightseeing trips to Paris).

Nobody really knows how much money, directly and indirectly, went to Fukui and Tsuruga over the decades for “bearing the burden of Monju.” Unofficial guesses put the figure in the billions of yen. But what has residents in Kansai, and elsewhere, concerned is how much it will cost them, in the form of future government payoffs to Fukui, to be rid of Monju.

The prefecture certainly has friends in high places looking out for its interests. Defense Minister Tomomi Inada, a favorite of Shinzo Abe, represents Fukui’s 1st district. That’s the one without nuclear power plants, but she’s very close to those in Fukui who support them. Then there’s Tsuyoshi Takagi, who served as reconstruction minister. He’s from Tsuruga and represents Fukui’s 2nd district in the Lower House, an area that hosts those 13 commercial nuclear reactors. In short, **Fukui has powerful allies who will work hard to ensure all manner of new funding flows to the prefecture and to Tsuruga over the coming decades. Making matters better for Fukui but worse for taxpayers elsewhere, three commercial reactors will be decommissioned over the next few decades.** You can be sure Fukui politicians from the governor on down are drawing up a long wish-list of pork barrel projects they will demand the central government, as well operator Kansai Electric Power Co., fork out in exchange for consenting to each reactor’s decommissioning plans — plans that might include disposing high-level radioactive waste generated by decommissioning in Fukui, over the objections of residents.

In short, **decommissioning means big money for Fukui in the years ahead in the form of subsidies, jobs and service-industry income. And not just at Monju, where the basic cost was recently estimated at ¥540 billion.**

With predictions it might cost ¥8 trillion to scrap the crippled Fukushima No. 1 nuclear power plant, and perhaps a dozen commercial reactors probably heading for the scrap heap in the next decade, Japan has entered the “age of nuclear power decommissioning.”

There’s big money involved that will draw a swarm of flies, especially in towns and prefectures hosting the power plants. Taxpayers elsewhere, therefore, will need to be especially vigilant and handy with the flyswatters and insect repellent.

View from Osaka is a monthly column that examines the latest news from a Kansai perspective.

TEPCO shares down after Yoneyama's election

October 16, 2016

Tepco shares slump after anti-nuclear novice wins Japan election

<http://www.reuters.com/article/us-japan-nuclear-election-idUSKBN12G0HM>

By Kentaro Hamada | NIIGATA, Japan

Shares in Tokyo Electric Power (9501.T) fell 8 percent on Monday after an anti-nuclear candidate won an upset victory in a Japanese regional election, in a blow to its attempts to restart the world's biggest atomic power station and a challenge to the government's energy policy.

The election of Ryuichi Yoneyama, 49, a doctor-lawyer who has never held office, is a setback for Prime Minister Shinzo Abe's energy policy, which relies on rebooting reactors that once met about 30 percent of the nation's needs. All but two are shut down in the wake of the 2011 Fukushima nuclear disaster.

Reviving the seven-reactor giant, with capacity of 8 gigawatts, is key to saving Tepco, which was brought low by the Fukushima explosions and meltdowns, and then the repeated admissions of cover-ups and safety lapses after the world's worst nuclear disaster since Chernobyl in 1986.

Yoneyama won the vote on Sunday after a campaign dominated by concerns over the future of the Kashiwazaki-Kariwa power station and nuclear safety, beating Tamio Mori, 67, who was backed by the ruling Liberal Democratic Party (LDP) and initially favored for an easy victory.

"As I have promised all of you, under current circumstances where we can't protect your lives and your way of life, I declare clearly that I can't approve a restart," Yoneyama told supporters at his campaign headquarters.

Tepco shares were down by 7.4 percent at 385 yen at 0100 GMT (09:00 p.m. EDT) after falling further earlier. The Nikkei 225 was up by 0.5 percent and other utilities were mixed.

Yoneyama had more than 500,000 votes to about 430,000 for Mori with 93 percent of the vote counted in the region on the Japan Sea coast, public broadcaster NHK said.

Mori, a former construction ministry bureaucrat, apologized to his supporters for failing to win the election.

Yoneyama, who had run unsuccessfully for office four times, promised to continue the policy of the outgoing governor who had long thwarted the ambitions of Tepco, as the company supplying about a third of Japan's electricity is known, to restart the plant.

As the race tightened, the election became a litmus test for nuclear safety and put Abe's energy policy and Tepco's handling of Fukushima back under the spotlight.

"The talk was of Kashiwazaki-Kariwa, but I think the result will affect nuclear restarts across the country," said Shigeaki Koga, a former trade and industry ministry official turned critic of nuclear restarts and the Abe administration.

Koga told Reuters it was important that Yoneyama join forces with another newly elected governor skeptical of nuclear restarts, Satoshi Mitazono of Kagoshima Prefecture in southern Japan. "Without strong support from others, it won't be easy to take on Tepco," he said.

TROUBLES

Tepco spokesman Tatsuhiro Yamagishi said the company couldn't comment on the choice of Niigata governor but respected the vote and would strive to apply the lessons of the Fukushima disaster to its management of Kashiwazaki-Kariwa.

The government wants to restart units that pass safety checks, also promoting renewables and burning more coal and natural gas.

Only two of Japan's 42 reactors are running more than five years after Fukushima, but the Niigata plant's troubles go back further.

Several reactors at Kashiwazaki-Kariwa have been out of action since an earthquake in 2007 caused radiation leaks and fires in a disaster that prefigured the Fukushima calamity and Tepco's bungled response.

Niigata voters opposed restarting the plant by 73 percent to 27 percent, according to an NHK exit poll. Yoneyama, who has worked as a radiological researcher, said on the campaign trail that Tepco didn't have the means to prevent Niigata children from getting thyroid cancer in a nuclear accident, as he said had happened in Fukushima. He said the company didn't have a solid evacuation plan.

The LDP's Mori, meanwhile, was forced to tone down his support for restarting the plant as the race tightened, media said, insisting safety was the top priority for Kashiwazaki-Kariwa, while promoting the use of natural gas and solar power in Niigata.

Niigata governor's election threatens restart

October 17, 2016

Niigata election a setback for restarting Japan's biggest nuclear power plant

<http://www.japantimes.co.jp/news/2016/10/17/national/politics-diplomacy/setback-operator-worlds-largest-atomic-plant-anti-nuclear-doctor-elected-niigata-governor/#.WAS1Ccldeot>

Reuters, Kyodo, Bloomberg

NIIGATA – Sunday's victory by an anti-nuclear activist in the Niigata gubernatorial election is a setback for Prime Minister Shinzo Abe's energy policy.

Ryuichi Yoneyama, 49, defeated the candidate endorsed by Abe's Liberal Democratic Party. Former construction ministry bureaucrat Tamio Mori, 67, was expected until the last moment to cruise to victory. Yoneyama, a doctor and lawyer, has never held office.

The campaign was dominated by concerns over the future of the world's biggest nuclear power station, the seven-reactor Kashiwazaki-Kariwa complex in Niigata Prefecture.

Currently, only two reactors across Japan are operating in the wake of the 2011 Fukushima nuclear disaster, and Abe has pushed hard for restarts.

"Under current circumstances where we can't protect the lives and the way of life of citizens in the prefecture, I can't approve a restart," Yoneyama told reporters Monday.

Supported by the Japanese Communist Party and two other small parties, Yoneyama secured close to 530,000 votes. Mori trailed with 465,000.

The focus will now be how Yoneyama will be able to cooperate with municipalities and the central government in creating evacuation plans for nuclear disasters. These will be key before restarts can take place.

Abe, meanwhile, told a Diet committee that he will respect the choice of Niigata and that he will cooperate with the new governor.

Shares in Tokyo Electric Power Company Holdings Inc., which operates the Kashiwazaki-Kariwa reactors, fell 8 percent Monday.

The complex has a capacity of 8 gigawatts. Its revival is key to saving Tepco, which was brought low by the Fukushima crisis and then repeated admissions of cover-ups and safety lapses.

“Senior managers at Tepco have made it clear that restarting the Kashiwazaki reactors is fundamentally important to restoring their finances,” Tom O’Sullivan, founder of Tokyo-based consultant Mathyos, said by email. “There now has to be significant uncertainty over restarting those reactors.”

Yoneyama’s victory came after Tepco President Naomi Hirose highlighted the utility’s financial vulnerability this month. He said it may face insolvency if it were to recognize the cost of decommissioning the crippled Fukushima No. 1 plant.

Tepco has said that resuming operations for just one of the Kashiwazaki-Kariwa reactors would boost its profit by about ¥10 billion a month.

This was Yoneyama’s fifth attempt at public office, and the first time he was successful.

During the campaign he promised to continue the policy of the outgoing governor, who had long thwarted the ambitions of Tepco to restart the plant. Tepco supplies about a third of Japan’s electricity.

When the race tightened, the election became a litmus test for nuclear safety and put Abe’s energy policy and Tepco’s handling of Fukushima back under the spotlight.

“The talk was of Kashiwazaki-Kariwa, but I think the result will affect nuclear restarts across the country,” said Shigeaki Koga, a former trade and industry ministry official who is a critic of nuclear restarts and the Abe administration.

Koga said it will be important for Yoneyama to join forces with another newly elected governor skeptical of nuclear restarts, Satoshi Mitazono of Kagoshima Prefecture.

“Without strong support from others, it won’t be easy to take on Tepco,” he said.

The government wants to restart nuclear plants that pass safety checks while also promoting renewables and burning more coal and natural gas.

All of Japan’s reactors were eventually taken offline after Fukushima, but the Niigata plant’s troubles go back further.

Several reactors at Kashiwazaki-Kariwa have been out of action since an earthquake in 2007 caused radiation leaks and fires in a disaster that prefigured the Fukushima calamity and Tepco’s bungled response.

Yoneyama, who has worked as a radiological researcher, said on the campaign trail that Tepco lacks the means to prevent Niigata children from getting thyroid cancer in a nuclear accident, as he said happened in Fukushima. He said the company did not have a solid evacuation plan.

The LDP’s Mori, meanwhile, was forced to tone down his support for restarting the plant as the race tightened, insisting safety was the top priority for Kashiwazaki-Kariwa, while promoting the use of natural gas and solar power in Niigata.

People affected by the Fukushima crisis welcomed the election result, while operators of nuclear power-related businesses expressed concern.

Some evacuees of the 2011 crisis, including a 57-year-old man living in temporary housing in the city of Fukushima, said they hope the voices of the anti-nuclear camp will be reflected in Yoneyama’s policies.

“I don’t want another nuclear plant accident,” he said. “No nuclear plant should be restarted.”

Kotaro Nagai, 67, who operates a guest house in Kagoshima Prefecture, home to the Sendai nuclear plant, however, said the financial boon for hosting reactors is the key factor behind his support for restarts.

“There are many people who have benefited financially from nuclear power plants,” Nagai said. “A restart is a matter of life and death for us.”

Upset in Niigata pushing LDP to review nuclear energy policy

THE ASAHI SHIMBUN

October 17, 2016 at 14:45 JST

<http://www.asahi.com/ajw/articles/AJ201610170029.html>

An opposition-backed candidate's victory in the Niigata gubernatorial election threw the Abe administration into a state of shock over the possible consequences to its nuclear energy policy and its standing on the national level.

Niigata Governor-elect Ryuichi Yoneyama has taken a cautious stance on restarting the Kashiwazaki-Kariwa nuclear plant in the prefecture, the key issue in the gubernatorial election north of Tokyo. The ruling coalition parties of the Liberal Democratic Party and Komeito thought they had a sure winner in Tamio Mori, a former Nagaoka mayor, before the official campaign period started.

But the voters' rejection of the coalition-backed candidate means the Abe administration will have to review its energy policy.

"Our side lost in an election in which the opposition parties took an anti-nuclear stance," a senior government official said. "That will naturally have an effect on the central government's energy policy." The defeat of Mori, however, could have repercussions beyond just energy policy.

"There will be an effect on national politics in general, above and beyond nuclear energy policy, because this will give the opposition parties additional momentum," a high-ranking LDP official said on Oct. 16. The ruling coalition and proponents of nuclear power saw a great opportunity when Hirohiko Izumida, who had long opposed restarting the Kashiwazaki-Kariwa plant, announced he would not run for re-election.

After Yoneyama entered the race and said he would continue the cautious stance taken by Izumida, LDP executives went to Niigata to campaign on behalf of Mori.

After such efforts by the ruling party failed, one pro-nuclear energy LDP official said about restarting the Kashiwazaki-Kariwa plant, "We will have to take a wait-and-see approach for the time being."

Yoneyama's victory also throws a monkey wrench into plans of the Ministry of Economy, Trade and Industry to help Tokyo Electric Power Co., the operator of the Kashiwazaki-Kariwa plant, to return to a more stable corporate footing.

TEPCO has been hampered by the huge costs associated with cleaning up after the 2011 disaster at its Fukushima No. 1 nuclear power plant.

Economy ministry officials had preconditioned their TEPCO rehabilitation plan on a resumption of operations at some of the seven reactors at the Kashiwazaki-Kariwa plant.

Although a prefectural governor does not have the legal authority to order utilities to start or suspend operations at a nuclear plant, the common practice until now has been for utilities to obtain the consent of the local government before resuming operations.

With Yoneyama having clearly stated his reluctance toward such a resumption, TEPCO faces a much higher hurdle in its attempt to reboot the Kashiwazaki-Kariwa plant.

"We will persistently try to gain the understanding of the new governor, but it might be difficult to resume operations over the next four years," a high-ranking economy ministry official said.

Nuclear foe Ryuichi Yoneyama elected Niigata governor, threatening Tepco reactor restarts

<http://www.japantimes.co.jp/news/2016/10/17/national/politics-diplomacy/anti-nuclear-candidate-yoneyama-leading-niigata-gubernatorial-election/#.WAS1Xcldeos>

Kyodo, Reuters

NIIGATA – An anti-nuclear candidate was elected governor of Niigata on Sunday, dealing a potential blow to Tokyo Electric Power Co.'s attempts to restart the world's biggest nuclear power station.

The winner, Ryuichi Yoneyama, 49, is a doctor and lawyer who has never held office and was backed mostly by left-wing parties.

The campaign was dominated by concerns over the future of the massive Kashiwazaki-Kariwa power station and nuclear safety more than five years after the Fukushima crisis.

Yoneyama defeated former Nagaoka Mayor Tamio Mori, 67, who was backed by the pro-nuclear Liberal Democratic Party.

Yoneyama gathered more than 528,000 votes, about 60,000 more than Mori. Voter turnout was 53.05 percent, up significantly from the 43.95 percent in the previous gubernatorial election in 2012.

"It's really regrettable. We will take the judgment of voters very seriously," said Keiji Furuya, a Lower House member who served as head of Mori's campaign office.

Yoneyama promised to continue the policy of the departing governor, who had long thwarted Tepco's ambitions to restart the plant.

Reviving the seven-reactor giant, with capacity of 8 gigawatts, is key to saving the utility, which was battered by the Fukushima catastrophe of March 2011 and then the repeated admissions of coverups and safety lapses.

Tepco is vital to Prime Minister Shinzo Abe's energy policy, which relies on rebooting more of the reactors that once provided about 30 percent of the nation's electricity needs.

Govt should take election results seriously

October 17, 2016

Editorial: Gov't, TEPCO should take Niigata gubernatorial election results seriously

<http://mainichi.jp/english/articles/20161017/p2a/00m/0na/009000c>

A candidate who is cautious about restarting idled nuclear power plants won the Oct. 16 Niigata gubernatorial election, defeating a rival backed by the ruling coalition. The government of Prime Minister Shinzo Abe and Tokyo Electric Power Co. (TEPCO) should take seriously the outcome of the election, in

which the pros and cons of reactivating the utility's atomic power station in the prefecture was a key point of contention.

- **【Related】** Anti-nuclear candidate wins Niigata governor race
- **【Related】** Niigata governor-elect calls for Fukushima nuclear crisis investigation
- **【Related】** TEPCO suffers blow with anti-nuclear candidate's win in Niigata governor race

Ryuichi Yoneyama, 49, supported by the opposition Japanese Communist Party, Liberal Party and Social Democratic Party, beat former Nagaoka Mayor Tamio Mori, 67, backed by the ruling Liberal Democratic Party (LDP) and its coalition partner Komeito.

Mori had been expected to score an easy victory as the approval rating of the Abe Cabinet has been high and both the ruling coalition parties enjoy support from the business community and related organizations. Therefore, the results highlight prefectural residents' deep-rooted distrust in TEPCO, the operator of the tsunami-ravaged Fukushima No. 1 Nuclear Power Plant.

The governing bloc's loss in the Niigata election follows its defeat in the July Kagoshima gubernatorial race, in which journalist Satoshi Mitazono, who called on Kyushu Electric Power Co. to stop operations at its Sendai Nuclear Power Plant in the prefecture during his campaigning, scored a victory.

The outcome of the Niigata race also apparently shows local residents' displeasure toward Mori, who failed to clarify his stance toward whether the Kashiwazaki-Kariwa Nuclear Power Plant in the prefecture should be restarted, as well as their criticism of the Abe administration that is proactively trying to reactivate atomic power plants.

Close attention was focused on the latest election because incumbent Hirohiko Izumida abandoned seeking a fourth four-year term as governor.

The reason why Izumida gave up on running in the race remains unclear. However, Izumida has continued to demand TEPCO clarify the cause of the Fukushima nuclear crisis as a precondition for sitting at the negotiation table to discuss whether the Kashiwazaki-Kariwa plant should be reactivated. As such, TEPCO and the Abe government had expected that the retirement of Izumida would help facilitate the resumption of operations at nuclear plants.

As the election campaign went on, however, Yoneyama, who declared that he would take over Izumida's policy line, garnered growing support from local voters. Alarmed by the situation, LDP heavyweights, including Secretary-General Toshihiro Nikai, delivered campaign speeches and urged the local business community and industry organizations to vote for Mori.

Numerous voters in Niigata, who saw the LDP's desperate efforts to persuade local voters to vote for Mori, probably felt the old-fashioned culture of the LDP. During his campaigning, Mori emphasized his experience of serving as president of the Japan Association of City Mayors to demonstrate his close relations with the national government. However, he gave local voters the impression that he was hesitant to clarify his position on reactivation of atomic power plants.

Many challenges have been left unaddressed by Izumida, such as whether the evacuation plan for local residents in case of an accident at the Kashiwazaki-Kariwa plant is appropriate. Yoneyama must address these challenges as he pledged during his campaigning.

The manner in which the largest opposition Democratic Party (DP) approached the election was poor. The DP did not officially support Yoneyama although the party had initially planned to field him in the next House of Representatives election because the TEPCO union has strong influence within the Japanese Trade Union Confederation (Rengo), which is a major supporting organization for the party. However, DP leader Renho did an about-face and delivered campaign speeches for Yoneyama in the final phase of the campaign apparently after being convinced that he would win.

The DP cannot win support from voters unless the party discusses its nuclear power policy and clarifies its stance on the issue.

Minister: We will listen to governor's ideas

http://www3.nhk.or.jp/nhkworld/en/news/20161017_16/

Japan's industry minister has indicated he wants to win the understanding of Niigata's newly elected governor for the restart of a nuclear power plant in the prefecture.

Hiroshige Seko made the remarks on Monday after Ryuichi Yoneyama won the gubernatorial election on the previous day.

The major issue in the campaign was whether to restart Tokyo Electric Power Company's Kashiwazaki-Kariwa nuclear power plant.

Yoneyama has expressed caution about restarting the facility.

The minister said the election result shows the will of people in the prefecture.

Seko said the government will consider its ways to restart the nuclear plant and seek the new governor's understanding on the issue.

He said the government has been listening to incumbent Governor Hirohiko Izumida's opinions on the new regulations introduced after the 2011 Fukushima Daiichi accident and evacuation procedures.

The minister said it is also important to reform management at TEPCO, and the government will seek the new governor's ideas on how that can be achieved.

Argument that nukes are cheaper is not tenable

October 15, 2016

Cost of pulling plug on reactors

<http://www.japantimes.co.jp/opinion/2016/10/15/editorials/cost-pulling-plug-reactors/#.WAJd3cldeos>

In its latest discussions on electricity market reform, the Ministry of Economy, Trade and Industry is reportedly considering a measure to financially help major power companies with decommissioning their

nuclear plants. METI is reportedly weighing having new entrants to the liberalized power retail market shoulder part of the decommissioning cost, which would be added to the electricity bills of their customers. That would be nothing less than welfare for the major suppliers that are seeing nuclear power lose its cost advantages in the face of power retail deregulation since April. The government should avoid policies that could distort the principles of electricity business liberalization.

In its discussions launched in late September, the ministry says the committee will weigh establishing a system that would have power suppliers respond to “issues of public interest,” such as investments to prepare for decommissioning nuclear plants and severe nuclear accidents amid market liberalization. That sounds like a legitimate question to consider, but the measures contemplated by the ministry pose many problems.

One is a change to the accounting system for decommissioning nuclear power plants. Tokyo Electric Power faces massive financial problems in dealing with its Fukushima No. 1 plant, which suffered triple meltdowns after it was hit by the March 2011 Great East Japan Earthquake and tsunami. The cost to decommission the crippled plant is certain to far exceed the estimated ¥2 trillion — in fact it is impossible to grasp the total cost at this stage since the technology to remove molten nuclear fuel from its reactors has not yet been established. Compensation for victims of the nuclear disaster, which was estimated in 2014 at ¥4.9 trillion, has already topped ¥6 trillion. The cost to decontaminate areas polluted with radioactive fallout from the plant is likely to top ¥2.5 trillion in the government’s plan.

Even in the absence of a major disaster like the Fukushima catastrophe, the major utilities operating nuclear power plants face a shortage in financial reserves to pay for decommissioning as they needed to scrap the plants earlier than scheduled in response to the tightened plant regulations following the Fukushima disaster, along with the overshooting of the cost of decommissioning from earlier forecasts. Besides Tokyo Electric, five major power firms have made decisions to decommission six of their reactors — one each for Kyushu Electric, Chugoku Electric, Shikoku Electric and Japan Atomic Power and two for Kansai Electric.

To cover the bloated expenses of decommissioning, the ministry is thinking of having all electricity suppliers — including new entrants to the market that do not run nuclear power plants — share the cost in the form of surcharges to the fees that they pay for accessing power transmission lines to service their customers. The cost will then be added to customers’ electricity bills.

Under the current system, the major suppliers operating nuclear power plants can include the cost of decommissioning them in the future — along with all other expenses in their power generation — in their electricity charges. But that system will be abolished in 2020, when their power transmission and distribution sections are to be separated from the power generation operations in the final phase of the reform. The idea of having all suppliers — and consequently all consumers — pay for the cost of decommissioning nuclear plants is intended to cope with this change. However, such a measure will blur the responsibility of major power companies that have relied heavily on nuclear power generation and miscalculated the related costs.

That will also have the effect of denying consumers the right to refuse to pay for electricity generated by nuclear power. The retail market liberalization in April enabled consumers to choose power suppliers, instead of being tied to regional monopolies. Some suppliers offer electricity mainly generated by renewable sources such as solar and wind. But applying the surcharge to all suppliers will result in forcing all consumers — including those who may not want to buy electricity from the former monopolies that run nuclear plants — to shoulder the cost of decommissioning.

The ministry’s committee is also reportedly weighing a scheme to enable suppliers that operate large-scale thermal power plants to receive a certain amount of revenue for keeping the plants even without

running them — based on their power-generation capacity. The idea represents another relief measure for major power companies whose thermal power plants saw their operating ratio fall with the sharp rise in renewable sources in recent years. The scheme is touted as necessary to maintain thermal power capacity as a buffer in case the supply from renewable sources decreases. But experience in other countries indicates that such a mechanism is not essential to managing possible fluctuations in the supply of renewable energy.

The government has long based its energy policy on the argument that nuclear power is cheaper than most other forms of power generation. But the fact that it is seeking to introduce a relief measure for major suppliers that run nuclear plants indicates that argument is no longer tenable. The government needs to reflect on the real meaning of the measures it is contemplating.

Listen to the public's voice

October 18, 2016

EDITORIAL: Niigata governor election shows anxiety about nuclear power

<http://www.asahi.com/ajw/articles/AJ201610180023.html>

In an upset, Ryuichi Yoneyama, a rookie candidate backed by the opposition Japanese Communist Party, the Social Democratic Party and the Liberal Party, was elected governor of Niigata Prefecture on Oct. 16. Yoneyama presented a tough stance toward the proposed restart of Tokyo Electric Power Co.'s Kashiwazaki-Kariwa nuclear power plant in the prefecture, which was the main election issue. He emerged victorious in a virtual one-on-one contest against Tamio Mori, a former mayor of Nagaoka in the prefecture, who was backed by the ruling Liberal Democratic Party and its junior coalition partner, Komeito.

The outcome could be called a manifestation of the public will that wants to halt the headlong way the administration of Prime Minister Shinzo Abe is seeking to have Japan's idled nuclear reactors brought back online.

The election highlighted the strong anxiety that Niigata Prefecture residents have concerning nuclear power.

Yoneyama said in his campaign pledge that he would not discuss the restart of the Kashiwazaki-Kariwa plant unless the causes of the 2011 disaster at TEPCO's Fukushima No. 1 nuclear power plant, its impact and the challenges it highlighted are scrutinized.

He has the responsibility to follow through on his promise and confront the central government and TEPCO, which are seeking to have the Kashiwazaki-Kariwa's nuclear reactors brought back online, with a resolute attitude.

Hirohiko Izumida, the incumbent governor who has consistently taken a cautious stance toward a nuclear restart, did not seek re-election.

Attention was focused during the gubernatorial race on whether Izumida's policy line would be succeeded. It was initially thought that Mori, a former head of the Japan Association of City Mayors who emphasized the connections he has with the central government, had an overwhelming advantage.

But Yoneyama, who announced his candidacy immediately before official campaigning started and asserted he would follow Izumida's stance over the nuclear restart issue, turned out to have more pull. An Asahi Shimbun survey of eligible voters in Niigata Prefecture found that, while only about 20 percent of the respondents said they approved the restart of the Kashiwazaki-Kariwa nuclear plant, more than 60 percent opposed it. Yoneyama was elected by that public opinion.

Kashiwazaki-Kariwa, where seven nuclear reactors are concentrated, is one of the world's largest nuclear plants. A serious cover-up of technical problems there came to light in 2002. The Niigata Chuetsu-oki Earthquake of 2007 resulted in a fire and the leakage of a small amount of radioactive substances there. It stands to reason that many feel anxious about plant operations.

Izumida told the central government that plans for evacuating local residents in the event of a nuclear plant disaster are not covered by the screenings by the Nuclear Regulation Authority, and called for the central government's Nuclear Emergency Response Guideline to be improved. He also used an expert panel of the prefectural government to pursue an independent investigation into the Fukushima nuclear disaster.

The governor also questioned TEPCO's delay in announcing that core meltdowns had occurred at the Fukushima No. 1 nuclear plant. That led to TEPCO's acknowledgment this year of a cover-up.

One can say that Izumida has demonstrated that a prefectural governor can play various roles without leaving the safety of a nuclear plant up to the central government. The election results have shown that many residents of Niigata Prefecture want their governor to continue that stance.

The Abe administration, which defines nuclear energy as an important mainstay power source, is hoping to restart nuclear reactors that have passed NRA screenings. It also defines the restart of the Kashiwazaki-Kariwa nuclear plant as an indispensable step for rehabilitating the embattled TEPCO, which has virtually become a government-owned entity.

The administration, however, should sincerely face up to the public will in Niigata Prefecture.

In Kagoshima Prefecture as well, the winner in a gubernatorial election this summer was a candidate who called for a nuclear plant in the southern prefecture to be taken temporarily offline.

It is the duty of top officials responsible for national politics to listen to the voices of the public.

"They can eliminate nuclear power, so why don't they?"

October 19, 2016

Ex-PM Koizumi: 'Why doesn't gov't eliminate nuclear power?'

<http://mainichi.jp/english/articles/20161019/p2a/00m/0na/019000c>

MATSUMOTO, Nagano -- Former Prime Minister Junichiro Koizumi on Oct. 18 commented on the victory of an anti-nuclear newcomer in the Oct. 16 Niigata gubernatorial election, asking why the government isn't giving up nuclear power when it can.

The newly elected governor, Ryuichi Yoneyama, has expressed a cautious view on the restart of the Kashiwazaki-Kariwa nuclear power plant in Niigata Prefecture.

"He beat a candidate backed by the Liberal Democratic Party (LDP), Komeito and the Japanese Trade Union Confederation, and it was an unexpected upset. I guess that the public has come to understand that

nuclear power plants are dangerous, not safe," Koizumi said during an address in the Nagano Prefecture city of Matsumoto.

He underscored the impact of the election, saying that if the opposition parties jointly field candidates in the next House of Representatives election and make the elimination of nuclear power plants the main focal point, "There's no telling how the LDP will end up."

Koizumi said that while he was in power, he believed the opinions of experts and thought that nuclear power plants were necessary. But his view on nuclear power changed in the wake of the Fukushima nuclear disaster.

"With the Fukushima nuclear disaster, I realized that the descriptions of (atomic power) as safe, clean and low-cost were all lies."

The former prime minister said he started efforts to eliminate all nuclear power plants in Japan after realizing the mistake and wanting to correct it and make amends. At times during his address, Koizumi raised his voice in earnest like he did when he was prime minister.

"They (the government) can eliminate nuclear power, so why don't they?" he asked. "It's time to turn a predicament into a chance."

Campaign to promote all-electric homes resumes

October 21, 2016

Japanese utility urges all-electric homes to sell expected excess of electricity

<http://www.japantimes.co.jp/news/2016/10/21/business/corporate-business/japanese-utility-urges-electric-homes-sell-expected-excess-electricity/#.WAol08ldeos>

by Stephen Stapczynski
Bloomberg

The first Japanese utility to restart a nuclear reactor under post-Fukushima rules has resumed a campaign urging users to increase power consumption.

The campaign had been discontinued after the unprecedented triple meltdown in March 2011.

Kyushu Electric Power Co., which expects at least two nuclear reactors to be online next year, aims to start a television advertising campaign to promote the adoption of "all electric households," according to spokesman Shinpei Ikeda.

The company began an online campaign earlier this month, and is offering promotions for customers who purchase electric stoves and heaters. By using electricity instead of gas, the Fukuoka-based company is hoping that households boost stagnating demand and eat up some of its excess supply.

The push comes amid market reform introduced in April to increase competition and after power demand from the nation's 10 regional utilities fell to an 18-year low. For the first time since the Fukushima meltdowns, the Ministry of Economy, Trade and Industry announced on Tuesday that it won't request companies and households to implement measures to cut power consumption, known as *setsuden*, this winter due in part to the boost in supplies following the restart of some nuclear reactors.

“Promoting the ‘all electricity household’ is a very big weapon for us now that the power market has liberalized,” Ikeda said by phone on Wednesday. Excess supply from its reactors and the setsuden decision “also played into why we resumed the campaign. The nation’s power supply-demand situation has improved.”

Kyushu Electric, along with other utilities, discontinued a similar campaign in 2011 after Fukushima led to the eventual closure of the nation’s nuclear fleet and resulted in rolling blackouts in parts of the country. In Fukushima’s wake, utilities and the government pushed for the adoption of power-saving measures as they struggled to meet demand and as power prices skyrocketed.

With the decline in consumption, utilities’ sales stagnated. Kyushu Electric’s revenue fell 2 percent in the fiscal year ended in March, and the utility expects it to remain little changed this fiscal year, it said in a presentation dated May 9.

The utilities have been feeling even more pressure this year after the government fully opened the power market in April, allowing Japanese households for the first time to choose their provider. With more than 350 companies now approved to sell power, regional utilities are concocting new strategies to shore up revenue.

Kyushu Electric is better positioned than its rivals as it is one of only two utilities currently operating nuclear reactors, allowing it to easily meet an increase in power demand. The utility has one reactor online at its Sendai facility, after shutting a separate unit for maintenance on Oct. 6.

In addition to the Sendai reactors, Michiaki Uriu, Kyushu Electric president, expects the company’s Genkai Nos. 3 and 4 reactors to restart within the fiscal year ending March 2017, the Nikkei newspaper reported in August. The reactors are in the final stage of the nation’s regulatory review, the paper said.

Kyushu Electric’s campaign “is a customer retention strategy,” Joseph Jacobelli, an analyst at Bloomberg Intelligence, said by email. “But this strategy will not boost consumption to a level to take up all of the electricity from the new plants. Those plants will mostly replace power from expensive fossil fuels.”

Get to the bottom of Fukushima disaster before restarting plants

October 17, 2016

Niigata governor-elect calls for Fukushima nuclear crisis investigation

<http://mainichi.jp/english/articles/20161017/p2a/00m/0na/008000c>

NIIGATA -- Governor-elect Ryuichi Yoneyama has called for getting to the bottom of the Fukushima nuclear crisis before debating the pros and cons of restarting the local atomic power station.

- **【Related】** Anti-nuclear candidate wins Niigata governor race
- **【Related】** TEPCO suffers blow with anti-nuclear candidate's win in Niigata governor race
- **【Editorial】** Gov't, TEPCO should take Niigata gubernatorial election results seriously

Yoneyama, 49, told reporters on the morning of Oct. 17, "We can't approve a restart as long as the lives and livelihoods of prefectural residents can't be protected."

During his campaigning, Yoneyama had said discussions on the issue "can't be started without clarifying the cause of the accident at the Fukushima No. 1 Nuclear Power Plant."

At the same time, he said he is prepared to have dialogue with the central government and Tokyo Electric Power Co. (TEPCO) instead of confronting these entities. TEPCO is the operator of both the idled Kashiwazaki-Kariwa Nuclear Power Plant in Niigata Prefecture and the tsunami-hit Fukushima plant. Yoneyama said he is prepared to cooperate with an investigation being conducted by a panel comprised of the prefectural government and TEPCO into an incident in which the utility had concealed that meltdowns occurred at the Fukushima No. 1 nuclear complex.

"We'd like to get to the bottom of the case by not just confronting but cooperating with TEPCO," he told reporters.

The governor-elect stopped short of ruling out the possibility that the power plant will be restarted if necessary conditions are met.

"I don't think we should rule out the possibility. We can't have discussions with each other unless there is room for compromise with each other," he said.

Yoneyama successfully ran in the Oct. 16 Niigata gubernatorial election with the backing of the opposition Japanese Communist Party, Liberal Party and Social Democratic Party. However, the Liberal Democratic Party, the ruling party in the National Diet, has a majority in the prefectural assembly.

"We've agreed to place priority on dialogue over confrontation, and on bringing benefits to prefectural residents," he said.

Forget nuclear fuel recycling

October 24, 2016

EDITORIAL: Japan should torch hopes of fast reactor to recycle nuke fuel

<http://www.asahi.com/ajw/articles/AJ201610240030.html>

The government has formed a "committee for fast reactor development" following its recent decision to review the Monju prototype fast-breeder nuclear reactor in Fukui Prefecture, with an eye toward decommissioning it.

If allowed to proceed like this, the government could only repeat the same mistake even if it were to decide to scrap the Monju reactor, on which more than 1 trillion yen (\$9.6 billion) has been spent.

The review should cover the entire nuclear fuel recycling program, of which Monju is a part.

The new expert panel has five members, comprising the industry minister, the science and technology minister, the president of the Japan Atomic Energy Agency, which operates Monju, the chairman of the Federation of Electric Power Companies of Japan, who is also president of Chubu Electric Power Co., and the president of Mitsubishi Heavy Industries Ltd., a nuclear reactor manufacturer.

They are representatives of central players that have promoted nuclear power development, and most of the committee's meeting was held behind closed doors.

The panel apparently has no plans to conduct a comprehensive review of the Monju program, including determining why it ended in this deadlock and questioning who should be held responsible. It would be farcical for officials to argue that the committee, as its name indicates, will be dedicated to the development of a fast reactor.

The nuclear fuel recycling program aims at reprocessing spent nuclear fuel to extract plutonium, which will be burned in nuclear reactors. A fast-breeder reactor such as Monju, which is supposed to produce more plutonium than they burn, is a core component of that program.

Even though a fast nuclear reactor is not aimed at “breeding” plutonium, it has the same basic structure of a fast-breeder reactor. It would face the same technical challenges that stood in the way of Monju.

Some government officials have made comments suggesting a fast reactor is certain to be realized. There is no prospect, however, for materializing a safe and economically viable fast reactor any time in the near future.

Japan is banking on joining France’s program for building an Advanced Sodium Technological Reactor for Industrial Demonstration if it decides to decommission Monju. But ASTRID still remains in the basic planning stage.

Officials say they will decide whether to build the fast demonstration reactor only on the basis of the outcome of research and development, on which more than 110 billion yen will be spent through 2019. Even if a decision is made to build ASTRID, it is only envisaged to enter into service sometime around 2030.

France is planning to have part of its experiments conducted at Monju and elsewhere. A French government official told a team of Japan National Press Club reporters that the plan would have to be amended if Monju were to be scrapped, adding that he looked forward to Japan’s financial contributions. Tokyo is apparently touting that everything will be fine with Japan’s nuclear fuel recycling program because of the ASTRID program, which, in fact, is full of uncertainty.

Japan already possesses 48 tons of plutonium, enough to make 6,000 nuclear bombs, at home and abroad, and the country’s urgent task is to reduce that stockpile.

Japan’s ongoing “plutothermal” (plutonium-thermal) power generation method for burning mixed oxide fuel, composed of plutonium blended with uranium, in a conventional nuclear reactor is not likely to consume the huge amount of plutonium in stock.

Given that, the government’s argument that using a fast reactor to recycle nuclear fuel is therefore the only available option is an illusion that ignores reality.

The government should give serious consideration to the fact that the United States and Britain have long abandoned their nuclear fuel recycling programs.

Nuclear exit issue might ruin LDP

October 22, 2016 (Mainichi Japan)

LDP may lose next election if nuclear exit becomes main issue: ex-PM

<http://mainichi.jp/english/articles/20161022/p2g/00m/0dm/002000c>

TOKYO (Kyodo) -- Former Prime Minister Junichiro Koizumi said the pro-nuclear ruling party of Prime Minister Shinzo Abe could lose the next lower house election if whether to give up nuclear power becomes the main election issue.

- **【Related】** Editorial: Gov't, TEPCO should take Niigata gubernatorial election results seriously
- **【Related】** Niigata governor-elect calls for Fukushima nuclear crisis investigation
- **【Related】** Kagoshima governor once again requests nuclear reactor halt
- **【Fukushima & Nuclear Power】**

Citing recent gubernatorial election wins for candidates cautious about restarting nuclear power plants in Niigata and Kagoshima prefectures, Koizumi said during a recent interview with Kyodo News, "(Anti-nuclear) opinions are beginning to grow...that could influence the (next) House of Representatives election."

If opposition parties unite in fielding anti-nuclear candidates and make complete phase-out of the country's nuclear plants one of the top election issues, they can defeat the ruling Liberal Democratic Party amid persistent worries among voters about nuclear safety following the 2011 Fukushima nuclear crisis, Koizumi said.

The current term of lower house lawmakers expires in December 2018, but some senior LDP officials have said Abe might dissolve the house for an election early next year.

Koizumi, who had promoted nuclear power generation as prime minister between 2001 and 2006, has become an active antinuclear campaigner. He has repeatedly criticized Abe and the way his government is dealing with the aftermath of the nuclear disaster.

"There is no way that a party which ignores the will of the public can maintain its hold on power," said Koizumi, who retired as a parliamentarian in 2009.

Koizumi also said that the main opposition Democratic Party "has not realized that the nuclear issue can be the biggest election issue."

"The slogan by promoters of nuclear power that (nuclear power) is safe, low cost and clean, are all lies," Koizumi said.

He noted that the government would be forced to pour more funds into Tokyo Electric Power Company Holdings Inc., operator of the Fukushima Daiichi nuclear power plant crippled following the 2011 quake-tsunami disaster, to cover costs for decontamination work at the plant and damage compensation.

The government should give up its nuclear fuel recycling policy, including the use of the Monju fast-breeder reactor, Koizumi said. The government has not decided on the fate of the trouble-prone reactor, which was intended to play a key role in the recycling policy.

On Abe's drive to revise the war-renouncing Article 9 of the Japanese Constitution, Koizumi said it will not be possible due to a lack of sufficient public support.

On the decades-old territorial dispute over a group of Russian-held islands claimed by Japan off the northernmost main island of Hokkaido, Koizumi said a breakthrough will be difficult as Russia would not accept Japan's ownership of the islands.

Abe hopes to make progress on the issue, which has prevented the two countries from signing a post-World War II peace treaty, when he meets Russian President Vladimir Putin on Dec. 15 in Japan.

Promoting tourism and local foods in Fukushima

October 21, 2016

Fukushima officials luring tourists from Australia

http://www3.nhk.or.jp/nhkworld/en/news/20161021_34/

Government and businesspeople from Japan's Fukushima Prefecture are in Australia to **promote tourism and specialty foods from the region.**

About 60 people attended a tourism seminar in Sydney on Friday. The event is the first of its kind to be held by Fukushima in Australia.

Officials of the prefecture's government and businesses introduced world-class skiing sites and other Fukushima attractions that are popular with overseas visitors.

Participants had a chance to try local specialties including sake and ramen.

One participant said he didn't know Fukushima was such a great place to visit, and expressed hope to go there.

Tourism officials say the number of foreign visitors has not returned to levels before the 2011 earthquake and nuclear crisis.

But Fukushima is becoming a popular destination for Australians. Last year about 1,500 visited -- nearly 4 times the pre-disaster level.

Miyagi: Radioactive waste mostly below "government standard"...

October 24, 2016

Radioactivity level of waste diminishes

http://www3.nhk.or.jp/nhkworld/en/news/20161024_11/

Japan's Environment Ministry officials say they have found that radioactivity levels of waste materials from the 2011 Fukushima Daiichi nuclear accident have significantly decreased.

Officials checked the radioactivity of plants, soils and other waste stored in the northeastern prefecture of Miyagi, which neighbors Fukushima.

The waste had radioactivity higher than the government-set level of 8,000 becquerels per kilogram. The central government is responsible for the disposal of such waste.

But about 2,500 tons have not been designated as high-level radioactivity waste. Local people did not apply for designation mainly because it could create the impression that the area is dangerous.

Environment Ministry officials say the radioactivity levels of about 2,000 tons, or 77 percent of such waste, is now below the government standard.

Miyagi prefectural officials say they want to discuss with municipality leaders next month how to dispose of low-level radioactive waste.

They say they need to consider the fact that the levels of radioactivity have decreased more than 5 years after the nuclear accident.

False certificates and untrained workers

October 25, 2016

Untrained staff did radioactive cleanup work in Fukushima

<http://www.asahi.com/ajw/articles/AJ201610250053.html>

18

[list](#)

Certificates of training in radioactive decontamination work were issued by a company in Nihonmatsu, Fukushima Prefecture, to workers who had received no such training. (Masakazu Honda)

NIHONMATSU, Fukushima Prefecture--A company has admitted to not giving the required special training to workers before dispatching them to carry out decontamination work in radiation-hit Fukushima city. A subcontractor called "Zerutech Tohoku" issued at least 100 bogus certificates to its workers showing they had completed the training, when, in fact, they had done nothing, according to the Fukushima Labor Standards Inspection Office.

The office had warned the subcontractor, which is based in Nihonmatsu and decontaminates parts of nearby Fukushima city, which was affected by the 2011 nuclear disaster, that it should give special training to workers to prepare them for the task.

The Ministry of Health, Labor and Welfare requires decontamination operators be given at least 5.5 hours of special training to each individual in accordance with the Industrial Safety and Health Law.

The training includes a lecture on potential health hazards and how to operate decontamination equipment as their job involves handling soil polluted by radioactive materials.

The 52-year-old representative of the company admitted wrongdoing in an interview with The Asahi Shimbun.

“We had to hire a large number of workers over a short period of time since we received a contract involving a vast swath of land,” he said of the false certificates, of which between 100 and 150 have been discovered.

In addition, the company, a fourth-tier subcontractor, issued seven other kinds of certificates needed to operate an aerial vehicle or chain saw, which were required to land the cleanup contract.

For issuing false certificates, offenders could be imprisoned for up to six months or fined 500,000 yen (\$4,800).

But the law has been criticized for having numerous loopholes.

One is that **there is not test of workers' knowledge after they have received the training.**

The operators are also not required to register the certificates with municipal authorities.

And **it is not specified what qualifications are required for the person who conducts the training.**

The Labor Standards office, a regional arm of the health ministry, has been inspecting the company for breaches of the law and regulations on decontamination work since Oct. 19.

The Zerutech Tohoku representative founded the company in March last year.

Fukushima update by G. Edwards

By Gordon Edwards (ccnr.ca)

FUKUSHIMA UPDATE -- OCTOBER 2016:

The government of Shinzo Abe has passed draconian legislation to prevent ongoing information about the Fukushima Daiichi nuclear disaster from leaking out to the world at large. Ordinary citizens, and even professional journalists, can be imprisoned for reporting on conditions that the government deems to be contrary to the public interest -- as defined by the government.

Nevertheless, some information does seep through the seemingly impregnable wall of governmental-industrial secrecy.

DECOMMISSIONING COSTS MORE THAN DOUBLE

(1) The cost of dealing with the triple meltdown, previously estimated at about 800 million dollars per year, and expected to take 40 years or more, has now been recognized as massively underestimated. It appears that the desperate cleanup measures will cost several billion dollars per

year if any real progress is to be made. This alarming state of affairs was documented by Japan's Ministry of Economy, Trade and Industry, in presentations made before a panel struggling to devise a viable financial plan for TEPCO, the electric utility that owns the Fukushima Daiichi nuclear power plant, according to an article that appeared in the South China Morning Post on October 25 2016.

See <http://www.scmp.com/news/asia/east-asia/article/2039929/cost-scrap-fukushima-nuclear-plant-massively-underestimated> .

ICE WALL PARTIALLY COLLAPSES

(2) The Fukushima Daichi nuclear power plant was constructed over a major aquifer. When the three reactor cores melted down five and a half years ago, the slow inexorable flow of groundwater beneath the crippled reactors flushed out radioactive materials from the molten cores, delivering hundreds of tonnes of radioactively contaminated water into the Pacific Ocean every day. The Abe government promised to invest hundreds of million of dollars to install and maintain an enormous underground ice wall surrounding the entire nuclear site to divert groundwater away from the molten reactor cores, thereby reducing the rate of contamination of the Ocean waters. On September 2, 2016, an article in the Asahi Shimbun reported that drenching rain from the recent typhoons melted at least two sections of the ice wall and allowed highly contaminated water from around the damaged reactor cores to migrate, still underground, but downstream towards the sea. A TEPCO official admitted that the underground ice wall of frozen dirt is not working. If there had been another 15 cm. of rain, he said, the highly radioactive water would have reached the surface and flowed overland directly into the sea.

Reorganising TEPCO's nuclear power business

October 26, 2016

Spinoff eyed for TEPCO's nuclear power business to secure profits

<http://www.asahi.com/ajw/articles/AJ201610260060.html>

THE ASAHI SHIMBUN

The industry ministry has proposed starting a subsidiary to manage the nuclear power business of Tokyo Electric Power Co. Holdings Inc., hoping it will lead to an earlier restart of the Kashiwazaki-Kariwa nuclear power plant.

The Ministry of Economy, Trade and Industry also hopes the spinoff would boost profits to help the parent company cover the ballooning costs for the decommissioning of the crippled Fukushima No. 1 nuclear power plant and for compensating victims of the nuclear accident there.

The subsidiary's headquarters would likely be set up in Niigata Prefecture, the location of the Kashiwazaki-Kariwa facility, one of the world's largest nuclear power stations in output capacity.

The ministry's proposal came at a meeting Oct. 25 of a panel of academics and business executives discussing reform of TEPCO. The ministry believes the new entity would find it easier to make profits by collaborating with other leading electric power companies.

Decommissioning the Fukushima No. 1 nuclear plant and compensating victims of the 2011 nuclear disaster will remain under the responsibilities of TEPCO Holdings.

TEPCO owns the Fukushima No. 1 and No. 2 nuclear plants and the Kashiwazaki-Kariwa facility.

The new subsidiary would sit alongside three other operating companies set up in April. They oversee the operation of thermal power generation, electric retailing, and electricity transmission and distribution.

The ministry also said the annual decommissioning costs of the Fukushima No. 1 nuclear plant could increase from 80 billion yen (\$76.9 million) to hundreds of billions of yen.

The costs are expected to surge in the coming years since the retrieval of melted nuclear fuel rods involves technological difficulties.

The combined costs for decommissioning and compensating victims are likely to jump from an estimated 11 trillion yen to 18 trillion yen.

The ministry hopes the proposal for founding a subsidiary to focus on the operation of the nuclear power business will lead to greater support from the public for a restart of the Kashiwazaki-Kariwa nuclear plant.

Two of the seven reactors there have been scrutinized by the Nuclear Regulation Authority on whether they meet safety guidelines set after the Fukushima catastrophe.

Starting a reactor would add about 100 billion yen in operating profits a year to TEPCO's coffers since fossil fuels to fire thermal plants are expensive.

Setting up the main office of the subsidiary in Niigata Prefecture is intended to appease local residents. Former Governor Hirohiko Izumida, who was cautious about a restart of the Kashiwazaki-Kariwa plant, called for the move while he was in office.

New Niigata Governor Ryuichi Yoneyama, who has succeeded Izumida's stance and took office on Oct. 25, welcomed the ministry's idea for a spinoff, calling it "a good direction."

But he denied a restart "under current circumstances."

The new governor has urged a more detailed inquiry into what went wrong during the Fukushima disaster before discussing the possible restart of the Kashiwazaki-Kariwa facility.

Industry ministry unveils plan to split nuclear power division from TEPCO

<http://mainichi.jp/english/articles/20161026/p2a/00m/0na/004000c>

The Economy, Trade and Industry Ministry is planning to spin off Tokyo Electric Power Co. (TEPCO) Holdings Inc.'s nuclear power generation division and aim for an alliance between the new subsidiary and another power company.

- **【Related】** Fukushima nuclear plant decommissioning cost to surge
- **【Fukushima & Nuclear Power】**

The ministry unveiled the plan at an Oct. 25 meeting of an expert panel on reform of TEPCO and issues related to the tsunami-hit Fukushima No. 1 nuclear plant. The possibility has emerged that realignment of

the major utilities' nuclear power divisions will be led by the government as the planned reactivation of idled nuclear reactors has stalled.

As part of TEPCO reforms this past April, the company's thermal power, power retail and power transmission and distribution divisions were transformed into subsidiaries and placed under the umbrella of the newly established TEPCO Holdings.

However, TEPCO Holdings has retained its nuclear power division because the company needs to decommission the crippled Fukushima nuclear complex and pay compensation to victims of the nuclear disaster, which broke out in March 2011.

Under the ministry's plan, a subsidiary would be set up to take over TEPCO's nuclear power business, excluding the Fukushima No. 1 plant, with an eye to forming an alliance between the new firm and another major utility.

The costs of decommissioning the crippled power station's reactors are likely to far surpass the initial estimate. The ministry released a revised projection at the Oct. 25 expert panel meeting stating that the annual decommissioning bill will likely balloon from the current 80 billion yen into the hundreds of billions, due to work to remove melted nuclear fuel from the reactors and other factors.

The panel discussed TEPCO reforms to raise funds to cover the massive expense of dealing with the accident, such as compensation payments and decontamination of areas tainted with radioactive substances emanating from the nuclear disaster, plus decommissioning.

The committee is aiming to increase TEPCO's profitability by promoting the realignment of the firm's nuclear power division and other cost-cutting efforts.

TEPCO set up a joint venture, JERA Co., with Chubu Electric Power Co. in April 2015 to gradually integrate their thermal power station fuel procurement and overseas power generation divisions. TEPCO has also formed a business tie-up with SoftBank Group Corp. to bundle electricity and communications device contracts.

The industry ministry furthermore proposed that TEPCO's power transmission and distribution subsidiary, which is highly profitable thanks to a large number of customers in the Tokyo metropolitan area, strengthen its alliances with other utilities.

The expert committee is poised to work out the details of a plan to spin off TEPCO's nuclear power division and how the subsidiary should join hands with other companies. The panel will draw up a draft of its proposals possibly by the end of this year, and incorporate the recommendations in TEPCO's corporate rehabilitation plan to be released next year.

October 25, 2016

TEPCO should consider reorganization

http://www3.nhk.or.jp/nhkworld/en/news/20161025_21/

The Japanese government may call on Tokyo Electric Power Company to reorganize its nuclear power business.

The plan was proposed at a meeting of a panel formed by the Economy, Trade and Industry Ministry.

The panel of experts is discussing ways to cover the ballooning costs of decommissioning crippled

reactors at TEPCO's Fukushima Daiichi nuclear power plant.

The government expects the costs to expand to several billions of dollars due to the technically difficult work of removing melted nuclear fuel from the reactors.

That's a huge increase from the current annual amount of about 770 million dollars.

The government officials also said TEPCO needs to carry out drastic managerial reforms to cover the costs. The government plan includes asking TEPCO to spin off its nuclear power business and promote ties with other power companies.

Some meeting participants asked how the government would help if TEPCO cannot cover the costs only by improving earnings through reforms.

The panel plans to discuss further how the government could provide public support for the decommissioning work.

Decommissioning Fukushima No.1: How much?

October 25, 2016

Cost of decommissioning Fukushima No. 1 to reach hundreds of billions of yen a year

<http://www.japantimes.co.jp/news/2016/10/25/national/cost-decommissioning-fukushima-no-1-reach-hundreds-billions-yen-year/#.WA8kQcldeos>

Kyodo

The cost of scrapping the damaged Fukushima No. 1 nuclear power plant is set to rise to hundreds of billions of yen annually from the previously projected ¥80 billion a year, according to a new government projection disclosed Tuesday.

Under the projection by the Ministry of Economy, Trade and Industry, and based on the estimated 30-year time frame to complete the decommissioning, the total cost will likely exceed the ¥2 trillion initially forecast by Tokyo Electric Power Company Holdings Inc.

The plant was ravaged by the March 2011 Great East Japan Earthquake and tsunami and three of its reactors subsequently suffered meltdowns.

METI presented the estimate at a meeting of a panel of experts set to discuss reforming Tepco's management and helping finance the decommissioning work.

The ministry also presented the panel with a plan to spin off Tepco's nuclear power business, aiming to cover the decommissioning cost through aligning with other utilities.

"The panel is considering ways in which Tepco can secure (decommissioning) funds while avoiding an increase in public burden," Chief Cabinet Secretary Yoshihide Suga said at a news conference. "It is still discussing the issue."

The utility's business has taken a heavy blow in the years since the nuclear crisis first began as it wears the costs of cleaning up contaminated areas as well as compensating the people and businesses affected by the incident.

The growing costs of decommissioning Fukushima No. 1 and rising competition in electricity sales as a result of market deregulation prompted Tepco to seek fresh government assistance in July.

Estimating decommissioning costs has serious flaws

October 27, 2016

EDITORIAL: Cost estimate needed first to decommission Fukushima plant

<http://www.asahi.com/ajw/articles/AJ201610270028.html>

An industry ministry panel of experts is tackling two key questions concerning the decommissioning of the crippled Fukushima No. 1 nuclear power plant.

One is how much money will be needed to decommission the plant's reactors, three of which melted down. The other is who should foot the bill and how.

However, there are some serious flaws in the way the expert panel is working on these knotty questions, which could lead to a huge financial burden on the public.

First of all, **the panel's meetings are not open to the public.** The main points of the discussions are published later, but many details, including who made specific remarks, are omitted.

The fate of Tokyo Electric Power Co., which operates the Fukushima plant and is responsible for its decommissioning, will be largely determined by whether it can restart its Kashiwazaki-Kariwa nuclear power plant in Niigata Prefecture.

Panel members include many business leaders who have been promoting nuclear power generation.

The outcome of the recent Niigata gubernatorial election underscored the strong opposition of local residents against TEPCO's plan to bring the plant back online.

The panel's lineup raises concerns that its discussions may be based on the assumption that the Kashiwazaki-Kariwa nuclear plant will eventually be restarted, despite the situation in the prefecture.

Another troubling fact is that **the government has yet to announce any estimate of the total decommissioning cost.**

In the panel's first meeting, some members urged the government to swiftly present an estimate of the cost. In the second meeting, however, the Ministry of Economy, Trade and Industry only said that annual spending could grow to several hundreds of billions of yen from about 80 billion yen (\$703 million) spent now.

The ministry says a specific estimate of the total cost will be announced as early as the end of the year, along with a plan for management reforms at TEPCO and a package of related measures the government will take.

But this timetable doesn't make sense. Pinning down the overall decommissioning cost should be the starting point for the panel's discussions.

With the conditions of the melted nuclear fuel remaining unclear, it is certainly difficult to accurately estimate the cost.

Still, **an estimate should first be shown to ensure substantive debate on whether the method used for the work is appropriate and whether there are ways to curb the cost.**

As for financing, the panel has supported the proposal that TEPCO should secure the necessary funds on its own through management reform over other options, such as the utility's liquidation involving debt forgiveness by its creditors, tax financing by the government and a continuation of the current state control of TEPCO.

In an apparent attempt to stress the importance of TEPCO's own efforts to save itself, the panel has also recommended that the Kashiwazaki-Kariwa nuclear plant should be spun off from TEPCO and integrated with the nuclear power business of another utility.

There is no disputing that TEPCO should push through thorough management reforms to prevent the public from shouldering part of the cost through tax financing or hikes in electricity rates.

The question, however, is whether the embattled utility's own efforts will be enough to cover the entire decommissioning cost, expected to reach several trillions of yen.

If a plan based on the company's own efforts fails and disrupts the decommissioning process, the reconstruction of disaster-hit areas in Fukushima Prefecture could be seriously delayed.

It is vital for the panel to win broad public support for its proposals on the national challenge of decommissioning the Fukushima No. 1 nuclear power plant.

This requires careful, exhaustive and reasonable debate, open to the public, on the cost and the financing method.

--The Asahi Shimbun, Oct. 27

New power firms to pay for decommissioning old plants

October 25, 2016

New power firms likely to share decommissioning costs for aging nuke reactors

<http://mainichi.jp/english/articles/20161025/p2a/00m/0na/013000c>

The Ministry of Economy, Trade and Industry is set to have new smaller electric power companies shoulder part of the costs of decommissioning nuclear reactors that major utilities decided to scrap for reasons other than nuclear disasters, it has been learned.

- **【Related】** New power firms may have to pay some costs for nuke reactor decommissioning
- **【Related】** Editorial: Making new power suppliers pay for reactor decommissioning costs unacceptable

The new power suppliers will be required to share the costs of decommission work for nuclear reactors that major utilities voluntarily decided to scrap after the Nuclear Regulation Authority introduced new safety standards following the 2011 Fukushima nuclear crisis.

Currently, this covers six reactors -- the No. 1 and 2 reactors at Mihama Nuclear Power Plant in Fukui Prefecture operated by Kansai Electric Power Co., the No. 1 reactor at Japan Atomic Power Co.'s Tsuruga nuclear station also in Fukui Prefecture, the No. 1 reactor at Kyushu Electric Power Co.'s Genkai nuclear plant in Saga Prefecture, the No. 1 reactor at Shimane nuclear station operated by Chugoku Electric Power Co. in the Shimane Prefecture capital of Matsue and the No. 1 reactor at Shikoku Electric Power Co.'s Ikata

nuclear power plant in Ehime Prefecture. It is expected, however, that the number of reactors that utilities will scrap is going to increase due to aging reactors across Japan.

The current system in which utilities are required to save up money necessary for reactor decommission projects, collected from electricity bills, will be maintained for reactors that are under operation or under work to be restarted. When utilities decide to scrap such reactors due to aging, however, new power companies will be required to pitch in for the decommission work.

Major utilities currently include a surcharge in electricity fees to cover the costs of decommissioning nuclear reactors, but the economy ministry is concerned that when deregulation of the electricity market is completed by around 2020, the shortfalls for decommissioning costs may not be covered in the current system. The ministry concluded that to make sure that the fees are collected, it needed new power companies to share the burden from 2020.

The ministry plans to have new power suppliers cover the shortfalls of the decommissioning costs as well as pay for depreciation -- money spent on the construction of nuclear plants and capital investment that is allocated later in the assets' useful life -- by adding extra costs on top of fees they pay to major utilities to use their power grids. It is likely that the extra costs the new power companies will pay will be added to electricity bills for those who use power supplied by the new utilities.

The economy ministry had initially considered having new companies share the costs of the decommission work for nuclear reactors whether they are being scrapped or under the process of being restarted, but decided to give up the initial plan after being met with a public backlash.

Nuclear pact with India

November 1, 2016

Japan to sign nuclear pact with India

http://www3.nhk.or.jp/nhkworld/en/news/20161101_03/

Japan will sign an agreement on nuclear energy technology with India during a visit by Prime Minister Narendra Modi scheduled to start on November 10th.

The agreement will be Japan's first such deal with a non-signatory of the Nuclear Nonproliferation Treaty. It will allow Japan to export nuclear power technology to India.

Japanese Prime Minister Shinzo Abe met with Modi in India last December and they came to a basic agreement regarding the deal.

The two governments have been negotiating the details of the agreement and the date of the signing.

There is concern in Japan about forming a deal with India, which has conducted nuclear tests.

The pact is expected to include a provision that prohibits the technology from being used for military purposes. If India conducts further nuclear tests, the deal would likely be suspended.

Japan has similar deals with 14 countries and territories.

Japan, India to sign energy pact on condition of no nuclear tests

THE ASAHI SHIMBUN

<http://www.asahi.com/ajw/articles/AJ201611010047.html>

Japan and India will sign a nuclear energy pact in mid-November that allows Tokyo to opt out if the South Asian nation tests its nuclear weapons, sources said.

The agreement, the first by Japan with a nation that has not ratified the Nuclear Nonproliferation Treaty, will be signed when Indian Prime Minister Narendra Modi visits Japan later this month, a high-ranking Foreign Ministry official said.

The agreement will enable Japan to export its nuclear energy technology for private-sector use in India. But the sources said wording in the pact will give Japan, which has long pushed for nuclear disarmament and nonproliferation, the option of ending cooperation if India conducts a nuclear test.

At a meeting in New Delhi in December 2015, Prime Minister Shinzo Abe and Modi agreed in principle to sign a nuclear energy agreement. However, Abe told his Indian counterpart, "We will discontinue cooperation should India conduct a nuclear test."

Diplomats of the two nations have since held discussions on the agreement.

Japanese diplomats asked for wording that could be interpreted to mean Japan can cease cooperation in the event of an Indian nuclear test after the bilateral agreement takes effect.

Although Indian officials were hesitant about such wording because of concerns it could constrain India's national security policy, they also showed an understanding toward the Japanese position.

The two nations are currently hammering out the final wording of the agreement. There is a possibility that the terminology will be vague enough to allow both nations to interpret the agreement in a way that is closer to their own national interests.

Call to end Govt.'s legal support of TEPCO

November 2, 2016

<http://www.japantimes.co.jp/community/2016/11/02/voices/japans-government-stay-u-s-sailors-lawsuit-tepco/#.WBn6-smDmos>

Japan's government should stay out of U.S. sailors' lawsuit against Tepco

Dear Prime Minister Shinzo Abe,

Let me first acknowledge that after four long years of silence, the Japanese government has finally taken a position regarding the lawsuit filed against Tokyo Electric Power Co. in the U.S. by more than 450 American sailors, marines and civilians who were on board the USS Reagan and accompanying military ships off the coast of Tohoku after 3/11.

These young people experienced serious health problems resulting from, they allege, radiation exposure while participating in Operation Tomodachi, the U.S. military's humanitarian rescue mission launched in response to the Great East Japan Earthquake, tsunami and multiple meltdowns at the Fukushima No. 1 nuclear plant on March 11, 2011.

While the Japanese government's acknowledgement of the suit is welcome, the unconditional support it has given to Tepco is a matter of deep concern. Even now, U.S. service personnel find themselves

prevented from seeking justice because Tepco, with the support of the Japanese government, is doing its utmost to ensure the case will never be heard in an American court.

The Japanese government submitted an amicus curiae brief to the Ninth Circuit Court of Appeals on Feb. 3. An amicus curiae (friend of the court) brief is one presented by a party not directly involved in the suit in the hope of influencing the outcome. The brief contains two points:

1. "The Government of Japan has developed a comprehensive system to ensure compensation for victims of the Fukushima Nuclear Accident."
2. "Damage claims brought in tribunals outside of Japan threaten the continuing viability of the compensation system established by the Government of Japan."

Examining the first point, if the Japanese government truly had "a comprehensive system to ensure compensation for victims," there would be no need for the U.S. service members' lawsuit. Yet, as you know, **the Japanese government and its subsidiaries have, to date, not paid a single yen to any non-Tepco-related victim of radiation exposure from Fukushima No. 1. This includes, as of March this year, a total of 173 children from the prefecture who underwent surgery after being diagnosed with suspected thyroid cancer, 131 of whom were confirmed to have had cancer.**

If the Japanese government will not admit that the suffering of its own children was caused by radiation exposure, how confident can young Americans be that the apparently radiation-induced injuries they experienced will be recognized as such, let alone compensated for, in Japan?

Further, at least seven of these previously healthy young Americans have already died and many others are too ill to travel to Japan even if they could afford to, let alone reside in this country during lengthy legal procedures, which typically take years to resolve. This is not to mention the prospect of expensive legal costs, including for court fees, hiring Japanese lawyers, translation of relevant documents, etc. And let us never forget, Prime Minister, it was the Japanese government that requested the assistance of these American military personnel.

As for the second point above, I agree the U.S. military personnel's lawsuit threatens "the continuing viability of the compensation system established by the Government of Japan." For example, **if a U.S. court were to ascribe the plaintiffs' illnesses to radiation exposure, how could the Japanese government continue to claim that none of the many illnesses the children and adults of Fukushima presently experience are radiation-related?** The American service personnel truly serve as "the canary in the coal mine" when it comes to demonstrating the damaging effects of radiation exposure. Moreover, this canary is out of the Japanese government's ability to control.

Let us further suppose that an American court were to award \$3 million per person as compensation for the deaths, currently standing at seven, of the military personnel who were irradiated. By contrast, the Japanese government continues to deny compensation, for radiation-induced illnesses let alone deaths, to its own citizens. This would surely impact the "viability" (not to mention reputation) of the Japanese government in its ongoing denial of radiation-related injuries to non-Tepco employees.

Let me close by noting that there is one Japanese political leader who has accepted personal responsibility for the injuries inflicted on American service personnel. I refer to former Prime Minister Junichiro Koizumi who, after meeting with injured servicemen and women in San Diego in May, initiated a fund to meet as many of the medical needs of these sailors and marines as possible.

Fortunately, thanks to the support of thousands of ordinary Japanese, he has already raised \$700,000 toward his \$1 million goal. With tears in his eyes, Koizumi explained that he could not ignore the suffering of hundreds of formerly healthy young Americans who willingly put themselves at risk in order to render aid to the Japanese people.

Prime Minister Abe, I call on you to end the Japanese government's unconditional legal support of Tepco. Further, if the Japanese government has a conscience, please immediately provide medical aid and compensation to the hundreds of American victims of Operation Tomodachi.

BRIAN VICTORIA

TEPCO's profits down in last half-year

November 1, 2016

TEPCO net profit plunges 66.3% in April-Sept.

<http://mainichi.jp/english/articles/20161101/p2g/00m/0bu/016000c>

TOKYO (Kyodo) -- Tokyo Electric Power Company Holdings Inc. said Monday its consolidated net profit for the half year through September plunged 66.3 percent from a year earlier, as it received no money from the government to pay damages caused by a 2011 nuclear plant disaster.

The operator of the disaster-struck Fukushima Daiichi nuclear power plant posted a group net profit of 94.17 billion yen (\$897 million), down from 279.48 billion yen a year earlier.

Revenue declined 15.5 percent to 2.64 trillion yen reflecting a drop in electricity rates necessitated by lower fuel procurement costs.

The utility, known commonly by the acronym TEPCO, **again provided no full-year guidance as its business outlook heavily depends on if and when regulators approve its plan to restart the Kashiwazaki-Kariwa nuclear plant in Niigata Prefecture.**

TEPCO booked an extraordinary charge of 168.54 billion, down from 465.26 billion yen a year earlier, related to compensation for damages caused by the 2011 nuclear plant disaster.

But unlike in the same period last year, TEPCO did not receive any subsidies from the state-backed Nuclear Damage Compensation and Decommissioning Facilitation Corp. TEPCO logged extraordinary income of 36.46 billion yen, but none of that came from the NDCDFC which a year earlier provided 426.76 billion yen in compensation payment subsidies.

The utility still faces massive costs for compensation, decommissioning damaged reactors and decontaminating areas affected by the world's worst nuclear catastrophe since the 1986 Chernobyl disaster.

Company President Naomi Hirose told a news conference on Monday that TEPCO does not intend to put additional burden on the public in terms of taxpayer money, despite the Ministry of Economy, Trade and Industry last week saying it now projects the cost of scrapping the damaged Fukushima Daiichi nuclear power plant to rise to hundreds of billions of yen annually from an initially projected 80 billion yen per year.

New utilities to share cost of Fukushima compensation

November 2, 2016

New utilities may have to chip in for Fukushima compensation costs

<http://www.japantimes.co.jp/news/2016/11/02/business/new-utilities-may-chip-fukushima-compensation-costs/#.WBtQ8cmDmos>

Kyodo

The industry ministry is planning to demand that new power industry entrants shoulder a portion of the compensation payments stemming from the crisis at the Fukushima No. 1 nuclear plant and to do the same for any future nuclear accidents, sources said Wednesday.

The Ministry of Economy, Trade and Industry also intends to introduce a system to allow Tokyo Electric Power Company Holdings Inc. to steadily accumulate funds necessary for decommissioning Fukushima No. 1, the sources said.

Since the system allows Tepco to effectively pass on the decommissioning cost in utility bills, METI's plan means the burden of the nuclear crisis aftermath will be shouldered by new utilities and by power users in the form of higher bills or reduced price cuts.

The amount of damages payments to those affected by the Fukushima crisis has already eclipsed ¥6 trillion. The cost of scrapping the plant is expected to far exceed the initially estimated ¥2 trillion.

Under the current system, Tepco must lower its transmission and distribution fees when it makes a profit above a certain level. But under the envisaged system, part of that excess profit will go to the fund for scrapping Fukushima No. 1 and not returned to the users.

METI, which says users should shoulder their share of the burden as they have widely benefited from nuclear power, plans to submit its proposals to a government working group discussing the matter.

So far, Tepco and 10 other conventional utilities are paying for the compensation by making general contributions to the Nuclear Damage Compensation and Decommissioning Facilitation Corp., a fund set up in the wake of the Fukushima crisis.

New utilities that joined the industry after Japan's liberalization of retail electricity market in April have not made such payments.

The conventional utilities, which have been less price-competitive than new players due to their need to reflect the Fukushima expenses in their bills, have been seeking to raise their transmission and distribution fees for the newcomers that use their infrastructure to make them shoulder the costs as well.

Should victims have to depend on charity?

Das Geschäft mit dem Krebs

Ein Meinungsartikel von Dr. Alex Rosen

<https://www.ipn.de/atomenergie/gesundheit/artikel/de/das-geschaeft-mit-dem-krebs.html>

11.10.2016

Der Umgang mit Betroffenen einer Katastrophe sagt viel mehr über eine Gesellschaft aus als statistische Daten wie Bruttosozialprodukt oder Wirtschaftswachstum. Seit 2011 werden die Schilddrüsen aller Bewohnern der Präfektur Fukushima, die zum Zeitpunkt des Super-GAU von Fukushima unter 18 Jahre alt waren, regelmäßig auf Krebs- und Krebsvorstufen untersucht. Während die Kosten für Kinder unter 18 Jahren von der Regierung generell gedeckt werden, müssen die Familien diese zunächst für einige Zeit vorstrecken und bekommen sie erst mit einer Verzögerung zurück erstattet. Zudem wird im japanischen Gesundheitswesen generell verlangt, dass ab dem 18. Lebensjahr 30% aller medizinischen Behandlungskosten von den Patienten selbst getragen werden.

Dies gilt pikanterweise auch für die Schilddrüsenuntersuchungen bei Menschen, die radioaktivem Niederschlag ausgesetzt wurden, sowie für eventuell notwendige Biopsien, Operationen oder Langzeittherapien. Für eine Schilddrüsenuntersuchung fallen für die Betroffenen somit Kosten von ca. 10.000 Yen (ca. 87 Euro) an, für eine Operation zwischen 150.000 und 300.000 Yen (zwischen 1.300 und 2.600 Euro). Für viele der betroffenen Familien, die durch Evakuierung und den Verlust ihrer Heimat und Arbeit ohnehin schwer getroffen sind, sind diese Kosten nicht tragbar und verschärfen die soziale Abwärtsspirale von Verschuldung und Verarmung, in der sich viele von ihnen bereits befinden. Angesichts der Tatsache, dass im Zuge der Atomkatastrophe von 2011 von Seiten der Behörden bewusst auf die Ausgabe von Jodtabletten verzichtet wurde und Millionen von Menschen somit radioaktivem Jod ausgesetzt wurden, hat die Präfektur Fukushima letztes Jahr begonnen, auch den mittlerweile über 18 Jahre alten Patienten die Kosten für die Schilddrüsenuntersuchungen zu erstatten. Allerdings dauern auch diese Erstattungen Zeit und die Familien müssen die Kosten zunächst vorstrecken. Zudem sind Erstattungen nur möglich, wenn die Patienten sich in den offiziellen Einrichtungen der Fukushima Medical University untersuchen lassen. Jegliche Form von Zweitmeinung außerhalb des staatlich kontrollierten Systems würde so zu finanziellen Mehrbelastungen führt. Auch werden Begleitkosten, wie der Transport zu den Untersuchungen oder Kompensationen von Lohnausfällen der Eltern nicht berücksichtigt.

Da diese Kosten und die komplexen Erstattungsverfahren viele Familien weiterhin vor große finanzielle Probleme stellt, hat sich nun zusätzlich eine karitative Nicht-Regierungs-Organisation gegründet. Der „3/11 Children's Fund for Thyroid Cancer“ will hilfsbedürftigen Familien in Fukushima bei den Kosten der Untersuchungen und Behandlungen selbst, wie auch bei eventuell anfallenden Begleitkosten unterstützen. Spenden aus der Bevölkerung sollen ab sofort entgegen genommen werden und man hofft, mehrere hundert Betroffene mit Beträgen ab 50.000 Yen (ca. 430 Euro) unterstützen zu können.

Der Umgang mit Betroffenen einer Katastrophe sagt viel mehr über eine Gesellschaft aus als statistische Daten wie Bruttosozialprodukt oder Wirtschaftswachstum. Der Untersuchungsausschuss des japanischen Parlaments kam nach dem Super-GAU von Fukushima zu dem Schluss, dass die Atomkatastrophe „menschengemacht“ war – und dass die Atomindustrie, die Aufsichtsbehörden und die Politik, die allesamt die Gefahren der Atomenergie und der grassierenden Korruption in der japanischen Atomwirtschaft jahrzehntelang ignoriert haben, eine bedeutende Mitschuld tragen. Angesichts des institutionellen Versagens der zuständigen Behörden und der anhaltenden Verschleierung des wahren Ausmaßes der Atomkatastrophe ist es besonders bitter, dass die vom radioaktiven Niederschlag betroffenen Familien, deren Angehörige ein signifikant erhöhtes Erkrankungsrisiko davontrugen, nun auch mit den finanziellen Lasten dieser Erkrankungen allein gelassen werden.

Es kann nicht sein, dass in einem der reichsten Länder, mit einem der fortschrittlichsten Gesundheitswesen der Welt, Menschen die durch staatliches Versagen zu Schaden gekommen sind, von barmherzigen Spenden und dem Engagement einiger Freiwilliger abhängig gemacht werden. Eine

vernünftige Aufarbeitung der ökologischen, gesundheitlichen, psychologischen, sozialen und wirtschaftlichen Folgen der Atomkatastrophe ist in Japan dringend notwendig, wie auch eine Kehrtwende im Umgang mit denjenigen, die von der Atomkatastrophe und der freigewordenen Radioaktivität betroffen wurden und weiterhin in Gegenden mit erhöhten Strahlenwerten leben müssen.

Make customers pay

November 2, 2016

Gov't to seek disaster compensation funds from consumers who used nuclear energy

<http://mainichi.jp/english/articles/20161102/p2a/00m/0na/004000c>

The Ministry of Economy, Trade and Industry is **considering making customers of new, smaller power companies who previously used nuclear energy from Tokyo Electric Power Co. (TEPCO) and other utilities shoulder part of the surging compensation costs for the Fukushima nuclear disaster.**

- **【Related】** Industry ministry to create new fund to decommission Fukushima No. 1 plant reactors
- **【Related】** New power firms likely to share decommissioning costs for aging nuke reactors
- **【Fukushima & Nuclear Power】**

Under the Act on Compensation for Nuclear Damage, nuclear power operators must each provide 120 billion yen to be used together with money paid by TEPCO and other major utilities to the Nuclear Damage Compensation and Decommissioning Facilitation Corporation to provide compensation. However, **the compensation bill for the Fukushima No. 1 Nuclear Power Plant disaster continues to grow, and the compensation fund is expected to be left trillions of yen short.**

The ministry takes the view that major utilities should have gathered more compensation funds from their customers, and it therefore plans to seek compensation funds from those who were previously in contracts with major power companies, using their nuclear energy.

A plan has surfaced to charge small-scale power companies more to deliver electricity through the power grids of major utilities, with the extra costs to be used for compensation. This and other plans will be debated on Nov. 2 at a working group of a ministry committee on energy reform. However, as some customers could face higher bills as a result, the move could trigger a public backlash.

An additional 17 billion yen will be needed

November 6, 2016

Decontamination to cost additional \$17 bil.

http://www3.nhk.or.jp/nhkworld/en/news/20161106_18/

It has been revealed that the cost of decontaminating areas affected by the 2011 Fukushima nuclear accident is **nearly 1.5 times the initial estimate.**

NHK has learned that about 19.5 billion dollars had already been spent on decontamination projects by March this year. The Environment Ministry and the Reconstruction Agency say an additional 17 billion dollars will be needed.

The government cites an increase in personnel costs as one reason for the rising expense.

Tokyo Electric Power Company, the operator of the Fukushima Daiichi nuclear plant, is primarily responsible for shouldering the financial burden.

The government now plans to pay for the decontamination by selling the TEPCO stocks it bought in 2012.

But these shares would have to triple in value to cover the full cost.

The government also says that **more than 10 billion dollars of taxpayers' money will be needed to build facilities to store the waste from the decontamination process.**

Just another way of giving preferential treatment to nukes

November 8, 2016

EDITORIAL: Ministry devises crafty finance scheme favoring nuclear power

<http://www.asahi.com/ajw/articles/AJ201611080049.html>

The industry ministry, the supposed champion of electricity market deregulation, is making a move that runs counter to the principles of reform by giving preferential treatment to nuclear power.

A proposal by the Ministry of Economy, Trade and Industry would force new electricity suppliers that have entered the market in response to its liberalization to shoulder part of the costs of decommissioning the crippled Fukushima No. 1 nuclear power plant.

The plan was submitted to an expert council discussing the issue.

The ministry, which regulates the power industry, has already presented a plan to make such new utilities bear part of the costs of decommissioning aging reactors at other nuclear power plants.

The power market reform, which was expanded this spring to cover retail electricity sales as well, is designed to abolish the regional monopolies of established utilities, thereby encouraging new entries into the market.

It is also aimed at lowering electricity rates by separating the operations of power plants and transmission grids to promote fair competition.

The ministry cannot claim it is working for fair competition if it is now creating rules that force new electricity providers that have nothing to do with any nuclear power plant or the 2011 Fukushima nuclear disaster to pay part of the decommissioning bills.

In its attempt to get new utilities involved in the financing plan, the ministry is targeting the fees they pay to use the power transmission lines operated by established utilities.

The total cost of decommissioning the stricken Fukushima nuclear plant is estimated at several trillion yen.

The ministry has stressed its intention to protect the public from the huge financial burden. It has promised to make Tokyo Electric Power Co., operator of the Fukushima plant, pay for the work by saving necessary funds through streamlining its operations.

But the ministry has proposed a new system to use the money saved from more efficient power grid operations primarily to cover decommissioning costs.

The current rule requires major utilities to lower the charges they impose on smaller power suppliers using their transmission lines when higher efficiency lifts their profits. But the proposed system would exempt the big power companies from the rule when they spend the money saved on decommissioning reactors.

The ministry seems to be trying to convince the public that this approach would not increase the financial burden on consumers because it doesn't involve price hikes.

But this idea raises some questions that cannot be overlooked.

The costs of decommissioning reactors are by nature expenses related to power generation. But the ministry's proposal would transfer part of the expenses to the operations of transmission lines.

As a result, new power suppliers using TEPCO's transmission cables would have to pay higher fees.

Subscribers to such new utilities would also have to shoulder part of the burden. In particular, **the envisioned system would be totally unacceptable for consumers who have switched to new power providers to avoid using electricity generated by nuclear plants.**

The ministry appears to be targeting an "easy source" of revenue. The charges on using transmission lines are not highly visible to general consumers.

The ministry's plan to use power transmission charges as a source of funds to decommission reactors is a crafty scheme to give preferential treatment to nuclear power. Its aim is to ensure nuclear plants will not lose their cost competitiveness against other electricity sources like thermal power generation.

For many years, both the government and established utilities have been emphasizing that atomic energy is a low-cost source of electricity.

They are grossly irresponsible and insincere if they are trying to impose part of the inevitable cost burden of decommissioning reactors on competitors.

The ministry should rethink the idea from the viewpoint of the basic principles of market deregulation.

Has Abe forgotten?

November 12, 2016

EDITORIAL: Japan's nuclear deal with India undermines its key principles

<http://www.asahi.com/ajw/articles/AJ201611120028.html>

Given the devastation of Hiroshima and Nagasaki caused by the 1945 atomic bombings of these cities, many Japanese harbor a profound desire to see the world rid itself of nuclear weapons.

Yet, the Abe administration is behaving as if it has forgotten Japan's fundamental principles concerning these weapons of mass destruction based on its status as the only nation that has ever sustained nuclear attacks.

The government signed an agreement Nov. 11 that opens the door to nuclear trade with India.

India has developed and now possesses nuclear arms. It has not joined the Nuclear Nonproliferation Treaty (NPT).

Signing a nuclear trade deal with a country that has shunned the treaty designed to stop the spread of nuclear weapons is itself a big mistake. Besides, the agreement contains many questionable and worrisome elements.

The pact allows Japan to provide nuclear technology to India without sufficient guarantee that New Delhi will not conduct nuclear arms tests.

New Delhi has imposed a voluntary moratorium on nuclear tests. The focus of the negotiations between the two countries over the agreement was what kind of action Japan can take in case India resumes testing nuclear arms.

A clause that allows Tokyo to suspend and revoke the agreement if India conducts a nuclear test has not been inserted into the main body of the agreement. Instead, it has been relegated to a related document.

Not only that, a separate clause suggests that when India detonates a nuclear device as a test, Japan will consider whether the test is a countermeasure against actions by countries like archrival Pakistan.

There is even a provision to keep the door open to India's production of highly enriched uranium, a key ingredient for an atomic bomb.

None of the nuclear trade agreements Japan has signed with countries that are parties to the NPT contains such a provision.

This stipulation has been included in the accord, apparently at India's insistence. But it is simply too risky. The pact doesn't make it clear whether India has to immediately shut down reactors using Japanese technology when it carries out a nuclear test. On the other hand, it says Japan must pay compensation to India when Tokyo decides to withdraw the materials and equipment it has provided for the operation of the nuclear power plants.

These elements of the agreement can only be described as major concessions. Japan clearly has fallen for the allure of India's rapidly growing market, which offers great opportunities to make profits quickly.

The Japanese Foreign Ministry asserts that the agreement is similar to India's deal with the United States, which is the strictest among all the nuclear trade agreements the South Asian power has concluded with other countries.

However, it doesn't reflect Japan's unique position as the only nation to have sustained atomic bombing, nor include any additional measure to prevent nuclear proliferation.

The mayors of Hiroshima and Nagasaki have repeatedly voiced strong objections to the agreement. They argue that the deal could be a serious impediment to efforts to eliminate nuclear weapons. They also warn that the nuclear materials, technologies and equipment provided by Japan under the deal could be used for the development of nuclear arms.

It's hard to fathom why the Abe administration has turned a deaf ear to their pleas.

India already has a nuclear agreement with Russia as well as the United States and France.

As it has weighed options for introducing nuclear technology, New Delhi has been focusing on the choice between two camps--Japan or the United States and France, where Japanese technology is used in reactors, on the one hand and Russia on the other.

Efforts by the United States, France and Japan to supply nuclear technology to India are driven partly by the geopolitical motive of countering Russia's strategic moves while putting pressure on China, which has been expanding its influence in the region.

Even so, Tokyo strongly resisted pressure from Washington and Paris in striking a nuclear trade agreement with New Delhi.

That's because Tokyo was concerned that such a deal could contribute to emasculating the global nuclear nonproliferation system based on the NPT.

As a country that has first-hand experiences of nuclear devastation, Japan must never take an action that can ruin the global nonproliferation safeguards. We demand that both the ruling and opposition camps engage in exhaustive Diet debate on the agreement.

--The Asahi Shimbun, Nov. 12

Nuke technology should not be exported

November 12, 2016

VOX POPULI: Nuclear disaster surely taught us not to export this technology

<http://www.asahi.com/ajw/articles/AJ201611120023.html>

The town of Futaba, which co-hosts the crippled Fukushima No. 1 nuclear power plant, used to boast signage promoting nuclear power generation.

One sign proclaimed, "Genshiryoku--Akarui Mirai no Enerugii," which translates literally as "Nuclear power: The energy of a bright future."

This and other signs were removed in the aftermath of the March 2011 nuclear disaster. They were relocated last month to the Fukushima Museum in the city of Aizuwakamatsu, according to the Fukushima edition of The Asahi Shimbun.

The museum is said to be considering an eventual exhibition of these acquisitions, which include a panel bearing the slogan, "Genshiryoku Tadashii Rikai de Yutakana Kurashi" (Proper understanding of nuclear energy enriches life).

These upbeat messages convey the hope, once held by the town of Futaba, that hosting the nuclear power plant will bring prosperity to the community.

But now, the reality gap is all too stark. Completely evacuated in the aftermath of the disaster, Futaba remains a dead town.

Is nuclear power still "the energy of a bright future"?

Prime Minister Shinzo Abe signed a Japan-India nuclear deal on Nov. 11 during his summit with Indian Prime Minister Narendra Modi, opening the way for Japan to export nuclear reactors to India.

This bilateral treaty came about at India's request for Japanese technological cooperation.

In the vicinity of the stricken Fukushima No. 1 nuclear power plant, more than 50,000 citizens are still living as forced evacuees, while work continues on the dismantling of the plant's disabled reactors.

How could any country that let this happen have no qualms about providing its nuclear technology to another country? This is simply beyond comprehension.

While campaigning for India's general election two years ago, Modi stressed that the nation could not hope for industrial or agricultural progress without electricity.

Of India's population of 1.3 billion, about 300 million are still living without electricity. Correcting this power deficiency is obviously an urgent task, but is providing nuclear technology to India the only help that Japan can offer?

With evacuation orders still in effect for Futaba citizens, there is still nothing to indicate that the town will be habitable again.

And we, the Japanese people, know at first hand how difficult it is to rebuild people's lives that were destroyed by a nuclear accident.

--The Asahi Shimbun, Nov. 12

Economic gain before disarmament

November 12, 2016

November 12, 2016

Japan's Nuclear Industry Finds a Lifeline in India After Foundering Elsewhere

<http://www.asahi.com/ajw/articles/SDI201611122242.html>

By JONATHAN SOBLE/© 2016 The New York Times

TOKYO--Despite objections from anti-nuclear campaigners, Japan's government cleared the way on Friday for companies that build nuclear power plants to sell their technology to India -- one of the few nations planning big expansions in atomic energy -- by signing a cooperation agreement with the South Asian country.

The deal is a lifeline for the Japanese nuclear power industry, which has been foundering since meltdowns at the Fukushima Daiichi power plant in northeastern Japan in 2011. Plans to build a dozen new reactors in Japan were canceled after that, a gut punch for some of the country's biggest industrial conglomerates, including Toshiba and Hitachi.

With the domestic market moribund, Japanese companies had been pursuing deals abroad, but success was elusive.

The economic case for nuclear energy has weakened as a result of low oil and gas prices, prompting utilities and governments around the world to rethink construction. The Fukushima disaster increased safety concerns. And Japanese vendors have had to fight lower-cost rivals from places like Russia and South Korea for a shrinking number of customers.

India looks like a rare opportunity. It is planning 20 new reactors over the next decade or so, and as many as 55 more have been proposed. Shinzo Abe, the Japanese prime minister, and Narendra Modi, his Indian counterpart, are hoping that trade can underpin a broader strategic relationship, aimed in part at fending off China.

The nuclear deal has nonetheless drawn criticism in Japan. India possesses atomic weapons and has kept itself outside the international legal framework against proliferation. Because of that, many in Japan, which was hit by two nuclear bombs in World War II, would prefer not to establish ties with nuclear power.

Left-leaning Japanese newspapers have published editorials against the Indian deal, and the mayors of Hiroshima and Nagasaki, the bombed cities, have issued pleas to stop it. Formal negotiations by the two governments lasted six years. Other countries have already begun allowing nuclear-related exports to India, including the United States, which signed a similar accord a decade ago.

“There was a huge outcry when the government first said it would pursue this” in 2010, said Masaaki Fukunaga, a professor at the Center for South Asian Studies at Gifu Women’s University in Gifu, Japan, who has followed the issue closely. “The industry and the government were determined.”

Abe said Japan had reserved the right to stop nuclear exports if India conducted another nuclear weapons test.

“There is a legal framework to ensure India’s responsible and peaceful use of technology,” he said.

Japanese leaders say they are looking to support more than just the nuclear industry. National economic growth may be at stake. As Japan has become less competitive in sectors like consumer electronics, big industrial projects are being counted on to fill the gap.

In addition to the nuclear accord signed Friday, Abe and Modi agreed to explore plans to build additional high-speed rail lines in India based on Japan’s Shinkansen bullet-train technology. Construction on a previously agreed line from Mumbai to Ahmedabad will begin in 2023, the leaders said. Japan will help finance the project with low-interest loans.

Japan’s push to become a global infrastructure powerhouse has had setbacks. Vietnam’s legislature scrapped plans in 2010 for a Shinkansen train line, citing costs, and is reportedly close to canceling plans for a proposed Japanese-built nuclear power station. Indonesia chose a Chinese group’s bid last year to build a high-speed rail line over a Japanese bid that had been considered the favorite.

South Korea underbid Japan to win a contract to build the first nuclear reactors in the United Arab Emirates. And Tokyo Electric Power, owner of the ruined power station in Fukushima, pulled out of a bid to build and run a nuclear power station in Turkey. A Japanese-French consortium ultimately won the Turkish contract in 2013, after a strong diplomatic push from Abe, but it remains the only successful Japanese nuclear-plant sale since the Fukushima accident.

The bet on India is no sure thing. Nuclear plants can take decades to plan and build, and proposals to develop them are vulnerable to political and economic shifts. The Indian government must find new locations for some proposed plants because of local protests. And even for countries that have already signed nuclear trade agreements with India, little actual business has materialized so far, in part because of an Indian law that opens hardware vendors to potentially unlimited liability claims in the case of accidents.

India has been working with the United States and other countries to create a framework for minimizing vendors’ liability risk, including the creation of a domestic accident compensation fund. Officials hope to complete it next year.

If that hurdle can be overcome, the first Japanese company to benefit from the agreement with India will most likely be Toshiba, whose U.S. subsidiary Westinghouse has won conditional approval to build six reactors in India. Westinghouse uses components from Japan, including reactor-containment vessels built in Japanese steelworks, so the deal signed Friday is essential to moving forward.

Toshiba needs the boost. It acquired Westinghouse in 2006 for \$5.4 billion, a princely investment upon which it was struggling to earn a return, even before Fukushima. Investigators examining a \$1.2 billion

accounting scandal at Toshiba last year concluded that managers had inflated revenue figures at the company in large part to cover up the poor financial state of its nuclear power business.
(Nov. 11, 2016)

Japan-India pact puts economic gain before disarmament: critics

<http://www.japantimes.co.jp/news/2016/11/12/national/politics-diplomacy/japan-india-pact-puts-economic-gain-disarmament-critics/>

Kyodo

The government signed a controversial civilian nuclear cooperation pact with India on Friday, disappointing A-bomb survivors and other opponents of the deal who believe Tokyo has placed economic gain ahead of its stated goal of global nuclear disarmament.

The pact opens up a massive market for Japan's nuclear energy industry, which suffered a huge setback from the March 2011 Fukushima disaster, and falls in line with Prime Minister Shinzo Abe's infrastructure export-focused growth strategy.

But opponents argue that India, which tested nuclear weapons in the 1970s and 1990s, could end up using technology obtained through the pact for military purposes. India is a nonsignatory to the Nuclear Non-Proliferation Treaty.

The government has downplayed the concerns, saying strictly peaceful use of the nuclear technology is ensured by provisions stating Japan that can terminate the pact if India breaks its 2008 promise to maintain a moratorium on nuclear testing.

"(The pact) matches with our country's stance to promote nonproliferation and a world without nuclear weapons," Abe told a joint news conference Friday after the deal was signed in Tokyo at a meeting with Indian counterpart Narendra Modi.

"(It) will ensure India will take responsible action regarding the peaceful use of nuclear energy," Abe said. But the mayors of Hiroshima and Nagasaki, which were devastated by atomic bombs in 1945 in the closing stages of World War II, said the deal defies the will of the Japanese people.

Nagasaki Mayor Tomihisa Taue called the pact "extremely regrettable."

"Nuclear-related technology and nuclear material could be diverted to development of nuclear weapons," Taue said in a statement. "I have concerns the NPT regime could be hollowed out."

Hiroshima Mayor Kazumi Matsui issued a similar statement, saying he remains concerned about possible diversion of nuclear materials and technology for military use.

Matsui also urged the Abe government to pressure India to join the NPT as soon as possible so the South Asian country will end its nuclear weapons development.

The deal hinged on a compromise by Tokyo, which walked back its demand for a guarantee that India would not resume nuclear testing, according to a source close to the negotiations, which began in 2010. Japan had long demanded an explicit provision stating that the deal is off if India restarts nuclear tests, but this was dropped at the last minute, apparently out of consideration for India's reluctance to renounce its nuclear capabilities in the face of border disputes with both China and Pakistan.

Critics say the pact is unprincipled and driven only by the lure of the 1.3 billion-strong Indian market. They say it sullies Japan's mission to rid the world of nuclear weapons as the only country in history to have come under nuclear attack.

The government is “only thinking about immediate profit,” said Takeshi Yamakawa, 80, who is a member of an anti-nuclear group in Nagasaki.

So Horie, a 76-year-old hibakusha, said that exporting nuclear technology to India is the “coercive selling of unhappiness” and shows that the government is “prioritizing the economy.”

The decision to sign the pact with India also spurred anger among the people displaced by the 2011 Fukushima nuclear disaster, including 67-year-old Fukushima Prefecture resident Haruko Kanai.

“I don’t want another restart of nuclear power plants ... I don’t want (nuclear technology) to be sold,” she said.

As China’s growing influence in the Asia-Pacific region extends to its economic push in India, analysts say Abe is keen to counter with infrastructure investment, including nuclear energy.

China has poured money into port facilities in India and its neighbors on the Indian Ocean, which are close to sea lanes Japan relies on for its oil imports from the Middle East.

The opening of the Indian market is welcome news for Japan’s nuclear technology firms, whose domestic market ground to a halt after the Fukushima disaster was triggered by a powerful earthquake that spawned a massive tsunami.

The Federation of Electric Power Companies of Japan, an electric utility lobby, stressed the importance of Japan “using its experience to make a contribution to the world, on the basic premise of the peaceful use of nuclear energy.”

Tightened safety guidelines and legal fights, along with public safety concerns, have delayed the government’s push to put its shuttered reactors back into service. Vietnam also recently scrapped plans to build its first nuclear reactors due to budgetary concerns. Some of the contracts had been awarded to Japanese concerns.

For India, whose economy grew 7.6 percent in 2015, the pact may help it meet its urgent need for stable power. With more than 300 million people in India living without electricity, the country aims to increase the proportion of nuclear-generated electricity from 2 percent now to 25 percent by 2050.

Standing next to Abe in Tokyo Friday, Modi said India’s economy is “pursuing many transformations.”

“Our aim is to become a major center for manufacturing, investment and for 21st century knowledge industries, and in this journey we see Japan as a natural partner,” he said.

Japan confirms unraveling of NPT

November 12, 2016

Editorial: Japan-India nuclear accord shows Japan's lacking will as A-bombed nation

<http://mainichi.jp/english/articles/20161112/p2a/00m/0na/004000c>

Japan signed a nuclear energy agreement with India on Nov. 11, on the occasion of a visit to Japan by Indian Prime Minister Narendra Modi, opening the way for Japan to sell civil nuclear power equipment and technology to India.

- **【Related】** Japan, India sign agreement on civil nuclear power

India, which possesses nuclear weapons, has not joined the Treaty on the Non-Proliferation of Nuclear Weapons (NPT), an international framework that regulates the use of nuclear energy. The latest deal allows Japan to cooperate with the nuclear state, which is not recognized as such under international law, in the field of atomic energy. Doesn't this signal that **Japan is confirming the unraveling of the NPT framework?**

Moreover, a promise -- which Tokyo had strongly demanded -- that cooperation would be suspended if India were to conduct a nuclear test was not written into the agreement. India refused to incorporate such a pledge into the bilateral agreement on the grounds that similar agreements it has with eight other countries, including the United States and France, do not have such a clause.

Instead, Japan and India signed a separate document instead, but it, too, does not mention nuclear testing. Japan is taking the position that the promise it sought has been made, since the document mentions a 2008 international agreement in which India pledged to continue its moratorium on nuclear tests and keep its civilian and military uses of atomic energy separate. Tokyo explains that the document is legally binding and effectively obligates India to participate in the international nuclear non-proliferation framework.

However, Tokyo should have persuaded New Delhi to incorporate the suspension of nuclear tests into the agreement. It is regrettable that Japan failed to stand firm in its demand as the only atomic-bombed country in the world. India apparently does not want to give up its right to conduct nuclear tests, as its neighbor Pakistan possesses nuclear arms and is not a member of the NPT.

The agreement also states that spent nuclear fuel in India can be reprocessed only for peaceful use. However, the International Atomic Energy Agency is authorized to inspect only civilian facilities in India to verify if India is indeed limiting its use of reprocessed nuclear fuel to peaceful purposes. Under such circumstances, it is impossible to completely prevent India from converting spent nuclear fuel to military use.

The NPT began to lose its substance when 45 countries belonging to the Nuclear Suppliers Group (NSG) decided to permit the supply of nuclear reactor equipment to India, which is not party to the NPT, as an exception. Japan was one of those countries. The signing of the latest Japan-India atomic energy agreement could be seen as a consequence of the NSG decision made eight years ago.

Japan's business community will likely welcome the fact that they can export nuclear plant equipment to India where the demand for such power stations is high. As a result of Japanese nuclear energy companies strengthening partnerships with their counterparts in the United States and France, these countries, which would have been adversely affected if Japan had failed to reach an atomic energy agreement with India, strongly pressured Japan to sign the pact. The administration of Prime Minister Shinzo Abe appears to be enthusiastic about stepping up cooperation with India to counter the rise of China.

India is an important partner for Japan in terms of both the economy and security. Strengthened relations between Tokyo and New Delhi should be welcomed. However, the latest agreement has tarnished the moral principles that Japan has maintained as the world's only atomic-bombed country.

Luxury hotel in Fukushima

November 12, 2016

A new luxury hotel — in Fukushima?

<http://www.japantimes.co.jp/life/2016/11/12/travel/new-luxury-hotel-fukushima/#.WCgaoMmDmot>

by Robert Michael Poole
Special To The Japan Times

On March 11, 2011, the residents of Fukushima Prefecture felt the earth shake as a massive quake struck off the northeastern coast of Japan. But few could have predicted the explosions that would later follow or that the reactors at the Fukushima No. 1 nuclear power plant would go in to meltdown. The region has been physically changed, tainted by radiation, but also altered in other ways: The government's investigation and ensuing media attention has ensured the words "Fukushima" and "radiation" are forever linked.

One of the most unique disaster images from Fukushima though, is not a photograph of earthquake-cracked villages or exploding reactor buildings. It is an ukiyo-e print by Meiji Era (1868-1912) artist Tankei Inoue. The print depicts the 1888 eruption of Mount Bandai in Yama-Gun, Fukushima, which wiped out villages and transformed the region's farmland. It was the first major natural disaster that the forward-thinking Meiji Era government faced.

The damage to Fukushima's reputation from that catastrophe eventually faded. In fact, the disaster created a new, rich landscape, one that forms part of the present Bandai-Asahi National Park. The region

is home to a rather unique hotel that is actively seeking to allay fears that Fukushima is once again a dodgy destination for tourists.

“We want to provide facts about what is happening in this region,” says Takeshi Munakata, owner of Hotelli Aalto, which provides radiation readings on its website that are taken at the hotel and other areas of Japan. “There are many areas with higher radiation than this place, so it’s important to show the facts to the public.”

Hotelli Aalto is surrounded by lakes and ponds created by the Mount Bandai eruption, and it offers access to nature at its most raw. The 13 rooms here (priced from ¥28,000 per person) are divided between those with a forest or mountain view. There is also the new Aalto Lodge a short distance from the main hotel, designed for families and even pets. Renovated in 2007, the hotel has a European mountain-lodge feel with an open-plan lobby where guests to relax and mingle. As well as indoor and outdoor natural *onsen* (hot springs), Aalto also offers Nordic and Japanese fusion cuisine.

The hotel is perched high in the mountains some 100 kilometers from the Fukushima No. 1 power plant, in the far west of the prefecture. But being located within Fukushima has left it with an image problem — everything within the prefecture borders can sound toxic, even though neighboring Ibaraki and Miyagi prefectures are closer to the plant and have been more affected by the events of March 2011.

“In the first two years before the earthquake we were just growing, working toward our targets,” Munakata says. “Only now we are getting to that target. In 2010, we had 30 percent capacity and now it’s getting to 50 percent.”

The Reconstruction Agency, tasked by the government with the rebuilding after the Great East Japan Earthquake, stated earlier this year that Fukushima tourism is still in a “severe situation” and that, due to reputational damage, Fukushima “has not been able to enjoy the effects of the national inbound surge.” In 2010, 8.6 million overseas visitors came to Japan, according to the Japan National Tourism Organization. After the 2011 disaster, every region except Okinawa saw a decrease in foreign tourists, but none more so than Tohoku, which dropped to 40 percent of its normal influx. By 2013, all regions bar Tohoku had rebounded past their 2010 numbers. Fukushima remains hit the hardest. The Reconstruction Agency shows that the number of foreign tourists staying overnight in Fukushima Prefecture fell by 70 percent in 2011 and has barely increased since.

“It’s difficult to communicate the safety of the region — when information comes from the government, non-Japanese will not trust the credibility,” Munakata says. “Also, saying ‘It is safe’ only draws attention to the issue, so it doesn’t really help.”

Fukushima Prefecture is itself divided into three regions: Aizu, Nakadori and Hamadori. Some in westernmost Aizu considered whether it would be beneficial to incorporate it within a neighboring prefecture in order to lose the damaging Fukushima tag. But Munakata, whose Hotelli Aalto is located in Aizu, disagrees.

“I also feel that I am responsible, we all are, to support the people on the coastal side. There are many ways to help, but what we think is important is to be able to sustain our business without (governmental) support, standing on our own feet.”

Rebuilding the infrastructure to attract foreign tourists back to Fukushima, however, has required the financial support of the national government and Tepco, the owner of the Fukushima No. 1 power plant, due to the massive loss in business revenue the region has faced. According to Yoshihiro Sonobe, director of Hakko construction — the company that renovated Hotelli Aalto’s 40-year-old building — financial assistance has had to come from various sources.

“Fukushima Prefecture created a system of interest compensation for loans taken out by businesses from financial institutions,” he says.

Tepco's official figures show it has paid ¥6 trillion (\$57.6 billion) in reparations, of which ¥4,780 billion (\$4.59 billion) went to local businesses. The compensation includes an amount for lost sales due to misinformation or damage to the business's reputation, totaling ¥1,460 billion (\$1.4 billion).

"How much of this is related to tourism though is unclear," Sonobe says.

Since 2011, the prefectural government and Tepco have been providing an ongoing fund to each hotel to fill in their average revenue, covering the gap that they have lost. They also paid up to ¥8,000 per day for evacuees to stay in hotels until temporary homes were built, which lasted about half a year.

"We struggle because of our location, but some have recovered better," Munakata says.

In March, Prime Minister Shinzo Abe set a target to triple international overnight visitors staying in Tohoku hotels from 500,000 in 2015 to 1.5 million by 2020, promising to boost the budget for research, promotion and marketing of a "new Tohoku" from ¥500 million (\$5 million) to ¥5 billion (\$50 million).

The Reconstruction Agency also recommended an initiative for boosting domestic educational travel.

Hotelli Aalto is perhaps better positioned than most to benefit from the government's new drive, due to its distinct international flavor. Designed by Yoshihiro Masuko, chairman of The Scandinavian Architecture and Design Institute of Japan, it blends Japanese and north European design.

The building first opened in the 1960s as a traditional *sanso* (Japanese mountain villa). Munakata had helped maintain the villa in the 10 years before it closed in 2007 and, not wanting to see the space go to waste, decided to revive it himself.

"I was in Finland when I had to make the name of the hotel and, while I was driving, I saw the word 'Aalto' come on the tuner of the radio, and that inspired me," he says. The name, meaning "small waves" in Finnish, also happens to be the surname of Finland's most famous architect: Alvar Aalto.

Munakata hired Yoshikazu Masuko, one of Japan's own "famous architects," who also has a long track record of designing Nordic architecture. The Japan-meets-Scandinavia concept for the hotel is an idea supported by a shared climate — temperatures can get down to -20 degrees Celsius in both Finland and Aizu.

"The people in Finland enjoy winter, with long nights and little sunlight, by staying inside. I wanted to have that mindset within this hotel," says Munakata.

Building on a strong demand in Japan for northern European style, the hotel is offering a lifestyle and design concept with an interior that uses only natural elements.

Unlike Japan, Scandinavia has a "culture of using chairs," Munakata says, "but what we did was to use wood in a unique Japanese way, combining the culture of chairs with the Japanese birch of Shirakawa. We wanted to use only local wood to create this."

This month the hotel is expanding, with the opening of Aalto Lodge, a private villa with a wooden bath separate from the main hotel. Munakata hopes it will further the hotel's appeal to foreign tourists. Priced at around ¥80,000 for a two-night stay, the family-sized house is set within a forest a short drive from the main hotel.

"It's all about communicating the beauty of this region, like the charming Kitashiobara Village and Ura Bandai ski resort on our doorstep," Munakata says.

"If that eruption of Mount Bandai didn't happen 128 years ago, we wouldn't have this beautiful region of rich soil and fresh lakes. Japan has faced many challenges **from natural disasters** but it's also our strength. No matter how tough the challenges are, we want to stand up and get moving again."

Remember Fukushima

November 14, 2016

Fukushima wants policy to reflect Daiichi lesson

http://www3.nhk.or.jp/nhkworld/en/news/20161114_22/

The governor of Fukushima Prefecture says Japan's nuclear energy policy should be based on lessons learned from the 2011 nuclear accident.

Masao Uchibori made the remarks on Monday 3 days after leaders from Japan and India signed an agreement that will allow the export of nuclear power technology to India.

The pact limits the use of nuclear-related technology to peaceful purposes and both countries will exchange information on materials and equipment.

Uchibori told reporters that the prefecture is still enduring hardship more than 5 years after the Fukushima Daiichi nuclear accident.

The governor said it is important for the prefecture to tell the country and the world about the massive problems and challenges it is experiencing.

He also stressed the importance of pressing the government and Tokyo Electric Power Company, the Daiichi plant's operator, to scrap all nuclear reactors in Fukushima.

Pakistan & nukes: Why not us?

November 12, 2016

Pakistan raps what it called Japan's 'discriminatory' nuclear deal with India

<http://www.japantimes.co.jp/news/2016/11/12/national/politics-diplomacy/pakistan-raps-called-japans-discriminatory-nuclear-deal-india/#.WCjVLsmDmos>

Kyodo

ISLAMABAD – Pakistan fears Japan's signing of a civilian nuclear technology deal with India could undermine regional stability, a Foreign Ministry spokesman said, while asking the international community not to discriminate against his country in favor of its neighboring archrival.

The official, Nafess Zakaria, responding to a Kyodo News query on Friday's deal inked during Indian Prime Minister Narendra Modi's visit to Tokyo, urged Japan and other countries "to objectively assess the consequences of discriminatory approaches to our region."

Pakistan, he said, considers the exemption granted to India by the Vienna-based Nuclear Suppliers Group, effectively allowing the South Asian country to expand its nuclear power industry, “has negatively impacted the strategic balance in the region.”

“It has allowed India to gain access to foreign sources of nuclear fuel and freed up its domestic reserves which are being utilized for rapid expansion of its military nuclear program,” he said, adding, “We have taken up the issue ... with the Japanese side.”

Pakistan has sought similar treatment since 2008 when the NSG — a group of nuclear supplier countries that seek to prevent proliferation by controlling the export of materials, equipment and technology that could be used to manufacture nuclear weapons — exempted India from its ban against selling to countries that have not signed the Nuclear Non-Proliferation Treaty.

But Pakistan’s track record as a nuclear proliferator has made that difficult to achieve.

Neither Pakistan nor India, which have both tested nuclear weapons and fought three wars since their 1947 split, have signed the NPT.

Under the civilian nuclear cooperation pact inked in Tokyo, which paves the way for Japan to export nuclear materials and technology to India, the latter is required to use them for peaceful purposes only, and not for research or development aimed at improving their nuclear weapons capability.

Under the pact, India will be allowed to reprocess supplied and produced nuclear materials and byproducts, but cannot make highly enriched uranium, which potentially could be used in the production of nuclear weapons, without Japan’s consent.

Tokyo can halt its nuclear cooperation if New Delhi breaches its 2008 commitment to a moratorium on nuclear testing.

India has already signed such nuclear deals with France, Russia and the United States, among other countries. Pakistan, by contrast, enjoys nuclear cooperation only with China.

Zakaria said all the NSG countries including the United States — which backs India’s membership in the 48-member body but not that of Pakistan — should adopt objective, nondiscriminatory criteria “which are not only promoting nonproliferation objectives but they promote strategic stability in South Asia.”

"Economically practical": 20 more years for Mihama No.3

November 16, 2016

NRA exception gives new lease on life to another aging reactor

<http://www.asahi.com/ajw/articles/AJ201611160045.html>

By HIROSHI ISHIZUKA/ Staff Writer

The No. 3 reactor of the Mihama nuclear power plant stands in the background. The two reactors in the foreground will be decommissioned. (Asahi Shimbun file photo)

The nation's nuclear watchdog granted approval Nov. 16 for the aging No. 3 reactor at the Mihama nuclear plant to operate for an additional 20 years, making an exception for the second time.

The plant in Fukui Prefecture operated by Kansai Electric Power Co. will reach its 40-year-lifespan at the end of the month.

The Nuclear Regulation Authority previously allowed the No. 1 and No. 2 reactors at the Takahama nuclear plant, also in the prefecture, to extend operations for 20 years. That authorization was given in June.

Limiting nuclear plant operations to 40 years, in principle, was decided on in the aftermath of the 2011 accident at the Fukushima No. 1 nuclear power plant.

The decision, made while the Democratic Party of Japan was in control of government, was supported by the Liberal Democratic Party and Komeito, then in opposition but now ruling as a coalition. Under that new rule, there was a provision for a one-time exemption to allow extension of operations for 20 years. But **the DPJ government said such extensions would be "extremely exceptional."**

The latest approval does not mean the Mihama No. 3 reactor will be resuming operations any time soon. Kansai Electric Power must first implement the measures it promised to heighten safety.

Anti-quake measures and the switching of electric cables that total about 1,000 kilometers in length is expected to take more than three years, meaning that operations will only resume by March 2020 at the earliest.

In order to allow for an extension, a nuclear plant operator has to pass three screenings based on tougher safety standards before the 40-year deadline is reached.

Kansai Electric Power submitted an application to the NRA in November 2015 for an extension of the Mihama reactor.

Under safety screening based on new standards, the estimated size of the shaking of a possible earthquake that might hit the area around the plant was raised from 750 gal to 993 gal. A gal is a measure of ground acceleration related to seismic shaking.

The higher standard meant Kansai Electric Power had to demonstrate that equipment at the Mihama plant could withstand shaking of that size. The utility was also told to switch the electric cables used on the plant site to ones that were less flammable.

With the November deadline approaching, the NRA pushed the Mihama No. 3 reactor safety screening to the top of its list. In October, the agency approved the utility's basic policy for safety measures. It later also approved the detailed design plans for plant equipment.

The latest decision by the NRA means Kansai Electric Power now has the three approvals it needs to extend operations for 20 years.

Operation extension approved for Mihama reactor

http://www3.nhk.or.jp/nhkworld/en/news/20161116_18/

Japan's nuclear regulator has said an aging reactor will be allowed to operate beyond its 40-year maximum life span.

The No.3 reactor at the Mihama nuclear power plant, on the Sea of Japan coast, has been given a 20-year extension. The Nuclear Regulation Authority made the unanimous decision on Wednesday.

The reactor, in Fukui Prefecture, went offline in March 2011 for a regular checkup and has not been restarted.

The Mihama reactor turns 40 years old later this year, and it will now be permitted to run until November 2036.

The Nuclear Regulation Authority heard evidence on Wednesday that the reactor's pipes and electric cables are expected to meet required standards for up to 60 years since operations began in 1976.

Some members referred to a 2004 accident at the reactor in which 5 workers were killed after high-temperature steam leaked from a damaged pipe. They urged the operator, Kansai Electric Power Company, to keep checking for possible decay to the facility.

The reactor is the third in Japan to be granted an extension, after 2 reactors at the nearby Takahama plant were approved for restarts in June.

Kansai Electric said it will not restart operations until additional safety work has been completed, by March 2020 at the earliest. It said **it believes the restart will be economically practical.**

Decommissioning: What cooperation?

November 16, 2016

TEPCO may struggle to find partners due to Fukushima decommissioning costs

<http://mainichi.jp/english/articles/20161116/p2a/00m/0na/008000c>

Naomi Hirose, president of Tokyo Electric Power Company Holdings Inc. (TEPCO), presented a proposal to reform the operator of the crippled Fukushima No. 1 Nuclear Power Plant to the Economy, Trade and Industry Ministry's expert panel on Nov. 15.

Under the proposal submitted by Hirose on the reform of TEPCO and issues related to the crippled Fukushima nuclear power plant, TEPCO is to collaborate with other power companies in the areas of nuclear power generation and energy transmission and distribution in an effort to boost its earning power. But if other major utilities were to work with TEPCO on a nuclear power project, questions would be raised about how to split risks such as decommissioning costs for the crippled Fukushima plant among companies concerned. Such being the case, TEPCO will likely have difficulty finding partners.

Hirose attended the closed-door expert committee meeting as an observer. Committee chairman Kunio Ito (specially-appointed professor at Hitotsubashi University) and a senior industry ministry official revealed the details of Hirose's reform proposal at a news conference after the panel meeting.

According to details revealed at the news conference, Hirose proposed to step up TEPCO's cooperation with other power companies on its nuclear power business including the areas of safety measures, joint technological development and overseas business operations. The industry ministry had already proposed at an expert panel meeting that TEPCO spin off its nuclear business into a subsidiary and collaborate with other utilities, among other moves. TEPCO is expected to incorporate these plans into the "New Comprehensive Special Business Plan" that is set to be revised early next year in line with discussions at expert panel meetings.

Under the current New Comprehensive Special Business Plan, TEPCO assumes reactivation of its Kashiwazaki-Kariwa Nuclear Power Plant as a source of earnings to be used to rebuild itself. But there are no prospects of the power plant being reactivated as the governor of Niigata Prefecture, which hosts the nuclear facility, is taking a cautious stance toward reactivation. The industry ministry wants to secure understanding of a plan to reactivate the nuclear power plant by improving the creditworthiness of TEPCO's nuclear business through collaboration with other utilities. But because there is a possibility of other power companies being forced to shoulder the costs of decommissioning the crippled Fukushima plant, it remains unclear whether TEPCO will be able to cooperate with those utilities as envisioned.

A member of the expert panel was quoted as saying at the meeting, "A proper alliance cannot be formed unless ways of shutting off the risks (for possible alliance partners) are considered. Hirose also proposed that TEPCO work with other firms in the area of power generation and transmission, as well as jointly procure materials with other firms.

As for the costs of decommissioning the Fukushima No. 1 nuclear plant, which are expected to exceed the initial estimate by several trillion yen, and expenses for paying compensation to nuclear disaster victims, the expert panel confirmed plans for TEPCO to minimize financial burdens on the public through management efforts. An expert panel member was quoted as saying at the Nov. 15 meeting, "If TEPCO's liability is defined as limited, the general public will see the move as relief measures for TEPCO. We should carefully consider public opinion."

Nuclear pact with India: How "safe"?

November 15, 2016

A questionable nuclear deal

<http://www.japantimes.co.jp/opinion/2016/11/15/editorials/questionable-nuclear-deal/#.WCr5KMMdmos>

The civilian nuclear cooperation deal signed by Tokyo and New Delhi last week paves the way for Japan to export nuclear power equipment and technology to India, which is a non-signatory to the Nuclear Nonproliferation Treaty and possesses nuclear weapons. When the pact is submitted for its endorsement, the Diet needs to scrutinize whether it is appropriate from the viewpoint of the international regime against nuclear proliferation and consistent with the efforts of Japan — the sole country to have experienced nuclear attacks — to promote nonproliferation and the abolition of nuclear arms. In concluding the deal with his visiting Indian counterpart Narendra Modi last week, Prime Minister Shinzo Abe — who is pushing the export of nuclear technology in his efforts for promote overseas infrastructure sale as a key pillar of his growth strategy — emphasized that the deal will lead to India effectively joining the nonproliferation regime. The two countries have concurred that Japan can terminate the accord if India ends its voluntary moratorium on nuclear weapons testing, which has been in place since 2008. Questions persist, however, as to how tight will be the guarantee that nuclear technology and materials made available through the pact will not be diverted to military purposes. In recent years, Japan has concluded a series of civilian nuclear cooperation pacts with such countries as Vietnam, Jordan and Turkey in an effort to export its nuclear power plant technology and equipment. But the latest deal with India carries different ramifications. **It marks a deviation from Japan's emphasis on the NPT regime as the international framework for nuclear nonproliferation and disarmament, which is already threatened by North Korea's repeated nuclear weapons tests.**

India carried out nuclear weapons tests in 1974 and 1998 and is believed to possess at least 100 nuclear warheads. It has refused to join the NPT, which limits possession of nuclear arms to the United States, Britain, France, Russia and China, nor has it signed the Comprehensive Nuclear Test Ban Treaty (CTBT). The international community for years prohibited civilian nuclear cooperation with India, but the U.S. administration of President George W. Bush in 2008 concluded such a pact with New Delhi with an eye on building nuclear power plants in the rapidly growing South Asian economy — a move followed by other countries including Japan.

Japan's negotiations with India on civilian nuclear cooperation began in 2010, but were suspended when Tokyo Electric Power's Fukushima No. 1 plant was hit by triple meltdowns in the March 2011 Great East Japan Earthquake and tsunami. Abe resumed the talks for the pact when Modi's predecessor Manmohan Singh came to Tokyo in 2013, and agreed in principle to the deal when he visited New Delhi last December.

The nuclear pact with India is **part of the Abe administration's broad strategy of beefing up both economic and security relations with India as a counterweight to China's expanding clout in Asia.** There are also views that **it makes sense for Japan and the U.S. in terms of security considerations to extend civilian nuclear cooperation with India, which is counting on nuclear energy to cover an acute power supply shortage, since it will otherwise turn to Russia or China for help in developing its nuclear power industry.**

Japanese businesses involved in nuclear power meanwhile see promising markets overseas for export of their technology and equipment since the Fukushima disaster made it difficult for utilities to build new nuclear plants in Japan and the restart of idled plants remains slow. These strategic and business considerations were prioritized as Tokyo pushed for the nuclear deal, which also authorizes India to reprocess spent nuclear fuel to extract plutonium. **Japan is reported to have compromised on its earlier demand that the pact include an explicit provision that cooperation would be halted if India resumed nuclear weapons tests.** The final accord merely states that each of the parties can terminate the cooperate by notifying the other one year in advance. It is only stipulated in a separate document exchanged along with the accord that India's 2008 nuclear test moratorium serves as the basis of civilian nuclear cooperation and that the Japanese government can initiate a process to terminate the pact if it ends. The accord says the cooperation will be restricted to peaceful purposes — and that nuclear materials and technology provided through the pact must not be diverted to other purposes. Doubts persist that these provisions will guarantee that India will not resume nuclear weapons testing or divert plutonium extracted by reprocessing spent fuel to use in nuclear arms. These and other questions over the pact must be fully addressed when it comes up for deliberations in the Diet.

Extending 40-year lifespan once again might set a trend

November 17, 2016

EDITORIAL: NRA decision on aging reactors is irresponsible and unnecessary

<http://www.asahi.com/ajw/articles/AJ201611170033.html>

The Nuclear Regulation Authority on Nov. 16 gave the green light to Kansai Electric Power Co.'s application to extend operations of the aging No. 3 reactor at its Mihama nuclear power plant for up to 20 years. The plant in Fukui Prefecture will reach its 40-year-lifespan at the end of the month.

The Mihama No. 3 unit is the third reactor to be granted a license renewal by the nuclear safety watchdog following the No. 1 and No. 2 reactors at the same utility's Takahama nuclear power plant, also in Fukui Prefecture.

In the aftermath of the disaster at Tokyo Electric Power Co.'s Fukushima No. 1 nuclear power plant in 2011, the law was revised to set 40 years, in principle, as the lifespan of nuclear reactors. The licenses for reactor operations can be renewed once for up to an additional 20 years, but license renewal is supposed to be highly exceptional.

We are deeply concerned that the NRA's decision to approve the extended operation of an aging reactor could set a trend, gradually eviscerating the principle. We feel obliged to express again our opposition to the decision.

There are reactors that have been in service for more than 40 years in the United States and Europe. But experts have warned about a possible significant decline in the level of safety due to such aging issues as deterioration of the reactor vessel, which cannot be replaced.

The No. 3 reactor at the Mihama nuclear plant had a serious accident in 2004 when 11 workers were killed or injured by high temperature steam blowing out of a worn-out pipe in a turbine facility.

One of the factors behind the deadly accident was inadequate inspection over many years.

Older nuclear power plants require more careful maintenance and safety checks.

The extended operation of the aging reactors will impose a heavy burden on Kansai Electric Power, which is responsible for securing their safety.

The utility has promised to raise its estimation of ground motion due to possible earthquakes that might strike areas around the plants and take appropriate measures to bolster the quake-resistance of the reactors by spring 2020. It will also have to take additional safety measures, including steps to make electric cables less flammable.

The company will have to spend more than 380 billion yen (\$3.47 billion) to meet the requirements to extend the operation of the three reactors. This sum doesn't include the costs of building new facilities to respond to terrorist attacks required under the new stricter safety standards.

The amount of money involved could have covered the entire cost of building a 1,000-megawatt nuclear power plant before the Fukushima disaster.

Still, Kansai Electric Power claims the massive investment makes economic sense. It said it plans to also seek license renewal for the No. 1 and No. 2 reactors at its Oi nuclear power plant, which will reach the 40-year legal lifespan in three years.

Of the 11 reactors it owns, the utility has decided to decommission only the two oldest--the No. 1 and No. 2 reactors at the Mihama plant.

Before the 2011 accident, Kansai Electric Power promised local communities that it would replace the aging Mihama No. 3 reactor with a new one. This promise seems to have played a role in its decision to keep the Mihama No. 3 unit running.

The license renewals offer no respite from concerns about the situation in areas around Wakasa Bay in Fukui Prefecture, which are dotted with many aging reactors.

Instead of making decisions only from a business point of view, the utility should opt to decommission these reactors to lower the risk of nuclear accidents.

The NRA's stance toward the issue is also questionable.

The three reactors at the Takahama and Mihama plants faced decommissioning unless their licenses were renewed before the expiration of the 40-year term.

The NRA gave precedence to the inspections of these reactors for license renewal and allowed the utility to delay required earthquake-resistance tests for important equipment until after the completion of the planned work.

These actions indicate **the nuclear regulator tried to complete the license renewal review process before the expiry dates kicked in.**

The pools for storing spent nuclear fuel at the nuclear plants operated by Kansai Electric Power are close to reaching their capacity.

The utility says it will build an interim storage facility outside Fukui Prefecture. But there is no workable and specific plan to realize this idea.

The utility is acting in an irresponsible manner by deciding to extend the operation of these aging reactors without solving the key problem.

The catastrophic accident at the Fukushima plant has radically changed the Japanese public's perceptions of nuclear power generation.

It is hard to believe that continued use of old reactors will open up a new energy future for this nation.

Kansai Electric Power should stop to reconsider whether extending the operation of these reactors is really necessary.

Another operation approval of aging nuclear reactor contradicts 40-year rule

<http://mainichi.jp/english/articles/20161116/p2a/00m/0na/019000c>

The Nuclear Regulation Authority (NRA) has allowed Kansai Electric Power Co. to continue running the No. 3 reactor at its Mihama Nuclear Power Station in Fukui Prefecture beyond the 40-year limit.

- **【Related】** Japan regulator OKs another nuclear reactor to run beyond 40-yr limit
- **【Related】** Another aging reactor passes safety checks to operate beyond 40 yrs
- **【Fukushima & Nuclear Power】**

This is the third nuclear reactor in the country that will have been allowed to continue to operate beyond the 40-year limit -- following the No. 1 and 2 reactors at the Takahama plant also in Fukui Prefecture. The move contradicts rules stipulating that nuclear reactors should be decommissioned after being operated for 40 years, in principle.

It had been viewed as extremely difficult to extend the lifespan of Mihama's No. 3 reactor because of its old design and difficulties in improving the reactor's quake resistance as the plant operator is required to largely increase the estimate of the scale of the maximum earthquake that could hit the plant.

As such, the NRA once hinted that it would discontinue examinations of the reactor to see if it meets the new regulatory standards.

However, Kansai Electric Power spent 165 billion yen on measures to enhance the safety of the reactor. The NRA increased its personnel to accelerate the examination of the plant, and managed to approve the continuation of its operation by the deadline.

Six aging nuclear reactors across the country are set to be shut down and decommissioned. Their operators voluntarily decided to decommission these reactors, whose outputs are small, considering the units' cost-benefit performance.

However, if power companies apply for permission to extend the lifespan of nuclear reactors, the NRA will almost certainly grant permission.

The rules limiting the operation of a nuclear reactor to 40 years, in principle, was established with the aim of reducing Japan's reliance on atomic power stations following the outbreak of the Fukushima nuclear crisis in March 2011. Both the NRA and power companies should go back to the fundamentals of the rules.

Man with (recognised) work-related cancer to sue TEPCO

November 18, 2016

Cancer patient compensated for Fukushima work to sue TEPCO

<http://www.asahi.com/ajw/articles/AJ201611180052.html>

THE ASAHI SHIMBUN

November 18, 2016 at 14:10 JST

A 42-year-old man diagnosed with leukemia after working at the crippled Fukushima No. 1 nuclear plant plans to sue Tokyo Electric Power Co., saying the utility failed to take adequate precautions against radiation exposure.

He will also sue Kyushu Electric Power Co., operator of the Genkai nuclear plant in Saga Prefecture where he had also worked, in the lawsuit expected to be filed at the Tokyo District Court on Nov. 22. The man, who is from Kita-Kyushu in Fukuoka Prefecture, will demand about 59 million yen (\$541,000) in total compensation from the two utilities.

“TEPCO and Kyushu Electric, as the managers of the facilities, are responsible for the health of workers there, but they failed to take adequate measures to protect them from radiation exposure,” said one of the lawyers representing him.

“The man was forced to undergo unnecessary radiation exposure because of the utilities’ slipshod on-site radiation management, and as a result had to face danger to his life and fear of death,” the lawyer said. The lawyers group said the man has a strong case, citing a ruling by labor authorities in October 2015 that recognized a correlation between his leukemia and his work in response to the 2011 Fukushima nuclear disaster.

It was the first time cancer was ruled work-related among people who developed the disease after working at the stricken Fukushima No. 1 nuclear plant.

The planned lawsuit will be the first legal action against TEPCO brought by an individual whose work-related compensation claim has already been granted.

Between October 2011 and December 2013, the man worked at the Fukushima No. 1 nuclear plant to set up a cover on the damaged No. 4 reactor building and perform other tasks.

The man also did regular maintenance jobs at the Genkai plant.

His accumulative radiation exposure at the two plants came to about 20 millisieverts.

He was diagnosed with acute myelocytic leukemia in January 2014.

Brazilian Govt worried about Fukushima jobs

November 18, 2016

Brazilian gov't calls for restraint on ads seeking foreign workers for Fukushima jobs

<http://mainichi.jp/english/articles/20161118/p2a/00m/0na/007000c>

The Brazilian Embassy in Japan and Consulate-General in Tokyo have asked media outlets serving foreigners of Japanese ancestry to refrain from easily advertising jobs with a risk of exposure to radiation from the Fukushima nuclear disaster.

- **【Related】** Foreigners hired at Fukushima nuke plant under suspected illegal contracts

The finding follows news that seven people including Brazilians of Japanese descent were involved in decommissioning work at Tokyo Electric Power Co.'s crippled Fukushima No. 1 Nuclear Power Plant.

Brazil wants its citizens to know the risks of working in such areas.

Sources told the Mainichi Shimbun that between March 2014 and May that year, several people, mostly Brazilians of Japanese ancestry, were involved in constructing tanks to hold contaminated water at the Fukushima No. 1 plant without receiving sufficient advance instruction on protecting themselves against radiation. Suspicions have arisen that they were hired through illegal contracts that obscured who was responsible for their safety.

The Brazilian Embassy took exception to a job ad published in a free Portuguese-language paper for Brazilians living in Japan in the spring of 2012, the year after the outbreak of the nuclear disaster. The job was to process debris within a 20-kilometer radius of the Fukushima plant. It paid 30,000 yen a day. Work for foreigners of Japanese ancestry has been declining since the economic downturn following the collapse of Lehman Brothers in 2008, and about 100 people applied within three days of the ad being carried.

At the same time, protests about the ad rose among some Brazilians of Japanese descent, and so the Brazilian Embassy in Japan asked the publisher of the free newspaper to refrain from carrying such ads. The temp staffing agency in Osaka that ordered the ad said it refrained from employing people before the issue caused a stir, and has not sought to employ foreign workers since.

In the spring of 2015, the Brazilian Consulate-General in Tokyo took note of occasional ads in other free newspapers and put up a notice on its website asking advertisers to refrain from seeking people to work in areas around the Fukushima No. 1 plant where workers' health is put at risk.

Consul General Marco Farani told the Mainichi, "Due to the problem of radiation, I think it would be better for them not to work there, but we can't stop people who want to. Rather than looking at the good wages, it's important to properly learn about the health risks of radiation before working there. I would like the media to think about that point before publishing job ads." He said he didn't know that Brazilians of Japanese ancestry had been involved in nuclear plant decommissioning work.

Musashi University professor Angelo Ishi, a third-generation Japanese-Brazilian who is familiar with labor issues involving Brazilians of Japanese ancestry, is among those who protested against the ads.

"I took a serious view of the fact that they carried them without thinking deeply about the effects of radiation on people's health," he explained.

Regarding the suspicions of disguised contracts, he said, "It's not enough to say it was all right in the end because there was no radiation exposure or any accidents. It is necessary to make people understand the risks, providing information in advance that can also be understood by foreigners."

TEPCO must reform but how and with whom?

November 19, 2016

Panel increasingly favors drastic Tepco reforms

<http://www.japantimes.co.jp/news/2016/11/19/business/panel-increasingly-favors-drastic-tepco-reforms/#.WDBDrn2Dmot>

JJI

A panel discussing reforms for Tokyo Electric Power Company Holdings Inc. is increasingly seeing a need for the utility to merge its nuclear and power grid operations with those of other companies, the chairman of the panel has said.

The panel commissioned by the industry ministry has been discussing how Tepco should streamline operations as a way to raise money to finance the decommissioning of its crippled Fukushima No. 1 nuclear power plant.

The view is spreading that tie-ups are not enough and that **Tepco should pursue integration with other firms for some operations**, Kunio Ito, chairman of the panel and professor at Hitotsubashi University, told a news conference Friday after the panel's meeting.

One member, citing a joint thermal power company between Tepco and Chubu Electric Power Co. as an example, said Tepco should explore integration for power grid operations as well, according to the panel's secretariat and other sources.

On nuclear power operations, another member said there are several possible options, including forming a company to run all plants in the country or one company each for the east and west of the country, according to the sources.

But Tepco is highly likely to face problems finding partners for business integration because they may be forced to shoulder part of the burden of funding the decommissioning of the Fukushima plant and compensating those affected by its triple core meltdown in March 2011, sources familiar with the matter said.

The electricity industry is not considering any plan for nuclear power business integration, Satoru Katsuno, chairman of the Federation of Electric Power Companies of Japan, told a news conference.

Fukushima students visit plant

November 19, 2016

Fukushima students see crippled nuclear plant firsthand

By CHIKAKO KAWAHARA/ Staff Writer

Students from Fukushima High School view the stricken Fukushima No. 1 nuclear power plant during a tour aboard a bus on Nov. 18. The No. 1 reactor building is in the background. (Chikako Kawahara)

<http://www.asahi.com/ajw/articles/AJ201611190023.html>

OKUMA, Fukushima Prefecture--It was no ordinary outing for the 13 students from Fukushima High School.

The teenagers toured the site of the crippled Fukushima No. 1 nuclear power plant by bus on Nov. 18 to get a firsthand look at work to decommission the reactors following the triple meltdown in 2011.

It was the first tour by youngsters since the disaster as plant operator Tokyo Electric Power Co. had deemed the radiation risk was too high.

Through bus windows, the students observed the damaged reactor buildings, rows of storage tanks holding contaminated water and other facilities on the sprawling nuclear complex.

"The tour made me realize that we should arm ourselves with accurate information if we want to change people's perceptions of Fukushima as a scary place," said Keika Kobiyama, a first-year student in the group. "For starters, I want to tell my fellow high school students 'We went to the plant to see for ourselves what was going on there.'"

TEPCO had previously refused to allow tours by those under the age of 18.

But the company gave the green light to this request as an exception on grounds that radiation levels had dropped significantly.

The students were each given a dosimeter as they boarded the bus for the two-hour tour. The trip was held after their parents agreed to the visit.

The students themselves had been releasing updates on the disaster for Japanese and foreign audiences by monitoring radiation levels in the prefecture and studying the decommissioning process.

<http://mainichi.jp/english/articles/20161119/p2a/00m/0na/008000c>

...Following the Labor Standards Act, which forbids employing people younger than 18 from working in places with harmful radiation, **TEPCO generally only allows people 18 or older to enter the plant.** From the time of the disaster through June of this year, TEPCO admitted around 23,000 visitors, but this was the first time it has done so for high school students. **According to TEPCO, the radiation exposure during the students' visit was at the most 10 microsievarts. ...**

Trying to attract tourists to Fukushima

November 20, 2016

Fukushima mounts winter tourism offensive to draw foreign tourists to its snowy charms

<http://www.japantimes.co.jp/news/2016/11/20/national/fukushima-mounts-winter-tourism-offensive-draw-foreigners-snowy-charms/#.WDHM-32Dmos>

Fukushima Minpo

A project will kick off in Fukushima Prefecture this winter to lure more foreign tourists to its snowy hills and mountains to help revitalize depopulated regions.

For starters, the prefecture will invite tourists from Taiwan, Thailand and Australia to Okuaizu, Urabandai and southern areas of the prefecture, and subsidize nearly all of their transportation and accommodation costs. About 200 people are expected to participate.

The purpose of the project is to promote Fukushima's name overseas, raise occupancy at its hotels and inns, and bolster jobs in its tourism industry.

The project will run until fiscal 2018. The Fukushima Prefectural Government plans to earmark about ¥17 million from the central government's local revitalization subsidies to finance the first year.

The prefecture is coordinating with travel agencies so that areas including the towns of Minamiaizu, Kaneyama and Bandai, as well as the villages of Kitashiobara and Tenei, can welcome visitors from Australia, where skiing is very popular, and Taiwan and Thailand, where Fukushima has tourism offices. The four towns and villages will get three tours each, including an overnight journey, with the prefecture shouldering most of the transport and accommodation fees.

Each tour is designed so participants can ski, snowboard and have snowball fights in Fukushima's powder snow, as well as enjoy local snow festivals. There are also plans to reserve a ski resort for a whole weekday just for foreign visitors.

In addition, tourists will be invited to soak in hot springs to interact with local residents after experiencing snow-removal activities. This will be followed by chances to sample the local cuisine and taste sake popular at home and abroad.

Other trips are being planned to famous tourist spots along the Tadami Line, which has gained an overseas following on the internet, and to fishing spots where pond smelt can be caught in Hibara and Hatori lakes.

Once the visitors return home, the project encourages them to spread information on the ski resorts, tourist spots, food and sake they experienced via SNS.

Already, the Fukushima Prefectural Government is looking to create more tours that appeal to a wider range of countries, including China and South Korea.

It intends to set up a study group comprising officials from cities, towns, villages and local tourism associations to analyze the participants' reactions. Based on the results, the prefecture will set up multiple tourism routes to draw attention ahead of the Tokyo 2020 Olympics.

"Amid tepid demand from Japanese skiers, if the prefecture successfully emphasizes the high quality of its snow, it is possible to lure more tourists from abroad," said a source connected with a ski resort in the Aizu region.

"We'd like to design a model tour to make the mountainous areas popular in winter," an official in the prefecture's regional development section said.

Even though tourism has rebounded since the Fukushima disaster unfolded in 2011, it has not fully recovered.

Last year, foreign tourists who stayed at lodging facilities with more than 20 employees in Fukushima came to 48,090, more than double the 2011 tally, according to the Japan Tourism Agency.

But that's still far short of the 87,170 who did so in 2010, and the prefecture is hunting for more ways to raise tourism in cooperation with its neighbors in the Tohoku and Kanto regions.

This section, appearing every third Monday, focuses on topics and issues covered by the Fukushima Minpo, the largest newspaper in Fukushima Prefecture. The original article was published on Aug. 5.

Tax breaks to reconstruct no-go zone?

November 22, 2016

Tax breaks mulled to aid reconstruction in Fukushima no-go zone

JJI

The Abe government and ruling coalition are considering giving tax breaks to companies that do business in reconstruction footholds to be set up in the no-go zone heavily contaminated by the 2011 nuclear accident in Fukushima Prefecture, according to informed sources.

Officials believe such measures will help advance industrial recovery in the prefecture hurt by the reactor meltdowns at the Fukushima No. 1 power plant in March 2011, the sources said Tuesday.

Under consideration are corporate tax cuts to promote capital investment and employment of people affected by the crisis by firms damaged by the nuclear accident and companies that newly expand into the area.

The special reconstruction areas will be created starting in fiscal 2017. Priority will be given to decontamination work and infrastructure development in the footholds, so that evacuation orders for local residents can be lifted around the end of March 2022.

The tax measures will be included in the fiscal 2017 tax system reform package that the Liberal Democratic Party-led ruling coalition plans to draw up Dec. 8.

Similar tax breaks are provided in evacuation areas outside the no-go zone. Through the planned measures, the government hopes to encourage the opening of businesses necessary for residents to live in the area, such as convenience stores and gas stations, as well as promoting job creation.

The government and the ruling camp are considering the options of allowing companies to deduct from their corporate taxes 15 percent of the amounts of their capital investment made in the footholds and granting lump-sum depreciation of new equipment and facilities so they can reduce their taxable incomes by larger margins than under regular depreciation rules.

Another possible measure is giving a corporate tax cut equivalent to 20 percent of salaries for employees in the footholds that companies hire from among those affected by the nuclear accident.

Also under consideration extending by four years a corporate tax cut granted to the owners of housing for disaster victims in special economic zones on condition the buildings meet fire resistance and other requirements and that the owners give priority to disaster-affected people in choosing tenants.

Can - definitely - be improved

November 23, 2016

Tsunami warning for Miyagi Pref. issued late despite prediction tech

<http://mainichi.jp/english/articles/20161123/p2a/00m/0na/007000c>

When a strong quake struck off the coast of Fukushima Prefecture in the early hours of Nov. 22, a tsunami warning was immediately issued for Fukushima Prefecture's coastal areas. However, there was a delay in issuing a tsunami warning for the coast of Miyagi Prefecture, directly north of Fukushima Prefecture, causing confusion among residents over whether they needed to evacuate.

- **【Related】** Tohoku coastal residents rush to high ground after quake in fear
- **【Related】** M7.4 quake hits northeastern Japan, causing tsunami
- **【Related】** Spent-fuel cooling at Fukushima Daini plant temporarily halts

When an earthquake measures lower than magnitude 8, and tsunamis are expected to reach a height of more than 1 meter up to 3 meters, tsunami warnings are issued. Tsunami advisories, meanwhile, are issued when tsunami heights are expected to be at a maximum between 0.2 meters and 1 meter.

The magnitude-7.4 quake struck at 5:59 a.m. on Nov. 22. But the tsunami advisory issued for Miyagi Prefecture was not switched to a tsunami warning until 8:09 a.m., approximately six minutes after a 1.4-meter tsunami -- the tallest tsunami recorded across the country following the latest quake -- had been observed at Sendai Port. It had already been two hours and 10 minutes since the quake had hit.

"We don't know why the waves were so high at Sendai Port," a befuddled official at the Japan Meteorological Agency (JMA) said. "It's extremely difficult to make accurate predictions."

At 6:02 a.m., about three minutes after the earthquake occurred, the JMA issued a tsunami warning for Fukushima Prefecture, and tsunami advisories for the Pacific Coast from Aomori Prefecture in the north all the way down to Chiba Prefecture near Tokyo.

The height and arrival times of tsunamis are calculated using a database with some 100,000 possibilities that take into consideration such factors as the magnitude, location and depth of a quake. To increase the accuracy of these calculations, data taken from the surface of the ocean and the ocean floor by GPS wave gauges installed about 20 kilometers offshore by the Ministry of Land, Infrastructure, Transport and Tourism is also used. Despite such data, the JMA was unable to predict the 1.4-meter tsunami, ultimately issuing a tsunami warning after the wave had already hit.

According to the JMA, not only is seabed topography more complicated closer to land than offshore, waves can grow irregularly in height after crashing into the coast. At a press conference held at JMA headquarters, senior coordinator for seismological information Koji Nakamura said, "We will analyze the causes for the delay, and consider making changes to our tsunami prediction database if necessary."

The delay in issuing a tsunami warning affected residents' evacuation.

The Miyagi Prefecture city of Higashimatsushima responded to the tsunami warning by cancelling classes at 11 municipal elementary and junior high schools. Yet, a total of 78 students attending two elementary schools arrived at their respective schools, because the school cancellation notification emails failed to reach their parents in time. Looking back on what happened, an official with the Higashimatsushima

Municipal Board of Education said, "It was difficult to determine when we should make the decision to cancel classes."

In the city center of Ishinomaki, residents trying to evacuate to high ground by car surged from around 8 a.m., causing traffic jams. Some 150 cars gathered at Ishinomaki Junior High School and Kadonowaki Junior High School -- both municipal schools on high ground -- forcing school officials to open up their school yards to the public. "As soon as the tsunami advisory was switched to a tsunami warning, people began arriving in droves," the vice principal at Kadonowaki Junior High said. "It drove home the fact that residents remember the 2011 disaster and take tsunami warnings seriously."

Experts have pointed out that the traffic jams caused by people fleeing by car in the 2011 Great East Japan Earthquake, tsunami and nuclear disaster were an issue that needed to be resolved. Indeed, the traffic jams that occurred following the latest quake were not limited to Miyagi Prefecture.

On a prefectural road running inland from Onahama, a coastal area of the city of Iwaki, Fukushima Prefecture, traffic was backed up by almost 1 kilometer for about an hour starting at 6:30 a.m. The city's disaster plan drafted after the March 2011 disasters stipulates that evacuation should generally take place on foot; at a disaster drill carried out on Nov. 5, participants walked to designated evacuation sites. An official at the Iwaki Municipal Government's Onahama outpost speculated on the reasons why many residents chose to evacuate by car, saying, "It allows people to stay warm, and to escape together with their families."

No major damage was reported from the quake or tsunami, but there is much improvement needed in tsunami prediction techniques and evacuation methods. Shinji Toda, a professor at Tohoku University's International Research Institute of Disaster Science (IRIDeS) said, "Coastal areas in the Tohoku region must be vigilant toward massive earthquakes and tsunami for another 10 to 20 years."

NRA not worried about quality of steel parts

November 22, 2016

NRA accepts utilities' assessment of plant parts

http://www3.nhk.or.jp/nhkworld/en/news/20161122_41/

Japanese nuclear regulators have accepted power companies' assessment of the durability of steel parts for their nuclear plants.

The Nuclear Regulation Authority asked 11 domestic utilities to check on steel parts made by a method called forging.

The move came after it was found that steel for nuclear plant parts made by the same method in France contained more carbon than it should. Steel with a high carbon concentration can break down easily.

Japanese utilities said last month that steel for their plant parts is unlikely to contain much carbon. [??????]

The authority on Tuesday judged the assessment as appropriate.

It also decided to review the method of inspection to make it easier to detect the amount of carbon in steel.

The authority plans to continue seeking updates on the investigation in France, where regulators have ordered some plants halted for safety checks.

NRA says weak steel components not used in Japan nuclear plants

http://www.japantimes.co.jp/news/2016/11/22/national/nra-says-weak-steel-components-not-used-japan-nuclear-plants/#.WDSA_H3rlyU

Kyodo

The Nuclear Regulation Authority says potentially weak steel components manufactured by a Japanese company have not been used in domestic nuclear facilities, after its French counterpart ordered reactors that used the company's parts to be checked.

The NRA determined at a regular meeting Tuesday there is no comparable risk at the domestic nuclear facilities of 11 companies as portions of steel with excessive carbon concentrations had been removed from the components manufactured by Kitakyushu-based Japan Casting & Forging Corp.

The NRA concluded that the removal of portions with higher levels of carbon was insufficient in the components used in the French reactors.

The authority also determined there were no problems with critical parts at domestic facilities that were manufactured by other companies, including Tokyo-based Japan Steel Works Ltd.

The French Nuclear Safety Authority said in June it had found potential weaknesses at a number of nuclear facilities due to steel with higher levels of impurities supplied by Japan Casting & Forging, prompting the NRA to commence its own investigation.

Utilities in Japan checked their facilities and submitted reports to the NRA last month.

According to the reports, Japan Casting & Forging manufactured pressure vessel lids for 11 reactors at seven nuclear power stations, including the No. 2 reactor at Kansai Electric Power Co.'s Takahama power plant in Fukui Prefecture.

The company's pressure vessel lids were also used at the No. 2 reactor at Kansai Electric's Mihama plant in Fukui Prefecture and the No. 1 reactor at Kyushu Electric Power Co.'s Genkai plant in Saga Prefecture, both of which are set to be decommissioned.

Has Fukushima quake shaken restart plans?

November 22, 2016

Earthquakes rattle Japan's plan to restart more nuclear reactors

<http://www.beyondnuclear.org/home/2016/11/22/earthquakes-rattle-japans-plan-to-restart-more-nuclear-react.html>

The Shinzo Abe government's plan to restart nuclear power in Japan was shaken to its core with a 7.4 magnitude earthquake that struck on November 21, 2016 (the date here in the U.S.) just off the coast of the destroyed Fukushima Daiichi atomic reactors. Fukushima Daiichi is also the site of a huge radioactive waste tank farm that continues to expand from an on-again off-again radioactive cooling water treatment system for the three still unrecovered melted reactor cores. Little is presently known about how the hastily built tank farm has fared during the earthquake.

The four-unit Fukushima Daini nuclear power complex just seven miles south of Fukushima Daiichi temporarily lost cooling to Daini's Unit 3 spent fuel pool raising concerns for the overheating of high-level nuclear waste configured as 2400 used fuel rods being stored underwater. Fukushima Daini remains shutdown and barred from power operations along with 38 operable units in Japan following the March 11, 2011 8.9M earthquake and catastrophic tsunami. Only two of the nation's nuclear reactors have successfully returned to power operations amid intense public and political opposition that continues to grow.

Tuesday morning's 7.4M earthquake struck around 6 am (JST) 31 miles off the east coast. The large earthquake set off coastal tsunami warnings for several hours, eventually measuring up to a sea level rise of 55 inches. A second 5.5M earthquake struck shortly after with its epicenter on land just 7 miles from Fukushima Daini with another tsunami warning. Aftershocks continue to jolt the area with officials concerned that another major quake can be expected within the week.

During times of natural disaster and national security threats, nuclear power is more a dangerous societal liability than an asset. All of the reactors' safety systems and their nuclear waste cooling systems are 100% reliant upon offsite electrical grid power during normal operations. If the electric grid is disturbed by disaster or sabotage, nuclear power plants automatically shut down and emergency electrical power systems kick in to service a subset of priority reactor safety and cooling systems. If those systems fail or are disabled, nuclear power stations typically have 4 to 8 hours of back-up battery power to prevent a meltdown. Cooling capability to thousands of tons of high-level nuclear waste (irradiated fuel rods) initially rely upon the same off-site electrical power. Since the 9/11 World Trade Center aircraft attacks and the 3/11 Fukushima nuclear disaster, reactor spent fuel pools with high-density storage of nuclear waste are being equipped with make-up water systems should a loss of power threaten to boil off the water filled pools. Each pool containing up to 700 to 1000 tons of thermally hot and highly radioactive nuclear waste can overheat, boil off and catch fire without cooling.

The Beyond Nuclear Facebook page posted live stream coverage broadcasted from Japan during the tsunami warning.

TEPCO told to improve its business practices

November 18, 2016

Ministry warns TEPCO subsidiary over driving up wholesale power prices

<http://mainichi.jp/english/articles/20161118/p2a/00m/0na/004000c>

An energy transaction watchdog has warned a subsidiary of Tokyo Electric Power Co. Holdings Inc. (TEPCO) over illicitly driving up wholesale electricity prices by selling power at unreasonably high rates.

- **【Related】** News Navigator: How does the liberalized electricity market work?
- **【Related】** What benefits, options will liberalization of electricity industry bring to consumers?

The Economy, Trade and Industry Ministry's Electricity and Gas Market Surveillance Commission (EGC) advised the subsidiary, TEPCO Energy Partner Inc., on Nov. 17 to improve its business practices. Many smaller power companies have entered the market following retail electricity liberalization, purchasing power on the Japan Electric Power Exchange (JEPX). However, these small firms have difficulty procuring power if the wholesale prices rise.

TEPCO Energy Partner denied any wrongdoing, but suggested that it would comply with the ministry's order. "We had no intention of manipulating market prices, but will respond to the advisory in an appropriate manner," a company official said.

TEPCO Power Grid Inc., which manages the group's power distribution network, was also issued a business improvement order by the EGC this past June for a delay in notifying smaller power companies of their electricity usage.

TEPCO Energy procures electricity from the TEPCO group, and supplies power to households and sells power on the JEPX. The company put power up for sale on JEPX's spot market -- the market for electricity to be delivered the following day -- at unreasonably high prices between April and August this year, according to the surveillance commission.

The products traded on the JEPX spot market are for 30-minute slots adding up to a 24-hour day. Due to sell orders by TEPCO Energy, power prices were driven up in about 60 percent of daytime slots, with the price rising by some 30 percent in at least one slot.

TEPCO Energy set minimum prices at the same level as the cost of procuring power, based on which the retail prices are calculated.

Considering that TEPCO Energy has an overwhelming influence on JEPX prices, the surveillance commission deemed that this practice constituted intent to drive up prices. The watchdog also hinted at the possibility that the company attempted to avoid supplying power to its rivals at lower prices.

"If a company that produces a massive amount of electric power takes an action like this, it could prevent other business operators from procuring necessary power from the market at fair prices and hinder new companies' entry into the retail market, and to maintain and expand their business," the commission stated.

The commission then urged TEPCO Energy to report measures the firm will take to prevent a recurrence within a month. In response, TEPCO Energy issued a statement saying, "We've voluntarily eliminated the minimum selling price. We'll continue to sincerely contribute to revitalizing the power wholesale market."

"Shifting the cost of bad management"

November 21, 2016

EDITORIAL: A preposterous proposal on nuclear accident compensation

<http://www.asahi.com/ajw/articles/AJ201611210025.html>

The industry ministry has put forth a ridiculous proposal on financing compensation payments to victims of nuclear accidents.

In essence, the ministry's proposal is designed to bail out operators of nuclear power plants that have failed to set aside compensation money for possible accidents at facilities that have been in service for decades.

To secure necessary funds for potentially huge compensation payments, the ministry wants to require old customers to bear part of the burden.

The Ministry of Economy, Trade and Industry, which regulates the power industry, has submitted this proposal to a panel of experts discussing the issue.

This effectively means shifting the cost of bad management to people who are not responsible, an approach that defies common sense in the world of business management and obscures the responsibility of the operators. The ministry should withdraw the proposal.

The law concerning compensation for nuclear accident-related damages stipulates that in principle operators are responsible for paying compensation for all damages caused by accidents at their facilities. But the 2011 disaster at the Fukushima No. 1 nuclear power plant, operated by Tokyo Electric Power Co., prompted the government to set up an entity to pay compensation to the victims. Under this arrangement, TEPCO and other established electric utilities will pay back the money over a long period of time.

This new system, based on the notion of mutual help, is designed to get nuclear power plant operators involved in a joint effort to cover the risks of nuclear accidents.

The utilities involved are allowed to raise their electricity rates to finance contributions to the system. So the burden is actually borne by customers of the utilities.

The ministry's new proposal would widen the scope of contributors to the pool of money for compensation payments. The new contributors include electricity suppliers that have entered the market in response to its liberalization even though they don't operate nuclear power plants.

Specifically, the new utilities would be required to make contributions through the increased fees they pay to use the power transmission lines operated by established utilities. That would force almost all people in this country to shoulder part of the burden.

Here's the ministry's case for this scheme.

The money needed to pay compensation for damages caused by nuclear accidents should have been set aside since the 1960s, when nuclear power generation started in Japan. So it is appropriate to require people who paid low electricity rates that didn't include this cost to bear the burden now.

Behind the ministry's move is the fact that the total compensation amount related to the Fukushima nuclear disaster has already surpassed the original estimate and is now reaching 6 trillion yen (\$54 billion). The amount is expected to grow in the coming years.

Even so, if past beneficiaries of low electricity rates are involved, the established utilities should be first forced to use the profits they accumulated in the past through their nuclear power operations.

At the very least, no consumer would accept such a new financial burden unless the utilities are held responsible for failing to save up for emergencies during the past half century.

The ministry has also proposed similar plans to tap the fees paid by new power suppliers for use of established utilities' transmission cables to cover the costs of decommissioning the reactors at the crippled Fukushima plant and aging reactors at other plants.

The latest proposal is the third scheme based on this approach.

Imposing part of the burden on newcomers in the power market is tantamount to giving preferential treatment to nuclear power and undermines the fair competitive environment that is the foundation for power deregulation.

Some consumers have switched from established utilities to new power suppliers because of their aversion to nuclear power generation.

Clearly, adequate compensation should be paid to victims of nuclear accidents.

But the costs related to nuclear power generation should be shouldered by the operators of nuclear plants. An unreasonable scheme to shift this burden from the operators is simply unacceptable.

First meeting between TEPCO and Niigata Governor

November 24, 2016

Niigata Governor, Tepco execs to meet Tuesday

<http://www.japantimes.co.jp/news/2016/11/24/business/niigata-governor-tepco-exec-s-meet-tuesday/#.WDgC032Dmos>

JJI

Tokyo Electric Power Company Holdings Inc. said Thursday that its first meeting with new Niigata Gov. Ryuichi Yoneyama will be held at the Niigata Prefectural Government's offices in Niigata next Tuesday. The meeting, initially scheduled for last Tuesday, was canceled by the magnitude-7.4 earthquake that coincidentally struck off Fukushima Prefecture the very same day.

At the meeting with Tepco Chairman Fumio Sudo and President Naomi Hirose, Yoneyama plans to convey his cautious attitude toward restarting the Kashiwazaki-Kariwa nuclear power plant, informed sources said.

Yoneyama was elected governor last month. At a news conference Thursday, he said he will clarify his stance that **"unless a thorough review of the (March 2011) accident at Tepco's Fukushima No. 1 nuclear plant is conducted, the talks on a restart (of Kashiwazaki-Kariwa) can't get started."**

As for the review of the crisis by the prefectural government's technical panel, Yoneyama said: "We can't proceed with the review if Tepco doesn't give us information. We'd appreciate its cooperation."

The Tepco officials, for their part, want the governor's support to restart the giant plant, which straddles Kashiwazaki and the town of Kariwa, because it is critical to the utility's survival.

"We'll sincerely deal with the issue without shutting down discussion," Yoneyama told the prefectural assembly.

TEPCO: Press release

November 24, 2016

Press Releases 2016

Press Release (Nov 24,2016)Financial Assistance from the Nuclear Damage Compensation and Decommissioning Facilitation Corporation

http://www.tepco.co.jp/en/press/corp-com/release/2016/1339554_7763.html

On November 24, we received a funding grant of 39.9 billion yen from the Nuclear Damage Compensation and Decommissioning Facilitation Corporation (hereinafter referred to as NDF) based on the revision of the Special Business Plan which was approved on March 31, 2016.

This financial assistance was given in response to the 58th request we made in order to cover the compensation payouts due by the end of December 2016. The amount of the payouts to be paid by that time had been estimated to exceed the sum of the compensation we had received in accordance with the "Act on Contract for Indemnification of Nuclear Damage Compensation" (188.9 billion yen) and the financial assistance that the NDF has provided (6,378.4 billion yen).

With financial assistance from the NDF, we are determined to continue to pay the compensation with courtesy and compassion to all of those who have been afflicted by the nuclear damage.

Fukushima disaster: 20 trillion yen...or more

November 28, 2016

Cost of Fukushima disaster expected to soar to ¥20 trillion

<http://www.japantimes.co.jp/news/2016/11/28/national/cost-fukushima-disaster-expected-soar-%c2%a520-trillion/#.WDw2kX2Dmos>

Kyodo

The overall cost of wrapping up the Fukushima nuclear disaster is now estimated at more than ¥20 trillion, nearly double the previous estimate, sources familiar with the matter said Monday.

The Ministry of Economy, Trade and Industry, which previously put the overall cost at ¥11 trillion, is considering passing on a portion of the costs, including for compensation and the decommissioning of the Fukushima No. 1 nuclear plant, to consumers via higher electricity prices, the sources said.

The aged, six-reactor plant, operated by Tokyo Electric Power Co. Holdings Inc., was plunged into a blackout by the March 2011 earthquake and subsequent tsunami, leading to three core meltdowns and the worst nuclear disaster since Chernobyl in 1986.

According to the new estimate, Tepco's compensation payments will rise to ¥8 trillion from ¥5.4 trillion and decontamination costs will double to around ¥5 trillion.

Trillions more will be needed to decommission the reactors and deal with radioactive water at the plant, on top of the ¥2 trillion earlier estimated, the sources said.

The ministry has been discussing reforming crisis-hit Tepco and is about to draft a plan for the utility based on the new estimate within this year.

Combined with the cost of building interim waste storage facilities, foreseen to remain at ¥1.1 trillion, the total cost is forecast to surpass ¥20 trillion, the sources said.

The government is studying the possibility of expanding a ¥9 trillion interest-free loan program for Tepco that was set up by issuing government bonds to cover compensation payments and decontamination costs in areas hit by the disaster.

It is expected to take up to 30 years to recover the ¥9 trillion through payments from Tepco and other big utilities.

The government also plans to recover the expected increase in compensation payments and decontamination expenses by raising charges for transmission line usage for new electricity retailers.

In principle, Tepco needs to secure funds on its own for decommissioning the plant. The government will manage the funds, which will be established using profits generated by the utility. But it is not clear if Tepco alone can shoulder the cost.

Fukushima plant decommissioning, compensation costs to almost double: gov't est.

<http://mainichi.jp/english/articles/20161128/p2a/00m/0na/006000c>

The Ministry of Economy, Trade and Industry estimates that the cost of decommissioning the disaster-stricken Fukushima No. 1 Nuclear Power Plant and compensation for disaster damage would top a total of 20 trillion yen -- almost twice the previous government forecast, it has been learned.

- **【Related】** Fukushima nuclear plant decommissioning cost to surge
- **【Related】** High school takes students to see Fukushima nuclear reactor decommissioning

As the government is planning to have major utilities and smaller power companies that newly entered into the power market after its liberalization shoulder part of the snowballing financial burdens, consumers are certain to face increased electricity bills. The ministry is set to draw a conclusion later this year possibly based on the estimate after continuing discussions at an expert panel on the management reform of plant operator Tokyo Electric Power Co. (TEPCO) and on measures to secure financial resources.

The government had previously estimated that a total of 11 trillion yen would be needed to cover the projects -- 5.4 trillion yen for nuclear damage compensation, 2.5 trillion yen for decontaminating areas affected by the nuclear disaster, 1.1 trillion yen for building interim storage facilities for radiation contaminated soil and 2 trillion yen for decommissioning reactors at the Fukushima No. 1 nuclear plant. In the latest estimate, the compensation cost is expected to surge to roughly 8 trillion yen and the decontamination cost is estimated at somewhere around 4-5 trillion yen. It is also highly likely that the decommissioning cost would spike by several trillion yen. The development cost for interim storage facilities remains unchanged.

The previous government estimate was calculated toward the end of 2013, but the coverage of nuclear damage compensation has since increased and decontamination efforts are taking longer than expected. The decommissioning cost has also expanded especially for work to salvage nuclear fuel debris from the

2011 meltdowns. The ministry had earlier projected that the yearly cost for these projects would reach hundreds of billions of yen from the current 80 billion yen.

The government had heretofore explained that: the compensation cost would be temporarily paid by the Nuclear Damage Compensation and Decommissioning Facilitation Corp. (NDF) before being covered by TEPCO and other major utilities; the decontamination cost would be covered by the government after it sells the TEPCO shares that it owns; revenue from the power resources development promotion tax would be used for the construction of interim storage facilities; and the reactor decommissioning cost would be secured by TEPCO.

The government is now looking into boosting the amount temporarily covered by the NDF, while tacking the snowballing compensation cost onto major utilities and new power providers that use power grids operated by existing power transmission companies. The power grid usage fees, which require government approval, are ultimately to be passed on to consumer electricity bills.

As it is highly likely that the proceeds from the sale of TEPCO shares are too small to cover the decontamination cost, the government is mulling demanding TEPCO and other utilities share the financial burden. In that case, the expenses may likely be passed onto electricity bills.

The government will consider establishing a system in which TEPCO accumulates funds through business streamlining efforts to cover the decommissioning cost. As it is widely deemed difficult to cover the cost only through management efforts, however, the expenses may likely be -- again -- tacked onto power bills.

Governor Mitazono: "A mere publicity stunt" before the election?

November 29, 2016

Governor under fire as Sendai nuclear reactor likely to restart

<http://www.asahi.com/ajw/articles/AJ201611290066.html>

THE ASAHI SHIMBUN

KAGOSHIMA—Anti-nuclear activists are castigating Governor Satoshi Mitazono, saying the politician has retreated from his campaign promises regarding the planned restart of a nuclear reactor in the prefecture. Despite stressing that he would take a hard look at safety issues, Mitazono's actions on Nov. 28 indicate that Kyushu Electric Power Co. will be allowed to restart the No. 1 reactor at its Sendai plant on Dec. 8 as was expected.

"What he had done over the past months now appears to be a mere publicity stunt," said Yukio Taira, chief of a confederation of labor unions in Kagoshima Prefecture.

Taira withdrew his candidacy in the governor's race in July after he and Mitazono agreed on many policy measures toward a temporary halt of operations at the nuclear plant in Satsuma-Sendai.

Mitazono on Nov. 28 submitted to the prefectural assembly a budget proposal for establishing an expert panel on nuclear power generation--a centerpiece of his campaign pledges.

“I will make a comprehensive judgment on how to respond when the panel releases its findings of the utility’s reports on ‘special checks,’” Mitazono told the assembly session, referring to the reactor restart plan.

However, given that a governor does not have the legal authority to order a halt, the No. 1 reactor will probably already be running by the time those findings are released.

The assembly is expected to vote on the budget request for the panel on Dec. 16. Kyushu Electric is scheduled to release the outcome of its special checks in early January.

The utility agreed to carry out the additional checks in response to the new governor's concerns. These inspections, including checking bolts fastened on barrels containing nuclear waste, are nothing new and have been done in the past, according to Kyushu Electric.

Two reactors at the Sendai plant were the first in the nation to go online under new nuclear safety regulations set up after the 2011 nuclear disaster in Fukushima Prefecture.

The No. 1 reactor has been shut down for maintenance since October. The No. 2 reactor is scheduled to be taken offline in December for a routine inspection.

Mitazono, a former TV journalist, was elected on campaign promises to take a “strong response regarding a reactor restart if the envisaged committee deems the plant unsafe.”

Concerns over the safety of the nuclear complex arose when roads and other infrastructure were damaged in a series of powerful quakes that began rattling neighboring Kumamoto Prefecture in April.

After gaining support from anti-nuclear groups, Mitazono won the race against the incumbent, who was seen as friendlier toward nuclear power generation.

But after he took office, Mitazono appeared to back off from his campaign promises.

He did request an “immediate halt” of plant operations to Michiaki Uriu, president of Kyushu Electric, in late August and early September.

After the company refused the governor’s requests, Mitazono decided not to pursue the issue, saying a governor does not have the legal authority to demand a halt to operations.

He tried to assuage public concerns about the safety of the plant, citing the extra special checks the utility promised to conduct.

Taira said Mitazono has rejected repeated requests for a meeting with him and other anti-nuclear activists. They have asked Mitazono to quickly establish the expert panel for possible action to counter Kyushu Electric’s reactor restart plans. But the governor did not reply.

Mitazono also did not submit a budget request for the expert panel in the September session.

When asked by reporters, Mitazono merely kept saying he would establish the panel “as soon as possible.”

“He is breaking the campaign promise if he allows the resumption of the plant without obtaining the conclusion of the panel,” Taira said.

According to one source, the governor told an informal gathering of members of the Liberal Democratic Party, the largest group in the assembly, that he shares the LDP’s direction in nuclear power policy.

No decommissioning costs for new power suppliers

November 29, 2016

New power suppliers won't have to pay Fukushima decommissioning costs

<http://mainichi.jp/english/articles/20161129/p2a/00m/0na/013000>

The Ministry of Economy, Trade and Industry has decided not to have new power industry entrants shoulder some of the costs of decommissioning the crippled Fukushima No. 1 Nuclear Power Plant, it has been learned.

The industry ministry had initially considered a plan to have new electricity suppliers pay decommissioning expenses in addition to "consignment charges" necessary for power transmission if they were to use TEPCO's power grid. But the ministry gave up on the idea due in part to a backlash from the public and experts. The ministry is to deal with the issue by accumulating funds raised through TEPCO's management efforts for decommissioning expenses.

TEPCO plans to raise 2 trillion yen for decommissioning, but it is highly likely that the utility will be several trillion yen short of the fees for scrapping the Fukushima plant because costs such as those for removing nuclear fuel (fuel debris) melted down in reactors are expected to surge in the future. With respect to the idea of tacking on consignment charges, many members of the industry ministry's expert panel on electric power market liberalization said it would be unfair to impose the burden on new power suppliers that had never used and would never use nuclear power.

The industry ministry's expert panel, tasked with discussing costs for decommissioning and compensation as well as TEPCO's rehabilitation, has concluded that **it would be "desirable" for TEPCO to raise the funds for decommissioning and other relevant purposes by reforming its management.**

Because of this, the industry ministry has abandoned a plan to add decommissioning expenses to consignment charges for new power suppliers. But the ministry plans to allow TEPCO not to reduce consignment charges even if it becomes able to do so due to improvements in its management efficiency. It will also have TEPCO contribute the balance and other funds to the Nuclear Damage Compensation and Decommissioning Facilitation Corp.

TEPCO and major utilities currently shoulder compensation payments, but new power suppliers are also paying some of the costs. Proceeds from sales of TEPCO shares will be set aside for decontamination projects, and shortfalls will be shouldered by TEPCO and other entities. Funds stemming from a power resources development promotion tax will be used for interim storage facilities.

Fukushima disaster will cost TEPCO over 170 billion yen

December 1, 2016

Fukushima Daiichi to cost TEPCO \$170 billion

http://www3.nhk.or.jp/nhkworld/en/news/20161201_19/

Japan's government estimates the crippled Fukushima Daiichi nuclear plant will end up costing its operator more than 170 billion dollars. The figure includes the costs of decommissioning the facility, as well as compensation and decontamination work.

Tokyo Electric Power Company has said it will secure about 17 billion dollars to decommission the plant's reactors.

However, government officials now say the total cost will be more than 4 times higher. They estimate about 70 billion dollars will be required for the work, which includes removing melted nuclear fuel and dealing with radioactive wastewater.

The costs of decontamination work and constructing intermediate storage facilities for contaminated soil and waste materials are also likely to increase.

An additional 70 billion dollars will be needed to compensate farmers seeking damages.

The government will temporarily shoulder some of the compensation costs, and seek repayment from TEPCO at a later date. Other power companies are sharing some of the burden, which means higher electricity bills for consumers.

Japan's industry ministry is currently working on a plan to reform TEPCO's management and divert its profits to decommissioning work. But the ballooning costs are threatening this plan. The government aims to decide by the year-end how to share the financial burden, and how the work will be done.

New Monju : a "folly not acceptable by any means"

December 1, 2016

EDITORIAL: Plan to build Monju successor is outrageously irresponsible

<http://www.asahi.com/ajw/articles/AJ201612010046.html>

The government at a closed meeting on Nov. 30 revealed plans to develop a demonstration fast reactor as the successor to the Monju prototype fast-breeder reactor in Fukui Prefecture, which will be decommissioned.

A totally irrational policy decision is now being made behind closed doors only by people with vested interests in the trouble-plagued Monju program.

The government is making a head-long plunge into another costly reactor project that has no solid prospects of success. The government has not scrutinized nor learned lessons from the miserable failure of the Monju program.

This behavior is outrageously irresponsible.

More than 1 trillion yen (\$8.8 billion) has been poured into the development and operation of Monju, but the reactor operated for only around 220 days during the 20-plus years since it first achieved criticality in 1994.

The experimental reactor has been mostly idle because of **a series of accidents and troubles**, including a 1995 leak of liquid sodium used as the coolant, a material that is famously hard to handle.

In contrast, the Joyo test fast reactor, which represents the first stage of developing a practical fast-breeder reactor, has operated for a total of 3,000 days, more than 13 times longer than Monju's record. This again shows that technological challenges involved in the development of such sophisticated new technology become far more formidable as the project moves to the later stages.

Unlike Monju, the new experimental fast reactor envisioned by the government would not be a breeder reactor that generates more fissile material--plutonium to be exact--than it consumes. But it will be **based on the same fast reactor technology.**

Given that even operating a prototype fast-breeder reactor has proved such a fierce challenge, there are countless reasons to doubt the viability of the government's plan to develop a cheap and safe demonstration fast reactor.

The government says it will seek international cooperation for the project. But France's Advanced Sodium Technological Reactor for Industrial Demonstration (ASTRID) program, which the Japanese government is counting on for its fast reactor project, is itself facing an unclear future. The French government is expected to decide in 2019 on whether to build the fast demonstration reactor.

The Japanese government is not even bothering to set up a proper forum for discussions on the new project.

The Nov. 30 meeting was attended by the industry minister, the science and technology minister, representatives of the Federation of Electric Power Companies, which is the power industry lobby, executives of Mitsubishi Heavy Industries Ltd., which makes nuclear reactors, and officials of the Japan Atomic Energy Agency, the operator of Monju. They are all parties involved in the Monju program. The two officials of Japan Atomic Energy Agency who were present at the meeting are a former Mitsubishi Heavy Industries executive and a former science and technology official.

In other words, **the decision-making process concerning the project is totally controlled by the interests of the government and the nuclear power industry.**

Why is the government so fixated on developing fast reactor technology?

Monju has long been cast as the linchpin of a nuclear fuel recycling program in which plutonium extracted from reprocessed spent nuclear fuel is burned in a fast-breeder reactor.

Now that it has decided to decommission Monju, the government is apparently concerned that the lack of the troubled reactor's successor could cause the entire nuclear fuel recycling program to collapse, undermining its efforts to promote nuclear power generation.

Japan, however, already has a stockpile of 48 tons of plutonium, enough to make 6,000 ordinary nuclear bombs.

With no prospects of practical use of a fast reactor, Japan's fixation on establishing a nuclear fuel recycling system makes no economic sense and only raises suspicions in the international community.

The government has been roundly criticized for its obstinate adherence to nuclear power policy decisions made in the past.

But the disaster that occurred in 2011 at the Fukushima No. 1 nuclear power plant has led to broad public recognition of the importance of impartial debate on related issues not influenced by special interests or past developments.

Now, however, the government is ignoring the lessons learned from the nuclear disaster. It is seeking to make the decision in collusive meetings to spend a huge amount of taxpayer money on the highly questionable fast reactor project. This folly cannot be acceptable by any means.

--The Asahi Shimbun, Dec. 1

Ballooning costs

NHK video :

<http://www3.nhk.or.jp/nhkworld/nhknewsline/nuclearwatch/ballooningcosts/>

Japanese officials estimate that the cost of dealing with the aftermath of the Fukushima nuclear accident will nearly double to more than 170 billion dollars.

The officials add that the cost of decommissioning the Fukushima Daiichi nuclear plant is likely to quadruple, to about 70 billion dollars. And 70 billion dollars will be needed for compensation because farmers will be seeking damages.

The cost of decontamination work is also likely to increase from a previous estimate of 35 billion dollars. The government will temporarily shoulder some of the compensation costs, and later seek repayment from Tokyo Electric Power Company. Other utilities are similarly shouldering part of the burden, meaning higher electricity bills for users.

The officials are also working on a reform plan for TEPCO in the hope of diverting its profits to pay for the decommissioning, but the ballooning costs threaten to jeopardize this plan.

The government hopes to decide how the financial burden will be shared by the end of the year.

Evacuees : End of free housing soon?

December 3, 2016

Fukushima's voluntary evacuees

<http://www.japantimes.co.jp/opinion/2016/12/03/editorials/fukushimas-voluntary-evacuees/#.WEQ6W32Dmos>

A citizens' group supporting the people in Fukushima Prefecture who have fled from their homes in the wake of the March 2011 nuclear disaster has submitted a petition to the Diet with nearly 200,000 signatures asking for the continuation of public housing assistance for the evacuees. The prefectural government announced last year that it plans at the end of next March to terminate the assistance for people who voluntarily left their homes. However, most such evacuees have yet to find new residences. Halting the housing assistance will place a heavy financial burden on low-income evacuees. Fears also persist over the radioactive contamination in the areas where they lived before the nuclear crisis. Not only the prefecture but the national government, which pays for a large portion of the assistance, should rethink the decision.

As of July, some 89,000 Fukushima people continued to live away from their homes — 48,000 inside the prefecture and 41,000 elsewhere in Japan — after they fled from the dangers posed by the triple meltdowns at Tokyo Electric Power's Fukushima No. 1 power plant. Some evacuees followed the government's designation of their hometowns as no-go zones due to the high levels of fallout, while others left their homes on their own out of fear of radiation exposure, particularly for their children, and other reasons even though they lived outside the designated evacuation zones.

The Fukushima Prefectural Government has since been providing housing assistance to the nuclear refugees regardless of whether they stayed within the prefecture — and regardless of whether they were forced out by government order or fled by choice — to cover their rent, including for public housing units owned by local governments. Fukushima has offered the aid by annually renewing the application of the Disaster Relief Law, under which a prefectural government carries out relief measures to residents in the

event of a disaster — including supply of food, water, clothing and medical services as well as emergency repairs to damaged homes — with a large portion of the cost coming from national coffers. The national government has shouldered most of the expense of the housing assistance regarding Fukushima. The prefectural government announced in June last year that it would end the assistance for voluntary evacuees at the end of next March. Gov. Masao Uchibori said the termination is aimed at prompting the evacuees to return to their original homes and at helping promote their sense of self-reliance. He explained that living conditions in the prefecture have improved with the development of public infrastructure and progress in the cleanup of radiation-contaminated soil.

According to a prefectural report based on a survey conducted in January and February, the decision will halt housing assistance for 12,436 households. Of the 3,614 households that voluntarily evacuated but remained in the prefecture, 56 percent have not yet found a place where they can live once the assistance is halted. The corresponding figure for the 3,453 such households living outside the prefecture is much higher — nearly 78 percent. The prefecture should pay serious attention to these findings. Some families may not be able to find and pay for a new home, although the prefecture reportedly plans to offer small subsidies for low-income and single-mother households after the large-scale assistance is ended.

The voluntary evacuees are confronted with various difficulties, both financial and psychological. The amount of compensation they received from Tepco is much smaller than that paid out to evacuees from the no-go zones. They also do not receive the monthly damages of some ¥100,000 that Tepco doles out to cover the mental suffering of those from the designated evacuation zones. Many of them face hardships ranging from the loss of their former jobs to separation from family members, long-distance commuting and divorces of couples due to differences over evacuating. The loss of housing assistance will likely result in even more hardships, both financial and emotional.

Many of the voluntary evacuees remain reluctant to go back to their hometowns for a variety of reasons, including the persistent fear of radiation, the desolate conditions of their original homes, and anticipated low levels of medical and other services in their former communities. The national government says it is safe for evacuees to return if the annual cumulative dose in the area is 20 millisieverts (mSv) or less, but that level is much higher than the legal limit of 1 mSv allowed for people in ordinary circumstances. In Ukraine, hit by the 1986 Chernobyl catastrophe, people are required to migrate if the annual cumulative dose in their area is 5 mSv or more and have “the right to evacuate” if the rate is between 1 mSv and 5 mSv. The national government and Fukushima Prefecture need to address why many of the volunteer evacuees are reluctant to return.

The national government may want to highlight the reconstruction in areas devastated by the March 2011 Great East Japan Earthquake and tsunami as well as the Fukushima nuclear disaster when Tokyo hosts the 2020 Summer Olympic Games. However, this should not result in the premature termination of vital relief measures for the affected people or untimely lifting of the designation of danger zones hit by the nuclear crisis. The government, which has sought to reactivate the nation’s nuclear power plants idled since the 2011 disaster, should understand why the evacuees felt they had to flee from their homes in the first place. It should not give up its duty of adequately helping the disaster victims.

December 3, 2016

Fukushima's voluntary evacuees

<http://www.japantimes.co.jp/opinion/2016/12/03/editorials/fukushimas-voluntary-evacuees/#.WELz2n2Dmos>

A citizens' group supporting the people in Fukushima Prefecture who have fled from their homes in the wake of the March 2011 nuclear disaster has submitted a petition to the Diet with nearly 200,000 signatures asking for the continuation of public housing assistance for the evacuees. The prefectural government announced last year that it plans at the end of next March to terminate the assistance for people who voluntarily left their homes. However, most such evacuees have yet to find new residences. Halting the housing assistance will place a heavy financial burden on low-income evacuees. Fears also persist over the radioactive contamination in the areas where they lived before the nuclear crisis. Not only the prefecture but the national government, which pays for a large portion of the assistance, should rethink the decision.

As of July, some 89,000 Fukushima people continued to live away from their homes — 48,000 inside the prefecture and 41,000 elsewhere in Japan — after they fled from the dangers posed by the triple meltdowns at Tokyo Electric Power's Fukushima No. 1 power plant. Some evacuees followed the government's designation of their hometowns as no-go zones due to the high levels of fallout, while others left their homes on their own out of fear of radiation exposure, particularly for their children, and other reasons even though they lived outside the designated evacuation zones.

The Fukushima Prefectural Government has since been providing housing assistance to the nuclear refugees regardless of whether they stayed within the prefecture — and regardless of whether they were forced out by government order or fled by choice — to cover their rent, including for public housing units owned by local governments. Fukushima has offered the aid by annually renewing the application of the Disaster Relief Law, under which a prefectural government carries out relief measures to residents in the event of a disaster — including supply of food, water, clothing and medical services as well as emergency repairs to damaged homes — with a large portion of the cost coming from national coffers. The national government has shouldered most of the expense of the housing assistance regarding Fukushima. The prefectural government announced in June last year that it would end the assistance for voluntary evacuees at the end of next March. Gov. Masao Uchibori said the termination is aimed at prompting the evacuees to return to their original homes and at helping promote their sense of self-reliance. It should not give up its duty of adequately helping the disaster victims.

December 1, 2016

12,000 evacuee households from Fukushima fret over benefit loss

<http://www.asahi.com/ajw/articles/AJ201612010006.html>

THE ASAHI SHIMBUN

Anxiety is spreading among many of the 12,000 or so households evacuated after the Fukushima nuclear disaster five years ago as their free housing benefits will end next March.

In late October, about 180 people, who have been receiving free housing after leaving their homes in Fukushima Prefecture, delivered a **200,000-signature petition** to politicians in Tokyo asking for the accommodation allowance to be extended.

At the Upper House Members’ Office Building, they voiced their concerns, one after another.

“We are being told to get out of our house,” one of them said. “We are in a real fix.”

The central government and Fukushima prefectural authorities have been providing prefabricated temporary housing units or paying the rent of those who have evacuated either within or to outside the prefecture, even if they did not come from designated evacuation zones.

The measures were introduced because many residents living outside evacuation zones left their homes out of anxiety over the spread of radioactive fallout.

A total of 231.6 billion yen (\$2.9 billion) had been spent by March 2016 on 44,000 households, including the cost of building prefab temporary housing units.

But the Fukushima prefectural government decided in June 2015 to discontinue the assistance for evacuees from areas outside evacuation zones.

“With cleanup efforts moving ahead, the living environments are getting better,” Fukushima Governor Masao Uchibori said at the time.

The decision will affect the so-called voluntary evacuees, who lived in areas that were never designated evacuation zones, and evacuees from areas where evacuation orders were lifted in 2014.

Briefing sessions have been held by the prefectural government since December 2015 at about 40 locations within and outside the prefecture to explain details of rent subsidy measures for low-income households, which will replace the free housing benefits.

In late September, prefectural government officials faced a barrage of questions from about 70 residents of Kawauchi, Fukushima Prefecture, who packed a meeting hall in a temporary housing complex in Koriyama, also in the prefecture.

The village of Kawauchi had 2,739 residents as of Oct. 1 and at least 889 of them were living for free in rented housing, prefab temporary housing units and elsewhere outside the village.

Fumio Sakuma, 67, is one of them. His wife, who has a kidney disease, takes a 40-minute drive to hospital three times a week to undergo dialysis. Sakuma said he is anxious about having to relocate with his sick wife.

“We would feel grateful if we were allowed to stay here for one or two more years,” he said at the meeting. Municipalities in disaster areas in Fukushima Prefecture, in the meantime, are hoping that the end of the free housing benefits will see a return of residents.

“Assistance measures by the central and prefectural governments cannot continue forever,” said Yuko Endo, mayor of Kawauchi. “We might as well take a step forward to rebuild our livelihoods.”

The town of Naraha, also in Fukushima Prefecture, has seen less than 10 percent of its residents return.

“More than five and a half years have passed since the onset of the nuclear disaster,” said Naraha Mayor Yukiei Matsumoto. “It’s time for every one of us to think about standing on our own two feet.”

Taiwan not ready to "compromise" on food safety

November 30, 2016

Taiwan-Japan trade talks conclude with signing of two memorandums

<http://focustaiwan.tw/news/aeco/201611300017.aspx>

Taipei, Nov. 30 (CNA) Annual trade and economic talks between Taiwan and Japan concluded in Taipei Wednesday, with the two sides signing two cooperation memorandums on product safety and language education.

Chiou I-jen (邱義仁), head of the Taiwan delegation and president of the Association of East Asian Relations (AEAR), and his Japanese counterpart, Japan Interchange Association Chairman Mitsuo Ohashi, signed the notes stipulating that the two countries will work together in the promotion of exchanges in

the two areas.

Chiou and Ohashi left the venue without speaking to the press after the signing ceremony, but they agreed to be photographed.

Outside the venue, several dozen activists staged a protest against radiation-contaminated food products. The protest came after Ohashi urged Taiwan at the opening of the annual talks a day earlier to lift a ban on food products from five radiation-affected Japanese prefectures.

Asked if Japan had asked Taiwan to ease the ban during the two-day trade and economic meeting, AEAR Deputy Secretary-General Tsai Wei-kan (蔡偉淦) confirmed in a press conference held after the event that the Japanese side brought up the request, as had been expected.

However, the Taiwanese delegates expressed hope for understanding that there are still disputes over the issue, and that they would not discuss the issue during the annual talks, since it was not on the agenda, Tsai said.

Taiwan has banned imports of food products from five prefectures in Japan -- Fukushima, Gunma, Chiba, Ibaraki and Tochigi -- that were contaminated with radiation following the meltdown of the Fukushima Daiichi Nuclear Power Plant in March 2011, a catastrophe triggered by a massive earthquake and tsunami.

After Taiwan's new government, inaugurated in May, revealed recently that it was considering lifting the ban on food from all of those prefectures except Fukushima, the idea has received strong opposition.

Economics Minister Lee Chih-kung (李世光) confirmed Wednesday that the controversial issue of Japanese food imports was not on the agenda of the 41st Taiwan-Japan Trade and Economic Meeting.

"It has been the Ministry of Economic Affairs' consistent stance that no compromise can be made in the people's welfare in the area of food safety," Lee told the press.

He also agreed that all food regulations should meet international regulations and scientific rules.

Meanwhile, elaborating upon what was discussed during the meeting, Tsai said that Taiwan, as usual, asked Japan to co-sign an economic partnership agreement (EPA).

Such a pact is not just one that touches on simply economic problems, Tsai said, but involves political considerations.

Nevertheless, the Japanese side said its stance in establishing a comprehensive trade and investment relationship with Taiwan has not changed, he went on.

As for a request by Taiwan for Japan to open its doors to five more kinds of Taiwan-grown fruit, Tsai said the Japanese side requires more data and relevant documents.

At Wednesday's press conference, Liu Ming-tang (劉明堂), head of the Bureau of Standards, Metrology

and Inspection, said the cooperation memorandum on product safety mainly focuses on electronic and electrical products, as well as machinery.

It will help reduce safety risks, allowing consumers to enjoy a higher level of safety protection, Liu said.

On the language education memorandum, the Taiwanese delegation said that under the pact, personnel exchanges will be conducted in the hope of upgrading the quality of language and culture education on both sides.

The Taiwan-Japan trade and economic meeting has been the only official platform for Taiwanese and Japanese officials to discuss issues of mutual concern since diplomatic relations between the two countries were severed in 1972. It has been held annually since 1976.

TEPCO's Interest-free loans ceiling to be increased

December 7, 2016

Loan ceiling for TEPCO to be raised

https://www3.nhk.or.jp/nhkworld/en/news/20161208_01/

Japan's government has decided to lift the ceiling for interest-free loans to the operator of the crippled Fukushima Daiichi nuclear power plant.

The government now estimates the facility will end up costing Tokyo Electric Power Company more than 194 billion dollars.

Decommissioning the plant is expected to cost 4 times the original estimate of 17 billion dollars. Compensation for farmers is expected to rise to 70 billion dollars from 47 billion dollars.

The cost of decontamination work and constructing intermediate storage facilities for contaminated soil and waste materials is also likely to increase to 53 billion dollars from 31 billion dollars.

Against this backdrop, the government plans to raise the upper limit of its loans to TEPCO from the current 79 billion dollars to 123 billion dollars.

The government plans to have TEPCO and other utilities pay back the loans. It says the utilities include newcomers to the market following deregulation of the retail power business this year.

Speculation is growing that the decision may result in higher electricity prices, which will increase the burden on consumers.

Japan to help Iran with nuclear safety

December 7, 2016

Japan to offer €2 million to Iran for nuclear safety cooperation

<http://www.japantimes.co.jp/news/2016/12/07/national/politics-diplomacy/japan-offer-e2-million-iran-nuclear-safety-cooperation/#.WEgf4H2Dmos>

Kyodo

Foreign Minister Fumio Kishida said Wednesday that Japan has decided **to offer Iran around €2.05 million (\$2.2 million) in the field of nuclear safety to help the Middle Eastern state steadily implement its historic nuclear deal with the West.**

“We agreed that bilateral relations are steadily making progress in a wide range of areas, including on cooperation for the steady implementation of the nuclear agreement,” Kishida told a joint news conference in Tokyo after his talks with Iranian counterpart Javad Zarif.

Zarif said at the outset of the meeting, which was open to the media, that he welcomes Japan’s “constructive contribution” that “strongly pushes the implementation” of the nuclear agreement.

The move comes amid uncertainty over the agreement’s future following the election of Donald Trump as U.S. president.

In his presidential campaign, Trump said that if elected, his “number one priority” as president would be to “dismantle the disastrous deal with Iran,” one promoted by President Barack Obama.

The nuclear deal Iran struck with six major powers in July last year limits Iran’s nuclear program in exchange for the lifting of most international sanctions. The deal has been endorsed by the U.N. Security Council.

Since the deal, Japan has been stepping up relations with the oil-rich country, lifting its sanctions on Iran in January and signing a bilateral investment pact the following month.

Tokyo is pushing Japanese companies to do business amid intensifying foreign competition for access to the Iranian market.

The ministers’ meeting came after Japanese Prime Minister Shinzo Abe expressed his readiness to visit Iran. Abe told of his willingness to travel to the country and boost economic ties during talks with Iranian President Hassan Rouhani on the sidelines of the U.N. General Assembly in New York in September, according to a Japanese official.

TEPCO to remain under state control

December 6, 2016

State ownership of TEPCO likely to continue as costs keep rising

<http://www.asahi.com/ajw/articles/AJ201612060043.html>

The government will likely prolong its effective state ownership of Tokyo Electric Power Co. Holdings Inc. because the expected costs for decommissioning its ruined Fukushima No. 1 nuclear plant and paying compensation continue to soar.

The industry ministry mentioned the rising expenses at a meeting on Dec. 5 with scholars and others.

The ministry at the meeting showed a six-item report titled, "Tokyo Electric Power Co. and the state's role." One pillar of the report was that the state should urge TEPCO to perform its responsibilities.

However, one of the participants said, "The state should hold a certain ratio of (TEPCO) shares for a long period."

The government-approved Nuclear Damage Compensation and Decommissioning Facilitation Corp. currently holds 50.1 percent of shares with voting rights of TEPCO.

The government planned to reduce the stake to less than 50 percent if it concluded at the end of this fiscal year that TEPCO could operate independently.

However, that scenario has collapsed.

Some sources now say total costs, including expenses for decommissioning and compensation, will probably exceed 20 trillion yen (about \$176 billion).

TEPCO initially said that it would need a total of 11 trillion yen to resolve problems related to the plant that suffered a triple meltdown after being hit by the Great East Japan Earthquake and tsunami in March 2011.

That amount includes 2 trillion yen to decommission the reactors, 5.4 trillion yen to pay compensation to people affected by the disaster and 2.5 trillion yen to decontaminate areas polluted with nuclear substances.

However, an internal report worked out by the industry ministry in August showed that the costs for decommissioning would probably increase by 4 trillion yen and the compensation sum would likely rise by 3 trillion yen, making the total amount 18 trillion yen.

December 5, 2016

Tokyo says Tepco may stay nationalized to deal with massive cost of nuclear disaster

<http://www.japantimes.co.jp/news/2016/12/05/national/tokyo-says-tepco-may-stay-nationalized-deal-massive-cost-nuclear-disaster/#.WEWjGn2Dmos>

Kyodo

Faced with massive ongoing costs stemming from the 2011 nuclear crisis in Fukushima, Tokyo Electric Power Co. Holdings Inc. may remain under state control longer than initially planned, the government said Monday.

Under the current plan, the utility would gradually reduce government involvement in its management from April.

However, at a key panel meeting the government proposed a revised option in light of the huge compensation and decommissioning expenses that are involved.

The government leads the business operations of the utility, known as Tepco, acquiring 50.1 percent of its voting rights through the state-backed Nuclear Damage Compensation and Decommissioning Facilitation Corp.

Some ministry bureaucrats have also been dispatched to the utility.

It is understood the state-backed body will assess efforts to reform the company in late March and make a decision on whether to reduce state involvement.

“The direction of Tepco reform is coming into sight,” said Economy, Trade and Industry Minister Hiroshige Seko at the panel meeting. “We have to come up with a more detailed picture of the reform.”

The government is seeking to split the activities of the utility into “business operations,” including retail sales and power generation, and “Fukushima operations” related to decommissioning reactors at the disaster-hit Fukushima No. 1 nuclear plant and paying compensation, which would remain under public control.

As for Tepco’s business operations, the government plans to free them of state control at an early date, hoping to promote industry reorganization involving nuclear and energy distribution businesses.

The plan was revealed at the panel meeting at the trade ministry to study compensation and decommissioning issues facing the utility. The panel will compile proposals by the end of this year.

The government also seeks cooperation from other power companies in reactivating Tepco’s Kashiwazaki-Kariwa nuclear power plant in Niigata Prefecture, which would be the main source of its revenue.

With the involvement of other utilities, the government hopes to ease local distrust of Tepco’s nuclear plant operations. Two reactors at the Kashiwazaki-Kariwa plant are under prolonged safety examinations by nuclear regulators.

Japanese companies to invest in Areva

December 8, 2016

Mitsubishi Heavy, Japan Nuclear Fuel to invest in France’s Areva

<http://www.japantimes.co.jp/news/2016/12/08/business/corporate-business/mitsubishi-heavy-japan-nuclear-fuel-invest-frances-areva/#.WEqhm32Dmos>

Kyodo

Mitsubishi Heavy Industries Ltd. and Japan Nuclear Fuel Ltd. are making final arrangements to invest tens of billions of yen in atomic energy company Areva, which is being bailed out by the French government, sources close to the matter said Thursday.

Through the investment, the heavy machinery manufacturer and the spent-fuel reprocessing firm hope to improve technical cooperation with Areva on decommissioning reactors and reprocessing nuclear fuel. Areva has been reeling from weak global demand since the 2011 Fukushima disaster triggered a slump in the nuclear power industry.

Areva is being bailed out by the French government, which has been asking Mitsubishi Heavy to invest since last year.

MHI President Shunichi Miyanaga had said that investing in Areva, which has expertise in decommissioning procedures and fuel reprocessing, would benefit Japan as it faces the prospect of decommissioning more aging nuclear reactors amid high public concern over nuclear safety. A major Chinese nuclear power company is also considering investing in the state-owned group. Mitsubishi Heavy is also planning to invest in Areva's plant-building arm in hopes of winning orders to build nuclear power plants in emerging economies where demand is growing. The heavy machinery maker and Areva are already involved in a joint venture to develop nuclear plants with advanced reactors.

Cleanup bill to double original estimate

December 9, 2016

Fukushima nuclear disaster bill to double to 21.5 trillion yen

<http://www.asahi.com/ajw/articles/AJ201612090075.html>

THE ASAHI SHIMBUN

Total costs to resolve the 2011 Fukushima nuclear disaster will reach 21.5 trillion yen (about \$188 billion), nearly double the previous estimate, which will be passed on to users in higher electricity bills. The industry ministry said on Dec. 9 that the final tab for the accident at the crippled Fukushima No. 1 nuclear power plant is estimated to balloon from the 11 trillion yen calculated in 2013.

To prevent the plant operator, Tokyo Electric Power Co., from going bankrupt under the skyrocketing costs for decommissioning, compensation and decontamination, the government said it will increase the maximum amount of its zero-interest loans to the utility from the current 9 trillion yen to 13.5 trillion yen. Much of the additional costs will be eventually covered by the public, as the government plans to raise electricity charges to that end.

Within the total, compensation paid to people affected by the nuclear accident will increase from 5.4 trillion yen to 7.9 trillion yen. Bills for decontaminating areas polluted with radioactive substances will rise from 2.5 trillion yen to 4 trillion yen.

The rise in compensation costs is mainly attributable to a new support measure adopted for people in the agricultural and forestry sectors who cannot restart their work due to restrictions on the shipments of their products.

The increase in decontamination costs was mainly led by the rise in prices of bags to hold contaminated materials and the larger-than-expected personnel costs of decontamination workers.

The compensation costs will be temporarily covered by the government. But TEPCO will eventually shoulder most of the burden, in principle, spending many years paying it off.

Other major utilities and newly established electric power companies will also contribute in the form of a rise in electric power cable usage fees.

The Ministry of Economy, Trade and Industry also unveiled plans to increase TEPCO's revenues to decrease the burden on the public.

The plan calls for TEPCO to increase its annual profits from the current 400 billion yen to 500 billion yen by cutting costs in the field of electricity transmission and distribution. It also expects an additional 100 billion yen through restarting the Kashiwazaki-Kariwa nuclear power plant in Niigata Prefecture.

Fukushima cleanup to cost 21.5 trillion yen, double original estimate

<http://mainichi.jp/english/articles/20161209/p2a/00m/0na/009000c>

The cost of dealing with the aftermath of the disaster at the Fukushima No. 1 Nuclear Power Plant will reach 21.5 trillion yen, roughly double the government's initial prediction of 11 trillion yen, preliminary calculations released on Dec. 8 by the Ministry of Economy, Trade and Industry have shown.

- **【Related】** Fukushima plant decommissioning, compensation costs to almost double: gov't est.
- **【Related】** Fukushima nuclear plant decommissioning cost to surge

The government plans to have new electricity suppliers and major utilities including the plant's operator, Tokyo Electric Power Co. (TEPCO), tack a portion of the additional costs onto power bills.

The ministry calculated that the cost of compensating people affected by the disaster would rise from 5.4 trillion yen to 7.9 trillion yen. The cost associated with decontamination and the construction of interim storage facilities for radioactive waste, meanwhile, was expected to rise from 3.6 trillion yen to 5.6 trillion yen. The ministry estimated that TEPCO would end up paying around 8 trillion yen to decommission the plant's reactors, up from an initial estimate of 2 trillion yen.

TEPCO and other major power companies are covering the cost of compensation payments but the ministry plans to make new power producers and suppliers also pay some compensation. A ministry representative explained, "Customers of power producers and suppliers that have newly entered the market used power from major utilities in the past, and benefitted from nuclear power plants."

Over a 40-year period beginning in 2020, new power producers and suppliers are set to add part of the additional costs of compensation payments to "wheeling charges" that they pay to use the lines of major power suppliers such as TEPCO, which will be passed onto power bills. However, new power producers and consumer groups say this runs counter to the aims of liberalization of the power market, which aims to stimulate the market with the entry of newcomers.

The ministry hopes to quieten resistance from market newcomers by having major utilities furnish them with relatively cheap power through the market, including nuclear and hydro power. Major utilities, however, are unhappy with this approach.

The cost of decommissioning the reactors at the Fukushima plant will be left in TEPCO's hands. A system will be created to have the Nuclear Damage Compensation and Decommissioning Facilitation Corp. collect profits that TEPCO acquires through streamlining of its management, which will be paid out under government supervision.

At this stage, however, the method of decommissioning the reactors at TEPCO's Fukushima No. 1 plant has yet to be established.

"It is difficult to accurately calculate at this stage how much it will cost to decommission the reactors," a ministry representative commented. There are accordingly fears that the decommissioning cost could rise in the future.

The government plans to extend the amount of compensation bonds loaned to TEPCO from the current 9 trillion yen to 14 trillion yen. It is possible that this could lead to an increased burden on the public in the future.

Panel says Fukushima power plant's cleanup fees are now almost double the 2013 estimate

<http://www.japantimes.co.jp/news/2016/12/09/national/panel-says-fukushima-power-plants-cleanup-fees-now-almost-double-2013-estimate/#.WEqgtH2Dmos>

Kyodo

The combined cleanup costs for the 2011 nuclear crisis at the Fukushima No. 1 plant have nearly doubled the figure estimated in 2013, reaching ¥21.5 trillion, a government panel said Friday.

The panel said it appears inevitable that Tokyo Electric Power Company Holdings Inc. will have to ask customers to shoulder part of the costs, including compensation for affected people, outlays for decommissioning, and cleanup of areas contaminated with radioactive substances released from the plant. To help the company secure money to cover ballooning expenses, the Ministry of Economy, Trade and Industry said it is planning to raise the maximum amount of government bond issuance for the utility to ¥13.5 trillion from the current ¥9 trillion.

The panel raised its estimate for decommissioning fees to ¥8 trillion from the previous ¥2 trillion, for compensation to ¥7.9 trillion from ¥5.4 trillion and for decontamination costs to ¥4 trillion from ¥2.5 trillion. It also increased fees related to temporary storage facilities for soil contaminated with radioactive substances and other waste to ¥1.6 trillion from ¥1.1 trillion.

Economy, Trade and Industry Minister Hiroshige Seko said at a news conference, "The costs could increase depending on the situation but could also drop in line with technological innovations in decommissioning work."

The panel suggested that operations related to the Fukushima plant effectively stay under state control before reviewing the status in 2019.

The panel meeting, which began in early October, has also agreed on the need to seek cooperation from other power companies in reactivating Tepco's Kashiwazaki-Kariwa nuclear plant in Niigata Prefecture, the world's largest nuclear plant by generation capacity, which will be a main source of its revenue.

And who is going to pay?

December 10, 2016

2.4 trillion yen in Fukushima crisis compensation costs to be tacked onto power bills

<http://mainichi.jp/english/articles/20161210/p2a/00m/0na/002000c>

The Economy, Trade and Industry Ministry plans to require power companies including new market entrants to tack approximately 2.4 trillion yen in compensation costs for those affected by the Fukushima nuclear crisis onto power bills.

- **【Related】** Fukushima cleanup to cost 21.5 trillion yen, double original estimate

The plan would result in an 18-yen average increase in monthly household electricity bills, ministry officials said. This policy is part of a draft proposal that the ministry unveiled at a Dec. 9 expert panel meeting to discuss how to share the ongoing cost of the Fukushima No. 1 nuclear plant disaster that broke out in March 2011.

At the meeting, the ministry also revealed that the estimated cost of dealing with the disaster has hit 21.5 trillion yen -- nearly double the initial projection of 11 trillion yen.

Total compensation for people affected by the disaster is estimated to rise from 5.4 trillion yen to 7.9 trillion yen, and decontamination-associated costs are likely to grow from 2.5 trillion yen to 4 trillion yen. The bill for building interim storage facilities for radioactive materials is expected to rise from 1.1 trillion yen to 1.6 trillion yen, while that of decommissioning reactors at the crippled plant will likely surge from 2 trillion yen to 8 trillion yen.

The draft proposal points out that nuclear power plant operators' financial reserves to deal with potential nuclear accidents are 2.4 trillion yen short -- almost equal to the projected increase in Fukushima disaster compensation costs.

The draft proposal urges not only major utilities including Tokyo Electric Power Co. (TEPCO), operator of the Fukushima power station, but also new market entrants to shoulder the cost. Over a 40-year period from 2020, new companies would be required to add part of their share of compensation payments to "wheeling charges" that they pay to use the transmission lines of major utilities. **All these costs would be passed onto the consumer.**

An increase in the cost of decontamination would be covered by proceeds from the sale of TEPCO shares held by the government, and an increase in interim storage facility costs would be financed with additional taxpayers' money, while that in decommissioning costs would be shouldered by TEPCO.

The draft proposal would also require new power companies to foot part of the cost of decommissioning nuclear plants if major utilities decide to scrap the power stations earlier than initially planned.

Compensation costs

December 13, 2016

Nuke crisis compensation costs tacked onto power bills to face 4 tril. yen cap

<http://mainichi.jp/english/articles/20161213/p2a/00m/0na/012000c>

The Economy, Trade and Industry Ministry is set to limit the amount of additional costs of compensating those affected by the Fukushima nuclear crisis, tacked onto "wheeling charges" that power companies pay to use power lines, to 2.4 trillion yen, sources close to the ministry said.

- **【Related】** 2.4 trillion yen in Fukushima crisis compensation costs to be tacked onto power bills
- **【Related】** Fukushima cleanup to cost 21.5 trillion yen, double original estimate

The amount would eventually be added to power charges that consumers pay. Moreover, the ministry admitted that the total amount to deal with the aftermath of the nuclear disaster, which it estimates at 21.5 trillion yen, will certainly increase further.

The ministry made the disclosure at a meeting of the ruling Liberal Democratic Party (LDP) panel on the issue on Dec. 12 in response to concerns expressed by LDP legislators that the cost of dealing with the crisis could rise.

The estimated total amount of compensation for the Fukushima crisis, which had been estimated at approximately 5.4 trillion yen in 2013, has grown to about 7.9 trillion yen.

Following the outbreak of the nuclear crisis, a system has been established under which Tokyo Electric Power Co. (TEPCO), operator of the crippled Fukushima No. 1 Nuclear Power Plant, and other major power companies contribute funds for compensation payments in proportion to the outputs of their nuclear plants.

In order to secure funds to cover an increase in the total compensation cost from 5.4 trillion yen, the ministry has proposed to a panel of experts on decommissioning of the Fukushima plant and compensation payments that the additional cost be added to wheeling charges. Not only major power companies but new market entrants would be required to foot the bill, which would eventually be added to power charges paid by consumers.

The ministry explains that it aims to require market newcomers to foot part of the compensation cost in order to "prevent consumers who have benefited from nuclear power by major power companies from switching to new power companies to avoid footing the compensation cost."

However, some experts have pointed out that such a move would run counter to the liberalization of the power market designed to spur new market entries.

Moreover, since the industry ministry is authorized to set the amount of wheeling charges at its own discretion without going through Diet deliberations, some members of the experts' panel and the LDP have voiced concerns that the amount of compensation costs passed onto consumers could unlimitedly snowball.

In response to such concerns, the ministry is considering obligating power companies to clearly show the amount of compensation cost each consumer is required to shoulder in detailed statements on power charges. Moreover, if the amount of compensation were to increase further, the ministry would consider other measures to cover the additional cost, which could also increase the burden on consumers.

The industry ministry has also disclosed that the estimated cost of dealing with the accident, which it released on Dec. 9, does not include the expense of creating hubs for reconstructing affected areas where residents are unlikely to be able to return in the foreseeable future and that of disposing waste to be generated when fuel debris is removed from the crippled reactors.

Therefore, the estimated total cost of dealing with the aftermath of the disaster, which has almost doubled from 11 trillion yen as of 2013 to 21.5 trillion yen, will certainly increase further.

Add disaster costs to consumers' bills

December 17, 2016

Panel wants new power suppliers to add charges to bills to cover Fukushima costs

<http://mainichi.jp/english/articles/20161217/p2a/00m/0na/006000c>

An expert committee of the Ministry of Economy, Trade and Industry put together a recommendation on Dec. 16 for energy policy revisions that would have new, small-scale power suppliers also help cover compensation for the Fukushima nuclear disaster and reactor decommissioning costs by adding charges to consumer power bills.

- **【Related】** 2.4 trillion yen in Fukushima crisis compensation costs to be tacked onto power bills
- **【Related】** Gov't to seek disaster compensation funds from consumers who used nuclear energy
- **【Related】** New power firms likely to share decommissioning costs for aging nuke reactors

The estimated total cost of handling the Fukushima disaster has nearly doubled from 11 trillion yen to 21.5 trillion yen, with further increases possible. Since the disaster, Tokyo Electric Power Co. (TEPCO), the operator of the disaster-stricken Fukushima No. 1 Nuclear Power Plant, has been paying around 70 billion yen a year in disaster-related costs from its own money. TEPCO and other major power providers have also been paying around an additional 163 billion yen a year by charging higher power bills.

The plan would raise consumers' share of the burden yet further. Under a scenario recommended by the committee, up to 60 billion yen a year for 40 years starting from fiscal 2020, or up to a total of 2.4 trillion yen, would be paid through charges to the power transmission costs of both traditional power producers and new producers.

Regarding this 2.4 trillion yen, the ministry argues, "**The money should have been prepared prior to the accident at the Fukushima plant,**" but says that, since that didn't happen, "**It is appropriate for all past users of cheap power (including those who switched to non-nuclear sources after the disaster) to equally share the burden (of post-disaster costs.)**" Under ministry calculations, the proposal would lead to an additional payment of 18 yen per month for 40 years for an average household.

Additionally, the plan, which would also start in fiscal 2020, would have new power producers help finance the plans of major power producers to decommission aging nuclear reactors through higher power transmission costs.

In exchange for new power producers paying part of the compensation costs, major utilities would supply more power from cheap sources to the market, such as nuclear power and coal, which can be used by smaller providers.

Yoh Yasuda, specially-appointed professor at Kyoto University, is critical of this, saying, "**This will lead to the protection of traditional power sources like coal and nuclear, and serve as a barrier to new technologies like renewable energy entering the market.**"

The economy ministry argues that even with the extra costs for the Fukushima disaster added on, nuclear power is still cheaper than thermal power. At the meeting on Dec. 16, committee member Toshihiro Matsumura, a professor at the University of Tokyo, criticized the move, saying, "If the ministry claims that nuclear power is still cheap even after including the massive compensation costs, nuclear power producers and the ministry should realize that there will be people who say those utilities should cover the costs themselves instead of pushing the burden onto others." However, **most of the committee members generally agreed on the plan.** After soliciting opinions from the public, the proposal will be officially decided upon.

The plan would go into effect with just a ministry order, not requiring a law amendment through the Diet, and there is criticism that the plan is being made without enough input from the public.

The non-partisan Diet group working for zero nuclear power plants, jointly headed by Taro Kono of the ruling Liberal Democratic Party and Shoichi Kondo of the main opposition Democratic Party, has released a statement saying, "The idea of adopting a proposal after no public discussion, with no participation from the Diet at all in its creation, is unspeakable, as **it will twist the basis of power system reforms and increase the burden on the people.**"

Japan's govt. involved in pushing nuclear power in UK

December 18, 2016

Japan to financially support UK nuclear projects

https://www3.nhk.or.jp/nhkworld/en/news/20161218_12/

The Japanese government will provide financial support for major electronics firms that are involved in the construction of nuclear power plants in Britain.

Increasing exports of infrastructure such as high-speed railway systems is one of the pillars of Japan's growth strategy.

However, Chinese companies have won the bidding for such projects by working closely with the Chinese government.

Japan's government plans to provide funding to help Hitachi and Toshiba to build 5 nuclear power plants in the UK.

The government-affiliated Japan Bank for International Cooperation and the Development Bank of Japan will provide loans and invest in these projects.

The government-linked Nippon Export and Investment Insurance will be asked to provide credit guarantees to encourage Japanese financial institutions to co-finance the projects.

Industry minister Hiroshige Seko is planning to meet his British counterpart, Greg Clark, in Japan this week, to exchange opinions on cooperation between the 2 governments.

Britain's finance minister Philip Hammond told NHK on Thursday in Tokyo that his government welcomes the interest of Japanese businesses and will look carefully at the proposals that have been put forward.

30 billion yen of public funds to decontaminate "difficult to return" areas

December 20, 2016

Government to help fund Fukushima decontamination, easing Tepco's burden

<http://www.japantimes.co.jp/news/2016/12/20/national/government-help-fund-fukushima-decontamination-easing-tepcos-burden/#.WFkrdn2Dmic>

Kyodo

The Cabinet decided Tuesday that the central government will help pay to decontaminate areas worst hit by the 2011 Fukushima reactor meltdowns, marking a shift from earlier rules requiring Tepco to foot the bill.

Prime Minister Shinzo Abe's team endorsed a plan to set up a reconstruction hub in the most contaminated, off-limits areas in Fukushima Prefecture and secure about ¥30 billion for decontamination work in the fiscal 2017 budget.

The cost of the work could total around ¥300 billion in the next five years and grow further depending on how it progresses.

The plan is in line with proposals made in August by the ruling coalition, but no government panel review or Diet deliberations have been held on it, raising the prospect that it could be criticized as a bailout for Tokyo Electric Power Company Holdings Inc.

The government decided to add the decontamination work, including soil and tree removal, to infrastructure projects for making the affected land habitable again, but the special law on decontamination states that Tepco should shoulder the expenses.

The government will have to revise the special law on rebuilding Fukushima to accommodate the shift.

The move to help pay for the decontamination came after the expected price tag surged to ¥4 trillion from the previous estimate of ¥2.5 trillion, which did not include the cost of cleaning the areas with the highest levels of radiation.

If the government-funded cleaning area expands, the use of taxpayer money is likely to balloon to several trillion yen.

Meanwhile, in an effort to turn Tepco's business fortunes around, the government proposed that the battered utility work together with other companies in operating nuclear power plants and distributing power.

A panel of the Ministry of Economy, Trade and Industry urged the company to launch talks with other power companies next year and set up a joint venture in the early 2020s to eventually consolidate their businesses.

"Tepco reform will be the basis of reconstruction in Fukushima and could lead to a new, stronger utilities industry," said industry minister Hiroshige Seko.

"We will profoundly accept the proposal and drastically carry out reform," said Tepco President Naomi Hirose.

December 19, 2016

Public funds earmarked to decontaminate Fukushima's 'difficult-to-return' zone

<http://mainichi.jp/english/articles/20161219/p2a/00m/0na/015000c>

The government is set to inject some 30 billion yen in public funds into work to decontaminate so-called "difficult-to-return" areas whose annual radiation levels topped 50 millisieverts in 2012 due to the Fukushima No. 1 Nuclear Power Plant disaster, it has been learned.

- **【Related】** News Navigator: How far has decontamination progressed in Fukushima?
- **【Related】** Temporary radioactive soil storage sites hinder Fukushima farmers

While the government had maintained that it would demand plant operator Tokyo Electric Power Co. (TEPCO) cover the decontamination expenses based on the polluter-pays principle, the new plan effectively relieves TEPCO from the hefty financial burden by having taxpayers shoulder the costs. The new plan is part of the government's basic guidelines for "reconstruction bases" to be set up in each municipality within the difficult-to-return zone in Fukushima Prefecture from fiscal 2017, with the aim of prioritizing decontamination work and infrastructure restoration there. The government is seeking to lift evacuation orders for the difficult-to-return zone in five years.

However, the details of the reconstruction bases, such as their size and locations, have yet to be determined due to ongoing discussions between local municipalities and the Reconstruction Agency and other relevant bodies.

The government is set to obtain Cabinet approval for the basic guidelines on Dec. 20 before submitting a bill to revise the Act on Special Measures for the Reconstruction and Revitalization of Fukushima to the regular Diet session next year. The 30 billion yen in funds for the decontamination work will be set aside in the fiscal 2017 budget.

In the basic guidelines, the government states that decontamination work at the reconstruction bases is part of state projects to accelerate Fukushima's recovery and that the costs for the work will be covered by public funds **without demanding TEPCO to make compensation**. The statement is also apparently aimed at **demonstrating the government's active commitment to Fukushima's restoration**.

Under the previous guidelines for Fukushima's recovery approved by the Cabinet in December 2013, the government had stated that it would demand TEPCO cover the decontamination expenses of both completed and planned work. However, it hadn't been decided who would shoulder the decontamination costs for the difficult-to-return zone as there was no such plan at that point.

Masafumi Yokemoto, professor at Osaka City University who is versed in environmental policy, criticized the government's move, saying, **"If the government is to shoulder the cost that ought to be covered by TEPCO, the government must first accept its own responsibility for the nuclear disaster, change its policy and investigate the disaster before doing so. Otherwise, (spending taxpayers' money on decontamination work) can't be justified."**

TEPCO should try and improve profitability, says panel

December 20, 2016

Govt. panel: TEPCO should improve profitability

https://www3.nhk.or.jp/nhkworld/en/news/20161220_33/

A government panel of experts has compiled a report saying that the operator of the damaged Fukushima Daiichi nuclear power plant should endeavor to improve its profitability to fund the aftermath of the 2011 accident.

The report released on Tuesday says Tokyo Electric Power Company is liable for 16 trillion yen, or about 137 billion dollars, of the entire cost of decontamination, decommissioning the plant, and compensation payments. The total estimate stands at about 180 billion dollars.

However, the panel also notes that there are limits to the amount TEPCO can fund on its own.

The report strongly urges the utility to streamline or merge with other power companies so that the public doesn't have to bear a greater burden.

It says TEPCO could take such measures in the nuclear power business at another of the utility's plants in Niigata Prefecture, or in the business of distributing electricity to households.

The report also says the government should remain involved in the decommissioning and compensation payments.

The government plans to put a new system in place that would require most consumers to bear the compensation costs.

The report asks the government to secure transparency in the system and to mitigate the burden on the public.

Fast reactor future

December 20, 2016

Gap emerges between gov't, private sector over fast reactor project

<http://mainichi.jp/english/articles/20161220/p2a/00m/0na/017000c>

The Japan Atomic Energy Agency's Monju fast-breeder reactor is seen in Tsuruga, Fukui Prefecture, from a Mainichi Shimbun helicopter on Dec. 19, 2016. (Mainichi)

Prospects of putting fast reactors into use in Japan remain dim in spite of the government's approval of policy to continue their development with the private sector, as the power industry appears hesitant to contribute during the developmental stage.

- **【Related】** Time for gov't to come clean on Monju reactor muck-up
- **【Related】** Plan to decommission troubled Monju reactor meets local criticism

"We would like to build a system where the government, manufacturers, power companies and research institutions cooperate and share responsibilities in a unified manner, without building walls against each other," Economy, Trade and Industry Minister Hiroshige Seko told the government's Council on Fast Reactor Development at the outset of its Dec. 19 meeting. The committee also agreed to launch a strategic working group to draw up a road map for technology development.

The Ministry of Economy, Trade and Industry insists on continuing with the fast reactor project because officials believe that such reactors are essential in nuclear fuel cycle, in which plutonium is extracted from spent nuclear fuel to be reused. While plutonium can be used at regular nuclear plants, its main planned use is in fast reactors -- particularly fast-breeder reactors that can produce more plutonium than they spend to generate power. The development of fast-breeder reactors has therefore been characterized as a trump card to solve resource problems. If the Monju prototype fast-breeder reactor is decommissioned, however, the government's plan will lose momentum. The collapse of the nuclear fuel cycle will bring issues pertaining to nuclear power development in Japan to the fore. For example, Aomori Prefecture accepts spent nuclear fuel from nuclear power stations across Japan on condition that plutonium extracted from the spent fuel can be reused. Once the nuclear fuel cycle emerges as a failure, such spent fuel is no longer a "resource" but "waste." And if the prefectural government tries to send the waste back to nuclear plants, it could cause major chaos.

Amid such circumstances, the Japan Atomic Energy Agency (JAEA) -- the main administrator of the Monju reactor -- has been declared disqualified from operating the troubled reactor. As a result, pressure has risen for the fast reactor project to be fundamentally reviewed.

The economy ministry came up with a scenario to involve all the interested parties, including power companies and manufacturers, in the development of fast reactors. It seems, however, that the private sector is not as keen. While Satoru Katsuno, chairman of the Federation of Electric Power Companies of Japan (FEPC) and president of Chubu Electric Power Co., told participants at the council meeting that he was ready to actively be involved in the process of clarifying the goals of technology development, an executive from a major utility revealed that electric companies cannot afford to work on the fast reactor project amid growing competition in the power market following deregulation. The official said, "We would rather work on restarting nuclear plants."

Former Tokyo Electric Power Co. executive Takaaki Masumoto, who served as the vice chairman of the FEPC, pointed out that fast reactors are "necessary in the long run" but said, "The power industry had no intention of getting directly involved in the project until the government was able to put the technology into commercial use." For power companies, promotion of the nuclear fuel cycle hinges on the central government taking responsibility for research and development of the technology, and the private sector being able to operate fast reactors for commercial use. The government had initially tapped the private sector to find a replacement for JAEA as the main operator of the Monju reactor, but power companies refused to take on the role.

Meanwhile, nuclear reactor manufacturers are trying to determine the best relationship with the government. Mitsubishi Heavy Industries Ltd., which was named in 2007 by the government as the core company for the fast-breeder reactor project, reconstructed a development system by spinning off the departments in charge of the project into separate companies. The firm supports the national project and those smaller subsidiaries have continued to hire new employees, but the project is not expected to bring in any profits, as it is believed to take 50 years or longer for technology to become commercially viable.

Those who were involved in the research and development of the Monju reactor are now aged 55 or older, and make up less than 30 percent of the overall staff at Mitsubishi Heavy. As such a shortage of experienced engineers could hinder development of the project, some Mitsubishi Heavy workers are taking part in the ASTRID fast-breeder reactor project in France to gain know-how.

A Mitsubishi Heavy official says the company will secure personnel by making an effort to pass technology on to younger generations, hiring new engineers, and conducting in-house transfers, but if the momentum toward fast-breeder reactor development slows down, it could set the government's plans back.

Japan To Decommission Monju FBR, But Faces Opposition From Prefecture

<http://www.nucnet.org/all-the-news/2016/12/20/japan-to-decommission-monju-fbr-but-faces-opposition-from-prefecture>

Research & Development

20 Dec (NucNet): Japan has decided to decommission the Monju prototype fast-breeder reactor, but is facing opposition from authorities in Fukui prefecture where the reactor is located. The Japan Atomic Industrial Forum said Fukui governor Issei Nishikawa said he would not accept the decision and would demand that the government reconsider it. According to Jaif, the government has said that a new experimental research reactor would be built in the prefecture and that Monju will be used for research. Jaif said confirmation of the decision was expected at a Cabinet meeting today, 20 December 2016. Monju reached criticality for the first time in 1994, but it has mostly been offline since 1995. In November 2015 Japan's nuclear regulator, the NRA, said state-run Japan Atomic Energy Agency (JAEA) was not fit to operate Monju because it had repeatedly failed to correctly carry out inspections of the plant. According to Jaif, the NRA recommended at the time that the government find another operator to replace JAEA within six months. In December 1995, just months after Monju first started power transmission, it was shut down when 640 kg of liquid sodium leaked from a cooling system, causing a fire. There were no injuries and no radioactivity escaped plant buildings, but the incident was compounded by JAEA's attempts to cover up the scale of the damage. Monju was allowed to restart in May 2010 after JAEA carried out a review of the plant's design, and its safety procedures, which were shown to be inadequate. However, operation was again suspended in August 2010 after a fuel handling machine was dropped into the reactor during a refuelling outage. In May 2013 JAEA president Atsuyuki Suzuki resigned after the NRA prevented the restart of Monju due to inspection deficiencies. In November 2012 it was revealed that JAEA had failed to conduct regular inspections on almost 10,000 out of a total 39,000 pieces of equipment at Monju. Some of these included safety-critical equipment. Monju is a 246-MW sodium-cooled fast reactor at the Tsuruga nuclear power station in Fukui Prefecture, southwest Japan. It is designed to use mixed fuel rods of uranium and plutonium, and to produce more fuel than it consumes. Regarded as the core facility of the government's policy for nuclear fuel recycling, Monju is different from conventional nuclear power plants, which use water as coolants. Monju uses sodium as the coolant, meaning more sophisticated technology is required for its operation.

- Eight Years Needed To Restart Japan's Monju FBR, Says Minister (News in Brief No.237, 30 November 2016)

Scrapping Monju

December 21, 2016

Japan govt. decides to scrap Monju

https://www3.nhk.or.jp/nhkworld/en/news/20161221_24/

Japan's government has officially decided to scrap its prototype fast-breeder nuclear reactor Monju.

The decision was made at a meeting of relevant Cabinet ministers on Wednesday.

They said restarting the troubled reactor in Fukui Prefecture, central Japan, would require at least 8 years of preparation, and continued operation would cost more than 4.5 billion dollars.

They decided to dismantle the facility over some 30 years, citing growing costs.

The government is to oversee the decommissioning work.

It plans to create a system to enable Monju's builder, the Japan Atomic Energy Agency, to carry out the work while ensuring safety.

The government says it hopes to eventually make the area around the site one of the key research bases for developing fast reactors.

The ministers also confirmed that they will promote research and development at facilities in Japan and overseas, including a demonstration reactor to be designed with France and the experimental fast reactor Joyo in Japan.

Japan govt. to formally decide on Monju scrapping

https://www3.nhk.or.jp/nhkworld/en/news/20161221_18/

Japan's government will make a formal decision to scrap its prototype fast-breeder nuclear reactor Monju, at a meeting of relevant cabinet ministers on Wednesday.

Science Minister Hirokazu Matsuno said the government hopes to have a detailed plan by next April for decommissioning the troubled reactor in Fukui Prefecture. He said they will do their utmost to gain local support for the plan.

Matsuno and Industry Minister Hiroshige Seko presented the plan to Fukui Governor Issei Nishikawa on Wednesday, prior to the government's final decision.

Nishikawa had urged the government to review its decommissioning plan. He said discussions on the country's fuel recycling system and the body that will manage scrapping of the Monju were insufficient.

The government stressed at the meeting that the lessons learned from Monju would be applied to development of a fast reactor.

They said the current operator of the Monju will do the decommissioning under a new framework supervised by the government to ensure steady progress and safety.

They also said they will continue to consult with Fukui Prefectural officials on the process.

Governor Nishikawa refrained from endorsing the plan. He said the government was not convincing and that implementation will not go smoothly without local support.

Fukushima clean-up and rigged bids

December 21, 2016

Fukushima's ¥8 trillion cleanup leaves foreign firms in the cold

<http://www.japantimes.co.jp/news/2016/12/21/business/fukushimas-%c2%a58-trillion-cleanup-leaves-foreign-firms-cold/#.WFp1X32Dmif>

by Stephen Stapczynski

Bloomberg

Cleaning up the Fukushima nuclear plant — a task predicted to cost 86 times the amount earmarked for decommissioning Japan's first commercial reactor — is the mother of all salvage jobs. Still, foreign firms with decades of experience are seeing little of the spoils.

Safely dismantling the Japanese power plant, wrecked by the 2011 earthquake and tsunami, will cost about ¥8 trillion (\$70 billion), the Ministry of Economy, Trade and Industry said Dec. 9, quadrupling the previous estimate. While a contract to help clean up the facility would be a windfall for any firm with specialized technology, the lion's share of the work has gone to local companies that designed and built most of Japan's atomic infrastructure.

The bidding process for Fukushima contracts should be more open to foreigners as Japan has never finished decommissioning a commercial nuclear plant, let alone one that experienced a triple meltdown, according to Lake Barrett, an independent adviser at Japan's International Research Institute for Nuclear Decommissioning. While the Fukushima cleanup is unlike any nuclear accident in history, foreign firms that have experience decommissioning regular facilities could provide much-needed support, according to Barrett, and even the plant's operator, Tokyo Electric Power Co. Holdings Inc.

'Cultural Resistance'

"Internationally, there is a lot more decontamination and decommissioning knowledge than you have in Japan," Barrett, a former official at the U.S. Nuclear Regulatory Commission, said in an interview in Tokyo. "I hope the Japanese contracting system improves to get this job done safely. There is this cultural resistance — it is almost like there is an isolated nuclear village still."

An **opaque bidding process** plays to the heart of criticisms put forward by independent investigators, who said in a 2012 report that collusion between the government, regulators and the plant's operator contributed to the scale of the disaster.

Of 44 subsidized projects publicly awarded by the trade and economy ministry since 2014, about 80 percent went to the International Research Institute for Nuclear Decommissioning. The group, known as **IRID, was established in the wake of the Fukushima disaster and is comprised entirely of Japanese corporations**, according to the ministry's website.

Japan's trade and industry ministry awarded funds directly to only two foreign firms during the same period. Many of the contracts had only one or two bidders.

Of about 70 contracts awarded since the March 2011 disaster, nine have gone to foreign companies, according to an official in the ministry's Agency of Natural Resources and Energy who asked not be named citing internal policy.

To provide opportunities for foreign companies, the ministry has created an English website for bids and also provides English information sessions to explain the contracts, the official said.

Toshiba, Hitachi

IRID's contracts are given to its members, including Toshiba Corp., Hitachi Ltd. and Mitsubishi Heavy Industries Ltd., which have partnerships and joint ventures with foreign firms, spokesman Yoshio Haruyama said by phone. While it doesn't directly contract work to companies overseas, IRID taps foreign experts as advisers and participates in international collaborative projects, he said.

Mitsubishi Heavy has about five or six contracts through IRID, but can't share how many partnerships it has with foreign firms, spokesman Shimon Ikeya said by phone. Hitachi has sub-contracts with foreign suppliers related to the Fukushima cleanup, but can't provide details about these agreements because they aren't public, a spokesperson said by e-mail.

As of March, IRID had about ¥30 billion worth of ongoing contracts primarily related to research and development of fuel removal and waste treatment. IRID, which aims to "gather knowledge and ideas from around the world" for the purpose of nuclear decommissioning, doesn't disclose how much of their money ultimately goes to foreign businesses, according to its spokesman. Barrett, its adviser, said he thinks it's "very low," but should ideally be 5 percent to 10 percent.

'Nuclear Village'

Japan's biggest nuclear disaster isn't void of foreign technology. Toshiba, which owns Pennsylvania-based Westinghouse Electric Co., and Hitachi, which has a joint venture with General Electric Co., are tapping American expertise. A giant crane and pulley system supplied by Toshiba to remove spent fuel from the wrecked reactors employs technology developed by Westinghouse.

"We bring in knowledge from foreign companies, organizations and specialists in order to safely decommission the reactors," Tatsuhiro Yamagishi, spokesman for Tepco, said by e-mail. While the company can't say the exact number of foreign firms involved in the Fukushima cleanup, companies including Paris-based Areva SA, California-based Kurion Inc. and Massachusetts-based Endeavor Robotics are engaged in work at the site, according to Yamagishi.

However, foreign firms independently securing contracts is still a tall order.

"When it comes to Japan's nuclear industry, the bidding system is completely unclear," Hiroaki Koide, a former assistant professor at Kyoto University Research Reactor Institute, said in an e-mail. "The system is designed to strengthen the profits of Japan's nuclear village," he added, referring to the alliance of pro-nuclear politicians, bureaucrats and power companies that promote reactors.

Tepco's annual cost to decommission its Fukushima plant may blow out to several hundred billion yen a year, up from the current estimate of ¥80 billion, the trade and industry ministry said in October. As of June, almost ¥1 trillion has been allocated for decommissioning and treating water at Fukushima, according to Tepco's Yamagishi.

'Ripe for Corruption'

With that much money at stake, Japan has become ground zero for a plethora of companies looking to benefit from the cleanup work. The structure of Japan's nuclear industry and the closed procurement preferred by the utilities that operate atomic plants means that the most lucrative opportunities for foreign companies are in the area of subcontracting, according to a report by the EU-Japan Centre for Industrial Cooperation released in March.

"Foreign firms have long argued that the Japanese bidding process is one that is ripe for corruption due to a lack of openness and transparency," Daniel Aldrich, professor and director of the security and resilience studies program at Northeastern University in Boston, said in an e-mail. For nuclear decommissioning "there is even less clarity and transparency due to security and proliferation concerns," he said.

Rigging Bids

The Japan Fair Trade Commission raided the offices of five companies last year in relation to rigged bids for maintenance contracts from Tepco, according to Jiji Press. Eleven road-paving companies were fined in September on projects to repair roads following the March 2011 earthquake and tsunami, Jiji reported. Andrew DeWit, a political economy professor at Rikkyo University in Tokyo, agrees that the contract-awarding process isn't transparent. A lot of foreign companies seek Japanese partners to better their chances, he said.

Purolite Corp., a closely held water purifying company, spent millions of dollars developing and testing a system that could be used to treat radioactive water at Fukushima. Pennsylvania-based Purolite partnered with Hitachi to help win a contract to use its technology at the wrecked facility.

Those plans didn't pan out. Purolite is suing Hitachi in New York and Tokyo, alleging that Hitachi is using its technology at Fukushima in breach of agreements made in 2011, shutting it out of more than \$1 billion in contracts, according to court documents filed in September.

Hitachi doesn't comment on ongoing legal matters, a spokesperson said by e-mail.

"With a smaller pool of competitors, firms can expand their profit margins," said Northeastern University's Aldrich. "There are French and Russian firms that have the technical expertise to participate in nuclear decommissioning processes, but it is unclear if they will be able to compete on a level playing field with Japanese firms, which have far more experience with Japanese regulations and expectations."

Nukes not an answer to global warming

Why nuclear energy is not an answer to global warming

Talk from Dr. Alex Rosen, Medact-Conference

On December 9th, Dr. Alex Rosen, Vice-President of IPPNW Germany, was invited to talk on the subject of nuclear energy and climate change at the MedAct Conference "Healthy Planet - Better World". The subject of his talk was "Why nuclear power is not an answer to global warming". In it, he argued that nuclear power was not a good investment and that the true and long-term costs and effects of nuclear power far outweigh its potential short-term benefits. He named the detrimental effects of uranium mining and nuclear waste on the environment and on public health and listed the most relevant studies on the effects of uranium mining and civil nuclear energy on childhood leukemia, lung cancer and other radiation-related diseases. He explained the underestimated risks of nuclear catastrophes and talked about the

nuclear legacy that we are leaving to future generations. He also cited studies showing that nuclear energy is in fact irrelevant when it comes to the reduction of greenhouse gas emissions or alleviating climate change. The inextricable links between nuclear power and nuclear weapons, brought to light in the common interests between the civil nuclear industry and the British Trident nuclear submarine program recently was also discussed, as were the attempts of the nuclear lobby to create fake citizen groups and NGO's in order to greenwash its business model. His presentation ended with an outlook to what could be described as a real energy revolution: modern energy conservation and efficiency methods, combined with 100% renewable energy generation, feeding flexible, distributed, community-based smart grid systems that would offer energy autonomy and independence of fossil and nuclear fuel imports. The main arguments of his talk can be found in the attached document.

"Why nuclear energy is not an answer to global warming" by Dr. Alex Rosen

Time to scrap nuclear fuel cycle (1)

December 22, 2016

Editorial: Time to scrap nuclear fuel cycle, not just Monju reactor

<http://mainichi.jp/english/articles/20161222/p2a/00m/0na/009000c>

The government formally decided on Dec. 21 to decommission Japan's Monju prototype fast-breeder nuclear reactor, yet will continue to pursue the nuclear fuel cycle in which plutonium is extracted from spent fuel through reprocessing to be used again. This stance by the government takes the existence of fast reactors and the nuclear fuel cycle as a foregone conclusion.

Over 1 trillion yen in public funds has been injected into the Monju project, yet due to recurring trouble and scandals, the reactor has operated for just 250 days over 22 years. The Nuclear Regulation Authority went as far as to point out that Monju's operator, the Japan Atomic Energy Agency, was not capable of running the reactor and should be replaced.

It is only natural for the reactor to be scrapped, but there remains a problem in that the government has closed its eyes to various issues in reaching its decision. Why was it unable to act sooner to put an end to the waste of taxpayers' money and decommission the reactor? Disregarding any probe into such issues, the government went ahead and made its decision behind closed doors. This in no way to win public approval.

An even more fundamental problem is that while the government is set to decommission the Monju reactor, it has decided to proceed with the development of a demonstration fast reactor -- a step up from Monju.

Fast reactors form a cornerstone of the nuclear fuel cycle. The decommissioning of Monju should mean the cycle is broken, and if that is the case, then what needs to be reviewed above all is the fuel cycle policy itself.

The government, however, is still trying to promote fast reactor development, on the grounds that maintenance of the nuclear fuel cycle was included in the nation's basic energy policy that the Cabinet approved in 2014.

As a step in that direction, the government has proposed taking part in France's project to build the Astrid fast demonstration reactor, but the feasibility of this project remains unclear, and the government's move sticks out as a seemingly stop-gap measure.

The reason the government has stuck to maintaining the nuclear fuel cycle is that as soon as it takes down its fuel cycle banner, spent fuel that was previously a "resource" becomes mere "waste." As a result, the Aomori Prefectural Government would probably have to ask power companies to take back the "resources" that have been piling up at the nuclear fuel reprocessing facility in the prefecture. And once the storage pools for spent fuel at the nation's nuclear power plants are full, those plants' reactors will have to be taken offline.

Politicians should be sitting down and working out measures to solve this problem; maintenance of the nuclear fuel cycle should not be used as an expedient.

Some may see officials as wanting to maintain the reprocessing of spent nuclear fuel from the viewpoint of potential nuclear deterrence, but this position lacks persuasiveness.

Five years and nine months have now passed since the onset of the disaster at the Fukushima No. 1 Nuclear Power Plant, and as we prepare to usher in a new year, there are still people living in temporary dwellings and other places to which they evacuated. And the government is trying to widely push the swelling costs of the disaster cleanup, reactor decommissioning, and compensation payments onto the public.

Looking squarely at this reality, fast reactor development is not something the government should be placing priority on tackling. It should give up on the nuclear fuel cycle and put the money to use in measures to assist Fukushima's recovery.

Time for gov't to come clean on Monju reactor muck-up

<http://mainichi.jp/english/articles/20161219/p2a/00m/0na/017000c>

December 19, 2016 (Mainichi Japan)

On Dec. 19, the central government informed Fukui Prefecture that the Monju fast-breeder reactor would be decommissioned. In its 22-year history, Monju has cost Japanese taxpayers more than a trillion yen, and been in actual operation for a grand total of 250 days.

- **【Related】** Plan to decommission troubled Monju reactor meets local criticism

Nevertheless, on the same day the government broke the news about Monju's impending end to Fukui Gov. Issei Nishikawa, it also decided internally to continue attempts to develop fast-breeder reactor technology, and all without any examination or investigation into why Monju failed in the first place. Fast-breeder technology holds out the promise of "dream reactors" that produce more fuel than they use. However, its cost and complexity have proven too much for other would-be developers, and Britain, the United States and Germany all abandoned their own fast-breeder efforts in the 1990s. Monju reached

criticality in 1994 with high hopes that it would prove the technology's efficacy, and become the "Model T" of fast-breeder reactors.

However, the reactor suffered repeated mishaps including a 1995 sodium leak, and never surpassed 40 percent of its power output capacity. Even so, the government claims that "much technological knowledge was gained (from Monju) that can be put to use for the development of the next test reactor." That is, the government has not admitted that Monju was a failure.

Or to put it another way, no one is willing to take responsibility for the Monju money pit, and Japan's taxpayers have been stuck with the bill.

Meanwhile, the government's committee on fast-breeder development decided unanimously on Dec. 19 to pursue, in cooperation with France and using domestic facilities, the construction of a new experimental reactor. It must be pointed out, however, who sits on this august body. Joining officials from the Ministry of Education, Culture, Sports, Science and Technology and the Japan Atomic Energy Agency -- who run the Monju project -- are those from two nuclear fuel cycle boosters, the Ministry of Economy, Trade and Industry and the Federation of Electric Power Companies of Japan. Rounding out the membership is the chief of Mitsubishi Heavy Industries, which makes nuclear reactors.

The proceedings of these committee meetings -- which are, as a rule, "private" and therefore never revealed to the public -- have always been based on the presumption that the problem-plagued nuclear fuel cycle policy (reprocessing spent fuel into MOX mixed-oxide fuel) will continue.

Continuing the fuel cycle and the fast-breeder project is costing Japan enormous sums, and if in the end it fails, the Japanese people may very well end up paying for it. To prevent another Monju muck-up, the government should conduct a very public examination of exactly what went wrong.

Time to scrap nuclear fuel cycle (2)

December 22, 2016

Review the failure of Monju

<http://www.japantimes.co.jp/opinion/2016/12/22/editorials/review-failure-monju/#.WFvFMX2Dmid>

Just as the government finally makes a belated decision to decommission the trouble-plagued Monju prototype fast-breeder reactor, it is seeking to pursue a successor project in order to keep alive its bid for a nuclear fuel cycle in Japan. What it should be doing first is conducting a thorough examination of why the Monju project ended in failure and holding an open discussion on whether the nuclear fuel cycle — in which Monju's technology was supposed to serve as a core component — is still a practical and feasible option for this country.

The formal decision to decommission the nation's sole prototype fast-breeder reactor in Tsuruga, Fukui Prefecture, was long overdue. Billed as a dream nuclear reactor for resource-scarce Japan because it produces more plutonium than it consumes as fuel, Monju first reached criticality in 1994, but it has been mostly offline after it was hit by a sodium coolant leak and fire in December 2015. Its trouble-prone operator was judged by the Nuclear Regulation Authority as unqualified to run the facility, but the government has been unable to build a new viable regime to restart its operation.

Despite the injection of more than ¥1 trillion in taxpayer money, Monju was in operation for a mere 250 days over the past 22 years, and never reached 100 percent of its output capacity. It is estimated that

restarting the reactor under the updated safety regulations will take at least eight years — a process that, including acquisition of necessary data that will require an additional eight years, is calculated to cost at least ¥540 billion. The decision to decommission the reactor — which in itself would require at least ¥375 billion over 30 years — was inevitable.

The problem is that the government seems to be moving headlong to the next project for its stalled nuclear fuel cycle policy without carrying out a proper assessment of Monju's failure — either from scientific viewpoints or policy perspectives. The government plans to compile by 2018 a road map for the domestic development of a demonstration fast reactor, which also consumes plutonium as fuel.

The government has long pursued a nuclear fuel cycle policy — in which spent fuel from nuclear power plants are reprocessed to extract plutonium for reuse as fuel — due to its efficient use of uranium resources. Monju was a facility in the second stage of development (from experimental to prototype, demonstration and commercial) of fast-breeder reactor technology — which was to be the core component of the policy. Still, the government says it will not review its nuclear fuel cycle policy. It intends to promote the use of plutonium-uranium mixed-oxide (MOX) fuel at conventional nuclear power plants — although MOX fuel is much more costly and its use remains low because the restart of nuclear plants idled since the 2011 meltdowns at Tokyo Electric Power's Fukushima No. 1 plant has been proceeding at a snail's pace.

What's puzzling is the plan to pursue the development of a demonstration fast reactor, even after the failure of the Monju project. The government reportedly says that even without restarting Monju, the same level of technological knowledge and data for development of a demonstration reactor can be obtained through a joint project with France to develop an advanced sodium technological reactor for industrial demonstration (ASTRID) and by using the Joyo experimental fast-breeder reactor. Still, ASTRID remains in its design stage, and it is unclear how much of its cost Japan will be sharing. The government has yet to publicly explain how much the development of a demonstration fast reactor will cost and how it plans to pay for it.

A bigger problem is that the plan to move forward on a fast reactor development was formulated in a closed discussion among a small group of people with stakes in nuclear power. The plan was adopted at the Council on Fast Reactor Development, which was set up by the Ministry of Economy, Trade and Industry and includes as members the economy and trade minister, the education and science minister, the head of the Japan Atomic Energy Agency — which operates Monju — the chairman of the Federation of Electric Power Companies of Japan, and the president of Mitsubishi Heavy Industries, a major nuclear power plant maker. It is unacceptable that the future direction of the nation's policy on nuclear energy and the decision to launch a costly new project are being made by a closed circle of interested parties without public discussions that reflect on Monju's failure.

The government has yet to give a convincing explanation of why the pursuit of a nuclear fuel cycle is still relevant as it seeks to reduce the nation's dependency on nuclear power and expand energy supply from renewable sources after the 2011 Fukushima crisis, which made it difficult to proceed with nuclear power generation in the same manner as before. The decision to end the Monju project should serve as a chance for the nation to rethink the policy itself and hold an open discussion on our energy needs and nuclear power.

EDITORIAL: Government still refuses to face up to reality, failure of Monju project

<http://www.asahi.com/ajw/articles/AJ201612220041.html>

The government officially decided on Dec. 21 to decommission the troubled Monju prototype fast-breeder reactor and instead develop a new fast reactor to maintain Japan's nuclear fuel recycling program.

The decision can be likened to a theater director determined not to declare an end to production despite dropping the spendthrift leading actor whose scandals have prevented him from performing on stage.

Fearing possible repercussions from the termination of the production, the director keeps promising to stage the play "sometime in the future." The director refuses to say clearly when the play will be staged because there is no actor in sight who can substitute for the dismissed one.

But this policy decision cannot be simply laughed away as an absurd piece of political theatrics. An enormous amount of taxpayer money has already been poured into Monju, and the government is poised to spend a huge additional amount to deal with its demise.

There is no doubt the Monju project has been a costly failure. The government cannot be allowed to put the debacle behind it by simply scrapping the experimental reactor and having the science and technology minister offer to return part of his salary for several months.

Despite an injection of more than 1 trillion yen (\$8.5 billion) of public funds into the project, the reactor has been mostly out of operation for the 20-odd years since it first reached criticality in 1994.

Decommissioning the reactor will require an additional expenditure of nearly 400 billion yen, according to a government estimate.

An exhaustive postmortem for the project to identify the causes of its failure is in order.

The government should not waste any more money or make unreasonable efforts to keep its nuclear fuel recycling program alive.

The government has made the questionable claim that "a certain amount of useful knowledge" has been acquired through the Monju project that can be used to develop a new fast reactor. Instead, the government should confront the grim reality of this undertaking.

Four years ago, the science and technology ministry submitted a report on technological achievements in the Monju project to the Japan Atomic Energy Commission.

The report included estimated levels of achievements, weighted in terms of importance, in different areas.

The degree of achievement, expressed as a percentage, for equipment and system tests was, for instance, 16 percent. The figure for reactor core tests and irradiation issues was 31 percent, while that for operation and maintenance was nil. The overall achievement level was estimated at 16 percent.

Does the government believe this poor track record justifies its claim that "a certain amount of useful knowledge" has been obtained?

The clear moral of the Monju saga is that a huge price must be paid for failing to take a hard look at the reality and underestimating risks and problems.

Serious concerns about the cost-effectiveness of a nuclear fuel recycling program and the risk of nuclear proliferation from accumulating stockpiles of plutonium led many countries to give up developing fast-breeder reactors. Japan, however, bucked the trend and embarked on building Monju.

When sodium leaks occurred overseas, Japanese proponents insisted that such an accident would not happen at the Monju reactor.

When a sodium leak accident did occur at Monju in 1995, they made false announcements and covered up vital information.

Monju resumed operations in 2010 after a long hiatus, but mechanical trouble soon caused it to be shut down again.

Eventually, the ability and competence of the Monju operator, Japan Atomic Energy Agency, was called into question.

The government's decision to decommission the reactor has long been delayed apparently because of fears that the step would raise questions about how to reprocess spent nuclear fuel in the recycling process and could have a negative impact on nuclear power generation itself.

The government should take this opportunity to confront the reality of its nuclear fuel recycling policy and try to create a new nuclear power policy that can win support of the public through open and broad debate.

Forging ahead with the plan to develop a fast reactor without following this process would be tantamount to betraying the people.

State funds will be used to clean up Fukushima

December 22, 2016

State funds to be used for clean-up in Fukushima

https://www3.nhk.or.jp/nhkworld/en/news/20161222_21/

The Japanese government, for the first time, is using state funds for decontamination work in areas affected by the 2011 nuclear accident in Fukushima Prefecture.

The environment ministry earmarked roughly 30 billion yen, or about 250 million dollars, in the fiscal 2017 budget plan, which was approved by the Cabinet on Thursday.

The allocation will be for cleaning up no-entry areas where radiation levels remain prohibitively high.

The government has so far made the plant operator, Tokyo Electric Power Company, pay for the cleanup, based on the principle that the entity responsible for the contamination should bear the cost.

Some lawmakers within the governing coalition are opposed to the turnaround in policy, saying the government should continue to make TEPCO pay.

Environment minister Koichi Yamamoto told reporters on Thursday that the ministry will carefully explain the decision in an effort to seek public understanding on the use of state funds.

The Environment Ministry says it estimates the cost of decontamination work carried out by TEPCO so far at around 36 billion dollars.

But the cleanup of the heavily-contaminated areas that starts from fiscal 2017 is expected to be more time- and labor-consuming than the work in lesser tainted areas.

Who is responsible?

December 23, 2016

The cost of cleaning up Fukushima

<http://www.japantimes.co.jp/opinion/2016/12/23/editorials/cost-cleaning-fukushima/#.WFz9Jn2Dmic>

The Abe administration has decided to use taxpayer money for decontaminating areas in Fukushima Prefecture off-limits to people due to fallout of radioactive substances from the March 2011 meltdowns at Tokyo Electric Power's Fukushima No. 1 power plant. The decision, which deviates from the current policy that Tepco should pay for the decontamination efforts, reflects a proposal put forward in August by the ruling coalition of Prime Minister Shinzo Abe's Liberal Democratic Party and Komeito but never discussed by the government's council of experts or in the Diet. The government may want to justify the move as an effort to help accelerate evacuees' return to their hometown communities. Still, it will be difficult for the administration to evade criticism that the measure is nothing but a taxpayer-funded bailout for Tepco, which is responsible for the nuclear fallout that affected so many people in Fukushima. By proceeding with the decontamination work, the administration hopes to lift evacuation orders in some of the no-go areas in about five years. It is hoped these areas will serve as bases for activities to promote reconstruction from the nuclear disaster. As the first step, the government plans to set aside ¥30 billion in the fiscal 2017 budget. So far, no full-scale cleanup work has been carried out inside these zones, which straddle seven municipalities around the Tepco plant.

The government's position is that it is safe for evacuees to return to their communities if the annual cumulative dose there is 20 millisieverts (mSv) or less, although the legal limit allowed for people in normal circumstances is 1 mSv. The millisievert is a measure of the absorption of radiation by the human body. In no-go zones, the annual dose tops 50 mSv and is not expected to fall below 20 mSv in the next five years.

Faithful to the standard polluter pays principle, which was also applied to the Minamata mercury poisoning disaster in the 1950s and '60s, the special law to cope with the damage from the Fukushima disaster stipulates that Tepco should shoulder the cleanup cost, and when decontamination work is paid for by taxpayer money, the utility must later reimburse the government. Now the government plans to revise the special law on decontamination and other legislation so it can pay for the planned decontamination work in Fukushima. To counter possible criticism that the scheme is intended merely to help Tepco, the government argues that the planned work aims to improve public infrastructure in the no-go zones so evacuees can return. However, the work will include scraping off top soil and cutting down trees, making it no different than decontamination efforts in other areas.

To justify the use of taxpayer money, the government also says that Tepco has paid compensation to evacuees from the no-go zones on the assumption that they would not be able to return to their homes over an extended period. Thus, in a revised guideline for the reconstruction of Fukushima Prefecture, the government says it will pay for the planned decontamination without asking for reimbursement from Tepco.

Behind the government's decision for the use of taxpayer money is the **mushrooming expense of decontamination, with the latest estimate rising from the original ¥2.5 trillion to ¥4 trillion, which does not include the cost of cleaning up the no-go areas.** The government expects the planned work in those areas to cost roughly ¥300 billion over five years, but the price tag could rise if the work becomes protracted. And the burden on taxpayers may further increase if the scope of government-paid decontamination in those areas is expanded.

In a related move, the Ministry of Economy, Trade and Industry has come up with an idea to pass part of the cost of Tepco's compensation for Fukushima disaster victims on to consumers in the form of higher electricity bills, as the total estimated cost for decommissioning the Fukushima No. 1 plant, compensation

and decontamination has swollen from the original ¥11 trillion to ¥21.5 trillion. **These moves not only increase people's financial burden but also blur the power company's responsibility for the devastation it caused.** The government may say the measures are necessary to help promote reconstruction in Fukushima. But they could distract public attention from the principle that it is Tepco which must pay for the decommissioning of its reactors, compensation for the victims and cleanup of the contaminated areas.

UK and Japan's nuke agreement

23.12.2016_No254 / News in Brief

UK And Japan Sign Nuclear Cooperation Agreement

<http://www.nucnet.org/all-the-news/2016/12/23/uk-and-japan-sign-nuclear-cooperation-agreement>

Plans & Construction

23 Dec (NucNet): The UK and Japan have signed an agreement that significantly expands cooperation in the nuclear energy sector and paves the way for Japanese companies to build nuclear plants in the UK, the Department for Business, Energy & Industrial Strategy said in a statement. The agreement also covers cooperation in the areas of decommissioning and decontamination and it is anticipated that the deal will give UK companies with advanced technologies greater access to projects at the Fukushima-Daiichi nuclear station, where three of the six reactors suffered meltdowns after the March 2011 earthquake and tsunami. The agreement was signed in Tokyo on 22 December 2016 by Hiroshige Seko, the Japanese trade and industry minister, and Greg Clark, the UK business and energy secretary. The agreement is the first of its kind for Japan, while Mr Clark described it as “vital” to the UK's industrial strategy and the development of clean energy sources. One of the key components of the agreement is the proposals to build new reactors in the UK. Two Japan-led consortia, Horizon and NuGen, are developing plans to build new nuclear projects in the UK. Horizon, bought by Hitachi from a German company in 2012, has delivered the outline of a project at Wylfa Newydd in Wales, and has plans to build as many as six reactors in the UK. Toshiba joint venture NuGen is planning the Moorside nuclear station in Cumbria, northwest England, and is considering additional projects. The first of the three Westinghouse AP1000 reactors at Moorside is targeted to come online in the mid-2020s.

TEPCO will sell gas

December 26, 2016

Tepco to sell gas to households

<http://www.japantimes.co.jp/news/2016/12/26/business/tepcosell-gas-households/#.WGE-a32Dmid>

JJI

Tepco Energy Partner Inc. will start selling gas to households next July in response to the full liberalization of the gas retail market coming in April.

Tepco Energy Partner, a unit of Tokyo Electric Power Company Holdings Inc., also said Monday it has concluded a basic wholesale agreement to supply gas to Nippon Gas Co., a major liquefied natural gas provider.

The two companies aim to win 150,000 new customers together in the service area of Tokyo Gas Co., until now the region's monopoly gas supplier, in the initial year of the alliance.

Last May, Tepco EP and Nippon Gas concluded a contract to switch the wholesale gas supplier for 320,000 current Nippon Gas customers to the Tepco unit from Tokyo Gas starting in April.

Tepco EP and Nippon Gas will discuss the possibility of jointly setting up a new company in a bid to expand their alliance and boost their competitive position against Tokyo Gas.

Tepco ready for bond offering?

December 27, 2016

TEPCO, investors eye 1st bond sale since Fukushima, sources say

<http://www.asahi.com/ajw/articles/AJ201612270064.html>

REUTERS

Tokyo Electric Power (TEPCO) is gauging demand for its first bond offering since the 2011 Fukushima nuclear calamity, with some market participants expecting a sale as early as February, sources familiar with the plans said.

While the size of the sale has not been decided, potential maturities being discussed are three-, five- and 10-years, bankers and investors told Thomson Reuters DealWatch, asking not to be identified because the information is private.

The company is likely to have to pay investors a premium of 1 percentage point above Japanese government bonds, about three times more yield pick up than on other electric utility bonds, they said. The company was in discussions last year with investors to sell as much as 330 billion yen of bonds. A TEPCO spokesman said the company still plans to issue bonds by the end of March but declined to comment on specific target dates or sizes.
